Mitotic recombination is exchange or rearrangement of DNA between homologous chromosomes during or around mitotic cell division. It can repair DNA or generate loss of heterozygosity and is relevant to tumor evolution and genetic disease.

Mitotic Telophase

Mitotic telophase is the stage after chromosome separation when chromosomes reach opposite poles, decondense, and become enclosed in newly forming nuclear envelopes. Cytokinesis usually follows or overlaps with telophase.

Mitoxantrone

A chemotherapy and immunosuppressive medicine that interferes with DNA and is used for selected cancers and some forms of multiple sclerosis.

MitraClip

A transcatheter device used for mitral valve edge-to-edge repair. It joins part of the anterior and posterior leaflets to reduce leakage; clinicians consider it for selected people with significant mitral regurgitation based on symptoms, valve anatomy, surgical risk, and other factors.

Mitral

Relating to the heart's mitral valve, which lies between the left upper and lower chambers. The valve opens for blood flow forward and closes to prevent backward leakage during each heartbeat.

Mitral Annular Calcification

Chronic calcium and fibrous deposition in the ring supporting the mitral valve. It is more common with older age and chronic kidney disease and can restrict leaflet motion, causing or worsening mitral regurgitation or degenerative mitral stenosis; echocardiography and sometimes CT assess its extent and consequences.

Mitral Atresia

A serious heart defect present from birth in which the opening of the mitral valve is absent or completely closed. Blood cannot flow normally into the heart's main pumping chamber; treatment involves staged surgery or transplantation.

Mitral Facies

A distinctive physical appearance characterized by a purplish or violaceous malar flush and patchy cyanosis across the cheeks, bridge of the nose, and lips. It is caused by chronic pulmonary hypertension, systemic vasoconstriction, and reduced cardiac output in severe mitral stenosis.

Mitral Insufficiency

Failure of the mitral valve to close completely, allowing blood to leak back into the left atrium during systole.

Mitral Regurgitation

Leakage through the mitral valve during heart contraction (systole), allowing blood to flow backward from the left ventricle into the left atrium. It may result from abnormal valve leaflets or supporting structures, infection, or heart damage, and can cause breathlessness, fatigue, palpitations, or heart failure.

Mitral Stenosis

Narrowing of the mitral valve orifice that impedes diastolic blood flow from the left atrium into the left ventricle. Most commonly caused by rheumatic heart disease or severe degenerative calcification of the mitral annulus. Elevated left atrial pressures produce left atrial enlargement, atrial fibrillation, pulmonary venous congestion, and secondary pulmonary hypertension and right heart failure.

Alternate Names:
Mitral Valve Stenosis; MS

Mitral Stenosis Murmur

A low-pitched, mid-diastolic rumbling heart murmur heard best at the cardiac apex in the left lateral decubitus position, classically preceded by an opening snap and displaying presystolic accentuation in patients with normal sinus rhythm.

Mitral Valve

The two-flap valve between the heart's left upper and lower chambers. It opens to let blood pass forward and closes to prevent backward flow; it may become narrowed, leaky, infected, or weakened.

Mitral Valve Insufficiency

Leakage of the mitral valve that allows blood to flow backward into the left atrium when the heart contracts. It may cause breathlessness, fatigue, palpitations, swelling, or heart failure.

Mitral Valve Prolapse

Bulging of one or both mitral-valve leaflets backward into the left atrium when the heart contracts. It is often harmless but can cause mitral regurgitation, palpitations, or abnormal heart rhythms.

Alternate Names:
MVP; Barlow Syndrome; Click-Murmur Syndrome; Floppy Mitral Valve

Mitral Valve Regurgitation

Backward leakage of blood through the mitral valve when the left ventricle contracts, which can cause breathlessness, fatigue, atrial enlargement, or heart failure.

Alternate Names:
MR; Mitral Incompetence; Mitral Insufficiency

Mitral Valve Repair

Unhyphenated variant; see *Mitral-Valve Repair*.

Mitral-Valve Repair

A surgical or transcatheter procedure to restore mitral valve competence without replacement, typi-

cally for regurgitation from prolapse, chordal rupture, or ischemic dysfunction. Repair preserves native valve tissue, maintains left ventricular function, and avoids lifelong anticoagulation required by mechanical prostheses.

Mitral Valve Stenosis

Alternate name; see *Mitral Stenosis*.

Mitral Valvotomy

A procedure that opens a narrowed mitral valve so blood can move more easily from the upper to the lower left heart chamber. It may use a balloon catheter or surgery and is suitable only for selected valve anatomy.

Mitral Valvuloplasty

Mitral valvuloplasty is a procedure that widens a narrowed mitral valve, often with a balloon catheter or surgical repair.

Mitsuokella

Mitsuokella is a genus of anaerobic bacteria found mainly in the mouth and digestive tract; human infection is uncommon.

Mittelschmerz

Recurrent one-sided lower-abdominal or pelvic pain occurring around ovulation. It is usually brief or lasts up to a day or two; severe, persistent, or atypical pain can have other causes.

Mixed Anxiety and Depressive Disorder

A psychiatric condition characterized by coexisting symptoms of both anxiety and depression that cause clinically significant distress or impairment, without either symptom set meeting the full threshold for a standalone disorder.

Mixed Aortic Valve Disease

Narrowing of the aortic valve (aortic stenosis) and backward leakage through it (aortic regurgitation) occurring together. The two problems affect blood flow and the heart at the same time, so their combined severity is assessed rather than judging each in isolation.

Mixed Connective Tissue Disease

An autoimmune illness with features of lupus, scleroderma, and inflammatory muscle disease. It may cause color changes in fingers with cold, swollen hands, joint pain, muscle weakness, swallowing problems, or inflammation around organs.

Alternate Names:
MCTD; Sharp Syndrome

Mixed Connective Tissue Disease-Associated Arthritis

Joint pain or inflammation occurring with mixed connective tissue disease, an autoimmune condition with features of lupus, systemic sclerosis, and inflammatory muscle disease.

Mixed Connective Tissue Disease (MCTD)

Alternate name; see *Mixed Connective Tissue Disease*.

Mixed Hearing Loss

Hearing loss caused by both a problem carrying sound through the outer or middle ear and a problem in the inner ear or hearing nerve. The best treatment depends on the causes found.

Mixed Hepatic Porphyria

An acute hepatic porphyria in which inherited impairment of heme synthesis can cause episodic abdominal and neurologic symptoms and, in some people, photosensitive skin disease.

Mixed-Lineage Leukemia

A leukemia in which malignant cells show defining features of more than one blood-cell lineage, usually myeloid and lymphoid. The current term for this entity is mixed-phenotype acute leukemia (MPAL).

Alternate Names:
Mixed-Phenotype Acute Leukemia; MPAL

Mixed Mitral Valve Disease

Narrowing of the mitral valve (mitral stenosis) and

backward leakage through it (mitral regurgitation) occurring together. The two problems affect blood flow and pressure in the heart at the same time, so their combined severity is assessed rather than judging each in isolation.

Mixed Oedema

Edema caused by more than one mechanism or affecting more than one tissue compartment; interpretation depends on clinical context.

Mixed Urinary Incontinence

Urine leakage caused by both a sudden strong urge to urinate and pressure from coughing, sneezing, laughing, or exercise. Treatment may include bladder training, pelvic-floor exercises, medicines, or procedures.

Miyoshi Myopathy

A rare inherited muscle disease that usually begins in adolescence or early adulthood with progressive weakness of the calf muscles. People may have difficulty standing on tiptoe or climbing stairs; weakness later spreads to the thighs and hips. Blood tests often show high muscle-enzyme levels. Physical therapy helps maintain movement and function.

Alternate Names:
Miyoshi Distal Myopathy; Distal Dysferlinopathy

MME

Membrane metalloendopeptidase, also called neprilysin, CD10, neutral endopeptidase, or CALLA; it is a cell-surface enzyme and marker expressed in several tissues and in some acute lymphoblastic leukemias.

Mobile

Capable of moving or being moved; a mass or structure described as mobile is not fixed to adjacent tissue.

Mobile Genetic Elements

Genetic elements that can move within and between genomes. These include plasmids, transposons, and integrons. Mobile genetic elements can carry antibiotic resistance genes and virulence factors. They facilitate horizontal gene transfer and contribute to the rapid evolution of bacteria.

Mobile Health

The use of phones, tablets, wearable devices, or similar portable technology to support health care. Uses include reminders, remote monitoring, education, communication, symptom tracking, and some diagnostic tools; privacy, accuracy, accessibility, and clinical oversight remain important.

Alternate Names:
mHealth

Mobile Health Unit

A mobile health unit is a vehicle or transportable facility equipped to provide health services at changing locations. It may deliver screening, vaccination, primary care, diagnostic testing, emergency support, or outreach to underserved communities.

Mobility

The ability to move or be moved, including functional movement of a person or range of motion of a joint.

Mobilization

The process of restoring or encouraging movement, such as early patient activity, joint movement, or surgical release of tissue.

Mobiluncus

A genus of curved anaerobic bacteria associated with bacterial vaginosis and occasionally isolated from other clinical specimens.

Mobiluncus Curtisii

A curved bacterium that grows without oxygen and may be present with bacterial vaginosis. Its detection can support assessment, but symptoms, examination, and other test results are needed to interpret vaginal findings.

Mobiluncus Mulieris

A curved bacterium that grows without oxygen and may be associated with bacterial vaginosis. Find-

ing it can support a diagnosis, but symptoms, examination, and other laboratory results are also important.

Mobitz Type I

A form of second-degree atrioventricular (AV) block characterized on electrocardiography by progressive PR interval prolongation in successive beats until a single P wave fails to conduct to the ventricles (dropped QRS), after which the cycle repeats (Wenckebach periodicity), typically localized within the AV node.

Alternate Names:
Wenckebach Block; Second-Degree AV Block Mobitz I

Mobitz Type I Block

A form of second-degree atrioventricular block characterized electrocardiographically by progressive lengthening of the PR interval in consecutive cardiac cycles until an atrial P wave fails completely to conduct to the ventricles (dropped QRS complex). The cycle then resets with a shorter PR interval. Typically localized to physiological or pathological fatigue within the atrioventricular node, often benign and reversible.

Alternate Names:
Wenckebach Block; Mobitz I AV Block

Mobitz Type II

A high-grade form of second-degree atrioventricular (AV) block characterized on electrocardiography by intermittent, non-conducted P waves (dropped QRS complexes) occurring without prior PR interval prolongation, typically localized in the infranodal His-Purkinje system and carrying a high risk of progression to complete heart block.

Alternate Names:
Second-Degree AV Block Mobitz II; Infranodal AV Block

Mobitz Type II Block

A heart rhythm problem in which some signals from the upper chambers fail to reach the lower chambers without the warning lengthening of the PR interval. It can suddenly worsen into complete heart block; a pacemaker is often used when the cause is not reversible.

Alternate Names:
Mobitz II AV Block; Infranodal Second-Degree AV Block

Mobius Syndrome

A rare condition present from birth that affects certain facial and eye-moving nerves. It can cause facial weakness or paralysis, trouble closing the eyes, limited outward eye movement, and feeding or speech difficulties.

Modafinil

A prescription medicine that promotes wakefulness in narcolepsy, shift-work sleep disorder, and persistent sleepiness from obstructive sleep apnea when airway treatment is adequate. It can cause headache, anxiety, insomnia, serious rash, or dependence and is not a substitute for sleep or airway treatment.

Modality

A particular method used for treatment, diagnosis, imaging, or sensory stimulation. Examples include surgery, medicines, ultrasound, MRI, physiotherapy, and forms of counseling; the best modality depends on the health problem and the person's needs.

Mode

The most frequent value in a dataset or a particular manner or method of operation.

Model

A simplified representation used to describe, explain, predict, or study a biological or clinical process.

Moderate To Severe Disabilities

Moderate to severe disability describes substantial limitations in physical, cognitive, sensory, communication, or adaptive functioning that require ongoing support. Needs vary widely and may include medical care, rehabilitation, assistive technology, education, and assistance with daily activities.

Moderation

Moderation is reduction or control of the intensity, amount, or severity of a process, symptom, behavior, or treatment effect. In clinical research, a moderator is a factor that changes the strength or direction of an association.

Moderator

A factor that changes the strength or direction of a relationship or treatment effect; it may also mean a person who guides a discussion.

Modes Of Inheritance

Patterns by which genetic traits pass through families, including autosomal dominant, autosomal recessive, X-linked, mitochondrial, and other patterns.

Modified Biophysical Profile

A pregnancy assessment that combines a fetal heart-rate test with measurement of the amniotic-fluid volume. A nonreactive heart-rate result or low fluid level may suggest that further assessment or delivery is needed, depending on gestational age and the clinical situation.

Alternate Names:
Modified BPP; NST with Amniotic Fluid Index

Modified Duke Criteria

Standardized set of clinical, microbiological, and echocardiographic criteria used to diagnose infective endocarditis. See *Duke Criteria*.

Modulator

A substance or factor that alters the activity of a biological pathway, receptor, gene, or physiological process.

Modus Operandi

The characteristic method by which a person performs an action; it is chiefly a forensic or legal term.

Modus Vivendi

A practical arrangement or way of living that allows people or groups with differences to coexist.

MODY

A group of monogenic diabetes forms, also called maturity-onset diabetes of the young, caused by pathogenic variants in a single gene affecting insulin secretion or glucose regulation. It often begins in adolescence or early adulthood and may appear across successive generations, but age at diagnosis and clinical features vary by subtype. It is distinct from type 1 and type 2 diabetes.

Moebius Syndrome

A congenital disorder characterized mainly by facial paralysis and inability to abduct the eyes, caused by developmental cranial-nerve abnormalities.

Moellerella

A rare group of bacteria that can occasionally cause urinary, bloodstream, or other infection, mainly in people who are seriously ill or have weakened defenses. Laboratory identification is needed to determine whether a specimen represents true infection.

Moellerella Wisconsensis

A rare type of bacterium that can occasionally cause urinary, bloodstream, wound, or other infections, especially in people with serious illness or weakened immunity. Laboratory testing identifies it and guides antibiotic choice.

Moeller's Glossitis

An older term for a smooth, painful, inflamed tongue associated especially with nutritional deficiency, including iron, folate, or vitamin B12 deficiency.

MOGAD

Abbreviation; see *MOG Antibody-Associated Disorder*.

MOG Antibody-Associated Disorder

A rare immune disorder in which antibodies target MOG, a protein on nerve coverings in the brain, optic nerves, and spinal cord. It can cause inflammation in these areas and problems with vision, movement, or balance.

Alternate Names:
MOGAD; MOG Antibody Disease; Myelin Oligodendrocyte Glycoprotein Antibody-Associated Disease

Mogibacterium

A genus of anaerobic bacteria found in the mouth and intestine and occasionally associated with dental or other infection.

Mohs Micrographic Surgery

Skin-cancer surgery in which the visible tumor and a thin layer of surrounding tissue are removed in stages. Each layer is mapped and examined under a microscope for cancer at its edges; additional tissue is removed only where cancer remains. The method preserves uninvolved tissue while checking margins during removal.

Mohs Surgery

Alternate name; see *Mohs Micrographic Surgery*.

Moisture

Water or other liquid present on a surface or in tissue; excessive moisture can cause maceration and skin breakdown.

Molar

Relating to a back tooth used for chewing, or to a chemical concentration measured in moles per liter.

Molar Pregnancy

An abnormal pregnancy in which placental tissue grows excessively instead of developing normally. In a complete mole no embryo forms; in a partial mole abnormal embryonic or fetal tissue may be present. It can cause bleeding, severe nausea, or unusually high pregnancy-hormone levels; follow-up tracks resolution and possible persistent disease.

Alternate Names:
Hydatid Mole; Hydatidiform Mole

Molasses

A viscous syrup produced during sugar refining; it is rich in sugar and may contain variable amounts of minerals.

Mold

A multicellular fungus that grows as branching filaments; molds can cause allergy, food spoilage, or opportunistic infection.

Mold Allergy

An allergic response to mold spores that may cause nasal, eye, skin, or lower-respiratory symptoms.

Alternate Names:
Fungal Hypersensitivity; Mold-Induced Rhinitis

Mold Exposure

Mold exposure can irritate the eyes, skin, and airways and may worsen asthma or allergic rhinitis; invasive infection is uncommon and mainly affects severely immunocompromised people. Reducing moisture and remediating contaminated areas are more useful than unproven detoxification.

Mole

A common, usually harmless skin growth made of pigment-producing cells. It may be flat or raised and brown, black, pink, or skin-colored. Changes in size, shape, color, or feel can sometimes signal skin cancer.

Molecular

Relating to molecules or processes occurring at the molecular level.

Molecular Chaperone

A molecular chaperone is a protein that assists other proteins with folding, assembly, transport, or refolding without becoming part of the final structure. Chaperones can also help prevent or resolve protein aggregation.

Molecular Diagnosis

Molecular diagnosis uses analysis of DNA, RNA, proteins, or other molecular markers to identify a disease, pathogen, inherited variant, tumor subtype, or treatment-relevant characteristic. Results require appropriate assay validation and clinical interpreta-

tion.

Molecular Dynamics

A computer method that predicts how atoms and molecules move and interact over time. Researchers use it to study protein shape, drug binding, chemical reactions, and other biological processes; its results depend on the model and assumptions used.

Molecular Imaging

Imaging that shows biological molecules, cell activity, or biochemical processes in the body, often using a targeted radioactive or fluorescent tracer. It can help characterize tumors, inflammation, infection, or organ function.

Molecular Pathology

The study of disease-related changes in genes, gene activity, or proteins within cells and tissues. It can help identify a disease, classify a tumor, estimate likely outcome, detect inherited risk, or select a treatment.

Molecular Pathology Of Colorectal Cancer

The assessment of molecular alterations that classify colorectal tumors and guide prognosis or therapy, including mismatch-repair deficiency or microsatellite instability, RAS mutations, BRAF mutation, HER2 amplification, and selected gene fusions.

Molecular Probe

A molecular probe is a labeled or otherwise detectable molecule designed to bind a particular nucleic-acid sequence, protein, metabolite, or other target. Probes are used in imaging, assays, microscopy, and molecular diagnostics.

Molecular Response

A molecular response is a measurable change in a molecular marker, such as a pathogen load, oncogenic transcript, mutation burden, or biomarker, after disease progression or treatment. Its definition and clinical significance depend on the disease and assay.

Molecular Testing

Analysis of DNA, RNA, or other molecular features to identify variants, fusions, expression patterns, or infectious agents for diagnosis, prognosis, or treatment selection.

Molecular Weight

The mass of one molecule, usually expressed in atomic mass units; for a substance used in chemistry, its numerical value corresponds to molar mass in grams per mole. It helps calculate concentrations and doses.

Molecule

A group of chemically bonded atoms forming the smallest unit of a substance that retains its chemical properties.

Moles

Plural form; see *Mole*.

Molimina

The symptoms and physical changes that occur before menstruation, including breast tenderness, bloating, or mood changes.

Mollusc

A soft-bodied invertebrate; the term is also used in names of mollusc-borne or mollusc-associated parasitic diseases.

Mollusca

The animal group containing snails, slugs, clams, and related species. Some mollusks can cause illness through venom, contaminated food, or parasites they carry; medical risk depends on the species and exposure.

Molluscipoxvirus

A group of poxviruses that includes the virus causing molluscum contagiosum. Infection produces small, firm, usually painless skin bumps with a central dimple and spreads through close skin contact or shared items.

Molluscum Contagiosum

A benign skin infection caused by molluscum contagiosum virus, a poxvirus. It produces smooth, firm, pearly or skin-colored dome-shaped papules with central dimples, often in clusters. It spreads through direct contact or contaminated objects and may be extensive or persistent in people with weakened immunity.

Molten Metal Fumes

Fumes produced during welding, smelting, or casting that can cause metal-fume fever, airway irritation, or metal toxicity.

Molteno Implant

A small drainage device placed during glaucoma surgery to lower pressure inside the eye. A tube carries excess fluid to a plate under the surface tissue of the eye, where it can drain. It may be used when other treatments are unlikely to work or have failed.

Alternate Names:
Molteno Glaucoma Drainage Device; Molteno Aqueous Shunt; Molteno Seton

Molybdenum

An essential trace element required in small amounts for enzymes; excessive exposure can affect copper balance.

Molybdenum-99

A radioactive form of molybdenum that changes into technetium-99m. It is used in generator systems to produce technetium-99m, a radioactive tracer used for many medical scans.

Molybdenum Cofactor Deficiency

An inherited disorder in which cells cannot make or use the molybdenum cofactor required by enzymes such as sulfite oxidase and xanthine dehydrogenase. Severe neonatal disease may cause feeding difficulty, seizures, abnormal muscle tone, encephalopathy, and progressive brain injury.

Molybdosis

Illness caused by excessive molybdenum exposure, which may disturb copper metabolism and cause systemic effects.

Mometasone

Mometasone is a potent synthetic glucocorticoid used topically or by inhalation for inflammatory skin or airway disease. It reduces local inflammation but may cause skin atrophy, oral candidiasis, adrenal effects, or other corticosteroid adverse effects.

Mometasone Furoate

Mometasone furoate is the furoate ester of the corticosteroid mometasone. Depending on formulation, it is used for inflammatory skin disease, allergic rhinitis, or asthma; local and systemic corticosteroid precautions apply.

Momordica

A genus of plants including bitter melon; preparations may affect blood glucose and can interact with medicines.

Monascus

Monascus is a genus of fungi used in some fermented foods; some species produce pigments, while contamination can produce harmful mycotoxins.

Monckeberg Medial Calcific Sclerosis

A benign, non-inflammatory form of arteriosclerosis characterized by dystrophic ring-like calcification localized within the tunica media of medium and small muscular arteries without luminal obstruction or intimal ulceration, producing palpable 'lead-pipe' rigidity of peripheral vessels.

Alternate Names:
Mönckeberg Arteriosclerosis; Medial Calcific Sclerosis

Mondor Disease

A benign, self-limited superficial thrombophlebitis affecting the subcutaneous veins of the anterior chest wall and breast (lateral thoracic, thoracoepigastric, or superior epigastric veins), presenting as a palpable, painful, cord-like indurated subcutaneous band under tension.

Mondor'S Disease

Superficial thrombophlebitis of the anterior chest wall veins, typically the lateral thoracic, thoracoepigastric, or superior epigastric veins. Presents as a tender, cord-like subcutaneous structure with skin retraction. Usually self-limited; associated with breast surgery, trauma, or hypercoagulable states.

Mongolian Spot

An older term for congenital dermal melanocytosis, a flat blue-gray patch caused by pigment-producing cells in the deeper skin, usually present at birth. It is benign and often fades during childhood; documenting it can help distinguish it from bruising.

Monilethrix

Monilethrix is an inherited hair-shaft disorder in which hair has regularly spaced narrow segments and breaks easily, producing a beaded appearance. It commonly causes short, brittle scalp hair and may involve follicles elsewhere.

Monitored Anesthesia Care

Anesthesia care in which a trained professional gives medicines for comfort or pain relief and continuously watches breathing, heart rate, blood pressure, and oxygen. The level of sedation can be adjusted and emergency support is available.

Monitoring Device

A monitoring device measures and displays or records a physiologic variable, such as heart rhythm, oxygen saturation, blood pressure, glucose, temperature, or respiratory rate. Accuracy, calibration, and clinical context determine how results should be interpreted.

Monitoring Test

A test repeated over time to follow a disease, treatment response, medicine safety, or a possible complication. The result is interpreted with symptoms and earlier measurements.

Monkeypox

Former name; see *Mpox*.

Monkeypox (Mpox)

Alternate name; see *Mpox*.

Mono

Alternate name; see *Infectious Mononucleosis*.

Monoamine Oxidase Inhibitor (MAOI) Toxicity

Poisoning or interaction involving an MAOI that may cause severe hypertension, tachycardia, agitation, hyperthermia, seizures, or serotonin syndrome with clonus and hyperreflexia. Stop serotonergic or sympathomimetic drugs, provide benzodiazepines and supportive care, and manage rapidly changing blood pressure and temperature in an intensive setting.

Monoamine Oxidase Inhibitors

A class of medications that work by blocking monoamine oxidase, an enzyme responsible for breaking down chemical messengers in the brain such as serotonin, dopamine, and norepinephrine. By allowing these neurotransmitters to remain active longer, they help regulate mood in conditions such as depression. Because the enzyme also breaks down tyramine in the digestive system, taking these medications requires strict dietary restrictions to prevent dangerous spikes in blood pressure.

Alternate Names:
MAOIs; MAO Inhibitors

Monoarticular Joint Pain

Pain affecting one joint, caused by trauma, infection, crystal arthritis, osteoarthritis, or inflammatory arthritis. Acute pain with swelling, warmth, fever, or inability to bear weight can occur with septic arthritis.

Monobactams

A class of antibiotics used mainly for certain infections caused by oxygen-using Gram-negative bacteria. Aztreonam is the main example; laboratory testing and allergy history help guide its use.

Monoblast

An early bone marrow cell that develops into a monocyte, a type of infection-fighting white blood cell.

Monoblast Count

A monoblast count is the number or proportion of monoblasts, immature precursors of monocytes, in a blood or bone-marrow sample. Increased blasts may support evaluation for acute myeloid leukemia or another marrow disorder and require expert morphologic or immunophenotypic interpretation.

Monochorionic Twin Pregnancy

A twin pregnancy in which identical twins share a single placenta. Because the babies share placental blood vessels, the pregnancy carries unique risks such as twin-to-twin transfusion syndrome and unequal growth, requiring frequent ultrasound monitoring throughout pregnancy. Twins may have separate inner fluid sacs (diamniotic) or rarely share a single sac (monoamniotic).

Alternate Names:
Monochorionic Twins

Monoclonal

Made by, or arising from, one original cell and therefore very similar to that cell. A monoclonal antibody is designed to recognize one specific target in the body or in a laboratory test.

Monoclonal Antibodies

Antibodies produced from a single B-cell clone and directed against one antigenic target; they are used in diagnosis and treatment.

Monoclonal Antibody

A laboratory-made immune protein designed to recognize one specific target. Monoclonal antibodies are used in tests and treatments for cancer, inflammatory disease, infection, and other conditions.

Monoclonal Gammopathy Of Undetermined Significance

A benign, non-cancerous condition in which abnormal plasma cells in the bone marrow produce an elevated amount of a specific antibody protein, known as an M-protein or monoclonal protein. It generally causes no symptoms and does not damage bones, kidneys, or blood counts, but it requires regular medical monitoring because it carries a small annual risk of progressing into multiple myeloma or another blood disorder.

Alternate Names:
MGUS; Monoclonal Paraproteinemia

Monoclonal Gammopathy of Undetermined Significance (MGUS)

Alternate name; see *Monoclonal Gammopathy Of Undetermined Significance*.

Monocrotophos

Monocrotophos is a highly toxic organophosphorus insecticide that inhibits acetylcholinesterase. Exposure can cause acute cholinergic poisoning with secretions, bronchospasm, vomiting, bradycardia, weakness, seizures, and respiratory failure.

Monocular

Involving or affecting one eye, or occurring with vision from one eye. Monocular vision can reduce depth perception and may result from eye disease, injury, or loss of vision in the other eye.

Monocyte

The largest type of circulating mononuclear leukocyte in peripheral blood, measuring 12–20 μm in diameter, constituting approximately 2–8% of circulating white blood cells. Originating from myeloid progenitor cells in the bone marrow under the influence of colony-stimulating factor 1 (M-CSF), monocytes are characterized morphologically by an indented, kidney- or horseshoe-shaped nucleus, delicate lace-like chromatin, and abundant grayish-blue cytoplasm containing fine azurophilic granules (lysosomes with peroxidase, acid phosphatase, and lysozyme). Monocytes circulate in the vascular system for 1 to 3 days before extravasating through capillary endothelial walls into tissues throughout the body, where they differentiate into specialized tissue-resident macrophages (e.g., alveolar macrophages

in lungs, Kupffer cells in liver, osteoclasts in bone, microglia in central nervous system) or inflammatory dendritic cells. In the innate and adaptive immune response, monocytes function as avid phagocytes, professional antigen-presenting cells expressing MHC class II molecules, and major producers of pro-inflammatory cytokines (TNF-α, IL-1, IL-6, IL-12). Monocytosis ($> 1.0 \times 10^9$/L) occurs in chronic bacterial infections (tuberculosis, subacute bacterial endocarditis), autoimmune diseases, and chronic myelomonocytic leukemia (CMML).

Monocytes

Plural form; see *Monocyte*.

Monocytopenia

An abnormally low number of monocytes, a type of white blood cell, in the blood. It may occur with bone-marrow disorders, medicines, infections, or severe illness and is interpreted with the full blood count.

Monocytosis

An increased absolute number of circulating monocytes. It may be reactive to infection or inflammation or associated with a hematologic neoplasm; persistent or marked elevations can indicate an underlying disorder.

Monogenic

Describing a condition or trait caused mainly by a change in one gene. The change may be inherited from a parent or arise for the first time in the affected person.

Monogenic Obesity

Severe or early-onset obesity caused mainly by a disease-causing change in one gene. The affected gene may alter appetite or the body's control of energy use.

Monograph

A monograph is a detailed, authoritative document devoted to one subject. In health care it may describe a drug's identity, quality, pharmacology, indications, dosing, safety, or regulatory standards.

Mono (Infectious Mononucleosis)

Alternate name; see *Infectious Mononucleosis*.

Monoiodotyrosine

Monoiodotyrosine is an iodinated tyrosine residue formed during thyroid-hormone synthesis. Coupling of iodinated tyrosine residues within thyroglobulin contributes to production of thyroxine and triiodothyronine.

Monokines

Monokines are cytokines produced chiefly by monocytes and macrophages, including mediators such as tumor necrosis factor and interleukin-1. They regulate inflammation, immune responses, fever, and communication among cells.

Monomer

A monomer is a relatively small molecule that can chemically bond with other monomers to form a polymer. Biological examples include amino acids and nucleotides; some industrial monomers can irritate tissues or be toxic.

Monomethylhydrazine

Monomethylhydrazine is a volatile, corrosive, highly toxic chemical used as a rocket propellant. Exposure can injure the eyes, skin, lungs, liver, and nervous system and may cause seizures or systemic poisoning.

Monomodal Visual Amnesia

A rare visual-memory disorder in which a person has marked difficulty recognizing or recalling visual information while other memory modalities may be relatively preserved; neurologic evaluation is needed to identify the cause.

Mononegavirales

An order of viruses with nonsegmented, negative-sense RNA genomes, including rabies, measles, Ebola, and respiratory syncytial viruses.

Mononeuritis Multiplex

A painful, asymmetrical, asynchronous sensory and

motor peripheral neuropathy affecting at least two separate, non-contiguous named peripheral nerves, classically provoked by systemic necrotizing vasculitides (such as polyarteritis nodosa, microscopic polyangiitis, or cryoglobulinemia).

Alternate Names:
Multifocal Neuropathy

Mononeuropathy

Mononeuropathy is dysfunction or injury of a single peripheral nerve. Common causes include compression, trauma, ischemia, inflammation, and metabolic disease; symptoms follow the nerve's distribution and may include pain, numbness, weakness, or autonomic changes.

Mononuclear Leukocyte

A white blood cell with one main, unsegmented nucleus. Monocytes and lymphocytes are examples; they help remove damaged material, recognize germs, and coordinate immune responses.

Mononucleosis

Common shortened term; see *Infectious Mononucleosis*.

Mononucleosis Spot Test

A rapid blood test detecting heterophile antibodies associated with infectious mononucleosis; it may be negative early in illness or in young children, so other testing may be needed.

Monoplegia

Complete paralysis of one arm or one leg. It can result from a stroke, brain or spinal-cord disease, or severe damage to a nerve. The cause is found through a neurological examination and, when needed, brain or spine imaging and nerve tests.

Monopodium

A single foot or one-sided foot structure; the term is uncommon and may be used descriptively in developmental anatomy.

Monorchidism

The presence of only one testis, either because the other failed to develop, descended, or was removed.

Monosaccharide

The simplest form of sugar, which cannot be split into a smaller carbohydrate. Glucose and fructose are examples; cells use these sugars mainly for energy.

Monosodium Glutamate

MSG, the sodium salt of glutamic acid, used as a flavor enhancer because it contributes umami taste; it occurs naturally in foods such as tomatoes and aged cheese.

Monosodium Urate

Needle-shaped crystals formed from urate that deposit in joints and other tissues and cause gout. Under polarized light microscopy, they are strongly negatively birefringent.

Alternate Names:
Monosodium Urate Crystals; MSU Crystals; Urate Crystals

Monosomy

A genetic condition in which a cell has one copy of a chromosome instead of the usual two. Effects depend on the chromosome and whether all cells or only some cells are affected.

Monospot Test

A rapid blood test that detects heterophile antibodies associated with infectious mononucleosis. It may be negative early in illness or in young children and does not directly detect Epstein-Barr virus; specific antibody testing may be needed.

Alternate Names:
Heterophile Antibody Test; Paul-Bunnell Test

Monotest

A rapid blood test that looks for heterophile antibodies produced during some cases of infectious mononucleosis. A negative result does not always exclude infection, especially early in illness or in

young children.

Monounsaturated Fat

A dietary fatty acid characterized chemically by an acyl hydrocarbon chain containing exactly one carbon-carbon double bond with all remaining carbon atoms single-bonded (e.g., oleic acid [18 : 1 cis-9], the primary fatty acid in olive oil, canola oil, avocados, and nuts). The single double bond, typically in the *cis* geometric configuration, introduces a structural kink that lowers the melting point, making monounsaturated fatty acids (MUFAs) liquid at room temperature. In cardiovascular metabolism, replacing saturated fatty acids and refined carbohydrates with dietary monounsaturated fats lowers circulating low-density lipoprotein cholesterol (LDL-C) without reducing high-density lipoprotein cholesterol (HDL-C), reduces susceptibility of LDL particles to oxidative modification, improves endothelial function, and enhances insulin sensitivity, representing a cornerstone cardioprotective element of the Mediterranean dietary pattern.

Monounsaturated Fats

Plural form; see *Monounsaturated Fat*.

Monozygotic Twin

A monozygotic twin develops when one fertilized egg divides into two embryos. The twins share nearly identical nuclear genomes but can differ through developmental, epigenetic, mitochondrial, and environmental factors.

Mons Veneris

The rounded fatty prominence over the pubic bone in front of the external female genitalia.

Monteggia Fracture

A traumatic fracture of the proximal third of the ulnar shaft accompanied by dislocation or subluxation of the radial head at the proximal radioulnar joint (PRUJ), classified into four types by Bado.

Alternate Names:
Monteggia Fracture-Dislocation; Proximal Ulnar Fracture with Radial Dislocation

Monteggia Fracture-Dislocation

A traumatic forearm injury consisting of a fracture of the proximal third of the ulna associated with anterior, posterior, or lateral dislocation of the radial head at the proximal radioulnar joint.

Montelukast

Montelukast is a leukotriene CysLT1-receptor antagonist used for asthma prevention and allergic rhinitis; it is not a rescue bronchodilator, and neuropsychiatric adverse effects require attention.

Montelukast Sodium

Montelukast sodium is the sodium salt of montelukast, a leukotriene-receptor antagonist used for asthma prevention and allergic rhinitis. It is not a rescue bronchodilator and carries an important warning for possible neuropsychiatric adverse effects.

Montevideo Units

A measurement of the strength of uterine contractions over 10 minutes during labor. It is calculated from pressure readings obtained by a catheter inside the uterus and helps clinicians assess whether contractions are strong enough to support labor progress.

Montgomery Tubercles

Small oil-producing glands in the darker skin around the nipple. They often become more noticeable during pregnancy and breastfeeding and release oil that helps protect and lubricate the nipple; they are usually normal.

Montreal Cognitive Assessment

A brief screening test of memory, attention, language, problem-solving, visual-spatial skills, and orientation. It can identify possible thinking problems but does not by itself diagnose dementia; education, language, sensory impairment, and acute illness affect the score.

Mood

A lasting emotional state experienced by a person and noticed by others. Mood may be described as

depressed, anxious, irritable, elevated, or stable and can change with illness, medicines, stress, or life events.

Mood Disorder

A broad category of psychiatric illnesses characterized predominantly by severe, pervasive, and persistent disturbances in an individual's internal emotional state (mood) and affective expression that are out of proportion to external circumstances, causing substantial functional disability and subjective distress. Broadly categorized into two primary divisions: (1) Depressive Disorders (unipolar depression, encompassing major depressive disorder, persistent depressive disorder [dysthymia], and premenstrual dysphoric disorder), defined by persistent sadness, emptiness, irritability, anhedonia, fatigue, neurovegetative disturbances in sleep and appetite, feelings of worthlessness, and suicidal ideation; and (2) Bipolar and Related Disorders (bipolar I disorder, defined by at least one manic episode; bipolar II disorder, defined by hypomanic episodes and major depressive episodes; and cyclothymic disorder), characterized by pathological mood swings between depressive episodes and elevated, expansive, or irritable manic or hypomanic states with decreased need for sleep, pressured speech, racing thoughts, and impulsivity. Management utilizes evidence-based psychotherapy (cognitive behavioral therapy), mood stabilizers (lithium, valproate), second-generation antipsychotics, antidepressants (SSRIs, SNRIs), and neurostimulation therapies (electroconvulsive therapy, transcranial magnetic stimulation).

Mood Disorders

Plural form; see *Mood Disorder*.

Mood Stabilizers

Medicines used mainly to treat or prevent episodes of mania and depression in bipolar disorder. Examples include lithium, valproate, carbamazepine, and lamotrigine; each has different benefits, interactions, monitoring needs, and risks during pregnancy.

Mood Swing

A mood swing is a noticeable change in emotional state or affect over time. Occasional changes can be normal, while frequent, severe, or impairing swings may occur with mood disorders, substance use, medical illness, medications, or sleep disruption.

Morale

Morale is the confidence, motivation, and sense of shared purpose within a person or group. It can affect teamwork and occupational well-being but is not itself a specific medical diagnosis.

Moraxella

Moraxella is a genus of bacteria that can colonize the respiratory tract and cause ear, sinus, eye, or respiratory infections.

Moraxella Atlantae

A rare Moraxella species; the significance of its recovery from a clinical sample varies with the site and other evidence of infection.

Moraxellaceae

A family of bacteria that includes Moraxella and related organisms. Some normally live on the skin or in the airways, while others can cause ear, sinus, lung, wound, or bloodstream infections.

Moraxella Lincolnii

Moraxella lincolnii is a rare respiratory-tract bacterium; clinical importance depends on the specimen and evidence of infection.

Moraxella Oblonga

Moraxella oblonga is a rare Moraxella species found in respiratory or oral specimens; significance depends on clinical evidence of infection.

Moraxella Osloensis

An uncommon bacterium that can occasionally cause bloodstream, respiratory, wound, or other opportunistic infections, usually in people with serious illness or weakened immunity.

Morbidity

Illness or disability in a person or group of people.

It can also mean how many people have a disease or how much illness or disability a disease causes.

Morbilli

The medical or Latin name for measles, an acute contagious viral infection with fever and a characteristic rash.

Morbilli Form

Resembling measles in appearance, especially a widespread rash made of flat and slightly raised spots. This description does not prove that a person has measles because medicines, infections, and other illnesses can cause similar rashes.

Morbillivirus

A genus of paramyxoviruses that includes measles virus and related animal viruses causing fever, respiratory illness, rash, or neurologic disease.

Morbus

A Latin word meaning disease. It appears in some older or formal disease names, but the word itself does not describe the cause, symptoms, or treatment of the condition.

Morcellation

The division of tissue into smaller fragments, often during minimally invasive surgery; it can spread an unrecognized cancer.

Mordant

A substance that helps fix a dye to tissue or a material, used in some histological staining methods.

Morgagni Hernia

A congenital diaphragmatic hernia occurring through the anterior retrosternal foramen of Morgagni, resulting from incomplete fusion of parts of the diaphragm. Abdominal contents may move into the chest and cause respiratory or gastrointestinal symptoms.

Morgagni-Turner-Albright Syndrome

Historical alternate name; see *Turner Syndrome*.

Morganella

Morganella is a genus of gram-negative bacteria that can cause urinary, wound, bloodstream, and other opportunistic infections.

Morganella Morganii

A gram-negative bacterium that can cause urinary, wound, bloodstream, or postoperative infections, especially in hospitalized or medically vulnerable people. Antibiotic susceptibility varies, and resistance is common.

Morgellons Disease

A controversial condition involving distressing skin sensations and the belief that fibers or materials emerge from the skin. Symptoms are real to the person; possible dermatologic, neurologic, psychiatric, toxic, and infectious causes are described without establishing a specific mechanism.

Moribund

Extremely ill and at high risk of imminent death. The term describes a person's condition, but does not by itself determine whether treatment can help or what care is appropriate.

Morning Sickness

Nausea, with or without vomiting, during pregnancy. It often begins early and improves by the middle of pregnancy, but severe or persistent vomiting can cause dehydration, weight loss, and nutrient problems and may require fluids or other treatment.

Moro Reflex

A normal newborn startle response that causes the baby to spread out the arms, open the hands, and then draw the arms inward. It usually fades by about 3 to 6 months; an absent or unequal response may indicate a nerve or developmental problem.

Morphea

A localized sclerosing skin disorder that produces areas of thickened, hardened, or discolored skin and differs from systemic sclerosis by usually lacking internal-organ involvement.

Morpheus

The Greek and Roman mythological god of dreams; the name is the source of *morphine*, an opioid named for its association with sleep and dreams.

Morphinans

Morphinans are a group of chemical compounds with a fused-ring structure related to morphine. The class includes opioid analgesics and other compounds with varying receptor activity, potency, and clinical effects.

Morphine

Morphine is a potent opioid analgesic used for selected moderate-to-severe pain and palliative-care indications. It activates opioid receptors and can cause respiratory depression, sedation, constipation, nausea, tolerance, dependence, and overdose.

Morphine Overdose

Taking too much morphine can cause extreme sleepiness, pinpoint pupils, slow or stopped breathing, low blood pressure, coma, and death. Naloxone can sometimes reverse opioid-related breathing suppression.

Morphine Sulfate

Morphine sulfate is a salt formulation of the opioid analgesic morphine. It is available in immediate- and extended-release preparations for selected pain indications and carries risks of respiratory depression, misuse, dependence, and fatal overdose.

Morphogenesis

The biological process by which cells and tissues change shape, move, and organize to form organs and body structures during development or tissue repair.

Morphologic Response

A morphologic response is a treatment-related change in the visible or microscopic structure of a lesion, tumor, tissue, or cell population. It may include shrinkage, necrosis, differentiation, or altered cellular features and is interpreted using disease-specific criteria.

Morphology

The study or description of the form, shape, and structural features of organisms, organs, tissues, cells, or other biological structures.

Morquio Syndrome

A rare inherited disorder in which complex sugars build up and interfere mainly with bone and cartilage growth. It can cause short stature, an unusually shaped chest and spine, loose joints, cloudy corneas, and pressure on the spinal cord in the neck. Intelligence is usually unaffected. Treatment may include enzyme replacement, surgery, and careful monitoring of breathing and the spine.

Alternate Names:
Mucopolysaccharidosis Type Iv; MPS IV

Mortality

Death, or the number of deaths in a particular group during a stated period. A mortality measure may describe all causes of death or deaths from a specific disease and population.

Mortality Rate

The number of deaths in a specified population and time period, often reported for a particular disease or cause. It helps compare the impact of illness between groups when the populations are defined appropriately.

Morton Neuroma

Thickening and irritation of a nerve in the ball of the foot, usually between the third and fourth toes. It can cause burning pain, numbness, or the feeling of a pebble under the foot, often worsened by tight shoes or walking.

Alternate Names:
Interdigital Neuroma; Morton's Metatarsalgia; Plantar Interdigital Neuroma

Morton's Metatarsalgia

Pain in the forefoot beneath the metatarsal heads, caused by pressure or irritation and distinct from Morton neuroma.

Morton's Neuroma

Thickening and irritation of tissue around a nerve, usually between the third and fourth toes. It causes burning forefoot pain or a feeling of a pebble in the shoe and may improve with wider footwear.

Morton's Toe

A foot shape in which the second toe is longer than the big toe, often because the first metatarsal is relatively short. It is usually a normal variation but may contribute to pressure or forefoot pain.

Morula

A morula is an early embryo consisting of a compact ball of blastomeres formed after several cleavage divisions. It develops into a blastocyst before implantation in the uterine lining.

Morvan Disease – Syringomyelia

Historical or imprecise index label combining Morvan syndrome and syringomyelia, which are distinct neurologic disorders; see *Morvan's Disease* and *Syringomyelia*.

Morvan's Disease

A rare autoimmune neurologic syndrome with severe insomnia, hallucinations, confusion, pain, and peripheral nerve hyperexcitability.

Mosaic

Describing a person or tissue composed of two or more genetically different cell populations derived from one zygote, often because of a post-zygotic mutation or chromosomal event; mosaicism can alter the severity and distribution of a genetic disorder.

Mosaicism

The presence of groups of cells in one person that have different genetic material, even though all the cells came from the same fertilized egg. It may or may not cause disease, and its effects depend on which cells are affected.

Mosquito

A small blood-feeding insect whose bites may transmit malaria, dengue, West Nile virus, and other infections.

Mosquito-Borne

Spread by mosquitoes, usually describing an infection or parasite carried from one host to another by a mosquito bite. Examples include malaria, dengue, West Nile virus, yellow fever, and some forms of encephalitis.

Mosquito Clamp

A small hemostatic clamp used to compress small blood vessels.

Motilin

A hormone made mainly in the small intestine that helps trigger waves of movement through the stomach and small intestine, especially between meals. Its activity contributes to the pattern that clears leftover food and secretions from the upper digestive tract.

Motility

The ability of an organ to move its contents or itself. Intestinal motility moves food and waste forward, while abnormal motility can cause pain, constipation, diarrhea, vomiting, or swallowing problems.

Motion Analysis

A detailed study of how a person moves during walking, reaching, or other activities. Clinicians use measurements and video to find movement problems, understand their causes, plan treatment, and track improvement.

Motion Artifact

Image distortion or blurring caused by movement of the patient, organs, or equipment during image acquisition.

Motion Correction

Processing or acquisition methods that reduce image blurring and errors caused by patient, breathing, or organ motion. Examples include image registration, tracking, gating, and navigator methods.

Motion Perception

Motion perception is the ability of the visual, vestibular, and proprioceptive systems to detect and interpret movement of the body or surrounding objects. Disturbance may cause vertigo, oscillopsia, imbalance, or visual-motion sensitivity.

Motion Sickness

Nausea, dizziness, sweating, or vomiting caused by sensory mismatch during travel or other motion. It can occur in cars, boats, aircraft, amusement rides, or virtual-reality environments and usually improves when motion stops. Severe or persistent symptoms require assessment for other causes.

Motivation

Motivation is the set of processes that initiate, direct, and sustain goal-directed behavior. Reduced or excessive motivation may occur with mood disorders, neurologic disease, substance use, medication effects, or other conditions.

Motivational Interviewing

A collaborative counseling approach that helps a person explore mixed feelings and strengthen their own reasons for changing a health behavior. The clinician listens without judgment, asks open questions, reflects the person's views, and supports informed choice.

Motor

Relating to movement or to the nerves and brain pathways that control movement. A motor problem may cause weakness, stiffness, poor coordination, tremor, or loss of normal control.

Motor Aphasia

Difficulty speaking or writing caused by damage to language areas of the brain, often after a stroke. A person may know what they want to say but struggle to find words, form sentences, or produce speech.

Motor Cortex

Areas at the front of the brain that plan and control voluntary movement. Each side mainly controls the opposite side of the body. Injury can cause weakness, loss of fine movement, or difficulty planning purposeful actions.

Motor Delay

Motor delay is slower-than-expected acquisition of gross- or fine-motor skills in a child. It may reflect neuromuscular, developmental, genetic, sensory, environmental, or systemic causes and warrants age-appropriate developmental assessment.

Motor End-Plate

Alternate spelling; see *Motor Endplate*.

Motor Endplate

The part of a muscle fiber where a nerve signal triggers muscle contraction. It contains receptors that respond to acetylcholine, the chemical signal released by the nerve.

Alternate Names:
Neuromuscular Junction Postsynaptic Membrane

Motor Incoordination

Impaired coordination of voluntary movement, often caused by disease affecting the cerebellum or other parts of the nervous system.

Alternate Names:
Ataxia

Motor Learning

A relatively lasting change in the ability to perform a motor skill resulting from practice, experience, feedback, and adaptation. Rehabilitation uses task-specific repetition and meaningful practice to promote motor learning.

Motor Neuron

An efferent neuron located within the central nervous system that projects its axon out of the brainstem or spinal cord to directly or indirectly innervate and control effector target tissues, predominantly skeletal muscle fibers and autonomic viscera. Classified into two fundamental tiers: (1) Upper Motor Neurons (UMNs), whose cell bodies originate in the cerebral motor cortex (primary motor cortex,

Betz cells in layer V) or brainstem, whose descending axons form the corticospinal and corticobulbar tracts; UMN lesions produce muscle spasticity, hyperreflexia, clonus, extensor plantar response (positive Babinski sign), and pronator drift; and (2) Lower Motor Neurons (LMNs), whose cell bodies reside in the motor nuclei of cranial nerves or the anterior (ventral) horn of the spinal cord (alpha and gamma motor neurons) and directly synapse upon muscle fibers via the neuromuscular junction; LMN lesions produce flaccid muscle weakness, severe muscle atrophy, hypotonia, hyporeflexia or areflexia, and muscle fasciculations. Amyotrophic lateral sclerosis (ALS) is characterized pathognomonically by the combined degeneration of both upper and lower motor neurons.

Motor Neuron Disease

Alternate spelling; see *Motor Neurone Disease*.

Motor Neuron Disorders Pathology

Pathologic changes affecting upper or lower motor neurons, which may include neuronal loss, chromatolysis, gliosis, corticospinal-tract degeneration, muscle denervation atrophy, and variable involvement of brainstem or spinal motor nuclei.

Motor Neurone Disease

A group of progressive disorders affecting upper and lower motor neurons, including amyotrophic lateral sclerosis. They cause worsening weakness, muscle wasting, stiffness, cramps, and difficulty with movement; speech, swallowing, and breathing may become affected as the disease advances. Cognitive or behavioral changes occur in some forms.

Motor Neurones

Variant spelling and plural form; see *Motor Neuron*.

Motor Stereotypy

A repeated, predictable movement such as hand flapping, rocking, or body waving. It may occur during normal development or with autism, intellectual disability, neurologic disease, stress, or other conditions.

Motor Tic

A motor tic is a sudden, brief, repetitive movement such as blinking, facial grimacing, or shoulder shrugging. Tics are often temporarily suppressible and may occur in transient tic disorder, persistent tic disorder, or Tourette syndrome.

Motor Unit

One movement-controlling nerve cell and all the muscle fibers it activates. Small units allow precise movements, while large units produce more force. Damage to motor units can cause weakness, wasting, cramps, or abnormal results on nerve and muscle tests.

Motor Vehicle Accident

A collision or other road-traffic event causing injury or property damage. Medical evaluation may be needed for visible or delayed injuries, including head, neck, chest, abdominal, or musculoskeletal trauma.

Mottled Enamel

Patchy, discolored, or structurally altered tooth enamel, classically caused by excessive fluoride during tooth development.

Mottled Teeth

Teeth with irregular white, brown, or pitted enamel, often due to dental fluorosis or developmental enamel defects.

Moulage

A model, cast, or realistic reproduction of a body part or lesion used for teaching, simulation, or forensic documentation.

Mould

British spelling of mold, a multicellular fungus that grows as branching filaments.

Mountain Fever

An informal name for Colorado tick fever, a viral infection transmitted by infected Rocky Mountain wood ticks. It commonly causes fever, chills, headache, body aches, and fatigue. It is distinct

from altitude illness, such as acute mountain sickness.

Mountain Sickness

Illness caused by rapid ascent to high altitude, ranging from acute mountain sickness to life-threatening pulmonary or cerebral edema.

Mouth

The oral cavity that serves as the entry point of the digestive tract, used for eating, breathing, and speaking.

Mouth Cancer

Cancer arising in the lips, gums, tongue, cheeks, floor of the mouth, palate, or other oral tissues. Most oral cavity cancers are squamous cell carcinomas.

Alternate Names:
Oral Cancer; Oral Cavity Cancer

Mouth Diseases

Disorders affecting the oral cavity, including infections, ulcers, inflammatory disease, dental disease, mucosal lesions, and tumors.

Mouth Neoplasm

An abnormal growth in the oral cavity that may be benign or malignant; persistent sores, lumps, or patches can be associated with cancer.

Mouth (Oral) Cancer

Alternate name; see *Mouth Cancer*.

Mouth Sores

Painful ulcers, blisters, raw areas, or inflamed patches inside or around the mouth. Trauma, infection, immune disease, medicines, nutritional deficiency, and cancer can cause them; persistent sores can reflect an underlying condition.

Mouth-To-Mouth Resuscitation

Rescue breathing in which air is delivered from a rescuer to a person who is not breathing normally, usually as part of CPR.

Mouth Ulcer

An open sore affecting the oral lining. Causes include aphthous ulcers, trauma, infection, irritation, and systemic inflammatory disease. Many heal within two weeks; persistent, recurrent, unusually large, or firm ulcers can have an underlying cause.

Alternate Names:
Oral Ulcer

Mouthwash

A liquid rinsed around the mouth and then expelled to freshen breath, deliver an active ingredient, or reduce selected oral microorganisms.

Mouthwash Overdose

Swallowing too much mouthwash may cause alcohol poisoning, vomiting, drowsiness, low blood sugar, breathing problems, or coma; products containing fluoride or other ingredients can cause additional toxicity.

Movement

Movement is a change in position of the body or a body part produced by coordinated activity of the nervous system, muscles, and joints. Abnormal movement may be excessive, reduced, involuntary, poorly coordinated, or restricted.

Movement Disorder

A neurologic condition causing excessive, reduced, or otherwise abnormal movement. Hyperkinetic disorders include tremor, dystonia, chorea, myoclonus, tics, and dyskinesia; hypokinetic disorders include bradykinesia and parkinsonism.

Movement Disorders

Alternate plural form; see *Movement Disorder*.

Movement Incoordination

Impairment in the ability to execute smooth, coordinated voluntary movements (ataxia), resulting from lesions or dysfunction within the cerebellum, spinocerebellar tracts, vestibular apparatus, or proprioceptive pathways. Manifests as dysmetria, intention tremor, and gait instability.

Alternate Names:
Ataxic Incoordination; Motor Incoordination

Moxalactam

Moxalactam is a beta-lactam antibiotic of the oxacephem group with activity against many gram-negative bacteria and some gram-positive organisms. It is rarely used today and may cause allergic reactions, diarrhea, or bleeding related to impaired coagulation.

Moxibustion

A traditional treatment that warms selected skin areas with burning mugwort or another heated material. Evidence of benefit varies by condition, and burns, smoke exposure, allergic reactions, or infection can occur.

Moxifloxacin

An antibiotic used for selected bacterial infections. It interferes with bacterial reproduction but can cause serious side effects, including tendon injury, nerve symptoms, blood-sugar changes, or dangerous heart rhythms, so use is selective.

Moyamoya Disease

A rare condition in which major arteries supplying the brain gradually narrow or close. Small fragile blood vessels form to compensate, but the condition can cause transient attacks, strokes, headaches, seizures, or thinking problems.

Moynihan's Hump

An anatomical variation in which the right hepatic artery forms an abnormally tortuous, caterpillar-like loop that extends close to the gallbladder neck and cystic duct within Calot's triangle. During gallbladder removal (cholecystectomy), this loop can be mistaken for the smaller cystic artery; accidental clipping or injury can cause severe arterial bleeding or damage blood flow to the right lobe of the liver.

Alternate Names:
Moynihan Caterpillar Turn; Caterpillar Turn of the Right Hepatic Artery; Hepatic Artery Tortuosity

MPH

Master of Public Health, a graduate degree focused on population health, disease prevention, health policy, epidemiology, and related public-health practice.

MPO

Myeloperoxidase, an enzyme in neutrophil and monocyte granules that uses hydrogen peroxide and halide ions to generate antimicrobial oxidants; MPO antibodies are also used in evaluating some autoimmune vasculitides.

Mpox

A viral disease caused by monkeypox virus, an orthopoxvirus. It spreads mainly through close contact with lesions, body fluids, respiratory particles, or contaminated objects and may cause fever, swollen lymph nodes, fatigue, and painful lesions on the skin or mucosal surfaces; severe disease is more likely in children, pregnancy, and immunocompromise.

Alternate Names:
Simian Pox; Monkeypox Virus Infection

MPS

Abbreviation for mucopolysaccharidosis, a group of inherited lysosomal storage disorders; see *Mucopolysaccharidosis*.

MPS Disorder

Alternate name; see *Mucopolysaccharidosis*.

MPS Disorder I

Alternate name; see *Mucopolysaccharidosis Type I*.

MPS Disorder II

Alternate name; see *Mucopolysaccharidosis Type II*.

MPS I

Abbreviation; see *Mucopolysaccharidosis Type I*.

MPS II

Abbreviation; see *Mucopolysaccharidosis Type II*.

MPTP

A toxic chemical that can permanently damage movement-controlling nerve cells and produce symptoms resembling Parkinson disease. It is mainly important in research and is not a routine medical treatment.

MRA

Magnetic resonance angiography, a noninvasive MRI-based technique that produces images of blood vessels and can help evaluate aneurysms, stenoses, malformations, and atherosclerosis.

MR Angiography

An MRI scan that creates pictures of blood vessels without using X-rays. It can help assess narrowed or blocked arteries, aneurysms, dissections, clots, and abnormal blood-vessel connections.

MRCP

Magnetic resonance cholangiopancreatography, an MRI technique that noninvasively images the bile ducts, gallbladder, and pancreatic duct without requiring endoscopic catheterization.

MRD

Minimal residual disease: a small number of malignant cells remaining after treatment, detectable by sensitive methods such as flow cytometry or PCR even when routine tests show remission.

MR Enterography

A specialized MRI scan of the small intestine after drinking contrast liquid. It can show inflammation, narrowing, fistulas, abscesses, bleeding, or other complications of Crohn disease and does not use X-rays.

MRI

Magnetic resonance imaging uses a strong magnetic field, radiofrequency energy, and computer processing to produce detailed images of body tissues without ionizing radiation. Contrast material may be used when clinically appropriate.

MRI And Low Back Pain

MRI may be used for low back pain when serious disease is suspected, neurologic deficits are present, or symptoms persist despite appropriate care; many uncomplicated cases do not need early MRI.

MRI Brain

An MRI scan used to examine the brain for tumors, stroke, bleeding, infection, inflammation, multiple sclerosis, or degenerative disease. Different settings highlight different tissues and abnormalities; contrast may be used when needed.

MRI Contrast

A contrast agent administered during magnetic resonance imaging to improve visibility of selected tissues or abnormalities.

MRI Joint

Evaluation of musculoskeletal structures: cartilage, ligaments, tendons, menisci, labrum. Knee: ACL, meniscus tears. Shoulder: rotator cuff, labrum. Hip: labral tears, FAI.

MRI Sequences

Different image settings used during an MRI scan to highlight anatomy, fluid, fat, bleeding, restricted water movement, or inflammation. Radiologists combine several settings because each shows different types of abnormality.

MRI-Targeted Fusion Prostate Biopsy

A prostate biopsy guided by combining a previous MRI with real-time ultrasound. The images help the clinician direct needles toward areas that look suspicious for cancer, sometimes along with routine samples from other areas. The procedure can cause blood in the urine or semen, infection, pain, or temporary difficulty passing urine.

Alternate Names:
Fusion Biopsy; Mri-Ultrasound Fusion Biopsy

MRKH Syndrome

Congenital condition where the uterus and upper vagina fail to develop properly in a chromosomal

female. See *Mayer-Rokitansky-Kuster-Hauser Syndrome*.

Mrna Precursor

An initial RNA transcript that is processed by capping, splicing, and polyadenylation to form mature messenger RNA.

MR Neurography

Magnetic resonance imaging optimized to show peripheral nerves and abnormalities such as swelling, compression, or injury.

MRSA

A strain of Staphylococcus aureus resistant to several common antibiotics. It may live harmlessly on the skin or cause skin, wound, lung, bone, joint, or bloodstream infection; treatment is guided by culture results.

MRSA Decolonization

Measures intended to reduce MRSA carriage on the skin or in the nose. Protocols may include topical agents and antiseptic bathing, but the indication, regimen, and duration depend on the person's risk, infection history, setting, and local guidance.

MRSA Infection

Methicillin-resistant Staphylococcus aureus is a strain of staphylococcus resistant to several beta-lactam antibiotics. It can colonize without illness or cause skin, wound, lung, bone, joint, or bloodstream infection; culture-guided treatment and hygiene reduce spread.

Alternate Names:
Methicillin-Resistant Staphylococcus Aureus Infection

MSA

Abbreviation for multiple system atrophy, a progressive neurodegenerative disorder affecting movement, autonomic function, and coordination; see *Multiple System Atrophy*.

MS Alternative Therapies

Complementary or nonstandard treatments used for multiple sclerosis symptoms or disease. Evidence and safety vary, some may interact with medicines, and effectiveness as a replacement for disease-modifying treatment is not established.

MSG Symptom Complex

A group of symptoms such as headache, flushing, or palpitations attributed by some people to monosodium glutamate; evidence for a consistent syndrome is limited and symptoms may have other causes.

MSL

Abbreviation for multiple symmetric lipomatosis, a disorder with symmetric deposits of fatty tissue around the neck, shoulders, or trunk; see *Multiple Symmetric Lipomatosis*.

MS (Multiple Sclerosis)

Alternate name; see *Multiple Sclerosis*.

MST

Multiple subpial transection, a neurosurgical procedure in which shallow cuts are made in the cerebral cortex to interrupt seizure pathways when the epileptogenic region cannot safely be removed.

MTOR

A protein inside cells that helps control growth, division, energy use, and response to nutrients. Medicines that block mTOR, such as rapamycin-related drugs, are used in some cancers, transplant treatments, and other selected conditions.

Mucha-Habermann Disease

An acute, severe, self-limiting variant of pityriasis lichenoides (PLEVA) characterized by the sudden eruption of widespread erythematous macules that rapidly evolve into necrotic, papulovesicular, and hemorrhagic crusted lesions that heal leaving small varioliform (pox-like) scars.

Alternate Names:
PLEVA; Pityriasis Lichenoides et Varioliformis

Acuta

Mu-Chain Disease

A rare B-cell disorder in which abnormal immunoglobulin heavy chains are produced, sometimes causing anemia, enlarged lymph nodes, or other features of lymphoproliferative disease.

Mucin

Mucin is a high-molecular-weight glycoprotein that forms mucus and helps lubricate and protect epithelial surfaces. Abnormal mucin production or accumulation occurs in some respiratory, gastrointestinal, and neoplastic diseases.

Mucinoses

A group of disorders in which excessive mucin, a gel-like substance in connective tissue, builds up in the skin or other tissues. Causes may be primary, metabolic, autoimmune, or associated with another disease.

Mucinous

Mucinous means containing, producing, or resembling mucin. In pathology, the term describes lesions or tumors with extracellular or intracellular mucin and must be interpreted with the organ, architecture, and other histologic features.

Mucinous Adenocarcinoma

Mucinous adenocarcinoma is a gland-forming cancer that produces abundant mucus and can arise in organs such as the colon, pancreas, lung, or breast.

Mucinous Borderline Ovarian Tumor

An ovarian mucinous epithelial tumor with cellular proliferation and atypia but without destructive stromal invasion; it may be large and unilateral.

Mucinous Cystadenoma

A mucinous cystadenoma is a usually benign cystic epithelial tumor that produces mucin, commonly arising in the ovary or pancreas. Large lesions may cause pain or pressure, and pathology is needed to distinguish benign from borderline or malignant mucinous tumors.

Mucinous Cystadenoma of Pancreas

An older term for a mucinous cystic neoplasm of the pancreas, a cystic growth that may be benign, precancerous, or malignant. It usually occurs in the body or tail of the pancreas, most often in women, and is assessed with imaging and sometimes tissue sampling.

Mucinous Cyst Of The Vulva

A benign mucus-filled cyst of the vulva, arising from obstruction or metaplastic mucinous epithelium in a vulvar gland or duct; persistent or atypical masses require examination and possible biopsy.

Mucinous Ovarian Carcinoma

A malignant ovarian epithelial tumor composed of invasive mucin-producing cells; metastatic gastrointestinal or pancreatobiliary carcinoma must be excluded.

Muckle-Wells Syndrome

An inherited cryopyrin-associated autoinflammatory syndrome causing recurrent fever, rash, joint or muscle pain, and progressive sensorineural hearing loss. Anti-inflammatory treatment can reduce inflammation and prevent complications.

Mucocele

A soft swelling filled with mucus. In the mouth, it usually forms when a small saliva-making gland or its tube is injured, often on the inner lower lip. The term can also describe similar swellings elsewhere in the body, so the site should be named.

Mucocele and Ranula

Mucus-filled lesions caused by leakage or blockage of a salivary gland duct. A mucocele usually affects the lower lip, while a ranula arises in the floor of the mouth; persistent, recurrent, or large lesions may need dental or oral-surgery treatment.

Mucociliary Escalator

The system of mucus and tiny moving hairs (cilia)

lining the airways. Mucus traps dust and germs, and cilia move it toward the throat so it can be swallowed or coughed out.

Mucocutaneous Leishmaniasis

A chronic, mutilating metastatic form of leishmaniasis caused by New World species of the Leishmania subgenus Viannia (principally Leishmania braziliensis), which disseminates from a primary cutaneous ulcer to mucosal tissues through hematogenous or lymphatic routes. It causes progressive, destructive granulomatous ulceration and cartilaginous necrosis of the nasal septum, palate, pharynx, and larynx, clinically presenting with nasal obstruction, epistaxis, septal perforation, and severe facial disfigurement.

Alternate Names:
Espundia; American Mucocutaneous Leishmaniasis; Nasopharyngeal Leishmaniasis

Mucocutaneous Lymph Node Syndrome

Alternate name; see *Kawasaki Disease*.

Mucoepidermoid Carcinoma

Mucoepidermoid carcinoma is a cancer containing mucus-producing and squamous-like cells, most often arising in salivary glands or the lungs.

Mucoid

Resembling mucus or having a thick, slippery, mucus-like appearance. The word describes a substance or finding and does not by itself identify its cause.

Mucolipidoses

A group of inherited lysosomal storage disorders in which cells cannot properly process certain lipids and carbohydrate-containing substances. Material accumulates in tissues and may cause developmental delay, skeletal changes, vision problems, and organ disease.

Mucolipidosis II Alpha/Beta

A severe, autosomal recessive lysosomal storage disorder caused by pathogenic variants in *GNPTAB*, which disrupt the tagging and delivery of lysosomal enzymes. Enzyme deficiency within lysosomes leads to widespread cellular storage and progressive disease beginning in infancy. Features may include poor growth, developmental impairment, skeletal abnormalities, and heart or respiratory problems. The older name is I-cell disease.

Alternate Names:
Mucolipidosis Type II; ML II Alpha/Beta; I-Cell Disease

Mucolytics

Medicines that make thick mucus thinner and easier to clear from the airways. They may help some people cough up mucus, but treatment depends on the cause of congestion and the person's overall condition.

Mucolytic Therapy

Treatment that makes thick mucus easier to move and cough up. Different medicines work by breaking mucus proteins, removing extra DNA, or drawing water into airway secretions; the choice depends on the disease and the person's ability to clear mucus.

Mucopolysaccharides

Long chains of sugar molecules that form part of connective tissue and help support joints, skin, cartilage, and other structures. Inherited problems breaking them down can cause storage diseases.

Mucopolysaccharidoses

A group of inherited lysosomal storage diseases in which glycosaminoglycans accumulate because one of several degradation enzymes is deficient. The disorders can affect the skeleton, joints, airways, heart, eyes, abdominal organs, and nervous system, with severity varying by type.

Mucopolysaccharidosis

The singular name for any of a group of inherited lysosomal storage disorders in which glycosaminoglycans accumulate because of deficient enzyme activity. Types differ in their genetic cause, age of onset, and effects on the skeleton, organs, airways, eyes, heart, and nervous system.

Mucopolysaccharidosis Type I

An inherited lysosomal storage disorder caused by deficient alpha-L-iduronidase, usually because of disease-causing variants in the *IDUA* gene. It ranges from severe Hurler syndrome through attenuated Hurler-Scheie and Scheie phenotypes and may affect the skeleton, airways, heart, eyes, abdominal organs, and nervous system.

Mucopolysaccharidosis Type II

Mucopolysaccharidosis type II, or Hunter syndrome, is an X-linked iduronate-2-sulfatase deficiency causing accumulation of glycosaminoglycans and multisystem disease.

Mucopolysaccharidosis Type III

Mucopolysaccharidosis type III, or Sanfilippo syndrome, is an inherited disorder of heparan-sulfate breakdown causing progressive neurodevelopmental and behavioral decline.

Mucopolysaccharidosis Type IV

Mucopolysaccharidosis type IV, or Morquio syndrome, is an inherited disorder of keratan-sulfate breakdown causing skeletal and connective-tissue abnormalities with variable neurologic involvement.

Mucopolysaccharidosis VII

Mucopolysaccharidosis VII, or Sly syndrome, is a lysosomal storage disorder caused by deficient beta-glucuronidase activity. Accumulation of glycosaminoglycans can cause skeletal, connective-tissue, visceral, developmental, and sometimes neurologic abnormalities.

Mucopus

A mixture of mucus and pus produced by inflammation or infection. It may appear in the nose, sinuses, airways, bowel, cervix, or other mucus-lined areas; its significance varies with symptoms and location.

Mucor

Mucor is a genus of molds; related Mucorales fungi can cause mucormycosis, a serious invasive infection mainly in people with severe immune or metabolic problems.

Mucorales

Mucorales is an order of molds that includes fungi capable of causing mucormycosis, a rapidly invasive infection of the sinuses, lungs, skin, or other tissues.

Mucormycosis

A rare but rapidly destructive infection caused by certain molds. It most often affects people with severely weakened immunity or uncontrolled diabetes and can damage the sinuses, eyes, lungs, skin, brain, or several organs.

Mucor Ramosissimus

A type of mold found in the environment that rarely causes infection in people. When infection occurs, it is usually in someone with severely weakened immune defenses and requires identification of the fungus and specialist treatment.

Mucosa

Mucosa is the moist epithelial lining of body passages such as the mouth, nose, airways, gastrointestinal tract, and reproductive or urinary tracts.

Mucosa-Associated Lymphoid Tissue

Collections of immune tissue in the moist linings of the digestive, breathing, and urinary or reproductive tracts. They help detect and respond to substances and germs entering through these surfaces.

Mucosa-Associated Lymphoid Tissue Lymphoma

Alternate name; see *MALT Lymphoma*.

Mucosal

Relating to a mucous membrane, the moist lining of areas such as the mouth, nose, airways, digestive tract, and genital or urinary tract. Mucosa helps protect tissues, produce mucus, absorb substances in some organs, and support local immune defense.

Mucosal Candidiasis

Candida yeast infection of a mucous membrane, commonly producing white plaques, soreness, redness, or burning in the mouth or genital tract. An-

tibiotics, diabetes, inhaled steroids, immune suppression, and moisture can increase risk.

Mucosal Immunity

Mucosal immunity is immune defense at surfaces lining the respiratory, gastrointestinal, genitourinary, and other tracts. It includes epithelial barriers, mucus, secretory IgA, antimicrobial molecules, innate cells, and locally regulated adaptive responses.

Mucosal Infection

An infection involving a moist epithelial lining such as the mouth, eye, nose, airway, gastrointestinal tract, or genital tract.

Mucosal Irritation

Inflammation or injury of moist linings in the eyes, nose, throat, mouth, stomach, or intestines. It may cause burning, pain, redness, swelling, or sores after chemicals, medicines, infection, or friction.

Mucosal Melanoma

A melanoma arising from melanocytes in mucosal surfaces such as the sinonasal tract, oral cavity, anorectal region, or genital tract; it is uncommon and often diagnosed at an advanced stage.

Mucosal Warts

Warts caused by human papillomavirus on moist lining tissues such as the mouth, genitals, or anus. They may be painless or cause itching, bleeding, or discomfort. Most genital warts are caused by low-risk HPV types; other mucosal HPV types can cause cancer.

Mucositis

Painful inflammation and sores in the moist lining of the mouth or digestive tract, often after chemotherapy or radiation. It can make eating and swallowing difficult and may increase the risk of infection.

Mucous

Relating to mucus, the viscous fluid produced by mucous membranes and glands that lubricates surfaces and helps trap particles and microorganisms.

Mucous Cysts

Small fluid-filled lumps near the end joint of a finger, often associated with osteoarthritis. They may cause tenderness, nail changes, or leakage; puncturing can introduce infection.

Alternate Names:
Digital Mucous Cyst; Myxoid Cyst

Mucous Membrane

A moist tissue lining body cavities that open to the outside, including the nose, mouth, and lungs.

Alternate Names:
Mucosa

Mucous Membrane (Cicatricial) Pemphigoid (MMP)

A group of autoimmune subepidermal blistering disorders affecting mucous membranes, especially the mouth, eyes, nose, and genitals. Repeated inflammation can scar and threaten vision, airway function, or other organ function, so specialist diagnosis and treatment are important.

Mucous Membrane Pemphigoid

A chronic autoimmune subepidermal blistering disease affecting mucous membranes, especially the eyes and mouth; scarring can impair vision or function.

Mucus

Mucus is a viscoelastic secretion containing water, mucin glycoproteins, salts, antimicrobial factors, and cellular material. It lubricates and protects epithelial surfaces and traps particles and microorganisms for clearance.

Mucus Plugging

Accumulation of thick mucus in an airway that partly or completely blocks airflow. It can occur in asthma, cystic fibrosis, bronchiectasis, and other lung diseases and may cause breathlessness, infection, or collapse of part of a lung. Treatment depends on the cause and may include airway-clearance methods or medicines that open the airways or thin mucus.

Mud Fever

A historical name sometimes used for leptospirosis, a bacterial infection caused by pathogenic *Leptospira*. People can acquire it through contact with water or soil contaminated by urine from infected animals. The name is imprecise; *leptospirosis* is the current disease name.

Muehrcke Lines

Paired, white, non-palpable, transverse parallel bands spanning the width of the nail bed, separated by normal pink nail bed, which do not migrate with nail growth and blanch with digital pressure (apparent leukonychia), characteristic of severe hypoalbuminemia (serum albumin less than 2 g/dL).

Muehrcke's Lines

Alternate name; see *Muehrcke Lines*.

Median Canaliform Nail Dystrophy

A nail change with a central lengthwise groove or split and slanted crosswise ridges that form a fir-tree pattern. It often affects the thumbnails and may follow repeated minor injury to the nail matrix. It can resemble damage from a habit-tic deformity.

Alternate Names:
Muehrcke's Lines; Paired White Bands of Hypoalbuminemia

Muehrcke Lines of the Fingernails

Paired transverse white bands in the nail bed that remain fixed as the nail grows. They may occur with low blood protein, severe illness, chemotherapy, or other systemic stress and usually improve when the underlying problem resolves.

Muehrcke's Nails

Paired transverse white bands in the nail beds, usually associated with hypoalbuminemia or other systemic illness. The bands remain fixed as the nail grows because they arise from the nail bed rather than the nail plate.

Muenke Syndrome

A craniosynostosis syndrome caused by a pathogenic FGFR3 variant. Premature fusion of one or more skull sutures may produce an abnormal head shape and can be accompanied by developmental, hearing, limb, or neurological findings.

MUGA Scan

A heart scan that uses a small radioactive tracer and records the heart's pumping with each heartbeat. It measures how much blood the main chambers pump and can assess wall movement.

Alternate Names:
Radionuclide Angiography; Radionuclide Ventriculography

Muir-Torre Syndrome

An autosomal dominant cancer predisposition syndrome (a variant of Lynch syndrome) caused by germline mutations in DNA mismatch repair genes (MSH2, MLH1), characterized by the combination of at least one sebaceous gland neoplasm (sebaceous adenoma, sebaceoma) or keratoacanthomas with internal visceral malignancies (especially colorectal and genitourinary carcinomas).

Alternate Names:
MTS; Sebaceous Neoplasm and Visceral Cancer Syndrome

Mulberry Molars

Permanent back teeth with many small, rounded, irregular cusps. They are classically linked with congenital syphilis but can also result from other developmental problems affecting tooth formation before birth.

Mulibrey Nanism

Mulibrey nanism is a rare inherited multisystem disorder, usually caused by biallelic variants in *TRIM37*. It may cause severe growth restriction, characteristic facial features, pericardial or hepatic disease, insulin resistance, and other organ involvement.

Muller Cells

Supporting glial cells of the retina that help nourish retinal nerve cells and maintain the retina's structure and chemical environment.

Mullerian Agenesis

A congenital condition in which the uterus, cervix, and upper part of the vagina are absent or underdeveloped, usually with normal ovarian function and puberty. It often presents as primary amenorrhea.

Alternate Names:
Mayer-Rokitansky-Kuster-Hauser Syndrome; MRKH Syndrome; Mayer-Rokitansky-Küster-Hauser Syndrome

Mullerian Duct Anomalies

Congenital differences in development of the uterus, cervix, fallopian tubes, or upper vagina. Examples include septate, bicornuate, didelphys, unicornuate, and agenesis patterns; they may cause menstrual obstruction, infertility, pregnancy loss, or preterm birth.

Multicenter Study

A multicenter study is a clinical or research investigation conducted at two or more sites under a coordinated protocol. It can improve enrollment and generalizability but requires harmonized methods, quality control, and site-specific oversight.

Multicentric

Having more than one center or focus; in oncology, describing separate primary tumor foci, often also called multifocal or polycentric.

Multicentric Reticulohistiocytosis

A rare systemic non-Langerhans cell histiocytosis characterized by papulonodular skin or mucosal lesions and often destructive inflammatory arthritis. It may involve other organs and can be associated with an underlying malignancy, so evaluation is multidisciplinary.

Multicystic Dysplastic Kidney

A birth defect in which one kidney develops as a cluster of cysts and has little or no working tissue. The other kidney often provides most kidney function but may also need monitoring for related urinary problems.

Multidetector Computed Tomography

A CT scan that uses many detectors to collect multiple thin image slices at the same time. It produces detailed pictures quickly and is useful for injuries, blood vessels, organs, and some virtual examinations, but uses X-rays.

Multidisciplinary Disaster Victim Identification

The coordinated process of identifying victims of mass-fatality incidents (natural disasters, transport crashes, terrorist attacks) using multiple disciplines: fingerprinting, dental records, DNA profiling, forensic anthropology/radiology, and personal effects, with ante-mortem data collection and comparison.

Multidisciplinary Team

Healthcare professionals from different fields who work together on one person's care. Depending on the problem, the team may include doctors, nurses, therapists, pharmacists, psychologists, dietitians, and social workers.

Multidrug-Resistant TB

Tuberculosis caused by bacteria resistant to at least the two most important first-line medicines, isoniazid and rifampin. It needs specialized medicines, susceptibility testing, and close monitoring because treatment is harder and may last many months.

Multidrug-Resistant Tuberculosis

Tuberculosis caused by bacteria resistant to at least isoniazid and rifampicin, two important tuberculosis medicines. It requires specialist testing and a longer combination treatment chosen according to drug-susceptibility results.

Multienzyme Complexes

Groups of enzymes organized together so that several steps in a chemical pathway occur efficiently. This arrangement can speed reactions, limit loss of intermediates, and coordinate metabolism inside cells.

Multifactorial

Caused or influenced by several factors rather than

one single cause. These may include genes, age, lifestyle, infections, medicines, environment, and other health conditions, with each factor adding to the overall risk.

Multifocal

Arising from or involving two or more distinct foci or sites, such as separate tumor foci or vascular lesions.

Multifocal Atrial Tachycardia

An atrial tachyarrhythmia with at least three distinct P-wave morphologies, irregular rhythm, and a rate above 100 beats per minute. It is strongly associated with severe pulmonary disease, hypoxia, and metabolic stress.

Multifocal Motor Neuropathy

A rare, chronic, acquired autoimmune peripheral neuropathy characterized by slowly progressive, asymmetric, distal lower motor neuron weakness and muscle atrophy predominantly affecting the upper extremities without sensory loss. Characterized electrophysiologically by persistent multifocal motor conduction blocks outside usual entrapment sites, with high circulating titers of IgM anti-GM1 ganglioside antibodies in over 50 percent of patients; responds selectively to intravenous immunoglobulin.

Alternate Names:
MMN; Multifocal Motor Neuropathy with Conduction Block

Multigravida

A person who has been pregnant two or more times, including pregnancies that did not continue.

Multi-Infarct Dementia

A decline in memory and thinking caused by several strokes that damage different parts of the brain. Problems may include slowed thinking, poor planning, mood changes, walking difficulty, or memory loss; the term is now often included under vascular cognitive impairment.

Multilocular

Having several separate spaces or compartments. The word may describe a cyst, tumor, or other lesion seen on imaging; its significance depends on the organ involved, the appearance of the walls, and the person's symptoms.

Multi-Minicore Disease

A rare inherited muscle disorder in which muscle fibers contain multiple small areas of damage. It can cause low muscle tone, weakness, spinal curvature, and breathing problems.

Alternate Names:
MmD; Minicore Myopathy; Multicore Disease

Multimodal Analgesia

Use of analgesic techniques with different mechanisms to improve pain control while reducing reliance on any single drug, especially opioids. Components may include acetaminophen, nonsteroidal anti-inflammatory drugs, regional anesthesia, local anesthetics, and selected adjuvants.

Multimodal Imaging

Use of two or more imaging methods, such as CT, MRI, ultrasound, or nuclear imaging, to examine the same disease or body region. Combining methods can provide complementary structural, functional, or molecular information.

Multimorbidity

The coexistence of two or more chronic health conditions in the same person, without requiring one to be considered the primary disease. It complicates treatment, increases polypharmacy risk, and requires coordinated patient-centered care.

Multinodular Goiter

An enlarged thyroid containing multiple nodules. Thyroid function may be normal, underactive, or overactive; evaluation commonly includes thyroid-function tests and ultrasound, with further assessment of suspicious nodules or compressive symptoms.

Multinucleated Hepatocyte

A multinucleated hepatocyte is a liver cell containing two or more nuclei, usually from nuclear division

without complete cytokinesis. It may be a normal or reactive finding, but its significance depends on the number, morphology, and associated liver abnormalities.

Multipara

A person who has had two or more pregnancies that reached the stage of potential fetal viability, regardless of whether the pregnancies resulted in live births.

Multiparametric MRI Of The Prostate

A detailed prostate MRI that combines several types of images to show prostate structure, water movement, and blood flow. It helps identify suspicious areas and guide biopsy or treatment, but an abnormal scan does not by itself prove cancer.

Multiparous

Having given birth two or more times to a fetus or fetuses beyond the stage of viability.

Multiple Bacterial Abscesses

Several pockets of pus caused by bacterial infection in one or more organs. They may develop when bacteria spread through the blood or extend from nearby tissue and can cause fever, pain, or organ problems; imaging helps locate them.

Multiple Biliary Hamartomas

Multiple small, harmless birth-related changes in the liver's bile ducts that look like tiny cysts on scans. They usually cause no symptoms and are often found by chance, but imaging helps distinguish them from cancer or other liver disease.

Multiple Endocrine Deficiency Syndrome

A syndrome involving deficiency of more than one endocrine hormone, caused by autoimmune, genetic, pituitary, hypothalamic, or other disease; evaluation identifies which glands are affected.

Multiple Endocrine Neoplasia

A group of inherited, usually autosomal dominant cancer-predisposition syndromes causing tumors or overactivity in two or more hormone-making glands during a person's lifetime. Types include MEN1, MEN2, and related subtypes with different gene associations and tumor risks.

Multiple Endocrine Neoplasia I

MEN type 1 is an inherited tumor syndrome involving parathyroid, pituitary, and pancreatic or duodenal neuroendocrine tumors, often caused by MEN1 variants.

Multiple Endocrine Neoplasia II

MEN type 2 is an inherited syndrome with medullary thyroid cancer, pheochromocytoma, and sometimes parathyroid disease, commonly involving RET variants.

Multiple Endocrine Neoplasia Type 1

An inherited condition that causes tumors in several hormone-making organs, especially the parathyroid glands, pituitary gland, and pancreas or nearby intestine. It is usually caused by a change in the MEN1 gene and requires lifelong monitoring.

Multiple Endocrine Neoplasia Type 2

An inherited condition that greatly increases the risk of medullary thyroid cancer and may cause adrenal or parathyroid tumors. Type 2B can also cause nerve-related mouth bumps and distinctive body features; lifelong specialist monitoring is needed.

Multiple Endocrine Neoplasia Type 2A

An inherited condition that greatly increases the risk of medullary thyroid cancer and can also cause adrenal tumors and overactive parathyroid glands. Regular genetic and specialist monitoring helps detect these problems early.

Alternate Names:
MEN 2A; MEN2A; Sipple Syndrome

Multiple Endocrine Neoplasia Type 2B

An inherited RET-associated syndrome characterized by medullary thyroid carcinoma, pheochromocytoma, mucosal neuromas, and a marfanoid habitus. The thyroid-cancer risk is high and requires early specialist genetic and surgical assessment.

Multiple Endocrine Neoplasia Type 2 (MEN2)

An inherited cancer-predisposition syndrome, usually caused by a pathogenic RET variant, featuring medullary thyroid carcinoma and, in some people, pheochromocytoma and parathyroid disease. Genetic counseling, biochemical testing, and preventive thyroid surgery may be needed.

Multiple Endocrine Neoplasia Type 4

A rare, autosomal dominant inherited tumor syndrome caused by germline mutations in the *CDKN1B* gene, which encodes the $p27^{Kip1}$ tumor suppressor protein. It presents with features overlapping with MEN1, most commonly characterized by primary hyperparathyroidism (parathyroid adenomas causing high blood calcium) and anterior pituitary adenomas (such as prolactinomas or growth hormone-secreting tumors). Patients may also develop pancreatic neuroendocrine tumors, adrenal adenomas, and reproductive organ tumors. It is typically diagnosed in patients with MEN1-like symptoms who test negative for mutations in the *MEN1* gene.

Alternate Names:
MEN 4; MEN4; Multiple Endocrine Neoplasia Type IV; CDKN1B-Related MEN

Multiple Exostoses

Multiple exostoses, or hereditary multiple osteochondromas, is an inherited disorder causing multiple cartilage-capped bony projections near growth plates. Lesions can deform bones, restrict motion, compress nerves or vessels, and rarely undergo malignant transformation.

Multiple Fibrofolliculomas

Numerous harmless small skin-colored growths arising from hair follicles, usually on the face and trunk. They can be a sign of Birt-Hogg-Dubé syndrome, which also increases the risk of kidney tumors and collapsed lung.

Multiple Inherited Schwannomas

Alternate name; see *Neurofibromatosis Type 2*.

Multiple Lentigines Syndrome

An inherited disorder causing numerous lentigines with variable heart, endocrine, eye, hearing, or developmental abnormalities; it may overlap with Noonan-spectrum syndromes.

Multiple Mononeuropathy

Damage to several separate nerves in different parts of the body, often developing unevenly. It can cause patchy pain, numbness, weakness, or muscle wasting and may result from blood-vessel inflammation, diabetes, infection, or another systemic disease.

Multiple Myeloma

A type of cancer that begins in plasma cells, white blood cells in the bone marrow that normally produce antibodies to fight infection. In multiple myeloma, abnormal plasma cells multiply uncontrollably, crowding out healthy blood cells and producing large amounts of a faulty antibody protein. This can lead to bone thinning, painful fractures, high blood calcium levels, anemia, recurrent infections, and kidney damage.

Alternate Names:
Plasma Cell Myeloma; Kahler Disease; Myelomatosis

Multiple Myeloma: Deadly To Chronic

Multiple myeloma is a plasma-cell cancer that produces a monoclonal protein and can cause bone lesions, anemia, kidney injury, high calcium, infections, and fatigue. It is often treatable as a chronic illness, though relapse and complications remain possible.

Multiple Organ Dysfunction Syndrome

Abnormal function of two or more organs during severe illness, such as sepsis, shock, trauma, or pancreatitis. Organ function may worsen over time and requires close monitoring and treatment of the underlying cause.

Multiple Organ Failure

A life-threatening condition in which two or more organs stop working properly, usually during severe infection, shock, injury, or widespread inflammation.

Intensive care supports the organs while doctors treat the underlying cause.

Multiple Peripheral Neuritis

Inflammation or injury affecting multiple peripheral nerves, causing pain, numbness, weakness, or autonomic symptoms; see *Peripheral Neuritis*.

Multiple Polyposis of the Colon

Development of many colorectal polyps, which may be inherited or acquired and may increase colorectal cancer risk; see *Polyposis*.

Multiple Gestation

A pregnancy involving two or more fetuses developing simultaneously in the uterus; see *Multiple Pregnancy*.

Multiple Pregnancy

A pregnancy involving two or more fetuses. Twins may develop from two separate eggs or from one fertilized egg that divides; triplets and higher-order pregnancies are less common. Multiple pregnancies have higher risks of premature birth, growth problems, and pregnancy complications and require closer monitoring.

Multiple Pregnancy: Twins or More

Alternate name; see *Multiple Pregnancy*.

Multiple Sclerosis

A chronic autoimmune disease of the central nervous system in which the body's immune defenses mistakenly attack myelin, the protective fatty coating around nerve fibers in the brain and spinal cord. This damage interferes with the transmission of electrical nerve signals, resulting in varied symptoms that can include muscle weakness, numbness or tingling, balance and coordination problems, vision changes, and chronic fatigue.

Alternate Names:
MS; Disseminated Sclerosis

Multiple Sclerosis (MS)

Alternate name; see *Multiple Sclerosis*.

Multiple Sclerosis MS And Pregnancy

Multiple sclerosis usually does not prevent pregnancy, but symptoms, disease-modifying medicines, relapse risk, delivery planning, and postpartum care require coordination. Some treatments must be stopped or changed, and relapse risk can shift after delivery.

Multiple Sleep Latency Test

A daytime sleep study measuring how quickly a person falls asleep during several scheduled nap opportunities. It helps evaluate excessive daytime sleepiness and narcolepsy after nighttime sleep has been assessed.

Multiple Sulfatase Deficiency

A rare inherited lysosomal-storage disorder caused by deficient activation of multiple sulfatase enzymes, producing progressive neurologic, skeletal, skin, and organ disease.

Multiple Symmetric Lipomatosis

A disorder characterized by symmetric, usually nonencapsulated fatty deposits around the neck, shoulders, upper trunk, or proximal limbs. It may be associated with alcohol use or metabolic and neurologic disorders.

Alternate Names:
Madelung Disease

Multiple System Atrophy

A progressive brain disorder affecting movement, coordination, and automatic body functions. It may cause stiffness and slowness, poor balance, fainting from low blood pressure, bladder problems, speech changes, or difficulty swallowing.

Alternate Names:
MSA

Multiple System Atrophy Cerebellar Type

An adult-onset neurodegenerative synucleinopathy (MSA-C) characterized primarily by progressive cerebellar ataxia (gait instability, limb dysmetria, dysarthria, oculomotor abnormalities) accompanied by severe autonomic failure and variable pyramidal

signs.

Alternate Names:
MSA-C; Cerebellar Multiple System Atrophy; Olivopontocerebellar Atrophy Variant

Multiple System Atrophy Parkinsonian Type

A progressive neurodegenerative disorder (MSA-P) characterized predominantly by parkinsonian features (rigidity, akinesia, postural instability) that respond poorly to levodopa, combined with early severe autonomic failure (orthostatic hypotension, urinary incontinence) and variable pyramidal dysfunction.

Alternate Names:
MSA-P; Parkinsonian Multiple System Atrophy; Striatonigral Degeneration Variant

Multiple System Failure

Failure of two or more organ systems, also called multiple-organ failure or multiple-organ dysfunction syndrome; it may occur during severe illness such as sepsis, shock, or major trauma.

Multiple Vitamin Overdose

Taking too many multivitamins can cause poisoning, especially from iron, vitamin A, or vitamin D. Symptoms may include vomiting, abdominal pain, confusion, liver injury, kidney injury, or dangerous calcium levels; severe poisoning can be life-threatening.

Multiplex PCR Panel

A laboratory test that looks for genetic material from several germs in one sample. Different panels test respiratory, intestinal, blood, or other specimens; a detected germ may represent infection, harmless carriage, or material left after an infection.

Alternate Names:
Multiplex Polymerase Chain Reaction; Syndromic Molecular Panel

Multiplicity

Multiplicity is the state of having more than one occurrence, copy, lesion, tumor, or pregnancy component. Its interpretation depends on context, such as multiple gestation, multifocal disease, or copy number in genetics.

Multipolar Neuron

A nerve cell with one long output branch and several receiving branches. This common type of neuron includes many cells that control movement or pass signals within the brain and spinal cord.

Multisystem Inflammatory Syndrome In Children

A serious delayed inflammatory illness occurring in some children after infection with SARS-CoV-2, involving fever and two or more organ systems and potentially causing shock or cardiac dysfunction.

Multivesicular Body

A multivesicular body is an endosomal compartment containing many small intraluminal vesicles. It can fuse with the plasma membrane to release exosomes or with a lysosome to degrade its cargo.

Multivisceral Transplant

Transplantation of several abdominal organs, commonly the stomach, small intestine, pancreas, and liver, from a donor to a recipient with irreversible intestinal failure or complex abdominal disease. Lifelong immunosuppression and specialist monitoring are required because rejection, infection, graft dysfunction, and surgical complications can occur.

Mumps

A contagious viral infection spread through respiratory droplets and saliva. It often causes fever, headache, fatigue, and tender swelling of one or both parotid salivary glands, making chewing and swallowing painful. Complications include orchitis, meningitis, pancreatitis, and hearing loss, and are less common in vaccinated people. Treatment is usually supportive. Two doses of measles-mumps-rubella (MMR) vaccine reduce the risk but do not prevent every infection.

Alternate Names:
Epidemic Parotitis; Mumps Parotitis

Mumps Orchitis

Inflammation of one or both testes during mumps infection, usually in postpubertal males. It causes testicular pain and swelling and may lead to testicular atrophy. CDC estimates it occurs in about 30

Mumps Parotitis

Alternate name; see *Mumps*.

Mumps Virus

The virus that causes mumps, a contagious infection spread through saliva and respiratory droplets. It commonly causes fever and painful swelling near the jaw, and can sometimes inflame the brain, pancreas, or reproductive organs; vaccination reduces risk.

Munchausen Syndrome

Alternate name; see *Factitious Disorder*.

Munchausen Syndrome by Proxy

Older name for factitious disorder imposed on another, in which a caregiver falsifies, exaggerates, or induces illness in another person; see *Factitious Disorder Imposed on Another*.

Mupirocin

Mupirocin is a topical antibiotic that inhibits bacterial isoleucyl-tRNA synthetase. It is used for selected skin infections and nasal eradication of certain staphylococci; resistance can develop with inappropriate or prolonged use.

Mural

Relating to a wall, especially the wall of a body cavity, organ, or blood vessel.

Mural Thrombosis

Formation of a blood clot along the wall of a heart chamber or blood vessel rather than freely within the lumen.

Mural Thrombus

A mural thrombus is a blood clot that forms on the wall of a heart chamber or large blood vessel, typically in areas of damaged endothelium, stasis, or turbulent flow.

Muramidase

Muramidase, or lysozyme, is an enzyme that cleaves the peptidoglycan backbone of bacterial cell walls. It is present in secretions and innate immune cells and contributes to defense against susceptible bacteria.

Murine Typhus

An acute endemic rickettsial illness caused by Rickettsia typhi and transmitted to humans primarily through the feces of infected rodent fleas (Xenopsylla cheopis). It typically presents with high prolonged fever, severe frontal headache, myalgias, arthralgias, and a maculopapular rash that typically spares the face, palms, and soles.

Alternate Names:
Endemic Typhus; Flea-Borne Typhus

Murk Jansen Metaphyseal Chondrodysplasia

Alternate name for Jansen metaphyseal chondrodysplasia; see *Jansen Metaphyseal Chondrodysplasia*.

Murmur

An extra sound heard during a heartbeat, usually caused by fast or turbulent blood flow through the heart or nearby blood vessels. Some murmurs are harmless, while others may be caused by heart valve or structural problems.

Murmur Classification

Heart murmurs are classified by timing, grade, shape, location, radiation, and pitch. Timing: systolic (between S1 and S2), diastolic (between S2 and S1), or continuous. Grade: I (barely audible) to VI (heard without stethoscope). Shape: crescendo, decrescendo, or plateau.

Murphy Sign

A sudden catch or stop in breathing when a doctor presses under the right ribcage as the patient takes a deep breath in, indicating an inflamed gallbladder.

Murphy's Sign

Inspiratory arrest caused by pain when the right upper quadrant is palpated, traditionally suggesting acute cholecystitis.

Musca

A fly genus including the housefly; some species can spread germs by carrying them on their bodies.

Muscae Volitantes

Moving spots, threads, or cobweb-like shapes seen in the visual field, usually caused by shadows from vitreous opacities.

Muscarine

Muscarine is a mushroom-derived agonist of muscarinic acetylcholine receptors. Ingestion of muscarine-containing mushrooms can cause a cholinergic syndrome with salivation, sweating, tearing, abdominal cramps, vomiting, diarrhea, bronchospasm, and bradycardia.

Muscarinic Antagonist

A muscarinic antagonist blocks acetylcholine at muscarinic receptors in smooth muscle, glands, the heart, and the central nervous system. Examples include atropine, ipratropium, and oxybutynin; effects can include dry mouth, blurred vision, urinary retention, tachycardia, and confusion.

Alternate Names:
Antimuscarinic

Muscidae

Muscidae is a family of flies that includes the housefly. Some species can mechanically carry pathogens to food or wounds, and their larvae may occasionally cause myiasis.

Muscimol

Muscimol is a psychoactive compound found in some Amanita mushrooms and an agonist at GABA-A receptors. Ingestion can cause altered perception, sedation, agitation, incoordination, or seizures and may require toxicologic evaluation.

Muscle

Body tissue that shortens to create force and movement. Skeletal muscle moves the bones and supports posture, heart muscle pumps blood, and smooth muscle moves substances through organs such as the bowel and blood vessels.

Muscle Aches

Pain or soreness in one or more muscles. Common causes include overuse, injury, infection, medicines, and conditions affecting the whole body.

Muscle Atrophy

Loss or wasting of muscle tissue caused by disuse, nerve injury, inflammation, malnutrition, or systemic disease. It may lead to weakness and reduced function; treatment focuses on the cause, nutrition, and appropriately supervised rehabilitation.

Muscle Belly

The thick, fleshy middle part of a muscle between its attached ends. It contains most of the muscle fibers that shorten to produce force.

Muscle Biopsy

Removal of a small sample of skeletal muscle for microscopic, histochemical, immunologic, or molecular examination in suspected myopathy, inflammation, infection, or infiltrative disease.

Muscle Cell

A cell specialized to contract; skeletal, cardiac, and smooth muscle cells perform different movement and organ functions.

Muscle Contraction

The tightening of a muscle, allowing it to produce force or movement. Muscle fibers use calcium and energy from ATP to make their protein filaments slide against each other.

Muscle-Contraction Headache

A pressure-like headache caused by prolonged tightening or sensitivity of muscles in the scalp, neck, or jaw. Stress, poor posture, fatigue, or jaw clench-

ing may contribute; frequent, severe, or changing headaches need medical assessment.

Alternate Names:
Tension-Type Headache; Stress Headache

Muscle Contracture

Persistent shortening or tightening of a muscle or nearby tissues that limits joint movement and does not fully relax with stretching. It may follow scarring, prolonged spasticity, immobility, injury, or, more rarely, a muscle-energy disorder.

Alternate Names:
Skeletal Muscle Contracture; Metabolic Contracture

Muscle Cramp

A muscle cramp is a sudden, involuntary, painful contraction of a muscle. It may follow exertion, dehydration, electrolyte disturbance, pregnancy, medication use, nerve disease, or vascular disease; recurrent cramps need assessment of the cause.

Muscle Cramps

Alternate plural form; see *Muscle Cramp*.

Alternate Names:
Charley Horse; Involuntary Muscle Spasm

Muscle Development

Muscle development is the formation, growth, differentiation, and maturation of muscle tissue. It depends on genetic programs, neural input, hormones, nutrition, mechanical loading, and repair processes.

Muscle Disorder

A disease affecting muscle structure or function, causing weakness, pain, cramps, stiffness, wasting, or abnormal movement. Causes include inherited conditions, inflammation, nerve disease, medicines, infection, and metabolic problems.

Muscle Fascicle

A bundle of muscle fibers surrounded by connective tissue. Several fascicles join to form a muscle.

Muscle Fatigue

A reduced ability of a muscle to produce force after prolonged or repeated activity. It may result from exertion, poor sleep, illness, medicines, nerve problems, or muscle disease, and improves when the cause is treated.

Muscle Fiber

A single multinucleated, elongated, cylindrical contractile cell of skeletal muscle tissue (myocyte), formed embryologically by the end-to-end fusion of multiple mononucleated mesodermal myoblasts. Enclosed by an excitable plasma membrane (sarcolemma) and an external basal lamina (endomysium), each muscle fiber contains numerous peripherally displaced nuclei, an extensive sarcoplasmic reticulum network for calcium storage and release, transverse tubules (T-tubules) for action potential propagation, and bundles of longitudinally arranged myofibrils composed of repeating contractile units called sarcomeres (demarcated by Z-discs, containing interdigitating actin thin filaments and myosin thick filaments). Functionally classified into two major physiological types: Type I fibers (slow-twitch, oxidative, rich in mitochondria and myoglobin, fatigue-resistant, suited for sustained posture and endurance); and Type II fibers (fast-twitch, glycolytic, specialized for rapid, high-force anaerobic bursts, further subdivided into Type IIa [fast oxidative-glycolytic] and Type IIx/IIb [fast glycolytic]).

Muscle Fibers

Plural form; see *Muscle Fiber*.

Muscle Function Loss

Reduced ability of a muscle or muscle group to generate movement or force, caused by muscle disease, nerve injury, neuromuscular-junction disorders, pain, or disuse.

Muscle Hypertrophy

Muscle hypertrophy is enlargement of individual muscle fibers, usually in response to resistance, hormonal stimulation, or compensatory workload. It can be physiologic or associated with disease, de-

pending on the muscle and cause.

Muscle Insertion

The attachment of a muscle to the body part that usually moves when the muscle contracts. The insertion is often farther from the body's center than the muscle's origin.

Muscle-Invasive Bladder Cancer

Bladder cancer that has grown into the bladder muscle layer. It has a greater risk of spreading than cancer limited to the bladder lining and is classified by examination of bladder tissue.

Muscle Neoplasm

A muscle neoplasm is an abnormal growth in skeletal or smooth muscle or nearby soft tissue and may be benign or malignant.

Muscle Origin

The attachment of a muscle to the body part that usually stays more fixed when the muscle contracts. It is often closer to the body's center than the muscle's insertion.

Muscle Pain

Pain, soreness, or aching in one or more muscles caused by exertion, injury, infection, inflammation, medicines, or an underlying medical condition. Persistent, severe, or weakness-associated pain needs assessment.

Alternate Names:
Myalgia; Muscle Ache; Myodynia

Muscle Protein

A protein found in muscle that provides structure, produces contraction, stores or transports substances, or regulates muscle activity. Important examples include actin, myosin, troponin, dystrophin, and myoglobin.

Muscle Relaxant

A medicine that reduces skeletal-muscle spasms or tightness. Some act in the brain or spinal cord and may cause sleepiness or weakness. Neuromuscular-blocking medicines are a distinct group that temporarily paralyzes muscles and requires breathing support and close monitoring.

Muscle Relaxants

See *Muscle Relaxant*.

Muscle Relaxation

The return of a muscle to a less tense state after contraction, when calcium levels inside the muscle cell fall and the contractile proteins stop generating force.

Muscle Rigidity

Muscle rigidity is abnormal resistance to passive movement caused by sustained muscle contraction or altered tone. It occurs in conditions such as Parkinson disease, dystonia, meningitis, neuroleptic malignant syndrome, and tetanus.

Muscle Spasm

An involuntary, abrupt, sustained, and often painful contraction of a muscle or group of muscle fibers that cannot be consciously relaxed. Pathophysiologically, spasms arise from peripheral motor nerve hyperactivity, neuromuscular fatigue, ischemia, metabolic or electrolyte derangements (hypokalemia, hypocalcemia [producing tetany via increased peripheral nerve excitability], hypomagnesemia, and hyponatremia), or dehydration, as well as protective reflex muscle splinting secondary to acute musculoskeletal trauma, facet joint injury, or lumbar intervertebral disc herniation. Differentiated from muscular cramps (transient, self-limited painful spasms, commonly in calf muscles) and spasticity (velocity-dependent resistance to passive stretch arising from upper motor neuron lesions). Management involves passive stretching, massage, local heat or cold application, electrolyte repletion, nonsteroidal anti-inflammatory drugs (NSAIDs), and short-term centrally acting skeletal muscle relaxants (e.g., cyclobenzaprine, baclofen, tizanidine).

Muscle Spasms

Plural form; see *Muscle Spasm*.

Muscle Spindle

A small sensor inside skeletal muscle that detects how much the muscle is stretched and how quickly it changes length. It helps maintain posture, muscle tone, balance, and coordinated movement.

Muscle Strain Treatment

Care for a stretched or torn muscle, usually involving temporary activity reduction, gradual movement, rehabilitation, and pain relief chosen safely for the person. Severe swelling, weakness, deformity, inability to use the limb, or persistent pain needs assessment.

Muscle Strength

Muscle strength is the maximal force a muscle or muscle group can generate under specified conditions. It is assessed by functional or resisted testing and may be reduced by muscle, nerve, neuromuscular-junction, central, or systemic disorders.

Muscle-Tendon Unit

The connected working unit made of a muscle and its tendon. It produces force and transfers that force to a bone or other structure.

Muscle Tissue

Specialized tissue that contracts to produce movement, maintain posture, move substances through organs, and generate heat. Skeletal, heart, and smooth muscle have different structures and control systems for their jobs.

Muscle Tone

The slight, continuous activity present in resting muscles that gives them some resistance to being stretched. Abnormally high or low muscle tone can occur with disorders of the brain, spinal cord, nerves, or muscles.

Muscle Tonus

The slight, continuous activity present in resting muscles, which gives them resistance to being stretched. Too much or too little tone can occur with disorders of the brain, spinal cord, nerves, or muscles.

Muscle Twitching

Brief involuntary contractions of a small group of muscle fibers, often called fasciculations; persistent or widespread twitching may require evaluation.

Muscle Weakness

Reduced ability to generate force with one or more muscles. Causes include nerve or muscle disease, pain, inactivity, medicines, metabolic disorders, and aging.

Muscular

Relating to muscle or made of muscle tissue. It may describe strength, body build, pain, weakness, or a structure containing muscle.

Muscular Dystrophies

Alternate plural form; see *Muscular Dystrophy*.

Muscular Dystrophy

An umbrella term for genetic disorders that cause progressive weakness and degeneration of skeletal muscle. The disorders differ in the genes and proteins involved, inheritance pattern, age of onset, distribution and rate of muscle involvement, and severity; some result from new genetic changes without a family history. Depending on the type, disease may also affect heart muscle, breathing, swallowing, vision, endocrine function, or cognition. Common forms include Duchenne, Becker, limb-girdle, facioscapulohumeral, congenital, and myotonic muscular dystrophies.

Alternate Names:
MD

Muscular Endurance

The ability of a muscle or muscle group to keep working during repeated or prolonged effort. It depends on muscle strength, energy supply, blood flow, nerve control, conditioning, and overall health.

Muscularis

A layer of smooth muscle in the wall of a hollow

organ, especially the digestive tract. Its coordinated contractions move contents through the organ and can also change the diameter or pressure of the passage.

Alternate Names:
Muscular Layer; Tunica Muscularis

Muscular System

The body system made up mainly of skeletal, smooth, and heart muscle. It produces movement, maintains posture, moves substances through organs, pumps blood, and generates heat.

Musculocutaneous Nerve

A nerve from the neck and upper chest that controls several muscles used to bend the elbow and turn the forearm. It also carries sensation from part of the outer forearm; injury can cause weakness or numbness there.

Musculoskeletal

Relating to muscles, bones, joints, tendons, ligaments, and related tissues.

Musculoskeletal Deformity

A musculoskeletal deformity is an abnormal shape, alignment, or structure of bone, joint, muscle, or related tissue. It may be congenital, developmental, traumatic, degenerative, neuromuscular, or caused by disease.

Musculoskeletal Disease

A disorder affecting bones, joints, muscles, tendons, ligaments, cartilage, or other supporting tissues, causing pain or limited movement.

Musculoskeletal Injury

Trauma to muscles, bones, joints, tendons, ligaments, cartilage, or related soft tissues, ranging from strains and sprains to fractures and dislocations.

Musculoskeletal Pain

Pain arising from muscles, bones, joints, ligaments, tendons, or related soft tissues. Common causes include injury, overuse, arthritis, and inflammation; persistent pain, weakness, swelling, or neurologic symptoms should be assessed.

Musculoskeletal System

The musculoskeletal system consists of bones, joints, cartilage, ligaments, tendons, muscles, and associated connective tissues. It provides support, protects organs, enables movement, and contributes to mineral storage and blood-cell production.

Musculoskeletal Tumor

An abnormal growth arising in bone, muscle, cartilage, connective tissue, or related structures. It may be benign or malignant and can cause a lump, pain, swelling, reduced function, or fracture.

Musculus

The Latin word for muscle, used in formal anatomical names. For example, “musculus deltoideus” means the deltoid muscle. Abbreviations may be used in anatomy texts to identify one or several muscles.

MUSE

A medicated urethral system that delivers a pellet into the urethra to treat erectile dysfunction.

Alternate Names:
Medicated Urethral System for Erection

Mushroom

The visible fruiting body of a fungus. Edible mushrooms can provide nutrients, but wild mushrooms may be poisonous or resemble edible species.

Mushroom Poisoning

Illness caused by eating toxic fungi, with effects ranging from gastrointestinal upset to liver failure, neurologic toxicity, or death.

Mushroom Toxicity

Poisoning from an edible-looking or otherwise toxic mushroom, with syndromes ranging from early gastrointestinal illness or hallucinations to delayed hepatic or renal failure. The species, amount, and

time to symptoms influence the toxicity pattern and treatment.

Music Therapy

The planned use of music by a trained therapist to support health and wellbeing. It may help with pain, stress, communication, movement, memory, emotional expression, or coping during illness and rehabilitation.

MuSK-Positive Myasthenia Gravis

A form of myasthenia gravis in which antibodies interfere with nerve-to-muscle communication. It often causes weakness of the face, mouth, throat, neck, or breathing muscles and requires specialist care.

Alternate Names:
MuSK Myasthenia Gravis; MuSK-Ab-Positive MG

Mustard Compounds

Mustard compounds are chemical agents containing reactive sulfur or nitrogen mustard groups that can alkylate DNA and other molecules. Some are chemotherapy drugs; others are highly toxic chemical-warfare agents.

Mustard Gas

Mustard gas, or sulfur mustard, is a vesicant chemical-warfare agent that damages skin, eyes, and respiratory tissues and can cause blistering, airway injury, and delayed complications. It is not a true gas at ordinary temperatures and has no specific widely available antidote.

Mutagen

A chemical, physical agent, or biological factor capable of causing a genetic mutation. Mutagenicity does not by itself prove that an agent causes cancer.

Mutant

A mutant is a cell, organism, or genetic sequence carrying a mutation relative to a reference or parental form. The change may have no effect, alter a trait, or cause disease, depending on its location and functional consequence.

Mutant Proteins

Proteins whose amino-acid sequence differs because of a genetic mutation. The change may have no effect or may alter folding, stability, location, or function and contribute to inherited disease, cancer, or drug resistance.

Mutate

To mutate means to undergo a change in genetic sequence. Mutations arise spontaneously or from replication errors, DNA damage, or mutagen exposure and may be inherited, acquired in somatic cells, harmful, neutral, or beneficial.

Mutation

A heritable or acquired alteration in the DNA sequence. Variants may be single-nucleotide substitutions, insertions, deletions, copy-number changes, or larger rearrangements and may be benign, pathogenic, or of uncertain significance.

Mutation Abnormality

A mutation abnormality is an atypical change in DNA sequence or chromosome structure identified relative to a reference. Its clinical significance must be classified using evidence, such as pathogenic, likely pathogenic, uncertain significance, likely benign, or benign.

Mutation Rate

The frequency at which new DNA changes arise in a cell, organism, or generation. The rate differs between genes and species and can be influenced by DNA-copying errors, repair systems, radiation, chemicals, or other factors.

Mute

Describing a person who does not speak, whether because of a physical, neurologic, developmental, or psychological reason or by choice; more specific terms identify the communication limitation or preference.

Mutism

Absence or near absence of spoken language in a person who has the physical ability to speak. It may

occur with neurologic or developmental conditions, catatonia, or selective mutism, an anxiety disorder in which a person consistently does not speak in certain settings despite speaking in others.

Myalgia

Muscle pain or aching. It may affect one area after injury or exercise, or be widespread with infection, inflammation, medicine effects, thyroid disease, or other conditions. Severe or unexplained muscle pain, weakness, or swelling, especially with dark urine, can signal rhabdomyolysis.

Alternate Names:
Myodynia; Muscle Pain

Myalgic Encephalomyelitis

A complex illness involving substantial activity-limiting fatigue, post-exertional worsening, unrefreshing sleep, and often cognitive or orthostatic symptoms.

Alternate Names:
ME/CFS; SEID; Systemic Exertional Intolerance Disease

Myalgic Encephalomyelitis/Chronic Fatigue Syndrome

A complex illness characterized by substantial reduction in activity, post-exertional malaise, unrefreshing sleep, and cognitive or autonomic symptoms. Management is individualized and focuses on pacing, symptom relief, and treatment of coexisting conditions.

Myasthenia

Muscle weakness. The term is sometimes used as a short name for myasthenia gravis, an autoimmune disease in which weakness often worsens with activity and improves with rest.

Myasthenia Crisis

A life-threatening exacerbation of myasthenia gravis in which worsening weakness causes respiratory failure requiring ventilatory support, either noninvasive ventilation or intubation. Severe weakness of the throat and other bulbar muscles may accompany respiratory weakness or, in some cases, predominate. Infection, surgery, or changes in medication can precipitate an episode.

Myasthenia Gravis

A chronic autoimmune disorder in which the immune system produces antibodies that block or destroy communication receptors between nerves and voluntary muscles. This prevents muscles from receiving signals properly, leading to fluctuating muscle weakness that worsens with repetitive physical activity and improves with rest. It commonly affects the muscles that control eyelid movement, facial expression, chewing, speaking, and swallowing.

Myasthenia Gravis and Pregnancy

Pregnancy and the postpartum period can alter autoimmune neuromuscular weakness, while some medicines and anesthesia may worsen respiratory or swallowing function. Neurology and obstetric planning addresses medication safety, delivery, neonatal weakness, and crisis risk.

Myasthenic Crisis

A life-threatening worsening of myasthenia gravis that weakens the muscles needed for breathing or swallowing. Infection, surgery, stress, pregnancy, or certain medicines may trigger it. Severe breathlessness, choking, inability to swallow, or rapidly worsening weakness may occur.

Alternate Names:
Myasthenia Gravis Crisis; Acute Myasthenic Exacerbation

Myasthenic Syndrome

A collective term for disorders that impair signaling at the neuromuscular junction and cause fatigable muscle weakness. The group includes autoimmune myasthenia gravis, Lambert-Eaton myasthenic syndrome, and inherited congenital myasthenic syndromes; the specific diagnosis should be named because these disorders have different causes.

Mycelium

The network of fine branching threads that makes up the growing part of a fungus. It spreads through

soil, food, or tissue and can produce the structures that form fungal spores.

Mycetoma

A chronic infection of the skin and tissue beneath it, usually beginning when fungi (eumycetoma) or filamentous bacteria (actinomycetoma) enter through a puncture wound. It typically causes a painless lump, draining sinus tracts, and discharge containing small grains of the causative organism; it can spread into deeper tissues and bone.

Mycobacteriaceae

A family of slow-growing or rapidly growing, acid-fast bacteria that includes Mycobacterium species causing tuberculosis, leprosy, and nontuberculous infections.

Mycobacterial Culture

A laboratory test that tries to grow Mycobacterium bacteria from a sample such as sputum, tissue, or fluid. It can identify tuberculosis or other mycobacteria and may show which medicines will work, but results can take weeks.

Mycobacterial Infection

Infection caused by bacteria in the genus Mycobacterium. It includes tuberculosis, leprosy, and nontuberculous mycobacterial disease; symptoms and treatment depend on the species and affected organs.

Mycobacterium

A genus of acid-fast bacteria that includes the causes of tuberculosis and leprosy and several nontuberculous infections.

Mycobacterium Abscessus

A rapidly growing nontuberculous mycobacterium that can cause pulmonary, skin, and soft-tissue infections and is often difficult to treat because of multidrug resistance.

Mycobacterium Avium

A member of the Mycobacterium avium complex that can cause lung disease, lymph-node infection, or disseminated infection, especially in people with weakened immunity.

Mycobacterium Avium Complex

A group of nontuberculous mycobacteria that can cause chronic pulmonary disease or disseminated infection, particularly in people with impaired immunity. Treatment depends on the species, site, severity, susceptibility, and patient factors.

Mycobacterium Bovis

A tuberculosis-complex bacterium that mainly infects cattle but can cause tuberculosis in humans through unpasteurized dairy or animal exposure.

Mycobacterium Chelonae

A rapidly growing nontuberculous mycobacterium that can cause skin, soft-tissue, bone, eye, or disseminated infection.

Mycobacterium Fortuitum

A rapidly growing nontuberculous mycobacterium that can cause wound, catheter, bone, lung, or other opportunistic infections.

Mycobacterium Gordonae

A usually nonpathogenic water-associated nontuberculous mycobacterium that can occasionally cause disease in people with weakened immunity.

Mycobacterium Haemophilum

A nontuberculous mycobacterium that can cause skin, joint, and bone infections, especially in people with impaired immunity.

Mycobacterium Infection

Infection caused by a Mycobacterium species, including tuberculosis, leprosy, and nontuberculous mycobacterial disease.

Mycobacterium Kansasii

A nontuberculous mycobacterium that commonly causes chronic lung disease resembling tuberculosis and can occasionally cause disseminated infection.

Mycobacterium Leprae

The bacterium that causes leprosy, a long-lasting infection affecting the skin and nerves. It usually spreads only after prolonged close contact, develops slowly, and can cause numbness, weakness, or skin lesions without treatment.

Mycobacterium Marinum

A nontuberculous mycobacterium associated with fish tanks and aquatic exposure that can cause chronic skin and soft-tissue infection.

Mycobacterium Scrofulaceum

A nontuberculous mycobacterium associated especially with cervical lymph-node infection in children and occasional other disease.

Mycobacterium Szulgai

A rare nontuberculous bacterium that can cause long-lasting lung disease or other infections, especially in people with underlying lung problems or weakened immunity. Diagnosis requires specialist laboratory testing and clinical assessment.

Mycobacterium Tuberculosis

An acid-fast bacterium in the *Mycobacterium tuberculosis* complex and the most common cause of tuberculosis in humans. It is transmitted in airborne particles released by people with infectious pulmonary or laryngeal disease. Infection most often involves the lungs but may affect other organs.

Alternate Names:
Mtb Tubercle bacillus

Mycobacterium Ulcerans

A mycobacterium that causes Buruli ulcer, a chronic destructive skin infection associated with the toxin mycolactone.

Mycology

The branch of microbiology that studies fungi, including yeasts, moulds, and mushrooms. Medical mycology focuses on fungal pathogens that cause disease in humans. Fungal infections (mycoses) are classified as superficial, cutaneous, subcutaneous, or systemic.

Mycophenolate Mofetil

Mycophenolate mofetil is a prodrug of mycophenolic acid that inhibits inosine monophosphate dehydrogenase and lymphocyte proliferation. It is used as an immunosuppressant, especially after organ transplantation, and can cause infection, cytopenias, gastrointestinal effects, and serious fetal harm.

Mycophenolic Acid

The active immune-suppressing substance formed from mycophenolate medicines. It blocks an enzyme needed by multiplying lymphocytes and helps prevent organ-transplant rejection, but can cause infections, low blood counts, diarrhea, and fetal harm.

Mycoplasma

A genus of very small bacteria lacking a cell wall, including organisms that cause respiratory and genitourinary infections.

Mycoplasma Genitalium

A sexually transmitted bacterium that can cause urethritis, cervicitis, pelvic inflammatory disease, and, less commonly, proctitis. Many infections are asymptomatic. Diagnosis is usually by a nucleic acid amplification test; macrolide resistance is common, and treatment varies with susceptibility.

Mycoplasma Genitalium Infection

Infection of the genital or urinary tract caused by Mycoplasma genitalium. It may cause urethritis, cervicitis, pelvic inflammatory disease, or proctitis, but many infections are asymptomatic; it is diagnosed with nucleic acid amplification testing.

Mycoplasma Hominis

A wall-less bacterium associated with the genital tract that can cause pelvic, postpartum, urinary, wound, or joint infection.

Mycoplasmal Pneumonia

Pneumonia caused by Mycoplasma species, most

often Mycoplasma pneumoniae, usually producing a gradual cough and fever.

Mycoplasma Pneumonia

Atypical pneumonia most common in ages 5–35. Dry cough, low-grade fever, headache. Patchy infiltrates on CXR disproportionate to symptoms ("walking pneumonia").

Mycoplasma Pneumoniae

A bacterium without a cell wall that can cause bronchitis, sore throat, or pneumonia, especially in school-age children and young adults. Illness often develops gradually with cough, fever, headache, or tiredness; complications outside the lungs are uncommon but possible.

Mycoplasma Pneumoniae-Associated Mucositis

Inflammation and sores affecting the mouth, eyes, or genitals during or after *Mycoplasma pneumoniae* infection. Skin lesions may be absent or limited; the term reactive infectious mucocutaneous eruption (RIME) is also used for similar illness associated with other infections.

Mycoplasmataceae

A family of very small bacteria that lack a cell wall and includes Mycoplasma and related genera.

Mycosis

An infection caused by a fungus, including a yeast or mold. Mycoses may be superficial, cutaneous, subcutaneous, or systemic, depending on the tissues involved; the site and organism determine symptoms and treatment.

Mycosis Fungoides

The most common cutaneous T-cell lymphoma, presenting with progressive patches, plaques, and tumors on the skin with an indolent course. Staging and therapy depend on skin involvement and extracutaneous spread.

Alternate Names:
MF

Mycosis Fungoides Lymphoma

Alternate name; see *Mycosis Fungoides*.

Mycotic Aneurysm

An infected arterial wall or aneurysm, usually caused by bacteria rather than fungi. It may develop from bloodstream infection or an infected embolus and can rupture, causing life-threatening hemorrhage.

Mycotoxin

A poisonous substance made by some fungi that can contaminate food, crops, or indoor environments. Exposure may damage the liver, kidneys, nervous system, immune system, or other organs depending on the toxin and dose.

Mydriasis

Dilation of the pupil, produced mainly by sympathetic activity through the dilator pupillae muscle or by reduced parasympathetic activity. Causes include darkness, medicines, toxins, neurologic disease, and ocular injury.

Mydriatic Agents

A medicine that widens the pupil. Some, such as tropicamide or atropine, also temporarily prevent focusing; others, such as phenylephrine, mainly widen the pupil. These medicines are used to examine the inside of the eye and sometimes to ease pain and prevent scarring during eye inflammation. They can trigger a dangerous rise in eye pressure in people with narrow drainage angles.

Myelin

Myelin is an insulating sheath around nerve fibers that speeds electrical conduction; it is produced by oligodendrocytes in the CNS and Schwann cells in the PNS.

Myelination

Myelination is formation of a myelin sheath around an axon by oligodendrocytes in the central nervous system or Schwann cells in the peripheral nervous system. It increases the speed and efficiency of nerve conduction.

Myelin Sheath

Alternate name; see *Myelin*.

Myelitis

Myelitis is inflammation of the spinal cord or, less commonly, other neural tissue described by the term. Transverse myelitis can cause weakness, sensory changes, and bladder or bowel dysfunction and may result from infection, immune disease, reduced blood flow, or pressure on the spinal cord.

Myeloablative Agonist

A nonstandard expression that most likely means *myeloablative agent*, a drug or treatment that severely or completely destroys blood-forming cells in the bone marrow. Myeloablative therapy may be used before a stem-cell transplant and causes profound, temporary low blood counts; "agonist" is not the usual term in this context.

Myeloablative Chemotherapy

Myeloablative chemotherapy destroys or severely suppresses bone-marrow blood-cell production and is often used before a stem-cell transplant.

Myeloblast

An immature precursor of granulocytes in the bone marrow; excess myeloblasts are characteristic of acute myeloid leukemia.

Myelocyte

A developing granulocyte precursor in bone marrow that is more mature than a myeloblast and normally absent or rare in peripheral blood.

Myelocytic Leukaemia

A blood cancer arising from cells that normally develop into several blood-cell types. It includes acute and chronic myeloid forms, which can cause anemia, infections, bleeding, fatigue, or an enlarged spleen.

Myelodysplastic Neoplasms

A group of clonal bone-marrow disorders in which blood cells develop abnormally and are made ineffectively. They can cause low red-cell, white-cell, or platelet counts, leading to anemia, infection, or bleeding; some types can progress to acute myeloid leukemia. They are also widely known as myelodysplastic syndromes (MDS).

Myelodysplastic Or Myeloproliferative Neoplasms

Myelodysplastic and myeloproliferative neoplasms are clonal bone-marrow disorders causing abnormal blood-cell production. They may produce anemia, infection, bleeding, high counts, enlarged spleen, thrombosis, or progression to acute leukemia; classification and mutation testing guide care.

Myelodysplastic Syndrome

See *Myelodysplastic Neoplasms*.

Myelodysplastic Syndrome (MDS)

Alternate name; see *Myelodysplastic Neoplasms*.

Myelodysplastic Syndromes

See *Myelodysplastic Neoplasms*.

Myeloencephalitis

Myeloencephalitis is inflammation involving the spinal cord and brain, caused by infection, immune disease, toxins, or other neurologic processes.

Myelofibrosis

A group of bone-marrow disorders in which fibrous tissue disrupts normal blood-cell production. It includes primary myelofibrosis and secondary forms caused by other blood or marrow diseases.

Myelogenous

Relating to blood-forming cells that develop from the bone marrow's myeloid cell line.

Alternate Names:
Myeloid

Myelogram

An imaging study of the spinal canal performed after contrast material is introduced around the spinal cord.

Myelography

Contrast injected into subarachnoid space for spinal imaging. Used when MRI contraindicated. CT myelography more common now.

Myeloid

Relating to bone marrow or to the non-lymphoid blood-cell lineages derived from hematopoietic stem cells.

Myeloid Cell

A blood-forming cell from the myeloid lineage, which produces red cells, platelets, and several white blood-cell types.

Myeloid Leukemia

Myeloid leukemia is a blood cancer arising from abnormal myeloid precursor cells in the bone marrow and blood.

Myeloid Sarcoma

Myeloid sarcoma is a mass of immature myeloid cells occurring outside the bone marrow, often associated with acute myeloid leukemia.

Myelolipoma

A usually benign tumor composed of mature adipose tissue and blood-forming tissue, most often arising in the adrenal gland and often found incidentally.

Myeloma

A cancer of plasma cells, usually called multiple myeloma when it affects many bone-marrow sites. It can cause bone pain, anemia, kidney damage, high blood calcium, infections, or abnormal proteins in blood and urine.

Myeloma Cast Nephropathy

Kidney damage caused by abnormal proteins from multiple myeloma blocking and injuring the kidney's filtering tubes. It can cause sudden kidney failure and is treated by addressing the myeloma and supporting kidney function.

Myelomalacia

Softening of the spinal cord, usually due to ischemia, trauma, hemorrhage, or other cord injury.

Myelomeningocele

A congenital neural tube defect in which the spinal cord and its coverings protrude through an opening in the vertebral column, often within a sac. Unlike a meningocele, the protrusion includes spinal cord or nerve tissue, which may be damaged. This can cause weakness or paralysis, loss of sensation, and bladder or bowel dysfunction below the defect. Severity varies with its level and extent; hydrocephalus and Chiari II malformation may also occur. It is the most severe common form of spina bifida.

Myelomonocyte

A bone-marrow precursor that can develop toward either the monocyte or granulocyte lineages. An immature bone marrow cell that can develop into either monocytes or certain infection-fighting white blood cells.

Myelopathy

Disease or damage affecting the spinal cord and disrupting signals between the brain and body. Causes include pressure on the cord, injury, reduced blood flow, infection, inflammation, changes in the spine with age, or a tumor. Symptoms may include weakness or stiffness, numbness, trouble walking, pain, or changes in bowel or bladder function.

Myeloperoxidase

An enzyme in neutrophil and monocyte granules that uses hydrogen peroxide and chloride to generate antimicrobial oxidants; antibodies against it occur in some autoimmune diseases.

Myelopoiesis

The production and development of myeloid blood cells, including granulocytes, monocytes, and some precursor cells, in the bone marrow.

Myeloproliferative Disorders

Clonal bone-marrow cancers that cause overproduction of one or more blood-cell lineages. The

classic Philadelphia chromosome-negative types are polycythemia vera, essential thrombocythemia, and primary myelofibrosis; chronic myeloid leukemia is another major myeloproliferative neoplasm.

Myeloproliferative Neoplasm

A group of cancers that begin in blood-forming cells in the bone marrow. They often cause overproduction of red blood cells, platelets, or certain white blood cells; in myelofibrosis, later scarring of the bone marrow can reduce blood-cell production. Major types include chronic myeloid leukemia, polycythemia vera, essential thrombocythemia, and primary myelofibrosis. Less common types include chronic neutrophilic and chronic eosinophilic leukemia. These disorders can cause blood clots or bleeding, and some can progress to acute leukemia.

Alternate Names:
Myeloproliferative Neoplasms; MPN; MPNs

Myelosuppression

Reduced bone marrow production of red cells, white cells, and platelets, causing anemia, neutropenia, and thrombocytopenia; a common dose-limiting toxicity of chemotherapy and radiation that increases infection and bleeding risk.

Myelosuppressive Therapy

Myelosuppressive therapy reduces bone-marrow production of blood cells, sometimes intentionally during cancer treatment but with risk of anemia, infection, and bleeding.

Myenteric Plexus

A network of enteric nerves between the circular and longitudinal muscle layers of the gastrointestinal tract that coordinates intestinal motility.

Myhre Syndrome

A rare inherited connective-tissue disorder caused by variants in SMAD4 and characterized by short stature, stiff joints, distinctive facial features, hearing loss, and cardiovascular abnormalities.

Myiasis

Infestation of living tissue by larvae (maggots) of various fly species, which feed on host tissue and can cause pain, secondary infection, and tissue destruction. It may be cutaneous, involving the skin and subcutaneous tissue, or affect other body sites including the nose, ears, and wounds.

Myoblast

An early muscle cell that develops and joins with others to form skeletal muscle fibers.

Myoblastoma

A rare tumor made of cells resembling developing muscle cells. The term has been used for more than one tumor type, so diagnosis requires modern microscopic and molecular classification.

Alternate Names:
Granular Cell Tumor; Abrikossoff Tumor

Myocardial

Relating to the myocardium, the muscular wall of the heart.

Myocardial Biopsy

Removal of a small sample of heart muscle, usually by catheter, for microscopic or molecular examination of suspected myocarditis, rejection, infiltrative disease, or other cardiomyopathy.

Myocardial Bridging

Myocardial bridging occurs when a segment of a coronary artery tunnels through heart muscle and may be compressed during contraction.

Myocardial Contusion

A bruise of the heart muscle caused by blunt chest trauma, which may produce chest pain, arrhythmias, or impaired heart function.

Myocardial Infarction

Commonly known as a heart attack, the damage or death of a segment of heart muscle caused by a sudden, prolonged disruption of blood flow and oxygen. It most frequently occurs when a blood clot forms over a ruptured fatty plaque inside a coronary artery, cutting off circulation. Classic symptoms

include chest pressure or squeezing pain that may radiate to the left arm, neck, or jaw, along with shortness of breath, cold sweating, and nausea.

Alternate Names:
Heart Attack; MI; Acute Myocardial Infarction

Myocardial Ischemia

Reduced blood flow and oxygen supply to heart muscle, usually from narrowed coronary arteries, potentially causing chest pain or heart damage.

Alternate Names:
Cardiac Ischemia

Myocardial Perfusion Imaging

A heart scan that compares blood flow to the heart muscle at rest and during exercise or medicine-induced stress. It can show areas with reduced blood supply or old heart-muscle damage.

Myocardial Reperfusion

Restoration of blood flow to heart muscle after ischemia, which can limit injury but may also cause reperfusion-related tissue damage.

Myocardial Rupture

A tear in the heart wall or other heart structure, usually a severe complication of myocardial infarction.

Myocardial Viability

The ability of heart muscle weakened by poor blood flow to recover if blood supply is restored. Imaging tests can show whether the tissue is still alive and may help guide decisions about restoring blood flow.

Myocarditis

Inflammation of the heart muscle. It is often related to an infection or an abnormal immune response; some medicines (such as clozapine and some cancer medicines) and conditions (such as lupus, systemic sclerosis, and sarcoidosis) can also cause it. It may cause chest pain, shortness of breath, abnormal heart rhythms, or weakened pumping of the heart. Severity ranges from no symptoms or mild illness to heart failure or shock.

Myocarditis Diagnosis

Doctors assess suspected heart-muscle inflammation using symptoms, examination, an electrocardiogram, blood tests, heart imaging, and sometimes MRI or biopsy. No single test proves every case, so results are interpreted together and other causes are excluded.

Myocarditis Pathology

Inflammatory infiltrates with associated cardiomyocyte injury or necrosis that is not explained by ischemia. The pattern may be lymphocytic, eosinophilic, giant-cell, granulomatous, or mixed depending on the cause.

Myocarditis Treatment

Treatment depends on the cause and severity. Care may include rest from strenuous exercise, medicines for heart failure or abnormal rhythms, treatment of infection or autoimmune inflammation when appropriate, and hospital monitoring for severe cases.

Myocardium

The thick muscular middle layer of the heart wall that contracts to pump blood throughout the body.

Myoclonic Epilepsy

An epilepsy syndrome in which seizures include brief, shock-like involuntary muscle jerks; the specific syndrome determines associated seizure types, age of onset, and prognosis.

Myoclonic Seizure

A seizure involving one or more brief, shock-like, involuntary muscle jerks. Awareness is often preserved, but may be impaired depending on the seizure type. Jerks commonly affect the arms and can cause a person to drop or throw an object; they are characteristic of juvenile myoclonic epilepsy but occur in other disorders as well.

Myoclonus

A sudden, brief, involuntary muscle jerk or group of jerks.

Myocyte

A differentiated muscle cell specialized for contraction. Skeletal myocytes are long, multinucleated fibers; cardiac myocytes are branching cells joined by intercalated discs; and smooth-muscle myocytes are spindle-shaped cells without organized sarcomeres. Myocyte injury or death contributes to myopathy, rhabdomyolysis, and myocardial infarction.

Alternate Names:
Muscle Cell

Myodegeneration

Degeneration or breakdown of muscle fibers, caused by inherited, inflammatory, ischemic, toxic, or other disorders.

Myodynia

Medical term describing localized or diffuse pain in muscles. See *Myalgia*.

Myoepithelial Carcinoma Pathology

An infiltrative malignant neoplasm composed predominantly of myoepithelial cells, which may be clear, epithelioid, spindle, or plasmacytoid and show variable immunoreactivity for myoepithelial markers. It most often arises in salivary tissue or soft tissue.

Myoepithelial Cell

A contractile cell around certain glands that helps push secretions from breast or salivary tissue.

Myoepithelioma

A myoepithelioma is a tumor composed of myoepithelial cells and can be benign or malignant, commonly arising in salivary or other glands.

Myoepithelioma Of Soft Tissue

A rare growth in soft tissue made of myoepithelial cells, which have features of both gland cells and muscle-like support cells. It may be harmless or cancerous; imaging and tissue examination determine treatment.

Myoepithelium

A layer of contractile epithelial cells surrounding secretory units and small ducts in some glands, including the breast and salivary glands. It helps move secretions and supports gland structure; in breast pathology, its presence or loss can help distinguish in-situ from invasive lesions.

Myofascial Pain Syndrome

A regional pain disorder involving sensitive trigger points in muscle and fascia, with pain that may be referred to other areas and often worsens with pressure or movement.

Myofibril

A contractile thread-like structure inside a muscle fiber, composed of repeating sarcomeres containing actin and myosin.

Myofibrillar Myopathy

Myofibrillar myopathy is a group of inherited muscle disorders with abnormal protein aggregates and progressive skeletal-muscle weakness, sometimes involving heart or breathing muscles.

Myofibrils

Plural form; see *Myofibril*.

Myofibroblastoma

A benign mesenchymal tumor composed of myofibroblastic cells in collagenous or myxoid stroma, most often arising in the mammary or inguinal region but potentially occurring at other soft-tissue sites.

Myofibroblastoma Of The Breast

A rare benign stromal tumor composed of spindle-shaped myofibroblastic cells, usually occurring in older adults. It is typically a well-circumscribed painless mass and is diagnosed by histology with immunohistochemistry.

Myofibroblasts

Cells that combine features of fibroblasts and smooth muscle cells and help contract wounds and

produce scar tissue.

Myofibromatosis

Myofibromatosis is a benign proliferation of myofibroblastic tumors, often in infants or children and involving skin, muscle, bone, or internal organs.

Myofilament

A contractile protein filament within a muscle fiber; actin and myosin myofilaments interact through cross-bridges to produce muscle contraction.

Myofilaments

Plural form; see *Myofilament*.

Alternate Names:
Contractile Filaments; Actin and Myosin Filaments

Myogenin

A muscle-specific transcription factor required for skeletal-muscle differentiation and used as an immunohistochemical marker in diagnosing some soft-tissue tumors.

Myoglobin

An oxygen-binding protein stored in skeletal and heart muscle. When muscle is injured, myoglobin can enter the blood and urine; large amounts may contribute to kidney damage and are interpreted with other tests.

Myoglobin Blood Test

A blood test measuring myoglobin released from injured skeletal or cardiac muscle; it rises early after muscle injury but is nonspecific and is not preferred over troponin for myocardial infarction.

Myoglobinuria

A condition in which muscle protein enters urine, often after severe muscle injury or breakdown.

Myoglobin Urine Test

A urine test detecting myoglobin released during muscle breakdown, used in evaluating rhabdomyolysis; substantial myoglobinuria can contribute to acute kidney injury.

Myokymia

Involuntary, fine, continuous rippling contractions of muscle fibers, often seen around the eye but also associated with nerve hyperexcitability or neurologic disease.

Myoma

A usually benign tumor made of muscle tissue. The term often refers to a leiomyoma, especially a uterine fibroid, but myomas can arise from smooth or skeletal muscle in other sites.

Myomalacia

Softening and breakdown of muscle tissue, sometimes affecting heart muscle after serious injury or poor blood supply.

Myomectomy

Surgical removal of uterine fibroids while leaving the uterus in place. It may improve bleeding, pain, or pressure symptoms and can preserve the possibility of pregnancy, although risks and recurrence remain.

Myometrium

The thick muscle layer forming most of the uterus. It contracts during menstruation and labor, responds to hormones, and may develop conditions such as fibroids, adenomyosis, or abnormal thickening.

Myopathic Facies

A characteristic expressionless, mask-like facial appearance marked by drooping eyelids (ptosis), prominent facial muscle wasting, an inability to bury the eyelashes, and a transverse, tented upper lip (tapir mouth). It occurs due to weakness of the facial musculature in conditions such as facioscapulohumeral dystrophy and myotonic dystrophy.

Myopathy

A disorder of skeletal muscle that can cause weakness, pain, cramps, or stiffness. It may be inherited or acquired. Causes include inflammation, some medicines, infections, toxins, hormone disorders, and problems with muscle energy production.

Myopericytoma

A myopericytoma is a usually benign perivascular tumor composed of cells around small blood vessels, often occurring in skin or soft tissue.

Myopia

A refractive error in which light focuses in front of the retina, usually because the eyeball is too long or the eye focuses too strongly. Distant objects appear blurred while near objects are usually clearer. It can be corrected with glasses, contact lenses, or selected refractive procedures.

Alternate Names:
Short-Sightedness; Nearsightedness

Myosarcoma

A general term for a malignant tumor arising from muscle tissue. Specific types include leiomyosarcoma, which arises from smooth muscle, and rhabdomyosarcoma, which shows skeletal-muscle differentiation.

Myosin

A protein that uses energy to pull on actin, another muscle protein, and produce movement or force. It is important for contraction of skeletal, heart, and smooth muscle and also helps movement inside many other cells.

Myosin Atpase

The activity by which the muscle protein myosin breaks down ATP, the cell's energy source. This releases energy that lets myosin pull on actin and produce muscle contraction.

Myositis

Inflammation of muscle tissue caused by autoimmune disease, infection, medicines, or injury. It may produce weakness, pain, swelling, or fatigue; evaluation often includes examination, blood tests, imaging, and sometimes muscle testing.

Myositis Ossificans

A noncancerous condition in which abnormal bone forms inside a muscle or soft tissue, most often following a severe blunt injury, deep bruise, or surgery, commonly in the thigh or upper arm. It causes a firm, painful lump and joint stiffness and may improve as the abnormal bone matures.

Alternate Names:
Traumatic Myositis Ossificans; Heterotopic Ossification of Muscle

Myotonia

Delayed relaxation of a muscle after voluntary contraction or stimulation, often caused by an inherited or acquired muscle-channel disorder.

Myotonia Congenita

An inherited skeletal-muscle channelopathy causing delayed relaxation after voluntary contraction. Stiffness often improves with repeated movement and may be accompanied by muscle hypertrophy; onset and severity vary between genetic forms.

Myotonia Fluctuans

A rare inherited muscle-channel disorder causing stiffness that varies from day to day or after activity. It is usually mild and does not cause lasting weakness; genetic testing may identify a change in the *SCN4A* gene.

Alternate Names:
Potassium-Aggravated Myotonia Fluctuans

Myotonia Permanens

A rare inherited muscle-channel disorder causing continuous, severe muscle stiffness, including at rest. It may begin in infancy and affect the face, throat, or breathing muscles; it is usually related to a change in the *SCN4A* gene and requires specialist care.

Alternate Names:
Severe Sodium Channel Myotonia; Continuous Myotonia

Myotonic Disorder

A neuromuscular disorder characterized by delayed relaxation after muscle contraction, often with weakness, stiffness, or progressive muscle wasting.

Myotonic Dystrophy

An inherited disorder causing delayed muscle relaxation, progressive weakness, and wasting. It can also affect the heart, breathing, swallowing, eyes, hormones, or thinking; symptoms and severity vary between types and people.

Myotonic Dystrophy Type 2

An inherited multisystem disorder caused by CCTG repeat expansion in CNBP, producing myotonia, proximal or axial weakness, muscle pain, cataracts, and variable endocrine or cardiac features.

Myringitis

Inflammation of the eardrum that may cause ear pain, blisters, drainage, or temporary hearing changes.

Myringotomy

A small opening made in the eardrum to drain fluid or relieve pressure in the middle ear. A ventilation tube may be inserted to keep the opening open temporarily. Possible problems include infection, scarring, persistent drainage, or a hole that does not close.

Myringotomy With Tympanostomy Tube

Incision of the tympanic membrane with placement of a ventilation tube to equalize middle-ear pressure and permit drainage. It is used selectively for persistent middle-ear effusion, recurrent acute otitis media, or associated hearing and developmental problems.

Myristica Oil Poisoning

Poisoning from concentrated nutmeg oil, which can cause nausea, vomiting, agitation, fast heartbeat, dizziness, hallucinations, confusion, seizures, or coma. Suspected ingestion needs prompt poison-control or emergency assessment.

Myxedema

Severe hypothyroidism causing accumulation of mucin in tissues, with swelling, slowed body functions, and other symptoms.

Myxedema Coma

A life-threatening emergency caused by severe, untreated or undertreated hypothyroidism. It can cause very low body temperature, confusion or coma, a slow heartbeat, low blood pressure, and slow or shallow breathing. Infection, cold exposure, heart attack, stroke, or sedating medicines may trigger it.

Alternate Names:
Myxoedema Coma; Myxedematous Coma

Myxofibroma

A myxofibroma is a benign tumor containing fibrous and gelatinous myxoid tissue, often arising in the jaw or other connective tissue.

Myxofibrosarcoma

A rare cancer of connective tissue, usually in or under the skin of the arms or legs. It is more common in older adults and can return after treatment.

Myxoid Cyst

A myxoid cyst is a gelatinous fluid-filled lesion near a joint or tendon, commonly on a finger near the distal joint and nail.

Myxoma

A usually noncancerous tumor, most often in the upper left chamber of the heart. It may obstruct blood flow or release clots, causing breathlessness, fainting, fever, or stroke-like symptoms; heart ultrasound is commonly used for diagnosis.

Myxomatous Degeneration

Degenerative weakening and excessive myxoid tissue in a heart-valve leaflet, commonly associated with mitral-valve prolapse and possible valve regurgitation.

Myxopapillary Ependymoma

Myxopapillary ependymoma is a usually slow-growing spinal tumor arising from ependymal cells, commonly in the conus or filum terminale.

Myxosarcoma

A rare cancer of soft tissue containing abundant

jelly-like material. It can grow into nearby tissue or spread to distant organs; diagnosis requires examination of a tissue sample.

MZL

Abbreviation; see *Marginal Zone Lymphoma*.

N

Nabothian Cyst

A small, harmless mucus-filled lump on the cervix caused by a blocked cervical gland. It is common and usually causes no symptoms or need for treatment; unusual or bleeding lesions may have other causes.

Nabumetone

A nonsteroidal anti-inflammatory medicine used for pain and inflammation in selected joint or muscle conditions. It can irritate the stomach, affect kidneys, raise cardiovascular risk, or cause allergic reactions, especially with prolonged use.

N-Acetylcysteine

An antidote used mainly for acetaminophen overdose. It helps protect the liver and may still help when treatment starts late or liver injury has already begun.

N-Acetylglutamate Synthetase Deficiency

An inherited urea-cycle disorder in which deficient N-acetylglutamate synthetase fails to activate carbamoyl phosphate synthetase I. Ammonia can accumulate and cause vomiting, sleepiness, confusion, seizures, coma, or developmental injury.

Nadir

The lowest level reached by a measurement or symptom. After chemotherapy, it often means the period when blood-cell counts are lowest and the risk of infection or bleeding is greatest.

Naegele Rule

A method for estimating the expected date of delivery by adding 280 days (40 weeks) to the first day of the last menstrual period, assuming a 28-day cycle with ovulation near day 14. It is less accurate when cycle length or menstrual dates are uncertain; ultrasound dating may revise the estimate.

Naegeli-Franceschetti-Jadassohn Syndrome

A rare inherited ectodermal disorder causing reticulate skin pigmentation, reduced sweating, abnormal teeth or nails, and sometimes loss of fingerprints. Associated features include heat intolerance and dental abnormalities.

Naegleria Fowleri

A free-living microscopic amoeba found mainly in warm freshwater lakes, rivers, and hot springs. If water containing it enters the nose, the amoeba can travel to the brain and cause primary amebic meningoencephalitis (PAM), a rare, rapidly worsening brain infection that is nearly always fatal. Early symptoms may include headache, fever, nausea, or vomiting, followed by stiff neck, confusion, seizures, or coma. Infection does not occur from swallowing the water and does not spread from person to person.

Naegleria Infection

Alternate name; see *Primary Amebic Meningoencephalitis*.

Naevus

The British spelling of nevus, a usually benign localized skin or mucosal lesion such as a mole.

Naevus Flammeus

A congenital vascular capillary malformation (port-wine stain) presenting as a flat, sharply demarcated, pink-to-violaceous cutaneous patch that does not regress spontaneously, classically involving the ophthalmic (V1) distribution of the trigeminal nerve in Sturge-Weber syndrome.

Alternate Names:
Port-Wine Stain; Capillary Vascular Malformation

Naffziger Sign

A historical test in which pressure on the neck veins was used to try to reproduce radiating nerve pain by raising pressure around the spinal cord. It is not a reliable test and is not part of routine modern evaluation.

Alternate Names:
Naffziger's Sign; Jugular Compression Radiculopathy Test

Nail

A hard protective plate on the end of each finger and toe. Nails protect the tips, help with fine tasks, and may show changes caused by injury, infection, skin disease, or illness elsewhere.

Nail Abnormalities

Changes in nail color, shape, thickness, texture, or attachment caused by trauma, infection, inflammatory disease, systemic illness, medication, or congenital conditions.

Nail Avulsion

Partial or complete separation of the nail plate from the nail bed, usually after injury. The term can also mean deliberate removal of part or all of the nail plate during a procedure. The nail bed or matrix may be injured at the same time.

Nail Bed Injury

Trauma to the tissue beneath a nail that may cause bleeding under the nail, laceration, nail separation, fracture of the fingertip, or permanent nail deformity. Severe disruption or fingertip crushing can damage the nail matrix or bone.

Nail Bed Laceration

A cut or tear in the skin beneath the nail plate, often caused by a crush or sharp injury. It may bleed or cause pain and can occur with a fingertip fracture or damage to the nail matrix. Healing injury can affect the shape of the new nail.

Nail-Biting

Repetitive biting of the fingernails or surrounding skin, often associated with stress, habit, or a body-focused repetitive behavior. It can damage the nail, skin, teeth, or jaw and may introduce infection.

Nail Changes

Alterations in nail color, shape, texture, or attachment that may result from local injury, skin disease, infection, medicines, nutritional deficiency, or systemic illness. Their significance depends on the pattern and other clinical findings.

Nail Clipping For Fungal Testing

Laboratory examination of clipped nail material by microscopy, culture, or another validated test for fungal infection. Testing can help distinguish nail fungus from injury, psoriasis, or other nail disorders, especially before oral antifungal treatment.

Nail Clubbing

Enlargement and rounding of the ends of the fingers or toes with more curved nails. It may run in families or signal disease of the lungs, heart, digestive system, or another organ, especially when it develops recently.

Nail Eczema

Eczema affecting the skin around the nail, especially the nail folds and cuticle. It can cause itching, redness, scaling, or cracks, and ongoing inflammation may produce ridges or other nail changes. Irritants, allergies, or atopic eczema may be involved.

Nail-Fold Capillaroscopy

A test that uses magnification to examine the tiny blood vessels near the nails. It can help distinguish primary Raynaud phenomenon from Raynaud phenomenon linked to conditions such as systemic scle-

rosis, dermatomyositis, or mixed connective-tissue disease.

Alternate Names:
Periungual Capillaroscopy; NFC Examination

Nail Fungus

A fungal infection of a fingernail or toenail, usually involving the nail plate or nail bed, that can cause thickening, discoloration, brittleness, distortion, or separation from the nail bed. The medical term is onychomycosis. Similar nail changes can result from psoriasis, trauma, or other disorders.

Alternate Names:
Onychomycosis

Nail Furrows

Nail furrows are grooves or depressions running across or along a nail; transverse Beau lines can follow systemic illness or trauma, while longitudinal ridges are often age-related but may reflect local or systemic disease.

Nail Infection

Infection of the nail or surrounding tissue, commonly caused by fungi or bacteria. It may cause thickening, discoloration, separation of the nail, pain, swelling, or drainage; diabetes and poor circulation increase the risk of complications.

Nail Injuries

Trauma to the nail plate, nail bed, nail folds, or fingertip that may cause bruising, laceration, avulsion, fracture, or later nail-growth abnormalities.

Nail Lichen Planus

Lichen planus affecting the nail matrix or nail bed can cause thinning, longitudinal ridges or splitting, and sometimes permanent nail deformity or loss. A dorsal pterygium, in which scar tissue grows from the proximal nail fold onto the nail, is a characteristic severe change.

Nail Patella Syndrome

Alternate spelling; see *Nail-Patella Syndrome*.

Nail-Patella Syndrome

A rare inherited condition that can affect the nails, kneecaps, elbows, and pelvis. Some people also develop kidney disease or glaucoma. It is usually caused by a change in the *LMX1B* gene.

Nail Pits

Small dents in the surface of a nail. They are common in psoriasis but may also occur with hair-loss disorders, eczema, lichen planus, or other conditions affecting nail growth.

Nail Pitting

Alternate name; see *Nail Pits*.

Nail Matrix Injury

Damage to the nail matrix, the tissue at the nail base that makes the nail plate. It can result from a cut, crush, or procedure and may cause temporary or lasting changes in nail shape or growth, depending on how much the matrix is damaged.

Nail Psoriasis

Psoriasis affecting the nails can cause small pits, separation from the nail bed, yellow or red-brown patches, thickening, crumbling, or ridges. It may occur with skin psoriasis or psoriatic arthritis and can be severe or newly developed.

Nails

Hard plates of keratin covering the ends of fingers and toes. Changes in color, shape, thickness, or attachment can result from injury, infection, skin disease, nutritional problems, or other illness.

Nail Surgery

A procedure on the nail plate, nail bed, nail fold, or matrix to treat ingrown nails, tumors, infection, trauma, or painful deformity. Risks include bleeding, infection, scarring, altered nail growth, and recurrence.

Nail Unit Basal Cell Carcinoma

A rare skin cancer arising in the nail unit, usually in skin beside or beneath the nail. It may look like a

persistent sore, swelling, or a damaged nail and can resemble infection or inflammation. It is a different cancer from nail-unit squamous cell carcinoma or melanoma.

Nail Unit Bowen Disease

Squamous cell carcinoma in situ of the nail unit, meaning abnormal cells remain in the surface layer and have not grown into deeper tissue. It may appear as a wart-like growth, scaling, a sore, or nail distortion and can be mistaken for infection.

Nail Unit Melanoma

A melanoma arising from pigment-producing cells in the nail unit, often in the nail matrix. It may cause a new brown or black lengthwise band, pigment on nearby skin, or nail splitting or damage; some tumors have little or no pigment.

Nail Unit Squamous Cell Carcinoma

A cancer arising from the surface cells of the nail unit. It often grows slowly and may look like a wart, a persistent sore, or a long-lasting nail infection. It can damage the nail and nearby tissue; Bowen disease is its in-situ form.

Nalbuphine

An opioid pain medicine with mixed effects, used for moderate to severe pain under medical supervision.

Naloxone

A medicine that blocks opioids and can quickly restore breathing during an opioid overdose. It comes as a nasal spray or injection. Emergency help is still needed because its effect may wear off before the opioid does.

Naltrexone

An opioid-receptor antagonist used in the treatment of opioid use disorder and alcohol use disorder. It blocks opioid effects and can reduce alcohol craving or heavy drinking. Because it can precipitate withdrawal in a person with recent opioid exposure, its use is limited to people who are no longer physically dependent on opioids.

Nanocolloid

Very small particles carrying a radioactive tracer. After injection, they can show how lymph drains and help locate the first lymph node receiving drainage from a tumor.

Nanomedicine

The use of very small materials or devices in medicine to help diagnose, prevent, monitor, or treat disease. Examples include nanoparticle drug carriers, imaging agents, biosensors, and some vaccine or cancer treatments; their effects and safety depend on the material, size, dose, and how the body handles them.

Nanoparticle

A particle with dimensions typically measured in nanometres. In medicine, nanoparticles may carry drugs, improve imaging, or support diagnostic tests; their safety depends on composition, size, dose, route, and how the body processes them.

Nanoscience

The study of materials and structures at approximately the nanometre scale, where surface and physical properties may differ from those of larger materials. It supports research in drug delivery, imaging, diagnostics, and biomaterials.

Nanotechnology

The design and use of materials, devices, or systems at the nanometre scale. Medical applications include targeted drug delivery, imaging agents, biosensors, tissue engineering, and diagnostic tests; safety depends on the specific material and exposure.

Napelline

A poisonous plant chemical related to aconite alkaloids. Exposure can disturb nerve signals and heart rhythm, causing tingling, weakness, vomiting, dangerous blood-pressure changes, or life-threatening cardiac poisoning.

Naphazoline

A topical alpha-adrenergic agonist used as a nasal decongestant or ocular vasoconstrictor; prolonged

use can worsen congestion.

Naphthalene Poisoning

Harm from mothballs or other products containing naphthalene. It can destroy red blood cells, causing weakness, jaundice, dark urine, kidney injury, seizures, or coma.

Nappy Rash

Alternate name; see *Diaper Rash*.

Naproxen

A nonsteroidal anti-inflammatory drug (NSAID) used to relieve pain, fever, and inflammation. It inhibits cyclooxygenase enzymes and reduces prostaglandin production. Important risks include stomach or intestinal ulcers and bleeding, kidney injury, fluid retention, and increased risk of heart attack or stroke, especially with higher doses or prolonged use.

Naproxen Sodium Overdose

Taking too much naproxen can cause stomach pain, vomiting, bleeding, drowsiness, kidney injury, seizures, or breathing problems. Large or intentional overdoses can be life-threatening.

Narcissism

A pattern of excessive self-focus, need for admiration, or sense of superiority. Mild traits are common, while persistent traits that impair relationships or functioning may occur in narcissistic personality disorder.

Narcissistic Personality Disorder

A pervasive pattern of grandiosity, need for admiration, and impaired empathy that begins by early adulthood and occurs across contexts. It causes significant difficulty in relationships or functioning. Diagnosis is based on established clinical criteria; narcissistic traits alone do not constitute the disorder.

Alternate Names:
NPD

Narcolepsy

A chronic disorder of sleep-wake regulation marked by excessive daytime sleepiness and, in some people, sudden sleep episodes. Other features can include disrupted nighttime sleep, sleep paralysis, vivid dream-like experiences at sleep onset or awakening, and cataplexy (brief emotion-triggered loss of muscle tone). Type 1 is associated with cataplexy and/or deficient hypocretin (orexin); type 2 occurs without cataplexy and without documented hypocretin deficiency.

Narcoleptic Syndrome

Alternate name for narcolepsy, a neurologic sleep disorder causing excessive daytime sleepiness and, in some people, cataplexy, sleep paralysis, or vivid hallucinations; see *Narcolepsy*.

NARP Syndrome

A rare inherited mitochondrial disorder that can cause nerve damage, muscle weakness, loss of coordination, seizures, and vision problems. Symptoms and severity vary widely.

Alternate Names:
NARP; Neuropathy, Ataxia, and Retinitis Pigmentosa

Narrow Angle Glaucoma

An older, imprecise term sometimes used for an anatomically narrow anterior chamber angle, which increases the risk of angle closure. A narrow angle is a risk state and is not itself synonymous with angle-closure glaucoma, which involves glaucomatous optic-nerve damage.

Narrowband UVB Phototherapy

Exposure to a narrow range of ultraviolet B light, centered near 311–313 nm, used for inflammatory and pigmentary skin disorders such as psoriasis, vitiligo, and eczema. The radiation suppresses cutaneous inflammation or alters pigment-cell activity; repeated exposure can cause erythema and cumulative skin damage.

Narrow-Complex Tachycardia

A fast heart rhythm with a QRS duration under

120 milliseconds on an electrocardiogram. It usually arises above the ventricles, though the rhythm's origin and cause require assessment; symptoms may include palpitations, dizziness, chest discomfort, breathlessness, or fainting.

Narrow Pulse Pressure

A pulse pressure—the difference between systolic and diastolic blood pressure—that is low relative to the systolic pressure. It is often defined as less than one-quarter of the systolic pressure, although thresholds vary by clinical setting. It can occur with reduced blood pumped by the heart, as in blood loss, cardiac tamponade, or severe heart failure.

Narrow Therapeutic Index

A medicine for which the helpful dose is close to the harmful dose. Small changes in dose or blood concentration can cause toxicity, and treatment commonly involves close dose or level monitoring.

Nasal

Relating to the nose or the space inside it. The nose warms, moistens, and filters incoming air and helps with smell and speech. Nasal disease may cause blockage, bleeding, discharge, reduced smell, or difficulty breathing.

Nasal Bleeding

Alternate name; see *Epistaxis*.

Nasal Cannula

A soft tube with two small prongs that rest inside the nostrils to deliver supplemental oxygen. The prescribed oxygen flow depends on the person's needs and is adjusted with monitoring.

Nasal Cavity

The paired space inside the nose, extending from the nostrils to the nasopharynx. It warms, humidifies, and filters inspired air and contains the receptors responsible for smell.

Nasal Congestion

A blocked or stuffy feeling in the nose caused by swelling of the nasal lining, extra mucus, or a structural problem. It occurs with colds, allergies, sinus disease, irritants, and other conditions.

Nasal Congestion And Rhinorrhea

Nasal obstruction or stuffiness together with a runny nose, commonly caused by viral infection, allergic or nonallergic rhinitis, sinus disease, irritants, or structural blockage. Persistent unilateral symptoms, recurrent bleeding, fever, facial swelling, or breathing difficulty can indicate a more serious cause.

Nasal Corticosteroid Sprays

Nasal corticosteroid sprays reduce mucosal inflammation and congestion in allergic rhinitis, nasal polyps, and some chronic sinus disorders; correct direction away from the septum limits irritation and nosebleeds.

Nasal Discharge

Alternate name; see *Rhinorrhea*.

Nasal Disorders

Conditions affecting the nose or nasal passages, including infection, allergy, trauma, obstruction, polyps, and tumors.

Nasal Endoscopy

An examination in which a thin camera is used to look inside the nose and upper throat. It can help find swelling, polyps, a foreign object, bleeding, or a growth.

Nasal Flaring

Widening and outward movement of the nostrils during breathing. It is a visible sign of increased work of breathing, particularly in infants and children, and may accompany airway obstruction, bronchiolitis, pneumonia, asthma, or severe systemic illness.

Nasal Foreign Body

An object lodged in a nasal passage, most often in a child. One-sided obstruction, foul-smelling discharge, bleeding, pain, or difficulty breathing may occur; button batteries and paired magnets

can rapidly damage nasal tissue.

Nasal Foreign Bodies

Alternate name; see *Nasal Foreign Body*.

Nasal Fracture

A break in one or more bones or cartilaginous structures of the nose, usually caused by facial trauma. Pain, swelling, bruising, deformity, bleeding, and nasal obstruction may occur; a septal hematoma can damage the nasal cartilage.

Nasal Furunculosis

A bacterial infection of a hair follicle in the nasal vestibule, usually caused by *Staphylococcus aureus*. It causes a tender, red swelling and may form a localized abscess or spread into nearby skin.

Nasal Implant

A medical device placed inside or near the nose to support weakened tissue, change nasal shape, or improve airflow. The implant may be temporary or permanent, and risks include infection, movement, scarring, or breathing problems.

Nasal Leech

A rare infestation in which a leech attaches to the lining of the nose, often after exposure to contaminated freshwater. It can cause repeated nosebleeds, nasal blockage, or a sensation of movement in the nose because leech saliva prevents blood from clotting.

Nasal Mucosal Biopsy

Removal of a small piece of tissue from the nose for laboratory examination. It may help investigate persistent inflammation, infection, unusual deposits, or a growth; soreness, bleeding, and infection are possible complications.

Nasal Obstruction

Blocked airflow through one or both nasal passages. Causes include congestion, allergy, infection, a deviated septum, polyps, trauma, or a mass. Persistent one-sided obstruction or bleeding can be associated with a mass or other structural condition.

Nasal Papilloma

A usually benign epithelial tumor arising from the lining of the nasal cavity or paranasal sinuses. Sinonasal papillomas include exophytic, inverted, and oncocytic types; some can recur, and the inverted and oncocytic types may become malignant.

Alternate Names:
Sinonasal Papilloma; Schneiderian Papilloma

Nasal Passage

One of the air channels inside the nose. Its lining warms, moistens, and filters inhaled air before it reaches the throat; swelling, mucus, polyps, or a structural blockage can make breathing difficult.

Nasal Polyps

Soft, usually noncancerous growths in the lining of the nose or sinuses. They can cause a blocked nose, runny nose, and reduced sense of smell.

Alternate Names:
Sinonasal Polyps; Nasal Polyposis

Nasal Septal Abscess

A collection of pus between the nasal septum and its overlying lining, usually caused by bacterial infection of a septal hematoma or another local infection. It can cut off the cartilage's blood supply, causing cartilage damage, perforation, or nasal deformity.

Nasal Septal Hematoma

A collection of blood beneath the lining of the nasal septum, usually after nasal trauma. It can obstruct airflow and compromise the cartilage's blood supply, causing necrosis, infection, or septal deformity.

Nasal Septal Perforation

A hole through the cartilage or bone separating the nasal passages, which may cause crusting, nosebleeds, whistling, or obstruction and can result from trauma, surgery, intranasal drugs, or inflammatory disease.

Nasal Septal Perforation Repair

A procedure to close or reconstruct a hole in the nasal septum, using local tissue, grafts, or other techniques when symptoms or progressive damage justify repair.

Nasal Septum

The wall that divides the nasal cavity into right and left sides. It consists mainly of cartilage in front and bone behind and helps support the nose and direct airflow.

Nasal Septum Perforation

Alternate name; see *Nasal Septal Perforation*.

Nasal Spray

A liquid or mist delivered into the nose. Different sprays contain saline, corticosteroids, antihistamines, or decongestants; correct use and duration depend on the product.

Nasal Stent

A small device placed inside the nose to keep an airway open or support healing after surgery. It may cause crusting, blockage, infection, bleeding, or pressure injury.

Nasal Vestibular Stenosis

Narrowing of the nasal vestibule or nearby nasal valve that restricts airflow through the nostril. It may be present from birth or develop after injury, surgery, infection, or scarring.

Nasal Vestibulitis

Inflammation or infection of the nasal vestibule, commonly caused by Staphylococcus bacteria and producing tenderness, crusting, redness, or small pustules near the nostrils.

Nasogastric Feeding Tube

A flexible tube passed through the nose into the stomach to deliver enteral nutrition or medicines, or to decompress or aspirate the stomach.

Nasogastric Tube

A tube passed through the nose into the stomach to remove contents or deliver nutrition, fluids, or medicines when clinically indicated.

Nasogastric Tube Insertion

The placement of a flexible plastic tube through the nose, down the esophagus, and into the stomach for feeding, medication administration, or gastric decompression; see *Nasogastric Tube*.

Nasojejunal Feeding Tube

A flexible tube passed through the nose and stomach, with its tip placed in the jejunum beyond the stomach. It delivers enteral nutrition when feeding into the stomach is unsuitable or poorly tolerated, including in selected cases of delayed gastric emptying or aspiration risk. Placement may be guided by imaging or endoscopy.

Alternate Names:
NJ Tube

Nasolacrimal Duct

A membranous canal enclosed within a bony canal that conveys tears from the lacrimal sac downward into the inferior meatus of the nasal cavity beneath the inferior nasal concha, guarded by the mucosal valve of Hasner.

Alternate Names:
Tear Duct

Nasopharyngeal Airway

A soft tube inserted through the nose to maintain a passage between the nares and pharynx. It may be useful in a spontaneously breathing patient with partial upper-airway obstruction but is relatively contraindicated in suspected basal skull fracture or significant nasal trauma.

Nasopharyngeal Cancer

Cancer arising in the upper throat behind the nose, most often a carcinoma associated with Epstein-Barr virus in endemic regions. Nasal obstruction, nosebleeds, hearing loss, neck nodes, or cranial-nerve symptoms may occur; endoscopy, biopsy, and imaging establish extent.

Nasopharyngeal Carcinoma

A cancer arising in the upper throat behind the nose. It may cause a blocked or bleeding nose, hearing problems, a neck lump, headache, or swallowing trouble; risk varies with genetics, infections, and geographic background.

Alternate Names:
NPC; Nasopharyngeal Cancer

Nasopharyngeal Culture

A laboratory test in which a sample from behind the nose is placed in a growth medium to look for selected bacteria or fungi. A negative result does not exclude every infection, and other tests may be more sensitive.

Nasopharynx

The upper part of the throat behind the nose and above the soft palate. It carries air, contains the openings of the tubes that connect to the middle ears, and includes nearby lymph tissue that helps defend against infection.

Natal Cleft

The groove between the buttocks, also called the intergluteal or sacral cleft.

Alternate Names:
Intergluteal Cleft; Sacral Cleft

Natal Teeth

Teeth present at birth, most often involving the lower central incisors. They may be loose, interfere with feeding, or injure the infant's tongue; a loose tooth can pose an aspiration risk.

Natriuresis

Removal of sodium from the body in urine. Water usually leaves with the sodium, which can reduce fluid volume and blood pressure; the process may be increased by natural hormones or water-removing medicines.

Natriuretic

Causing the kidneys to remove more sodium in urine. Water usually leaves with the sodium, which can lower blood volume and pressure. The term describes certain body hormones and some medicines; related blood tests can help assess heart failure.

Natural Immunity

Immunity developed after a person is infected with a disease-causing organism. This is a form of active immunity because the person's own immune system responds. Antibodies passed from a pregnant person to a fetus or infant provide passive immunity, a separate form of naturally acquired protection that is temporary.

Natural Killer Cell

A type of white blood cell that can recognize and destroy some virus-infected or abnormal cells without previous exposure to that specific target. It helps provide early immune defense and releases signals that guide other immune cells.

Alternate Names:
NK Cells

Natural Killer Cells

Alternate plural form; see *Natural Killer Cell*.

Naturopathic Medicine

A system of complementary or alternative health practices that may use diet, supplements, herbs, and other treatments.

Nausea

An unpleasant feeling that you may vomit. It can occur with stomach or intestinal illness, pregnancy, medicines, migraine, inner-ear problems, metabolic disorders, or serious abdominal or neurologic disease. Persistent vomiting, severe pain, dehydration, blood, or confusion may signal a serious condition.

Nausea And Vomiting

Nausea is the urge to vomit; vomiting is forceful emptying of stomach contents. Causes include infection, medicines, pregnancy, migraine, obstruction, and other illnesses.

Nausea And Vomiting – Adults

Nausea and vomiting in adults can result from infection, stomach or bowel disease, medicines, pregnancy, migraine, metabolic illness, neurologic disease, or blockage. Severe pain, blood, confusion, dehydration, chest symptoms, or persistent symptoms may indicate a serious condition.

Nausea And Vomiting During Early Pregnancy

Nausea and vomiting are common in early pregnancy, but persistent symptoms with inability to keep fluids down, weight loss, dehydration, abdominal pain, fever, blood, or altered mental status may indicate hyperemesis gravidarum or another significant condition.

Navel

The navel, or umbilicus, is the scar left after the umbilical cord separates and marks the former connection between fetus and placenta.

Navicular

A boat-shaped bone in the middle of the foot that helps support the arch. Injury to it can cause foot pain and may heal slowly because part of the bone has a limited blood supply.

Navicular Fracture

A break in the navicular bone of the foot, caused by acute trauma or repetitive loading. Midfoot pain, swelling, and tenderness over the navicular may occur, and some fractures are difficult to detect without advanced imaging.

Navicular Fracture of the Wrist

A fracture of the scaphoid, a small wrist bone historically called the navicular. It may cause pain in the anatomic snuffbox after a fall and can heal poorly because part of the bone has limited blood supply.

Alternate Names:
Scaphoid Fracture; Wrist Navicular Fracture

NCS

Usually an abbreviation for nerve-conduction study, a test that measures how quickly and strongly electrical signals travel through nerves. It can help assess nerve damage, pressure on a nerve, or some causes of numbness and weakness.

NDI

Abbreviation for nephrogenic diabetes insipidus, in which the kidneys do not respond adequately to vasopressin and produce excessive dilute urine; see *Nephrogenic Diabetes Insipidus*.

NDM-1

An enzyme made by some bacteria that makes them resistant to many important antibiotics. Infections caused by these bacteria can be difficult to treat; laboratory identification and infection-control measures help limit spread.

Near-Drowning

An older term for *non-fatal drowning*: respiratory impairment from submersion or immersion in liquid when the person survives. “Non-fatal drowning” is the preferred term.

Alternate Names:
Non-Fatal Drowning

Nearsightedness

A common focusing problem in which nearby objects are clear but distant objects look blurry because light focuses in front of the retina. Glasses, contact lenses, or selected procedures can improve vision.

Alternate Names:
Myopia; Short-Sightedness

Nearsightedness (Myopia)

Alternate name; see *Nearsightedness*.

Nebulizer

A device that converts liquid medicine into an aerosol for inhalation through a mouthpiece or mask. Common types include jet nebulizers, ultrasonic nebulizers, and vibrating-mesh nebulizers; they differ in how the aerosol is generated and delivered.

Alternate Names:
Nebuliser; Atomizer

NEC

Abbreviation; see *Neuroendocrine Carcinoma*.

Necator

A group of hookworms that live in the small intestine. They enter through the skin, mature in the gut, and feed on blood, potentially causing abdominal symptoms, iron-deficiency anemia, weakness, and poor growth.

Necator Americanus

A hookworm species that infects humans through skin penetration by larvae and causes intestinal blood loss.

Neck

The neck connects the head to the trunk and contains the cervical spine, airway, esophagus, thyroid, vessels, nerves, muscles, and lymph nodes.

Neck And Back Pain

Pain in the neck, upper back, lower back, or surrounding tissues, commonly caused by strain, age-related changes, disc problems, or trauma. Weakness, numbness, walking difficulty, bowel or bladder changes, fever, cancer history, or major trauma may indicate a serious cause.

Neck Abscess

A pocket of pus in the skin or deeper tissues of the neck, usually caused by infection. It may cause pain, swelling, fever, or trouble swallowing; a deep abscess can threaten breathing.

Neck Cancer

Cancer arising in tissues of the neck, such as the throat, thyroid, salivary glands, lymph nodes, or other structures. Symptoms may include a persistent lump, pain, swallowing trouble, voice change, or unexplained weight loss.

Neck Dissection

Surgical removal of cervical lymph nodes and sometimes surrounding tissues to treat or stage head and neck cancer.

Neck Lump

A localized swelling or mass in the neck caused by enlarged lymph nodes, thyroid or salivary disease, cyst, infection, or tumor; persistent or concerning masses can reflect significant disease.

Neck Lipoma

A usually harmless, soft lump made of fat cells under the skin of the neck. It often grows slowly and may move slightly when pressed.

Neck Lymphoma

Lymphoma involving lymph nodes or other lymph tissue in the neck. It may cause one or more painless lumps and can occur with fever, night sweats, or unexplained weight loss.

Neck Mass

A lump or swelling in the neck caused by an enlarged lymph node, congenital cyst, thyroid or salivary-gland lesion, infection, or tumor. A persistent, enlarging, firm, fixed, or unexplained mass—especially in an adult—can be associated with malignancy or other significant disease.

Neck Pain

Pain or stiffness in the neck, commonly caused by muscle strain, poor posture, injury, arthritis, degenerative disc disease, or nerve compression. It may be localized or spread to the shoulders, arms, or head.

Neck Pain And Dizziness

Neck pain with dizziness may reflect muscle strain, migraine, inner-ear disease, medication, blood-pressure change, or less commonly vascular or neurologic disease. Sudden severe symptoms, weakness, speech or vision change, fainting, or inability to walk may occur with a serious condition.

Neck Sprain

Alternate name; see *Whiplash*.

Neck Stiffness

Reduced ability to move the neck comfortably because of muscle tightness, inflammation, injury, or irritation of tissues around the spine or meninges. Severe stiffness with fever, headache, confusion, rash, or neurologic symptoms can occur with serious infection or neurologic disease.

Neck Strain

Alternate name; see *Whiplash*.

Neck X-Ray

Plain radiographic imaging of the cervical spine or neck soft tissues used to evaluate alignment, fractures, degenerative change, foreign bodies, or selected airway abnormalities.

Necrobiosis Lipoidica

A chronic inflammatory skin disorder characterized by yellow-brown, atrophic plaques, usually on the shins. It is associated with diabetes but can occur without diabetes.

Necrobiosis Lipoidica Diabeticorum

A chronic inflammatory skin disorder producing yellow-brown atrophic plaques with a raised border, most often on the shins and associated with diabetes, although it can occur without diabetes.

Necrolytic Acral Erythema

A rare rash with dark, thickened, or blistered patches, usually on the feet and ankles. It is often linked to long-term hepatitis C but can also occur with low zinc or other metabolic problems; these associations help distinguish possible causes.

Alternate Names:
NAE; Hepatitis C-Associated Necrolytic Erythema

Necrolytic Migratory Erythema

A recurrent skin eruption with red patches that develop blisters, erosions, or crusts and spread to new areas as older lesions heal. It often affects skin folds, the groin, buttocks, or areas around the mouth. It is a characteristic feature of glucagonoma, a glucagon-producing pancreatic tumor, but similar eruptions can occur with liver disease, intestinal malabsorption, or chronic pancreatitis; these are sometimes called pseudoglucagonoma syndrome.

Necrosis

Necrosis is death of cells or tissue within a living body caused by ischemia, infection, toxins, trauma, inflammation, or other injury.

Necrotizing Anterior Scleritis

A severe inflammation of the white outer coat of the eye that causes tissue damage and can threaten vision. It usually causes intense eye pain, redness, and light sensitivity.

Necrotizing Enterocolitis

A severe intestinal disease of newborns, especially premature or medically fragile infants, in which inflammation damages and may kill bowel tissue. Injury can extend through the bowel wall and cause perforation, peritonitis, or sepsis. Abdominal distension, feeding intolerance, and bloody stools are common findings.

Necrotizing Fasciitis

A rare, severe, and rapidly spreading bacterial infection of the deep layers of skin and subcutaneous connective tissue (the fascia). As the bacteria multiply, they release toxins that destroy surrounding tissues, cut off blood supply, and cause tissue death (necrosis). Often beginning after a minor cut, scrape, or surgical wound, it quickly produces severe pain that seems out of proportion to the visible skin changes, followed by rapid swelling, blister formation, skin discoloration, and life-threatening systemic shock.

Alternate Names:
Necrotizing Soft Tissue Infection (NSTI); Flesh-Eating Disease

Necrotizing Fasciitis of the Perineum

Necrotizing soft-tissue infection of the perineum or genital region, commonly called Fournier gangrene. Severe pain, swelling, skin discoloration,

fever, or rapid progression can occur; treatment involves emergency surgery and antibiotics.

Alternate Names:
Fournier Gangrene

Necrotizing Granuloma

A granulomatous inflammatory lesion containing central tissue necrosis, commonly associated with infections such as tuberculosis or fungal disease but requiring clinical and histologic correlation.

Necrotizing Infections

Severe infections that cause tissue death through germs, toxins, blocked blood flow, or intense inflammation. Examples include necrotizing fasciitis, necrotizing pneumonia, and necrotizing enterocolitis. Rapidly worsening pain, swelling, skin changes, severe illness, or organ problems may occur.

Necrotizing Pneumonia

Severe pneumonia in which infection causes necrosis and cavitation of lung tissue, often accompanied by sepsis, respiratory failure, or abscess formation.

Necrotizing Sialometaplasia

A benign, self-limiting, ischemic inflammatory lesion of the salivary glands (most commonly involving the minor salivary glands of the hard palate) that clinically and histologically mimics mucoepidermoid carcinoma or squamous cell carcinoma.

Alternate Names:
Ischemic Sialadenitis; Benign Palatal Sialometaplasia

Necrotizing Soft Tissue Infection

A rapidly progressive infection of the tissue beneath the skin or in muscle that causes severe pain, swelling, severe illness, and tissue death. Treatment may include surgery and antibiotics.

Necrotizing Vasculitis

Inflammation of blood-vessel walls causing fibrinoid necrosis and potential vessel narrowing, thrombosis, hemorrhage, ischemia, or organ injury.

Needle

A hollow, sharp tube used to inject medicine or remove blood, fluid, or tissue. Needles come in different lengths and widths; the appropriate size depends on the procedure and body site.

Needle Aspiration Biopsy

A biopsy that uses a thin needle to remove cells or fluid from a lump, organ, or lesion for laboratory examination. Results are interpreted with imaging and clinical findings and may require a larger biopsy.

Needle Biopsy

Removal of cells, fluid, or a tissue sample through a needle for cytologic or histopathologic examination. Fine-needle aspiration primarily collects cells, whereas core biopsy collects tissue architecture.

Needle Decompression

An emergency procedure used to release trapped air from around a collapsed lung when a tension pneumothorax is causing severe breathing or circulation problems. A trained clinician places a needle or catheter through the chest, then usually inserts a chest tube for ongoing treatment. It is a temporary lifesaving measure, not a complete repair.

Alternate Names:
Needle Thoracostomy; Tension Pneumothorax Decompression; Emergency Chest Decompression

Needle Driver

A surgical instrument with gripping jaws and handles used to hold and guide a suture needle through tissue. Its design helps control the needle while protecting the operator's fingers.

Alternate Names:
Needle Holder Suture Needle Holder

Needle Holder

Alternate name; see *Needle Driver*.

Needlestick Injury

A puncture from a needle or sharp object that may expose someone to blood or body fluids. It can create a risk of infection, including HIV or hepatitis,

and may lead to testing or preventive treatment.

Neer Sign

A shoulder examination finding in which pain occurs as the clinician raises the person's straight arm forward while turning it inward. It may support a diagnosis of subacromial shoulder pain, but does not identify its cause by itself.

Alternate Names:
Neer Impingement Test

Neer Test

Alternate name; see *Neer Sign*.

Alternate Names:
Neer Impingement Sign; Neer Shoulder Test

Negative Feedback

A control process in which a change triggers a response that reduces or reverses the original change. It helps keep body functions, such as temperature, blood sugar, and hormone levels, within a useful range.

Negative Predictive Value

The chance that a person with a negative test result truly does not have the condition. It depends on test accuracy and how common or likely the condition was before testing.

Negative Pressure Pulmonary Edema

A form of non-cardiogenic pulmonary edema provoked by vigorous, forceful inspiratory efforts against an acutely obstructed upper airway (such as post-extubation laryngospasm), generating extreme negative intrathoracic pressures that increase venous return and cause alveolar capillary stress failure.

Alternate Names:
NPPE; Post-Obstructive Pulmonary Edema

Negative Pressure Ventilation

Breathing support that uses pressure around the chest to help the lungs expand, instead of pushing air directly through the airway. It is used rarely, including for some neuromuscular conditions.

Negative-Strand RNA Virus

A virus whose genetic material cannot be read directly to make proteins. After entering a cell, it must first make a readable copy of its RNA before producing new virus particles.

Negative Symptoms

A reduction or loss of usual emotional expression, speech, motivation, pleasure, or interest in other people. They can occur in schizophrenia and some other conditions and may interfere with work, relationships, and daily activities.

Neglect

Failure to provide a child with necessary food, shelter, supervision, education, emotional care, or medical care, causing harm or risk of harm. The term can also describe ignoring one side of space after brain injury; the intended meaning depends on context.

Neglected Tropical Disease

An infectious or parasitic disease that mainly affects populations in tropical or subtropical regions with limited resources. Examples include schistosomiasis, leprosy, dengue, and lymphatic filariasis.

Neglect Syndrome

A neurologic problem in which a person fails to notice or respond to one side of the body or surrounding space, usually after injury to the opposite side of the brain. It is more than ordinary inattention.

Neisseria Gonorrhoeae

A gram-negative bacterium that causes gonorrhea, a sexually transmitted infection. It has developed resistance to several antibiotics, so treatment follows current local guidance.

Neisseria Infection

Infection caused by a pathogenic Neisseria species. The most important human infections are gonorrhoea caused by N. gonorrhoeae and meningococcal disease caused by N. meningitidis; illness may affect the genital tract, throat, rectum, joints, bloodstream, or meninges, and treatment depends on the

site and antibiotic susceptibility.

Alternate Names:
Neisseria Infections

Neisseria Meningitidis

A gram-negative diplococcus that can cause meningitis or bloodstream infection (meningococcemia). Its polysaccharide capsule defines major disease-causing serogroups; conjugate vaccines target serogroups A, C, W, and Y, while serogroup B vaccines target surface proteins. Meningitis may cause fever, headache, neck stiffness, or altered mental status.

Nelson Syndrome

Enlargement and hypersecretion of an adrenocorticotropic-hormone-producing pituitary tumour after bilateral adrenalectomy, usually for Cushing disease. It may cause rapid skin hyperpigmentation, headache, visual-field loss, and other effects of an expanding sellar mass.

Nemaline Myopathy

A group of inherited muscle diseases that cause weakness because muscle fibers do not develop or work normally. Severe forms begin in infancy and may affect movement, feeding, or breathing; milder forms begin later. The severity varies widely, and care may include breathing support, nutrition, physical therapy, and genetic counseling.

Alternate Names:
Rod Body Myopathy; Nemaline Rod Myopathy

Neoadjuvant Therapy

Treatment given before the main treatment, such as surgery or radiotherapy, to shrink a tumor or make it easier to treat. It may also show how the tumor responds and help doctors plan the next treatment.

Neocortex

The outer part of the cerebral hemispheres involved in conscious perception, language, planning, memory, and voluntary movement.

Neoehrlichiosis

A tick-borne bacterial infection caused by *Candidatus Neoehrlichia mikurensis*, usually transmitted by *Ixodes* ticks. It may cause fever, fatigue, muscle or joint pain, and skin findings; vascular inflammation and venous or arterial thromboembolic events can also occur, particularly in immunocompromised people.

Neologisms

Newly created words, phrases, or idiosyncratic combinations of word fragments that have meaning only to the speaker and are incomprehensible to others. They are characteristic features of formal thought disorder in schizophrenia and fluent (Wernicke) aphasia.

Neonatal

Relating to a newborn, especially during the first 28 days after birth. This period includes important changes in breathing, feeding, temperature control, immunity, circulation, and adjustment to life outside the womb.

Neonatal Abstinence Syndrome

Withdrawal symptoms in a newborn after exposure to opioids or certain other medicines or substances during pregnancy. Symptoms may include trembling, irritability, poor feeding, vomiting, diarrhea, sweating, or breathing problems.

Neonatal Cephalohematoma

A collection of blood beneath the outer covering of a newborn's skull, usually caused by birth trauma. It is limited by the skull's seams and generally resolves over time, but it can be associated with injury or jaundice.

Neonatal Conjunctivitis

Inflammation of the eye's outer lining during the first month of life, caused by chemical irritation, bacteria, or viruses acquired during delivery. Pus-like discharge, eyelid swelling, and corneal involvement may occur.

Neonatal Cystic Fibrosis Screening Test

A newborn screening test, usually measuring immunoreactive trypsinogen with reflex DNA or sweat

testing, used to identify infants at increased risk for cystic fibrosis.

Neonatal Diabetes Mellitus

Diabetes first diagnosed during the first six months of life. It may be temporary or lifelong and is usually caused by a genetic change affecting insulin production; management often involves specialist care.

Neonatal Encephalopathy

A syndrome of disturbed brain function in a newborn, ranging from abnormal alertness or muscle tone to seizures or coma. Causes include hypoxic-ischemic injury, infection, stroke, metabolic disorders, and genetic conditions; it is broader than hypoxic-ischemic encephalopathy.

Alternate Names:
Newborn Encephalopathy

Neonatal Galactorrhea

Milk-like secretion from a newborn's breast tissue, usually related to hormonal changes around birth. It is usually temporary; persistent secretion can be associated with endocrine disorders.

Alternate Names:
Neonatal Milk Secretion; Newborn Galactorrhea

Neonatal Harlequin Color Change

A brief, harmless color change in a newborn in which one side of the body becomes red while the other remains pale, with a sharp line between them. It reflects temporary differences in blood-vessel control and usually resolves without treatment.

Neonatal Hepatitis

An older, broad term for liver inflammation and poor bile flow in a newborn, often causing prolonged jaundice. Many cases once given this name have a specific cause, such as infection, blocked bile ducts, or an inherited disease. When no cause is found, idiopathic neonatal cholestasis is a more precise term.

Neonatal Herpes Simplex

Herpes simplex infection in a baby during the first 28 days of life, usually acquired around delivery. It may affect the skin, eyes, mouth, brain, or several organs and can resemble sepsis. Treatment uses antiviral medicine.

Neonatal Herpes Simplex Virus

A severe neonatal infection caused by herpes simplex virus, typically acquired during passage through the birth canal, presenting within the first month of life as skin, eye, and mouth disease, central nervous system disease, or disseminated disease with multiorgan involvement.

Neonatal Hyperbilirubinemia

An excess of bilirubin in a newborn's blood that can cause yellowing of the skin and eyes (jaundice). Very high levels can injure the brain, causing acute bilirubin encephalopathy or lasting injury known as kernicterus.

Neonatal Hyperglycemia

Blood glucose higher than expected in a newborn. The level considered high depends on the infant's age, gestational age, and clinical situation. Causes include prematurity, infection, stress, or receiving too much glucose through a vein.

Alternate Names:
Newborn Hyperglycemia

Neonatal Hypertension

Sustained blood pressure elevation in infants and neonates exceeding age- and birthweight-adjusted norms. Frequently secondary to umbilical artery catheter-related renal artery thrombosis, congenital renal anomalies, bronchopulmonary dysplasia, or congenital heart defects.

Alternate Names:
Neonatal High Blood Pressure

Neonatal Hypocalcemia

Low serum calcium in a newborn, which may cause jitteriness, poor feeding, hypotonia, apnea, or seizures. Causes include prematurity, maternal diabetes, birth asphyxia, and disorders of parathyroid

function.

Neonatal Hypoglycemia

A low blood glucose level in a newborn. It may cause trembling, sleepiness, poor feeding, breathing pauses, or seizures and is more likely with prematurity, unusually small or large birth size, or maternal diabetes.

Neonatal Hypothermia

A newborn's body temperature below 36.5°C. It can result from environmental exposure, prematurity, infection, or other illness and can worsen breathing, blood glucose, and circulation problems.

Neonatal Hypothyroidism

Insufficient thyroid hormone production in a newborn, which can impair brain development and growth if untreated; newborn screening enables early diagnosis and treatment.

Neonatal Hypoxic-Ischemic Encephalopathy

Brain injury in a newborn caused by too little oxygen or blood flow around the time of birth. It may cause poor alertness, abnormal muscle tone, seizures, breathing difficulty, or injury to other organs. Selected babies benefit from carefully controlled cooling started soon after birth.

Neonatal Infections

Infections occurring during the first weeks of a newborn's life. They may begin before or soon after birth from exposure during pregnancy or delivery, or later from the environment or medical devices. Warning signs include poor feeding, temperature change, breathing difficulty, unusual sleepiness, irritability, or color change.

Neonatal Jaundice

Yellow discoloration of a newborn's skin or eyes caused by elevated bilirubin. It is common; severe, early, or prolonged jaundice can reflect high bilirubin levels or an underlying disorder.

Alternate Names:
Neonatal Hyperbilirubinemia; Icterus Neonatorum

Neonatal Listeriosis

Listeria infection acquired before birth or during delivery that can cause sepsis, pneumonia, meningitis, or other serious illness in a newborn; see *Listeriosis*.

Neonatal Lupus

An antibody-mediated condition in a fetus or newborn caused by placental transfer of maternal anti-Ro/SSA and/or anti-La/SSB antibodies. The mother may have lupus or Sjögren syndrome, or may have no symptoms. The infant may develop a skin rash, low blood-cell counts, liver abnormalities, or heart injury, especially congenital heart block. Skin, blood, and liver findings usually resolve as the maternal antibodies disappear over several months, but established heart block is often permanent and may require a pacemaker; this condition does not mean the infant has systemic lupus.

Alternate Names:
Neonatal Lupus Erythematosus; NLE

Neonatal Mechanical Ventilation

Breathing support for a newborn who cannot breathe adequately without help. Air may be delivered through a breathing tube or a mask; the method and settings are chosen for the infant's condition.

Alternate Names:
Neonatal Ventilatory Support

Neonatal Neutropenia

A low number of neutrophils, a type of white blood cell, in a newborn's blood. The cutoff depends on gestational age and the infant's age after birth. Causes include infection, maternal conditions, immune problems, medicines, or bone-marrow disorders.

Alternate Names:
Neonatal Low Neutrophil Count

Neonatal Opioid Withdrawal Syndrome

A withdrawal syndrome in a newborn after prenatal opioid exposure. Features can include irritability, tremor, high-pitched crying, disturbed sleep, poor feeding, vomiting, loose stools, and sweating, reflecting effects on the central nervous, autonomic, and

gastrointestinal systems. Onset and severity vary with the opioid, timing and duration of exposure, and exposure to other substances.

Alternate Names:
NOWS; Opioid-Induced NAS

Neonatal Peripheral Arterial Line

A fine indwelling cannula placed in a peripheral artery (such as the radial, posterior tibial, or dorsalis pedis artery) of an infant for continuous invasive hemodynamic arterial blood pressure monitoring and frequent arterial blood gas sampling in neonatal intensive care.

Alternate Names:
Infant Arterial Line; Pediatric A-Line; Neonatal Arterial Cannulation

Neonatal Peripheral IV Line

A short peripheral venous catheter inserted into a superficial vein in the hand, foot, forearm, or scalp of an infant for short-term hydration, medication delivery, or blood transfusions.

Alternate Names:
Infant PIV; Pediatric Peripheral Cannula; Neonatal IV Cannulation

Neonatal PICC Line

A small-caliber (1.0–2.0 Fr) central venous catheter inserted percutaneously into a peripheral vein of an infant or neonate with the tip positioned in the superior or inferior vena cava, providing reliable vascular access for total parenteral nutrition and hyperosmolar medications.

Alternate Names:
Neonatal Percutaneous Central Line; Infant PICC; Pediatric Percutaneous Central Catheter

Neonatal Pneumothorax

Air in the pleural space of a newborn, which can compress the lung and impair breathing. It may occur spontaneously or with lung disease, resuscitation, or mechanical ventilation; severity ranges from an imaging finding to a life-threatening emergency.

Alternate Names:
Newborn Pleural Air Collection

Neonatal Polycythemia

An abnormally high red-cell concentration in a newborn, often defined by a venous hematocrit of at least 65 percent. It may increase blood viscosity and cause respiratory, neurologic, or metabolic symptoms.

Neonatal Respiratory Distress Syndrome

A lung disorder of newborns, especially those born preterm, caused chiefly by insufficient pulmonary surfactant and immature lungs. Increased surface tension promotes alveolar collapse, impairing oxygen exchange and causing early respiratory distress. "Hyaline membrane disease" is an older name.

Neonatal Resuscitation

Emergency steps used to help a newborn who is not breathing well or has a slow heart rate after birth. They may include warmth, airway support, assisted breathing, and chest compressions.

Neonatal Seizures

Seizures occurring in a newborn, usually during the first 28 days after birth. They may be subtle or detectable only with electroencephalography (EEG). Causes include oxygen-related brain injury, stroke or bleeding, infection, low blood sugar or calcium, and genetic or metabolic conditions; they can indicate serious neurologic or metabolic disease.

Neonatal Sepsis

A serious infection causing illness throughout a newborn's body during the first 28 days of life. It may begin before or after birth and can cause poor feeding, temperature change, breathing difficulty, sleepiness, or color change.

Neonatal Skin Conditions

Skin changes common in newborns, including temporary rashes, tiny white spots, heat rash, and small yellow bumps. Most are harmless, but blistering, widespread redness, fever, poor feeding, or a rapidly worsening rash may signal illness.

Neonatal Testicular Torsion

Twisting of the spermatic cord around a testicle

during the newborn period, reducing or stopping its blood supply. It may appear as a firm, enlarged, discolored, or painless scrotal swelling.

Neonatal Thyrotoxicosis

Excess thyroid activity in a newborn, usually caused by thyroid-stimulating antibodies passed from the mother. It may cause a fast heartbeat, irritability, poor feeding, poor weight gain, sweating, or breathing problems and usually needs temporary treatment and monitoring.

Neonatal Transition

The newborn's adjustment from receiving oxygen through the placenta to breathing with the lungs after birth. The lungs fill with air, blood flow changes, and the baby must begin controlling temperature, blood pressure, and feeding.

Neonate

A neonate is a newborn infant during the first 28 completed days after birth, a period requiring attention to feeding, temperature, jaundice, infection, breathing, and transition to extrauterine life.

Neonatologist

A pediatrician who specializes in the medical care of newborn infants, particularly premature and critically ill neonates.

Neoplasia

Abnormal, uncontrolled growth of cells that forms a new mass or tissue. It may be benign and remain localized, or malignant and invade nearby tissues or spread elsewhere.

Neoplasm

A new, abnormal growth of cells that forms a mass or tissue. A neoplasm may be benign and stay localized, or malignant and invade nearby tissues or spread to distant organs.

Neoplastic

Relating to an abnormal new growth of cells. A neoplastic growth may be noncancerous and localized or cancerous and able to invade nearby tissue or spread.

Neostigmine

An acetylcholinesterase inhibitor used to reverse selected nondepolarizing neuromuscular blockade and to treat some disorders of neuromuscular transmission or bowel and bladder motility.

Nephoptosis

Alternate spelling; see *Nephroptosis*.

Nephrectomy

Surgery to remove part or all of a kidney. It may treat kidney cancer, severe kidney damage, infection, or a kidney that no longer works.

Nephric

Relating to the kidney. In embryology, nephric structures are involved in development of the urinary system.

Nephritic Syndrome

A kidney disorder caused by acute inflammation and damage to the glomeruli, the microscopic filtering units of the kidneys. This inflammation allows red blood cells and moderate amounts of protein to leak into the urine, classically resulting in dark or tea-colored urine (hematuria). It typically presents with a sudden decline in kidney function, fluid retention causing body swelling (edema), and high blood pressure.

Nephritis

Inflammation of kidney tissue that can cause blood or protein in the urine, swelling, high blood pressure, reduced urine, or loss of kidney function. Infection, medicines, and immune diseases are possible causes.

Nephroblastoma

Another name for Wilms tumor, the most common kidney cancer in children. It may appear as a painless abdominal lump, abdominal pain, blood in the urine, fever, or high blood pressure; treatment is usually provided by a specialist cancer team.

Nephrocalcinosis

Buildup of calcium deposits inside kidney tissue. It may result from high calcium levels, hormone or kidney disorders, inherited conditions, dehydration, or medicines and can lead to stones, blood in the urine, or reduced kidney function.

Nephrocarcinoma

A carcinoma arising in the kidney, usually referring to renal cell carcinoma; see *Renal Cell Carcinoma*.

Nephrogenic Diabetes Insipidus

A condition in which the kidneys do not respond properly to vasopressin, the hormone that helps conserve water. It causes large amounts of dilute urine and intense thirst; inherited changes, kidney disease, electrolyte problems, or medicines may cause it.

Nephrogenic Fibrosing Dermopathy

An older name for nephrogenic systemic fibrosis, a rare condition causing thick, tight, hardened skin and sometimes stiff joints in people with severe kidney disease, usually after exposure to certain gadolinium contrast agents.

Nephrogenic Systemic Fibrosis

A rare disorder in which skin and connective tissue become thick and hardened, sometimes limiting movement. It is linked mainly to certain gadolinium contrast exposures in people with severe kidney impairment and may affect internal tissues.

Nephrolithiasis

Formation of stones in the kidneys or urinary tract. Stones can cause severe side or back pain, blood in the urine, nausea, or blockage; dehydration, inherited conditions, medicines, and diet can contribute.

Nephrologist

A doctor who specializes in kidney disease. Nephrologists assess reduced kidney function, high blood pressure related to kidney problems, kidney inflammation, and mineral or salt disturbances and may manage dialysis or transplant care.

Nephrology

The medical specialty concerned with kidney disease, fluid and electrolyte disorders, hypertension, dialysis, and kidney transplantation.

Nephrolysis

Surgical freeing of a kidney from surrounding adhesions or tissue.

Nephron

The microscopic working unit of a kidney. Each nephron filters blood, returns needed water and substances to the body, and removes waste to make urine; each kidney contains about one million.

Nephron Function

Each kidney contains about one million nephrons, its microscopic filtering units. A nephron filters blood, removes wastes into urine, and returns needed water and substances to the bloodstream while helping control salts, acid, and blood pressure.

Nephronophthisis

A rare inherited kidney disease that gradually reduces the kidneys' ability to concentrate urine. It may cause excessive thirst and urination, anemia, growth problems, and eventually kidney failure.

Nephropathy

Disease or damage of the kidneys. It may reduce waste removal, disturb fluid and salt balance, cause protein or blood in the urine, or eventually lead to kidney failure.

Nephropathy Diabetic

Alternate name; see *Diabetic Nephropathy*.

Nephroptosis

Abnormal downward movement of a kidney when a person stands, sometimes causing flank discomfort, urinary symptoms, or intermittent obstruction.

Alternate Names:
Wandering Kidney; Floating Kidney; Ren Mobilis; Hypermobile Kidney

Nephrosclerosis

Hardening and scarring of kidney tissue, commonly caused by long-standing high blood pressure or blood-vessel disease. Progressive damage can reduce filtering ability, cause protein in urine, and lead to chronic kidney disease.

Nephrostomy

A procedure that creates a drainage path from the kidney through the skin when urine cannot pass normally to the bladder. A temporary tube usually carries urine into a bag while the blockage is treated.

Nephrostomy Tube

A drainage tube passed through the skin into the kidney to carry urine into a bag when the ureter is blocked. Blockage may be caused by a stone, tumor, or narrowing. Infection with blockage can lead to sepsis and is treated with drainage; the tube may be temporary or long-term.

Nephrotic Range Proteinuria

Very large protein loss in the urine, usually more than 3.5 grams per day in an adult. It often indicates serious damage to the kidney filters and can cause swelling, low blood protein, high cholesterol, blood clots, or infection.

Nephrotic Syndrome

A kidney disorder caused by damage to the tiny clusters of blood vessels (glomeruli) that filter waste and excess water from the blood. The damaged filters allow excessive amounts of protein to spill from the bloodstream into the urine. This loss of vital blood proteins leads to widespread swelling (edema), particularly around the eyes and in the feet and ankles, along with low levels of albumin in the blood and high levels of blood cholesterol.

Nephrotoxic

Describing a substance or condition that can damage the kidneys or reduce their function. Examples include some medicines, poisons, infections, and severe dehydration; risk depends on dose, duration, and kidney health.

Nephrotoxicity

Kidney injury or impaired kidney function caused by a medicine, poison, contrast agent, or other exposure. It may present as an acute rise in serum creatinine, reduced urine output, or tubular, interstitial, or glomerular damage. The pattern and severity depend on the agent, exposure, and underlying kidney function.

Nernst Equation

A formula for calculating the equilibrium electrical potential for a single ion across a membrane from its concentration or activity on each side, ion charge, and absolute temperature. At this potential, the electrical and chemical forces on that ion balance, so there is no net movement of that ion across the membrane.

Nerve

A bundle of nerve fibers that carries messages between the brain or spinal cord and the rest of the body. Nerves control movement and carry sensations such as touch, pain, and temperature.

Nerve Biopsy

Removal of a small piece of a nerve for laboratory examination when serious nerve disease is suspected. It may help identify inflammation, infection, abnormal deposits, or a tumor, but can leave permanent numbness or weakness near the biopsy site.

Nerve Block

An injection of numbing medicine near a nerve or group of nerves to temporarily stop pain signals. It may help diagnose the source of pain or provide pain relief during or after a procedure; weakness or other temporary effects can occur.

Nerve Compression

Alternate name; see *Pinched Nerve*.

Nerve Conduction Studies

Tests that stimulate peripheral nerves with small electrical pulses and record how quickly and strongly signals travel. They help identify nerve damage, compression, loss of the nerve's insulating covering,

or loss of nerve fibers.

Nerve Conduction Study

A test that gives small electrical pulses to a nerve and measures how quickly and strongly the signal travels. It helps identify nerve damage, pressure on a nerve, or loss of its protective covering.

Nerve Conduction Velocity

The speed at which an electrical signal travels along a peripheral nerve. A nerve-conduction test measures this speed and the signal strength to help identify nerve damage, pressure on a nerve, or damage to its insulating covering.

Nerve Deafness

Hearing loss caused by damage to the cochlea, auditory nerve, or central auditory pathways rather than blockage of sound transmission through the outer or middle ear.

Alternate Names:
Sensorineural Hearing Loss; SNHL

Nerve Endings

The tiny ends of nerves that detect sensations such as touch, pain, heat, or pressure, or release signals to muscles and glands. Injury or irritation can cause pain, numbness, tingling, or abnormal sweating.

Nerve Fiber

The long, thread-like part of a nerve cell that carries signals. Most nerve fibers are axons, sometimes covered by a fatty insulating layer called myelin.

Nerve Fiber Types

A classification of peripheral nerve axons by diameter, myelination, and conduction speed. Group A fibers are myelinated and include fast motor and sensory fibers; group B fibers are thinly myelinated preganglionic autonomic fibers; group C fibers are unmyelinated and conduct slowly, including many fibers for pain, temperature, and postganglionic autonomic signals.

Nerve Impulse

An electrical signal that travels along a nerve cell or nerve fiber to carry information.

Nerve Injury

Damage to a nerve that can cause pain, numbness, tingling, weakness, altered reflexes, or changes in sweating, blood pressure, digestion, or bladder function. Recovery depends on the nerve, severity, cause, and treatment.

Nerve Plexus

A network where nerves join and branch to supply a body region. The brachial plexus, for example, supplies much of the arm.

Nerve Repair

Surgical reconstruction of an injured or divided peripheral nerve using direct repair, a nerve graft, a nerve conduit, or nerve transfer. The aim is to restore continuity and support recovery of sensation or movement, although recovery depends on the injury and timing.

Nerve Root

The beginning part of a spinal nerve where it connects with the spinal cord. Sensory and motor roots carry signals into and out of the cord.

Nerve Sheath Myxoma

A benign myxoid peripheral-nerve-sheath tumor, usually presenting as a slow-growing papule or nodule on the fingers, hands, or upper extremities.

Nerve Sparing

A surgical approach that tries to preserve nearby nerves needed for erection, sensation, or other functions. It may improve recovery after prostate or other pelvic surgery, but success depends on disease and nerve involvement.

Nerve Thickening

Enlargement of a nerve that a health professional can feel or see during an exam. It can occur in leprosy, especially when the affected nerve also causes

loss of feeling or muscle weakness.

Nerve Tract

A group of nerve fibers traveling together inside the brain or spinal cord. Fibers in a tract carry signals between specific regions, so damage can cause predictable movement, sensation, or organ-control problems.

Nervous Colon Syndrome

An older name for irritable bowel syndrome, a disorder causing recurrent abdominal pain with diarrhea, constipation, or both without a structural explanation. Symptoms may improve with individualized diet, medicines, and stress management.

Nervous System

The brain and spinal cord (central nervous system), peripheral nerves and ganglia (peripheral nervous system), and supporting cells that detect and process information. It coordinates sensation, movement, automatic body functions, cognition, emotion, learning, and behavior.

Nervous Tissue

Tissue made of nerve cells and supporting cells that detects changes, processes information, and sends signals through the body. It forms the brain, spinal cord, and nerves and helps control movement, sensation, and organ function.

Nesidioblastosis

A rare diffuse or focal hyperfunctional hypertrophy and hyperplasia of pancreatic beta cells budding from the pancreatic ductal epithelium, causing endogenous persistent hyperinsulinemic hypoglycemia in neonates (congenital hyperinsulinism) and adults (post-gastric bypass hyperinsulinemic hypoglycemia).

NET

Abbreviation; see *Neuroendocrine Tumor*.

Netherton Syndrome

A severe autosomal recessive genodermatosis caused by mutations in the SPINK5 gene encoding the serine protease inhibitor LEKTI, characterized by the classic triad of congenital ichthyosiform erythroderma (ichthyosis linearis circumflexa), trichorrhexis invaginata ('bamboo hair'), and severe atopic diathesis.

NETs

Spectrum of neoplasms that arise from cells of the endocrine and nervous systems, producing hormones. See *Neuroendocrine Tumors*.

Nettle Rash

An itchy rash made of raised patches that come and go, often within hours. It results from substances released in the skin and may be triggered by infection, foods, medicines, pressure, heat, or no clear cause.

Neural

Relating to nerves, nerve cells, or the nervous system. In pregnancy, the neural tube develops into the brain and spinal cord; failure of it to close can cause birth defects such as spina bifida or anencephaly.

Neural Crest

A temporary embryonic multipotent cellular population located along the borders of the closing neural folds that undergoes epithelial-to-mesenchymal transition and migrates extensively to form peripheral sensory ganglia, autonomic ganglia, Schwann cells, melanocytes, craniofacial bones, and adrenal chromaffin cells.

Neuralgia

Neuralgia is sharp, burning, or electric pain along the distribution of a nerve, caused by irritation, compression, infection, injury, or other disease.

Neuralgia Amyotrophica

Another name for neuralgic amyotrophy (Parsonage-Turner syndrome), a disorder usually involving the brachial plexus. It typically begins with sudden severe shoulder or upper-arm pain, followed over days or weeks by patchy weakness and sometimes muscle wasting. The cause is often unknown; immune,

infectious, and other triggers have been proposed.

Alternate Names:
Parsonage-Turner Syndrome; Neuralgic Amyotrophy

Neuralgic Amyotrophy

Sudden-onset severe shoulder and arm pain followed by progressive muscle weakness and sensory changes in the brachial plexus. See *Parsonage-Turner Syndrome*.

Neural Pathway

A connected route of nerve cells and nerve fibers that carries signals between different parts of the nervous system.

Neural Tube Defect

A congenital structural anomaly resulting from incomplete closure of the embryonic neural tube during early pregnancy; see *Neural Tube Defects*.

Neural Tube Defects

Birth defects caused when the early structure that becomes the brain and spinal cord does not close completely during the first month of pregnancy. They include anencephaly, encephalocele, and spina bifida and vary from fatal to mild.

Neuraminidase Inhibitors

Antiviral medicines that block a surface protein used by influenza viruses to release new virus particles from infected cells. They work best when started early and are used according to the influenza type, illness severity, and risk of complications.

Neurapraxia

The mildest category of peripheral nerve injury in the Seddon classification, involving a temporary block of nerve-signal conduction, usually from focal myelin injury or ischemia without axon disruption. Recovery is generally good and often occurs over weeks to a few months, though timing varies with the injury.

Neurilemma

The outer layer of a Schwann cell that surrounds and supports a nerve fiber outside the brain and spinal cord.

Neurilemmoma

Alternate spelling; see *Schwannoma*.

Neurinomatosis

Alternate name; see *Schwannomatosis*.

Neuritic Plaques

Clusters of beta-amyloid surrounded by damaged nerve-cell branches. They are one brain change associated with Alzheimer disease and occur alongside other changes, including abnormal tau protein and loss of nerve cells.

Neuritis

Inflammation or irritation of a nerve, often causing pain, altered sensation, weakness, or other changes in nerve function.

Neuroacanthocytosis

A group of rare inherited disorders causing movement or psychiatric symptoms together with abnormal spiny red blood cells called acanthocytes. Neurologic and genetic findings help distinguish the disorders in this group.

Neuroanatomy

The study of the structure and organization of the nervous system, including the brain, spinal cord, peripheral nerves, and their connections.

Neuroblastoma

A childhood cancer arising from immature nerve cells, commonly in or near the adrenal glands or spine. It may cause an abdominal mass, pain, weakness, or other symptoms and can range from mild to aggressive.

Alternate Names:
Sympathicoblastoma

Neurocardiogenic Syncope

Alternate name; see *Vasovagal Syncope*.

Neurocognitive Disorder

A decline from a person's previous level of cognitive ability, such as memory, attention, language, executive function, or judgment, that develops after normal earlier development. Mild neurocognitive disorder causes modest decline while independence is largely preserved; major neurocognitive disorder causes substantial decline that interferes with independent daily life and is often called dementia. Causes include brain disease, stroke, injury, infection, substance use, or medicines. Delirium is distinguished by its sudden onset and fluctuating attention and awareness.

Neurocognitive Disorders

Alternate plural form; see *Neurocognitive Disorder*.

Neurocutaneous Syndrome

A disorder affecting both the nervous system and the skin, often because of an inherited genetic change. Examples include neurofibromatosis and tuberous sclerosis.

Neurocutaneous Syndromes Pathology

Pathologic features of inherited disorders affecting the skin, nervous system, eyes, and sometimes other organs. Findings vary by syndrome and may include hamartomas, vascular malformations, neural tumors, or characteristic pigmentary lesions.

Neurocysticercosis

Infection of the brain or spinal cord by larvae of the pork tapeworm, *Taenia solium*. It develops when a person swallows the tapeworm's eggs, usually through food, water, or hands contaminated with the feces of someone carrying the adult tapeworm; eating undercooked pork causes intestinal tapeworm infection, not neurocysticercosis directly. Symptoms depend on where and how many cysts form and commonly include seizures or headaches; confusion, weakness, or fluid buildup in the brain can also occur.

Neurocytoma

A usually slow-growing tumor made of nerve-cell-like cells, most often found in the fluid-filled spaces inside the brain. It may block fluid flow and cause headache, vomiting, vision changes, or balance problems; imaging and tissue testing guide care.

Neurodegeneration

Progressive damage and loss of nerve cells, causing worsening problems with movement, memory, thinking, sensation, or other nervous-system functions.

Neurodegeneration With Brain Iron Accumulation

A group of inherited disorders in which excess iron builds up in certain brain regions and gradually damages nerve cells. Symptoms may include abnormal movements, muscle stiffness, seizures, speech or thinking problems, and vision changes.

Neurodegenerative Disease

A disease in which nerve cells progressively lose function or die. Examples include Alzheimer disease, Parkinson disease, and Huntington disease.

Neurodegenerative Disorder

Another term for a condition involving progressive damage or loss of nerve cells, which can affect movement, memory, behavior, sensation, or autonomic function.

Neurodermatitis

A chronic itchy skin condition in which repeated scratching or rubbing makes a patch thick, leathery, and irritated. Stress, dry skin, or an initial rash may start the itch–scratch cycle.

Alternate Names:
Lichen Simplex Chronicus; Circumscribed Neurodermatitis

Neurodevelopmental Disabilities

Disabilities that begin during development and affect one or more areas such as movement, communication, learning, behavior, or adaptive functioning. They may result from genetic, prenatal,

birth-related, or early-life causes and vary in severity and support needs.

Neurodevelopmental Disorders

A group of conditions that begin during the developmental period and affect cognition, communication, behavior, motor function, learning, or adaptive skills. Examples include attention-deficit/hyperactivity disorder, autism spectrum disorder, intellectual disability, communication disorders, specific learning disorder, motor disorders, and tic disorders.

Neuroendocrine

Relating to the connection between the nervous system and hormone system, or to cells that receive nerve signals and can release hormones. Neuroendocrine cells are found in many organs and can sometimes form tumors.

Neuroendocrine Carcinoma

A cancer arising from cells with nerve-like and hormone-related features. It can begin in the lung or digestive system, often grows quickly, and may release hormones that cause additional symptoms.

Neuroendocrine Carcinoma of the Skin

Alternate name; see *Merkel Cell Carcinoma*.

Neuroendocrine Tumor

A diverse group of neoplasms that arise from specialized neuroendocrine cells, which have traits of both nerve cells and hormone-producing endocrine cells. These tumors most frequently develop in the digestive tract, lungs, or pancreas. Because they can produce and release hormones directly into the bloodstream, they may cause distinct symptoms such as severe flushing, diarrhea, wheezing, or blood sugar fluctuations, though many grow slowly without producing noticeable hormone-related symptoms.

Alternate Names:
NET; Carcinoid Tumor

Neuroendocrine Tumor Grading

Classification of a neuroendocrine tumor based on how quickly its cells divide, assessed by the Ki-67 index and mitotic count. Higher grades generally indicate faster cell growth, although behavior also depends on tumor type and site.

Neuroendocrine Tumors

Plural form; see *Neuroendocrine Tumor*.

Alternate Names:
NETs; Neuroendocrine Neoplasms

Neuroendocrinology

The medical field that studies how the brain and nerves control hormones and how hormones affect the nervous system. It includes conditions involving the pituitary, adrenal glands, thyroid, reproduction, growth, and body-fluid balance.

Neurofibrillary Tangles

Twisted clumps of an abnormal protein called tau inside nerve cells. They damage the cells and are a characteristic finding in Alzheimer disease and some other disorders that cause progressive memory or thinking problems.

Alternate Names:
Paired Helical Filaments; Tau Tangles

Neurofibroma

A benign peripheral nerve sheath tumor. Solitary neurofibromas are common and present as soft, flesh-colored papules or nodules. Multiple neurofibromas are characteristic of neurofibromatosis type 1 (NF1).

Neurofibromatosis

A group of inherited tumor-predisposition disorders involving nerve-associated tissues. The term traditionally includes neurofibromatosis type 1 and the condition now called NF2-related schwannomatosis; current classification also recognizes other schwannomatoses. Features vary by subtype and may include skin findings, nerve-sheath tumors, bone changes, or central nervous-system tumors.

Neurofibromatosis-1

An inherited condition that can cause light-brown skin patches, freckles in the armpits or groin, soft growths along nerves, bone changes, vision problems, learning difficulties, or blood-vessel complications.

Findings vary widely between people.

Neurofibromatosis 2

An older name for NF2-related schwannomatosis, a tumor-predisposition disorder associated with pathogenic variants in *NF2*. It is characterized especially by bilateral vestibular schwannomas and may also involve other schwannomas, meningiomas, or ependymomas. Current terminology distinguishes it from other schwannomatoses.

Neurofibromatosis Type 1

A genetic disorder that causes benign tumors to grow along nerves in the skin, brain, and other parts of the body. It is caused by a change in the *NF1* gene, which normally helps control cell growth. Common signs include flat, light-brown skin patches (café-au-lait spots), freckling in the armpits or groin, tiny harmless bumps on the iris of the eye (Lisch nodules), and soft non-cancerous skin tumors (neurofibromas), as well as bone differences or learning challenges.

Alternate Names:
NF1; Von Recklinghausen Disease

Neurofibromatosis Type 2

Alternate name; see *NF2-Related Schwannomatosis*.

Alternate Names:
NF2; Bilateral Acoustic Neurofibromatosis (historical term)

Neurofibromatosis Type I

Alternate spelling; see *Neurofibromatosis Type 1*.

Neurofibromatosis Type II

Alternate name; see *NF2-Related Schwannomatosis*.

Neurofibrosarcoma

Alternate name; see *Malignant Peripheral Nerve Sheath Tumor*.

Neurogenesis

The formation of new nerve cells. It happens mainly before birth but can continue in limited areas of the adult brain.

Neurogenic

Caused by, arising from, or related to the nervous system. For example, neurogenic bladder results from nerve damage that disrupts bladder storage or emptying. The specific symptoms and treatment depend on which nerves are affected.

Neurogenic Bladder

Bladder problems caused by damage to the nerves that control storing or passing urine. A person may have urgency, leakage, difficulty emptying, or urine retention; repeated infection and high bladder pressure can damage the kidneys.

Neurogenic Claudication

Pain, heaviness, weakness, or numbness in the buttocks or legs that occurs with standing or walking and often improves with sitting or bending forward. It commonly results from narrowing around nerves in the lower spine; symptoms may affect one or both legs.

Alternate Names:
Pseudoclaudication; Spinal Stenosis Claudication

Neurogenic Megacolon

Severe widening of the large intestine caused by damage to the nerves that control bowel movement. It can cause long-term constipation, abdominal swelling, and stool blockage and may lead to dangerous bowel inflammation or rupture.

Neurogenic Orthostatic Hypotension

A drop in blood pressure after standing because nerve damage prevents the body from tightening its blood vessels and maintaining pressure. It may cause light-headedness, blurred vision, weakness, fainting, or falls.

Neurogenic Pulmonary Edema

Rapid-onset, non-cardiogenic pulmonary edema developing acutely after severe central nervous system insults (such as massive subarachnoid hemorrhage, head trauma, or status epilepticus), provoked by an intense sympathetic surge that induces sudden pulmonary vasoconstriction and capillary leak.

Alternate Names:

NPE

Neurogenic Shock

A type of distributive shock, usually caused by a high spinal-cord injury that disrupts sympathetic nerve signals. Blood vessels widen, causing low blood pressure; the heart rate may also be slow, and the skin may feel warm. It is distinct from spinal shock, which is a temporary loss of reflexes and other spinal-cord functions.

Neuroglia

Supporting cells of the nervous system that nourish, protect, insulate, and maintain nerve cells. Different types help control the nerve environment, form protective coverings, remove waste, and respond to injury or infection.

Neurography

An MRI method that produces detailed pictures of nerves outside the brain and spinal cord. It can help assess trapped, injured, inflamed, or enlarged nerves and may help find some nerve tumors.

Neurohypophysis

The back part of the pituitary gland that stores and releases oxytocin and vasopressin. These hormones help control childbirth, milk release, water balance, and urine concentration.

Neuroimmunology

The study of interactions between the nervous system and the immune system. It includes immune-related diseases of the brain, spinal cord, nerves, and muscles and the effects of inflammation on neural function.

Neuroinvasive Disease

An infection in which a pathogen, most commonly a virus, crosses into the central nervous system to infect the brain, spinal cord, or surrounding membranes. It typically manifests as meningitis, encephalitis, or acute flaccid paralysis, with symptoms including high fever, severe headache, neck stiffness, confusion, and muscle weakness.

Alternate Names:
Neuroinvasive Infection; Central Nervous System Invasion

Neurolathyrism

A toxic neurologic disorder caused by excessive consumption of Lathyrus sativus, producing progressive spastic weakness of the legs.

Neuroleptic

An older term for an antipsychotic medicine, used to treat conditions such as schizophrenia, severe mania, or psychosis. The term remains in names such as neuroleptic malignant syndrome; these medicines may cause sleepiness, movement problems, or metabolic effects.

Neuroleptic Agents

Antipsychotic medicines used for conditions such as schizophrenia, bipolar disorder, severe agitation, or nausea, depending on the drug. They can cause movement, metabolic, heart-rhythm, and sedation-related effects.

Alternate Names:
Antipsychotics

Neuroleptic Agent Toxicity

Overdose or adverse effects from an antipsychotic or other dopamine-blocking agent, causing sedation, hypotension, anticholinergic effects, seizures, QT prolongation, or other dysrhythmias. Neuroleptic malignant syndrome is a distinct delayed reaction with hyperthermia and rigidity; ECG, airway, temperature, and neurologic monitoring guide supportive treatment.

Neuroleptic Malignant Syndrome

A rare, life-threatening reaction to medications that block dopamine receptors in the brain, most commonly antipsychotic medications. The condition causes severe muscle rigidity (often described as "lead-pipe" stiffness), an abrupt and dangerous spike in body temperature, altered mental status, and severe instability of the autonomic nervous system, resulting in rapid heart rate and fluctuating blood pressure.

Alternate Names:

NMS

Neurological

Related to the brain, spinal cord, or nerves. Neurological symptoms may include weakness, numbness, seizures, headache, dizziness, confusion, or problems with movement, speech, vision, or memory.

Neurological Disease

Any disease affecting the brain, spinal cord, peripheral nerves, muscles, or their connections. Symptoms may include weakness, numbness, seizures, headache, movement changes, or problems with thinking.

Neurological Examination

A clinical assessment of mental status, cranial nerves, motor function, reflexes, coordination, sensation, and gait. It helps localize nervous-system dysfunction and determine the need for further testing.

Neurological Rehabilitation

Treatment and training that help a person regain movement, communication, thinking, or independence after stroke, brain or spinal-cord injury, Parkinson disease, multiple sclerosis, or another nervous-system disorder.

Neurologic Deficit

Loss or impairment of a neurologic function, such as strength, sensation, coordination, vision, language, or consciousness, caused by dysfunction of the nervous system.

Neurologic Disorders

A group of conditions affecting the brain, spinal cord, peripheral nerves, neuromuscular junction, or muscles. Examples include stroke, epilepsy, migraine, multiple sclerosis, Parkinson disease, Alzheimer disease, peripheral neuropathy, meningitis, neuromuscular disorders, and movement disorders.

Neurologic Localization

Using the pattern of weakness, numbness, reflex changes, coordination problems, vision, speech, or thinking changes to identify where the nervous system is affected. This helps clinicians choose likely causes and appropriate tests.

Neurologist

A medical doctor who diagnoses and treats disorders of the brain, spinal cord, nerves, and muscles. Neurologists assess symptoms such as weakness, numbness, seizures, tremor, headaches, memory change, and movement or balance problems.

Neurology

The medical specialty concerned with diseases of the brain, spinal cord, peripheral nerves, and muscles.

Neurology PET

PET imaging used in selected neurologic disorders to assess brain metabolism or receptor activity, such as in some dementias, epilepsy evaluations, and movement disorders.

Neurolysis

A procedure that frees a nerve from scar tissue or pressure, or deliberately interrupts selected nerve fibers to relieve pain. The purpose and possible effects depend on the nerve treated and the technique used.

Neuroma

A benign growth or reactive thickening involving nerve tissue, often producing pain or altered sensation.

Neuromodulation

Changing nerve activity with electrical, magnetic, chemical, or other signals. Treatments include spinal cord stimulation, deep brain stimulation, and some noninvasive brain-stimulation methods.

Neuromuscular

Relating to nerves, muscles, or the place where a nerve tells a muscle to contract. Neuromuscular diseases can cause weakness, tiredness with activity, muscle wasting, cramps, or problems with breathing

or swallowing.

Neuromuscular Blockade Reversal

The pharmacological restoration of normal neuromuscular transmission following surgical paralysis, achieved by administering an acetylcholinesterase inhibitor paired with an anticholinergic (neostigmine and glycopyrrolate) or a selective encapsulating reversal agent (sugammadex for rocuronium/vecuronium).

Neuromuscular Blocking Agents

Medicines used during anesthesia to temporarily relax skeletal muscles, making insertion of a breathing tube and some operations easier. They stop muscle movement but do not provide pain relief or unconsciousness and require breathing support and monitoring.

Neuromuscular Disorders

A group of conditions affecting motor nerves, neuromuscular junctions, or skeletal muscles. Examples include myasthenia gravis, Lambert-Eaton syndrome, muscular dystrophy, spinal muscular atrophy, motor neuron disease, inflammatory myositis, myopathies, and peripheral neuropathies.

Neuromuscular Hamartoma

A rare benign developmental lesion in which mature skeletal muscle and nerve fascicles are intermixed, typically involving a major peripheral nerve and causing enlargement or neuropathic symptoms.

Neuromuscular Junction

The small connection where a movement-controlling nerve communicates with a skeletal muscle. The nerve releases a chemical messenger there, causing the muscle to contract.

Alternate Names:
NMJ; Motor End-Plate

Neuromuscular Medicine

A neurology subspecialty concerned with disorders of peripheral nerves, neuromuscular junctions, and skeletal muscles. It uses clinical assessment and tests such as electromyography and nerve-conduction studies to diagnose and characterize weakness, sensory loss, muscle disease, and related conditions.

Neuromyelitis Optica

An older name, often used for neuromyelitis optica spectrum disorder (NMOSD), an autoimmune inflammatory disease of the optic nerves, spinal cord, and selected brain regions. Optic neuritis and longitudinally extensive myelitis are characteristic manifestations. Current usage distinguishes NMOSD from multiple sclerosis and related disorders.

Neuromyelitis Optica Spectrum Disorder

An autoimmune inflammatory disorder of the central nervous system, commonly associated with antibodies to aquaporin-4; some patients meet diagnostic criteria without detectable antibodies. It affects the optic nerves, spinal cord, or specific brain regions and can cause optic neuritis, myelitis, or area-postrema symptoms. It is distinct from multiple sclerosis and MOG-antibody-associated disease.

Alternate Names:
Neuromyelitis Optica NMO NMOSD Devic Disease Devic's Disease

Neuromyotonia

A rare disorder in which nerves repeatedly stimulate muscles, causing ongoing stiffness, twitching, cramps, delayed muscle relaxation, and sometimes excessive sweating. It may be inherited or caused by an immune reaction. An electrical nerve and muscle test helps diagnosis; treatment aims to calm nerve activity and address any underlying cause.

Alternate Names:
Isaacs Syndrome; Continuous Muscle Fiber Activity Syndrome

Neuron

The fundamental nerve cell that serves as the basic building block of the nervous system, responsible for transmitting information throughout the brain, spinal cord, and body. A typical neuron consists of a cell body containing the nucleus, branch-like dendrites that receive incoming electrical and chemical signals from other neurons, and a long slender fiber called an axon that carries electrical impulses

outward toward target cells or neighboring neurons.

Neuronal Ceroid Lipofuscinoses

A group of inherited disorders in which waste material builds up inside nerve cells. They usually cause worsening seizures, vision loss, movement problems, and difficulty thinking or learning, with symptoms and age of onset varying by type.

Neuronal Migration Disorder

A developmental brain disorder in which nerve cells do not move to their normal positions before birth. It can cause abnormal brain structure, seizures, developmental delay, or learning problems.

Neurone

The British spelling of neuron, an excitable nerve cell that receives and transmits signals.

Neuronopathy

A disorder caused mainly by damage to nerve-cell bodies, often in sensory or motor nerve groups. It may cause numbness, imbalance, weakness, or loss of reflexes.

Neurons

Plural form; see *Neuron*.

Neuron-Specific Enolase

A protein that can be released by nerve cells and some neuroendocrine tumors. A raised blood level may support evaluation or monitoring in selected situations but is not specific enough to diagnose a disease alone.

Neuron-Specific Enolase Tumor Marker

Neuron-specific enolase, a protein that may be increased in some neuroendocrine cancers or after nerve-cell injury. It can support monitoring in selected situations but is not specific enough to diagnose cancer alone.

Neuro-Oncology

The subspecialty concerned with tumors of the nervous system and their neurologic effects. It includes primary brain and spinal cord tumors and tumors that spread to the nervous system. It also addresses neurologic complications of cancer or its treatment.

Neuro-Ophthalmology

The clinical subspecialty at the intersection of neurology and ophthalmology, concerned with visual problems caused by the brain, optic nerves, or visual pathways. It also evaluates disorders of the pupils and eye movements and helps distinguish neurologic causes of visual dysfunction from disease within the eye itself.

Neuropathic

Caused by disease or dysfunction of nerves; neuropathic skin symptoms may include burning, electric-shock pain, altered sensation, numbness, or itch.

Neuropathic Pain

Pain caused by disease or injury of the nerves that carry sensation, the spinal cord, or the brain. It is often burning, shooting, electric, or accompanied by numbness and may follow diabetes, shingles, injury, or nerve compression.

Neuropathic Ulcer

A wound caused or worsened by loss of protective feeling, most often in the foot. A person may not notice pressure or injury, allowing the wound to deepen; diabetes, poor circulation, and infection can delay healing and increase the risk of amputation.

Neuropathy

Damage or disease affecting one or more nerves outside the brain and spinal cord. It can cause pain, tingling, numbness, weakness, balance problems, or changes in sweating and other body functions. Causes include diabetes, nerve injury or pressure, some medicines, alcohol or other toxins, vitamin deficiencies, and inherited disorders such as Charcot-Marie-Tooth disease.

Neuropeptide

A small protein-like molecule produced and released by neurons in the brain and nervous system to transmit and modulate communication between nerve

cells. Unlike rapid neurotransmitters that act instantly across narrow synapses, neuropeptides often act more slowly and over wider areas to influence long-term neural functions, including pain sensation (such as endorphins), appetite, mood, and stress responses.

Neuropeptides

Plural form; see *Neuropeptide*.

Neuropharmacology

The study of how medicines and other substances affect the brain, spinal cord, and nerves. It examines their actions, benefits, side effects, interactions, and uses in treating neurological or psychiatric conditions.

Neurophysiology

The study of how the nervous system functions, including electrical signaling, sensory processing, movement, reflexes, and communication between nerve cells. Clinical neurophysiology uses tests such as EEG and nerve-conduction studies to assess nervous-system function.

Neurophysiotherapy

Physical therapy focused on movement and function problems caused by disorders of the brain, spinal cord, or nerves. Treatment may address strength, balance, walking, coordination, and daily activities.

Neuroplasticity

The brain's ability to change its connections and activity in response to learning, experience, or injury. This process supports recovery and skill development, especially with repeated practice and rehabilitation, but recovery varies with the injury and the person.

Neuroplegic

Causing paralysis or severe loss of nerve-controlled movement. The effect may result from a neurologic disease, spinal injury, toxin, or medicine and can impair breathing or other vital functions when major nerve pathways are affected.

Neuropsychiatry

The clinical field concerned with mental, behavioral, and cognitive problems associated with disorders of the brain and nervous system. It considers how neurologic disease can affect mood, perception, memory, and behavior, and how psychiatric symptoms can overlap with neurologic conditions.

Neuropsychopharmacology

The study of how medicines and other substances alter brain function and behavior, especially in neurological and psychiatric disorders. It links drug actions on neural systems with therapeutic effects and adverse effects.

Neuroradiology

The radiology subspecialty that uses and interprets imaging of the brain, spine, head, and neck. Modalities include computed tomography, magnetic resonance imaging, and vascular imaging; findings help diagnose neurologic, neurosurgical, and head-and-neck disorders.

Neuroretinitis

Inflammation of the optic nerve and nearby retina that can cause blurred or reduced vision, blind spots, and pain with eye movement. Infections and immune disorders are possible causes; diagnosis and treatment depend on the underlying cause.

Neurosarcoidosis

Sarcoidosis affecting the brain, spinal cord, coverings around them, or peripheral nerves. It may cause headaches, facial weakness, vision problems, seizures, weakness, numbness, or hormone disturbances; treatment varies with the affected nervous-system structures.

Neuroscience

The comprehensive, interdisciplinary scientific domain dedicated to the systematic investigation of the nervous system—encompassing the brain, spinal cord, peripheral nerves, and sensory organs—across all levels of organization, from molecular and cellular neurobiology to neuroanatomy, neurophysiology, neural circuitry, computational neuroscience, behav-

ioral neurology, and clinical neuropharmacology. It examines the mechanisms of neuronal excitability, synaptic transmission, neurodevelopment, cognitive processing, sensory perception, motor control, memory formation, neuroplasticity, and the pathophysiological underpinnings of neurological and psychiatric diseases (e.g., neurodegenerative disorders, stroke, epilepsy, schizophrenia).

Neurosciences

Plural form; see *Neuroscience*.

Neurosurgeon

A surgeon trained to diagnose and operate on disorders of the brain, spinal cord, spine, nerves, and nearby supporting structures. Neurosurgeons may treat tumors, injuries, bleeding, pressure, pain, or blood-vessel problems.

Neurosurgery

Surgery for disorders of the brain, spinal cord, spine, peripheral nerves, or supporting structures. Procedures may remove tumors, relieve pressure, repair injuries, stop bleeding, treat blood vessels, or improve severe pain.

Neurosyphilis

Infection of the central nervous system by *Treponema pallidum*, which can occur at any stage of syphilis. Manifestations include meningitis, cranial-nerve dysfunction, stroke, motor or sensory deficits, cognitive changes, and late forms such as tabes dorsalis or general paresis. Diagnosis combines clinical findings and syphilis serology; cerebrospinal-fluid testing is used when neurologic involvement is suspected. Ocular or ear syphilis may occur alone or with neurosyphilis.

Neurotoxicity

Injury or dysfunction of the nervous system caused by a medicine, drug, toxin, heavy metal, infection, or other harmful exposure.

Neurotransmission

The process by which nerve cells communicate with one another or with muscles and glands using electrical signals and chemical messengers. It involves release of a neurotransmitter, movement across a synapse, receptor binding, and termination or removal of the signal.

Neurotransmitter

A chemical messenger released by a nerve cell. It crosses a tiny gap to affect another nerve cell or a muscle or gland cell, either increasing or reducing its activity.

Neurotransmitter Receptors

Proteins on or inside cells that receive chemical messages released by nerve cells. When a message attaches to a receptor, it can increase or decrease activity, affecting movement, mood, pain, heart rate, or other body functions.

Neurotrophic

Describing a substance or effect that supports the growth, survival, connection, or repair of nerve cells. Neurotrophic signals help nerves develop and maintain function and are studied in nerve injury and degenerative disease.

Neurotrophic Keratopathy

Corneal damage caused by reduced sensation from injury or disease of the trigeminal nerve. It can lead to poor healing, recurrent epithelial defects, ulceration, and vision loss, sometimes with little pain.

Neurotropic

Having a preference for nervous tissue or mainly affecting the brain, spinal cord, or nerves. The term is often used for infections, medicines, or other substances that act in these tissues.

Neurovascular Examination

A check of movement, feeling, pulses, skin color, temperature, and blood return in an injured arm or leg. Repeated checks can detect worsening nerve damage, reduced blood flow, or dangerous swelling and pressure.

Neutral Alignment

A posture in which the body is arranged in a straight, balanced line while preserving normal spinal curves.

Neutral Endopeptidase

A membrane-bound zinc metallopeptidase expressed in vascular endothelial and renal proximal tubular cells that degrades circulating natriuretic peptides (ANP, BNP, CNP), bradykinin, and substance P; pharmacologically inhibited by sacubitril in heart failure therapy.

Alternate Names:
Neprilysin; NEP; CD10

Neutralization

Removal or reduction of an effect by counteraction, such as an acid-base reaction or antibody-antigen binding.

Neutralizing Antibodies

Antibodies that bind a pathogen or its toxin and block its ability to enter cells, attach to tissues, or cause its usual biologic effects.

Neutropenia

An abnormally low number of neutrophils, white blood cells that help fight bacterial and fungal infections. The lower the count, the greater the infection risk; fever during severe neutropenia can signal a serious infection.

Alternate Names:
Neutrocytopenia; Low Absolute Neutrophil Count

Neutropenic Enterocolitis

A life-threatening, necrotizing transmural inflammation of the cecum and ascending colon occurring in severely neutropenic oncology patients receiving intensive myelosuppressive chemotherapy, presenting with fever, right lower quadrant abdominal pain, and bowel wall thickening on CT.

Alternate Names:
Typhlitis

Neutropenic Fever

Alternate name; see *Febrile Neutropenia*.

Alternate Names:
Febrile Neutropenia

Neutropenic Sepsis

Sepsis occurring in a person with a markedly reduced neutrophil count, usually during or after cancer treatment. Infection may produce few localizing signs, while fever, chills, low blood pressure, altered mental status, or organ dysfunction can occur; the severity reflects both infection and impaired host defense.

Neutrophil

The most common type of white blood cell in the bloodstream, serving as the immune system's primary first responders against acute infections, especially those caused by bacteria and fungi. Produced in the bone marrow, neutrophils travel rapidly to sites of infection or tissue injury, where they ingest and neutralize invading microorganisms using antimicrobial enzymes and chemical defenses.

Neutrophil Extracellular Traps

Web-like structures of DNA and proteins released by activated neutrophils that can trap microbes. Excessive formation may contribute to inflammation, blood clots, or autoimmune disease.

Alternate Names:
NETs

Neutrophilic Dermatosis

A group of inflammatory skin diseases in which infection-fighting white blood cells collect in the skin without causing a typical skin infection. Examples include Sweet syndrome and pyoderma gangrenosum; the rash may be painful, swollen, or associated with fever.

Neutrophilic Eccrine Hidradenitis

An uncommon skin inflammation in which infection-fighting white cells collect around sweat glands. It often occurs during chemotherapy and causes painful red or purple bumps or patches, usually on the trunk or limbs.

Neutrophil Recruitment

The movement of neutrophils from the bloodstream into injured or infected tissue. They first slow and attach to the blood-vessel lining, then pass through it and follow chemical signals to the affected area.

Neutrophils

Plural form; see *Neutrophil*.

Nevi

Plural of *Nevus*.

Nevi of Ota and Ito

Benign dermal melanocytic nevi causing blue-gray pigmentation around the eye and forehead in nevus of Ota or over the shoulder and upper back in nevus of Ito. They may persist for life; nevus of Ota can involve ocular tissues, and changing lesions may indicate atypia.

Nevoid Basal Cell Carcinoma Syndrome

Gorlin syndrome, an inherited disorder increasing the risk of basal-cell cancers, jaw cysts, and other developmental abnormalities.

Nevus

A localized, usually benign lesion of the skin or mucous membrane caused by a growth or developmental variation of pigment cells, blood vessels, or other tissue components. A melanocytic nevus is commonly called a mole; other nevi have different tissue origins.

Nevus Anemicus

A congenital vascular anomaly presenting as a localized, well-circumscribed, pale, hypopigmented macule or patch that remains pale after rubbing or temperature changes due to localized hypersensitivity of cutaneous alpha-adrenergic receptors producing constant arteriolar vasoconstriction.

Alternate Names:
Anemic Nevus; Pharmacologic Vasoconstrictive Nevus

Nevus Araneus (Spider Nevus)

A small central red vessel with radiating branches that blanch with pressure and refill from the center. It is common in children, pregnancy, and liver disease; numerous or new lesions can be associated with an underlying condition.

Nevus Comedonicus

A congenital hamartoma of the pilosebaceous unit presenting as a localised cluster of dilated follicular ostia filled with keratinous plugs, resembling closely grouped open comedones. It typically appears at birth or in early childhood on the face, neck, or trunk, and may be associated with other developmental anomalies.

Nevus Comedonicus Syndrome

A rare disorder in which multiple comedone-like skin lesions occur with abnormalities of the eyes, bones, nervous system, or other organs. It is usually present from birth or early childhood.

Nevus of Ito

A benign dermal melanocytic hamartoma characterized by mottled, patchy slate-gray, blue-brown, or hyperpigmented macules distributed along the sensory branches of the posterior supraclavicular and lateral cutaneous brachial nerves (involving the supraclavicular, acromial, and scapular regions).

Alternate Names:
Omohyoid Nevus; Dermal Melanocytosis of Shoulder

Nevus of Ota

A congenital or acquired dermal melanocytosis presenting as mottled blue-gray or brownish-black pigmentation in the distribution of the ophthalmic (V1) and maxillary (V2) branches of the trigeminal nerve, commonly involving the ipsilateral sclera, conjunctiva, and facial skin.

Alternate Names:
Oculodermal Melanocytosis; Nevus Fusco-Caeruleus Ophthalmomaxillaris

Nevus Sebaceus

A congenital or early-onset hamartoma of seba-

ceous and other adnexal structures, usually a yellow-orange hairless plaque on the scalp or face; secondary tumors may rarely arise within it.

Newborn

A baby during the first 28 days after birth, a period of rapid adaptation in breathing, circulation, feeding, and temperature regulation.

Newborn Circumcision

Surgical removal of the foreskin from a newborn's penis. Potential benefits and risks vary; complications can include bleeding, infection, or injury. Decisions vary with the infant's health and the family's preferences.

Newborn Head Molding

Temporary shaping or overlapping of a newborn's skull bones during passage through the birth canal; it usually resolves as the skull returns to its normal contour.

Newborn Hearing Screen

A quick test, usually before discharge from the birth facility, that checks whether a newborn responds normally to sound. A result needing repeat testing does not by itself prove hearing loss; further testing clarifies hearing status.

Newborn Infant Development

The normal physical, neuromotor, sensory, and social milestone progression of a healthy full-term infant during the first month of life (neonatal period), including primitive reflexes (Moro, rooting, suckling, palmar grasp), visual tracking, auditory responsiveness, and weight recovery.

Alternate Names:
Neonatal Development; Infant Milestone Progression; Newborn Neuromotor Development

Newborn Jaundice

Yellow discoloration of a newborn's skin or eyes caused by elevated bilirubin. Mild physiologic jaundice is common, while early, severe, rapidly rising, prolonged, or conjugated hyperbilirubinemia can signal an underlying disorder. Very high bilirubin can cause acute bilirubin encephalopathy and permanent neurologic injury called kernicterus.

Newborn Metabolic Screen

A blood-spot screening test performed shortly after birth to identify selected inherited metabolic and other disorders before symptoms appear. A heel-prick sample is commonly used; timing and the conditions included vary by screening program. An out-of-range result is not itself a diagnosis and requires confirmatory testing.

Newborn Screening

Testing shortly after birth for selected treatable genetic, metabolic, hormone, hearing, and heart conditions before symptoms appear. A small blood sample is usually taken from the heel; the conditions screened and timing vary by country or region.

Newborn Screening Panel

The set of conditions screened for in newborns by a regional or national public-health program. Blood-spot panels commonly include selected inherited metabolic, endocrine, and blood disorders; hearing and critical congenital heart disease are screened by separate methods. Panel contents and collection timing vary by jurisdiction, and a positive screen requires diagnostic confirmation.

Newborn Screening Tests

Tests performed shortly after birth to detect selected treatable genetic, endocrine, metabolic, hematologic, hearing, or critical congenital heart conditions before symptoms develop.

New Daily Persistent Headache

A headache that begins on a clearly remembered day and becomes continuous within 24 hours, persisting for at least three months. It may resemble migraine or tension-type headache; secondary causes include infection, pressure disorders, and vascular disease.

New York Heart Association Functional Classification

A standardized clinical grading scale assessing the severity of functional symptomatic limitation in pa-

tients with heart failure based on physical exertion, ranging from Class I (no symptoms with ordinary physical activity) to Class IV (symptoms present at rest).

Alternate Names:
NYHA Functional Classification; NYHA Class

Nexium

Brand name; see *Esomeprazole*.

Next-Generation Sequencing

A laboratory method that reads many DNA sections at the same time. It can examine selected genes, nearly all protein-coding genes, the whole genome, or tumor DNA; results may miss some changes and require expert interpretation.

Nexus

A general word for a connection or central link between medical structures, processes, or findings. It has no single standardized medical meaning; the specific relationship should be stated.

NF1

Abbreviation; see *Neurofibromatosis Type 1*.

NF2

Abbreviation; see *NF2-Related Schwannomatosis*.

NF2-Related Schwannomatosis

A genetic tumor-predisposition disorder, usually involving pathogenic variants in NF2, characterized by schwannomas, especially bilateral vestibular schwannomas, with possible hearing loss, tinnitus, balance problems, meningiomas, or other nerve tumors.

Niacin

Vitamin B3, needed to help cells release energy and perform many chemical reactions; it forms the coenzymes NAD+ and NADP+ that carry electrons in metabolism. Severe deficiency causes pellagra, with skin changes, digestive problems, confusion, weakness, and potentially life-threatening complications.

Alternate Names:
Vitamin B3; Nicotinic Acid

Niacinamide

The amide form of vitamin B3, used as a nutritional supplement and in selected dermatologic preparations. Unlike niacin, it usually does not cause flushing at nutritional doses.

Niacin Deficiency

A lack of vitamin B3, usually from inadequate intake of niacin or tryptophan, impaired absorption, or increased metabolic needs. Severe deficiency causes pellagra, classically involving photosensitive dermatitis, diarrhea, and neuropsychiatric changes. It can also occur with alcohol use disorder, malabsorption, or certain metabolic disorders.

Niacin For Cholesterol

Niacin lowers triglycerides and can raise HDL cholesterol, but its routine cardiovascular benefit is limited when added to effective statin therapy; flushing, liver injury, hyperglycaemia, and hyperuricaemia limit high-dose use.

Niacin Vitamin B3

Alternate name; see *Niacin*.

Nialamide

An older monoamine-oxidase-inhibitor antidepressant that is no longer commonly used.

Nicardipine

A calcium-channel-blocking medicine that relaxes blood vessels and lowers blood pressure. It is used for selected urgent or ongoing blood-pressure problems and may cause headache, flushing, dizziness, fast heartbeat, or swelling.

Nickel Allergy

An allergic skin reaction caused by contact with nickel-containing materials.

Alternate Names:
Nickel Hypersensitivity; Nickel Contact Dermatitis

Nickel-Chromium

A metal mixture used in some dental crowns and medical devices. It is strong and less costly than

some alternatives, but people allergic to nickel may develop skin or mouth reactions after contact.

Niclosamide

An antiparasitic medicine used in some countries to treat selected intestinal tapeworm infections. It acts mainly in the gut and does not reliably treat larval tapeworm infections in tissues, such as neurocysticercosis.

Nicolau Syndrome

A rare injection-site injury marked by severe pain, a net-like red or purple discoloration, and sometimes skin or deeper-tissue death. It usually follows an intramuscular or other injection; the exact mechanism is uncertain but may involve vascular injury, spasm, or blockage.

Alternate Names:
Embolia Cutis Medicamentosa; Livedo-like Dermatitis

Nicotinamide

Alternate name; see *Niacinamide*.

Nicotinamide Adenine Dinucleotide

A molecule present in all living cells that helps transfer energy from food and supports enzymes involved in cell repair and communication. It exists in forms commonly written as NAD+ and NADH.

Nicotine

An addictive stimulant found in tobacco and some vaping products that acts on neuronal nicotinic receptors.

Nicotine Addiction

Alternate name; see *Nicotine Dependence*.

Nicotine And Tobacco

Nicotine poisoning can follow swallowing tobacco or liquid nicotine, breathing concentrated vapor, or skin contact. It may cause nausea, vomiting, sweating, dizziness, fast heartbeat, seizures, or breathing failure.

Nicotine Dependence

A pattern of compulsive nicotine use with cravings, loss of control, tolerance, and withdrawal symptoms when use is reduced or stopped.

Alternate Names:
Tobacco Use Disorder; Nicotine Addiction

Nicotine Poisoning

Nicotine poisoning causes early nausea, vomiting, salivation, dizziness, tachycardia, and agitation followed by weakness, bradycardia, seizures, or respiratory failure in severe exposure.

Nicotine Replacement Therapy

Nicotine medicines help reduce withdrawal when stopping tobacco. Using too much or combining products improperly can cause nausea, vomiting, dizziness, sweating, fast heartbeat, confusion, or seizures; keep them away from children.

Nicotine Withdrawal

Symptoms occurring after reducing or stopping nicotine, such as irritability, craving, anxiety, low mood, restlessness, poor concentration, increased appetite, and sleep disturbance. Symptoms usually improve with time and can be treated with behavioral and medication support.

Nicotinic

Relating to nicotine or to nicotinic acetylcholine receptors. These receptors respond to the chemical messenger acetylcholine and help control nerve signals, skeletal-muscle movement, attention, and some automatic body functions.

Nicotinic Acetylcholine Receptor

A pentameric ligand-gated cation channel activated by acetylcholine and, at many receptor subtypes, nicotine. Muscle-type receptors mediate transmission at the skeletal neuromuscular junction; neuronal subtypes occur in autonomic ganglia and the central nervous system and influence diverse neural functions.

Alternate Names:
nAChR

Nicotinic Acid

Alternate name; see *Niacin*.

NICU Staff

NICU staff are the healthcare professionals who monitor and treat newborns in a neonatal intensive care unit and support their families.

Nidation

Implantation of a fertilized egg into the lining of the uterus early in pregnancy. The term is largely synonymous with implantation.

Nidus

A starting point or central focus from which a process develops. In medicine, it may mean the core of a kidney stone, the focus of an infection, or the central part of an abnormal blood-vessel network.

Niemann-Pick Disease

A group of rare inherited lysosomal storage disorders in which lipids accumulate in cells. The group includes acid sphingomyelinase deficiency, formerly called Niemann-Pick disease types A and B, and Niemann-Pick disease type C, caused by impaired intracellular cholesterol trafficking. Features vary by type and may include enlargement of the liver or spleen, lung disease, difficulty coordinating movement, and progressive neurologic impairment.

Nifedipine

A medicine that relaxes blood vessels to lower blood pressure and relieve some types of chest pain. It may cause flushing, headache, dizziness, ankle swelling, or a fast heartbeat; the dose depends on the condition and formulation.

Night Blindness

Difficulty seeing in dim light or darkness. Causes include vitamin A deficiency, inherited retinal disorders, cataracts, glaucoma, and some medicines.

Night-Blindness

Alternate spelling; see *Night Blindness*.

Night Eating

A pattern of eating after dinner or waking to eat during the night, sometimes with reduced morning appetite; persistent distress or impairment may indicate night eating syndrome or another eating disorder.

Night Eating Syndrome

A recurring pattern of eating much of the day's food in the evening or after waking at night, often with little morning appetite and sleep problems. When it causes significant distress or affects daily life, it may be diagnosed as an other specified feeding or eating disorder after other causes are considered.

Night Leg Cramps

Sudden, painful involuntary contractions of leg muscles occurring during sleep or rest, often affecting the calf or foot.

Nightmare Disorder

Repeated frightening dreams that cause distress, wake a person, or interfere with sleep and daytime activities. It may be linked with stress, trauma, medicines, mental health conditions, or other sleep disorders.

Nightmares

Vivid frightening dreams that cause distress or wake a person, sometimes linked to stress, illness, or medicines.

Night Sweats

Episodes of excessive sweating during sleep that soak clothing or bedding. They may occur with infection, hormonal changes, cancer, medication effects, or other systemic illness. The term describes a symptom and does not identify its cause.

Alternate Names:
Sleep Hyperhidrosis; Nocturnal Diaphoresis

Night-Sweats

Alternate spelling; see *Night Sweats*.

Night Sweats in Men

Alternate name; see *Night Sweats*.

Night Terrors

Sudden episodes of fear, screaming, or confusion during deep non-REM sleep. A person may be difficult to wake and usually remembers little afterward. They occur most often in children.

Night Terrors In Children

Alternate name; see *Night Terrors*.

NIH Stroke Scale

The National Institutes of Health Stroke Scale is a standardized, validated clinical assessment tool used to quantify the severity of acute ischemic stroke.

Nijmegen Breakage Syndrome

A rare autosomal-recessive DNA-repair disorder caused by pathogenic variants in *NBN*. It can cause progressive microcephaly, growth and developmental differences, combined immunodeficiency, chromosomal instability, and increased cancer risk, particularly lymphoma. The older label "ataxia-telangiectasia variant 1" is no longer preferred because this is a distinct disorder.

Alternate Names:
NBS

Nikethamide

An old medicine once used to stimulate breathing. It is no longer a routine treatment because its benefit is limited and excessive doses can cause agitation, shaking, seizures, or other dangerous effects.

Nikolsky Sign

Peeling or separation of the top skin layer when nearby skin is gently rubbed. It can occur in serious blistering disorders, but the sign is not specific and must be interpreted with the rash and other findings.

Nikolsky's Sign

Shearing or peeling of the superficial epidermis when apparently normal skin beside a blister is rubbed; it may occur in pemphigus and other blistering disorders.

Nipah Virus

A zoonotic RNA virus in the genus *Henipavirus*, naturally carried by fruit bats of the family Pteropodidae. It can infect people and other mammals and spread from animals, through contaminated food, or by close contact between people. In humans it causes Nipah virus infection; see *Nipah Virus Infection*.

Nipah Virus Infection

A zoonotic disease caused by Nipah virus, transmitted to people from infected bats or other animals, contaminated food, or close contact with an infected person. Infection may be asymptomatic or cause fever, headache, vomiting, and respiratory illness; severe disease can progress to encephalitis, confusion, seizures, coma, or death.

Nipple

The projection at the centre of the breast through which milk is released from the mammary ducts; it contains smooth muscle and sensory nerve endings.

Nipple Adenoma

A rare benign growth of the small milk ducts within the nipple. It may cause a small lump, erosion, crusting, redness, or discharge and can resemble Paget disease of the breast.

Alternate Names:
Erosive Adenomatosis Of The Nipple; Erosive Adenomatosis; Erosive Papillomatosis Of The Nipple; Papillary Adenoma Of The Nipple

Nipple-Areola Complex

The nipple together with the darker skin around it, called the areola. It contains ducts, smooth muscle, glands, and sensory nerves.

Nipple Discharge

Fluid coming from one or both nipples, either on its own or when touched or squeezed. It may be related to pregnancy, breastfeeding, hormones, medicines, infection, or a breast-duct problem. Spontaneous discharge from one breast or duct, especially if

bloody or clear, can be associated with an underlying lesion.

Nipple Eczema

An itchy, sore, red, or scaly rash affecting the nipple and areola. It is a type of skin inflammation and may be related to eczema or contact irritation. Persistent changes affecting only one nipple can have other causes, including Paget disease of the breast.

Nipple Inversion Or Retraction

Inward turning or pulling-in of the nipple. It may be longstanding and benign, but new one-sided inversion or retraction can occur with duct disease or breast cancer.

Nipple Retraction

Alternate name; see *Nipple Inversion Or Retraction*.

Niridazole

An older medicine once used against schistosomiasis, a parasitic infection. Its use is now limited because of serious possible side effects, including seizures, liver injury, and damage to blood-cell production.

Nissen Fundoplication

An antireflux operation in which the upper stomach is wrapped completely around the lower esophagus to reinforce the gastroesophageal junction. It may be combined with repair of a hiatal hernia and is used in selected cases of gastroesophageal reflux disease. The complete wrap distinguishes it from partial fundoplication procedures.

Alternate Names:
360-Degree Complete Fundoplication; Total Antireflux Fundoplication

Nit

The egg of a louse, usually attached firmly to a hair shaft or clothing fiber. Nits may be confused with dandruff, but they do not brush away easily. Finding live lice confirms an active infestation; treatment and fine combing remove lice and eggs.

Nitabuch Layer

A fibrinoid layer at the maternal-fetal interface between the decidua basalis and anchoring placental trophoblast. It is associated with limitation of trophoblast invasion and may be attenuated or absent at sites of placenta accreta spectrum; abnormal placental attachment also reflects defects in the decidua and uterine wall.

Alternate Names:
Stria of Nitabuch; Decidual Fibrinoid Boundary

Nitrates

Medicines that widen blood vessels by releasing nitric oxide. They can relieve angina and lower the heart's workload but may cause headache, flushing, dizziness, or dangerously low blood pressure with certain medicines.

Nitrate Tolerance

Reduced vascular or antianginal response to nitrate medicines after sustained exposure. It can limit the effect of continuously administered nitrates and is associated with changes in nitrate bioactivation and vascular signaling.

Nitrazepam

A benzodiazepine medicine that slows brain activity and can cause sleepiness, calmness, and seizure prevention. It can cause dependence, falls, memory problems, and dangerously slow breathing, especially with alcohol or opioids.

Nitric Acid

A strong corrosive chemical that can burn skin, eyes, mouth, throat, and digestive organs. Breathing its fumes can injure the lungs, and swallowed or inhaled exposure can cause severe poisoning.

Nitric Acid Poisoning

Exposure to nitric acid can severely burn the skin, eyes, mouth, throat, and stomach and may damage the lungs if fumes are inhaled.

Nitric Oxide

A short-lived signaling molecule made by many

cells. It relaxes blood-vessel muscle, helping regulate blood flow and pressure, and also participates in nerve signaling and immune defense. Too much or too little production may contribute to disease.

Nitric Oxide Synthase

An enzyme family that catalyzes the synthesis of the gaseous signaling molecule nitric oxide (NO) and L-citrulline from L-arginine, oxygen, and NADPH, comprising constitutive calcium-dependent isoforms (endothelial eNOS, neuronal nNOS) and a calcium-independent inducible isoform (iNOS).

Alternate Names:
NOS

Nitrofurantoin

An antibacterial medicine used mainly for bladder infections caused by susceptible bacteria. It concentrates in urine but is not suitable for many kidney infections; nausea, lung reactions, liver injury, or nerve problems are uncommon but important risks.

Nitrogen

An essential element in amino acids, proteins, nucleic acids, and other biological molecules; atmospheric nitrogen is largely inert to humans.

Nitrogen Balance

The difference between dietary nitrogen intake, estimated mainly from protein intake, and nitrogen loss, primarily in urine. Positive balance supports growth or tissue repair; negative balance occurs with inadequate intake, inflammation, trauma, or catabolic disease.

Nitrogenous Base

A nitrogen-containing component of nucleic acids; adenine, guanine, cytosine, thymine, and uracil pair in DNA or RNA to encode genetic information.

Nitroglycerin

An organic nitrate that releases nitric oxide and relaxes vascular smooth muscle. Its principal cardiovascular use is relief or prevention of angina through venodilation, reduced cardiac preload, and lower myocardial oxygen demand; it can also dilate coronary arteries.

Nitroglycerin for Chest Pain

A symptom-based term for nitroglycerin used to relieve angina caused by transient myocardial ischemia. Nitroglycerin is an organic nitrate that relaxes vascular smooth muscle and reduces cardiac preload; the term refers to its antianginal use, not to chest pain from other causes.

Nitroglycerin Overdose

Too much nitroglycerin can cause severe headache, flushing, dizziness, fainting, low blood pressure, fast heartbeat, or breathing difficulty.

Nitromors

A trade name for paint or varnish stripper formulations; exposure can cause chemical burns or toxic inhalation.

Nitrosoureas

A group of chemotherapy medicines that can cross the blood-brain barrier and damage DNA; examples include carmustine and lomustine.

Nitrous Oxide

An inhaled anesthetic and analgesic gas, administered with oxygen for procedural or labor analgesia and as an adjunct to general anesthesia. It acts rapidly but has low anesthetic potency, so it is not adequate alone for most general anesthesia. It can expand gas-filled spaces and inactivate vitamin B12, particularly with prolonged or repeated exposure or deficiency.

Nitrous Oxide For Labor

A mixture of nitrous oxide and oxygen inhaled through a mask or mouthpiece to help relieve pain during labor. The person in labor controls when to inhale it; availability and use depend on local practice.

Nizatidine

A histamine H2-receptor blocker that reduces stomach-acid production and is used for peptic

ulcers and gastroesophageal reflux. It is cleared mainly by the kidneys, and drug interactions can occur.

NMR

NMR, or nuclear magnetic resonance, measures how atomic nuclei respond to a magnetic field and is used in chemical analysis and imaging.

Nocardia Asteroides Infection

A historical label for nocardiosis when the organism was identified as *Nocardia asteroides* or assigned to the former *N. asteroides* group. That group included several species now classified separately, so the label may not identify the infecting species precisely. Nocardiosis can affect the lungs, skin, or brain, especially in people with weakened immunity.

Nocardia Infection

An infection caused by Nocardia bacteria, usually affecting the lungs, skin, or brain, especially in people with weakened immunity.

Nocardiosis

An infection caused by Nocardia bacteria found in soil and water. It most often affects the lungs, skin, or brain, especially in people with weakened immunity, and may cause cough, fever, skin sores, confusion, or seizures.

Nocebo

A harmful or unpleasant symptom or treatment effect caused or amplified by negative expectations rather than by the treatment's specific pharmacologic action.

Nociception

The nervous system's detection and processing of potentially harmful heat, pressure, or chemicals. It can lead to pain, but pain also depends on how the brain interprets these signals.

Nociceptor

A specialized sensory nerve ending that detects potentially harmful or tissue-damaging stimuli—such as extreme heat or cold, intense pressure, or irritant chemicals. When activated, nociceptors send electrical warning signals through the spinal cord to the brain, where the sensation is interpreted as pain, triggering protective reflexes to prevent or minimize physical injury.

Nociceptors

Plural form; see *Nociceptor*.

Nocturia

Waking during the night one or more times to urinate and then returning to sleep. It may result from evening fluids, medicines, bladder or prostate problems, diabetes, heart disease, or sleep disorders.

Nocturnal

Occurring at night or during sleep. Examples include bedwetting, nighttime cough, breathing pauses during sleep, nighttime low oxygen, or breathlessness that wakes a person. Persistent or severe symptoms can have significant underlying causes.

Nocturnal Emission

Involuntary ejaculation during sleep, sometimes called a wet dream. It is a common and normal event during male puberty and adolescence.

Alternate Names:
Wet Dream

Nocturnal Enuresis

Repeated involuntary urination during sleep in a child aged five years or older, the usual age threshold for the diagnosis. It may be primary, when nighttime dryness has never been established, or secondary, when bedwetting returns after a sustained dry period. Daytime urinary symptoms may indicate a broader bladder disorder.

Alternate Names:
Sleep Enuresis

Nocturnal Hypoventilation

A reduction in minute ventilation occurring specifically during sleep, resulting in nighttime hyper-

capnia and hypoxemia, commonly encountered in neuromuscular diseases (such as ALS or muscular dystrophies), severe kyphoscoliosis, and obesity hypoventilation syndrome.

Nocturnal Incontinence

Alternate name; see *Incontinence*.

Nocturnal Lagophthalmos

Incomplete closure of the eyelids during sleep, which may cause dryness, irritation, and exposure injury to the cornea.

Nocturnal Polyuria

Production of an unusually large share of the day's urine during nighttime sleep. It can contribute to repeated nighttime urination and may be related to fluid shifts, sleep disorders, medicines, or other medical conditions.

Nocturnal Pruritus

Itching that occurs or worsens at night and may interrupt sleep. It is a symptom pattern rather than a distinct disease and may accompany skin disorders or systemic causes of pruritus.

Alternate Names:
Nighttime Itching

Nodal Rhythm

A heartbeat rhythm that starts near the atrioventricular node instead of the heart's usual pacemaker. It may occur when the normal pacemaker is slow or blocked and can cause a slow pulse, dizziness, or no symptoms.

Node

A localized swelling, structure, or point of connection; examples include lymph nodes and electrical conduction nodes.

Node of Ranvier

Periodic, unmyelinated gaps or interruptions occurring at regular intervals along the length of a myelinated nerve axon where high concentrations of voltage-gated sodium channels enable rapid saltatory nerve impulse conduction.

Alternate Names:
Ranvier Node; Myelin Sheath Gap

Nodular

Made up of or containing one or more rounded lumps called nodules. The word may describe a skin lesion, thyroid swelling, lung finding, or other tissue. Its importance depends on the nodule's size, appearance, location, growth, and associated symptoms.

Nodular Fasciitis

A rapidly growing benign self-limited fibroblastic and myofibroblastic proliferation, usually presenting as a painful or tender superficial mass. It can mimic sarcoma clinically and microscopically.

Nodular Localized Cutaneous Amyloidosis

A localized cutaneous amyloidosis presenting as one or more firm, waxy, skin-colored or yellow-brown nodules. It is usually confined to the skin, but examination may be needed to distinguish it from systemic amyloidosis or other nodular disorders.

Nodular Lymphoid Hyperplasia

Enlargement of small areas of immune tissue, most often in the small intestine. It is usually harmless but may be associated with reduced antibody production or intestinal infection; its significance depends on symptoms and the test findings.

Nodular Melanoma

A type of skin cancer that grows downward early and often appears as a rapidly enlarging firm bump. It may be black, brown, pink, or skin-colored; rapid growth or bleeding can occur.

Nodular Vasculitis

Alternate name; see *Erythema Induratum*.

Nodule

A small, rounded area of abnormal tissue that may be solid or fluid-filled and may occur in the skin,

lung, thyroid, or another organ. Its significance depends on location, size, appearance, growth, and symptoms; some are harmless, while others reflect neoplastic or inflammatory disease.

Noise-Induced Hearing Loss

Hearing loss caused by very loud sound, either from one sudden blast or repeated exposure over time. It is often permanent and may occur with ringing in the ears or trouble understanding speech, especially in noisy places.

Noise-Related Hearing Loss

Alternate name; see *Hearing Loss*.

Noma

A rapidly progressive gangrenous disease of the mouth and face, usually affecting severely malnourished or immunocompromised children. It often begins as necrotizing gingivitis and can destroy oral and facial soft tissue and bone. The condition is associated with extreme poverty, malnutrition, impaired immunity, and polymicrobial infection.

Nomenclature

Nomenclature is the organized system used to name and classify diseases, organisms, chemicals, anatomy, medicines, or other entities.

Nomogram

A graphical tool that estimates a quantity or risk from related measurements. The Rumack–Matthew nomogram is used in selected cases of acute acetaminophen ingestion.

Nonaccidental Injury

An injury caused deliberately or by neglect rather than by an accident. In children, suspicious patterns may include injuries inconsistent with the history, injuries at different stages of healing, or injuries in protected areas.

Non-Accidental Trauma

An injury caused deliberately or through abuse rather than by an accident. It is considered when the explanation does not fit the injuries, when injuries are repeated or occur at different healing stages, or when a child cannot explain what happened; safeguarding assessment may be involved.

Non-Adherence

The extent to which a person's medication use or other health behavior differs from a mutually agreed plan. It may be intentional or unintentional and can reflect access barriers, adverse effects, beliefs, communication problems, or practical difficulties; the term does not itself identify the reason.

Non-Alcoholic Steatohepatitis

An older name for metabolic dysfunction-associated steatohepatitis (MASH), a form of steatotic liver disease with liver-cell injury and inflammation. It can cause scarring and, in some people, cirrhosis or liver cancer.

Alternate Names:
NASH; Metabolic Dysfunction-Associated Steatohepatitis (MASH)

Nonalcoholic Steatohepatitis Pathology

Liver-tissue findings associated with metabolic dysfunction-associated steatohepatitis (MASH), including fat in liver cells, cell injury, and inflammation, with or without scarring. NASH is an older name for MASH.

Non-Allergic Rhinitis

Alternate spelling; see *Nonallergic Rhinitis*.

Nonallergic Rhinitis

Nasal congestion, sneezing, or runny nose caused by irritants or other triggers rather than an allergic immune response. Triggers may include changes in temperature or humidity, smoke, odors, medicines, or hormonal changes.

Alternate Names:
NAR

Nonallergic Rhinopathy

Alternate name; see *Nonallergic Rhinitis*.

Non-Articular Rheumatism

An older term for painful disorders of muscles, tendons, bursae, or other tissues outside the joints.

Nonarticular Rheumatism/Regional Pain Syndrome

A broad clinical category of pain arising outside the joints, including disorders of muscles, tendons, bursae, fascia, nerves, or other regional soft tissues. The cause may be overuse, injury, inflammation, nerve dysfunction, or altered pain processing.

Non-Asthmatic Eosinophilic Bronchitis

A cause of long-lasting cough in which certain white blood cells inflame the airways without the variable narrowing seen in asthma. Breathing tests may be normal, but an inhaled corticosteroid can reduce the cough when this diagnosis is confirmed.

Nonbacterial Prostatitis

Chronic pelvic pain syndrome (CP/CPPS) characterized by persistent pelvic, perineal, or genital pain and urinary symptoms for at least 3 months without evidence of active urinary tract bacterial infection on standard cultures.

Alternate Names:
Chronic Pelvic Pain Syndrome in Men; Abacterial Prostatitis; Category III Prostatitis

Nonbacterial Thrombotic Endocarditis

Small, sterile blood clots that form on heart valves without infection. It is often linked to cancer, lupus, or another condition that makes blood clot easily. The clots can break off and cause stroke or blockage elsewhere, so treatment focuses on the cause and preventing further clots.

Alternate Names:
NBTE; Marantic Endocarditis

Noncandidal Fungal Infections of the Mouth

Fungal infections of the oral cavity caused by organisms other than Candida, including selected dermatophytes, molds, and endemic fungi. They may produce plaques, ulcers, swelling, or deep tissue disease and often require culture, biopsy, or systemic treatment.

Non-Celiac Gluten Intolerance

Alternate name; see *Non-Celiac Gluten Sensitivity*.

Non-Celiac Gluten Sensitivity

Symptoms attributed to gluten or wheat that improve after removal, despite testing not showing celiac disease or wheat allergy. Other foods and conditions can cause similar symptoms, complicating diagnosis.

Non-Coding RNA (ncRNA)

An RNA molecule that is not translated into a protein. Non-coding RNAs can regulate gene activity, RNA processing, protein production, and chromosome function; abnormal regulation is involved in some cancers and other diseases.

Non-Communicable Disease

A health condition that does not spread from person to person, such as heart disease, cancer, chronic lung disease, or diabetes. Many result from a mix of inherited, environmental, and lifestyle factors.

Alternate Names:
NCD; Non-Communicable Diseases; Noncommunicable Disease

Non Communicating Hydrocephalus

A buildup of cerebrospinal fluid in the brain because a blockage prevents it from moving between the brain's fluid-filled spaces and reaching the area where it is absorbed. It can increase pressure on the brain and cause headache, vomiting, sleepiness, vision problems, or difficulty walking.

Noncompetitive Antagonist

A medicine that reduces another medicine or natural chemical's effect by attaching to its receptor or signaling pathway in a way that extra amounts of the activating substance cannot fully overcome.

Noncompetitive Inhibition

A form of enzyme inhibition in which a substance binds away from the enzyme's working site and

reduces its activity. Because it does not compete directly with the usual substrate, adding more substrate does not fully overcome the inhibition.

Non-Compliant Angioplasty Balloon

A small balloon on a catheter that keeps its shape when inflated at high pressure to widen a narrowed blood vessel. It is used during selected vascular procedures and can rarely cause bleeding, vessel injury, or blockage.

Alternate Names:
High-Pressure Angioplasty Balloon; Non-Compliant Balloon

Non-Contact Tonometry

A quick estimate of pressure inside the eye using a brief puff of air against the clear front surface of the eye. It does not touch the eye and can screen for glaucoma, but unusual results may need confirmation.

Non-Convulsive Status Epilepticus

Alternate spelling; see *Nonconvulsive Status Epilepticus*.

Nonconvulsive Status Epilepticus

Ongoing seizure activity without prominent convulsive movements. It may present as prolonged confusion, reduced awareness, behavioral change, or subtle movements. Electroencephalography is central to diagnosis, with findings interpreted alongside the person's clinical state and other evidence.

Alternate Names:
NCSE

Nondisjunction

Failure of chromosome copies to separate properly when a cell divides. This can produce cells with too many or too few chromosomes and may cause conditions such as Down syndrome, Turner syndrome, or some miscarriages.

Non-Fatal Drowning

Respiratory impairment from submersion or immersion in liquid when the person survives. Outcomes range from no lasting effects to ongoing health problems.

Non-Functioning Pituitary Adenoma

A usually noncancerous pituitary tumor that does not release enough active hormones to cause a hormone syndrome. As it enlarges, it may cause headache, reduced vision, or loss of normal pituitary function.

Nongenital Warts

Common benign skin growths caused by cutaneous human papillomaviruses, usually appearing as rough papules on the hands, fingers, elbows, or knees; plantar warts affect the soles. They spread by direct contact or self-inoculation, may persist for months or years, and are distinct from anogenital warts.

Non-Hodgkin Lymphoma

A broad group of blood cancers that originate in lymphocytes, a type of white blood cell that forms part of the immune system. The cancerous cells multiply abnormally in lymph nodes and lymphatic tissue, leading to painless swelling of lymph nodes in the neck, armpits, or groin, as well as systemic symptoms such as persistent fever, drenching night sweats, fatigue, and unexplained weight loss. Types range from slow-growing (indolent) to fast-growing (aggressive) forms.

Alternate Names:
NHL; Non-Hodgkin's Lymphoma; Non-Hodgkins Lymphoma

Non-Hodgkin Lymphoma In Children

A group of childhood cancers arising from immune cells called lymphocytes. Some grow quickly and can cause swollen nodes, fever, abdominal symptoms, or breathing problems; the exact type and spread determine treatment.

Non-Hodgkin's Lymphoma

Alternate spelling; see *Non-Hodgkin Lymphoma*.

Non-Hodgkins Lymphomas

Alternate spelling and plural form; see *Non-Hodgkin Lymphoma*.

Non-Infectious Cystitis

Alternate spelling; see *Noninfectious Cystitis*.

Noninfectious Cystitis

Bladder inflammation not caused by an active infection. Causes include radiation, some medicines, chemicals, and interstitial cystitis. It can cause pain, urgency, and frequent urination.

Alternate Names:
Abacterial Cystitis; Sterile Cystitis

Noninfectious Uveitis

Inflammation inside the eye not caused by an active infection, often related to autoimmune or inflammatory disease. It can threaten vision; treatment varies with the site and underlying cause.

Noninvasive

Describes a test, treatment, or device that does not enter the body or breach the skin, such as ultrasound or an external electrocardiogram. In oncology, "noninvasive" describes a neoplasm confined to its epithelial layer without invasion through the basement membrane into underlying tissue; the precise meaning depends on the tumor type.

Non-Invasive Positive Pressure Ventilation

The delivery of mechanical ventilatory support without an invasive endotracheal tube or tracheostomy, utilizing a tight-fitting facial or nasal mask to provide continuous positive airway pressure (CPAP) or bilevel positive airway pressure (BiPAP) in acute hypercapnic respiratory failure or cardiogenic pulmonary edema.

Alternate Names:
NIPPV; NPPV

Non-Invasive Prenatal Testing

Alternate name; see *Cell-Free Fetal DNA Screening*.

Non-Invasive Procedure

An examination or treatment that does not cut or pierce the skin or place an instrument inside the body. Examples include blood-pressure measurement, electrocardiography, ultrasound, magnetic resonance imaging, and external physical therapy. The term describes how a procedure is performed, not its accuracy, effectiveness, or overall risk.

Alternate Names:
Noninvasive Procedure; Non-Invasive Medical Procedure; Non-Invasive Technique

Non-Invasive Ventilation

Breathing support delivered through a face or nose mask instead of a tube placed in the windpipe. Continuous or two-level air pressure can improve breathing in selected people with respiratory failure, sleep apnea, or fluid in the lungs.

Nonischemic Priapism

Alternate name; see *Priapism*.

Nonketotic Hyperglycemic Hyperosmolar Syndrome

A life-threatening diabetic emergency in which very high blood sugar causes profound dehydration and concentrated blood, usually without major ketone buildup. It can cause extreme thirst, weakness, confusion, seizures, coma, and organ failure.

Non-Ketotic Hyperosmolar State

Alternate name; see *Nonketotic Hyperglycemic Hyperosmolar Syndrome*.

Alternate Names:
Hyperosmolar Hyperglycemic State; HHS

Nonmelanoma Skin Cancer

A group of skin cancers that arise from the cells of the epidermis, excluding melanoma. The two most common types are basal cell carcinoma (BCC) and squamous cell carcinoma (SCC), which together account for the vast majority of all skin cancers diagnosed globally.

Non-Muscle-Invasive Bladder Cancer

Bladder cancer limited to the inner lining or connective tissue beneath it, without invasion of the bladder muscle. It can recur and may progress to muscle-invasive disease.

Non-Obstructive Azoospermia

Complete absence of sperm in semen because the testicles make too few or no sperm, rather than because a tube is blocked. Causes include genetic conditions, undescended testes, infections, cancer treatment, or an unknown problem. Testing may include hormone tests and genetic studies; some people can use surgically retrieved sperm for assisted reproduction.

Non-Ossifying Fibroma

A common, noncancerous bone lesion, usually found by chance in the leg bones of children or teenagers. It often causes no symptoms and may shrink as the skeleton matures. A large lesion can weaken the bone and rarely lead to a fracture.

Alternate Names:
NOA; Secretory Azoospermia; Testicular Failure Azoospermia

Nonpathogenic

Nonpathogenic means not ordinarily capable of causing disease in a given host or setting; an organism can still cause opportunistic infection when immunity or barriers are impaired.

Non-Pitting Edema

Swelling of subcutaneous tissue that does not leave a persistent indentation when firm digital pressure is applied, usually due to local accumulation of protein-rich fluid, mucopolysaccharides, or chronic cellular infiltration. Common causes include lymphedema, pretibial myxedema in Graves disease, and severe lipedema.

Non-Polio Enterovirus Infection

Alternate name; see *Enterovirus*.

Non-Proliferative Diabetic Retinopathy

An early form of diabetes-related damage to the retina, the light-sensitive tissue at the back of the eye. Small blood vessels may leak or swell, causing blurred vision, but abnormal new vessels have not formed.

Nonproliferative Retinopathy

Retinal disease in which small blood vessels leak or become damaged without abnormal new vessels growing. Diabetes is a common cause; progression can impair vision, especially when the macula is affected.

Alternate Names:
NPDR

Non-Radiographic Axial Spondyloarthritis

Inflammatory arthritis affecting the spine or joints between the spine and pelvis without definite changes on a plain X-ray. It may cause persistent back pain and morning stiffness, and may occur with eye inflammation, psoriasis, or inflammatory bowel disease.

Non-Rapid Eye Movement Sleep

Sleep that includes lighter and deeper stages without rapid eye movements. Deep stages support physical restoration, while lighter stages help the body transition into and out of sleep.

Non-Rebreather Mask

An oxygen-delivery mask with a reservoir bag and one-way valves intended to limit rebreathing of exhaled gas and entry of room air. The delivered oxygen concentration depends on oxygen flow, mask fit, valve design, and the person's breathing pattern; it is not a fixed concentration device.

Alternate Names:
NRB Mask

Non-REM Sleep

Sleep stages without rapid eye movements, ranging from light sleep to deep slow-wave sleep. These stages support physical restoration, memory processing, and the normal transition between waking and sleep.

Alternate Names:
NREM sleep

Non-Responder

A person or disease that shows little or no expected

response to a treatment, vaccine, or test stimulus.

Non-Scarring Epidermolysis Bullosa

An epidermolysis bullosa subtype in which genetic fragility causes blisters or erosions without primary scarring; severity and complications depend on the subtype.

Nonselective Beta-Blockers

Medicines that block two main types of adrenaline receptor. They slow the heart and lower blood pressure but can also narrow the airways, which can worsen asthma or some other lung diseases.

Non-Seminomatous Germ Cell Tumor

Alternate spelling; see *Nonseminomatous Germ Cell Tumor*.

Nonseminomatous Germ Cell Tumor

A group of cancers that begin in germ cells, the cells that develop into eggs or sperm. They most often start in a testicle but can occur elsewhere. Types include embryonal carcinoma, yolk sac tumor, choriocarcinoma, and teratoma.

Alternate Names:
NSGCT; Nonseminoma

Nonseminomatous Testicular Tumors

Testicular germ-cell tumors containing or resembling embryonal carcinoma, yolk-sac tumor, choriocarcinoma, teratoma, or mixed components. They may produce elevated AFP or hCG and require staging with tumor markers, imaging, and examination of the contralateral testis.

Nonsense Variant

A change in DNA that tells a cell to stop making a protein too early. The resulting shortened or missing protein may cause disease, but the effect depends on the gene, the location of the change, and how much normal protein remains.

Non-Small Cell Lung Cancer

A group of lung cancers that includes adenocarcinoma, squamous-cell cancer, and large-cell cancer. It is more common than small-cell lung cancer; treatment depends on the cancer type, how far it has spread, and gene changes.

Alternate Names:
NSCLC

Non-Small Cell Lung Carcinoma

Alternate name; see *Non-Small Cell Lung Cancer*.

Nonspecific Interstitial Pneumonia

An interstitial lung disease pattern with relatively uniform inflammation and/or fibrosis across affected areas, rather than the temporally varied pattern of usual interstitial pneumonia. It may be idiopathic or associated with connective-tissue disease, medicines, or other exposures and can cause dry cough and breathlessness.

Nonspecific Interstitial Pneumonitis

Alternate name; see *Nonspecific Interstitial Pneumonia*.

Non-Specific Urethritis

Inflammation of the urethra that is not caused by *Neisseria gonorrhoeae*; it may be caused by other infectious agents, including *Chlamydia trachomatis*, or sometimes have no identified cause. Symptoms can include painful urination or urethral discharge.

Nongonococcal Urethritis

Alternate name; see *Non-Specific Urethritis*.

Non-ST Elevation Myocardial Infarction

Alternate spelling; see *Non-ST-Elevation Myocardial Infarction*.

Non-ST-Elevation Myocardial Infarction

A heart attack in which blood tests show heart-muscle injury but the electrocardiogram does not show persistent ST-segment elevation. It is usually caused by reduced or blocked blood flow to the heart and can cause permanent cardiac injury or death.

Alternate Names:
NSTEMI; Non-ST-Segment Elevation Infarct

Nonsteroidal Anti-inflammatory Drug (NSAID) Toxicity

Harmful effects from excessive exposure to a nonsteroidal anti-inflammatory drug. Symptoms may include nausea, vomiting, abdominal pain, gastrointestinal bleeding, ringing in the ears, or drowsiness; severe poisoning can cause acute kidney injury, metabolic acidosis, seizures, or coma.

Nonsteroidal Anti-Inflammatory Drugs

A group of medicines that reduce pain, fever, and inflammation by lowering the body's production of prostaglandins. They can cause stomach bleeding, kidney injury, fluid retention, heart problems, or allergic reactions, especially at high doses or with long use.

Nonsteroidal Anti-Inflammatory Drugs And Ulcers

Nonsteroidal anti-inflammatory drugs can reduce stomach-protective prostaglandins and cause gastritis, ulcers, and gastrointestinal bleeding. Risk rises with age, prior ulcer, anticoagulants, steroids, kidney disease, and high doses; safer alternatives or acid protection may be needed.

Alternate Names:
NSAID-Induced Peptic Ulcer; NSAID Gastropathy

Non-Stress Test

A test during pregnancy that monitors the baby's heart rate while the baby moves. A healthy response usually includes temporary heart-rate increases; an abnormal result may reflect sleep, medicines, or a problem requiring further assessment.

Non-ST-Segment Elevation Myocardial Infarction

Alternate name; see *Non-ST-Elevation Myocardial Infarction*.

Nonsyndromic

Nonsyndromic means occurring without the additional characteristic features of a recognized syndrome; it may still be genetic, congenital, or clinically significant.

Nonthrombocytopenic Idiopathic Purpura

Purpura or easy bruising with a normal platelet count and no identified cause; the evaluation considers vessel fragility, medicines, coagulation disorders, nutritional deficiency, and systemic disease.

Nontraditional Medicine

Treatments outside conventional evidence-based medical practice, including some complementary, alternative, or traditional systems. Safety and effectiveness vary, and interactions or delayed diagnosis are possible.

Nontropical Sprue

Alternate name; see *Celiac Disease*.

Nontuberculous Mycobacteria

Mycobacteria other than the tuberculosis complex and M. leprae. They are found in soil and water and can cause lung, skin, lymph-node, or disseminated infections, especially in people with underlying illness.

Nontuberculous Mycobacterial Infection

Infection caused by Mycobacterium species other than M. tuberculosis, often affecting the lungs but sometimes the lymph nodes, skin, or other organs. Disease is more likely in people with structural lung disease or impaired immunity.

Nontuberculous Mycobacterial Lung Disease

Lung disease caused by mycobacteria in the environment, not by the bacteria that cause tuberculosis. It may cause cough, breathlessness, tiredness, or weight loss, but some people carry these bacteria without becoming ill. Symptoms, scans, and repeated lab tests help distinguish disease from bacteria that are present without causing illness.

Nontuberculous Mycobacterial (NTM) Diseases

Infections caused by environmental mycobacteria other than the tuberculosis complex and *M. leprae*. They may affect the lungs, skin, lymph nodes, or

other organs, especially in people with underlying lung disease or weakened immunity. Lung disease may cause cough, fatigue, weight loss, breathlessness, or coughing blood; diagnosis and treatment depend on symptoms, imaging, and test results.

Nonulcer Dyspepsia

Alternate name; see *Functional Dyspepsia*.

Nonulcer Stomach Pain

Alternate name; see *Functional Dyspepsia*.

Nonunion And Malunion

Nonunion means a broken bone fails to heal after an expected period, leaving pain or instability. Malunion means it heals in a poor position, causing deformity, altered movement, or strain on nearby joints. Both may require further treatment.

Nonunion Fracture

A broken bone that has failed to heal after the expected period and shows no further progress toward joining. It may cause ongoing pain, movement at the fracture, weakness, or deformity and may require surgery or other treatment.

Nonverbal Learning Disorder

A neurodevelopmental profile characterized by well-developed verbal abilities contrasted with significant deficits in visual-spatial perception, motor coordination, and nonverbal social comprehension.

Noonan Syndrome

An inherited condition that may cause distinctive facial features, short stature, heart defects, delayed development, easy bruising, or swelling from lymph problems. Its features vary; care often includes monitoring of heart, growth, hearing, and development.

Noonan Syndrome With Multiple Lentigines

A genetic disorder, formerly called LEOPARD syndrome, characterized by multiple lentigines and variable features such as distinctive facial appearance, short stature, heart disease, hearing loss, or genital abnormalities.

Alternate Names:
LEOPARD Syndrome (historical term)

Noradrenaline

A chemical messenger acting as both a hormone and neurotransmitter. It helps regulate alertness, attention, stress responses, heart activity, and blood-vessel tightening, which can raise blood pressure.

Alternate Names:
Norepinephrine

No-Reflow Phenomenon

Failure of blood to reach small vessels and damaged tissue even after a larger blocked artery has been reopened. It can occur after a heart attack or stroke and may limit recovery despite successful treatment of the main blockage.

Norepinephrine

A hormone and nerve messenger involved in alertness, stress responses, heart function, and blood-vessel tightening. It can increase blood pressure and is also used in hospitals to support blood pressure during some forms of shock.

Alternate Names:
Noradrenaline

Norethisterone

A manufactured progesterone-like medicine used for contraception and selected menstrual problems or endometriosis. It can change bleeding patterns and may cause nausea, headache, mood changes, breast tenderness, or other hormone-related effects.

Norgestrel

A synthetic progestogen used in some hormonal contraceptives. It helps prevent pregnancy by suppressing ovulation and changing cervical mucus and the uterine lining.

Norketamine

Norketamine is an active metabolite of ketamine with NMDA-receptor antagonist activity; it contributes to ketamine's analgesic and psychoactive

effects and may persist after the parent drug is cleared.

Normal

Within an expected range or consistent with usual anatomy, physiology, or function for a specified population.

Normal and Abnormal Puerperium

The puerperium is the weeks after birth while the uterus and other body systems recover. Normal findings include lochia, uterine involution, breast changes, fatigue, and emotional fluctuation; heavy bleeding, fever, severe pain, headache, breathlessness, or profound mood change may signal a complication.

Normal Flora

The bacteria, fungi, and other microorganisms that normally live on the skin and in the mouth, intestine, and urinary or genital tract without causing illness. They can help block harmful germs, support immunity, and contribute to digestion and vitamin production.

Normal Growth And Development

Normal growth and development describes expected physical growth, movement, language, learning, and social progress for a person's age and stage of life.

Normalization

A mathematical adjustment that makes measurements comparable by correcting for known differences in scale, background, equipment response, or other measurement conditions.

Normal Labor and Delivery

Spontaneous labor with progressive cervical dilation, descent and birth of the fetus, delivery of the placenta, and stable maternal and newborn adaptation. Labor can become prolonged or complicated by fetal distress, malposition, bleeding, or infection.

Normal Labour

Spontaneous labour at term with regular uterine contractions, progressive cervical dilatation, and delivery through the birth canal without major complication.

Normal Menstrual Cycle

The recurring hormonal and uterine changes that usually produce menstrual bleeding at a predictable interval; cycle length, flow, and symptoms vary, and persistent changes can reflect an underlying condition.

Normal Pressure Hydrocephalus

A type of hydrocephalus, usually in older adults, in which cerebrospinal fluid builds up and enlarges spaces inside the brain even though pressure readings may be normal. It often causes slow, unsteady walking, followed by changes in thinking and loss of bladder control. Some people improve after a shunt drains the fluid.

Normal-Pressure Hydrocephalus

Alternate spelling; see *Normal Pressure Hydrocephalus*.

Normal Range

A normal range is the interval of results commonly found in a reference population; a result outside it does not by itself prove disease.

Normal Saline

A sterile approximately 0.9% sodium-chloride solution used for fluid replacement, irrigation, and dilution of medicines.

Normal-Tension Glaucoma

A type of primary open-angle glaucoma in which glaucomatous optic-nerve damage occurs despite intraocular pressure (pressure inside the eye) readings within the statistically normal range. It may cause gradual loss of peripheral (side) vision without early symptoms.

Normoblast

A nucleated immature red-cell precursor in bone marrow that normally loses its nucleus before enter-

ing circulation.

Normocalcemic Hyperparathyroidism

Persistently elevated parathyroid hormone with normal blood calcium. This finding requires repeat testing and exclusion of secondary causes, such as vitamin D deficiency, kidney disease, low calcium intake, poor absorption, or certain medicines, before normocalcemic primary hyperparathyroidism can be diagnosed.

Normocytic Anaemia

Alternate British spelling; see *Normocytic Anemia*.

Normocytic Anemia

Anemia in which red blood cells are about their usual size but the blood has too little hemoglobin. Causes include blood loss, breakdown of red cells, chronic illness, kidney disease, and bone-marrow problems. Other blood tests help identify the cause.

Alternate Names:
Normocytic Normochromic Anemia; Normal-MCV Anemia

Normotensive

Having blood pressure within the expected range for the person and measurement setting.

Norovirus

A highly contagious virus that causes acute gastroenteritis, or inflammation of the stomach and intestines. Symptoms usually begin 12–48 hours after exposure and include sudden nausea, vomiting, watery diarrhea, stomach cramps, and sometimes fever, headache, or body aches. It spreads mainly when tiny particles of stool or vomit enter the mouth, through infected people, contaminated food or water, surfaces, or particles released during vomiting. Most illness improves within 1–3 days, but severe fluid loss can cause dehydration, especially in infants, older adults, and people with other illnesses.

Noroviruses

A group of highly contagious viruses that cause acute gastroenteritis with vomiting, diarrhea, cramps, and dehydration; see *Norovirus*.

Norovirus Infection

Acute gastroenteritis caused by norovirus. Symptoms usually begin 12–48 hours after exposure and include nausea, vomiting, watery diarrhea, abdominal cramps, and sometimes fever, headache, or body aches. Infection spreads easily through infected people, contaminated food or water, surfaces, or particles released during vomiting. Most cases improve within 1–3 days, but fluid loss may cause dehydration, especially in infants, older adults, and people with other illnesses.

Norrbottnian Gaucher Disease

A rare northern-European genetic form of Gaucher disease, usually a non-neuronopathic type caused by inherited glucocerebrosidase deficiency; see *Gaucher Disease*.

Norrie Disease

A rare inherited eye disorder in which the retina develops abnormally, usually causing severe vision loss or blindness from birth or early infancy. Some people also develop hearing loss, developmental differences, or problems in the eye's blood vessels.

Nortriptyline

A medicine used to treat depression and sometimes long-lasting nerve pain. It changes the levels of certain chemical messengers in the nervous system and may cause dry mouth, constipation, sleepiness, dizziness, heart-rhythm problems, or overdose toxicity.

Norwegian Scabies

A severe form of scabies in which thick crusts contain very large numbers of mites. It is extremely contagious and occurs especially in people with weakened immunity or difficulty sensing or scratching the skin; management includes treatment and contact precautions.

Norwood Procedure

The first operation for many newborns with hypoplastic left heart syndrome and related heart

defects. It rebuilds the main artery so the right ventricle can send blood to the body, creates a wide opening between the upper heart chambers, and provides controlled blood flow to the lungs through a shunt or tube. It is usually performed within the first days of life and is followed by further staged operations.

Alternate Names:
Stage 1 Norwood Reconstruction; Norwood Operation

Nose

The external structure and internal passages used for breathing and smell. The nose warms, moistens, and filters air and contains bone, cartilage, skin, mucus, blood vessels, and smell-sensing tissue.

Nosebleed

Bleeding from the blood vessels lining the inside of the nasal passages (epistaxis). Most nosebleeds occur in the front part of the nose (anterior nosebleeds), where fragile blood vessels are easily irritated by dry air, nose picking, allergies, or minor trauma. Less commonly, bleeding originates from larger blood vessels deep in the back of the nose (posterior nosebleeds), which tends to be heavier, is more common in older adults or those with high blood pressure, and requires medical evaluation.

Alternate Names:
Epistaxis

Nosebleeds

Plural form; see *Nosebleed*.

Alternate Names:
Epistaxis

Nose Fracture

A break in one or more nasal bones caused by trauma, potentially causing pain, swelling, deformity, bleeding, or nasal obstruction.

Nosocomial

Acquired during healthcare, especially in a hospital, rather than being present or incubating when the person entered care. A nosocomial infection may be caused by bacteria, viruses, fungi, or other organisms and can involve drug-resistant organisms.

Nosocomial Infection

An infection acquired during healthcare that was not present or developing when the person entered care. It may occur in a hospital or another healthcare setting; timing and definition depend on the infection and surveillance rules.

Nosocomial Norovirus Infection

Norovirus gastroenteritis acquired in a healthcare setting. It causes sudden nausea, vomiting, watery diarrhea, and abdominal cramps and can spread rapidly, causing outbreaks in hospitals and long-term-care facilities.

Alternate Names:
Hospital-Acquired Norovirus

Nosocomial Vancomycin-Resistant Enterococci

Enterococcal bacteria that resist vancomycin and can spread in healthcare settings. They may cause urinary, wound, bloodstream, or other infections, particularly in people who are seriously ill or have devices such as catheters; treatment requires susceptibility testing.

Nostril

One of the two openings at the front of the nose. Each nostril leads into the nasal passage, where hairs and mucus help trap particles before air reaches the deeper airways.

Alternate Names:
Nostrils; Nares

Notalgia Paresthetica

A localized neuropathic itch or burning sensation, usually between or just below the shoulder blades, caused by irritation or entrapment of thoracic sensory nerves. Scratching may produce a persistent darkened patch; treatment focuses on reducing itch and addressing contributing spine or nerve disease when present.

Notencephalocele

An older term for an occipital encephalocele, a congenital defect in the back of the skull through which brain tissue protrudes; the sac may also contain the membranes covering the brain.

Notifiable Disease

An infection or other condition that healthcare professionals or laboratories must report to public-health authorities under local law. Reporting helps detect outbreaks, arrange control measures, protect contacts, and plan services; the exact list and reporting rules vary by location.

Notochord

A flexible embryonic rod that guides axial development and largely disappears as the vertebral column forms.

Novel Biomarkers of Kidney Function

Emerging blood, urine, or tissue measurements intended to detect kidney injury or altered filtration earlier or more specifically than serum creatinine alone. Examples include selected tubular-injury proteins, but clinical usefulness depends on validation, timing, and the patient's context.

NOWS

Alternate name; see *Neonatal Opioid Withdrawal Syndrome*.

Noxious

Harmful, poisonous, or capable of causing tissue injury or pain. Noxious stimuli activate protective sensory pathways such as pain and withdrawal reflexes.

NPS

Abbreviation for nail-patella syndrome, an inherited disorder affecting nails, kneecaps, elbows, pelvis, eyes, and sometimes kidneys; see *Nail-Patella Syndrome*.

NREM Sleep

The part of sleep without rapid eye movements, ranging from light sleep to deep slow-wave sleep. It alternates with REM sleep in repeated cycles and supports physical restoration, learning, and memory.

NS

Abbreviation commonly used for Noonan syndrome, a genetic condition with characteristic facial features, short stature, congenital heart disease, bleeding tendency, or developmental differences; see *Noonan Syndrome*.

NSAID

A nonsteroidal anti-inflammatory drug used to reduce pain, fever, and inflammation. Examples include ibuprofen and naproxen; these medicines can irritate the stomach, cause bleeding or kidney problems, and increase heart risks in some people.

Alternate Names:
Nonsteroidal anti-inflammatory drug

NSAID-Induced Ulcers

Alternate name; see *Peptic Ulcer*.

NSTEMI

A heart attack in which a blocked or narrowed coronary artery injures heart muscle but does not produce the typical persistent ST-segment elevation on an ECG. It may cause chest pressure, breathlessness, sweating, nausea, or faintness.

Alternate Names:
Non-ST-Elevation Myocardial Infarction

NTD

NTD commonly means neural-tube defect, a congenital brain or spinal-cord malformation associated with inadequate folate and other factors.

Nuchal

Relating to the back of the neck. Nuchal rigidity means painful or limited neck bending and can occur with meningitis or bleeding around the brain. Nuchal translucency is a first-trimester ultrasound measurement used to estimate certain pregnancy risks.

Nuchal Cord

Wrapping of the umbilical cord around the fetal neck, occurring once or more times. It is common and often harmless; fetal heart-rate abnormalities can occur during labor in some cases.

Nuchal Rigidity

Stiffness or pain that makes it difficult to bend the neck forward. It may occur with meningitis, bleeding around the brain, severe muscle problems, or other illnesses; sudden stiffness with fever or severe headache may signal a serious condition.

Nuchal Translucency Screening

An ultrasound measurement of the clear space at the back of a fetus's neck, usually performed early in pregnancy. A larger-than-expected measurement can indicate increased risk of chromosome or heart problems but is not a diagnosis.

Nuchal Translucency Test

An early-pregnancy ultrasound measurement of the clear space at the back of the fetus's neck. It estimates the chance of certain chromosome or structural problems but cannot diagnose them; abnormal results may lead to additional testing.

Nuclear

Relating to the nucleus of a cell, the center of an atom, or medical tests and treatments that use radioactivity. The intended meaning depends on the surrounding medical context.

Nuclear Factor Kappa B

A ubiquitous inducible master transcription factor complex that coordinates immune and inflammatory responses, cell survival, and cytokine transcription; normally held inactive in the cytoplasm by I-kappa-B inhibitor proteins until activated by inflammatory cytokines, bacterial LPS, or viral infection.

Alternate Names:
NF-kappaB; NF-kB

Nuclear Medicine

A medical specialty that uses radiopharmaceuticals for diagnostic imaging and targeted treatment. Diagnostic tracers reveal body function or chemical activity, while therapeutic agents deliver radiation to selected tissues. Common imaging methods include PET and SPECT.

Nuclear Medicine Imaging

Imaging that uses a radioactive tracer and a specialized detector to show organ function, blood flow, chemical activity, or disease distribution. Common examples include PET, SPECT, bone scans, thyroid scans, and radionuclide cardiac imaging.

Nuclear Medicine Scan

A diagnostic imaging examination that uses small amounts of radiopharmaceuticals and a gamma camera to visualize organ physiology and metabolism; see *Nuclear Medicine*.

Nuclear Pore Complex

A large, multiprotein cylindrical channel spanning the double-membrane nuclear envelope, composed of multiple nucleoporin proteins that regulate and mediate the selective bidirectional transport of macromolecules (RNA, ribonucleoproteins, proteins) between the nucleus and the cytoplasm.

Alternate Names:
NPC

Nuclear Sclerosis

A common age-related cataract in which the center of the eye's lens gradually becomes yellow and hard. It can slowly blur vision, reduce contrast, or alter color perception and is treated when it interferes with daily activities.

Nuclear Stress Test

A test that compares blood flow to heart muscle at rest and during exercise or medicine-induced stress using a radioactive tracer. It can identify areas of reduced perfusion that suggest coronary artery disease.

Nuclear Ventriculography

A heart scan that follows a small radioactive tracer through the bloodstream to measure how much

blood the heart pumps with each beat and whether the heart walls move normally.

Nucleic Acid

DNA or RNA, the molecules that store, copy, and use genetic instructions. DNA usually stores the long-term information, while RNA helps read those instructions and make proteins or perform other jobs in cells.

Nucleic Acid Hybridization

A laboratory method in which matching DNA or RNA strands bind together. This allows a test to find, identify, or measure a particular genetic sequence from a person, tumor, or infectious organism.

Nucleolus

A dense region within the cell nucleus where ribosomal RNA is produced and ribosome subunits begin assembly.

Nucleoside

A small molecule made of a nitrogen-containing base joined to a sugar. Adding one or more phosphate groups makes a nucleotide, the building block used to make DNA or RNA and to carry energy in cells.

Nucleoside Analogs

Medicines that resemble the building blocks used to make DNA or RNA. Some viruses use them by mistake, which interrupts viral copying; the medicine chosen depends on the virus, illness, kidney function, and other factors.

Nucleotide

A small molecule made of a sugar, a nitrogen-containing base, and one or more phosphate groups. Nucleotides build DNA and RNA and also carry energy used by cells.

Nucleus

The membrane-bound cell organelle containing most genetic material, or a defined cluster of neurons in the central nervous system.

Nucleus Accumbens

A group of nerve cells deep in the brain that helps process reward, motivation, learning, and reinforcement. Its activity is involved in normal behavior and in disorders such as addiction and some psychiatric illnesses.

Nucleus Ambiguus

A group of motor neurons in the medulla that supplies striated muscles of the palate, pharynx, and larynx, chiefly through the glossopharyngeal and vagus nerves. It also contains neurons contributing to cardiac parasympathetic control. Its motor output supports swallowing, speech, and vocalization.

Nucleus Pulposus

The soft, gel-like center of a spinal disk, surrounded by a tough outer ring. It helps spread pressure between vertebrae, but a tear may allow it to bulge or press on nerves.

Nulligravida

An obstetric term for a person who has never been pregnant. It is different from nullipara, which means never having given birth beyond the stage of pregnancy used in a particular medical record system.

Nullipara

A person who has never carried a pregnancy beyond the stage of fetal viability; the adjective is nulliparous.

Null Mutation

A genetic change that prevents a gene from producing a functional protein or RNA. The effect depends on the gene, the other copy, and whether the change occurs in body cells or reproductive cells.

Numb

Numb means lacking normal sensation or emotional responsiveness; physical numbness can result from nerve, brain, circulation, metabolic, or medication-related problems.

Number Needed To Harm

The estimated number of people who must receive a treatment, rather than the comparison treatment, for one extra person to experience a specified harmful outcome during a stated period. A smaller number means the harm is more frequent.

Number Needed To Treat

The number of people who must receive an intervention for one additional person to experience the specified beneficial outcome compared with the control over a defined time. It is the reciprocal of absolute risk reduction.

Numbness

Numbness is reduced or absent sensation, often from nerve compression, neuropathy, stroke, spinal disease, circulation problems, or anesthetic effects.

Numbness And Tingling

Reduced sensation or prickling, often caused by nerve compression, neuropathy, spinal disease, vitamin deficiency, altered circulation, or other neurologic disorders. The pattern may be localized or widespread and can occur with weakness, pain, or changes in coordination, depending on the underlying cause.

Alternate Names:
Paresthesia; Pins and Needles

Numbness In Hands

Reduced or absent sensation in one or both hands, commonly caused by nerve compression, neuropathy, injury, circulation problems, or systemic disease.

Nummular

Coin-shaped or round. The term is commonly used for nummular eczema, which causes itchy, coin-shaped patches of inflamed skin.

Nummular Dermatitis

An inflammatory skin disorder characterized by itchy, coin-shaped patches, often on the arms or legs. Lesions may be dry, scaly, crusted, or weeping. Dry skin and local irritation can contribute, and similar-appearing eruptions include fungal infection and other eczematous disorders.

Nummular Eczema

An inflammatory skin condition causing intensely itchy, coin-shaped red patches, sometimes with blisters, crusting, or scaling, usually on the arms or legs. Dry skin, irritation, or injury can trigger it; similar rashes can have other causes.

Nursemaid's Elbow

Nursemaid's elbow is subluxation of the radial head after sudden traction on a young child's extended or pronated arm; the child avoids using the arm, and gentle clinician reduction usually restores movement.

Nurse Practitioner

A nurse practitioner is an advanced-practice nurse who can assess patients, diagnose and treat many conditions, prescribe medicines where authorized, and provide preventive care.

Nursery

A place or service for the care of infants, including specialized newborn care in a hospital.

Nursing

The professional practice of caring for people, promoting health, preventing illness, and supporting recovery or comfort.

Nursing Home

A residential facility that provides ongoing nursing care, assistance with daily activities, and medical or rehabilitation services for people who cannot live independently.

Nursing Home Acquired Pneumonia

Pneumonia occurring in a person living in a nursing home or other long-term-care setting. Residence in long-term care alone is not considered a separate category for predicting antibiotic-resistant infection; risk depends on the person's clinical factors.

Nut Allergies

An immune-mediated reaction to one or more tree nuts or peanuts. Reactions range from hives or gastrointestinal symptoms to life-threatening anaphylaxis.

Alternate Names:
Nut Allergy; Nut-Allergy

Nutation

A nodding or rocking movement; in anatomy it commonly describes movement of the sacrum relative to the pelvis.

Nutcracker Esophagus

An older manometry term for unusually strong but coordinated contractions of the esophagus, which may cause chest pain or difficulty swallowing. Current classifications generally use *hypercontractile esophagus*; evaluation also considers reflux and other causes of symptoms.

Nutcracker Syndrome

Symptoms caused by compression of the left renal vein, usually between the aorta and the superior mesenteric artery, which impairs blood drainage from the kidney. It may cause blood or protein in the urine, left flank or pelvic pain, or enlarged pelvic veins or a varicocele. Compression seen on imaging without related symptoms is called nutcracker phenomenon; diagnosis requires matching symptoms with imaging and excluding other causes. Mild cases may be observed, while persistent severe symptoms may warrant vascular intervention.

Nutrient

A substance the body needs for energy, growth, repair, or normal function. Nutrients include protein, fats, carbohydrates, vitamins, minerals, and water; too little or too much of some nutrients can cause illness.

Nutrigenomics

The study of how food and nutrients interact with genes and how genetic differences influence responses to diet. It is used in research on metabolism and disease risk; many proposed personalized-nutrition applications remain under study.

Nutrition

How the body takes in, digests, absorbs, and uses food and its nutrients for health.

Nutritional Anemia

Anemia caused by inadequate intake, absorption, or use of nutrients needed for red-cell production, especially iron, vitamin B12, or folate.

Nutritional Assessment

A structured evaluation of food intake, body measurements, laboratory results, symptoms, and health conditions. It identifies nutritional problems and guides a safe, individualized eating plan or nutrition support.

Nutritional Deficiency

A lack of a vitamin, mineral, protein, energy, or other nutrient needed for normal body function. It may result from inadequate intake, poor absorption, increased needs, or disease and can impair growth, blood formation, immunity, nerves, or other organs.

Nutritional Dermatoses

Skin changes caused by too little or too much of a nutrient. For example, vitamin C deficiency can cause easy bruising and bleeding gums, while niacin deficiency can cause a sun-sensitive rash, diarrhea, and confusion.

Nutritional Disorders

Health problems caused by too little, too much, or poor use of nutrients. Examples include undernutrition, obesity, vitamin or mineral shortages, and problems caused by the body being unable to digest or absorb food properly.

Nutritional Rickets

Defective bone mineralization in a growing child caused by inadequate vitamin D, calcium, phosphate, or absorption, leading to bone pain, growth problems, or deformity; see *Rickets*.

Nutritional Screening

A brief check for risk of malnutrition using weight change, food intake, illness, and other factors. A concerning result leads to a fuller assessment and an individualized nutrition plan.

Nutrition-Focused Physical Examination

A structured examination for physical findings associated with malnutrition, including loss of subcutaneous fat, muscle wasting, edema, ascites, reduced functional status, and micronutrient-related signs. It complements dietary history, anthropometry, laboratory data, and disease assessment.

Nutrition In Pregnancy

Nutritional intake during pregnancy to support the pregnant person and growing fetus. Important nutrients include folate, iron, calcium, vitamin D, iodine, and protein; individual needs and supplements vary with diet and health.

Nutrition Risk Screening 2002

A hospital screening questionnaire that considers recent food intake, weight change, illness severity, and age to identify adults at risk of malnutrition. A high score prompts a fuller assessment; it is not itself a diagnosis.

Nutrition Support

Use of oral nutrition supplements, tube feeding, or intravenous nutrition when a person cannot meet nutritional needs by ordinary eating. The method depends on the digestive tract, illness, nutrition needs, and risks of treatment.

Nutritive

Providing nourishment that the body can use for energy, growth, repair, or normal function. Nutritive substances include protein, fat, carbohydrates, vitamins, minerals, and water.

Nux Vomica

The seed of Strychnos nux-vomica, containing strychnine and brucine; ingestion can cause severe convulsant poisoning.

Nyctalopia

Impaired vision in dim light or darkness, also called night blindness.

Alternate Names:
Night Blindness

NYHA Functional Classification

A four-class system describing how heart failure symptoms limit activity: class I causes no limitation, class II limits ordinary activity, class III limits less-than-ordinary activity, and class IV causes symptoms even at rest.

Nystagmus

Involuntary, repetitive eye movements that may be side-to-side, up-and-down, or rotary. It may be congenital or acquired and can occur with inner-ear disease, neurologic disorders, reduced vision, or medicines. The direction, pattern, and effect of gaze or head position can help distinguish its cause.

Nystagmus Benign Paroxysmal Positional

Positional nystagmus caused by movement of displaced inner-ear crystals, usually as part of benign paroxysmal positional vertigo; see *Benign Paroxysmal Positional Vertigo*.

Nystagmus Retractorius

An unusual eye movement in which the eyes pull backward and may move toward each other when a person tries to look upward. It is a characteristic sign of a problem in the upper part of the brain, but other findings are needed to identify the cause.

Alternate Names:
Retraction-Convergence Nystagmus; Koerber-Salus-Elschnig Sign

O

OAB

Abbreviation; see *Overactive Bladder Syndrome*.

Ober Test

A hip examination maneuver sometimes used to assess tightness around the outer thigh. With the person lying on one side, the clinician moves the upper leg backward and outward, then checks whether it lowers toward the table. The test alone cannot confirm the cause of hip or thigh pain.

Alternate Names:
Ober's Test

Obesity

A chronic disease involving abnormal or excessive accumulation of body fat that may impair health. It is linked with a higher risk of conditions such as type 2 diabetes, high blood pressure, heart disease, stroke, sleep apnea, osteoarthritis, and some cancers. Many factors can contribute, including genes, metabolism, hormones, medicines, eating patterns, activity, environment, and social conditions; it is not caused by one factor or by lack of willpower alone. Body mass index (BMI) is commonly used to classify obesity in adults, but it does not measure body fat directly and is interpreted with other information.

Obesity Hypoventilation Syndrome

A syndrome defined by obesity, usually a body mass index of at least 30 kg/m^2, and elevated carbon dioxide while awake, typically an arterial carbon dioxide pressure of at least 45 mmHg, after other causes of hypoventilation are excluded. Sleep-disordered breathing, most often obstructive sleep apnea, commonly accompanies it. It may cause low blood oxygen, daytime sleepiness, and strain on the heart.

Obex Region

A small area at the lower end of the brain's fourth fluid-filled space, where it narrows into the central canal of the spinal cord. It lies near centers controlling breathing, swallowing, and vomiting.

OB/GYN

Abbreviation for obstetrics and gynecology, the medical specialties that care for pregnancy, childbirth, the period after birth, and the reproductive system.

Objective Response Rate

The percentage of people in a cancer study whose tumors shrink by a predefined amount or disappear during treatment. It does not show how long the response lasts or whether treatment improves survival.

Objects Or Insects In Ear

A foreign object or insect in the ear canal that may cause pain, reduced hearing, bleeding, discharge, or a sensation of movement. Objects touching the eardrum or lodged deeply can injure the ear canal or eardrum.

Alternate Names:
Aural Foreign Body; Foreign Body in Ear

Oblique Fracture

A break in a bone that runs diagonally across it.

Oblique Plane

A slice or view through the body or an organ at an

angle other than straight across. Medical imaging can use oblique planes to show structures that are difficult to see in standard horizontal, vertical, or front-to-back views.

Obliteration

Complete closing, destruction, or disappearance of a space, passage, or hollow channel in the body. It may result from scarring, inflammation, growth, injury, or treatment and can prevent normal movement of air, blood, fluid, or other contents.

Observation

Planned monitoring of a person, symptom, disease, or test result without immediate treatment or a procedure. The term may also describe watchful waiting, in which intervention is deferred while the clinical course is followed.

Obsession

A recurrent, intrusive, unwanted thought, image, or urge that causes distress and is difficult to control. Common themes include contamination, harm, mistakes, symmetry, or taboo subjects; having an obsession does not mean a person will act on it.

Obsessive-Compulsive And Related Disorders

A group of mental disorders involving recurrent intrusive thoughts, repetitive behaviors or mental acts, preoccupation with perceived appearance flaws, difficulty discarding possessions, or repetitive body-focused behaviors. Examples include obsessive-compulsive disorder, body dysmorphic disorder, hoarding disorder, trichotillomania, and excoriation disorder.

Obsessive Compulsive Disorder

Alternate spelling; see *Obsessive-Compulsive Disorder*.

Obsessive-Compulsive Disorder

A chronic mental health disorder characterized by recurring, unwanted, and intrusive thoughts, urges, or fears (obsessions) that produce significant anxiety, accompanied by repetitive physical actions or mental rituals (compulsions) that an individual feels compelled to perform to ease the distress or avert a feared event, causing marked disruption to daily functioning.

Alternate Names:
OCD

Obsessive-Compulsive Disorder (OCD)

Alternate name; see *Obsessive-Compulsive Disorder*.

Obsessive-Compulsive Personality Disorder

A long-lasting pattern of excessive concern with order, rules, perfection, and control. It can make a person inflexible, slow to complete tasks, or unable to delegate and can interfere with relationships or work.

Obstetrical Forceps

Alternate spelling; see *Obstetric Forceps*.

Obstetric Anal Sphincter Injury

A third- or fourth-degree perineal tear during childbirth that involves the external or internal anal sphincter, with fourth-degree tears also extending through the anorectal mucosa. It can impair control of gas or stool and cause persistent pelvic-floor symptoms.

Obstetric Cholestasis

Alternate name; see *Intrahepatic Cholestasis Of Pregnancy*.

Obstetric Epidural Anesthesia

Pain relief during labor using medicine delivered through a thin catheter into the epidural space in the lower back. The medicine usually includes a local anesthetic and may include an opioid.

Alternate Names:
Epidural Analgesia in Labor; Labor Epidural; Obstetric Epidural

Obstetric Fistula

An abnormal passage between the vagina and blad-

der or rectum that develops after childbirth. The classic obstetric fistula follows prolonged obstructed labor, when sustained pressure from the fetus compresses pelvic tissues and causes ischemic injury and tissue death. It can cause continuous leakage of urine or stool, skin injury, recurrent infection, and substantial social consequences.

Obstetric Forceps

Paired curved instruments placed around the baby's head during selected assisted vaginal births to help guide delivery.

Alternate Names:
Delivery Forceps

Obstetrician

A medical doctor who cares for pregnant people during pregnancy, labor, birth, and the postpartum period. Obstetricians manage routine and high-risk pregnancies, perform deliveries, and treat complications such as high blood pressure, diabetes, bleeding, or preterm labor.

Obstetric Nursing

Obstetric nursing provides care during pregnancy, labor, birth, and the postpartum period, including monitoring, education, support, and recognition of complications.

Obstetrics

The branch of medicine concerned with care during pregnancy, labor, birth, and the weeks after birth, including routine care and treatment of complications affecting the pregnant person or baby.

Obstetrics and Gynaecology

The medical and surgical specialty combining obstetrics—the care of pregnancy, childbirth, and the postpartum period—with gynaecology, concerned with reproductive organs and health across life. It includes reproductive health, contraception, infertility, pregnancy, and childbirth.

Common name: Obstetrics and Gynecology

Obstetric Ultrasound

An ultrasound scan during pregnancy used to check the baby's age, growth, anatomy, position, heartbeat, and sometimes the placenta and fluid.

Obstipation

Severe constipation with inability to pass stool or gas. It can occur with a blockage in the intestine and may cause abdominal swelling, pain, vomiting, or serious illness.

Obstructed Infected Urinary System

A urinary tract obstruction with infection in the urine trapped above the blockage. The combination can rapidly damage the kidney or lead to sepsis.

Obstructed Labour

Failure of the fetus to pass through the birth canal despite adequate uterine contractions, commonly because of disproportion, abnormal presentation, or an obstructing lesion.

Obstruction

A blockage that prevents normal movement through a body passage, such as an airway, intestine, bile duct, blood vessel, or urinary tract. Causes include swelling, stones, scars, tumors, clots, and foreign objects.

Obstructive Azoospermia

Absence of sperm in the ejaculate because a reproductive duct is blocked or absent, despite sperm production in the testes. Causes include congenital absence of the vas deferens, vasectomy, scarring after infection, ejaculatory-duct obstruction, or surgical injury. Testicular size and reproductive hormone levels are often normal.

Alternate Names:
OA; Excretory Azoospermia

Obstructive Hydrocephalus

A buildup of cerebrospinal fluid caused by a blockage in its normal flow through the brain's ventricles.

Obstructive Hypertrophic

Cardiomyopathy

Alternate name; see *Hypertrophic Obstructive Cardiomyopathy*.

Obstructive Jaundice

Yellowing of the skin or eyes caused by blocked bile flow, usually in the bile ducts. Causes include gallstones, scarring, or a tumor. It may cause dark urine, pale stools, itching, or upper-abdominal pain; fever and chills may indicate infection of the bile ducts.

Obstructive Nephropathy

Kidney damage caused by a blockage that prevents urine from draining normally. Stones, tumors, scarring, an enlarged prostate, or birth-related problems can cause it; untreated blockage may lead to infection, permanent loss of kidney function, or kidney failure.

Obstructive Parotitis

Inflammation of a saliva gland near the ear because its drainage tube is blocked, often by a stone. Painful swelling usually worsens during meals, and trapped saliva can lead to repeated infection and tenderness.

Obstructive Shock

A life-threatening form of shock caused by a blockage that prevents the heart from filling or pumping blood properly. Causes include tension pneumothorax, cardiac tamponade, and a large pulmonary embolism. Findings may include very low blood pressure, a rapid heartbeat, and signs of impaired blood flow to organs.

Alternate Names:
Extracardiac Obstructive Shock

Obstructive Sleep Apnea

A common sleep disorder in which the muscles supporting the soft tissues in the back of the throat temporarily relax during sleep, narrowing or blocking the upper airway. This obstruction causes recurrent pauses in breathing, abrupt drops in blood oxygen levels, and brief awakenings, leading to loud disruptive snoring, morning headaches, unrefreshing sleep, and chronic daytime sleepiness, while increasing long-term cardiovascular risks.

Alternate Names:
OSA; Obstructive Sleep Apnea Syndrome (OSAS)

Obstructive Sleep Apnea Syndrome

Alternate name; see *Obstructive Sleep Apnea*.

Obstructive Uropathy

A blockage anywhere between the kidneys and the urethra that slows or stops urine flow. Stones, scarring, an enlarged prostate, tumors, or pressure from nearby tissue may cause it and can damage the kidneys if not relieved.

Obtund

To blunt or reduce alertness, responsiveness, or sensation; in clinical use, it often refers to reducing a person's level of alertness.

Obtundation

A state of reduced alertness and slowed responses, in which a person remains responsive to stronger voice or touch. It may result from illness, medicines, metabolic disturbance, poisoning, or brain disease.

Obtunded

Having reduced alertness and slowed responses but still responding to a loud voice or touch. It can result from medicines, illness, metabolic problems, poisoning, or brain disease.

Obturator

Relating to a structure that closes an opening. In the pelvis, the obturator nerve helps control muscles that draw the thigh inward and carries feeling from part of the inner thigh; the obturator artery supplies nearby muscles.

Obturator Canal

A short passage in the pelvic bone through which the obturator nerve and blood vessels travel from the pelvis to the inner thigh.

Obturator Foramen

A large opening in each side of the pelvis, mostly covered by a strong membrane. The obturator canal is a small passage at its upper edge for a nerve and blood vessels.

Obturator Hernia

A rare hernia in which part of the intestine pushes through an opening in the pelvic bone. It can block the bowel and may cause pain in the inner thigh.

Obturator Nerve

A nerve from the lumbar plexus that supplies muscles responsible for bringing the thigh inward and carries sensation from part of the inner thigh.

Obturator Sign

A physical examination finding in acute appendicitis or pelvic peritonitis; with the patient supine, passive internal rotation of the flexed right hip stretches the obturator internus muscle against the inflamed pelvic appendix, provoking acute right lower quadrant or pelvic pain.

Alternate Names:
Cope's Obturator Test; Obturator Internus Sign

Obtuse Marginal Artery

A branch of the circumflex coronary artery that runs along the outer border of the heart and supplies part of the left ventricle. Its size and number vary between people; blockage can cause a heart attack.

Occipital

Relating to the back of the head, the occipital bone, or the occipital lobe. These structures protect and support the brain and help process visual information and head or neck movement.

Occipital Bone

The bone at the back and base of the skull. It surrounds the opening where the spinal cord joins the brain and connects with the first neck vertebra.

Occipital Diastasis

Widening or separation of a joint between bones at the back of a newborn's skull. It may follow difficult birth or abnormal development, and imaging assesses its extent and associated injury.

Occipital Hematoma

A collection of blood in the scalp or tissues over the back of the head, usually after blunt trauma. It may cause a tender, localized swelling and can occur with other scalp, skull, or intracranial injuries.

Occipital Lobe

The part of the brain at the back of the head that receives and interprets visual signals. Injury or disease may cause missing areas of vision, difficulty recognizing objects, or visual hallucinations.

Occipital Neuralgia

Brief attacks of sharp, stabbing, or electric-shock pain caused by irritation of nerves at the back of the head. Pain may spread from the upper neck across the scalp and can be associated with tenderness or sensitivity to touch.

Occiput

The back part of the skull and the back of the head. It protects the rear of the brain and includes the occipital bone, which joins the skull base and neck.

Occiput Posterior Position

A position during labor in which the back of the baby's head faces the pregnant person's back. It can cause back pain or slow descent, although many babies rotate to a better position during labor.

Occiput Transverse Position

A fetal head position in which the back of the baby's head faces the pregnant person's side. It often rotates during labor; if it persists, descent may be slow and assisted delivery or cesarean birth may be needed.

Occlude

To block or close a passage, vessel, airway, duct, or opening. An occlusion may be caused by a clot, stone, swelling, scar, tumor, foreign object, or de-

liberate medical treatment.

Occlusal Adjustment

Selective reshaping of tooth surfaces to improve how the upper and lower teeth meet and reduce abnormal contact or bite interference.

Occlusal Guard

A removable device worn over the teeth to protect them from grinding, clenching, or injury. A night guard may reduce tooth wear during sleep, while a sports mouthguard protects against blows; it does not treat every cause of jaw pain.

Occlusal Splint

A removable dental appliance that changes or protects tooth contact and may reduce effects of grinding, jaw-joint strain, or selected bite problems.

Occlusion

Partial or complete blockage of a blood vessel or body passage. It may be caused by a blood clot, plaque, pressure, swelling, or an intentional medical procedure; the effects depend on the location and can include reduced blood flow, pain, or organ damage.

Occlusive Vascular Disease

Disease in which narrowing or blockage of a blood vessel reduces or stops blood flow to tissues.

Occult

Hidden or not readily visible or detectable on routine examination. An occult disease or bleeding may be found only with imaging, microscopy, or laboratory testing.

Occult Blood

Blood that is not visible to the naked eye and is detected by laboratory testing. In stool, it may be detected by a chemical guaiac test or an immunochemical test; the method and specimen determine the collection instructions and possible dietary or medicine effects. A positive stool test indicates blood is present but does not establish its cause.

Occult Blood Screen

Alternate name; see *Fecal Occult Blood Test*.

Occult Gastrointestinal Bleeding

Slow or intermittent bleeding somewhere in the digestive tract that cannot be seen in the stool. It may cause iron-deficiency anemia, tiredness, or a positive stool blood test and can have many possible sources.

Occult Primary Cancer

Alternate name; see *Carcinoma Of Unknown Primary*.

Occupational Asthma

Asthma caused by workplace exposures, such as flour dust, latex, chemicals, or fumes, or recurrence of previously inactive asthma after such exposure. Symptoms may improve on days away from work and worsen during exposure. Asthma that began independently and is only worsened by work is called work-aggravated asthma.

Occupational COPD

Chronic obstructive pulmonary disease caused or worsened by repeated workplace exposure to dust, fumes, chemicals, smoke, or other inhaled hazards. It causes lasting airflow limitation, cough, phlegm, and breathlessness; smoking and other risks may also contribute.

Occupational Dermatoses

Skin diseases caused or worsened by workplace conditions, such as repeated wet work, chemicals, gloves, dust, plants, or friction. Common examples are irritant and allergic contact dermatitis, often affecting the hands. The pattern depends on the exposure, duration, and individual susceptibility.

Occupational Disease

An illness caused or significantly worsened by workplace exposures or conditions. Examples include asthma from dust, hearing loss from noise, skin disease from chemicals, and lung disease from harmful particles.

Occupational Exposure

Contact with a potentially harmful substance, energy source, or condition during work. Examples include radiation, chemicals, dust, noise, heat, infection, and repetitive strain. Risk depends on the hazard, amount, duration, and protective controls; monitoring and prevention are part of occupational health.

Occupational Exposure Limit

A concentration or level of a substance in the workplace set for a defined exposure period. Limits vary by substance and jurisdiction and may be legally enforceable or advisory.

Occupational Health

The medical field focused on preventing work-related illness, injury, and harmful exposure while supporting workers' health.

Occupational Hearing Loss

Hearing damage caused by repeated or prolonged workplace noise or ototoxic substances. It is usually permanent and may cause difficulty understanding speech, especially in background noise. The pattern and severity depend on the exposure, duration, and individual susceptibility.

Occupational Lung Disease

Lung disease caused or worsened by dusts, fumes, gases, vapors, fibers, or other exposures at work. Examples include occupational asthma, pneumoconiosis, hypersensitivity pneumonitis, and asbestos-related disease.

Occupational Rehabilitation

Assessment, treatment, and workplace support that help a person return to work or remain employed after illness, injury, or disability. It may include graded activity, skills training, equipment, job changes, and coordination with employers and clinicians.

Occupational Safety And Health

Rules and practices that protect workers from injuries, illness, dangerous exposures, and unsafe conditions. Measures include training, protective equipment, ventilation, safe procedures, health monitoring, and reporting or controlling workplace hazards.

Occupational Therapist

A healthcare professional who helps people perform daily activities through rehabilitation, adaptive techniques, environmental changes, and assistive equipment.

Occupational Therapy

Rehabilitation that helps a person perform daily activities, work, school, and other meaningful tasks after illness, injury, or disability. It may use exercises, practice, adaptive equipment, changes to the environment, and strategies for movement, thinking, or sensory problems.

Occupational Therapy Assessment

An evaluation of how illness, injury, disability, or development affects daily activities, school, work, and self-care. The therapist identifies strengths and barriers and recommends exercises, skills practice, equipment, or environmental changes.

OCD

Obsessive-compulsive disorder, a condition involving recurrent unwanted thoughts or urges and/or repetitive behaviors or mental acts that cause distress or interfere with daily life.

Alternate Names:
Obsessive-Compulsive Disorder

Ochre

A yellow-brown color or earth pigment. In medicine, ochre discoloration can describe yellow-brown skin or tissue changes caused by pigment, blood breakdown, chronic congestion, or other conditions.

Ochronosis

Blue-black or brown discoloration of cartilage, tendons, skin, or the whites of the eyes caused by buildup of a chemical called homogentisic acid. It is most often linked to the inherited disorder alkaptonuria and may cause arthritis.

OCP

OCP commonly means oral contraceptive pill, a medicine containing estrogen, progestin, or both to prevent pregnancy and sometimes treat menstrual disorders.

Octreoscan

Nuclear-medicine imaging using indium-111-labeled octreotide, which binds to somatostatin receptors. It can demonstrate receptor-positive neuroendocrine tumors and their distribution; it is an older form of somatostatin-receptor imaging.

Octreotide

Octreotide is a somatostatin analogue that suppresses growth hormone, several gastrointestinal hormones, and intestinal secretion; it is used for acromegaly, certain neuroendocrine tumors, and selected secretory diarrhoeas.

Ocular

Relating to the eye or vision. The term may describe an eye structure, examination, medicine, injury, infection, or disease affecting sight. Sudden severe pain or sudden loss of vision can indicate an ocular emergency.

Ocular Albinism

Ocular albinism is an inherited disorder with reduced pigment primarily in the eyes, causing decreased visual acuity, nystagmus, photophobia, and abnormal retinal development.

Ocular Bobbing

Repeated rapid downward movements of both eyes followed by a slower return toward the primary position. It is classically associated with dysfunction in the pons or other brainstem pathways.

Alternate Names:
Fast Downward Ocular Movement; Pontine Ocular Bobbing

Ocular Burns and Chemical Injuries

Injuries to the eye from chemicals, heat, radiation, or other agents. Damage may involve the conjunctiva, cornea, limbus, eyelids, or deeper structures and can threaten vision.

Ocular Cicatricial Pemphigoid

A chronic autoimmune disease that scars the conjunctiva, the membrane covering the white of the eye and lining the eyelids. It can cause eyelid scarring, lashes rubbing the eye, corneal damage, and vision loss; it may also affect other mucous membranes.

Ocular Fixation

The ability to hold the eyes steadily on a target; abnormal fixation can impair visual acuity, tracking, or alignment.

Ocular Flutter

An involuntary ocular motility disorder characterized by rapid, conjugate, horizontal saccadic oscillations without an intersaccadic pause around the point of visual fixation, occurring in paraneoplastic syndromes, viral encephalitis, and cerebellar dysfunction.

Alternate Names:
Horizontal Saccadic Flutter

Ocular Foreign Body

A particle lodged on the conjunctiva or cornea, or penetrating the eyeball. It may cause pain, redness, tearing, or a foreign-body sensation; a penetrating object can damage internal eye structures.

Alternate Names:
Foreign Body in Eye

Ocular Gnathostomiasis

A rare form of visceral gnathostomiasis in which migrating *Gnathostoma* larvae invade tissues of the eye. Depending on the site, it can cause eyelid swelling, conjunctival or intraocular inflammation, bleeding, retinal scarring or detachment, and vision loss.

Ocular Histoplasmosis Syndrome

An eye condition linked to an earlier histoplasmosis infection. It can cause scars in the retina and, in some people, abnormal blood vessels that damage

central vision.

Ocular Hypertension

Higher-than-normal intraocular pressure (pressure inside the eye) without glaucomatous optic neuropathy (damage to the optic nerve) or visual-field loss. It is a risk state for glaucoma, but does not mean glaucoma is already present or certain to develop.

Ocular Hypotony

Abnormally low pressure inside the eye. The cutoff varies, but pressure around 5–6 mmHg or lower is often considered very low. Causes include reduced fluid production or excess fluid drainage; severe or lasting hypotony can damage the retina or other eye tissues.

Alternate Names:
Hypotony, Ocular; Ocular Hypotension; Low Eye Tension

Ocular Ischemic Syndrome

Eye findings caused by severely reduced blood flow through the arteries supplying the eye, usually from advanced carotid artery disease. It may cause gradual or sudden vision loss, eye pain, retinal changes, or abnormal new blood vessels.

Ocular Larva Migrans

Eye infection caused by migrating larvae of *Toxocara* roundworms, usually affecting one eye. It can cause inflammation inside the eye, a white pupil, reduced vision, crossed eyes, or retinal damage. Diagnosis uses the eye findings, exposure history, and sometimes blood tests.

Ocular Melanoma

A malignant tumor of pigment-producing melanocytes in the eye. Most primary intraocular melanomas arise in the uvea, comprising the iris, ciliary body, and choroid; melanoma can also arise in the conjunctiva. Uveal tumors may be asymptomatic initially and can spread through the bloodstream, most often to the liver.

Ocular Migraine

An imprecise term often used for visual aura with migraine, which usually affects both eyes because it arises in the brain. True retinal migraine causes reversible visual symptoms in one eye and is rare; temporary vision loss can also have other causes.

Ocular Motility

The ability of the eyes to move together in a coordinated way. Abnormal eye movements or poor alignment can cause double vision, eyestrain, dizziness, or reduced vision and may result from muscle, nerve, brain, or eye disease.

Ocular Myasthenia Gravis

A form of myasthenia gravis in which weakness affects only the muscles that move the eyes and lift the eyelids. It causes drooping eyelids or double vision that worsens with use and improves with rest. Symptoms may later spread to swallowing, speech, breathing, or limb muscles.

Alternate Names:
OMG; Ocular MG

Ocular Myiasis

Infestation of the eye or nearby tissues by fly larvae. It can cause pain, irritation, tearing, and vision problems.

Ocular Oncology

The ophthalmic subspecialty concerned with tumors of the eye and surrounding structures, including the uvea, retina, conjunctiva, eyelids, and orbit. It evaluates both benign and malignant ocular tumors and coordinates diagnosis and tumor-directed care with pathology, radiology, and other cancer specialists.

Ocular Orbit

The bony cavity around the eye. It contains the eyeball, eye-movement muscles, nerves, blood vessels, glands, and protective tissues.

Ocular Pain

Pain in or around the eye caused by surface irritation, infection, inflammation, injury, glaucoma, or disease of tissues surrounding the eye. It may be accompanied by redness, tearing, light sensitivity, visual change, or pain with eye movement, depending

on the cause.

Ocular Proptosis

Forward protrusion or bulging of one or both eyeballs out of the eye socket. See *Proptosis*.

Ocular Rosacea

Rosacea affecting the eyelids or surface of the eyes, causing burning, redness, a gritty feeling, dryness, or light sensitivity. Persistent inflammation can affect the cornea and may impair the eye surface.

Ocular Surface Disease

A group of conditions affecting the eye's surface, eyelids, or tears, including dry eye and eyelid inflammation. Symptoms may include burning, redness, irritation, and blurred or changing vision.

Ocular Toxoplasmosis

A retinal infection or inflammation caused by Toxoplasma gondii, which can produce blurred vision, floaters, pain, and recurrent retinal scars.

Oculocardiac Reflex

A slowing of the heartbeat or similar body response caused by pressure or pulling on the eye or tissues around it.

Oculocephalic Reflex

A brainstem reflex sometimes tested in an unconscious person by moving the head. In people who cannot focus their eyes, the eyes normally move opposite to the head movement. The response provides information about brainstem pathways and is interpreted with other examination findings.

Oculocerebrorenal Syndrome

An older name for Lowe syndrome, a rare X-linked disorder caused by changes in the *OCRL* gene. It primarily affects the eyes, brain, and kidneys and commonly causes congenital cataracts, low muscle tone, developmental impairment, and progressive kidney dysfunction.

Alternate Names:
Lowe Syndrome; Lowe Oculocerebrorenal Syndrome

Oculocutaneous Albinism

A group of inherited conditions in which reduced melanin affects the skin, hair, and eyes. Vision findings vary by type; reduced pigmentation can increase sensitivity to sunlight and the risk of skin damage and skin cancer.

Oculogyric Crisis

A prolonged, involuntary upward turning of the eyes, often caused by a medicine or neurologic disorder.

Oculomotor Nerve

The third cranial nerve, controlling most eye movements, eyelid lifting, and pupil narrowing. Damage can cause double vision, a drooping eyelid, an outward-turning eye, or an abnormally enlarged pupil.

Oculomotor Nerve Palsy

Weakness or paralysis of muscles supplied by the third cranial nerve, causing eyelid drooping, double vision, abnormal eye position, and sometimes a dilated pupil.

Oculomotor Nucleus

A group of nerve cells in the midbrain that controls most eye movements, lifts the upper eyelid, and narrows the pupil through the third cranial nerve.

Oculopharyngeal Muscular Dystrophy

An inherited muscle disease that usually begins in middle age and gradually weakens the eyelids and throat muscles. Drooping eyelids and difficulty swallowing are typical; weakness of the hips and shoulders may develop later. Most cases result from a repeat expansion in the *PABPN1* gene.

Alternate Names:
OPMD

Oculoplastic Procedures

Operations on the eyelids, tear ducts, eye socket, or nearby facial tissues to restore function, repair injury, remove disease, or change appearance. Risks include bleeding, infection, scarring, dry eyes, and rarely injury affecting vision.

Oculoplastic Surgery

An ophthalmic surgical subspecialty concerned with disorders of the eyelids, orbit, tear drainage system, and nearby facial tissues. It includes reconstructive, functional, and selected cosmetic surgery.

Alternate Names:
Oculoplastics and Orbital Surgery; Oculofacial Plastic and Reconstructive Surgery; Ophthalmic Plastic Surgery

Oculosympathetic Palsy

Alternate name; see *Horner's Syndrome*.

Oculovestibular Reflex

A brainstem reflex tested by stimulating the balance organs in the inner ear. In an unconscious person with an intact brainstem, cold water in the ear canal normally causes both eyes to drift slowly toward that side; the response is interpreted with other examination findings.

Alternate Names:
Caloric Vestibulo-Ocular Reflex

ODD

Abbreviation; see *Oppositional Defiant Disorder*.

Odontalgia

Pain coming from a tooth or the tissues around it. Common causes include decay, a cracked tooth, infection, gum disease, or injury; swelling, fever, difficulty swallowing, or severe pain can indicate spreading infection or other significant disease.

Odontoblast

A cell along the inner part of a tooth that makes dentin, the hard layer beneath enamel. Odontoblasts produce dentin while teeth develop and can make limited repairs after injury.

Odontoclast

A cell that breaks down the hard tissues of a tooth. This process helps baby teeth be shed naturally, but unwanted tooth resorption can weaken a tooth and may follow injury, inflammation, pressure, or other disease.

Odontodysplasia

Odontodysplasia is abnormal development of tooth enamel and dentin, producing thin, weak, discolored teeth that may erupt late or be easily damaged.

Odontogenesis

The process by which teeth form and develop before and after birth. Problems during development can cause missing teeth, weak enamel, abnormal dentin, or changes in tooth shape and eruption.

Odontogenic Cutaneous Fistula

An abnormal tunnel from an infected tooth to the skin, usually on the chin, cheek, or jaw. It may appear as a small draining opening; treating the tooth infection usually closes the tunnel.

Odontogenic Cyst

A fluid-filled sac arising from tissues involved in tooth development, usually within the jaw. It may be painless or cause swelling, tooth displacement, infection, or bone damage.

Odontogenic Fibroma

An odontogenic fibroma is a rare benign tumor arising from tooth-forming connective tissue, usually presenting as a jaw lesion.

Odontogenic Infection

An infection arising from a tooth or the tissues around it, usually caused by dental caries, pulp infection, gum disease, or trauma. It may form an abscess and spread into the jaw, face, neck, or bloodstream.

Odontogenic Keratocyst

A cyst that develops in the jaw from tooth-forming tissue. It may grow into bone without causing symptoms, can recur after removal, and is sometimes associated with an inherited skin-cancer syndrome; imaging and tissue examination guide treatment.

Odontogenic Keratocyst Pathology

An odontogenic cyst typically lined by a thin, uniform parakeratinized stratified squamous epithelium

with a palisaded basal layer. Satellite cysts and a tendency to recur may be present.

Odontogenic Neoplasm

An odontogenic neoplasm is a growth arising from tissues involved in tooth formation, usually in the jaw; it may be benign or malignant.

Odontogenic Tumors and Cysts

Alternate name; see *Jaw Tumors And Cysts*.

Odontoid Process

A peg-like projection from the second neck vertebra that fits into the first neck vertebra and allows the head to turn from side to side.

Odontoma

A noncancerous overgrowth of tooth-forming tissue, usually found in the jaw and often discovered when a permanent tooth fails to erupt. It may look like several small teeth or a solid calcified mass and is usually removed if it blocks eruption.

Odontopathy

Any disease or abnormality affecting a tooth or the tissues supporting it. Examples include tooth decay, gum disease, infection, abnormal tooth development, wear, and injury. Untreated dental infection can spread to surrounding tissues and occasionally to the bloodstream.

Odynophagia

Pain when swallowing, often felt as burning, squeezing, or a sticking sensation in the throat or chest. Causes include infection, reflux, ulcers, medicines, injury, and other swallowing-tube disorders.

Oedema

British spelling of edema: abnormal fluid accumulation in tissues that causes swelling. Causes include injury, infection, venous disease, heart or kidney failure, medicines, and lymphatic blockage.

Oesophageal

Relating to the oesophagus, the muscular tube carrying swallowed material from the pharynx to the stomach.

Oesophageal Atresia

A birth defect in which the swallowing tube ends blindly instead of connecting normally to the stomach. A baby may drool, cough, choke, or turn blue during feeds; treatment involves surgery, especially when an abnormal connection to the airway is also present.

Oesophageal Ulcer

An open sore in the swallowing tube between the throat and stomach. Reflux, infection, medicines, corrosive injury, inflammation, or cancer may cause it, leading to painful swallowing, chest pain, bleeding, or difficulty swallowing.

Oesophageal Varices

Enlarged fragile veins in the wall of the swallowing tube, usually caused by high pressure in the liver's circulation. They may cause no symptoms until they rupture, leading to vomiting blood or black stools and a life-threatening emergency.

Oesophagitis

Alternate spelling; see *Esophagitis*.

Oesophagoscopy

Examination of the food pipe using a thin viewing tube passed through the mouth. It can investigate swallowing difficulty, pain, bleeding, or abnormal tissue, and can remove a foreign body, take samples, stop bleeding, or widen a narrowing. Sedation or anesthesia is usually used.

Oesophagus

The muscular tube that transports swallowed food and liquid from the pharynx to the stomach.

Oestradiol

British spelling of estradiol, the main naturally occurring estrogen during the reproductive years. It supports reproductive development, the menstrual cycle, bone health, and other body functions.

Oestriol

A form of estrogen made in large amounts during pregnancy by the placenta using substances from the fetus and pregnant person. Its level can be measured in some prenatal screening tests, but it is not interpreted alone to diagnose a problem.

Oestrogen

British spelling; see *Estrogen*.

Oestrogen Replacement Therapy

Treatment with estrogen, sometimes combined with a progestogen, to relieve symptoms caused by low estrogen such as hot flushes and vaginal dryness. Benefits and risks depend on age, medical history, uterus status, dose, and route, so treatment is individualized.

Oestrogens

British spelling; see *Estrogens*.

Oestrone

A form of estrogen made by the ovaries and by conversion of other hormones in body tissues. It becomes the main estrogen after menopause and affects reproductive tissues, bones, blood vessels, and metabolism.

Ofatumumab

A monoclonal antibody that targets CD20 on B cells. It is used to treat adults with relapsing forms of multiple sclerosis and has also been used for selected blood cancers; it can lower B-cell numbers and increase infection risk.

Off-Label

Use of an approved medicine for an indication, dose, route, or population not specified in its regulatory approval.

Off-Label Use

Use of an approved medicine for a condition, dose, route, or age group not specifically included in its official approval. A clinician may choose it when evidence and expected benefits support its use.

Offspring

The young or descendants produced by one organism or by a pair. In medicine and genetics, offspring may be studied to understand inherited traits, pregnancy outcomes, developmental conditions, and disease risk.

Ofloxacin

A fluoroquinolone antibiotic used for selected susceptible bacterial infections. It can cause serious tendon, nerve, heart-rhythm, and other adverse effects.

Ogilvie'S Syndrome

Another spelling of Ogilvie syndrome: severe widening of the large intestine without a physical blockage, often after surgery or during serious illness. Rising pressure can reduce blood flow or cause a bowel perforation.

Ogilvie Syndrome

A dangerous widening of the large intestine without a physical blockage, usually in a seriously ill or recently operated patient. Abdominal swelling, pain, nausea, or failure to pass stool may occur, and the bowel can perforate if untreated.

OHL

White, corrugated, non-scrapable patches on the lateral borders of the tongue caused by Epstein-Barr virus in immunocompromised patients. See *Oral Hairy Leukoplakia*.

Ohm

The standard unit of electrical resistance, equal to one volt per ampere. In medical equipment, resistance affects how electrical current flows through devices, sensors, wires, and body tissues.

OHSS

Abbreviation; see *Ovarian Hyperstimulation Syndrome*.

Oidium

A fragment or spore-like fungal element formed by

fragmentation of a hypha; the term is also used in older fungal classifications.

Oil

A hydrophobic liquid used as a nutrient, solvent, emollient, or medicinal preparation; safety depends on the specific oil.

Oil Red O

A fat-soluble histologic dye used to stain neutral lipids red in tissue. It is commonly used on frozen sections because routine tissue processing can remove much of the lipid.

Alternate Names:
Oil-Red-O

Oily Hair

Hair that appears greasy because the scalp produces excess oil or because of product buildup. It may occur with infrequent washing, hormonal changes, or some skin conditions and is not poisoning.

Oily Skin

Skin that produces more oil than usual, often causing shine, enlarged-looking pores, or acne. It may occur with hormonal changes, genetics, or some skin conditions; persistent acne or irritation can have other underlying causes.

Ointment

A thick, semisolid preparation applied to the skin, inside the nose, or other body surfaces. Its oily base helps protect the area and keep it moist; some ointments also contain medicines that treat infection, inflammation, pain, or other conditions.

Ointment Bases

Semisolid materials that carry medicines applied to the skin or moist body surfaces. They affect how easily a product spreads, how much moisture it retains, how much medicine enters tissue, and how long it remains stable.

Okadaic Acid

A toxin made by certain marine organisms that can accumulate in shellfish. Eating contaminated shellfish may cause diarrhoea and vomiting; in laboratories it is used to study enzymes that remove phosphate groups from proteins.

Okihiro Syndrome

A rare inherited condition caused by changes in the SALL4 gene. It may combine abnormalities of the thumb or forearm with difficulty moving the eyes, and may also affect hearing, the heart, kidneys, or spine.

Olanzapine

Olanzapine is an atypical antipsychotic that blocks dopamine and serotonin receptors and treats schizophrenia and bipolar disorder; weight gain, diabetes, dyslipidaemia, sedation, and movement disorders are important risks.

Olaparib

Olaparib is a PARP inhibitor used for selected cancers with BRCA or other homologous-recombination repair defects; anaemia, nausea, fatigue, myelosuppression, and rare myelodysplastic syndrome or acute myeloid leukaemia may occur.

Old Age

Later life, a period associated with wide variation in physical function, chronic illness, cognition, and social circumstances.

Oleander Poisoning

Poisoning from eating oleander, which contains toxins that affect the heart. Nausea, vomiting, dizziness, confusion, slow or irregular heartbeat, fainting, or seizures may occur.

Olecranon

The prominent bony process at the proximal end of the ulna forming the point of the elbow.

Olecranon Bursitis

Inflammation of the subcutaneous synovial bursa overlying the olecranon process of the ulna, presenting with fluctuant, localized swelling over the pos-

terior elbow, provoked by repetitive trauma ("student's elbow"), gout, or bacterial infection (septic bursitis).

Alternate Names:
Student Elbow; Miner Elbow

Olecranon Fossa

A deep triangular depression on the posterior surface of the distal humerus superior to the trochlea that accommodates the curved olecranon process of the ulna during full elbow extension.

Oleic Acid

A monounsaturated fat found in olive oil, nuts, seeds, avocados, and many other foods. Replacing some saturated fats with it may support healthier blood cholesterol levels as part of a balanced diet.

Oleum

A very corrosive mixture of sulfur trioxide and sulfuric acid, used industrially and dangerous to skin, eyes, and lungs.

Olfaction

The sense of smell. Odor molecules stimulate special cells in the upper part of the nose, which send signals to the brain to identify and perceive odors.

Olfactory

Relating to the sense of smell or the nerves and brain pathways that process odors. Problems in this system can cause reduced smell, loss of smell, distorted smells, or unusual odor sensations.

Olfactory Bulb

The olfactory bulb is a forebrain structure that receives signals from nasal smell receptors and begins processing odor information.

Olfactory Cortex

The olfactory cortex is a group of brain regions that interprets smell signals and links them with memory, emotion, and behavior.

Olfactory Gyrus

The olfactory gyrus is a cortical region associated with processing olfactory information and includes areas near the medial temporal and frontal lobes.

Olfactory Learning

Olfactory learning is acquisition or modification of behavior or memory through exposure to odors and their associations.

Olfactory Mucosa

The olfactory mucosa is specialized nasal lining containing receptor neurons, supporting cells, and glands that detect odor molecules.

Olfactory Nerve

The first cranial nerve, which carries smell signals from specialized cells high in the nose to the brain. Injury or disease can reduce or eliminate the sense of smell or distort odors.

Olfactory Neuroblastoma

A rare malignant tumor arising in the upper nasal cavity near the olfactory nerves, often causing nasal blockage, nosebleeds, or reduced smell.

Olfactory Tract

The olfactory tract is a bundle of nerve fibers carrying smell information from the olfactory bulb to cerebral regions involved in odor perception.

Olfactory Tubercle

The olfactory tubercle is a ventral forebrain region involved in odor processing, reward, motivation, and integration with limbic circuits.

Oligoasthenoteratozoospermia

A semen abnormality in which sperm numbers are low, movement is reduced, and fewer sperm have a typical shape. It can reduce fertility and may result from testicular disease, hormone problems, heat, medicines, smoking, or an unknown cause. Repeat semen testing and evaluation help guide treatment or assisted reproduction.

Alternate Names:

OAT Syndrome; OAT

Oligoclonal Bands

Distinct bands of immunoglobulins, usually IgG, detected by laboratory testing of cerebrospinal fluid and compared with a blood sample. Bands present in cerebrospinal fluid but not blood indicate antibody production within the central nervous system; they occur in multiple sclerosis and other infectious or inflammatory conditions and are not specific to multiple sclerosis.

Oligocythaemia

An obsolete term for a red blood cell count below the reference range. It is not itself a definition of anemia, which is identified by a low hemoglobin concentration relative to the appropriate reference range.

Oligodendrocyte

A supporting cell in the central nervous system that forms myelin around axons. Myelin helps nerve signals travel quickly; oligodendrocytes can be damaged in disorders such as multiple sclerosis.

Oligodendroglia

Oligodendroglia are glial cells of the central nervous system that produce myelin around axons and support nerve conduction.

Oligodendroglial Neoplasm

An older descriptive term for a brain tumor whose cells resemble oligodendrocytes, the cells that form myelin around nerve fibers. It is not a precise current diagnosis: an oligodendroglioma is classified by an IDH gene mutation and deletion of chromosome arms 1p and 19q, while other tumors with similar-looking cells receive different diagnoses.

Oligodendroglioma

A diffuse glioma defined by an IDH1 or IDH2 mutation and whole-arm codeletion of chromosomes 1p and 19q. It most often arises in the cerebral hemispheres and may cause seizures or other neurologic symptoms. Histologic grade and clinical features influence its behavior.

Oligodontia

Congenital absence of six or more permanent teeth, usually excluding the third molars. It may occur alone or with a genetic syndrome and can affect chewing, speech, appearance, and jaw development. The number and pattern of missing teeth help distinguish it from hypodontia and anodontia.

Oligogenic Inheritance

A pattern in which changes in a small number of genes work together to influence a disease or characteristic. The combination and strength of the changes can make symptoms differ among affected people.

Oligohydramnios

A lower-than-expected amount of amniotic fluid during pregnancy, commonly identified on ultrasound by a deepest vertical fluid pocket of less than 2 cm. Causes include leaking membranes, placental problems, fetal kidney or urinary-tract conditions, or a pregnancy continuing beyond the due date.

Oligomenorrhea

Infrequent menstrual periods. In adults more than three years after the first period, cycles longer than 35 days or fewer than 8 cycles a year are commonly considered irregular; definitions vary with age and time since menstruation began. Causes include ovulation disorders, polycystic ovary syndrome, endocrine disease, undernutrition, excessive exercise, or perimenopause.

Oligomenorrhea (Infrequent Menstruation)

Alternate name; see *Oligomenorrhea*.

Oligomenorrhoea

British spelling; see *Oligomenorrhea*.

Oligometastasis

A state in which cancer has spread to a limited number of sites that may be suitable for treatment directed at each site. The number used to define "limited" varies by cancer type and study; the term does not by itself predict outcome.

Oligonucleotide

A short piece of DNA or RNA made in the laboratory or found in cells. It can be used to detect genetic material, block or change gene messages, or help read and study genes.

Oligopeptide

A short chain of amino acids, usually containing only a few to about 20 building blocks. Oligopeptides can act as hormones, signaling molecules, antimicrobial substances, or parts of larger proteins.

Oligosaccharide

A short chain of sugar molecules joined together. Oligosaccharides form parts of cell-surface molecules, affect how cells recognize one another, and occur naturally in foods where some are used by gut bacteria.

Oligospermia

A lower-than-expected sperm concentration in semen. It can reduce fertility and may result from hormone problems, infections, medicines, heat, toxins, varicoceles, genetic conditions, or problems with sperm production.

Oliguria

Abnormally low urine output. In adults, it is often defined as less than 0.5 mL per kilogram of body weight per hour; thresholds vary by age and clinical setting. Causes include dehydration, reduced blood flow, urinary blockage, kidney disease, or medicines, and it can be a sign of acute kidney injury.

Olivary

Relating to the olive-shaped inferior olivary nucleus of the medulla or to an olive-like structure.

Olivary Nucleus

The olivary nucleus is a brainstem structure that sends timing and motor-learning signals to the cerebellum through climbing fibers.

Olive Pontocerebellar Atrophy

A group of progressive brain disorders that damage areas controlling balance and coordination. They may cause worsening unsteadiness, clumsy movements, slurred speech, stiffness, or other neurologic problems.

Olivopontocerebellar Atrophy

A descriptive term for degeneration affecting the inferior olives, pons, and cerebellum, usually associated with progressive incoordination. It has been used for several inherited and sporadic neurologic disorders rather than one distinct disease.

Ollier Disease

A rare, non-hereditary skeletal dysplasia characterized by multiple benign cartilaginous enchondromas developing predominantly in the metaphyses and diaphyses of long bones with marked asymmetrical skeletal involvement and significant risk of malignant chondrosarcoma transformation.

Alternate Names:
Multiple Enchondromatosis; Dyschondroplasia

Ollier's Disease

A nonhereditary skeletal disorder with multiple enchondromas, causing deformity, limb-length discrepancy, and an increased risk of malignancy.

Olmesartan Medoxomil

An oral prodrug converted to olmesartan, an angiotensin II receptor blocker used to treat high blood pressure.

Olopatadine Hydrochloride

Olopatadine hydrochloride is an antihistamine used in eye drops or nasal spray to treat allergic conjunctivitis or rhinitis.

OLP

Abbreviation; see *Oral Lichen Planus*.

Olsenella

Olsenella is a genus of anaerobic bacteria found mainly in the mouth and digestive tract; human infection is uncommon.

Olsenella Uli

An anaerobic gram-positive bacterium found in the mouth and associated with periodontal disease; invasive infection is rare.

Omacetaxine Mepesuccinate

Omacetaxine mepesuccinate is a protein-synthesis inhibitor used for selected chronic myeloid leukemia resistant or intolerant to tyrosine-kinase inhibitors.

Omalizumab

Omalizumab is a monoclonal antibody that binds circulating IgE and reduces allergic inflammation; it is used for selected allergic asthma, chronic urticaria, nasal polyps, and food allergy, with rare anaphylaxis.

Omasum

The omasum is the third compartment of a ruminant stomach, absorbing water and small particles before contents reach the abomasum.

Omega-3

A family of polyunsaturated fats found in fish, flaxseed, walnuts, and some supplements, supporting heart and brain health.

Omega-3 Fatty Acid

A polyunsaturated fatty acid characterized by a double bond three carbons from the methyl terminal end, notably eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA). Contributes to cardiovascular, neurological, and anti-inflammatory functions.

Omega-3 Fatty Acids

Plural form; see *Omega-3 Fatty Acid*.

Omega-6

A family of essential polyunsaturated fats, found in vegetable oils, nuts, seeds, and many prepared foods. The body uses them for cell membranes and signaling. Linoleic acid is the main dietary form; replacing saturated fats with unsaturated fats generally supports heart health.

Omega-6 Fatty Acids

Essential polyunsaturated fats found in plant oils, nuts, seeds, and many prepared foods. The body needs them for cell membranes and signaling, but overall health depends on balanced intake with other fats.

Alternate Names:
n-6 Fatty Acids; Omega-6 Polyunsaturated Fatty Acids

Omega-N-Methylarginine

Omega-N-methylarginine is a methylated arginine compound that can inhibit nitric-oxide synthase and affect vascular signaling.

Omega Sign

A descriptive term for a furrowed forehead that resembles the Greek letter omega. It has been reported in severe depression but is not specific and cannot establish a diagnosis.

Alternate Names:
Veraguth's Fold; Depressive Facial Omega

Omenn Syndrome

A severe inherited immune deficiency that usually begins in infancy. Babies may develop widespread red, peeling skin, swollen lymph nodes, enlarged liver or spleen, diarrhea, poor growth, and repeated serious infections.

Omental Caking

Thickening and nodular change in the greater omentum, often caused by cancer spread within the abdomen. Infection and inflammation can also cause a similar appearance; imaging or surgery may identify it, but it is not a diagnosis by itself.

Alternate Names:
Omental Cake

Omentectomy

Removal of part or all of the greater omentum, commonly performed during staging and cytoreduction for ovarian and other intra-abdominal cancers.

Omentum

A fold of fatty tissue inside the abdomen that hangs from the stomach and partly covers the intestines. It contains blood vessels and immune cells and can help limit the spread of infection or inflammation.

Omeprazole

Omeprazole is a proton-pump inhibitor that irreversibly suppresses gastric H+/K+-ATPase; it treats reflux and peptic-ulcer disease and supports Helicobacter pylori eradication, while prolonged use may affect magnesium, B12, bone, and infection risk.

Ommaya Reservoir

A surgically implanted reservoir connected to a catheter in a brain ventricle, used to sample cerebrospinal fluid or deliver selected medicines.

Omphalitis

Infection of a newborn's umbilical stump, usually during the first weeks of life. Redness spreading onto the skin, swelling, pus, bad smell, fever, poor feeding, or unusual sleepiness may occur, and infection can spread rapidly.

Omphalocele

A birth defect in which abdominal organs protrude through an opening at the navel into a protective sac. Other chromosome or organ abnormalities may also occur.

Omphalocele Repair

Treatment to place an infant's abdominal organs back inside the abdomen and close the opening in the abdominal wall. Repair may be immediate or staged according to the size of the defect and the baby's breathing and circulation.

Onchocerca Volvulus

A roundworm parasite that causes river blindness. It spreads to people through repeated bites from infected blackflies, which breed near fast-flowing rivers. Adult worms live in lumps under the skin; their young can move through the skin and eyes and may cause itching, skin changes, or vision loss.

Onchocerciasis

A parasitic infection caused by Onchocerca volvulus and spread by infected blackflies. It can cause intensely itchy skin, nodules, skin changes, and eye inflammation that may lead to permanent visual impairment or blindness.

Oncocytic Neoplasm

A growth made of cells containing unusually many energy-producing structures, giving them a granular appearance under a microscope. It may be noncancerous or cancerous, depending on the organ and the tumor's other features.

Oncocytoma

A usually noncancerous tumor made of cells containing many energy-producing structures. It most often develops in the kidney but can occur in other organs and may resemble cancer on imaging or tissue examination.

Oncogene

A gene that can make cells grow or survive without normal control when it is changed, overactive, or present in too many copies. Oncogene changes can contribute to the development and progression of cancer.

Oncogenic

Capable of causing or promoting cancer. An oncogenic change, virus, gene, or chemical can increase abnormal cell growth or reduce normal control of cell division.

Oncogenicity

The ability of a substance, infection, genetic change, or other factor to contribute to the development of cancer.

Oncogenic Osteomalacia

Osteomalacia caused by excess fibroblast growth factor 23 (FGF23), usually produced by a phosphaturic mesenchymal tumor. FGF23 causes the kidneys to waste phosphate and lowers active vitamin D, impairing bone mineralization; the tumors are usually benign but can rarely be malignant.

Alternate Names:
Tumor-Induced Osteomalacia; TIO

Oncogenic Virus

A virus capable of contributing to cancer by altering cell growth, suppressing tumor defenses, or integrating or maintaining oncogenic genetic material.

Oncologic Emergency

A cancer-related problem that can quickly threaten life, organ function, or the nervous system. Examples include spinal-cord pressure, blocked major chest veins, dangerously high calcium, tumor breakdown, airway blockage, and infection during low white-cell counts.

Oncologist

A doctor who specializes in cancer care. Medical oncologists use medicines, radiation oncologists use radiation, and surgical oncologists operate; many people receive care from more than one type of oncologist.

Oncology

The branch of medicine focused on cancer diagnosis, staging, treatment, and follow-up. It includes medical, radiation, and surgical oncology and coordinates care across specialties for malignant disease and its effects. Supportive and palliative care may also be part of oncology.

Oncology Nursing

Oncology nursing provides cancer-related assessment, treatment support, symptom control, education, coordination, survivorship, and end-of-life care.

Oncology Nutrition

Nutritional care for people with cancer, addressing intake, symptoms, treatment effects, weight, muscle mass, and personal goals.

Alternate Names:
Cancer Nutrition Support; Oncology Nutrition

Oncology PET

A positron-emission tomography scan, often combined with CT, that uses a small radioactive tracer to show active cancer in the body. It may help assess spread, treatment response, or recurrence, but inflammation can also appear active.

Oncology Rehabilitation

Healthcare that helps people prevent or manage cancer-related problems before, during, or after treatment. It may address fatigue, pain, weakness, nerve symptoms, swelling, movement, nutrition, work, daily activities, and emotional wellbeing.

Oncolytic Virotherapy

Oncolytic virotherapy uses modified viruses that preferentially infect and destroy cancer cells and may stimulate an immune response against the tumor.

Oncolytic Virus

A genetically modified or naturally occurring virus that selectively replicates in and lyses cancer cells while stimulating antitumor immune responses.

Oncolytic Viruses

Plural form; see *Oncolytic Virus*.

Oncoprotein

A protein that promotes abnormal cell growth or survival and can contribute to cancer. It may result from a cancer-causing gene, a mutation, a chromosome change, or infection with certain viruses.

Oncosis

A form of cell injury in which cells swell and may die, usually because severe lack of oxygen or another injury disrupts energy production and the movement of salt and water across the cell membrane.

Oncotic Pressure

The pulling force created by proteins in the blood, mainly albumin, that helps keep fluid inside blood vessels. When blood protein is low, fluid may leak into tissues and cause swelling.

Oncotoxic

Harmful to cancer cells or relating to substances that damage tumors. An oncotoxic treatment may also injure healthy cells, with effects depending on the substance, dose, and exposure.

Ondansetron

Ondansetron is a selective 5-HT3-receptor antagonist used to prevent nausea and vomiting after chemotherapy, radiotherapy, surgery, or other triggers; constipation, headache, and QT prolongation can occur.

Ondansetron Hydrochloride

Alternate form; see *Ondansetron*.

Ondine Curse

An older eponym for congenital central hypoventilation syndrome, a disorder in which automatic breathing is inadequate, especially during sleep. Most congenital cases are associated with changes in the *PHOX2B* gene.

Alternate Names:
Congenital Central Hypoventilation Syndrome; CCHS

Ondine'S Curse

Alternate spelling; see *Ondine Curse*.

One-Hour Glucose Challenge Test

A screening test for gestational diabetes, often done at 24–28 weeks as part of a two-step testing approach. After drinking a measured glucose solution, blood sugar is checked one hour later. A high result is not a diagnosis and usually leads to a longer test.

Oneirophrenia

A dreamlike state with confusion or impaired reality testing; the term is uncommon and does not represent a specific modern psychiatric diagnosis.

Onset

Onset is the time or manner in which a symptom, disease, or physiologic change begins, such as sudden, gradual, acute, or insidious onset.

Onychia

Inflammation or infection of the nail or nail-producing tissue. It can cause redness, swelling, pain, pus, or changes in nail growth and may result from bacteria, fungi, injury, or skin disease. Treatment depends on the cause.

Onychauxis

Thickening of the nail plate without the marked claw-like curve of onychogryphosis. It may affect one or more nails and can follow repeated injury, fungal infection, psoriasis, or other nail disease. The thickened nail may become difficult to trim or uncomfortable in footwear.

Onychodystrophy

An abnormal change in the shape, color, thickness, texture, or growth of a nail. It is a finding rather than one specific disease and can result from infection, injury, skin disease, medicines, or illness elsewhere in the body. See also *Nail Abnormalities*.

Onychocryptosis

Onychocryptosis is an ingrown nail, usually at the great toe, in which the nail edge penetrates surrounding skin and causes pain or inflammation.

Onychogryphosis

Severe thickening and overgrowth of a nail, which becomes curved and may resemble a claw. It is more common in older adults and can follow injury, fungal infection, poor circulation, or difficulty caring for the feet; it may cause pain in shoes.

Onycholysis

Separation of the nail plate from the underlying nail bed, beginning distally or laterally. Causes include trauma, psoriasis, fungal infection, thyroid disease, medications, and chemical exposure.

Onychomadesis

Onychomadesis is proximal separation and shedding of a nail caused by temporary arrest of nail-matrix growth, often after infection, systemic illness, trauma, or medication exposure.

Onychomatricoma

A rare, usually benign tumor that begins in the nail matrix, the area that makes the nail plate. It may cause a thickened, yellow nail with lengthwise ridges or bleeding beneath the nail. Its appearance can resemble a fungal infection or other nail growth.

Onychomycosis

A fungal infection of a nail, more common in toenails than fingernails. The nail may become thick, yellow or white, brittle, crumbly, or separated from the skin. A sample may be tested before prolonged antifungal treatment because other nail diseases look similar.

Onychomycosis (Fungal Nail Infection)

Alternate name; see *Onychomycosis*.

Onychopapilloma

A rare, usually benign growth arising from the nail unit. It often causes a lengthwise red or white band in one nail, with thickened skin or a small mass beneath the nail's free edge. It most often affects a fingernail and can resemble other nail disorders.

Onychophagia (Nail Biting)

Alternate name; see *Nail-Biting*.

Onychorrhexis

Lengthwise ridges or splits in the nail plate. The nails may also be brittle and break easily. This change can occur with aging, repeated wetting and drying, nail injury, or skin and general health conditions; it is a sign rather than a single disease.

Onychoschizia

Splitting of the nail plate into thin layers at its free edge. It often affects brittle nails and may follow repeated wetting and drying, chemical exposure, or minor injury. It differs from onychorrhexis, which describes lengthwise ridges or splits.

Onychotillomania

Repeated picking, pulling, or tearing at the nails, causing self-inflicted injury to the nail plate or nearby tissue. It may lead to nail thinning, grooves, discoloration, loss of the nail, or infection. It is distinct from onychophagia, or nail biting.

Oocyte

An immature female reproductive cell in the ovary. Oocytes begin developing before birth and remain paused until they resume maturation during menstrual cycles after puberty. Usually one is released at ovulation; if fertilized, it completes its final maturation and forms an ovum.

Oocyte Cryopreservation

Freezing unfertilized eggs for possible use in future pregnancy. Hormone medicines stimulate the ovaries, and the eggs are collected through the vagina with a needle before being rapidly frozen. Eggs may be stored before cancer treatment or for other fertility-preservation reasons, but freezing does not guarantee a future pregnancy.

Alternate Names:
Egg Freezing

Oocyte Retrieval

A procedure used in assisted reproduction to collect mature eggs from the ovaries. After hormone stimulation, a clinician guides a thin needle through the vagina using ultrasound and gently draws fluid containing the eggs into a container for laboratory fertilization.

Alternate Names:
OPU; Egg Retrieval; Follicular Aspiration

Oocytes

Alternate plural; see *Oocyte*.

Oogenesis

The formation and maturation of egg cells, or ova, in the ovaries. It begins before birth and continues through the reproductive years, with changes during each menstrual cycle.

Oogonium

An oogonium is an early female germ cell that proliferates during embryonic development and gives

rise to primary oocytes.

Oophorectomy

Surgery to remove one or both ovaries. It may treat cancer, a cyst, infection, torsion, or reduce inherited cancer risk; removing both ovaries before natural menopause causes an immediate fall in ovarian hormones.

Oophoritis

Inflammation of an ovary, usually associated with pelvic infection or, less commonly, autoimmune disease. It may cause lower abdominal or pelvic pain, fever, abnormal discharge, or menstrual changes; severe pain can occur with ovarian torsion or abscess.

Ooplasm

Ooplasm is the cytoplasm of an egg cell, containing organelles, nutrients, and molecular factors that support fertilization and early embryo development.

Opacity

Clouding of a normally clear part of the eye, such as the cornea, lens, or fluid inside the eye. It can blur vision and may result from injury, infection, inflammation, swelling, or age-related change.

Open Abdominal Aortic Aneurysm Repair

Open surgery to repair a widened, weakened area of the abdominal aorta. The surgeon reaches the aorta through the abdomen and replaces the damaged section with a strong artificial tube.

Alternate Names:
Open AAA Repair; Surgical AAA Repair

Open-Angle Glaucoma

A type of glaucoma in which the eye's drainage angle remains open, but fluid drains too slowly. Pressure may rise and damage the optic nerve, causing gradual, permanent vision loss, often without early symptoms.

Open Aortic Valve Surgery

Surgery to repair or replace a diseased aortic valve through an incision in the chest. It often uses cardiopulmonary bypass; the specific operation depends on the valve disease and may involve valve repair or replacement.

Alternate Names:
Open Aortic Valve Operation

Open Bite

An open bite is a malocclusion in which upper and lower teeth do not meet in part of the mouth when the jaws are closed.

Open-Book Fracture

A severe pelvic injury in which the front or back pelvic joints separate, making the pelvis widen like an open book. It usually follows major trauma and can cause life-threatening internal bleeding or organ injury.

Open Esophagectomy

Surgical removal of part or all of the esophagus through thoracic and/or abdominal incisions, rather than through a minimally invasive approach. It may be performed for esophageal cancer or selected noncancerous disease; reconstruction commonly uses the stomach or another segment of bowel.

Alternate Names:
Open Esophageal Resection

Open Fracture

A fracture associated with a wound that communicates between the fracture site and the external environment. It carries increased risks of infection and tissue damage.

Open Fractures

Alternate plural; see *Open Fracture*.

Open Gallbladder Removal

Surgery to remove the gallbladder through one larger abdominal incision. It may be needed when keyhole surgery is unsafe or cannot be completed; bleeding, infection, bile leakage, and injury to nearby ducts or organs are possible.

Open-Heart Surgery

Surgery in which the chest is opened to repair or treat the heart or its major blood vessels. Some operations use a heart–lung machine while the heart is temporarily stopped; risks depend on the operation and the person's health.

Opening Snap

A sharp sound heard soon after the heart starts to relax, caused by a stiff mitral valve opening. It suggests mitral valve narrowing and is considered with other examination findings.

Alternate Names:
Mitral Opening Snap; OS Sound

Open Lung Biopsy

An open lung biopsy removes a small piece of lung through a surgical chest incision for microscopic diagnosis when less invasive tests are insufficient.

Open Mitral Valve Surgery

Surgery to repair or replace the mitral valve through an incision in the chest. It often uses a heart-lung machine; the approach depends on the valve problem and the person's health.

Open Pleural Biopsy

An open pleural biopsy removes a sample of the lining around the lung through surgery to investigate cancer, infection, or unexplained pleural disease.

Open Prostatectomy

Surgery through an abdominal incision to remove the part of an enlarged prostate that blocks urine flow. It can improve severe urinary obstruction but may cause bleeding, infection, urine leakage, or changes in sexual and urinary function.

Open Reduction And Internal Fixation

Surgery to expose a broken bone, put the pieces back into position, and hold them with plates, screws, wires, or rods. It is used when a cast or other nonsurgical treatment cannot provide safe alignment or stability.

Alternate Names:
ORIF

Open Surgery

Surgery performed through a relatively large incision that allows the surgeon to see and reach the affected area directly. It is used when a larger working space is needed, although recovery may be longer than after some keyhole procedures.

Open Surgical Wound Care

Care of a surgical wound left partly or completely open to drain or heal gradually, usually with dressings and scheduled assessment for infection, bleeding, and healthy tissue growth.

Operable

Able to be treated with surgery because the disease can be safely reached or removed.

Operant Conditioning

Learning in which the likelihood of a behavior changes because of its consequences, such as reinforcement or punishment.

Operating Room

An operating room is a controlled sterile or semi-sterile clinical area equipped for surgical procedures, anesthesia, monitoring, and recovery support.

Operating Tables

Adjustable tables designed to support and position patients during surgery or other procedures while allowing access and maintaining safety.

Operation

A planned surgical procedure used to diagnose, repair, remove, replace, or improve part of the body. It may be performed through an incision or with instruments inserted through small openings, depending on the condition and goal.

Operative Dentistry

The branch of dentistry that repairs teeth damaged by decay, fractures, wear, or developmental defects. Treatment may include fillings, bonding, reshap-

ing, and other procedures that restore appearance, strength, and function.

Operative Vaginal Delivery

Vaginal birth assisted with a vacuum cup or forceps when the baby's position is suitable and birth needs to be completed promptly. Reasons may include prolonged pushing or concern about the baby's condition; tears, bleeding, or injury to the baby can occur.

Operator

A person who performs a procedure or operates equipment; in healthcare, training and authorization are essential.

Operculum

A lid, covering, or flap-like structure; in anatomy it may cover an opening or cortical region.

Ophthalmia

Inflammation of the eye, especially the conjunctiva or other surface tissues. It may cause redness, discharge, pain, light sensitivity, or blurred vision and can result from infection, allergy, injury, or inflammation.

Ophthalmia Neonatorum

Inflammation or infection of a newborn baby's eye during the first weeks of life. It may be caused by bacteria passed during birth, other infections, or chemical irritation; redness, swelling, or pus may occur and can threaten the cornea and vision.

Ophthalmic

Relating to the eye. An ophthalmic medicine, drop, ointment, or device is formulated or designed for use on or around the eye; contamination can cause infection or injury.

Ophthalmic Emergency

An eye problem that can rapidly cause permanent vision loss or serious injury. Examples include sudden vision loss, retinal detachment, severe eye infection, chemical exposure, a penetrating injury, or rapidly painful high eye pressure.

Ophthalmic Pathology

The medical subspecialty that examines tissue specimens from the eye and ocular adnexa, including the eyelids, conjunctiva, and orbit. Microscopic evaluation helps diagnose tumors, inflammation, infection, degenerative disease, and developmental disorders of these structures.

Ophthalmic Solution

A sterile liquid medicine made for application to the eye. Contamination or sharing can introduce microorganisms and cause eye infection.

Ophthalmitis

Inflammation of the eye caused by infection, immune disease, injury, or surgery. It may cause redness, pain, light sensitivity, discharge, or blurred vision; severe forms can threaten vision.

Ophthalmologist

A medical doctor trained to diagnose and treat eye disease and vision problems. Ophthalmologists can prescribe medicines and glasses, perform eye procedures and surgery, and manage conditions affecting the eye, optic nerve, and visual system.

Ophthalmology

The medical and surgical specialty concerned with the eyes and visual system. Ophthalmologists diagnose and treat eye diseases, assess visual function and refractive errors, prescribe optical correction, and perform ocular procedures and surgery. The field also includes disorders of the optic nerves and visual pathways.

Ophthalmomyiasis

Infestation of the eye by fly larvae. Larvae may remain on the eye surface or enter deeper tissues, causing intense irritation, pain, inflammation, or vision loss; treatment involves removal of the larvae and management of tissue injury.

Ophthalmoplegia

Weakness or paralysis of the muscles that move the eyes, causing restricted eye movement, double vision, or abnormal eye alignment. It may result from disorders of the eye muscles, neuromuscular junction, cranial nerves, or brain pathways; causes include myasthenia gravis, thyroid eye disease, stroke, trauma, and mitochondrial disorders.

Ophthalmoscope

A lighted instrument used to examine the back and internal structures of the eye, including the retina, macula, optic nerve, and retinal blood vessels. Direct ophthalmoscopes provide a magnified view through the pupil, while indirect ophthalmoscopes use a separate light and lens to provide a wider view. Findings may relate to diabetes, high blood pressure, glaucoma, infection, inflammation, or other eye and nervous-system disorders.

Ophthalmoscopy

Examination of the inside of the eye with a lighted instrument. It allows a clinician to inspect the retina, optic nerve, and blood vessels for changes caused by diabetes, high blood pressure, glaucoma, inflammation, or other disease.

Opiate

A naturally occurring opioid alkaloid from the opium poppy, such as morphine or codeine. Opiates can relieve pain but may cause sleepiness, constipation, dependence, and dangerously slow breathing.

Opiate Alkaloid

An opiate alkaloid is a naturally occurring alkaloid from the opium poppy, such as morphine or codeine, with opioid analgesic and dependence potential.

Opiate And Opioid Withdrawal

Opioid withdrawal is a predictable syndrome after reducing or stopping opioid exposure, producing anxiety, sweating, muscle aches, diarrhea, abdominal cramps, nausea, and autonomic symptoms.

Opiate Assay

A laboratory test that detects or measures opiates or their breakdown products in urine, blood, saliva, or another specimen. Results may support clinical care or toxicology testing, but some synthetic opioids require separate tests.

Opiate Overdose

A life-threatening amount of an opioid medicine or drug that slows brain and breathing activity. Extreme sleepiness, pinpoint pupils, slow or absent breathing, blue lips, or inability to wake may occur. Naloxone can sometimes restore breathing.

Opiate Overdose Triad

The common combination of extreme sleepiness or unconsciousness, very slow or stopped breathing, and very small pupils after an opioid overdose. Not every person has all three signs. Naloxone may restore breathing.

Opioid

A natural, semi-synthetic, or synthetic substance that binds to opioid receptors (mu, delta, kappa) to produce analgesia, sedation, euphoria, respiratory depression, and constipation.

Opioid Addiction

Alternate name; see *Opioid Use Disorder*.

Opioid Agonist Treatment

Treatment for opioid use disorder using a prescribed medicine, usually methadone or buprenorphine, that activates opioid receptors in a controlled way. It reduces withdrawal and cravings, lowers illicit opioid use and overdose risk, and works best with ongoing medical support.

Opioid Analgesic Medications

Medicines that act on opioid receptors to reduce pain. They may be used for selected acute or cancer-related pain and can cause sedation, constipation, physical dependence, tolerance, and life-threatening respiratory depression.

Alternate Names:
Opioid Analgesics; Narcotic Analgesics

Opioid Dependence

A state in which the body adapts to repeated opioid exposure and withdrawal symptoms occur when the medicine or drug is reduced or stopped. Physical dependence can occur during appropriate pain treatment and is different from opioid use disorder, which involves problematic use and loss of control.

Opioid Intoxication

Opioid intoxication can cause euphoria, drowsiness, slowed breathing, pinpoint pupils, impaired coordination, coma, and death.

Opioid Overdose

Poisoning from an excessive amount of an opioid, commonly causing reduced consciousness and dangerously slow or absent breathing. Small pupils may occur but are not always present; untreated respiratory depression can lead to brain injury or death.

Opioid Poisoning

Alternate name; see *Opioid Toxicity*.

Opioid Receptor

A cell-surface protein activated or blocked by opioids and naturally produced endorphins. Mu, kappa, and delta receptors influence pain, breathing, mood, bowel movement, and reward; excessive mu-receptor activation can suppress breathing.

Opioid Reversal

Emergency treatment of opioid toxicity with naloxone, a competitive opioid-receptor antagonist. It is titrated to restore adequate breathing, with repeated doses or monitoring sometimes needed because its effect may wear off before the opioid.

Opioids

Plural form; see *Opioid*.

Opioid Toxicity

Toxic effects of opioid agonists, classically respiratory depression, central nervous system depression, and miosis. Management prioritizes ventilation and airway support; naloxone is titrated to restore adequate breathing while recognizing the risk of recurrent toxicity and withdrawal.

Opioid Toxidrome

A poisoning pattern caused by opioid excess, characterized by respiratory depression, reduced consciousness, and small pupils; naloxone and ventilatory support may be required.

Opioid Use Disorder

A chronic medical condition characterized by a problematic pattern of opioid use that leads to significant physical, emotional, or social impairment and distress. It involves a compulsive urge or craving to use prescription pain relievers or illicit opioids, difficulty controlling the amount or frequency of use, and persistent use despite awareness of harmful consequences.

Alternate Names:
OUD

Opioid Withdrawal

A characteristic group of symptoms occurring after abrupt reduction or cessation of prolonged opioid use, including anxiety, muscle aches, sweating, abdominal cramps, diarrhea, nausea, and insomnia.

Opisthorchis Felineus

A liver fluke acquired by eating raw or undercooked freshwater fish; chronic infection can cause bile-duct inflammation and increase cholangiocarcinoma risk.

Opisthotonos

Severe backward arching of the head, neck, and spine caused by sustained muscle spasm. It can occur with tetanus, strychnine poisoning, severe brain or meningeal disease, and some acute drug reactions.

Opisthotonus

Alternate spelling; see *Opisthotonos*.

Opium

The dried latex of Papaver somniferum containing

opioid alkaloids; it can cause dependence and respiratory depression.

Oppenheim Sign

A pathological neurological reflex elicited by firmly stroking down the anterior medial aspect of the tibia with the examiner's thumb and knuckles, provoking extension (dorsiflexion) of the great toe and fanning of the other toes in corticospinal upper motor neuron dysfunction.

Alternate Names:
Oppenheim Reflex; Oppenheim's Sign

Opponens

A muscle that moves a body part toward an opposing surface, especially the thumb across the palm.

Opportunistic Infection

An infection that causes illness mainly when the immune system is weakened or a normal protective barrier is damaged. Causes may include cancer treatment, HIV, transplantation, severe illness, or prolonged use of immune-suppressing medicines.

Opportunistic Pathogen

A microorganism that is more likely to cause illness when immune defenses are weakened or a body barrier is damaged. For example, *Pneumocystis jirovecii* can cause severe pneumonia in people with advanced HIV.

Opposition

Movement of the thumb across the palm so it can touch the fingertips. It is important for grasping and depends on several small movements at the joint where the thumb meets the wrist.

Oppositional Defiant Disorder

A childhood or adolescent disorder involving a persistent pattern, lasting at least six months, of angry or irritable mood, argumentative or defiant behavior, or vindictiveness toward an authority figure or other person. The pattern causes clinically significant distress or impairment and is not limited to conflicts with siblings.

Opsoclonus

Rapid, involuntary, back-and-forth eye movements in many directions without pauses. It may occur with muscle jerks and poor coordination, sometimes because of an immune reaction, infection, medicine, or an underlying tumor.

Opsoclonus-Myoclonus-Ataxia Syndrome

A rare neurologic syndrome combining rapid, involuntary eye movements in many directions with muscle jerks and poor coordination. In children it may be associated with neuroblastoma or an immune-mediated process.

Alternate Names:
Dancing Eye-Dancing Feet Syndrome; Kinsbourne Syndrome; OMS

Opsoclonus-Myoclonus Syndrome

A rare neurologic disorder causing rapid, involuntary eye movements, muscle jerks, poor coordination, and sometimes behavioral or cognitive changes. In children it may be associated with neuroblastoma or an immune reaction.

Opsonin

An immune protein that coats a germ and marks it for destruction. Antibodies and complement proteins can act as opsonins by helping infection-fighting cells recognize and engulf the germ.

Opsonization

The coating of a germ or other particle with immune proteins so that infection-fighting cells can recognize, capture, and destroy it more easily. Antibodies and complement proteins commonly perform this function.

Optical Aids

Eyeglasses correct focusing errors, sunglasses reduce glare and ultraviolet exposure, and magnifiers enlarge nearby targets. Correct prescription, fit, lens protection, and the underlying eye condition determine the appropriate aid.

Optical Coherence Tomography

A painless scan that uses reflected light to create detailed cross-sectional pictures of the retina and other eye structures. It helps detect and monitor glaucoma, macular disease, swelling, and other changes without touching the eye.

Optical Coherence Tomography Angiography

A scan that uses optical coherence tomography to show blood flow in small vessels of the retina and the layer beneath it, without injecting a dye.

Optical Illusion

A visual perception in which an object, image, or movement appears different from its physical properties. Illusions are common, but new or persistent visual distortions may occur with eye, brain, medicine, or migraine-related disorders.

Optical Rotation

The turning of plane-polarized light as it passes through a substance whose molecules have a particular three-dimensional arrangement. Measuring it can help identify or assess the concentration of some chemicals and medicines.

Optic Atrophy

Damage and loss of optic-nerve fibers, causing permanent reduction in vision, color vision, or part of the visual field. Causes include glaucoma, poor blood supply, inflammation, pressure, injury, toxins, and inherited disorders; treatment targets the cause when possible.

Optic Chiasm

An X-shaped junction beneath the brain where some fibers from the optic nerves cross. Damage can cause characteristic loss of parts of the visual field, depending on the location and cause.

Optic Chiasma

Alternate spelling; see *Optic Chiasm*.

Optic Disc

The small area at the back of the eye where the optic nerve and blood vessels pass through the retina. It has no light-sensing cells, so it creates the eye's normal blind spot.

Optic Disc Drusen

Clusters of protein-like material within the optic nerve head that often calcify with age. They can make the optic disc look elevated, mimicking papilledema, and may be associated with visual-field defects.

Alternate Names:
Optic Nerve Head Drusen; Pseudopapilledema Drusen

Optic Disc Edema

Swelling of the optic nerve head where the nerve enters the eye. Causes include raised intracranial pressure, inflammation, impaired blood supply, and local eye or optic-nerve disease. Papilledema is optic-disc edema specifically caused by raised intracranial pressure.

Optic Disc Swelling

Enlargement or elevation of the optic nerve head where it enters the eye. Causes range from raised pressure inside the skull to inflammation, ischemia, or local eye disease; sudden vision changes can indicate serious ocular or neurologic disease.

Optic Disk

The point where the optic nerve leaves the retina; it has no photoreceptors and forms the blind spot.

Optic Embolism

An embolus in the retinal arterial circulation, more precisely termed a retinal artery embolus. It may temporarily or persistently obstruct blood flow and cause focal retinal ischemia or visual loss; sustained blockage is termed retinal artery occlusion.

Optic Glioma

A usually slow-growing tumor of the optic nerve or the visual pathway leading to the brain, most often

in children. It may cause reduced vision, loss of part of the visual field, a bulging eye, or abnormal eye movements and is associated with neurofibromatosis type 1.

Alternate Names:
Optic Pathway Glioma; Optic Nerve Glioma

Optician

A technician who fits and dispenses eyeglasses or contact lenses.

Optic Nerve

The nerve that carries visual signals from each eye to the brain. Damage can cause reduced vision, loss of color or part of the visual field, and sometimes pain with eye movement.

Optic Nerve Atrophy

Permanent damage and loss of nerve fibers carrying vision from the eye to the brain. It can reduce sharpness, color vision, or part of the visual field and may follow glaucoma, inflammation, poor blood supply, pressure, injury, or toxins.

Optic Nerve Disorder

A disease affecting the optic nerve, which carries visual signals from the eye to the brain; it can cause reduced vision, color loss, or visual-field defects.

Optic Nerve Glioma

Alternate name; see *Optic Glioma*.

Optic Nerve Swelling

Swelling of the optic nerve head where the nerve enters the eye. It may be caused by raised pressure inside the skull, inflammation, reduced blood supply, infection, or other eye or nerve disease; new swelling with headache or vision change can indicate serious disease.

Optic Neuritis

Inflammation or demyelination of the optic nerve, often causing subacute vision loss, impaired color vision, and pain with eye movement. It may be associated with multiple sclerosis or other inflammatory, infectious, or immune-mediated disorders.

Optic Pathway Glioma

Alternate name; see *Optic Glioma*.

Optic Tract

A bundle of nerve fibers carrying visual information from the optic chiasma to brain areas that process sight and control visual reflexes. Damage causes loss of a characteristic part of the visual field.

Optokinetic Nystagmus

Rhythmic eye movements produced when a person views a large moving visual scene, consisting of a slow tracking phase followed by a rapid resetting phase.

Optometrist

A trained eye-care professional who examines vision and many ocular conditions and prescribes optical correction within local scope of practice.

Optometry

The healthcare profession focused on examining vision and the eyes, prescribing glasses or contact lenses, detecting eye disease, and providing treatment or referral within the professional scope allowed by local law.

Oral

Relating to the mouth, or taken through the mouth. Oral medicines are swallowed and absorbed through the digestive tract unless otherwise specified.

Oral Administration

Taking a medicine by mouth so it is absorbed through the digestive tract; absorption can be affected by food, vomiting, interactions, or gastrointestinal disease.

Oral Allergy Syndrome

Also called pollen-food allergy syndrome, it is an IgE-mediated reaction to plant foods that cross-react with pollen allergens, causing itching or tingling of the mouth, lips, or throat. Symptoms most

often follow raw fruits or vegetables; heat-labile allergens may be altered by cooking. Systemic reactions are uncommon but can occur.

Alternate Names:
Pollen-Food Allergy Syndrome

Oral and Maxillofacial Surgery

The surgical specialty concerned with diseases, injuries, and defects of the mouth, jaws, face, and associated hard and soft tissues. Its scope includes corrective jaw procedures and reconstruction after trauma or disease.

Oral Antidiabetic Agents

A broad group of prescription medications taken by mouth to help lower and maintain blood glucose levels in people with type 2 diabetes. Different classes work through various physiological mechanisms, such as increasing the body's responsiveness to insulin, prompting the pancreas to release additional insulin, or helping the kidneys filter excess sugar out of the body through urine.

Oral Appliance Therapy

Treatment using a removable dental appliance during sleep, commonly to advance the mandible or retain the tongue and reduce upper-airway collapse in selected obstructive sleep apnea.

Oral Burn

An injury to the lining of the mouth, tongue, lips, or palate caused by heat, a chemical, or electricity. It may cause pain, redness, peeling, or sores; swelling that affects breathing can be life-threatening.

Alternate Names:
Oral Cavity Burn; Mouth Burn; Thermal Palatal Burn

Oral Cancer

Cancer of the lips or tissues inside the mouth, including the tongue, gums, cheeks, floor of the mouth, and roof of the mouth. Tobacco, alcohol, and chewing areca (betel) nut increase risk. It may cause a lasting sore, lump, red or white patch, pain, or numbness. Human papillomavirus (HPV) is more strongly linked to cancers of the throat behind the mouth.

Oral Candidiasis

A yeast infection of the mouth or throat, often called oral thrush. It may cause white patches, redness, soreness, altered taste, or cracks at the mouth corners. Risk is higher with antibiotics, steroid inhalers, dentures, diabetes, or a weakened immune system.

Alternate Names:
Oral Thrush; Thrush; Oropharyngeal Candidiasis

Oral And Pharyngeal Candidiasis

Alternate name; see *Oral Candidiasis*.

Oral Cavity

The space inside the mouth, extending from the lips to the throat and bounded by the cheeks, palate, tongue, and floor of the mouth. It receives food, begins digestion, and helps with speech, taste, and breathing.

Oral Cavity Cancer

Cancer arising in the lips, tongue, gums, inner cheeks, floor of the mouth, or palate. Tobacco, alcohol, betel quid, and some HPV infections increase risk; persistent sores, lumps, patches, pain, or numbness may occur.

Oral Cholecystogram

An older X-ray test in which swallowed contrast collects in the gallbladder, allowing gallstones and gallbladder function to be assessed. Ultrasound and other imaging methods have largely replaced it.

Oral Contraceptive

A birth-control pill containing progestin alone or progestin combined with estrogen. It mainly prevents ovulation and thickens cervical mucus; it does not protect against sexually transmitted infections.

Oral Contraceptive Pill

An oral hormonal contraceptive, usually a combined estrogen–progestin pill or a progestin-only pill, that prevents ovulation and/or changes cervical mucus and the uterine lining.

Oral Cutaneous Fistulas

Abnormal channels connecting the mouth or an oral structure with the skin surface, often caused by dental infection, salivary-gland disease, trauma, surgery, or inflammatory disease. Persistent drainage or swelling can occur.

Oral-Facial-Digital Syndrome

A group of genetic disorders affecting the mouth, face, fingers, and toes. Features vary and may include oral abnormalities, unusual facial development, shortened or joined digits, and neurologic or kidney problems.

Oral Fibromas and Fibromatoses

Benign fibrous overgrowths in the mouth or jaw region. A solitary oral fibroma is often a firm response to chronic irritation, whereas fibromatoses can infiltrate nearby tissue and recur; persistent lesions may resemble other growths.

Oral Glucose Tolerance Test

A test in which a person drinks a measured sugar solution and has blood sugar checked afterward. It helps assess diabetes, prediabetes, or gestational diabetes when other tests do not give a clear answer.

Oral Hairy Leukoplakia

A painless white, ridged patch, usually on the side of the tongue, caused by Epstein-Barr virus. It occurs most often in people with weakened immunity, including some people with HIV, and usually cannot be wiped away.

Alternate Names:
OHL

Oral Health

Oral health is the condition of the teeth, gums, mouth, jaw, and related functions such as eating, speaking, and swallowing.

Oral Hemangiomas

Benign blood-vessel lesions of the lips, tongue, gums, or other oral tissues that may appear red, blue, or purple and bleed after trauma. Evaluation distinguishes them from vascular malformations and other tumors; treatment depends on symptoms and risk.

Oral Hemorrhage

Bleeding from the mouth, gums, tongue, throat, or nearby tissues, caused by trauma, dental disease, infection, medicines, or a bleeding disorder.

Oral Herpes

Infection of the mouth or lips by the herpes simplex virus, usually type 1. It may cause no symptoms, but can cause painful blisters or sores. Cold sores may return and often begin with tingling or burning.

Alternate Names:
Herpes Simplex Labialis; Cold Sores; Fever Blisters; Oral HSV-1 Infection

Oral Human Papillomavirus Infection

Oral human papillomavirus infection affects the mouth or throat; many infections clear without symptoms, while persistent high-risk types can contribute to some cancers.

Oral Hygiene

Practices that keep the teeth, gums, and other mouth tissues clean and healthy and help limit plaque, tooth decay, and gum disease.

Oral Hypoglycemics Overdose

Toxic effects from taking too much oral diabetes medicine. Some medicines can cause dangerously low blood glucose, leading to sweating, shaking, confusion, seizures, or loss of consciousness.

Oral Leukoplakia

A persistent white patch in the mouth that cannot be rubbed off and is not explained by another condition. It is often linked to tobacco, alcohol, or betel-nut use and can sometimes develop into mouth cancer.

Oral Leukoplakia and Erythroplakia Pathology

Histopathologic evaluation of persistent white or red oral mucosal lesions for hyperkeratosis, epithelial

dysplasia, carcinoma in situ, or invasive squamous cell carcinoma. The clinical appearance alone does not determine the diagnosis.

Oral Lichen Planus

A long-lasting condition that can cause lace-like white lines, red patches, or painful sores inside the mouth, often on the cheeks or gums. It may improve and worsen over time, and its appearance can resemble other mouth diseases.

Alternate Names:
OLP; Mucosal Lichen Planus

Oral Medications for Type 2 Diabetes

Oral medicines for type 2 diabetes lower glucose through effects on insulin, liver glucose production, kidney reabsorption, or intestinal absorption; choice depends on health and treatment goals.

Oral Moniliasis

Oral moniliasis is oral candidiasis, a Candida yeast infection causing white plaques, soreness, burning, or altered taste.

Oral Mucosa

The moist lining of the mouth, including the inner lips and cheeks, gums, tongue, and palate. It protects deeper tissues, provides sensation, stays lubricated, and can develop ulcers, infections, inflammation, or tumors.

Oral Mucous Cyst

An oral mucous cyst is a mucus-filled lesion caused by salivary-gland duct injury or blockage, often appearing on the lower lip or floor of the mouth.

Oral Nutritional Supplement

A calorie-, protein-, or micronutrient-containing product consumed by mouth to increase nutrient intake when ordinary food provides insufficient energy or nutrients. Composition and suitability vary with nutritional needs and swallowing ability.

Oral Pathology

The study and diagnosis of diseases affecting the mouth, teeth, jaws, and related tissues. These include tooth decay, infections, cysts, inflammation, developmental changes, and tumors. Examination, imaging, laboratory tests, or a tissue sample may be needed to identify the cause.

Oral Potentially Malignant Disorders

Conditions affecting the mouth lining that carry an increased risk of developing into oral cancer. Examples include leukoplakia, erythroplakia, and some long-lasting inflammatory or inherited disorders; appearance alone cannot determine the risk.

Oral Psoriasis Therapy

Treatment of psoriasis with systemic medicines taken by mouth. Options include conventional drugs such as methotrexate, ciclosporin, and acitretin, and targeted oral medicines such as apremilast or deucravacitinib. This route differs from topical medicines applied to the skin and biologic medicines usually given by injection or infusion.

Oral Pyogenic Granuloma

A rapidly growing, friable vascular overgrowth of the gums or other oral mucosa, often related to irritation, trauma, or pregnancy. It bleeds easily and may recur unless the lesion and its local cause are treated.

Oral Radiology

The use and interpretation of X-rays and other scans of the mouth, teeth, jaws, face, and nearby structures. These images help find decay, infection, fractures, tumors, bone disease, and problems related to treatment planning.

Oral Rehydration Salts

A balanced mixture of glucose and electrolytes dissolved in clean water to replace fluid and salts lost through diarrhea or vomiting.

Oral Rehydration Therapy

Replacement of water and electrolytes by mouth using a balanced glucose-and-salt solution, especially to prevent or treat dehydration from diarrhoea or vomiting.

Alternate Names:
ORT

Oral Route

Administration of a medicine by swallowing it through the mouth for absorption in the digestive tract. Absorption may be altered by food, vomiting, or gastrointestinal disease.

Alternate Names:
PO; Per Os; By Mouth

Oral Sex Practices

Sexual stimulation of the genitals or anus using the mouth. Fellatio means oral stimulation of the penis, cunnilingus of the vulva or clitoris, and analingus of the anus. Some sexually transmitted infections can spread through oral sex.

Alternate Names:
Oral-Genital Stimulation

Oral Spray

A liquid medicine or preparation sprayed into the mouth or throat for local treatment or absorption through oral tissues.

Oral Squamous Cell Carcinoma

The most common type of mouth cancer, arising from the cells lining the lips, tongue, gums, cheeks, or palate. It may present as a persistent sore, lump, red or white patch, bleeding, pain, or numbness.

Oral Submucous Fibrosis

A long-lasting condition in which scar tissue forms inside the mouth, strongly linked to chewing areca (betel) nut or betel quid, a chew made with betel leaf and other ingredients. The mouth may become stiff and hard to open; burning and trouble eating or swallowing may occur. The condition can sometimes become cancerous.

Alternate Names:
OSMF

Oral Surgery

Operations on the mouth, teeth, jaws, or nearby facial tissues. Procedures include tooth removal, dental implants, tissue sampling, cyst removal, repair of injury, and correction of jaw problems.

Oral Thrush

Alternate name; see *Oral Candidiasis*.

Oral Toxicity

Harm to the mouth, throat, or digestive system caused by a swallowed poison, medicine, treatment, or excessive dose. It may cause burning, sores, nausea, vomiting, abdominal pain, or rapidly developing organ injury.

Oral Verruciform Xanthoma

A rare, noncancerous growth in the lining of the mouth, often on the gums or hard palate. It may appear as a pink, yellow, or gray raised spot with a rough or warty surface. A biopsy may be needed because it can resemble other oral growths.

Oral Yeast Infection

Alternate name; see *Oral Candidiasis*.

Orange Peel Skin

Skin with a dimpled surface resembling an orange peel, caused by edema or tissue thickening around hair follicles. The appearance may occur with lymphatic obstruction, including in inflammatory breast cancer, but it also has noncancerous causes and is not diagnostic by itself.

Orbicularis

A circular muscle surrounding an opening, such as orbicularis oculi around the eye or orbicularis oris around the mouth.

Orbit

The bony socket that contains and protects the eye, its muscles, nerves, blood vessels, and supporting tissues. Problems in the orbit can cause pain, swelling, double vision, bulging, or impaired eye movement.

Orbital

Relating to the orbit, the bony cavity containing the eye, or to structures within it. Orbital disease

may affect the eye, muscles, nerves, or surrounding tissues.

Orbital Apex Syndrome

A clinical syndrome resulting from compressive, neoplastic, or inflammatory lesions located at the orbital apex involving both the superior orbital fissure and the optic canal, characterized by combined palsies of cranial nerves III, IV, V1, and VI (complete ophthalmoplegia, ptosis, and forehead sensory loss) associated with optic nerve (CN II) atrophy and vision loss.

Alternate Names:
Apex Orbitae Syndrome; Combined Superior Orbital Fissure and Optic Canal Syndrome

Orbital Blowout Fracture

A break in one of the thin bones forming the eye socket, usually after blunt trauma. It can cause swelling, double vision, numbness, or restricted eye movement and may trap an eye muscle or injure nearby structures.

Orbital Cavity

The bony space in the skull that contains and protects the eye, its muscles, nerves, blood vessels, and supporting tissues.

Orbital Cellulitis

A serious infection in the tissues around and behind the eye. It can cause eyelid swelling, fever, pain with eye movement, double vision, or reduced vision and can spread to the brain.

Orbital Contusion

A bruise of the tissues around the eye caused by blunt trauma, often producing swelling, bruising, and tenderness.

Orbital Floor Fracture

A break in the thin bone forming the bottom of the eye socket, usually caused by blunt facial trauma. The floor is formed mainly by the maxilla. The fracture may cause double vision, restricted eye movement, numbness of the cheek or upper lip, or a sunken appearance of the eye; some fractures trap tissues that move the eye.

Alternate Names:
Blowout Fracture of the Orbit; Orbital Floor Blowout

Orbital Fracture

A traumatic fracture involving the bony walls of the eye socket, classically an orbital blowout fracture of the thin inferior or medial wall.

Orbital Fracture Repair

Surgery to restore the structure of a fractured orbital wall or floor. It may involve releasing trapped orbital tissue and supporting the repaired area with an implant or graft.

Orbital Fractures

Plural form; see *Orbital Fracture*.

Orbital Irradiation

Radiation treatment directed at tissues within the eye socket, sometimes used for severe thyroid eye disease.

Orbital Metastasis

Cancer that has spread to the bony socket around the eye from another organ, commonly the breast, lung, or prostate. It may cause bulging of the eye, pain, double vision, restricted movement, or reduced sight.

Orbital Myositis

Inflammation of one or more muscles that move the eye. It can cause pain, eyelid swelling, double vision, and restricted eye movement; treatment depends on the cause.

Orbital Neoplasm

An abnormal growth in the eye socket that may arise from the eye, optic nerve, muscles, glands, bone, or other tissues. It can cause bulging, pain, double vision, or vision loss and may be benign or cancerous.

Orbital Pseudotumor

Painful inflammation of tissues around the eye that is not caused by infection or a true tumor. It may cause eyelid swelling, bulging of the eye, double vision, and painful or limited eye movement.

Alternate Names:
Idiopathic Orbital Inflammatory Disease; IOID

Orbital Tumors

Benign or malignant growths arising within or around the eye socket. They may cause a visible mass, proptosis, double vision, pain, impaired eye movements, or vision loss; examination and orbital imaging guide biopsy and treatment.

Orbital Varix

An enlarged, flexible vein in the eye socket. The eye may bulge more when a person bends, coughs, or strains and then return to normal when upright. It can rarely bleed, clot, or press on the optic nerve; imaging helps confirm the diagnosis.

Alternate Names:
Orbital Phlebectasia; Orbital Venous Varix

Orbit CT Scan

A CT scan of the eye socket that uses X-rays and computer images to show the bones, eye muscles, nerves, blood vessels, and surrounding tissues. It can help assess injury, infection, bleeding, or a growth.

Orchialgia

Pain in one or both testes, which may be acute or chronic. Causes include infection, trauma, varicocele, torsion, referred pain, or neuropathic pain; in some cases no cause is identified. Associated findings vary with the underlying disorder.

Orchidectomy

Alternate spelling; see *Orchiectomy*.

Orchiectomy

Surgical removal of one or both testicles. Radical inguinal orchiectomy is diagnostic and therapeutic for testicular cancer; bilateral orchiectomy is a hormonal therapy for prostate cancer.

Orchitis

Inflammation of one or both testes, usually due to infection. Viral causes include mumps; bacterial orchitis commonly accompanies epididymitis. It can cause testicular pain, swelling, and fever. Bilateral mumps orchitis can impair fertility, although infertility is uncommon.

Order Coleoptera

The insect order containing beetles, characterized by hardened forewings that protect the flying wings; some species affect health as pests or vectors.

Order Spirochaetales

A biological order of spiral-shaped bacteria that includes groups causing syphilis, Lyme disease, relapsing fever, and leptospirosis. Identification of the species determines medical significance and treatment.

Orexin

Orexin, or hypocretin, is a hypothalamic neuropeptide that promotes wakefulness, arousal, appetite, and energy regulation; loss of orexin signaling is strongly associated with narcolepsy type 1.

Orexin Receptor Antagonists

Medicines that block orexin receptors, reducing wakefulness and promoting sleep. Suvorexant and lemborexant are used for insomnia; they can cause next-day drowsiness, have potential for misuse, and may worsen some breathing disorders during sleep.

Orf

A zoonotic skin infection caused by orf virus, a parapoxvirus of sheep and goats. Humans acquire it through contact with infected animals or contaminated fomites; a painful or tender nodular, ulcerating lesion usually develops on the hand or finger and often resolves without treatment.

Organ

A structure composed of two or more different types

of tissues that has a recognizable shape and performs specific functions.

Organelle

A specialized part inside a cell that performs a particular job. Examples include the nucleus, which stores genetic instructions, and mitochondria, which release energy; organelles work together to keep the cell alive.

Alternate Names:
Organelles

Organ Failure

Severe loss of an organ's ability to perform essential functions, such as filtering blood, exchanging oxygen, or pumping blood.

Organic

Relating to living matter or carbon-containing chemistry; in psychiatry, an older term for symptoms caused by a physical brain disorder.

Organic Chemical

A carbon-containing chemical compound, usually also containing hydrogen and sometimes oxygen, nitrogen, sulfur, or other elements. Organic chemicals include medicines, fats, sugars, proteins, solvents, and many toxins.

Organic Disease

An illness caused by a physical change or measurable disturbance in the body, such as infection, inflammation, tissue damage, or abnormal organ function. The term is older and is less useful when symptoms have not yet been explained.

Organic Impurity

An organic impurity is an unintended carbon-containing chemical in a medicine, material, or specimen that may affect safety, quality, or measurement.

Organization Name

The formal name of a group, institution, company, or agency; healthcare records use it to identify the responsible organization.

Organ of Corti

The hearing-sensing structure inside the cochlea of the inner ear. Its hair cells turn sound vibrations into nerve signals that travel to the brain.

Alternate Names:
Spiral Organ

Organogenesis

The embryonic process in which cells from the germ layers differentiate and organize into organs and organ systems. It follows gastrulation and involves coordinated cell signaling, growth, and tissue shaping. Disruption during organogenesis can alter normal organ formation and result in congenital anomalies.

Organophosphate

A class of chemicals that can inhibit acetylcholinesterase. Some are pesticides or nerve agents and can cause cholinergic poisoning.

Organophosphate Poisoning

A serious poisoning caused by pesticides or nerve agents that excessively stimulate nerves and muscles. It may cause sweating, drooling, vomiting, diarrhea, pinpoint pupils, muscle twitching, wheezing, weakness, seizures, or breathing failure.

Organophosphate Toxicity

Poisoning caused by chemicals that inhibit acetylcholinesterase, leading to excess acetylcholine at muscarinic, nicotinic, and central nervous system synapses. Features may include pinpoint pupils, sweating, salivation, vomiting, diarrhea, excessive airway secretions, muscle twitching, weakness, confusion, seizures, and respiratory failure. Delayed neuropathy or persistent neuromuscular weakness may follow severe poisoning.

Organosilicon Compounds

Organosilicon compounds contain silicon bonded to carbon and are used in materials, medicines, devices, and industry; biological effects depend on the specific compound.

Organ System

A group of organs that work together to perform an important body function, such as breathing or digestion.

Organ Transplant

A surgical procedure in which a failing organ (such as kidney, liver, heart, or lung) is replaced with a viable donor organ.

Organ Transplantation

Replacement of a failing organ with a healthy organ from a donor. Transplants can restore function but require careful matching, lifelong monitoring, and medicines to prevent rejection; infection, rejection, and medicine-related harm remain possible.

Organ Transplants

Plural form; see *Organ Transplant*.

Orgasm

The peak of sexual pleasure, usually accompanied by involuntary muscle and body responses that vary among individuals.

Orgasmic Dysfunction

Persistent or recurrent difficulty reaching orgasm, markedly reduced orgasmic intensity, or absent orgasm that causes clinically significant distress. Medical, psychological, medication-related, hormonal, and relationship factors may contribute.

Orgasmic Dysfunction in Women

Alternate name; see *Orgasmic Dysfunction*.

Orientation

Awareness of personal identity, place, time, and situation. Clinicians assess orientation as part of mental-status and neurologic examinations.

Orifice

An opening leading into or out of a body structure, organ, or passage, allowing materials to enter or leave.

Orlistat

A medicine used with a reduced-calorie diet to help with weight loss or weight control. It stops some dietary fat from being absorbed, so oily stools, gas, and urgent bowel movements can occur; it can also reduce absorption of vitamins and some medicines.

Ornithine

A nonessential amino acid and intermediate in the urea cycle that helps convert toxic ammonia into urea.

Ornithine Decarboxylase

An enzyme that converts ornithine to putrescine, an early step in polyamine synthesis involved in cell growth.

Ornithine Transcarbamylase Deficiency

OTC deficiency is an inherited urea-cycle disorder causing ammonia accumulation, vomiting, confusion, seizures, or coma, especially during metabolic stress.

Organizing Pneumonia

A pattern of lung injury in which small plugs of healing tissue block air sacs and nearby airways. It may cause cough, fever, and shortness of breath. It can follow infection or occur with medicines or immune disease; when no cause is found, it is called cryptogenic organizing pneumonia.

Orogastric Tube

A flexible tube passed through the mouth into the stomach. It may deliver nutrition or medicines, remove stomach contents, or decompress the stomach when nasal placement is unsuitable.

Orolabial Herpes Simplex

Alternate name; see *Oral Herpes*.

Oropharyngeal

Oropharyngeal means relating to the mouth and the part of the throat behind it, including structures involved in breathing, swallowing, and speech.

Oropharyngeal Airway

A rigid device placed through the mouth to keep the tongue from blocking the throat in an unconscious person. Insertion in a person with a gag reflex can provoke vomiting, and the device does not prevent vomit from entering the lungs.

Oropharyngeal Cancer

Alternate name; see *Oropharyngeal Carcinoma*.

Oropharyngeal Carcinoma

Cancer arising in the part of the throat behind the mouth, including the tonsils, back of the tongue, soft palate, or throat wall. Tobacco, alcohol, and some HPV infections increase risk; assessment usually includes examination, tissue sampling, and scans.

Oropharyngeal Dysphagia

Difficulty moving food or liquid from the mouth through the throat. It may cause coughing, choking, a wet voice, food coming through the nose, or food entering the airway; persistent dysfunction can cause aspiration and malnutrition.

Oropharyngeal Neoplasm

An oropharyngeal neoplasm is an abnormal growth in the throat behind the mouth, including the tonsils and base of the tongue; it may be benign or malignant.

Oropharynx

The part of the throat behind the mouth, including the tonsils and back of the tongue. It helps move food and liquid toward the esophagus and carries air toward the voice box.

Oropharynx Lesion Biopsy

Sampling of an oropharyngeal lesion, usually through the mouth under local or procedural anesthesia, for histopathologic evaluation of infection, dysplasia, or cancer. It can distinguish benign lesions from malignancy.

Oropouche Fever

An illness caused by Oropouche virus, spread mainly by infected biting midges and sometimes mosquitoes in parts of the Americas. It usually causes sudden fever, severe headache, chills, muscle aches, and joint pain; symptoms may return after improving, and rarely the infection can cause meningitis. Infection during pregnancy has been linked to poor pregnancy outcomes.

Alternate Names:
Oropouche Virus Disease; Oropouche Fever Arbovirus Infection

Orotic Aciduria

An unusually high amount of orotic acid in urine. It may result from a rare inherited disorder affecting blood-cell and DNA building blocks, causing anemia and poor growth, or from a urea-cycle disorder with high ammonia.

Orphan Disease

A rare disease affecting relatively few people; definitions and eligibility for orphan-drug programs vary by jurisdiction.

Orphenadrine

A centrally acting medicine with anticholinergic properties used in some countries for painful muscle spasm; it can cause drowsiness, dry mouth, and confusion.

Orthodontic

Adjectival form; see *Orthodontics*.

Orthodontic Appliance

A device used to move teeth, guide jaw growth, maintain alignment, or correct a bite problem.

Orthodontic Bracket

A bonded or banded attachment that transmits forces from an orthodontic archwire to a tooth. Bracket position and wire sequence guide controlled tooth movement.

Orthodontic Retainer

A removable or fixed appliance used after active orthodontic treatment to maintain tooth position

while periodontal and alveolar tissues remodel. Retention is often needed long term because relapse can occur.

Orthodontics

The dental specialty focused on the diagnosis, prevention, and correction of malpositioned teeth and misaligned jaw relationships.

Orthodontic Treatment

Treatment that uses braces, wires, aligners, or other appliances to move teeth and guide jaw development. It can improve bite, spacing, and cleaning access; planning involves assessment, and retention helps limit relapse.

Orthodontic Wires

Metal or other wires used with braces to apply controlled forces that move teeth or help maintain their position.

Orthodontist

A dentist specially trained to diagnose and treat teeth or jaws that do not align properly. Orthodontists use braces, clear aligners, retainers, and sometimes surgery to improve biting, chewing, appearance, and oral health.

Orthodromic AVRT

The most common form of atrioventricular reentrant tachycardia in Wolff-Parkinson-White syndrome, in which the electrical cardiac impulse conducts antegradely down the normal atrioventricular node and His-Purkinje system (yielding a narrow QRS complex) and retrogradely up the accessory pathway (bundle of Kent) back to the atria.

Orthoebolavirus

A genus of filoviruses that includes Ebola virus, Sudan virus, Bundibugyo virus, and related viruses. Some members cause severe disease in humans, usually transmitted through direct contact with infected blood or body fluids.

Orthognathic Surgery

Corrective surgery to reposition the upper jaw, lower jaw, or both when bone alignment causes problems with biting, chewing, speaking, breathing, or facial development. It is often combined with orthodontic treatment.

Orthohepadnavirus

A group of viruses that includes hepatitis B virus and related viruses infecting mammals. These viruses carry genetic material as DNA and may cause long-lasting liver infection, inflammation, scarring, or cancer.

Orthokeratology

A method that uses specially fitted hard contact lenses worn overnight to temporarily reshape the cornea, the clear front part of the eye. It mainly corrects nearsightedness during the day after the lenses are removed. The effect wears off when lens use stops; overnight wear increases the risk of eye infection.

Alternate Names:
Ortho-K; Corneal Refractive Therapy

Orthokeratosis

Thickening of the outer skin layer with fully mature skin cells. It can be a normal protective response, such as on the soles, or part of conditions causing thick, scaly, or rough skin.

Orthomyxoviridae

A family of viruses that includes influenza A, B, and C. They mainly infect the airways and can cause flu, outbreaks, and sometimes severe pneumonia or other complications.

Orthopaedics

The British spelling of orthopedics, the medical and surgical specialty concerned with the musculoskeletal system.

Orthopaedic Surgery

Surgery for disorders and injuries involving bones, joints, muscles, ligaments, tendons, and related tis-

sues. Procedures may repair fractures, replace joints, correct deformity, stabilize the spine, or relieve pressure on nerves.

Orthopedic Biologics

Biologic materials or products used to support healing of bone, tendon, or other musculoskeletal tissues. Examples include autologous or donor bone graft, bone-marrow-derived products, platelet-rich plasma, and bone morphogenetic proteins; their composition and evidence of benefit vary by product and indication.

Orthopedic Implant

A device placed in or on the body to repair, support, replace, or stabilize a bone or joint. Examples include plates, screws, rods, joint replacements, and artificial ligaments. Possible complications include infection, loosening, breakage, wear, or bone damage.

Orthopedic Infections

Infections involving bones, joints, muscles, or orthopedic implants. Examples include osteomyelitis, septic arthritis, prosthetic-joint infection, and some diabetic foot infections.

Orthopedic Rehabilitation

Treatment that restores movement, strength, daily function, and independence after injury or surgery involving bones, joints, muscles, ligaments, or tendons. It may include exercises, activity training, pain management, and assistive equipment.

Orthopedics

The branch of surgery concerned with the musculoskeletal system, including bones, joints, ligaments, tendons, muscles, and nerves.

Orthopedic Screws

Metal or other screws used to hold broken bones or surgical implants in position while bone heals. Their shape and size are chosen for the bone and purpose. Complications can include loosening, breakage, infection, or injury to nearby structures.

Orthopedic Services

Orthopedic services diagnose and treat problems of bones, joints, muscles, ligaments, tendons, and related movement systems.

Orthopedist

A physician who diagnoses and treats problems of bones, joints, muscles, ligaments, tendons, and related tissues. Treatment may include rehabilitation, medicines, injections, or surgery.

Alternate Names:
Orthopedic Surgeon; Orthopedist Surgeon

Orthopnea

Shortness of breath that occurs or worsens when lying flat and improves when sitting or standing. It may occur with heart failure, lung disease, or other conditions.

Orthopneic Position

An upright seated posture, sometimes with the arms supported or the upper body leaning forward, that can reduce breathlessness. The term is also used for the posture assumed by a person with orthopnea, which commonly occurs in cardiopulmonary disease.

Orthopnoea

Alternate spelling; see *Orthopnea*.

Orthopoxvirus

A genus of poxviruses that includes variola, mpox, vaccinia, and cowpox viruses. Infection may cause fever and skin lesions; severity and transmission depend on the specific virus.

Orthoptera

The insect order containing grasshoppers, crickets, katydids, and locusts; some species cause bites, allergies, or crop-related health effects.

Orthoptic

Relating to assessment and treatment of binocular vision, eye alignment, and disorders such as strabismus.

Orthoptist

An eye-care professional who assesses and treats problems with eye movement, eye alignment, and the use of both eyes together. Orthoptists commonly help manage strabismus, amblyopia, double vision, and some vision problems in children and adults.

Orthoreovirus

A genus of nonenveloped, segmented double-stranded RNA viruses; human infection is often mild or asymptomatic but can occasionally cause disease.

Orthorexia

A term used for an excessive or rigid preoccupation with eating foods considered healthy. It is not a universally recognized formal psychiatric diagnosis but may cause nutritional or social impairment.

Orthorexia Nervosa

A term used for an unhealthy preoccupation with eating foods considered pure or healthy, leading to severe restriction, distress, or impaired daily life. It is not a formal standalone diagnosis in major classification systems.

Orthoscopic

Orthoscopic means providing a straight or undistorted view, as in an optical instrument or examination.

Orthosis

A brace, splint, shoe insert, or similar device worn outside the body to support, align, protect, or improve movement of a body part. Unlike a prosthesis, it does not replace a missing body part.

Orthostatic Hypotension

A sustained fall in systolic blood pressure of at least 20 mm Hg or diastolic pressure of at least 10 mm Hg within three minutes of standing. It may cause dizziness, blurred vision, weakness, or fainting and can result from volume depletion, medicines, or autonomic dysfunction.

Orthostatic Hypotension and Autonomic Failure

Disorders in which autonomic nerves or their central pathways cannot maintain blood pressure and other automatic body functions. They may cause orthostatic hypotension, faintness, urinary or bowel dysfunction, sweating abnormalities, sexual dysfunction, or impaired heart-rate responses.

Orthostatic Intolerance

Dizziness, fast heartbeat, weakness, blurred vision, fatigue, or faintness that develops or worsens on standing because the body does not maintain blood flow to the brain adequately. Causes include dehydration, medicines, nerve disorders, and some chronic conditions.

Orthotic

Orthotic means relating to a brace, splint, insert, or device that supports, aligns, protects, or improves function of a body part.

Orthotic Devices

External supports that hold, align, protect, or assist a body part, such as a brace, splint, shoe insert, or spinal support. They can reduce pain and improve movement, but poor fit may cause pressure, numbness, skin injury, or restricted circulation.

Orthotic Training

Instruction and practice for safely using a brace or other support. It includes putting it on and removing it, checking skin, cleaning it, walking with it, and recognizing problems needing review.

Orthotopic

Situated in the usual anatomical location. In transplantation, an orthotopic graft is placed where the corresponding organ normally lies; compare *Heterotopic*.

Ortolani Maneuver

A hip examination in infants used to look for a dislocated hip that can be gently moved back into place. The clinician bends and moves the leg outward while feeling for a distinct clunk as the hip

enters the socket. This positive finding suggests developmental dysplasia of the hip; a simple click is not the same.

Alternate Names:
Ortolani's Sign; Hip Reduction Maneuver

Ortolani Sign

A distinct clunk felt when a clinician gently moves an infant's hip outward and a dislocated hip slips back into its socket. This is a positive finding that may indicate developmental dysplasia of the hip; a simple click is not the same finding.

Ortolani's Sign

A palpable or audible clunk produced when a dislocated but reducible infant hip is gently abducted and reduced; it is a screening sign of developmental dysplasia of the hip.

Ortolani's Test

Alternate name; see *Ortolani Maneuver*.

Os

A bone or bony structure; in Latin anatomical terminology it means bone, while in obstetrics it means an opening.

Osborn Wave

A notch or extra wave on an electrocardiogram, classically seen with hypothermia. It can also occur in other conditions; its significance depends on body temperature and other findings.

Alternate Names:
J Wave; Hypothermic Wave

Oscillation

Repeated movement or variation around a central position or value.

Oscillator

A device or system that produces repeated movement or an electrical signal at regular intervals.

Oscillograph

An instrument or computer display that records a changing signal over time. It can show electrical, sound, pressure, or movement waves and has been used in medical tests to study signals from the heart, brain, muscles, or breathing.

Oscillometry

A method that measures pressure-related vibrations, commonly used by automated blood-pressure cuffs and some vascular devices. The result estimates blood pressure or blood-flow characteristics but may be inaccurate with movement or irregular rhythms.

Oscillopsia

The disturbing illusion that the visual environment is moving or bouncing, often caused by vestibular or eye-movement dysfunction.

Oscitation

Yawning, a reflex involving opening the mouth and deep inhalation that is associated with sleepiness, fatigue, or other physiologic states.

Oseltamivir

An antiviral medicine used to treat or prevent influenza, with the greatest benefit when started early.

Alternate Names:
Tamiflu

Oseltamivir Phosphate

Oseltamivir phosphate is the salt form of oseltamivir, an antiviral medicine used for treatment or prevention of influenza.

OSFED

A recognized eating-disorder category in which symptoms cause significant distress or interfere with health or daily life but do not meet every criterion for another named eating disorder. The abbreviation means other specified feeding or eating disorder.

Osgood-Schlatter Disease

Painful irritation of the growing area where the kneecap tendon attaches to the shinbone. It commonly affects active children and teenagers and causes tenderness or swelling below the knee.

Osler Nodes

Tender red or purple lumps on the pads of the fingers or toes. They can occur with infective endocarditis and some other conditions; they are a suggestive but nonspecific finding.

Osler Triad

The combination of pneumococcal pneumonia, pneumococcal endocarditis, and pneumococcal meningitis, also called Austrian syndrome. The endocarditis classically affects the aortic valve. It is a rare invasive manifestation of *Streptococcus pneumoniae* infection.

Alternate Names:
Austrian Syndrome

Osler-Weber-Rendu Disease

An autosomal dominant vascular disorder, also called hereditary hemorrhagic telangiectasia, characterized by recurrent nosebleeds, mucocutaneous telangiectasias, and arteriovenous malformations in organs such as the lungs, brain, liver, and gastrointestinal tract. Pathogenic variants most often involve *ENG* or *ACVRL1*; *SMAD4* and *GDF2* are also associated.

Alternate Names:
Hereditary Hemorrhagic Telangiectasia; HHT

Osmidrosis

Strong, unpleasant body odor caused when skin bacteria break down sweat and skin oils. It commonly affects the armpits or feet and may improve with washing, dry clothing, antiperspirants, treatment of skin infection, or assessment of an underlying condition.

Osmium

A dense metallic element; some osmium compounds are highly toxic and can damage the eyes and respiratory tract.

Osmolal Gap

The difference between measured and calculated serum osmolality. A raised gap can indicate unmeasured particles, including toxic alcohols, but is not specific to them; interpretation depends on the formula, substances present, and clinical context.

Alternate Names:
Osmolar Gap

Osmolality

A measure of the number of dissolved particles per kilogram of solvent, usually water. Blood osmolality depends mainly on sodium, glucose, and urea and helps determine how water moves between the bloodstream and cells.

Osmolality Blood Test

A blood osmolality test measures the concentration of dissolved particles in blood and helps assess hydration, electrolyte disorders, and certain poisonings.

Osmolality Urine Test

A urine osmolality test measures how concentrated the urine is and helps evaluate the kidneys' ability to regulate water balance.

Osmolar

Describing a liquid according to the number of dissolved particles in each liter. This property affects water movement between body compartments and helps clinicians assess blood chemistry, hydration, kidney function, and intravenous fluids.

Osmolarity

The concentration of osmotically active particles per liter of solution.

Osmole

A unit representing the amount of a substance that contributes one mole of osmotically active particles.

Osmoreceptor

A sensory cell or neural receptor that detects changes in osmotic concentration, especially in the hypothalamus.

Osmoregulation

Control of water and dissolved-solute balance in the body or an organism, maintaining appropriate cell

volume and internal concentration.

Osmosis

Movement of water through a membrane toward the side with more dissolved particles. This process helps determine how water is distributed between blood, cells, and surrounding tissues.

Osmotic Demyelination Syndrome

Serious brain injury that can occur when long-standing low blood sodium is corrected too quickly. Symptoms may appear days later and include confusion, difficulty speaking or swallowing, weakness, movement problems, or reduced consciousness.

Osmotic Diarrhea

Diarrhea caused by poorly absorbed solutes retaining water in the intestinal lumen. It typically improves with fasting and may result from carbohydrate malabsorption, laxatives, or other osmotically active substances.

Osmotic Diuresis

Increased urine production caused by poorly reabsorbed solutes in the kidney tubules, such as glucose during marked hyperglycemia.

Osmotic Fragility Test

A test that measures the susceptibility of red blood cells to haemolysis when placed in progressively more dilute saline solutions. Increased fragility supports hereditary spherocytosis, although the result may also be affected by other haemolytic disorders and recent transfusion.

Osmotic Pressure

The force that draws water across a membrane toward the side containing more dissolved particles. It helps control how water moves between blood, cells, and surrounding tissues.

Os Odontoideum

Os odontoideum is a separate ossicle near the second cervical vertebra's odontoid process that can cause atlantoaxial instability or spinal-cord risk.

Osseointegration

The firm attachment of living bone to the surface of an implant, such as a dental implant or artificial joint. Good stability, healthy bone, healing, and infection control support this process.

Osseous

Relating to or composed of bone. For example, an osseous lesion is a bone lesion.

Osseous Metaplasia

Osseous metaplasia is formation of mature bone in tissue where bone is not normally present, sometimes after injury, inflammation, or within a lesion.

Ossicle

A small bone, especially one of the three tiny middle-ear bones. The malleus, incus, and stapes transmit eardrum vibrations to the inner ear, allowing sound to be heard.

Ossicles

Alternate plural; see *Ossicle*.

Ossicular Discontinuity

Partial or complete separation of the middle-ear ossicles, usually caused by trauma, chronic ear disease, or surgery. It produces conductive hearing loss and may be evaluated with otoscopy, audiometry, and imaging.

Alternate Names:
Ossicular Chain Discontinuity; Ossicular Disruption

Ossicular Fusion

Abnormal joining or fixation of the middle-ear ossicles (malleus, incus, or stapes), which can restrict sound transmission and cause conductive hearing loss. Evaluation and treatment depend on the underlying congenital, inflammatory, traumatic, or postoperative cause.

Ossicular Prosthesis

An artificial replacement or support for one or more middle-ear ossicles, used during ear surgery to restore sound transmission in selected conductive hear-

ing loss.

Ossification

The formation of bone. It occurs during growth and fracture healing and can also happen abnormally in soft tissues after severe injury, burns, or nervous-system damage.

Ossifying Fibroma

An ossifying fibroma is a usually benign fibro-osseous tumor that replaces normal bone with fibrous tissue and mineralized material, often in the jaw.

Osteitis

Inflammation of bone caused by infection, injury, inflammatory disease, or another process. It may cause localized pain, swelling, warmth, reduced movement, or fever; treatment depends on the cause and extent of bone injury.

Osteitis Deformans

Alternate name; see *Paget Disease Of Bone*.

Osteitis Fibrosa

Weakening of bone caused by prolonged high levels of parathyroid hormone. In severe cases, bone may be replaced by fibrous tissue and develop painful weak spots.

Osteitis Fibrosa Cystica

A rare, severe bone complication of long-standing hyperparathyroidism. Excess parathyroid hormone causes bone to break down, become weak, and sometimes form cyst-like areas called brown tumors. It may cause bone pain, deformity, or fractures.

Alternate Names:
Von Recklinghausen Disease Of Bone

Osteitis Pubis

A usually noninfectious inflammation or stress-related disorder of the pubic symphysis and nearby tissues, causing pain in the groin or lower abdomen. It may follow athletic overuse, pelvic surgery, pregnancy, or childbirth.

Osteoarthritis

The most common form of arthritis, characterized by the gradual wear and breakdown of the smooth protective cartilage that cushions the ends of bones within joints. As the cartilage wears away, underlying bone surfaces rub together, leading to joint pain, stiffness (especially after periods of inactivity), swelling, bony spurs, and reduced joint mobility, most frequently affecting the knees, hips, hands, and spine.

Alternate Names:
Degenerative Joint Disease (DJD); Arthrosis

Osteoarthritis Of The Foot

Osteoarthritis affecting one or more foot joints, often causing pain, stiffness, or swelling with standing and walking. It commonly affects the big-toe joint or the middle of the foot; see also *Osteoarthritis*.

Osteoarthropathy

Osteoarthropathy is disease affecting bones and joints, often describing degenerative, hypertrophic, metabolic, or systemic-associated changes.

Osteoarthrosis

Another name for osteoarthritis, a joint disorder in which cartilage and nearby bone gradually change, causing pain, stiffness, and reduced movement.

Osteoblast

A specialized bone-forming cell derived from mesenchymal stem cells that synthesizes and secretes unmineralized organic bone matrix (osteoid, predominantly type I collagen) and facilitates its subsequent mineralization with calcium hydroxyapatite.

Osteoblastoma

A rare benign bone-forming tumor, usually in the spine or long bones, that can cause persistent pain and sometimes neurologic symptoms.

Osteoblasts

Plural form; see *Osteoblast*.

Osteocalcin

A protein made mainly by osteoblasts that participates in bone mineralization and serves as a marker of bone formation.

Osteocalcin Assay

A blood test measuring osteocalcin, a protein made by bone-forming cells. It can provide information about bone formation and turnover, but results are affected by age, kidney function, medicines, and the laboratory method.

Osteochondritis

Inflammation or injury involving bone and its overlying cartilage, often near a joint. The term includes conditions such as osteochondritis dissecans, in which a fragment may loosen.

Osteochondritis Dissecans

An area of damaged bone and cartilage beneath a joint surface that may loosen or separate. It most often affects the knee in adolescents and young adults and can cause activity-related pain, swelling, catching, or locking. Treatment depends on lesion stability, age, and symptoms.

Osteochondroma

A usually noncancerous cartilage-covered growth projecting from the surface of a bone, often near a growth plate. It may be single or occur as multiple inherited growths and can cause pain, deformity, or pressure on nearby nerves or vessels.

Osteochondromatosis

A term used for the formation of multiple osteochondromas, cartilage-capped bony outgrowths arising near growth plates. The hereditary form is called hereditary multiple osteochondromas or multiple hereditary exostoses and can cause deformity or compression of nearby nerves and vessels. It is distinct from synovial chondromatosis.

Osteochondrosis

A general name for several disorders affecting developing bone and nearby cartilage, often near a growth area or joint. The specific condition depends on the bone and age involved; it may cause pain, swelling, stiffness, or limited movement.

Osteoclasis

Deliberate surgical breaking or manipulation of a bone to correct a deformity or restore alignment. It requires stabilization while the bone heals and may cause bleeding, infection, or nerve injury.

Osteoclast

A large, multinucleated, specialized bone-resorbing cell derived from monocyte/macrophage hematopoietic precursors that degrades the organic and inorganic extracellular matrix of bone.

Osteoclastoma

See *Giant Cell Tumor Of Bone*.

Osteoclasts

Plural form; see *Osteoclast*.

Osteocyte

The most abundant and long-lived cell type in mature bone tissue, representing terminally differentiated osteoblasts that have become entombed within individualized lacunar spaces throughout the mineralized bone matrix.

Osteocytes

Plural form; see *Osteocyte*.

Osteodystrophy

Abnormal bone growth, strength, or renewal caused by a body-wide or metabolic disorder. It may result from kidney disease, mineral imbalance, hormone problems, or inherited conditions and can cause pain or fractures.

Osteofibrous Dysplasia

A usually benign bone lesion that mainly affects the shinbone in young children. It can cause a painless swelling or gradual bowing of the leg, and rarely weakens the bone enough to cause a fracture. It is distinct from fibrous dysplasia, though the names and imaging findings can be similar.

Osteogenesis

The formation and development of bone. It occurs in the growing skeleton and during fracture repair. Abnormal osteogenesis can contribute to birth disorders, poor healing, or fragile bones.

Osteogenesis Imperfecta

A group of genetic disorders, also called brittle bone disease, in which bones break easily, sometimes after mild injury or for no clear reason. The disorders are often caused by gene changes that reduce or alter type I collagen, a protein that gives strength to bone and other connective tissues. Osteogenesis imperfecta is present from birth and can range from mild to severe; severe forms may cause fractures before birth. Other features may include short height, loose joints, blue or gray whites of the eyes, hearing loss, weak or discolored teeth, weak muscles, or a curved spine.

Alternate Names:
Brittle Bone Disease

Osteogenic Sarcoma

A cancerous bone tumor whose cells make immature bone tissue. It often develops near the ends of growing long bones and may cause persistent pain, swelling, reduced movement, or a fracture.

Osteoid

The newly formed, unmineralized organic framework of bone, produced mainly by osteoblasts. Minerals are later deposited in it to make mature hard bone.

Osteoid Osteoma

A small noncancerous bone tumor, usually in an adolescent or young adult. It often causes persistent pain that is worse at night and may improve with anti-inflammatory medicine; scans help locate it and guide treatment.

Osteology

The study of bones, including their structure, development, function, injuries, and diseases. It supports the assessment and treatment of fractures, bone deformities, weak bones, infections, and bone tumors.

Osteolysis

Osteolysis is progressive destruction or resorption of bone caused by tumors, inflammation, prosthesis reactions, infection, metabolic disease, or other processes.

Osteolytic

Causing or characterized by breakdown and loss of bone tissue. Osteolytic lesions can weaken bones and occur with cancers, infections, inflammation, metabolic disorders, or excessive activity of bone-removing cells.

Osteoma

A benign, slow-growing tumor made of bone. It often develops in the skull or facial bones and may cause no symptoms unless it blocks a passage or presses on nearby structures.

Osteoma Cutis

Osteoma cutis is formation of bone within the skin or subcutaneous tissue, occurring as a primary disorder or secondary to acne, trauma, or another condition.

Osteomalacia

Osteomalacia is inadequate mineralization of adult bone, commonly from vitamin-D deficiency or phosphate disorders, causing bone pain, weakness, and fractures.

Osteomyelitis

A serious infection of the bone and bone marrow, usually caused by bacteria or fungi. Microorganisms can reach bone tissue through the bloodstream from an infection elsewhere in the body, through an open fracture or penetrating wound, or by spreading from adjacent infected skin or soft tissues. It causes localized bone pain, swelling, tenderness, warmth, and fever, and can lead to irreversible bone damage or necrosis if not treated promptly.

Osteomyelitis In Children

Childhood osteomyelitis is infection of bone, often caused by bacteria entering through blood or trauma, producing pain, fever, swelling, and impaired movement.

Osteon

The fundamental microscopic, cylindrical structural unit of compact (cortical) bone tissue (Haversian system), consisting of concentric lamellae of mineralized bone matrix surrounding a central Haversian canal.

Osteonecrosis

Death of bone tissue caused by reduced or interrupted blood flow; it is also called avascular necrosis. Causes include injury, certain diseases, long-term corticosteroid use, and heavy alcohol use, though sometimes the cause is unknown. Bone near a joint may collapse, leading to pain and joint damage.

Alternate Names:
Avascular Necrosis; Aseptic Necrosis; Ischemic Bone Necrosis; AVN

Osteonecrosis Of The Jaw

Death of jawbone tissue. Medication-related osteonecrosis of the jaw is associated with antiresorptive or antiangiogenic drugs and is characterized by exposed bone, or bone probeable through a fistula, persisting for more than eight weeks in the absence of jaw radiation or metastatic disease to the jaw. Radiation-related jaw necrosis is termed osteoradionecrosis.

Alternate Names:
Medication-Related Osteonecrosis Of The Jaw; MRONJ

Osteonectin

An extracellular-matrix protein involved in collagen organization, mineral binding, and tissue remodeling.

Alternate Names:
SPARC

Osteons

Plural form; see *Osteon*.

Osteopath

A physician trained in medicine and surgery who earns a Doctor of Osteopathic Medicine degree.

Alternate Names:
Doctor of Osteopathic Medicine; DO

Osteopathy

A term with different meanings by country. In the United States, osteopathic medicine is full-scope physician practice by doctors of osteopathic medicine (DOs), who may use osteopathic manipulative treatment. In the United Kingdom, osteopathy refers to a regulated form of manual diagnosis and treatment, mainly for musculoskeletal problems; it is a distinct profession from medical doctors.

Osteopenia

Bone density that is below the usual range but does not meet the bone-density threshold for osteoporosis. In some adults, a DXA scan describes osteopenia with a T-score between -1.0 and -2.5; this range is not used to classify everyone. Fracture risk also depends on age, previous fractures, falls, medicines, and other health factors.

Osteopetrosis

A rare inherited disorder in which old bone is not removed normally. Bones become unusually dense but brittle and may fracture; crowding of the bone marrow and nerves can cause anemia, infections, vision loss, or other problems.

Osteophyte

A bony outgrowth forming at the edge of a joint, commonly with osteoarthritis. It may cause stiffness, pain, reduced movement, or pressure on nearby nerves, although some osteophytes cause no symptoms.

Osteoplasty

Surgery to repair, reshape, or reconstruct bone to restore structure, movement, or function. The technique depends on the bone problem and may be combined with fixation, grafting, or joint surgery.

Osteopoikilosis

Osteopoikilosis is an inherited benign bone condition with multiple small dense spots on imaging, usually asymptomatic and discovered incidentally.

Osteopontin

A protein involved in bone remodeling, immune responses, inflammation, and attachment between cells and tissues. Its level may change in several diseases, but a measurement is not by itself a specific diagnosis.

Osteoporosis

A progressive skeletal condition characterized by reduced bone mineral density and deterioration of bone structure, causing bones to become fragile, porous, and prone to fractures. It develops when the body loses bone mass faster than it can rebuild it, often progressing silently without pain or symptoms until a fracture occurs—commonly in the hip, spine, or wrist—even from a minor fall or ordinary daily movement.

Alternate Names:
Brittle Bones; Low Bone Density

Osteoporosis Of The Hip

Osteoporosis is a disease that weakens bones throughout the body, including the hip bones, and raises the chance of fracture. It is not a condition limited to the hip; see *Osteoporosis*.

Osteoporosis Fracture Risk Assessment

An estimate of a person's probability of fracture over a defined period, using factors such as age, bone density, previous fractures, falls, medicines, family history, and other health conditions. Tools such as FRAX combine clinical risk factors with or without bone-density measurements.

Osteoporotic Fracture

A fracture resulting from weakened, porous bone after a low-energy event that would not usually break healthy bone.

Osteoradionecrosis

Death of bone within an area treated with radiation, most often the jaw after head-and-neck cancer treatment. The bone may become exposed or fail to heal after injury or dental work and can become infected.

Osteosarcoma

A primary bone cancer in which tumor cells make osteoid, the early tissue that forms bone. It most often starts in a long bone near the knee or shoulder and occurs mainly in children, adolescents, and young adults, though it can develop in other bones and at older ages. It may cause persistent bone pain, swelling, or a fracture.

Osteosclerosis

Abnormally increased bone density seen on imaging or examination. It may result from inherited disease, altered bone renewal, chronic stress, inflammation, medicines, or cancer; dense bone can still be weak or painful.

Osteosynthesis

Surgical repair and stabilization of a broken bone using implants such as plates, screws, rods, nails, or wires. The implants hold the pieces in alignment while the bone heals.

Osteotome

A sharp surgical instrument used to cut or shape bone.

Osteotomy

A surgical procedure involving cutting and repositioning of bone to correct deformity, realign joint surfaces, alter weight-bearing forces, or change limb length.

Osteotomy Of The Knee

Surgery that cuts and reshapes a knee-region bone to correct alignment and redistribute weight across the joint.

Ostium

A natural opening into or out of an organ, cavity, blood vessel, or duct. It allows air, fluid, or other contents to pass between connected body spaces.

Ostomy

A surgically created opening that connects part of the bowel or urinary tract to the skin so stool or

urine can leave the body. A colostomy or ileostomy passes stool; a urostomy passes urine. A pouch usually collects the output and protects the surrounding skin.

Ostomy Appliance

A pouching system that collects stool or urine from a surgically created opening in the abdomen. Colostomy and ileostomy appliances collect stool; urostomy appliances collect urine. Leakage or poor fit can irritate or injure the surrounding skin.

Ostraceous Psoriasis

A rare severe form of psoriasis in which plaques become very thick, hard, and layered, resembling an oyster shell. It can be difficult to treat and may involve extensive skin thickening and fissuring.

Otalgia

The medical term for earache or ear pain. It is divided into two main types: primary and referred. Primary ear pain originates directly inside the ear, most often caused by middle ear infections, swimmer's ear (infection of the outer ear canal), buildup of earwax, pressure changes, or eardrum injury. Referred ear pain comes from nearby body parts that share the same sensory nerves with the ear, including tooth decay, jaw joint problems (temporomandibular joint issues), throat infections, or neck strain. Doctors find the cause by inspecting the ear canal and eardrum with a lighted scope (otoscope) and checking the teeth, mouth, and jaw when the ear looks healthy.

Alternate Names:
Earache; Ear Pain

Othello Syndrome

A delusional belief that a partner is unfaithful despite insufficient evidence; it may occur with psychiatric, neurologic, or substance-related disorders.

Other Pain Conditions

Pain conditions that do not fit neatly into a single category, including nociplastic pain, fibromyalgia, chronic tension-type headache, temporomandibular pain, chronic pelvic pain, and complex regional pain syndrome. Diagnosis and treatment depend on the specific condition.

Otic Barotrauma

Injury to the ear caused by failure to equalize pressure during flying, diving, or other pressure changes.

Otic Capsule

The dense part of the skull bone that surrounds and protects the inner ear, including the hearing and balance organs. Disease or abnormal remodeling in this bone can affect hearing or balance.

Otic Ointment

A semisolid medicine formulated for application to the outer ear or ear canal. Some preparations can injure inner-ear structures if they pass through a perforated eardrum.

Otitis

Inflammation of the ear, which may be infectious or noninfectious. Otitis externa affects the ear canal, otitis media affects the middle ear, and inner-ear inflammation may cause vertigo or hearing loss. Symptoms can include pain, fever, blockage, discharge, or reduced hearing and vary with the location and cause.

Otitis Externa

Inflammation or infection of the ear canal, often called swimmer's ear. It can cause pain, itching, swelling, tenderness, or discharge, and may make hearing feel blocked.

Alternate Names:
Swimmer's Ear; External Otitis; Tropical Ear

Otitis Media

Inflammation or infection of the middle ear, the air-filled space located directly behind the eardrum. It often develops after a common cold or respiratory virus causes swelling that blocks the eustachian tube, trapping fluid and allowing bacteria or viruses to multiply. Commonly affecting infants and young children, it typically causes sharp ear pain, fever, irritability, fluid drainage, and temporary muffled hearing.

Otitis Media With Effusion

Fluid behind the eardrum without signs of an active middle-ear infection. It may make hearing seem muffled and often clears on its own, but long-lasting fluid can affect hearing and speech development in children.

Otoacoustic Emissions

Very soft sounds naturally produced by a healthy inner ear that can be measured with a small probe placed in the ear canal. The test is quick and painless and is commonly used to screen newborn hearing and assess inner-ear function.

Alternate Names:
OAE; Cochlear Emissions

Otocephaly

A severe congenital craniofacial malformation characterized by absent or markedly underdeveloped mandible, ventral displacement or fusion of the ears, and associated facial and airway abnormalities. It is usually lethal because of profound impairment of breathing and feeding.

Otolaryngologist

An otolaryngologist is a physician specializing in disorders of the ear, nose, throat, head, neck, voice, swallowing, and related surgery.

Otolaryngology

The medical specialty treating disorders of the ears, nose, throat, head, and neck. Specialists manage hearing, balance, breathing, swallowing, voice, sinus, facial, and related surgical problems.

Alternate Names:
Otorhinolaryngology; ENT

Otolith

A calcium carbonate (calcite) crystalline structure embedded within the gelatinous otolithic membrane covering the sensory maculae of the utricle and saccule within the inner ear vestibular system.

Otolithiasis

Displacement of calcium carbonate crystals (otoconia) from the utricle into a semicircular canal or onto its sensory cupula. This can cause brief episodes of positional vertigo, as in benign paroxysmal positional vertigo.

Alternate Names:
Otoconial Displacement

Otoliths

Plural form; see *Otolith*.

Otology

The study and medical care of the ear and hearing.

Otomycosis

A fungal infection of the ear canal. It can cause itching, pain, a blocked feeling, reduced hearing, and white or dark debris in the ear.

Alternate Names:
Fungal Otitis Externa; Mycotic Otitis

Otoplasty

Surgery to alter the shape, position, or proportion of the external ear, commonly to correct prominent or congenital ear differences.

Otorhinolaryngology

Alternate name; see *Otolaryngology*.

Otorrhea

Fluid, pus, blood, or other discharge flowing from the ear. Causes include infection, eardrum perforation, injury, or a growth; persistent, bloody, foul-smelling, or clear discharge can indicate significant disease. Clear watery discharge after a head injury may be cerebrospinal fluid.

Otorrhoea

Alternate spelling; see *Otorrhea*.

Otosalpingitis

Inflammation, mucosal edema, and catarrhal obstruction of the Eustachian tube connecting the middle ear to the nasopharynx, predisposing to negative middle ear pressure, tympanic membrane retraction, and serous otitis media.

Alternate Names:
Eustachian Salpingitis; Tubotympanitis

Otosclerosis

A condition in which one of the tiny middle-ear bones becomes fixed and cannot move freely. Sound then does not pass well to the inner ear, gradually reducing hearing.

Otoscope

A lighted instrument used to examine the ear canal and eardrum. It can help identify earwax, infection, a foreign object, fluid, swelling, or a perforated eardrum. Examination findings are interpreted with symptoms and, when needed, hearing tests.

Otoscopy

Looking into the ear canal and at the eardrum with a lighted instrument called an otoscope. It can help find earwax, infection, a foreign object, a hole in the eardrum, fluid, or other causes of ear symptoms.

Ototoxicity

Damage to the inner ear from a medicine, chemical, or other toxic exposure. It may cause hearing loss, ringing in the ears, dizziness, or imbalance and can be temporary or permanent.

Alternate Names:
Ear Toxicity

Ottawa Ankle Rules

A clinical guide for deciding whether an ankle or foot X-ray is needed after an injury. An ankle X-ray is indicated for pain near the ankle bones with tenderness at the back edge or tip of either ankle bone, or inability to take four steps both after injury and at assessment. A foot X-ray is indicated for midfoot pain with tenderness at the navicular or base of the fifth metatarsal, or the same inability to take four steps.

Ounce

A unit of mass or fluid volume whose exact conversion depends on the measurement system; the same word can refer to different quantities in different systems.

Outcome

The result or final effect of a disease, treatment, exposure, or healthcare intervention. Outcomes may include recovery, symptom control, complications, disability, quality of life, or death and can be measured in different ways.

Outcome Measurement

The use of defined measures to assess a patient's symptoms, function, quality of life, or other results before and after care.

Outer Ear

The visible auricle and the external auditory canal, which collect and conduct sound toward the eardrum.

Outer Ear Infection

Alternate name; see *Swimmer's Ear*.

Outpatient

A person who receives medical evaluation or treatment without being admitted overnight to a hospital or other inpatient facility.

Outpatient Rehabilitation

Rehabilitation provided without hospital admission to improve function after illness, injury, surgery, or disability. The setting, frequency, and duration are individualized.

Output

The amount of a substance produced or eliminated by the body or by an organ over a specified time, such as urine output or cardiac output.

Ova

Plural of ovum; eggs or egg cells, and in parasitology, eggs of worms or other parasites.

Ovalocyte Count

An ovalocyte count estimates the number or proportion of oval-shaped red blood cells on a blood smear and may help evaluate anemia.

Ovarian

Relating to an ovary. The ovaries release eggs and produce hormones. Ovarian problems include cysts, inflammation, reduced function, twisting that cuts off blood supply, and tumors; sudden severe pelvic pain may indicate torsion.

Ovarian (Adnexal) Torsion

Twisting of an ovary, often together with its fallopian tube, around its blood supply. Sudden unilateral pelvic pain, nausea, or vomiting may occur; it is a surgical emergency because prolonged torsion can cause ovarian necrosis.

Ovarian Cancer

A type of cancer that begins in the ovaries, fallopian tubes, or the peritoneal lining of the abdomen. Because early symptoms—such as persistent abdominal bloating, pelvic discomfort, feeling full quickly when eating, and urinary changes—are subtle and easily mistaken for digestive issues, the cancer is often detected at an advanced stage. It most commonly affects older women, and individuals with a family history or specific inherited genetic variations (such as *BRCA1* or *BRCA2*) have an increased risk.

Alternate Names:
Ovarian Carcinoma; Malignant Ovarian Neoplasm; Ovarian Malignancy

Ovarian Carcinoid

Alternate form; see *Ovarian Neuroendocrine Tumor*.

Ovarian Cyst

A fluid-filled or partly solid sac that develops within or on the surface of an ovary. Most are harmless functional cysts that form during normal menstrual cycles and resolve spontaneously within a few weeks to months without causing symptoms. Larger or complex cysts can cause pelvic aching, lower abdominal pressure, or bloating, and can lead to severe sudden pain if they rupture or cause the ovary to twist (ovarian torsion).

Alternate Names:
Ovarian Cysts; Ovarian Fluid-Filled Sacs

Ovarian Cyst Rupture

Breakage of an ovarian cyst that may cause sudden pelvic pain and internal bleeding or, if the cyst is infected, fever and inflammation. Assessment depends on vital signs, pregnancy testing, ultrasound, blood loss, and the severity and persistence of symptoms.

Ovarian Cysts

Plural form; see *Ovarian Cyst*.

Alternate Names:
Ovarian Fluid-Filled Sacs

Ovarian Dysgerminomas

Malignant ovarian germ-cell tumors that occur most often in adolescents and young adults. They may present as a rapidly enlarging pelvic mass or pain; treatment commonly involves fertility-sparing surgery with staging and, when indicated, chemotherapy.

Ovarian Failure

Reduced ovarian activity causing irregular or absent periods, difficulty becoming pregnant, and symptoms of low estrogen such as hot flushes or vaginal dryness. When it occurs before age 40, it is usually called primary ovarian insufficiency.

Ovarian Fibromata

Usually noncancerous tumors made of fibrous tissue that develop in an ovary. They may cause no symptoms or produce pelvic pressure, pain, menstrual changes, or fluid in the abdomen when large.

Ovarian Follicle

A small fluid-filled structure in an ovary that contains an immature egg and supporting cells. During each menstrual cycle, one follicle usually matures and releases an egg during ovulation.

Ovarian Gonadoblastoma

A rare tumor containing cells that normally develop into eggs and cells that support sex-hormone production. It often occurs in an atypically developed gonad, may contain Y-chromosome material, and can produce hormones.

Ovarian Hemorrhage

Bleeding into or around an ovary, often from a ruptured cyst or blood vessel. It may cause sudden pelvic pain, weakness, dizziness, or internal blood loss and can require surgical treatment.

Ovarian Hyperstimulation Syndrome

A complication of fertility treatment in which the ovaries enlarge and fluid moves into the abdomen or other tissues. It may cause bloating, pain, vomiting, reduced urine, breathlessness, blood clots, or kidney problems and can be severe.

Alternate Names:
OHSS

Ovarian Induction

Alternate name; see *Ovulation Induction*.

Ovarian Infection

Infection involving an ovary, often as part of pelvic inflammatory disease or an abscess, causing pelvic pain, fever, and abnormal discharge.

Ovarian Insufficiency

Reduced ovarian hormone production or follicular function, which may cause irregular or absent menstruation, infertility, hot flashes, vaginal symptoms, and reduced bone density. The cause, age at onset, pregnancy goals, and associated autoimmune or genetic findings guide evaluation.

Ovarian Metastasis

Cancer that has spread to an ovary from another organ, commonly the digestive tract, breast, or reproductive organs. It may resemble a primary ovarian cancer, so tissue testing is important because treatment depends on the original site.

Ovarian Neuroendocrine Tumor

A rare ovarian tumor arising from cells with neuroendocrine features. It may be a primary ovarian tumor or part of a tumor arising elsewhere, and its behavior ranges from well-differentiated to aggressive disease.

Ovarian Overproduction Of Androgens

Excess production of androgens, such as testosterone, by the ovaries. It may cause acne, increased facial or body hair, irregular periods, or difficulty becoming pregnant.

Ovarian Pregnancy

A rare ectopic pregnancy in which the embryo implants in an ovary. It may cause pelvic pain or internal bleeding and can be difficult to distinguish from other ectopic pregnancies.

Ovarian Reserve

The approximate number of immature eggs (oocytes) remaining in the ovaries. It generally declines with age and may be estimated with blood tests or an ultrasound follicle count. It reflects egg quantity more than egg quality and does not by itself predict whether or when a person can become pregnant.

Ovarian Reserve Testing

Tests that estimate the number of available ovarian follicles, mainly to predict how the ovaries may respond to fertility medicines. They commonly measure anti-Müllerian hormone or follicle-stimulating hormone in blood, or count small follicles by ultrasound. Results do not directly measure egg quality and do not reliably predict natural conception.

Ovarian Rupture

A tear in an ovary or ovarian cyst that may cause sudden pelvic pain and internal bleeding.

Ovarian Stimulation

Use of hormone medicines to make ovarian follicles grow and eggs mature. In in vitro fertilization, the aim is usually to develop several eggs for collection; ovulation induction more often aims to mature one egg. An excessive response can cause ovarian hyperstimulation syndrome.

Ovarian Teratoma

A tumor of an ovary made from reproductive cells that can form different kinds of tissue, such as skin, hair, or bone. Mature teratomas are usually non-

cancerous; immature teratomas can be cancerous.

Ovarian Thecoma

Alternate form; see *Thecoma*.

Ovarian Torsion

Twisting of an ovary, often together with its fallopian tube, that can cut off blood flow. It causes sudden one-sided pelvic pain, often with nausea or vomiting, and is a gynecologic emergency that is usually treated with surgery.

Ovaries

The paired female gonads that produce oocytes and secrete sex hormones, mainly estrogen and progesterone. They are located on either side of the uterus and participate in the menstrual cycle and reproduction.

Alternate Names:
Female Gonads; Oophoron

Ovariotomy

Older term; see *Oophorectomy*.

Ovary

A reproductive organ that contains developing oocytes and produces hormones, including estrogen and progesterone. In most menstrual cycles, an ovary releases an oocyte during ovulation.

Ovary Disease

Any disorder affecting an ovary, including cysts, infection, inflammation, tumors, hormonal dysfunction, torsion, or bleeding.

Ovary Neoplasm

An abnormal growth in an ovary that may be noncancerous, have uncertain behavior, or be cancerous. Symptoms can include bloating, pelvic pain, pressure, or abnormal bleeding, but some growths are found incidentally on imaging.

Overactive Bladder

Alternate name; see *Overactive Bladder Syndrome*.

Overactive Bladder Syndrome

A symptom complex characterized by urinary urgency, with or without urgency urinary incontinence, usually accompanied by daytime frequency and nocturia in the complete absence of a proven urinary tract infection or other obvious local pathological condition.

Alternate Names:
OAB; Overactive Bladder

Overall Survival

The length of time from diagnosis, treatment, or study entry until death from any cause. Doctors and researchers use it to describe how long people live and to compare treatments. It differs from time without worsening disease because it includes survival regardless of whether the illness has progressed.

Overbite

Vertical overlap of the upper front teeth over the lower front teeth; excessive overbite can damage gums, teeth, or jaw function.

Overdenture

A removable denture supported by dental implants or remaining natural teeth. This support can improve stability, chewing, speech, and comfort, while attachments may help preserve jawbone and reduce denture movement.

Overdose

Taking, receiving, or being exposed to more of a medicine or other substance than intended or prescribed. An overdose may or may not cause harm; its effects depend on the substance, amount, formulation, route, timing, and person exposed.

Overflow Incontinence

Involuntary leakage of urine occurring when the intravesical pressure exceeds the outlet resistance in a chronically overdistended, poorly contracting bladder, caused by mechanical bladder outlet obstruction (e.g., benign prostatic hyperplasia) or an acontractile detrusor muscle in diabetic or neurogenic bladder.

Alternate Names:
Paradoxical Incontinence; Overdistension Incontinence

Overflow Urinary Incontinence

Urine leakage caused by a bladder that remains too full because it does not empty properly. Weak flow, difficulty starting, frequent small amounts, dribbling, or constant leakage may occur; blockage or nerve disease can be responsible.

Overgrowth Syndrome

A group of disorders, usually present from birth, in which the whole body, one side, or particular tissues grow more than expected. Examples include Beckwith-Wiedemann syndrome, Sotos syndrome, and PIK3CA-related overgrowth spectrum. Findings may include large body size, asymmetric limb or tissue growth, or an enlarged tongue; tumor risk is increased in some syndromes, such as Beckwith-Wiedemann syndrome, but not in all.

Over-Hydration

Excess accumulation of body water, which may cause edema, dilutional hyponatremia, or heart and lung complications.

Overlap Myositis

Muscle inflammation occurring together with another autoimmune connective-tissue disease, such as lupus, systemic sclerosis, mixed connective-tissue disease, or Sjögren syndrome. It may cause muscle weakness, skin changes, joint symptoms, swallowing problems, or lung disease; treatment is tailored to the affected organs.

Overlapping Autoimmune Syndrome

A condition in which features of two or more defined autoimmune diseases occur in the same person. Examples include systemic sclerosis with myositis and autoimmune hepatitis with primary biliary cholangitis. The term does not require every feature of each disease and is interpreted according to the specific overlap pattern.

Alternate Names:
Overlap Syndrome

Overlay Denture

A removable denture that fits over remaining teeth, roots, or implants to improve support, chewing, and retention.

Over-Nutrition

Excessive intake or accumulation of energy or nutrients that can contribute to obesity, metabolic disease, or toxicity.

Overriding Aorta

A birth-related heart abnormality in which the main artery leaving the heart sits over a hole between the lower chambers and receives blood from both. It commonly occurs as part of tetralogy of Fallot.

Oversedate

To give excessive sedation, causing unusually deep sleep, slowed responses, impaired breathing, or difficulty maintaining the airway.

Over-The-Counter

A medicine available without a prescription for specified conditions. It can still cause side effects, interact with other medicines, or be unsuitable for some health conditions.

Overt Proteinuria

Abnormally high protein loss in the urine that is detectable by routine testing and may indicate kidney disease.

Overuse Syndrome

Alternate name; see *Repetitive Strain Injury*.

Overweight

Body weight above the usual range for height. In adults, a Body Mass Index of 25 to less than 30 kg/m^2 is commonly classified as overweight, but it does not directly measure body fat.

Oviduct

A tube carrying an ovum from the ovary toward the uterus; in humans it is the uterine or fallopian tube.

Ovomucin

A glycoprotein in egg white that contributes to its gel-like viscosity and helps stabilize the egg-white structure.

Ovotesticular Disorder of Sex Development

A difference of sex development in which both ovarian and testicular tissue are present, either in one ovotestis or in separate gonads. Chromosomal patterns and external anatomy vary. The deprecated historical term "true hermaphroditism" may appear in older records; current terms include ovotesticular disorder of sex development and ovotesticular DSD.

Alternate Names:
Ovotesticular DSD; True Hermaphroditism (deprecated historical term)

Ovotesticular Disorder of Sexual Development

A difference of sex development in which a person has both ovarian and testicular tissue, in the same or different gonads. Evaluation is multidisciplinary and considers anatomy, hormones, chromosomes, genetics, fertility, wellbeing, and the person's preferences.

Ovotestis

A gonad containing both ovarian-type and testicular tissue. It is an uncommon difference of sex development and may produce ovarian hormones, testicular hormones, eggs, sperm, or none of these; evaluation is individualized.

Ovulation

Release of a mature egg from an ovarian follicle, usually around the middle of the menstrual cycle.

Ovulation Home Test

An ovulation home test detects the rise in urinary luteinizing hormone that usually occurs shortly before ovulation.

Ovulation Induction

Use of medicines to trigger or regulate ovulation in someone who ovulates rarely or not at all. The medicines help ovarian follicles grow and mature; this treatment may be used alone or with insemination. It differs from IVF stimulation, which usually develops several eggs for collection.

Ovum

A mature female gamete; in humans, the cell released at ovulation is usually a secondary oocyte, which completes its final meiotic division when a sperm enters. The resulting genetic material combines with the sperm's to form a zygote, the first cell of a developing embryo.

Oxacillin

A penicillinase-resistant penicillin used to treat infections caused by susceptible bacteria, especially staphylococci. It is also used in laboratory testing for methicillin resistance.

Oxalate

A dicarboxylic acid anion ($C_2O_4^{2-}$) derived from dietary sources and endogenous glyoxylate metabolism that forms insoluble complexes with calcium, serving as the primary constituent of calcium oxalate nephrolithiasis.

Oxalate Nephropathy

Renal tubular injury and interstitial fibrosis resulting from the intrarenal precipitation and deposition of insoluble calcium oxalate crystals within renal tubular lumens, seen in enteric hyperoxaluria (due to fat malabsorption, Crohn disease, or bariatric surgery) and ethylene glycol intoxication.

Oxalates

Plural form; see *Oxalate*.

Oxalic Acid

A dicarboxylic acid whose oxalate salts can contribute to calcium-oxalate kidney stones; concentrated exposure is toxic.

Oxalic Acid Poisoning

Swallowing oxalic acid can burn the digestive tract

and bind calcium, causing muscle cramps, abnormal heart rhythms, seizures, kidney injury, or shock. It is a medical emergency.

Oxaliplatin

Oxaliplatin is a platinum chemotherapy drug that forms DNA cross-links and is used especially in colorectal cancer regimens; acute cold-triggered neuropathy and cumulative sensory neuropathy are characteristic toxicities.

Oxaloacetate

A small molecule used in the cell's energy-making cycle. It combines with another molecule to begin a step that produces energy and can also help make glucose and the amino acid aspartate.

Oxaluria

Excretion of oxalate in urine. Increased urinary oxalate, called hyperoxaluria, can promote calcium oxalate kidney stones. Causes include inherited metabolic disorders, increased intestinal absorption after fat malabsorption or bowel surgery, and other factors; measurement may be included in a metabolic stone evaluation.

Oxandrolone

An anabolic steroid used in selected conditions involving severe weight loss or catabolic stress; it can affect the liver, lipids, and hormone function.

Oxaprozin

A nonsteroidal anti-inflammatory drug used to relieve pain and inflammation in conditions such as osteoarthritis and rheumatoid arthritis.

Oxazepam

A benzodiazepine medicine used short-term for anxiety or alcohol withdrawal, causing sleepiness and possible dependence.

Oxazepam Overdose

Taking too much oxazepam, a sedative medicine, can cause severe sleepiness, confusion, poor coordination, slowed breathing, coma, or death, especially with alcohol or other sedatives.

Oxazole

Oxazole is a five-membered chemical ring containing oxygen and nitrogen that is used as a building block in medicinal and other chemistry.

Oxcarbazepine

Oxcarbazepine is an antiseizure medicine that blocks voltage-gated sodium channels and treats focal seizures; dizziness, ataxia, rash, and clinically important hyponatraemia may occur.

Oxidant

A chemical substance or reactive oxygen species (ROS) that accepts electrons from another molecule in an oxidation-reduction reaction, contributing to cellular oxidative stress when production exceeds antioxidant defenses.

Oxidants

Plural form; see *Oxidant*.

Oxidation

A chemical process that changes a substance through loss of electrons or reaction with oxygen.

Oxidation-Reduction

A chemical reaction involving transfer of electrons, in which one substance is oxidized and another is reduced.

Oxidative Phosphorylation

A process mainly occurring at the inner mitochondrial membrane in which electron transfer drives a proton gradient that powers ATP synthase to produce ATP. It is linked to, but distinct from, the earlier pathways that generate the electron carriers.

Oxidative Stress

A state in which reactive molecules exceed the capacity of antioxidant systems to control them, potentially damaging cell membranes, proteins, and DNA. It is studied in many diseases but is not itself a specific diagnosis.

Oxidoreductase

An enzyme that transfers electrons or hydrogen between molecules during a chemical reaction. These enzymes are important in energy production, drug breakdown, and many other cell processes.

Oxime

A type of chemical compound. Some oximes, such as pralidoxime, are used as emergency antidotes because they can restore an important nerve enzyme after organophosphate pesticide poisoning.

Oximeter

A device that estimates blood oxygen level, usually by shining light through a finger, toe, or earlobe. A pulse oximeter also displays pulse rate, but readings can be affected by movement, poor circulation, or skin factors.

Oximetry

Measurement of oxygen levels in blood or tissue. A pulse oximeter estimates blood oxygen through a skin sensor, while arterial testing measures oxygen more directly; results can be affected by poor circulation or motion.

Oxter

Oxter is an anatomical term for the armpit or axilla.

Oxybuprocaine

A local anaesthetic eye drop that briefly numbs the surface of the eye. It may be used for examinations or short procedures. Repeated use can delay healing and damage the cornea.

Oxycephaly

A cone-shaped skull caused by premature fusion of cranial sutures, also called acrocephaly.

Alternate Names:
Acrocephaly

Oxycodone

Oxycodone is an opioid analgesic used for moderate-to-severe pain; sedation, constipation, respiratory depression, tolerance, dependence, and overdose risk increase with alcohol or other sedatives.

Oxycodone Hydrochloride

Alternate form; see *Oxycodone*.

Oxygen

A gas essential for aerobic metabolism and tissue energy production.

Oxygenases

Enzymes that incorporate oxygen from molecular oxygen into a substrate; monooxygenases add one oxygen atom and dioxygenases add both.

Oxygenated Blood

Blood with a relatively high oxygen content, usually after passing through the lungs. It travels through systemic arteries to tissues; pulmonary arteries carry oxygen-poor blood from the heart to the lungs.

Oxygenation

The process of supplying oxygen to blood and tissues, or the degree to which hemoglobin and tissues are adequately oxygenated.

Oxygenator

A machine that adds oxygen to blood and removes carbon dioxide when the lungs cannot do this adequately. It is used during heart-lung bypass surgery and some forms of extracorporeal life support.

Oxygen Consumption

The amount of oxygen the body uses in a given time. It reflects the body's energy needs and rises with exercise, fever, or illness; it can be measured during exercise testing to assess heart and lung function.

Oxygen Content

The amount of oxygen carried in blood, mainly bound to hemoglobin with a small dissolved component.

Oxygen Delivery

The amount of oxygen transported from the lungs to body tissues each minute. It depends mainly on

cardiac output, the amount of hemoglobin, and how much oxygen the hemoglobin carries. Inadequate delivery can injure organs when the body cannot compensate.

Oxygen Desaturation Index

The number of drops in blood oxygen saturation per hour of sleep or recording time during a sleep study. The report should state the drop threshold used, commonly at least 3% or 4% from baseline, and whether the rate is calculated per hour of sleep or monitoring time.

Oxygen Dissociation Curve

A graph showing how readily hemoglobin in the blood takes up or releases oxygen at different oxygen levels. Temperature, blood acidity, carbon dioxide, and other factors can shift the curve.

Alternate Names:
Oxygen-Hemoglobin Dissociation Curve; Oxyhemoglobin Dissociation Curve

Oxygen Enhancement Ratio

A measure of how much oxygen increases the effect of radiation on cells. It compares the radiation dose needed with little oxygen to the dose needed when oxygen is normal to produce the same amount of cell injury.

Oxygen-Hemoglobin Dissociation Curve

Alternate name; see *Oxygen Dissociation Curve*.

Oxygen Mask

A mask that delivers supplemental oxygen through the nose and mouth. The type and flow rate are selected according to oxygen needs and may be monitored with blood or pulse-oximetry measurements.

Oxygen Pulse

The amount of oxygen used by the body with each heartbeat, estimated during exercise as oxygen uptake divided by heart rate.

Oxygen Safety

Practices that reduce fire, explosion, pressure, and treatment risks during oxygen use, including keeping oxygen away from flames, smoking, oils, and unsafe equipment.

Oxygen Saturation

The percentage of hemoglobin in the blood carrying oxygen. A finger or ear sensor estimates it without taking blood, while an arterial blood test measures it more directly; the healthy target varies with the person's condition.

Oxygen Tent

A canopy or enclosure used to deliver oxygen around a patient's head; modern oxygen masks, nasal cannulas, or ventilatory devices are usually more precise.

Oxygen Therapy

Administration of extra oxygen through a tube, mask, or breathing machine when blood oxygen is too low or expected to fall. It is titrated to oxygen needs because excessive oxygen can also cause harm; oxygen accelerates combustion and creates a fire hazard near flames.

Oxygen Therapy In Infants

Carefully measured extra oxygen given to a baby whose blood oxygen is too low or whose lungs are not exchanging gases adequately. Clinicians monitor oxygen closely because both too little and too much can injure developing organs.

Oxygen Toxicity

Tissue injury caused by exposure to oxygen at excessively high partial pressures or concentrations, potentially affecting the lungs, eyes, or central nervous system.

Oxygen Transport

The movement of oxygen from the lungs to tissues, mainly bound to hemoglobin and partly dissolved in plasma, with delivery affected by blood flow and hemoglobin concentration.

Oxyhaemoglobin

British spelling; see *Oxyhemoglobin*.

Oxyhemoglobin

Hemoglobin bound to oxygen, formed mainly in the lungs and carrying oxygen through arterial blood to tissues.

Oxylipins

Oxylipins are oxygenated fatty-acid derivatives that act as local mediators of inflammation, vascular tone, pain, and other physiologic responses.

Oxymetazoline

A topical alpha-adrenergic agonist used as a nasal decongestant or ocular vasoconstrictor; prolonged nasal use can cause rebound congestion.

Oxymetholone

Oxymetholone is an anabolic steroid used in selected severe anemias; it can cause liver injury, fluid retention, and hormonal side effects.

Oxymorphone

A potent opioid analgesic used for severe pain; it can cause sedation, constipation, dependence, and life-threatening respiratory depression.

Oxyphil Cell

A cell with many mitochondria, giving it a distinctive granular appearance under a microscope. Oxyphil cells occur in tissues such as the parathyroid and thyroid, where their significance depends on the organ and the surrounding findings.

Oxyphil Cell Carcinoma

Alternate name; see *Hurthle Cell Carcinoma (Oncocytic Carcinoma)*.

Oxyphilic Adenoma

An oxyphilic adenoma is a usually benign glandular tumor composed of cells rich in mitochondria, such as an oncocytic parathyroid or salivary-gland tumor.

Oxytocic

An agent or drug that stimulates uterine smooth muscle contractions, used to induce or augment labor and control postpartum hemorrhage.

Oxytocics

Plural form; see *Oxytocic*.

Oxytocin

A hormone made in the hypothalamus and released by the posterior pituitary gland. It stimulates uterine contractions during labor and milk ejection during breastfeeding; synthetic oxytocin is used in obstetric care.

Oxytocin Infusion

A controlled drip of synthetic oxytocin into a vein to start or strengthen labor or help control heavy bleeding after birth. Overly strong or frequent contractions can harm the pregnant person or baby.

Oxyuriasis

Infection with pinworms, especially Enterobius vermicularis. The worms commonly cause itching around the anus at night, disturbed sleep, and sometimes abdominal discomfort; treatment usually includes medicine and household hygiene.

Ozaena

British spelling; see *Ozena*.

Ozena

Ozena is a chronic form of atrophic rhinitis with widened nasal passages, crusting, foul odor, and impaired mucosal function.

Ozone

Ozone is a reactive form of oxygen that can irritate and injure the airways and lungs when inhaled, despite useful atmospheric and disinfecting roles.

P

1p36 Deletion Syndrome

A genetic disorder caused by loss of a piece of chromosome 1. It may cause developmental and intellectual disability, small head size, low muscle tone, seizures, hearing loss, heart problems, and distinctive facial features; severity varies.

Alternate Names:
Monosomy 1p36; Chromosome 1p36 Deletion Syndrome

Generalized Pustular Psoriasis

A rare, potentially severe inflammatory skin disease marked by widespread, visible sterile pustules on reddened skin, usually outside the palms and soles and not limited to existing psoriasis plaques. It can occur with or without plaque psoriasis and with or without systemic symptoms such as fever, fatigue, or inflammation affecting other organs. Episodes may recur or persist.

Alternate Names:
Generalised Pustular Psoriasis; GPP

P2Y12 Inhibitors

Medicines that block the P2Y12 receptor on platelets, reducing platelet activation and clot formation. Examples include clopidogrel, prasugrel, ticagrelor, and the intravenous medicine cangrelor.

Alternate Names:
P2Y12 Receptor Antagonists; ADP Receptor Antagonists

P53 Tumor Suppressor

A protein that helps prevent damaged cells from dividing or surviving. Changes in the TP53 gene can allow abnormal cells to multiply and contribute to many cancers, but a gene change alone does not determine a person's outcome.

Pacemaker

A device that senses the heart's electrical activity and sends impulses to maintain or coordinate its rhythm. It may be temporary or permanently implanted; implanted devices may use wires (leads) or be leadless. Pacemakers are used for slow heart rhythms or conduction blocks, and some coordinate the ventricles' contractions.

Alternate Names:
Artificial Pacemaker

Pacemaker Complications

Problems associated with pacemaker implantation or use include pocket bleeding or infection, pneumothorax, cardiac or vascular injury, lead displacement or fracture, venous thrombosis, device malfunction, and pacing-related arrhythmias.

Pacemaker Implantation

A procedure to place a pacemaker under the skin of the chest and connect it to the heart with one or more wires, or place a leadless device inside the heart. The device supports an abnormally slow or unreliable rhythm; the approach depends on the rhythm problem and the person's anatomy.

Pacemaker Malfunction

Failure of a pacemaker system to sense, pace, capture, or communicate as intended. Causes include lead displacement or fracture, battery depletion, programming problems, electromagnetic interference, and myocardial or metabolic factors.

Pacemaker-Mediated Tachycardia

An endless-loop reentrant tachycardia in a dual-chamber tracking pacemaker, usually requiring retrograde ventriculoatrial conduction: a ventricular paced beat conducts back to the atrium and is sensed, triggering another ventricular pace. It may cause palpitations, dizziness, or hemodynamic symptoms.

Pacemakers and Implantable Cardioverter-Defibrillators

Implantable devices that provide bradycardia pacing, resynchronization, or detection and treatment of dangerous ventricular arrhythmias. Assessment includes indications, programming, leads, battery status, complications, and follow-up.

Pacemaker Syndrome

Symptoms caused by loss of atrioventricular synchrony or other adverse hemodynamic effects of pacing, most often during right-ventricular pacing. Features may include fatigue, dizziness, hypotension, dyspnea, and prominent neck pulsations.

Pachyderma

Abnormal thickening and coarsening of the skin, which may occur with chronic inflammation, lymphedema, endocrine disease, or pachydermoperiostosis.

Pachydermoperiostosis

The primary form of hypertrophic osteoarthropathy, usually inherited and characterized by thickened oily or furrowed facial skin, enlargement of the fingers and toes, clubbing, and painful periosteal new bone formation. Severity varies, and the disorder may be associated with joint and bone complications.

Pachygyria

A birth-related brain-development abnormality in which the brain's outer surface has fewer, broader folds than usual. It can cause developmental delay, learning difficulties, seizures, movement problems, or other neurologic effects of varying severity.

Pachymeningitis

Inflammation and thickening of the tough outer covering of the brain and spinal cord. It may cause headache, nerve problems, or pressure on the brain and can result from infection, immune disease, or other inflammation.

Pachymetry

Measurement of the thickness of the cornea, the clear front surface of the eye. It is used to assess corneal disease and helps place eye-pressure readings in context.

Pachyonychia Congenita

An inherited skin disorder causing very thick, abnormal nails and painful thick skin on the palms and soles. Some people also develop blisters, cysts, excess sweating, or white patches in the mouth.

Pacing

Planning activity, rest, and effort to stay within a person's tolerance and limit symptom flare-ups. It is used in rehabilitation and in managing conditions that cause fatigue or pain.

Pacinian Corpuscle

A specialized nerve ending deep in the skin and connective tissue that detects deep pressure and vibration. It helps the nervous system sense contact, movement, and the handling of objects.

Paclitaxel

Paclitaxel is a taxane chemotherapy drug that stabilizes microtubules and prevents cell division; it treats several cancers and can cause myelosuppression, neuropathy, alopecia, myalgia, and hypersensitivity reactions.

Paclitaxel Liposome

A liposomal formulation of paclitaxel designed to alter drug distribution and delivery; paclitaxel disrupts microtubules and is used as chemotherapy in selected cancers.

PACS

A computer system used by healthcare services to store, retrieve, view, and share medical images such as X-rays, CT scans, MRI scans, and ultrasound studies.

Paediatric Surgery

The surgical specialty concerned with congenital and acquired conditions requiring operations in fetuses, newborns, infants, children, and adolescents. It includes neonatal surgery, childhood trauma, and surgical treatment of pediatric tumors.

Alternate Names:
Pediatric Surgery

PAES

Alternate name; see *Popliteal Artery Entrapment Syndrome*.

Page Kidney

High blood pressure caused when blood or another mass presses on a kidney from the outside. The pressure activates the kidney's blood-pressure system and may follow injury, bleeding, or treatment with blood thinners.

Paget Disease Of Bone

A chronic disorder of bone remodeling in which bone is broken down rapidly and rebuilt in a disorganized way. One or more bones, often in the pelvis, spine, skull, or legs, may become enlarged, weak, painful, or deformed and may fracture; skull involvement can affect hearing. Many people have no symptoms.

Alternate Names:
Paget's Disease of Bone; Paget's Disease of Bone; Osteitis Deformans

Paget Disease Of The Anus

Extramammary Paget disease affecting the skin around the anus. It usually appears as a persistent red, itchy, scaly, or sore patch and is an in-situ glandular cancer; an underlying cancer can also be present. Diagnosis requires biopsy, with further evaluation guided by the site and findings.

Paget Disease Of The Breast

A rare breast cancer in which malignant glandular cells involve the skin of the nipple and often the areola. It commonly causes persistent redness, scaling, crusting, or itching of the nipple and is often associated with ductal carcinoma in situ or invasive cancer elsewhere in the breast.

Alternate Names:
Paget Disease Of The Nipple; Paget's Disease of the Nipple; Mammary Paget Disease; Mammary Paget's Disease; Paget's Disease of the Breast; Nipple Paget Disease

Paget Disease Of The Vulva

Extramammary Paget disease affecting vulvar skin. It usually appears as a persistent itchy, red, scaly, or sore patch and is an in-situ glandular cancer; an underlying cancer can also be present. Diagnosis requires biopsy, with further evaluation guided by the site and findings.

Pagetoid Reticulosis

A rare localized variant of cutaneous T-cell lymphoma with solitary slowly enlarging scaly plaques containing atypical pagetoid lymphocytes.

Paget-Schroetter Syndrome

An effort-induced deep vein thrombosis (effort thrombosis) of the axillary-subclavian venous system, typically occurring in young, athletic individuals following repetitive, strenuous upper-extremity overhead exertion (e.g., throwing or weightlifting), caused by extrinsic compression of the vein at the thoracic outlet.

Alternate Names:
Effort Thrombosis of Subclavian Vein; Effort-Induced Axillosubclavian Vein Thrombosis

Paget's Disease

An ambiguous term that may refer to Paget disease of bone or Paget disease of the breast. Paget disease of bone is a chronic disorder of abnormal bone breakdown and regrowth that can enlarge, weaken, or deform bone; mammary Paget disease is a malignancy involving the nipple and areola, often associated with underlying breast cancer.

Paget's Disease of the Nipple

Alternate name; see *Paget Disease Of The Breast*.

Paget's Disease of the Vulva

A rare form of extramammary Paget disease, usually an intraepithelial adenocarcinoma of vulvar skin characterized by Paget cells. It may be associated with an underlying invasive or internal carcinoma and often appears as a persistent eczematous plaque.

Pain

An unpleasant physical and emotional experience linked to actual or possible tissue injury. Pain can be short-lived or persistent and is influenced by nerves, inflammation, health, emotions, past experiences, and social circumstances.

Pain Assessment Scales

Tools that help a person describe pain intensity or its effect on daily life. They may use numbers, words, faces, or observation of behavior when self-report is not possible. A score tracks change but does not identify the cause or fully measure suffering.

Painful Bladder Syndrome

Ongoing bladder-related pain, pressure, or discomfort, often with urinary frequency or urgency and no identified infection or other cause. The term overlaps with interstitial cystitis; many clinicians use the combined term interstitial cystitis/bladder pain syndrome.

Painful Intercourse

Pain in the genital or pelvic area before, during, or after sexual activity; medically called dyspareunia. Causes include dryness, infection, inflammation, pelvic-floor spasm, endometriosis, injury, and other gynecologic or urologic conditions.

Painful Menstrual Periods

Painful menstrual periods, or dysmenorrhea, are cramps during menstruation caused by uterine contractions or conditions such as endometriosis or fibroids.

Painful Swallowing

Painful swallowing, or odynophagia, is discomfort when swallowing and may result from infection, inflammation, injury, reflux, or a blockage.

Pain Management

Care that identifies the cause of pain and reduces pain while improving function and quality of life. It may combine medicines, physical treatment, psychological support, procedures, and treatment of the underlying condition, with risks reviewed regularly.

Pain Medicine

The medical specialty concerned with assessment and treatment of acute, chronic, and cancer-related pain. Its scope includes identifying pain mechanisms and functional effects and using approaches such as medicines, procedures, rehabilitation, and psychological care, often with a multidisciplinary team.

Alternate Names:
Algology

Pain Perception

The process by which the nervous system notices possible or actual tissue injury and the brain interprets it as pain. Attention, emotions, past experiences, inflammation, and medicines can change how pain feels.

Painsomnia

An informal term for difficulty falling asleep or staying asleep because of pain. Pain may delay sleep onset or cause awakenings, while disrupted sleep can heighten pain sensitivity and worsen daytime function. "Painsomnia" is not a formal diagnosis; clinical descriptions specify the sleep disturbance and associated pain condition.

Pain Threshold

The minimum intensity of a stimulus that a person perceives as painful; it varies with tissue, context, attention, inflammation, medications, and neurologic state.

Pain Unit

A clinical service specializing in assessment and treatment of acute, chronic, cancer, neuropathic, or procedural pain using medicines, procedures, rehabilitation, and psychological care.

PA/IVS

Alternate name; see *Pulmonary Atresia*.

Palatal Muscle

Muscle of the soft palate that elevates or tenses the palate and helps separate the nasal and oral cavities during swallowing and speech.

Palatal Myoclonus

Repeated, involuntary twitching of the soft palate, sometimes causing a clicking sound in the ear or difficulty speaking and swallowing. It may follow a brainstem injury or occur without an identified cause.

Palate

The roof of the mouth, consisting of a bony hard palate and muscular soft palate.

Palate Neoplasm

An abnormal growth in the roof of the mouth. It may be noncancerous or cancerous and can cause a lump, pain, bleeding, loose teeth, difficulty swallowing, or speech changes.

Palatine

Relating to the palate, the roof of the mouth, or the palatine bones. Palatine structures include the tonsils, nerves, and blood vessels of the mouth; problems may include tonsillitis, cleft palate, or infection near a tooth.

Palatine Tonsil

One of two masses of lymphoid tissue at the sides of the throat that help detect inhaled or swallowed pathogens.

Palatorrhaphy

Palatorrhaphy is surgical repair of a cleft or defect of the palate to restore separation between the oral and nasal cavities and improve feeding and speech.

Palatoschisis

A congenital cleft or failure of fusion of the palate, commonly called cleft palate, which may affect feeding, speech, hearing, and dental development.

Alternate Names:
Cleft Palate

Paleness

Unusual lightening of the skin or mucous membranes, which may result from reduced blood flow, anemia, shock, cold, or normal variation.

Paleo Diet

An eating pattern based on foods thought to resemble those available to early humans, such as meat, fish, vegetables, fruits, nuts, and seeds. It excludes or limits grains, legumes, and dairy and may not provide balanced nutrition for everyone.

Pale or Clay-Colored Stools

Light-colored stool caused by reduced bile pigment reaching the intestine, potentially indicating bile-duct obstruction, gallbladder disease, liver disease, or certain transient conditions.

Palindromic Rheumatism

Repeated attacks of joint pain and swelling that begin suddenly and resolve completely within hours or days, leaving no lasting joint damage between attacks. Some people later develop rheumatoid arthritis, especially when specific antibodies are present.

Paliperidone

An antipsychotic medicine used to treat schizophrenia and schizoaffective disorder. It changes the action of certain brain chemicals and is available as tablets or long-acting injections; possible effects include sleepiness, movement problems, weight gain, hormone changes, and heart-rhythm changes.

Palivizumab

A monoclonal antibody that binds the respiratory syncytial virus (RSV) fusion protein. It was given by monthly injection during RSV season to selected high-risk infants and young children to reduce severe RSV disease. In the United States, it was discontinued at the end of 2025 and is no longer routinely recommended; longer-acting RSV antibodies are now used for infant prevention.

Palla Sign

Enlargement of the right descending pulmonary artery on a chest X-ray, described as a possible sign of pulmonary embolism. It is uncommon and nonspecific, so it cannot diagnose or exclude a clot by itself.

Alternate Names:
Palla's Sign; Descending Pulmonary Artery Sign

Pallesthesia

The ability to feel vibration, usually tested with a vibrating tuning fork on the fingers or toes. Reduced vibration sense may result from nerve disease, spinal-cord problems, poor circulation, or other neurologic conditions.

Palliative Care

Care that aims to improve quality of life for people with serious illness and their families by relieving pain and other physical, psychological, social, or spiritual distress. It can be provided at any stage of illness, alongside treatments intended to cure or control disease; it is not limited to hospice or end-of-life care.

Palliative Radiation

Radiation therapy given to relieve symptoms caused by cancer, such as pain, bleeding, obstruction, or pressure from a tumor. It is usually intended to improve comfort or function rather than cure the cancer and may be delivered in a short treatment course.

Palliative Rehabilitation

Rehabilitation for a person with serious or life-limiting illness that focuses on comfort, independence, meaningful activities, and quality of life. It may address weakness, breathlessness, pain, fatigue, movement, communication, swallowing, or daily tasks.

Palliative Surgery

Surgery intended to relieve symptoms, prevent complications, or improve function when the underlying disease may not be curable. It can ease blockage, bleeding, pain, breathing difficulty, or problems caused by advanced cancer.

Palliative Treatment

Treatment intended to relieve symptoms and improve comfort or quality of life rather than cure the underlying disease.

Pallidotomy

A neurosurgical lesioning procedure that destroys a small part of the internal globus pallidus to reduce selected motor complications of Parkinson disease, especially dyskinesia. It is an ablative procedure and does not treat the underlying neurodegeneration.

Pallister-Hall Syndrome

A rare inherited condition that may cause an extra finger or toe, a noncancerous growth near the brain's hormone-control center, and abnormalities of the anus, kidneys, airway, or pituitary hormones.

Pallor

Unusual paleness of skin or mucous membranes, often due to reduced blood flow, anemia, or other illness.

Palm

The inner surface of the hand between the wrist and fingers. It contains thick skin, creases, muscles, nerves, and blood vessels that help with grip, touch, movement, and protection.

Palmar

Relating to the palm or palmar surface of the hand, including the palmar sides of the fingers.

Palmar Erythema

Redness, often on both palms, caused by widening of small blood vessels. It can occur normally or with pregnancy, liver disease, thyroid disease, or other conditions; the cause depends on the clinical context.

Palmar Erythema Of Pregnancy

Redness of both palms that can occur during pregnancy, often because of normal blood-vessel and hormone changes. It is usually harmless and fades after birth; itching or yellowing can accompany liver or bile-duct disease.

Palmar Grasp Reflex

A primitive reflex in which an infant flexes the fingers around an object placed in the palm. It is normally present at birth and gradually diminishes as voluntary grasp develops during infancy.

Palmar Hyperhidrosis

Alternate name; see *Hyperhidrosis*.

Palmar Reflex

Alternate name; see *Palmar Grasp Reflex*.

PALM-COEIN Classification

The FIGO system for classifying causes of abnormal uterine bleeding in nonpregnant reproductive-age patients. PALM denotes structural causes: polyp, adenomyosis, leiomyoma, and malignancy or hyperplasia. COEIN denotes nonstructural causes: coagulopathy, ovulatory dysfunction, endometrial, iatrogenic, and not otherwise classified.

Alternate Names:
FIGO AUB Classification; PALM-COEIN System

Palmitate

Palmitate is the salt or ester form of palmitic acid and participates in fatty-acid metabolism, lipid storage, and protein modification.

Palmitic Acid

A 16-carbon saturated fatty acid common in dietary and stored fats; excess saturated-fat intake can contribute to adverse lipid profiles, although the body also synthesizes it normally.

Palmoplantar Hyperkeratosis

Excessive thickening of the skin on the palms and soles, inherited or acquired, causing calluses, fissures, pain, impaired walking, and sometimes infection.

Palmoplantar Keratoderma (Keratosis Palmaris et Plantaris)

Excessive thickening of the skin on the palms and soles. It may be inherited or acquired and can cause fissures, pain, impaired walking, sweating problems, or secondary infection.

Palmoplantar Pustulosis

A chronic, relapsing inflammatory skin disease with recurrent, sterile pustules on the palms, soles, or both. The pustules often form on reddened, thickened skin, then dry, crust, and peel; itching, pain, or skin cracks may occur. It can occur with or without psoriasis elsewhere on the body.

Alternate Names:
Primary Palmoplantar Pustulosis; Pustulosis Palmaris et Plantaris

Palonosetron Hydrochloride

A long-acting 5-HT3 serotonin-receptor antagonist used to prevent nausea and vomiting caused by chemotherapy, surgery, or selected other treatments.

Palpable

Palpable means detectable by touch during physical examination, such as a mass, enlarged organ, lymph node, pulse, tenderness, or abnormal surface.

Palpable Purpura

Raised red or purple spots caused by bleeding under the skin that do not fade when pressed. It often results from inflammation of small blood vessels, as in leukocytoclastic or IgA vasculitis, but can have other causes.

Palpate

To examine part of the body by feeling it carefully

with the hands. A healthcare professional may assess size, shape, tenderness, warmth, movement, swelling, firmness, pulses, or unusual lumps.

Palpation

Examination by touching the body to assess tenderness, temperature, texture, masses, pulses, organ size, and movement.

Palpebra

The anatomical term for an eyelid. Eyelids protect the eye, spread tears over the cornea, and limit light entry; disorders include drooping, inward or outward turning, inflammation, styes, and blocked oil glands.

Palpebral Conjunctiva

The thin, moist membrane lining the inner surfaces of the eyelids. It joins the membrane covering the front of the eye and helps protect, lubricate, and move tears across the eye's surface.

Palpebral Slant

The upward or downward angle of the line between the inner and outer corners of the eyes. It varies among people and may be one feature considered when assessing a genetic syndrome.

Alternate Names:
Palpebral Fissure Slant

Palpitation

Awareness of the heart beating fast, forcefully, irregularly, or as if it skipped a beat. Causes include stress, stimulants, anemia, thyroid disease, medicines, and abnormal rhythms.

Alternate Names:
Cardiac Palpitations; Palpitations

PALS

Alternate name; see *Pediatric Advanced Life Support*.

Palsy

Weakness or loss of movement in a body part, often affecting muscles supplied by a particular nerve. It may be temporary or lasting and can result from nerve injury, infection, stroke, inflammation, or a problem present from birth.

Palsy Of The Long Thoracic Nerve

Weakness of the nerve that activates a muscle holding the shoulder blade against the ribs. It can cause a winged shoulder blade, difficulty raising the arm, and pain after injury, infection, surgery, or pressure on the nerve.

PAM

Rare, rapidly fatal brain infection caused by the water-borne amoeba *Naegleria fowleri*. See *Primary Amebic Meningoencephalitis*.

Pamidronic Acid

An intravenous bisphosphonate that inhibits osteoclast-mediated bone resorption and is used for selected hypercalcemia, bone complications of cancer, and Paget disease.

Pampiniform Plexus

A network of veins in the spermatic cord that drains the testis and helps cool blood entering the testicular artery.

Panacinar Emphysema

A form of emphysema in which air sacs and small airways are damaged throughout affected areas of the lung. It can cause breathlessness and reduced lung function and is strongly associated with severe alpha-1 antitrypsin deficiency.

Alternate Names:
Panlobular Emphysema

Pancoast Syndrome

Symptoms caused by a cancer at the top of the lung growing into nearby nerves or other tissues. It may cause severe shoulder or arm pain, hand weakness, numbness, and drooping of one eyelid with a smaller pupil.

Pancoast Tumor

A lung cancer at the top of the lung that can grow

into nearby nerves, blood vessels, or the spine. It may cause severe shoulder or arm pain, hand weakness, or drooping of one eyelid.

Pancolitis

Inflammation affecting the entire large intestine. It may result from ulcerative colitis, infection, reduced blood flow, or another inflammatory condition and can cause diarrhea, abdominal pain, fever, or bleeding.

Pancreas

An organ behind the stomach that makes digestive juices and hormones. Its digestive enzymes enter the small intestine, while insulin and other hormones help control blood sugar and digestion.

Pancreas Divisum

A congenital difference in which the main pancreatic ducts do not join normally. Most people have no symptoms. It has been proposed as a contributing factor in recurrent pancreatitis, but the association is uncertain and most affected people do not develop pancreatitis.

Pancreas Enzyme

An enzyme produced by the pancreas, such as amylase, lipase, or proteases, that helps digest carbohydrate, fat, or protein in the small intestine.

Pancreas Infection

Infection involving the pancreas or a pancreatic collection, usually occurring with pancreatitis, surgery, trauma, or spread from nearby infection.

Pancreas Inflammation

Alternate name; see *Pancreatitis*.

Pancreas Neoplasm

An abnormal growth in the pancreas that may be noncancerous, precancerous, or cancerous. Its effects depend on its location and may include pain, jaundice, digestive problems, or diabetes.

Pancreas Transplant

A procedure that replaces a diseased pancreas with a healthy donor pancreas, usually to restore insulin production in selected people with severe diabetes.

Pancreas Transplantation

Alternate name; see *Pancreas Transplant*.

Pancreatectomy

Surgery to remove part or all of the pancreas. It may treat a pancreatic tumor, severe injury, or another serious disease; removal of pancreatic tissue can affect digestion and blood-sugar control.

Pancreatic Abscess

An older term for an infected collection in or near the pancreas, usually related to acute pancreatitis. Current classification describes the collection by its contents, timing, and presence of dead tissue; infection may cause fever, worsening pain, or sepsis.

Pancreatic Adenocarcinoma

The most common cancer of the pancreas, arising from cells in its digestive-juice ducts. It may cause jaundice, abdominal or back pain, weight loss, or no early symptoms; smoking, chronic pancreatitis, diabetes, obesity, and inherited risks can contribute.

Pancreatic Cancer

Cancer that begins in the pancreas, most often in cells lining its digestive-juice ducts. It may cause jaundice, abdominal or back pain, weight loss, or digestive problems, but early cancer may cause no symptoms; treatment depends on type and spread.

Alternate Names:
Pancreatic Carcinoma; Cancer of the Pancreas

Pancreatic Carcinoma

Pancreatic carcinoma is cancer arising in the pancreas, most often from duct cells, and may cause jaundice, pain, weight loss, or digestive problems.

Pancreatic Cysts

Fluid-filled sacs in or around the pancreas. Some follow inflammation or injury, while others are growths

that can become cancerous; imaging and sometimes fluid or tissue testing guide follow-up or treatment.

Pancreatic Diseases

Disorders affecting the pancreas's digestive or hormone-producing functions, including inflammation, cysts, tumors, duct blockage, and diabetes-related damage. They may cause abdominal pain, vomiting, weight loss, jaundice, abnormal blood sugar, or poor digestion.

Pancreatic Divisum

Alternate name; see *Pancreas Divisum*.

Pancreatic Duct

The main tube carrying digestive fluid from the pancreas into the first part of the small intestine. It often joins the bile duct before opening into the intestine; blockage can cause pain, jaundice, or pancreatitis.

Pancreatic Ductal Adenocarcinoma

The most common exocrine pancreatic malignancy, arising from ductal epithelium and often presenting late with painless jaundice, weight loss, pain, or pancreatitis. Diagnosis and staging rely on imaging, tissue sampling when needed, and multidisciplinary assessment.

Pancreatic Elastase

A stool test that estimates how well the pancreas makes digestive enzymes. A low result supports pancreatic insufficiency, which can cause greasy stools, weight loss, and vitamin deficiency, but watery stool and other factors can affect interpretation.

Pancreatic Enzyme

A digestive substance made by the pancreas and released into the small intestine. Amylase breaks down starch, lipase breaks down fat, and proteases break down protein; bicarbonate helps neutralize stomach acid.

Pancreatic Exocrine Insufficiency

Alternate name; see *Exocrine Pancreatic Insufficiency*.

Pancreatic Fistula

A pancreatic fistula is an abnormal passage through which pancreatic juice leaks from the pancreas, often after trauma or surgery, causing fluid collections, ascites, or skin drainage.

Pancreatic Hormones

Hormones produced by pancreatic islet cells, including insulin, glucagon, somatostatin, and pancreatic polypeptide, which regulate glucose, digestion, and energy metabolism.

Pancreatic Inflammatory Cysts

Alternate name; see *Pancreatic Cysts*.

Pancreatic Insufficiency

Failure of the pancreas to produce or deliver enough digestive enzymes or other secretions for normal digestion and absorption. It may cause greasy stools, diarrhea, bloating, weight loss, or vitamin deficiency; exocrine insufficiency specifically refers to inadequate digestive enzymes.

Pancreatic IPMN

Alternate name; see *Intraductal Papillary Mucinous Neoplasm*.

Pancreatic IPMN Entry

Alternate name; see *Intraductal Papillary Mucinous Neoplasm*.

Pancreatic Islet

A pancreatic islet is a cluster of endocrine cells that releases hormones such as insulin, glucagon, and somatostatin to regulate blood glucose and digestion.

Pancreatic Juice

Pancreatic juice is an alkaline digestive secretion containing bicarbonate and enzymes such as amylase, lipase, and proteases, delivered into the duode-

num.

Pancreatic Mass

A lump or abnormal area seen in the pancreas on an imaging test. It may be a cyst, inflammation, scar, or tumor; further scans, blood tests, or a tissue sample may be needed to determine its cause.

Pancreatic Necrosis

Death of pancreatic or nearby fatty tissue, usually during severe acute pancreatitis. The dead tissue may remain sterile or become infected, causing fever, worsening pain, sepsis, and organ failure.

Alternate Names:
Necrotizing Pancreatitis; Acute Necrotizing Pancreatitis

Pancreatic Neuroendocrine Tumor

A neoplasm that develops from the hormone-producing islet cells (islets of Langerhans) in the pancreas. These tumors can be functional, overproducing specific hormones like insulin or gastrin that lead to noticeable symptoms such as severe low blood sugar or recurrent stomach ulcers, or non-functional, producing no excess hormones and often growing silently until they cause abdominal pain, jaundice, or digestive problems.

Alternate Names:
pNET; Pancreatic Neuroendocrine Tumors; Islet Cell Tumors; Pancreatic Endocrine Neoplasms

Pancreatic Neuroendocrine Tumors

Plural form; see *Pancreatic Neuroendocrine Tumor*.

Pancreatic Non-Inflammatory Cysts

Alternate name; see *Pancreatic Cysts*.

Pancreaticobiliary Cytology

Cytologic evaluation of pancreatic and biliary lesions, usually from fine-needle aspiration, brushings, or bile-duct sampling. It is used to assess neoplasia, inflammation, and obstructive lesions alongside imaging and histology.

Pancreaticoduodenectomy

Pancreaticoduodenectomy, or the Whipple procedure, removes the head of the pancreas and nearby parts of the digestive tract to treat selected tumors and other serious disease.

Pancreatic Panniculitis

A rare lobular inflammation of subcutaneous fat associated with pancreatic disease, most often acute or chronic pancreatitis or a pancreatic neoplasm. Circulating pancreatic enzymes can cause fat necrosis, producing tender red or violaceous nodules, usually on the legs; lesions may ulcerate and drain oily material. Fat necrosis can also affect joints and bone marrow.

Alternate Names:
Enzymatic Panniculitis; Pancreatic Fat Necrosis

Pancreatic Pseudocyst

A walled-off collection of pancreatic fluid that usually develops after acute or chronic pancreatitis. It has no true cell lining and may cause abdominal pain, vomiting, early fullness, infection, bleeding, or blockage of nearby organs.

Pancreatic Secretion

Release of digestive fluid from the exocrine pancreas into the small intestine. Pancreatic juice contains enzymes that digest carbohydrates, proteins, and fats, together with bicarbonate that helps neutralize stomach acid.

Pancreatic Serous Cystadenoma

Alternate name; see *Pancreatic Cysts*.

Pancreatic Surgery

An operation on the pancreas to remove diseased tissue, drain a collection, repair an injury, or treat cancer. The type of surgery depends on the problem and its location.

Pancreatic Trauma

Injury to the pancreas caused by blunt or penetrating trauma. Assessment may require CT, laboratory testing, and observation or intervention according

to the injury.

Pancreatitis

Inflammation of the pancreas that may be acute or chronic. Causes include gallstones, alcohol, medicines, metabolic disorders, and other conditions. Acute disease may cause severe upper-abdominal pain, vomiting, fluid loss, infection, tissue death, or organ failure; chronic disease can permanently scar the pancreas and cause poor digestion, weight loss, or diabetes.

Alternate Names:
Pancreatic Inflammation

Pancreatoblastoma

A rare cancer of the pancreas that occurs mainly in children. It may cause an abdominal lump, pain, vomiting, weight loss, or hormone-related symptoms; diagnosis uses imaging, biopsy, and staging.

Pancreatography

Imaging of the tubes that carry digestive juices from the pancreas, usually after contrast dye is introduced. It can show narrowing, blockage, leaks, stones, or other changes and may be done during ERCP or with MRI; ERCP also carries a risk of pancreatitis.

Pancreazymin

An older name for cholecystokinin, a hormone that stimulates pancreatic enzyme secretion and gallbladder contraction.

Pancrelipase

Pancrelipase is a mixture of pancreatic digestive enzymes used as replacement therapy for exocrine pancreatic insufficiency, including that caused by cystic fibrosis or pancreatic disease.

Pancuronium

A long-acting medicine that temporarily prevents skeletal muscles from contracting during anesthesia or assisted breathing. It causes paralysis but does not relieve pain or cause unconsciousness; its use is accompanied by airway and breathing support.

Pancytopenia

A reduction in red blood cells, white blood cells, and platelets at the same time. It can cause tiredness, infections, and bleeding and may result from medicines, infection, immune disease, or a problem in the bone marrow.

PANDAS

A proposed condition in which obsessive-compulsive symptoms or movement tics begin suddenly or worsen after a streptococcal infection in a child. The diagnosis remains debated, and similar symptoms can have neurologic, psychiatric, or infectious causes.

Pandemic

An epidemic that spreads across multiple countries or continents and affects many people. It may occur when an infectious agent spreads widely among populations with limited previous immunity.

Panendoscopy

Examination of several connected areas of the throat and upper swallowing and breathing passages with a viewing instrument, often including the throat, voice box, and swallowing tube. Tissue samples may be taken during the procedure.

Paneth Cell

A cell at the base of a small-intestinal gland that releases substances helping control bacteria and other microbes in the gut. It supports the intestinal lining's normal defense system.

Panhypopituitarism

Failure of the pituitary gland to make most or all of its important hormones. It can cause tiredness, low blood pressure, infertility, growth or thyroid problems, and inability to respond normally to illness; lifelong hormone replacement may be needed.

Panic

Panic is sudden intense fear or distress with autonomic symptoms such as racing heart, sweating, trembling, breathlessness, or a sense of impending danger.

Panic And Anxiety Disorders

Alternate name; see *Anxiety Disorders*.

Panic Attack

A sudden surge of intense fear or discomfort that usually reaches peak intensity within minutes. Symptoms may include a racing or pounding heart, sweating, trembling, breathlessness, chest pain, nausea, dizziness, tingling, a sense of losing control, or fear of dying.

Panic Attacks And Panic Disorder

Panic attacks are sudden episodes of intense fear; panic disorder involves recurrent attacks and persistent concern about having more.

Panic Disorder

Recurrent unexpected panic attacks followed by at least one month of persistent concern about further attacks or a maladaptive change in behavior related to them. Attacks peak within minutes and may cause a racing heart, breathlessness, trembling, dizziness, or fear of dying.

Panlobular Emphysema

A type of permanent lung damage affecting the whole small air-sac unit, often more severe in the lower lungs. It is strongly associated with alpha-1 antitrypsin deficiency and can cause breathlessness, cough, and reduced exercise ability.

Panmyelopathy

An uncommon, nonstandard term for widespread disease involving the bone marrow or spinal cord; it has no single established meaning. Medical descriptions should specify whether the disorder affects bone-marrow blood-cell production or the spinal cord.

Panniculectomy

Surgical removal of a hanging apron of excess lower-abdominal skin and fat, usually after substantial weight loss; it is distinct from a full abdominoplasty.

Panniculitis

Inflammation of the layer of fat beneath the skin, usually causing tender red or purple lumps, often on the legs. Causes include infection, immune disease, medicines, injury, and pancreatic disease; treatment depends on the cause.

Panniculus

A panniculus is a fold or layer of subcutaneous fatty tissue, especially the lower abdominal apron that may overhang the pubic region.

Pannus

An abnormal layer of inflamed tissue that grows over a joint or the clear front surface of the eye. It can damage cartilage or reduce vision and may occur with rheumatoid arthritis, trachoma, or other chronic inflammation.

Panophthalmitis

Severe infection and inflammation involving the entire eye and its surrounding tissues. It can cause intense pain, redness, swelling, discharge, and major vision loss.

Panoramic Radiograph

An extraoral radiograph displaying both jaws, teeth, temporomandibular regions, and surrounding structures in one image. It is useful for surveying dentition, development, impaction, and gross osseous pathology but has less fine detail than intraoral radiographs.

Panretinal Photocoagulation

A laser treatment that places many small burns in the outer retina to reduce the abnormal blood-vessel growth caused by severe retinal disease, especially diabetic retinopathy. It can preserve central vision but may reduce side or night vision.

Pantothenic Acid

Vitamin B5, needed to help cells make energy and produce fatty acids and certain hormones.

Pantothenic Acid And Biotin

Two B vitamins involved in energy metabolism, fatty-acid synthesis, and other enzyme reactions; deficiency is uncommon but can occur with severe malnutrition, malabsorption, or specific inherited disorders.

Panuveitis

Inflammation affecting all the main internal layers around the eye, including the iris, the gel inside the eye, and the tissues near the retina. It can cause pain, redness, light sensitivity, floaters, and vision loss.

Papain

A protein-breaking enzyme found in papaya latex. It is used in some foods and products, but evidence for many medicinal claims is limited; it can irritate tissues or cause allergic reactions.

Papillary Cystadenoma Lymphomatosum

Benign cystic salivary gland tumor predominantly occurring in the parotid gland, strongly associated with cigarette smoking. See *Warthin Tumor*.

Papillary Fibroelastoma

A usually noncancerous, small growth attached to a heart valve. It often causes no symptoms but can release a clot and lead to a stroke or other blockage, especially when it is mobile; treatment depends on its size, location, and risk.

Papillary Muscle

Muscles inside the lower chambers of the heart that connect by thin cords to the heart valves. They tighten when the heart contracts to keep the valves from turning inside out and prevent blood from flowing backward.

Papillary Thyroid Carcinoma

The most common type of thyroid cancer. It often grows slowly and may spread to nearby neck lymph nodes; treatment and outlook depend on the tumor's size, spread, and other features.

Papillectomy

Surgical removal of a papilla or papillary growth, such as a tumor near the bile and pancreatic ducts.

Papilledema

Swelling of the area where the optic nerve enters the eye because pressure inside the skull is raised. It can threaten vision and may result from bleeding, a mass, infection, or other serious illness.

Papilloedema

Swelling of the optic discs caused by raised intracranial pressure.

Papilloma

A usually noncancerous growth from a surface lining, often appearing as a wart, skin tag, or small finger-like projection. Some are linked to human papillomavirus; treatment depends on the site, appearance, and tissue findings.

Papillomatosis

A condition in which multiple papillomas, or wart-like overgrowths of epithelial tissue, develop. Causes and risks vary by body site, virus, inherited condition, or other disease.

Papillomatosis Cutis Lymphostatica

Thick, rough, wart-like skin caused by long-standing swelling from poor lymph or vein drainage, usually in the legs. The skin may become cobblestoned and prone to infection; controlling the swelling and protecting the skin are important.

Papillomavirus

A papillomavirus, especially human papillomavirus, which can cause warts and some anogenital, oropharyngeal, and other cancers.

Papilloma With Atypia / DCIS Pathology

Evaluation of an intraductal papillary breast lesion for fibrovascular cores, epithelial atypia, and ductal carcinoma in situ. The key distinction is between benign papilloma, atypical proliferation, in situ car-

cinoma, and invasive carcinoma.

Pap Smear

A screening test in which cells are collected from the cervix and examined for early changes that could become cervical cancer or for cancer itself. It may be done alone or with a test for high-risk human papillomavirus (HPV).

Alternate Names:
Pap; Papanicolaou Smear

Pap Test

A screening test for cervical cancer and precancerous changes in which cells are collected from the cervix and examined under a microscope. It may also reveal inflammation or some infections, but an abnormal result does not by itself diagnose cancer.

Papular

A papule: a small, solid, elevated skin lesion <1 cm in diameter (palpable), of various colors and etiologies.

Papular Urticaria

A hypersensitivity reaction to insect bites, especially from fleas, bedbugs, or mosquitoes, causing recurrent intensely itchy papules or small vesicles, often clustered on exposed areas in children. Diagnosis is clinical.

Papule

A solid, raised skin lesion, usually less than 1 cm in diameter. It may be skin-coloured or change colour with inflammation and occurs in conditions such as acne, warts, and psoriasis. Unlike a pustule or vesicle, a papule contains no visible pus or fluid.

Alternate Names:
Papules

Papulonodules

A skin eruption composed of papules and nodules: solid, raised lesions, typically with papules no larger than 1 cm and nodules larger or extending into deeper skin. The term describes lesion morphology, not a specific diagnosis; causes vary with the clinical context.

PAPVR

Alternate name; see *Partial Anomalous Pulmonary Venous Connection*.

Paracentesis

A procedure in which a clinician uses a needle to remove fluid from the abdomen. The fluid may be tested to find its cause or removed to relieve pressure and discomfort.

Paracetamol

Also called acetaminophen, paracetamol reduces pain and fever. Excessive doses can cause serious liver injury, especially with alcohol or other products containing paracetamol.

Alternate Names:
Acetaminophen

Paracetamol Overdose

Exposure to more than a safe amount of paracetamol, also called acetaminophen, can seriously damage the liver even before symptoms appear. The risk depends on the amount, timing, repeated doses, and health of the person; an antidote can reduce the risk of liver failure when given early.

Alternate Names:
Acetaminophen Overdose

Paracetamol Toxicity

Liver injury caused by excessive acetaminophen (paracetamol) exposure. Severe poisoning may cause nausea, abdominal pain, liver failure, or death; an antidote is most effective when given early.

Paracusia

A hearing disturbance in which sounds are perceived unusually, inaccurately, or differently from their actual qualities. It may occur with hearing loss, inner-ear disease, neurological conditions, medicines, or mental health disorders.

Paradichlorobenzene Poisoning

Harm from mothballs or other products contain-

ing paradichlorobenzene. It may cause headache, nausea, dizziness, liver injury, or destruction of red blood cells; toxicity depends on the amount and duration of exposure.

Paraesophageal Hernia

A hiatal hernia in which part of the stomach moves through the diaphragm beside the esophagus. It may cause obstruction or strangulation even when reflux is absent.

Paraesthesia

An unusual skin sensation such as tingling, pins and needles, burning, prickling, or numbness. It can result from pressure on a nerve, nerve disease, poor circulation, medicines, vitamin deficiency, or other causes.

Paraffin

A mixture of hydrocarbons used in laboratory tissue processing, topical preparations, and other applications; some forms are flammable.

Paraffin Poisoning

Harm from swallowing or breathing paraffin wax or liquid paraffin. Small swallowed amounts may cause stomach upset, but liquid entering the lungs can cause chemical pneumonia.

Paraganglioma

A rare tumor arising from specialized nerve-related cells outside the adrenal glands. Some release hormones that cause high blood pressure, sweating, headaches, or a fast heartbeat; some occur as part of inherited tumor syndromes.

Paragonimiasis

A parasitic infection caused by lung flukes, usually acquired by eating raw or undercooked freshwater crab or crayfish. It commonly affects the lungs and may cause a long-lasting cough, chest pain, fever, or blood-stained sputum.

Paragraphia

A language problem in which a person writes an unintended word, letter, or symbol instead of the one intended. It may occur with damage to language areas of the brain, such as after a stroke, and is assessed with other speaking, reading, and writing abilities.

Parainfectious

Describing a problem that occurs during or soon after an infection, often because the immune system reacts to the infection rather than because germs directly invade the affected tissue.

Parainfluenza

Parainfluenza viruses are respiratory viruses that commonly cause colds, croup, bronchitis, or pneumonia, especially in children; illness ranges from mild to severe airway disease.

Paraldehyde

An older sedative and anticonvulsant medicine with limited current use.

Paralysis

Loss of voluntary muscle movement in part or all of the body due to nervous-system or muscle disease.

Paralysis Agitans

An older name for Parkinson disease, characterized by tremor, rigidity, and bradykinesia.

Paralytic Ileus

A temporary slowdown or stop in the bowel's movement, even though there is no physical blockage. It can make the belly swell and cause pain, nausea, vomiting, or constipation. It may happen after surgery or with illness or some medicines.

Paramedical

Relating to healthcare professionals or services that support medical practice, such as physiotherapy, radiography, or emergency medical care.

Parametritis

Inflammation or infection of the connective tissue beside the uterus, often associated with pelvic in-

fection or occurring after childbirth, miscarriage, or surgery. It may cause pelvic pain, fever, tenderness, or abnormal discharge.

Paramnesia

A memory disturbance involving false, distorted, or inaccurately familiar recollections.

Paramyotonia Congenita

An inherited skeletal-muscle sodium-channel disorder, usually caused by a pathogenic variant in *SCN4A*. Cold exposure and repeated muscle contractions can cause paradoxically worsening stiffness, often affecting the face, eyelids, neck, or hands; episodes may be followed by temporary weakness.

Alternate Names:
Eulenburg Disease; Paramyotonia Congenita of Eulenburg

Paranasal Sinuses

Air-filled spaces in the bones around the nose that connect with the nasal passages. Their lining produces mucus, which drains into the nose; inflammation or blockage can cause facial pressure, congestion, and pain.

Paraneoplastic Autonomic Neuropathy

Autoimmune injury to autonomic nerves associated with cancer, causing problems such as abnormal blood-pressure control, sweating, heart-rate variability, gastrointestinal motility, bladder function, or sexual function. It may accompany broader paraneoplastic neurologic syndromes.

Paraneoplastic Cerebellar Degeneration

A rare disorder in which an immune response linked to cancer damages the cerebellum, the brain area that coordinates movement. It can cause rapidly worsening poor balance, uncoordinated movement, slurred speech, or abnormal eye movements and may appear before the cancer is found. Specific antibodies can help guide evaluation.

Alternate Names:
PCD; Subacute Cerebellar Degeneration

Paraneoplastic Disorder

A health problem caused indirectly by cancer rather than by the tumor invading or spreading to the affected organ. Tumors may release hormones or trigger immune reactions that affect the nerves, skin, blood, joints, or other distant organs.

Paraneoplastic Encephalomyelitis

An immune-mediated disorder affecting multiple regions of the central or peripheral nervous system in association with cancer, without direct tumor invasion or metastasis. Manifestations vary with the neural structures involved and may include cognitive, sensory, motor, autonomic, or cerebellar dysfunction.

Paraneoplastic Endocrine Syndromes

Hormonal disorders caused by a cancer or by the body's response to it rather than by direct tumor growth in an endocrine gland. Examples include inappropriate antidiuretic hormone secretion, ectopic adrenocorticotropic hormone production, and hypercalcemia caused by tumor-related factors.

Paraneoplastic Neurological Disorder

Alternate name; see *Paraneoplastic Syndromes Of The Nervous System*.

Paraneoplastic Neurological Syndrome

Alternate name; see *Paraneoplastic Syndromes Of The Nervous System*.

Paraneoplastic Neurologic Syndrome

A rare group of nervous system disorders that occur when an underlying cancer triggers an abnormal autoimmune response. The immune system, in its effort to fight the cancer, mistakenly produces antibodies that attack healthy nerve tissues in the brain, spinal cord, or peripheral nerves. Symptoms vary depending on the nerves involved but can include difficulty walking, loss of balance, muscle weakness, confusion, or sensory disturbances, often appearing months before the underlying tumor is detected.

Alternate Names:
Paraneoplastic Neurologic Syndromes; Paraneoplastic Neurological Disorder; PNS

Paraneoplastic Neurologic Syndromes

Plural form; see *Paraneoplastic Neurologic Syndrome*.

Paraneoplastic Pemphigus

A rare, often severe autoimmune blistering disease associated with an underlying tumor, especially a lymphoid cancer. It causes painful mouth sores and skin lesions and may affect the lungs or other mucous membranes.

Paraneoplastic Syndrome

A group of clinical effects caused by tumor-produced substances or an immune response to cancer, rather than by direct tumor invasion, compression, or metastasis. Manifestations may involve endocrine, neurologic, dermatologic, hematologic, renal, or rheumatologic systems.

Paraneoplastic Syndromes Of The Nervous System

Nervous-system problems caused by an immune reaction to a cancer rather than by the cancer growing into the nerves or brain. They may cause weakness, poor balance, seizures, memory change, or abnormal sensation.

Alternate Names:
Paraneoplastic Neurological Syndromes; PNS

Paranoia

A thought process characterized by excessive or irrational suspiciousness and distrust of others, often manifesting as delusions of persecution, reference, or grandeur.

Paranoid

Characterized by persistent or excessive suspicion and distrust, often involving beliefs that others intend harm. Severe or fixed beliefs may occur in a psychotic disorder.

Paranoid Ideation

Suspicious or persecutory thoughts that other people intend harm, deceive, monitor, or plot against the person. The significance depends on the degree of conviction, distress, functional effect, and associated symptoms.

Paranoid Personality Disorder

A longstanding pattern of distrust and suspiciousness in which other people's motives are interpreted as threatening or deceitful.

Paranoid Psychosis

An older term for psychosis dominated by delusions of persecution, reference, or grandeur.

Paraparesis

Weakness in both legs caused by disease affecting the spinal cord, brain, nerves, or muscles.

Paraphasia

An unintended substitution, omission, or distortion of a sound or word during speech. It commonly occurs with aphasia after brain injury or stroke and may affect naming, conversation, reading, or writing.

Paraphilia

A persistent and intense sexual interest involving atypical objects, situations, or activities. A paraphilia by itself is not a mental disorder. It becomes a paraphilic disorder when it causes significant personal distress or problems in daily life, apart from distress caused only by social disapproval, or when acting on it involves harm, risk of harm, or people who do not or cannot consent.

Paraphilic Disorder

A psychiatric disorder in which recurrent, intense, sexually arousing fantasies, urges, or behaviors (paraphilias) cause clinically significant distress or impairment in social, occupational, or other important areas of functioning, or involve distress, injury, or non-consenting individuals. Distinct from non-disordered paraphilic interests, specific DSM-5 diagnostic categories include exhibitionistic, voyeuristic, frotteuristic, sexual masochism, sexual sadism, pedophilic, fetishistic, and transvestic disorders. Management incorporates cognitive-behavioral psychotherapy and pharmacological interventions (e.g.,

SSRIs or antiandrogens) where clinically indicated.

Alternate Names:
Paraphilic Disorders

Paraphilic Disorders

Plural form; see *Paraphilic Disorder*.

Paraphimosis

A retracted foreskin trapped behind the head of the penis. The tight band can cause swelling and cut off blood flow if it is not released.

Paraplegia

Paralysis or severe weakness of both legs, usually caused by spinal-cord or other neurologic disease.

Parapneumonic Effusion

Pleural fluid that develops in association with pneumonia. It may be uncomplicated, complicated by bacterial invasion or loculation, or progress to empyema, which is pus in the pleural space.

Parapneumonic Pleural Effusion

See *Parapneumonic Effusion*.

Parapneumonic Pleural Effusions and Empyema Thoracis

Pleural fluid associated with pneumonia is a parapneumonic effusion; empyema is frank pus in the pleural space. A complicated parapneumonic effusion has evidence of pleural-space infection, such as positive microbiology, low pH, or loculation, but is not necessarily purulent.

Parapsoriasis

A group of chronic scaly patches or thin plaques that resemble psoriasis but have different causes and risks. Some forms remain stable, while large-plaque disease can rarely evolve into cutaneous T-cell lymphoma.

Paraquat

A highly toxic herbicide. Ingestion can cause injury to the mouth and gastrointestinal tract, kidney failure, and delayed lung injury; severe poisoning has a high risk of death.

Paraquat Poisoning

A medical emergency caused by swallowing or significant exposure to the herbicide paraquat. It can burn the mouth and digestive tract and later cause lung, kidney, or liver failure.

Paraseptal Emphysema

A form of emphysema affecting air sacs near the outer surface of the lung. It may cause few symptoms but can form fragile air pockets that rupture and cause a collapsed lung.

Parasite

An organism that lives on or inside another organism, called the host, and obtains food or shelter from it. Parasites may cause disease in the skin, intestine, blood, or organs.

Parasitemia

The presence and amount of parasites in the bloodstream. It is especially used for malaria and some other blood infections; a higher amount may indicate more severe disease, but interpretation depends on the parasite and the person's symptoms.

Parasitic

Parasitic means relating to an organism that lives in or on a host and obtains nutrients at the host's expense, sometimes causing disease.

Parasitic Infection

Illness caused by a parasite living in or on a person. Parasites include protozoa, helminths, and ectoparasites such as lice or mites; manifestations and transmission vary by organism.

Alternate Names:
Parasitic Infections; Parasitic Disease; Parasitosis

Parasitic Worm

A worm that lives in or on a host and uses the host for nourishment. Human infections may affect the intestine, blood, lymph system, lungs, liver, skin, or other tissues and can cause anemia, pain, or organ

damage.

Parasitology

The study of parasites and the diseases they cause, including those caused by protozoa, worms, and external parasites.

Parasitosis

Infestation or infection by a parasite; the term may describe a confirmed parasitic disease or, in delusional parasitosis, a fixed false belief of infestation without evidence.

Parasomnia

A category of sleep disorders characterized by abnormal behavioral, experiential, or physiological events occurring during entry into sleep, within specific sleep stages, or during sleep-to-wake transitions. Classified into non-rapid eye movement (NREM) parasomnias (e.g., confusional arousals, sleepwalking, sleep terrors), rapid eye movement (REM) parasomnias (e.g., REM sleep behavior disorder, nightmare disorder), and other types (e.g., sleep-related hallucinations). Diagnosis is aided by nocturnal polysomnography, and management focuses on environmental safety, sleep hygiene, and pharmacotherapy when indicated.

Alternate Names:
Parasomnias

Parasomnias

Plural form; see *Parasomnia*.

Parasternal Heave

A palpable lifting or thrusting sensation felt over the left parasternal border during systole, examined using the heel of the examiner's hand. It is a sign of right ventricular hypertrophy or right ventricular volume overload, commonly seen in severe pulmonary hypertension or congenital heart defects.

Parasuicide

An older term for a nonfatal act of intentional self-injury or self-poisoning, used variably for acts with or without suicidal intent. Current descriptions generally use *self-harm* and state whether there was intent to die; see *Suicide Attempt*.

Parasympathetic Nervous System

The part of the automatic nervous system that supports resting functions such as digestion, saliva, urination, and slowing the heartbeat. It also helps the body conserve energy and recover after activity.

Parathyroid

One of the usually four small glands behind the thyroid gland. They release parathyroid hormone, which helps keep calcium and phosphate levels balanced in the blood and bones.

Parathyroid Adenoma

A usually noncancerous growth in one of the small glands behind the thyroid. It may release too much parathyroid hormone, raising the calcium level in the blood.

Parathyroid Cancer

Parathyroid cancer is a rare malignant tumor of the parathyroid gland that often causes excessive parathyroid hormone and high blood calcium.

Parathyroid Carcinoma

A rare malignant tumor of the parathyroid gland that commonly causes excessive parathyroid-hormone secretion, hypercalcemia, kidney stones, bone disease, or related symptoms.

Parathyroid Crisis

A life-threatening rise in blood calcium caused by severe overactivity of the parathyroid glands. It may cause extreme thirst, vomiting, constipation, confusion, weakness, abnormal heart rhythm, kidney injury, or coma.

Parathyroidectomy

Surgery to remove one or more overactive parathyroid glands. It may treat primary or kidney-related hyperparathyroidism when hormone excess causes high calcium, kidney stones, bone disease, or other complications; blood calcium can fall after surgery.

Parathyroid Gland

One of usually four small, bean-sized endocrine glands located on the posterior surface of the thyroid gland. Composed primarily of chief cells and oxyphil cells, the glands synthesize and secrete parathyroid hormone (PTH) in response to hypocalcemia, acting on bone (stimulating osteoclastic resorption), the kidneys (increasing calcium reabsorption and activating 1,25-dihydroxyvitamin D), and the intestines to tightly maintain calcium and phosphate homeostasis.

Alternate Names:
Parathyroid Glands

Parathyroid Gland Removal

Surgery to remove one or more overactive parathyroid glands, usually for persistent high blood calcium. It can improve symptoms and protect bones or kidneys; low calcium, bleeding, voice-nerve injury, or persistent disease may occur.

Parathyroid Glands

Plural form; see *Parathyroid Gland*.

Parathyroid Hormone

A hormone that regulates calcium and phosphate levels in the blood and supports bone remodeling.

Parathyroid Hormone Blood Test

A blood test measuring parathyroid hormone, interpreted with calcium, phosphate, vitamin D, and kidney function to evaluate parathyroid and calcium disorders.

Parathyroid Hormone Physiology

When blood calcium falls, the parathyroid glands release more parathyroid hormone. The hormone acts on bone and kidneys and increases active vitamin D, helping raise calcium and maintain the balance needed for nerves, muscles, and bones.

Parathyroid Hormone-Related Protein Blood Test

A blood test measuring parathyroid hormone-related protein, used mainly to evaluate humoral hypercalcemia of malignancy and selected disorders of calcium regulation.

Parathyroid Hormone Test

A blood test measuring intact parathyroid hormone (PTH) to investigate abnormal calcium levels and parathyroid gland function; see *Parathyroid Hormone* and *Parathyroid Hormone Blood Test*.

Parathyroid Hyperplasia

Enlargement of one or more small glands behind the thyroid, causing them to release too much parathyroid hormone. This can raise blood calcium and may occur with kidney disease or inherited multiple-gland disorders.

Parathyroid Surgery

Operations on the parathyroid glands, usually performed for selected cases of primary or secondary hyperparathyroidism. The decision depends on symptoms, calcium levels, kidney involvement, bone disease, overall health, and current clinical guidance.

Paratubal Cyst

A usually noncancerous, fluid-filled sac near a fallopian tube or ovary, separate from the ovary. It often causes no symptoms, but a larger cyst may cause pain or twist with the tube.

Alternate Names:
Paratubal Cysts; Paraovarian Cyst; Paraovarian Cysts; Parovarian Cyst

Paratyphoid Fever

An enteric fever caused by *Salmonella enterica* serovars Paratyphi A, B, or C, usually acquired through contaminated food or water. It can cause sustained fever, headache, weakness, and abdominal symptoms and can be severe.

Parechovirus

A group of viruses that commonly cause mild respiratory or gastrointestinal illness but can cause severe sepsis-like illness, meningitis, or encephalitis in newborns and young infants.

Parenchyma

The working tissue of an organ, distinguished from its supporting framework, blood vessels, and connective tissue. For example, lung parenchyma performs gas exchange, while liver parenchyma processes nutrients and harmful substances.

Parenchymal

Parenchymal means relating to the functional cells of an organ, distinguished from its supporting connective tissue, vessels, and framework.

Parenteral

Parenteral means delivered by a route other than the gastrointestinal tract, commonly by injection or infusion such as intravenous, intramuscular, or subcutaneous administration.

Parenteral Nutrition

Nutrition given through a vein when the digestive tract cannot safely absorb enough nutrients. The solution can contain water, glucose, amino acids, fats, vitamins, and minerals. It can cause bloodstream infection, liver problems, or abnormal blood sugar and salts, so it requires monitoring.

Parenting

The care, protection, guidance, and support provided to a child. It includes meeting basic needs, setting safe limits, and supporting development.

Paresis

Partial weakness or incomplete paralysis of voluntary muscles. It may affect one limb, one side of the body, both legs, or all four limbs, depending on the nerves, brain, or spinal cord involved.

Paresthesia

An unusual sensation such as tingling, prickling, burning, pins and needles, or numbness. Brief symptoms often follow pressure on a nerve, while persistent or spreading symptoms can occur with nerve or circulation disorders.

Paresthesia (Pins and Needles)

Alternate name; see *Paresthesia*.

Paricalcitol

Paricalcitol is a vitamin-D receptor activator used to reduce secondary hyperparathyroidism in selected chronic kidney disease, with monitoring for calcium and phosphate changes.

Parietal

Relating to a wall of a body cavity or to the parietal bone or lobe of the skull and brain.

Parietal Bone

One of two broad bones forming much of the skull's sides and roof. They protect the brain, meet along the top midline, and connect with several neighboring skull bones.

Parietal Cell Antibodies

Antibodies directed against proteins in the stomach's parietal cells. They can support evaluation for autoimmune gastritis or pernicious anemia, but a positive result alone does not establish either diagnosis.

Alternate Names:
PCA; Anti-Parietal Cell Antibodies

Parietal Lobe

A part of the brain that processes touch, pain, temperature, body position, and spatial awareness. Damage may cause numbness, difficulty recognizing objects by touch, poor coordination, or trouble understanding where parts of the body are.

Parietal Pericardium

The outer serous layer of the pericardium that lines the inner surface of the fibrous sac surrounding the heart.

Parietal Pleura

The pleural layer lining the chest wall, diaphragm, and mediastinum; it is sensitive to pain when inflamed.

Parinaud Oculoglandular Syndrome

Conjunctivitis with nearby lymph-node swelling, usually caused by infections such as Bartonella, tularemia, or certain viruses.

Parinaud Syndrome

A disorder caused by dysfunction of the dorsal midbrain, characterized by impaired upward gaze, abnormal pupil responses, and convergence-retraction eye movements. Causes include tumors, stroke, multiple sclerosis, and hydrocephalus.

Paris System For Reporting Urinary Cytology

A standardized framework for urinary cytology that emphasizes detection of high-grade urothelial carcinoma and uses defined categories to improve diagnostic consistency and clinical communication.

Parity

The number of pregnancies that reached the gestational-age threshold used to count a birth, regardless of whether the infant was born alive or stillborn. The threshold varies by clinical convention; parity differs from gravidity, which counts all pregnancies.

Park-Bench Position

A modified lateral position in which the upper body is partly rotated toward prone; it is used for selected posterior brain and neck procedures.

Parkinson Disease

Alternate spelling; see *Parkinson's Disease*.

Parkinsonian Gait

A walking pattern that may occur in Parkinson disease, with short shuffling steps and reduced arm swing. A stooped posture, freezing, or increasingly rapid short steps (festination) may also occur, but features vary and often change as the disease progresses.

Parkinsonism

A group of movement problems involving slowness, stiffness, shaking, or balance difficulty. Parkinson disease is one cause, but medicines, other brain disorders, and several less common conditions can produce similar symptoms.

Parkinson's Disease

A progressive neurodegenerative movement disorder caused by the gradual loss of dopamine-producing nerve cells in a deep region of the brain called the substantia nigra. Because dopamine is essential for smooth, coordinated muscle movement, its deficiency leads to hallmark motor symptoms: tremors (often starting in one hand as a rhythmic shaking at rest), muscle stiffness or rigidity, slowness of movement (bradykinesia), and balance or posture difficulties. Non-motor symptoms such as loss of smell, sleep disturbances, constipation, and mood changes often develop before or alongside motor signs.

Alternate Names:
Idiopathic Parkinsonism; Paralysis Agitans; PD; Parkinson Disease

Parkinson's Disease Center

Alternate name; see *Parkinson's Disease*.

P Arm Of A Chromosome

The shorter arm of a chromosome, labeled p, opposite the longer q arm. A genetic report may use this label to show where a gene change or missing or extra DNA segment is located.

Paromomycin

Paromomycin is an aminoglycoside antibiotic used mainly in the intestine for selected parasitic infections and sometimes for other infections under specialist care.

Paronychia

Inflammation of the nail fold, often with infection, causing pain, redness, and swelling beside a fingernail or toenail. Acute cases may form pus after a break in the skin; chronic cases are often related to repeated moisture or irritant exposure.

Parosteal Osteosarcoma

Parosteal osteosarcoma is a usually lower-grade bone cancer that grows on the outer surface of a bone, often near the back of the thigh.

Parotidectomy

Surgery to remove part or all of a parotid salivary gland, usually because of a tumor. Possible complications include facial-nerve weakness, bleeding, infection, saliva leakage, numbness, or sweating while eating.

Parotid Gland

The largest major saliva-producing gland, located in front of and below each ear. It releases saliva into the mouth near the upper back teeth and can become swollen from infection, blockage, inflammation, or a tumor.

Parotid Neoplasm

An abnormal growth in a parotid salivary gland in front of or below the ear. Most are noncancerous, but some are cancerous; a painless lump, facial weakness, pain, or rapid growth may occur.

Parotid Swelling

Swelling of one or both parotid glands, the large saliva-producing glands in front of and below the ears. Causes include infection, a blocked saliva duct, inflammation, or a growth.

Parotid Tumor

An abnormal neoplasm arising within the parotid salivary gland, the largest of the major salivary glands. Approximately 75–80% of parotid neoplasms are benign, most frequently pleomorphic adenoma (benign mixed tumor) and Warthin tumor (papillary cystadenoma lymphomatosum). Malignant parotid tumors include mucoepidermoid carcinoma, adenoid cystic carcinoma, and acinic cell carcinoma, which may manifest as a rapid-growing mass, local pain, skin fixation, or facial nerve (cranial nerve VII) paralysis. Diagnostic evaluation involves fine-needle aspiration biopsy and MRI or CT, followed by superficial or total parotidectomy with facial nerve preservation.

Alternate Names:
Parotid Tumors; Parotid Neoplasm

Parotid Tumors

Plural form; see *Parotid Tumor*.

Parotitis

Inflammation or infection of one or both parotid salivary glands, which lie in front of and below the ears. It can cause painful swelling, fever, dry mouth, or pus near the upper back teeth. Causes include viruses such as mumps, bacteria, blocked ducts, dehydration, and autoimmune disease.

Paroxetine Hydrochloride

Paroxetine hydrochloride is an SSRI antidepressant used for depression and several anxiety-related disorders; it can cause sexual side effects and withdrawal symptoms if stopped abruptly.

Paroxysm

A sudden, often brief attack or burst of symptoms or body activity that may recur. Examples include an episode of pain, coughing, rapid heartbeat, seizure, or involuntary movement; the cause depends on the symptom.

Paroxysmal Atrial Fibrillation

A clinical subtype of atrial fibrillation in which recurrent, uncoordinated atrial tachyarrhythmias terminate spontaneously or with pharmacological/electrical intervention within seven days of onset (usually within 48 hours).

Alternate Names:
PAF

Paroxysmal Atrial Tachycardia

Sudden episodes of rapid, regular atrial rhythm that start and stop abruptly, often producing palpitations, lightheadedness, chest discomfort, or shortness of breath.

Paroxysmal Cold Hemoglobinuria

A rare immune disorder in which cold temperatures trigger destruction of red blood cells when the blood

warms again. It can cause sudden anemia, fever, back pain, jaundice, or dark urine, often after an infection.

Paroxysmal Hemicrania

A rare headache disorder causing repeated attacks of severe one-sided pain, usually around the eye or temple. Attacks last 2 to 30 minutes and may occur many times a day, with tearing, a red eye, or a blocked or runny nose on the painful side. Attacks stop with indomethacin, a key feature used to distinguish this disorder.

Paroxysmal Nocturnal Dyspnea

Sudden breathlessness that wakes a person after they have been asleep for a while, often improving after sitting or standing. It commonly occurs with heart failure but may have other heart or lung causes.

Paroxysmal Nocturnal Haemoglobinuria

Alternate spelling; see *Paroxysmal Nocturnal Hemoglobinuria*.

Paroxysmal Nocturnal Hemoglobinuria

A rare acquired disorder of blood-forming stem cells. Red blood cells lack protective proteins and are destroyed by the complement system, which can cause anemia, dark urine, blood clots, low blood counts, or kidney injury.

Paroxysmal Nocturnal Hemoglobinuria (PNH)

Alternate name; see *Paroxysmal Nocturnal Hemoglobinuria*.

Paroxysmal Positional Nystagmus

Involuntary, rhythmic eye movements triggered by a change in head position. It may accompany benign paroxysmal positional vertigo or arise from another vestibular or neurologic disorder; persistent or atypical nystagmus can have central neurologic causes.

Paroxysmal Supraventricular Tachycardia

Repeated episodes of a very fast, usually regular heartbeat that start and stop suddenly and begin in the upper chambers or connecting electrical tissues of the heart. It may cause pounding heartbeat, dizziness, chest discomfort, breathlessness, or fainting.

Alternate Names:
PSVT

Pars

A part or portion of an anatomical structure, used in names such as pars interarticularis.

Pars Compacta

A dopamine-producing part of the substantia nigra, a movement-control area deep in the brain. Loss of these nerve cells contributes to the slowness, stiffness, and tremor of Parkinson disease.

Parsonage-Turner Syndrome

An acute neuro-inflammatory disorder affecting the brachial plexus, typically presenting with the abrupt onset of excruciating, unremitting, burning shoulder and periscapular pain, followed days to weeks later by patchy multifocal muscle weakness, flaccid paresis, and rapid denervation atrophy of the shoulder girdle and arm muscles. Often triggered by prior viral infection, vaccination, trauma, or surgical stress.

Alternate Names:
Neuralgic Amyotrophy; Acute Brachial Radiculitis; Brachial Plexitis

Pars Planitis

A form of inflammation inside the eye, near the edge of the retina. It may cause floaters, blurred vision, and swelling or other retinal complications and is treated according to its severity and cause.

Partial

Partial means incomplete or involving only a portion, such as partial loss, partial response, partial thickness, or partial seizure; the specific meaning depends on context.

Partial Agonist

A medicine that attaches to a cell receptor and activates it, but produces a smaller effect than a full activator even when all available receptors are occupied. It can reduce the effect of a stronger activator at the same receptor.

Partial Anomalous Pulmonary Venous Connection

A congenital cardiovascular malformation in which one or more (but not all) pulmonary veins drain into the systemic venous circulation (e.g., superior vena cava, right atrium, or coronary sinus) instead of the left atrium, commonly associated with a sinus venosus atrial septal defect. It produces a left-to-right shunt whose physiological severity depends on the volume of anomalous pulmonary venous flow.

Alternate Names:
PAPVC; Partial Anomalous Pulmonary Venous Return; PAPVR

Partial Breast Brachytherapy

Radiation treatment placed inside or next to the area where a breast cancer was removed, usually after breast-conserving surgery. It treats selected early cancers over a shorter course but may cause skin changes, breast firmness, infection, or delayed healing.

Partial Cystectomy

Surgery to remove part of the urinary bladder, usually for a tumor or localized disease while leaving the rest of the bladder in place. Urinary or surgical complications can occur, and the remaining bladder can develop recurrent disease.

Partial Denture

A removable replacement for some missing teeth, supported by remaining teeth, gums, or both. It may use metal or plastic and can improve chewing, speech, appearance, and tooth stability.

Partial Hysterectomy

A common but imprecise term usually referring to supracervical or subtotal hysterectomy, in which the uterine body is removed while the cervix remains. The fallopian tubes and ovaries may or may not be removed separately.

Partial Knee Replacement

Surgery replacing only the damaged compartment of the knee with an artificial surface while preserving healthy bone, ligaments, and cartilage. It may relieve pain from localized arthritis; infection, clots, stiffness, loosening, or later arthritis elsewhere can occur.

Partial Lipodystrophy

A form of lipodystrophy involving selective deficiency or loss of body fat in specific regions rather than throughout the body. It may be inherited or acquired, and depending on the subtype and extent, can be associated with insulin resistance, diabetes, high triglycerides, or fatty liver.

Partial Nephrectomy

Partial nephrectomy removes a diseased part of a kidney while preserving the remaining healthy tissue.

Partial Remission

A reduction in signs, symptoms, or measurable disease burden that does not meet criteria for complete remission; the definition depends on the disease and response criteria used.

Partial Response

A measurable improvement after treatment in which a tumor or other disease becomes smaller or less active but does not disappear completely. The exact amount of improvement required is defined by the cancer type, test method, or study criteria.

Partial Seizure

Obsolete term for a *focal seizure*, which begins in networks limited to one cerebral hemisphere. Awareness may be preserved or impaired, and manifestations depend on the networks involved.

Partial Thromboplastin Time

A blood test measuring how long a clot takes to

form through several clotting pathways. It helps investigate unusual bleeding and monitor unfractionated heparin; abnormal results may reflect a clotting-factor problem, medicine effect, or another illness.

Partial Volume Artifact

An imaging effect that occurs when one image element contains more than one tissue or structure, blending their signals and blurring boundaries.

Alternate Names:
Partial-Volume Effect

Partial-Volume Effect

Alternate name; see *Partial Volume Artifact*.

Participation

A person's involvement in life situations and activities, a central concept in rehabilitation and the International Classification of Functioning that extends beyond impairment alone.

Particle Size

Particle size is the diameter or size distribution of particles in a powder, suspension, aerosol, or formulation, influencing dissolution, absorption, stability, and delivery.

Particulate Matter

Small solid or liquid particles suspended in air. Fine particles can penetrate the lungs and increase cardiovascular and respiratory risk.

Partogram

A graphic record of cervical change, fetal descent, contractions, and maternal or fetal observations during labor. It can support communication and recognition of abnormal progress; interpretation depends on current labor guidance and the overall clinical situation.

Alternate Names:
Labor Progress Chart; Partographic Curve

Parturition

The process of childbirth, including cervical ripening, labor contractions, delivery of the fetus, and expulsion of the placenta.

Paruresis

Difficulty urinating in the presence of other people or in public places, often called shy bladder syndrome. It is related to anxiety and can improve with behavioral therapy and gradual exposure.

Alternate Names:
Shy Bladder Syndrome

Parvimonas Micra

An anaerobic gram-positive bacterium found in the mouth and gastrointestinal tract that can cause dental, bone, joint, or bloodstream infections.

Parvoviridae

A family of very small DNA viruses; human parvovirus B19 can cause fifth disease, anemia, or fetal complications.

Parvovirus

A small DNA virus; parvovirus B19 is the main human pathogen and can cause rash, joint symptoms, or red-cell aplasia.

Parvovirus B19

A human virus spread mainly through respiratory droplets. It commonly causes a mild rash illness in children, but can cause joint pain or severe anemia and may harm a fetus during pregnancy.

Parvovirus B19 Infection

An infection that may cause fever, a slapped-cheek rash, joint pain, or temporary reduction in red-blood-cell production. It can be serious in people with certain blood disorders or weakened immunity and can affect pregnancy after significant exposure.

Parvovirus Infection

An infection caused by parvovirus B19 that commonly causes mild fever and rash but may be serious in some people.

Alternate Names:
Fifth Disease; Erythema Infectiosum; Slapped

Cheek Disease

Passing Out

Temporary loss of consciousness accompanied by loss of postural tone, followed by spontaneous recovery. See *Syncope*.

Passive Exercise

Movement of a person's joint or limb by another person, a machine, or gravity without active muscle effort from the patient. It can maintain flexibility and reduce stiffness when illness or weakness limits movement, but forceful movement can injure tissues.

Passive Heat Therapy

Use of external heat, such as warm packs, baths, or saunas, to relax muscles and temporarily reduce pain or stiffness. Excessive heat can cause burns, dehydration, or fainting.

Passive Immunity

Protection produced by transferred antibodies rather than by the person's own immune response, such as maternal antibodies or immunoglobulin treatment.

Passive Immunization

Protection produced by giving preformed antibodies, such as immunoglobulin or antivenom, which acts quickly but is temporary because the recipient does not generate durable immune memory.

Passive Smoking

Breathing smoke from another person's tobacco or nicotine product. Secondhand smoke increases the risk of respiratory disease, heart disease, stroke, and lung cancer and is especially harmful to children and during pregnancy.

Pasteurella

A genus of bacteria carried by animals that can cause wound infections after bites and other human disease.

Pasteurella Aerogenes

Pasteurella aerogenes is a rare Pasteurella species; its recovery from a clinical sample should be interpreted with the source and evidence of infection.

Pasteurella Canis

Pasteurella canis is a bacterium found in dogs and cats that can cause wound or soft-tissue infection after an animal bite.

Pasteurellaceae

Pasteurellaceae is a family of bacteria that includes Pasteurella and related animal-associated organisms capable of causing bite-wound and respiratory infections.

Pasteurella Multocida

A bacterium commonly carried by animals that can cause wound infections after bites or scratches and, less often, respiratory or bloodstream infection.

Pasteurellosis

Infection caused by Pasteurella bacteria, commonly introduced through animal bites or scratches and causing cellulitis, abscesses, or occasionally invasive disease.

Pasteurization

A heat treatment reducing microbial load in liquids by heating below boiling point to inactivate vegetative pathogens and spoilage organisms while preserving quality.

Pastia Lines

Darker red lines that appear in skin creases during some rashes, especially scarlet fever. They support the diagnosis when other signs fit but are not specific by themselves.

Alternate Names:
Pastia's Sign; Pastia Lines of Scarlet Fever

Patau's Syndrome

A congenital disorder caused by an extra copy of chromosome 13. It can cause severe developmental problems, brain and heart defects, cleft lip or palate,

and other organ abnormalities.

Patau Syndrome

A genetic condition caused by an extra copy of chromosome 13. It can cause severe problems involving brain development, growth, the eyes, heart, kidneys, hands or feet, and the lip or palate. Many affected pregnancies end before birth, and surviving infants often have complex medical needs.

Patau Syndrome (Trisomy 13)

Alternate name; see *Patau Syndrome*.

Patch

A flat, circumscribed area of altered skin or mucous membrane color larger than 1.0 cm in diameter, without elevation, depression, or textural change relative to surrounding tissue. It represents the larger counterpart of a macule and can arise from vascular, pigmentary (e.g., vitiligo, melasma, café-au-lait macules), inflammatory, or neoplastic dermatologic processes.

Alternate Names:
Patches

Patches

Plural form; see *Patch*.

Patch Graft

A piece of natural or synthetic material sewn onto a blood vessel to widen or repair it during patch angioplasty. Materials may include a patient's tissue, bovine pericardium, or synthetic PTFE.

Patch Test

A skin test used to identify delayed allergic contact reactions to substances applied under adhesive patches.

Patch Testing

Patch testing helps identify substances that cause allergic contact dermatitis. Small amounts of suspected allergens are placed on the skin, usually on the back, under patches; a clinician checks for delayed reactions over the following days. The allergens and timing vary by test series and clinical need.

Patch Tonsil

A white or yellow spot or coating on a tonsil. It can occur with an infection, but its appearance alone cannot show whether the cause is bacterial or viral; a tonsil stone can also look like a patch.

Patchy Skin Color

Areas of skin that are lighter, darker, redder, or otherwise different in color from the surrounding skin. Causes include vitiligo, birthmarks, inflammation, infection, sun exposure, injury, and changes in blood flow; appearance and evolution vary with the cause.

Patella

The largest sesamoid bone in the human body, embedded within the quadriceps tendon at the front of the knee. It improves the mechanical efficiency of knee extension, protects the front of the joint, and distributes forces across the femoral trochlea.

Alternate Names:
Rotula; Knee Cap

Patellar Apprehension Test

A knee examination used to look for kneecap instability. The examiner gently moves the kneecap outward while the knee is slightly bent. Fear, pain, or a muscle tightening response may support instability, but the test is interpreted with the history and other findings.

Alternate Names:
Fairbank Apprehension Test

Patellar Bulge Test

A physical examination manoeuvre used to detect small intra-articular effusions in the knee joint. The examiner sweeps the medial aspect of the knee upward to displace fluid, then sweeps downward on the suprapatellar and lateral aspects; a visible fluid bulge or wave returning to the medial hollow indicates a small effusion.

Alternate Names:
Brush Test; Stroke Test; Sweep Test

Patellar Dislocation

Complete displacement of the kneecap from the femoral groove, usually laterally, causing acute pain, deformity, swelling, and difficulty extending the knee.

Patellar Reflex

A monosynaptic deep tendon stretch reflex elicited by sharply tapping the patellar tendon beneath the patella with a reflex hammer, producing involuntary quadriceps contraction and knee extension; tests the integrity of the L3-L4 spinal nerve roots and femoral nerve.

Alternate Names:
Knee-Jerk Reflex

Patellar Tap Test

A clinical examination technique used to detect moderate to large knee joint effusions. The examiner compresses the suprapatellar pouch with one hand and pushes the patella downward against the femoral condyles with the other; a floating sensation followed by a distinct tap or click against the femur confirms fluid accumulation.

Alternate Names:
Patellar Ballottement Test

Patellar Tendinitis

Alternate name; see *Patellar Tendinopathy*.

Patellar Tendinopathy

An overuse mechanical tendinopathy of the patellar tendon near its origin at the inferior pole of the patella, common in jumping athletes, presenting with localized anterior knee pain exacerbated by jumping, squatting, and descending stairs.

Alternate Names:
Jumper Knee

Patellofemoral Instability

A tendency of the patella to move abnormally or dislocate from the femoral trochlea. Risk factors include abnormal trochlear shape, a high-riding patella, ligament insufficiency, altered limb alignment, and previous dislocation.

Patellofemoral Osteoarthritis

Degenerative disease affecting the cartilage and bone surfaces between the kneecap and the femoral groove. It commonly causes pain at the front of the knee with stairs, squatting, kneeling, or prolonged sitting.

Patellofemoral Pain Syndrome

Pain around or behind the kneecap, often worsened by running, stairs, squatting, or sitting with the knee bent. It commonly results from repeated loading, muscle weakness, movement changes, or kneecap tracking problems.

Alternate Names:
Runner's Knee

Patellofemoral Syndrome

Pain around or behind the kneecap related to movement and loading of the patellofemoral joint, often without a major structural injury.

Patent

Patent means open, unobstructed, or functioning, as in a patent airway, vessel, duct, or congenital fetal channel.

Patent Ductus Arteriosus

Persistence after birth of the ductus arteriosus, a fetal blood vessel connecting the pulmonary artery to the aorta. After birth, the vessel normally constricts and closes; if it remains open, blood usually flows from the aorta into the pulmonary artery, potentially increasing blood flow to the lungs and straining the heart. Small openings may cause no symptoms, while the effects of larger openings vary with the infant's circulation. The condition is more common in infants born prematurely.

Patent Ductus Arteriosus (PDA)

Alternate name; see *Patent Ductus Arteriosus*.

Patent Foramen Ovale

A flap-like passage between the heart's upper chambers that remains from fetal circulation because it does not seal completely after birth. It is com-

mon and usually causes no problems or need for treatment. In some circumstances, a clot can pass from the venous to the arterial circulation through it (paradoxical embolism). In selected people with a PFO-associated stroke, closure may be considered after evaluation for other causes.

Alternate Names:
PFO

Patent Urachus

A patent urachus is persistence of the fetal channel between the bladder and umbilicus after birth, allowing urine to drain from the umbilicus and predisposing to infection.

Patent Urachus Repair

Surgery to close an abnormal open connection between the bladder and the navel that remains from fetal development. It may stop urine leaking from the umbilicus and prevent infection; treatment depends on the child's anatomy and health.

Paternal Depression

Depression occurring in a father during pregnancy or after a child is born. Symptoms may include low mood, irritability, withdrawal, sleep or appetite changes, and loss of interest; treatment can help both parent and family.

Paternal Postnatal Depression

Depression in a father during the first year after a baby's birth. It may be linked to stress, sleep loss, previous depression, or a partner's depression and deserves professional assessment.

Paternal Uniparental Disomy 14

Inheritance of both copies of chromosome 14 from the father, causing abnormal expression of imprinted genes in the 14q32 region and usually resulting in Kagami-Ogata syndrome. Features include a small bell-shaped thorax, characteristic facial appearance, abdominal-wall defects, feeding and respiratory problems, and variable developmental impairment; severity and survival vary.

Alternate Names:
UPD(14)pat

Paternity Testing

A DNA test that assesses whether a person is the biological parent of a child. Samples are usually collected from the child and possible parent, and the result reports either exclusion or a calculated probability of biological relationship.

Pathogen

An organism or infectious agent that can enter the body and cause disease. Examples include viruses, bacteria, fungi, and parasites.

Pathogenesis

The way a disease begins and develops, including its causes, changes in cells or tissues, and progression over time. Understanding pathogenesis helps explain symptoms, complications, and possible treatment targets.

Pathogenic

Pathogenic means capable of causing disease in a susceptible host; pathogenicity depends on the organism or factor, dose, route, and host defenses.

Pathogenicity

The capacity of a microorganism to cause disease in a susceptible host. Pathogenicity is a qualitative property, whereas virulence describes the relative degree of disease-causing capacity among strains or organisms.

Pathogenic Variant

A change in DNA with strong evidence that it causes or contributes to a disease. Its importance depends on the gene, the person's symptoms and family history, and whether one or both copies of the gene are affected.

Pathognomonic

Describes a finding considered highly specific for a particular disease. Truly pathognomonic findings are uncommon; most findings must still be interpreted with the history, examination, and other test results.

Pathologic

Pathologic means related to disease or an abnormal structural or functional change, rather than normal anatomy or physiology.

Pathological Fracture

See *Pathologic Fracture*.

Pathological Laughter And Crying

Alternate name; see *Pseudobulbar Affect*.

Pathological Stealing

Alternate name; see *Kleptomania*.

Pathologic Dilatation

Abnormal widening of a hollow organ, duct, blood vessel, or other structure beyond its expected size because of obstruction, weakness, pressure, or disease.

Pathologic Fracture

A break in bone weakened by a disease, such as osteoporosis, cancer, infection, or another bone disorder. It can happen after a minor injury or sometimes during ordinary activity; treatment addresses both the fracture and its cause.

Pathologic Hypertrophy

Enlargement of an organ because its cells become larger, usually after long-term extra workload or hormone stimulation. It can help at first but may eventually impair function, as in an overworked heart.

Pathologic Nipple Discharge

Nipple fluid that occurs without squeezing, comes from one breast or one duct, or is bloody or clear. Causes include benign duct changes and, less often, breast cancer; evaluation may include imaging and other tests.

Pathologic Ossification

Abnormal formation of bone in soft tissue or in a location where bone should not develop, as in heterotopic ossification after trauma, neurologic injury, or surgery.

Pathologic Process

A pathologic process is an abnormal biological change that produces disease, such as infection, inflammation, ischemia, degeneration, abnormal growth, or immune injury.

Pathologic Response

A pathologic response is an abnormal reaction of cells, tissues, or organs to injury, infection, immune activation, toxins, or other stressors that contributes to disease.

Pathologist

A pathologist is a physician who diagnoses disease by examining tissues, cells, blood, or body fluids and may guide laboratory testing, cancer classification, and treatment decisions.

Pathology

The study and diagnosis of disease through examination of tissues, cells, blood, and other specimens. Anatomic pathology examines cells and tissues; laboratory or clinical pathology studies blood, body fluids, and laboratory processes. General pathology studies disease processes, while systemic pathology focuses on organs.

Pathology Artifact

A change introduced while collecting, preserving, cutting, staining, or imaging a sample rather than by disease. Recognizing these false changes prevents an incorrect diagnosis.

Pathophysiology

The study of the functional changes produced by disease or injury and the mechanisms through which they cause signs and symptoms.

Patient

A person receiving medical care, advice, examination, or treatment. Good care includes listening to the patient's concerns, explaining choices clearly, respecting informed decisions, protecting privacy,

and reducing avoidable harm.

Patient Advocacy

Acting on behalf of a patient to ensure that the patient's needs, rights, and preferences are addressed in healthcare.

Patient Autonomy

A patient's right and capacity to make informed voluntary decisions about healthcare after receiving understandable information about options, benefits, risks, and alternatives.

Patient-Centered Care

Healthcare planned around a person's needs, values, preferences, and goals. It includes clear communication, shared decisions, respect for cultural and personal choices, coordination between professionals, and support for the person and family.

Patient-Centered Outcome

An outcome that reflects what matters to the patient, including symptoms, function, quality of life, treatment burden, and ability to achieve personal goals, rather than relying only on laboratory or imaging measures.

Patient-Controlled Analgesia

A method in which a patient self-administers prescribed doses of analgesic medication using a programmable pump with preset safety limits. The medication, dose, and lockout interval are individualized according to the patient's condition and monitoring needs.

Patient Education

The process of explaining a health condition, treatment, medicines, exercises, equipment, warning signs, and prevention strategies in a way the patient can understand and use.

Patient Observation

Systematic monitoring of a patient's symptoms, vital signs, examination findings, behavior, and response to treatment to detect deterioration or guide management.

Patient Positioning

Placing and supporting a patient in a position that permits safe care, accurate examination or imaging, and adequate comfort.

Patient Preparation

The instructions and assessments completed before a test or procedure, such as fasting, medicine review, hydration, consent, or skin preparation when required.

Patient-Reported Outcome Measure

A validated questionnaire completed directly by a patient to assess symptoms, function, health status, or quality of life without clinician interpretation of the response.

Patient Rights

Ethical and legal protections for people receiving care, including informed consent, privacy, access to information, respectful treatment, participation in decisions, and refusal of treatment where lawful.

Patient Safety

Preventing avoidable harm during healthcare. It includes accurate identification, safe prescribing and medicine use, infection prevention, clear communication, fall prevention, and checking procedures and results.

Patlak-Rutland Analysis

A graph used with some nuclear-medicine scans to estimate how quickly a tracked substance moves from the blood into tissue and stays there. It can help measure tissue activity, including activity in some tumors.

Patrick Test

A hip examination, also called the FABER test, in which the person lies on their back with one ankle resting on the opposite knee. The examiner gently lowers the bent knee; pain may point to a hip or nearby pelvic problem, but the test alone cannot

identify the cause.

Alternate Names:
FABER Test; Patrick's FABER Maneuver

Pattern Recognition Receptors

Proteins on or inside immune cells that detect common features of germs or damaged tissue. Their activation helps start the body's early immune response.

Pattern-Recognition Receptors

Sensors on or inside immune cells that detect common features of germs or damaged cells. Their activation starts early immune responses, including inflammation and signals that help coordinate protection and tissue repair.

Pauci-Immune Glomerulonephritis

A necrotizing and crescentic glomerulonephritis characterized on renal biopsy by focal glomerular capillary necrosis and cellular crescent formation with minimal or absent deposition of immunoglobulins or complement on immunofluorescence, strongly associated with antineutrophil cytoplasmic antibodies (ANCA-associated vasculitis).

Alternate Names:
ANCA-Associated Glomerulonephritis; Pauci-Immune Crescentic GN

Pavement Burn

A skin injury caused by sliding against pavement, combining abrasion (scraping away of skin) with tissue damage from friction. It can range from superficial skin loss to a deeper burn, and grit or asphalt may become embedded in the wound.

Alternate Names:
Road Rash

Paxillin

Paxillin is a focal-adhesion adaptor protein that links integrin signaling to the actin cytoskeleton and helps regulate cell adhesion, migration, and mechanical sensing.

PA X-Ray

A posteroanterior X-ray is taken with the beam traveling from the back toward the front, commonly for a chest image. This position reduces enlargement of the heart's outline compared with some other views.

Pazopanib

An oral tyrosine-kinase inhibitor targeting vascular endothelial growth factor and other receptors, used for selected advanced renal-cell carcinoma and soft-tissue sarcoma.

PBA

Alternate name; see *Pseudobulbar Affect*.

PBG Urine Test

A urine test measuring porphobilinogen, used urgently to evaluate suspected acute hepatic porphyria during compatible neurovisceral or abdominal attacks.

PCBs

PCBs, or polychlorinated biphenyls, are persistent industrial chemicals that accumulate in tissues and can affect the nervous, endocrine, immune, and reproductive systems.

PCI

Minimally invasive catheter procedure used to open blocked coronary arteries and restore blood flow to the heart. See *Percutaneous Coronary Intervention*.

PCL Injuries

Sprains or tears of the posterior cruciate ligament, a strong ligament inside the knee. They may follow a blow to the shin or forceful bending and can cause pain, swelling, stiffness, or a feeling that the knee gives way.

PCO

An abbreviation for *polycystic ovaries* in reproductive medicine or *posterior capsule opacification* in ophthalmology. The full term should be given when the field is not clear.

PCO Disease

Nonstandard name; see *Polycystic Ovary Syndrome*.

PCOS

Abbreviation; see *Polycystic Ovary Syndrome*.

PCP

Alternate name; see *Pneumocystis Jirovecii Pneumonia*.

PCP and Ketamine Toxicity

Dissociative-drug toxicity causing agitation, hallucinations, impaired coordination, nystagmus, analgesia, tachycardia, hypertension, hyperthermia, seizures, or coma. PCP often produces severe behavioral disturbance, whereas ketamine can cause profound sedation; reduce stimulation, protect the airway, use benzodiazepines when needed, and treat hyperthermia or complications.

PDA

Alternate name; see *Patent Ductus Arteriosus*.

PDD

Chronic form of depression where depressive symptoms persist continuously for at least two years. See *Persistent Depressive Disorder*.

PDE5 Inhibitors

Medicines that improve blood flow into the penis by relaxing blood vessels and are mainly used for erectile dysfunction. Combining them with nitrate medicines can cause a dangerous fall in blood pressure.

PEA

Cardiac arrest rhythm where electrical activity is visible on an ECG but produces no detectable pulse or heart contractions. See *Pulseless Electrical Activity*.

Peak Expiratory Flow Rate

The fastest speed at which a person can blow air out after taking a full breath. A handheld meter measures it in litres per minute; lower or changing values can help monitor airway narrowing, especially in asthma.

Peak Flow Meter

A handheld device that measures peak expiratory flow rate, the fastest speed of air expelled after a full breath, usually reported in liters per minute. It provides a simple measure of large-airway flow but does not measure the full range of airflow and lung volumes assessed by spirometry.

Peak Plasma Concentration

The highest measured concentration of a medicine in the blood after a dose. It is often called Cmax and is influenced by the dose, absorption speed, formulation, and route of administration.

Alternate Names:
Cmax

PE Anticoagulation

Anticoagulant treatment for pulmonary embolism to prevent clot extension and recurrence. Options include direct oral anticoagulants, heparins, and vitamin K antagonists; the choice and duration depend on bleeding risk, pregnancy, kidney function, cancer, provoking factors, and other clinical features.

Peanut Allergy

An immune reaction to peanut proteins that can cause symptoms ranging from hives to life-threatening anaphylaxis.

Alternate Names:
Peanut Hypersensitivity; Peanut Anaphylaxis

Peanut Oil

Peanut oil is oil extracted from peanuts; refined oil usually contains little allergenic protein, whereas unrefined products may trigger reactions in susceptible people.

Pearly Penile Papules

Small, benign, dome-shaped papules arranged circumferentially around the glans penis, representing normal anatomical variants requiring no treatment.

Peau D'Orange

Peau d'orange is dimpled skin resembling an orange peel, caused by edema tethered around hair follicles; it can occur with breast cancer, infection, or lymphatic obstruction.

Pectinate Line

A boundary inside the anal canal where the lining, nerve supply, blood vessels, and lymph drainage change. Conditions above and below this line may cause different symptoms and may be treated differently.

Pectoral

Relating to the chest muscles or the front of the chest. The pectoral muscles move the arm and help stabilize the shoulder. Pain in this area may come from muscle strain, the ribs, breast tissue, or organs inside the chest.

Pectoral Girdle

The pectoral girdle consists of the clavicles and scapulae, attaching the upper limbs to the trunk and providing broad surfaces for shoulder and arm movement.

Pectoralis

Relating to the chest muscles, especially pectoralis major and pectoralis minor. These muscles help move the arm, support the shoulder, and connect the chest wall with the upper limb.

Pectoralis Major Muscle

The large chest muscle that moves the arm across the body, turns it inward, and helps with pushing. It attaches to the collarbone, breastbone, ribs, and upper arm.

Pectoralis Minor Muscle

A small chest muscle beneath the larger pectoralis major. It helps draw the shoulder blade forward and downward, hold it against the ribs, and assist forceful breathing; tightness can contribute to rounded shoulders.

Pectoralis Muscles

The pectoralis major and minor muscles of the chest, which move and stabilize the shoulder and assist with movements such as pushing, adduction, and breathing.

Pectoriloquy

Abnormally clear transmission of spoken sounds through the chest wall, often suggesting lung consolidation or another change in lung tissue.

Pectus Carinatum

A chest-wall deformity in which the sternum and adjacent costal cartilages protrude outward, sometimes asymmetrically. It may be present at birth but often becomes more noticeable during growth, especially puberty. Most people have no physical symptoms, though some experience chest pain, shortness of breath with exertion, or concerns about appearance.

Alternate Names:
Pigeon Chest; Pigeon Breast; Keel Breast

Pectus Excavatum

A chest-wall deformity in which the sternum and adjacent costal cartilages are displaced inward, creating a depression in the chest. It may be mild and cause no symptoms; severe deformity can cause chest pain, shortness of breath, or exercise intolerance and may affect heart or lung function.

Alternate Names:
Sunken Chest; Funnel Chest

Pectus Excavatum Repair

Surgical correction of a sunken sternum and adjacent costal cartilage, performed when chest-wall deformity causes significant symptoms, physiologic impairment, or psychosocial impact.

Pediatric ADHD

Attention-deficit/hyperactivity disorder in children or adolescents, involving developmentally inappropriate inattention, hyperactivity, and/or impulsivity that persist across settings and impair functioning.

Pediatric Advanced Life Support

Emergency training and guidance for recognizing and treating life-threatening breathing, circulation, or heart problems in infants and children. It covers resuscitation, airway support, shock, abnormal rhythms, and care after recovery.

Alternate Names:
PALS

Pediatric AIDS

Pediatric AIDS is advanced HIV infection in a child, with severe immune suppression or AIDS-defining illness; antiretroviral therapy and prevention of opportunistic infection are essential.

Pediatric Anesthesia

Anesthesia for infants and children uses age- and weight-appropriate medicines, equipment, and monitoring. Children's airways and breathing reserves differ from adults, so they can develop low oxygen levels or changes in blood pressure quickly and need specialized care.

Pediatric Antireflux Surgery

Surgical reconstruction of the gastroesophageal junction—most commonly via laparoscopic Nissen fundoplication—in infants and children with medically refractory gastroesophageal reflux disease, recurrent aspiration, or severe failure to thrive.

Alternate Names:
Pediatric Fundoplication; Pediatric Anti-Reflux Surgery; Nissen Fundoplication in Children

Pediatric Apnea

A pause or cessation of breathing in an infant or child. Causes include prematurity, infection, airway obstruction, seizures, metabolic disease, medication exposure, and central or obstructive sleep disorders.

Pediatric Appendicitis

Acute inflammation of the vermiform appendix, usually caused by luminal obstruction. Children may have evolving periumbilical-to-right-lower-quadrant pain, anorexia, vomiting, fever, and guarding, but presentation can be atypical in young children; timely surgical and antimicrobial assessment reduces perforation risk.

Pediatric Assessment Triangle

A rapid first look at a sick child that does not require touching the child. Clinicians observe appearance, effort of breathing, and skin color or circulation. The findings show how urgently help is needed and guide the next examination and treatment.

Alternate Names:
PAT; Pediatric Visual Triage Triangle

Pediatric Brain Tumor

A primary neoplasm originating within the brain parenchyma, ventricular system, meninges, or cranial nerves during childhood or adolescence. As the leading cause of disease-related death in children, common histologic entities include pilocytic astrocytoma, medulloblastoma, ependymoma, atypical teratoid/rhabdoid tumor (AT/RT), and diffuse midline glioma. Clinical presentation reflects increased intracranial pressure (headache, vomiting, papilledema, macrocephaly) or focal neurologic deficits. Multidisciplinary treatment encompasses maximal safe neurosurgical resection, molecular stratification, and risk-adapted adjuvant chemotherapy or craniospinal radiotherapy.

Alternate Names:
Childhood Brain Tumor; Pediatric Brain Tumors; Pediatric CNS Neoplasm

Pediatric Brain Tumors

Plural form; see *Pediatric Brain Tumor*.

Pediatric Cancer

Cancer occurring in infants, children, or adolescents. Common types include leukemia, brain tumors, lymphoma, neuroblastoma, and Wilms tumor; prognosis varies by type and stage.

Pediatric Cardiopulmonary Resuscitation

Emergency chest compressions and rescue breaths used when an infant or child has cardiac arrest. Technique, compression depth, and the ratio of compressions to breaths depend on the child's age, number of rescuers, and current resuscitation guidance.

Alternate Names:
Pediatric CPR

Pediatric Cataract

Clouding of the natural lens in an infant or child. It may be present at birth or develop after birth and can interfere with visual development, causing amblyopia or reduced vision.

Pediatric Central Venous Line

A small-caliber central vascular access catheter specifically designed and placed in neonates and pediatric patients for total parenteral nutrition, critical drug infusions, hemodialysis, or advanced hemodynamic monitoring.

Alternate Names:
Neonatal Central Line; Pediatric CVC; Infant Venous Catheter

Pediatric Crutch Gait Training and Fitting

Clinical fitting and rehabilitation gait training for children utilizing axillary or forearm crutches, ensuring proper axillary clearance (2 − −3 finger-breadths) and handgrip alignment to prevent compressive crutch palsy.

Alternate Names:
Pediatric Crutch Fitting; Pediatric Gait Training; Axillary Crutch Training in Children; Crutch Gait Training; Crutch Fitting

Pediatric Crutch Stair Training

Physical therapy gait training for pediatric crutch users navigating stairs safely (advancing the unaffected extremity first when ascending, and advancing crutches with the affected extremity when descending).

Alternate Names:
Stair Ambulation with Crutches; Crutch Stair Training

Pediatric Crutch Transfers

Physical therapy instruction for pediatric patients utilizing axillary crutches to safely transition between seated and standing positions by grasping both crutches on the injured side and supporting weight on the unaffected extremity.

Alternate Names:
Crutch Chair Transfers in Children; Crutch Transfers

Pediatric Dehydration

A deficit of body water and electrolytes in a child, commonly caused by vomiting, diarrhea, fever, poor intake, or excessive losses. Signs include reduced urination, dry mucosa, lethargy, tachycardia, and altered perfusion.

Pediatric Dentistry

Dental care for infants, children, and adolescents, including prevention and treatment of tooth decay, care of developing teeth, growth-related problems, behavior support, and adaptations for children with special healthcare needs.

Pediatric Dermatology

The medical specialty concerned with skin, hair, and nail disorders in infants, children, and adolescents. It includes congenital lesions, inflammatory diseases, infections, vascular lesions, and tumors.

Pediatric Dermatology Conditions

Skin conditions in children may include birthmarks, eczema, infections, vascular growths, pigment changes, and inherited disorders. Rapidly changing, painful, bleeding, or infected lesions can indicate significant disease.

Pediatric Diabetic Ketoacidosis

A life-threatening complication of diabetes in which very high blood sugar and a lack of insulin make the blood acidic. A child may urinate and drink excessively, vomit, have abdominal pain, deep breathing, fruity-smelling breath, sleepiness, or coma.

Pediatric Early Warning Score

A hospital scoring system that combines a child's behavior, breathing, heart rate, circulation, and need for oxygen to detect worsening illness early. A rising score indicates increased risk and supports clinical judgment.

Alternate Names:
PEWS; Pediatric Early Warning System

Pediatric Echocardiogram

A noninvasive ultrasound examination of the heart in infants and children used to evaluate congenital structural heart defects, valve function, and cardiac blood flow.

Alternate Names:
Pediatric Echo; Pediatric Cardiac Ultrasound

Pediatric Eczema

Atopic dermatitis in children commonly begins in infancy with facial and extensor involvement; flexural disease predominates in older children. Pruritus, xerosis, sleep disturbance, and scratching are characteristic.

Pediatric Feeding Tube

A small, flexible plastic tube inserted through the nose (nasogastric/nasojejunal) or directly into the stomach (gastrostomy) to deliver breast milk, formula, or medications to infants unable to feed adequately by mouth.

Alternate Names:
Infant Feeding Tube; Infant Enteral Tube

Pediatric Fever

An elevated body temperature in a child, usually caused by infection but sometimes by inflammation, medicines, or environmental heat. Evaluation depends on age, appearance, duration, and associated findings.

Pediatric Foreign Body Ingestion

Swallowing of a nonfood object by a child, with risk determined by the object, location, size, symptoms, and time since ingestion. Batteries, magnets, sharp objects, and obstructing objects can cause rapid tissue injury or blockage.

Pediatric Gastroesophageal Reflux Disease

Reflux that causes troublesome symptoms or complications in a child, such as feeding difficulty, pain, or poor growth. Evaluation and treatment depend on the child's age, symptoms, and effect on growth and health.

Alternate Names:
Pediatric GERD; Childhood Acid Reflux; Pediatric Gastroesophageal Reflux

Pediatric Glaucoma

Glaucoma occurring in an infant or child, often involving abnormal development or blockage of the eye's drainage system. Increased eye pressure can enlarge or damage the eye and impair vision.

Pediatric Growth Hormone Deficiency

Inadequate secretion of growth hormone by the anterior pituitary gland in infants and children, leading to deceleration of growth velocity, proportionate short stature, delayed bone age, and abnormal body composition. Causes include pituitary hypoplasia, genetic defects, midline cranial defects, intracranial tumors, radiation therapy, or idiopathic hypopituitarism.

Alternate Names:
Pediatric GH Deficiency; Growth Hormone Deficiency in Children

Pediatric Health

The physical, mental, emotional, and social well-being of infants, children, and adolescents. Care includes prevention, vaccinations, growth and development checks, treatment of illness, and support for the child and family.

Pediatric Heart Surgery

An operation to repair or improve a child's heart or major blood vessels, often for a congenital heart defect. Procedures may close abnormal openings, improve blood flow, or replace a valve; recovery and risks depend on the defect and operation.

Pediatric Hepatitis A

An acute liver infection caused by hepatitis A virus, usually spread through contaminated food or water or close contact with an infected person. It often resolves without chronic infection, though symptoms and severity vary.

Alternate Names:
Childhood Hepatitis A; Pediatric HAV Infection; Acute Viral Hepatitis A in Children

Pediatric Hepatitis B

A liver infection caused by hepatitis B virus, often acquired at birth or in early childhood. Infection acquired in infancy is more likely to become chronic; chronic infection can damage the liver over time.

Alternate Names:
Childhood Hepatitis B

Pediatric Hepatitis C

Infection with the hepatitis C virus (HCV) in infants and children, primarily acquired vertically through perinatal maternal-fetal transmission or through parenteral exposure. Modern direct-acting antiviral (DAA) regimens provide high cure rates in pediatric cohorts.

Alternate Names:
Childhood Hepatitis C; Pediatric HCV Infection

Pediatric Hypercholesterolemia

Elevated circulating total cholesterol or low-density lipoprotein (LDL) levels in children and adolescents. Causes include familial hypercholesterolemia, obesity, insulin resistance, endocrine disorders, or dietary factors.

Alternate Names:
Childhood Hyperlipidemia; Pediatric Dyslipidemia

Pediatric Hypertension

Persistently high blood pressure in a child or adolescent. Diagnosis depends on repeated, properly measured readings interpreted using age, sex, height, or age-specific clinical thresholds; kidney and heart conditions are among possible causes.

Alternate Names:
Childhood Hypertension; Pediatric High Blood Pressure

Pediatrician

A medical doctor who specializes in the health and medical care of children from birth through adolescence (typically up to age 16-18).

Alternate Names:
Paediatrician

Pediatric Limp

An abnormal walking pattern or refusal to walk in a child. Causes range from minor injury and transient synovitis to infection, fracture, inflammatory disease, neuromuscular disease, or malignancy; fever, severe pain, swelling, or inability to bear weight can indicate serious disease.

Pediatric Meningitis

Inflammation or infection of the coverings of a child's brain and spinal cord. Fever, headache, stiff neck, vomiting, light sensitivity, confusion, seizures, or a rash may occur; babies may be irritable, feed poorly, or have a bulging soft spot. It can progress quickly and is life-threatening.

Pediatric Midline Catheters

Peripheral intravenous catheters in children whose tips end in a vein of the upper arm rather than a central vein. They are used when longer access is needed than a short peripheral IV can provide; suitable solutions and duration depend on the device and clinical need.

Pediatric Myocarditis

Acute or chronic inflammation of the myocardium in infants and children, most commonly triggered by viral infections (enteroviruses, adenovirus, parvovirus B19, SARS-CoV-2) or post-infectious autoimmune responses. Manifests as tachypnea, poor feeding, tachycardia, cardiomegaly, arrhythmias, or acute congestive heart failure.

Alternate Names:
Childhood Myocarditis; Pediatric Myocardial Inflammation

Pediatric Nasal Congestion

A stuffy or runny nose in a child is usually caused by a viral infection or allergy; breathing difficulty, dehydration, prolonged fever, or symptoms in an infant can indicate a more serious illness.

Pediatric Nursing

Pediatric nursing provides age-appropriate care to infants, children, and adolescents, accounting for growth, development, family involvement, communication, safety, and medication differences.

Pediatric Obesity

Excess body fat in a child or adolescent, assessed by comparing weight and height with other children of the same age and sex. It can affect breathing, joints, blood sugar, sleep, and emotional wellbeing; stigma can worsen emotional and social effects.

Pediatric Obstructive Sleep Apnea

Repeated narrowing or blockage of a child's throat during sleep, causing pauses in breathing, snoring, restless sleep, daytime behavior or attention problems, and sometimes poor growth. Enlarged tonsils or adenoids are common causes.

Pediatric Ophthalmology

The ophthalmology subspecialty concerned with eye and vision disorders in infants, children, and adolescents. It includes strabismus and amblyopia, congenital and developmental eye conditions, refractive disorders, and other diseases affecting vision during childhood.

Alternate Names:
Pediatric Ophthalmology and Strabismus

Pediatric Orthopedics

The branch of orthopedics focused on bone, joint, muscle, and movement problems in infants, children, and adolescents. It includes developmental conditions, limb differences, fractures, sports injuries, spine deformities, and growth-related disorders.

Pediatric Pancreatitis

Acute or chronic inflammatory disease of the pancreas in infants, children, and adolescents. Common pediatric etiologies include abdominal blunt trauma, viral infections (mumps, Coxsackie, EBV), medications, systemic illness, gallstones, and genetic mutations (*PRSS1*, *SPINK1*, *CFTR*).

Alternate Names:
Childhood Pancreatitis; Pediatric Pancreatic Inflammation

Pediatric Pneumonia

Infection or inflammation of the lung tissue in an infant, child, or adolescent. It may cause cough, fever, fast or difficult breathing, chest pain, or low oxygen and can be caused by bacteria, viruses, fungi, or aspiration.

Pediatric Poisoning

Harmful exposure to a medicine, chemical, plant, gas, or other toxic substance in an infant, child, or adolescent. Effects depend on the agent, amount, route, formulation, age, and time since exposure and may range from no symptoms to severe illness.

Pediatric Ptosis

Drooping of the upper eyelid in an infant or child, present from birth or acquired later. If it blocks vision, it can interfere with visual development; assessment depends on its cause and severity.

Alternate Names:
Pediatric Blepharoptosis; Childhood Drooping Eyelid

Pediatric Pump Gastrostomy Feeding

Continuous or intermittent enteral nutrition delivered to pediatric patients through a gastrostomy tube using an electronic feeding pump. Provides precise, controlled flow rates and volumes for children who cannot tolerate bolus feeding.

Alternate Names:
Pediatric Enteral Pump Feeding; Pediatric G-Tube Pump Feeding; Continuous Enteral Infusion

Pediatric Pyloric Stenosis

Alternate name; see *Hypertrophic Pyloric Stenosis* and *Pyloric Stenosis*.

Pediatric Rash Evaluation

Assessment of a rash in an infant or child, considering its appearance, location, timing, associated symptoms, and possible infectious, allergic, inflammatory, or other causes. Fever, severe illness, breathing difficulty, or purple spots that do not fade when

pressed can indicate a serious condition.

Pediatric Rehabilitation

Therapy that helps children with conditions present from birth, injuries, illness, or developmental disabilities gain skills and independence. Care considers growth, family goals, school participation, communication, movement, learning, and daily activities.

Pediatrics

The medical specialty concerned with the physical, developmental, emotional, and social health of infants, children, and adolescents, extending into young adulthood in some settings. Pediatric care includes health promotion and prevention, and diagnosis and treatment of acute and chronic illness, with attention to growth and development.

Alternate Names:
Paediatrics

Pediatric Sepsis

Sepsis occurring in an infant, child, or adolescent, in which the body's response to infection causes organ dysfunction. Signs vary with age and may include abnormal temperature, breathing difficulty, unusual sleepiness, poor feeding, or reduced urine.

Pediatric Shock

A dangerous condition in which a child's organs do not receive enough blood flow or oxygen. Causes include severe fluid loss, infection, heart failure, or a blockage. Early signs may include a fast heartbeat, pale or cold skin, unusual sleepiness, confusion, or little urine.

Pediatric Skin Tumors

Skin growths in children include harmless birth-related or blood-vessel growths, cysts, and, rarely, cancer. Rapid growth, bleeding, ulceration, color change, or pain can occur in significant lesions.

Pediatric Sleep Apnea

Pediatric sleep apnea is repeated interruption or reduction of breathing during sleep, commonly from enlarged tonsils or adenoids, causing snoring, restless sleep, behavior changes, or impaired growth.

Pediatric Total Parenteral Nutrition

Intravenous nutrition for a child who cannot receive enough nutrients through the digestive tract. It requires careful monitoring of blood sugar, salts, liver function, infection, and catheter complications.

Pediatric Toxicology

The medical study and treatment of poisoning or harmful exposure in children. Common exposures include medicines, iron, household chemicals, and plants. Symptoms vary with the substance and may include vomiting, sleepiness, breathing problems, seizures, or burns; severe exposures can progress rapidly.

Pediatric Volvulus

Twisting of a loop of intestine around its mesentery, causing obstruction and potentially loss of blood supply. In children it is often related to intestinal malrotation and is a surgical emergency when acute.

Pedicle

A pedicle is a stalk or attachment containing vessels, nerves, or other supporting structures, such as the base of a polyp, flap, or vertebral arch.

Pedicle Skin Graft

A piece of skin moved to cover a wound while remaining attached to its original blood supply through a tissue bridge.

Pediculosis

Infestation with lice, small insects that live on the scalp, body, or pubic hair. It causes itching and spreads mainly through close contact or shared personal items.

Pediculosis and Pthiriasis (Lice Infestation)

Infestation of scalp, body, or pubic hair by lice. It may cause itching, visible lice or attached eggs, excoriations, or secondary skin infection; the affected site and louse species determine the clinical features.

Pediculosis Capitis

Alternate name; see *Head Lice*.

Pediculus Humanus Capitis

A blood-sucking parasite commonly known as the louse (plural, lice) that can cause an itchy scalp; infestations are highly contagious and especially common in school-age children.

Pedigree

A family diagram that shows relationships and who has a particular trait or disease. Doctors and genetic counselors use it to look for inheritance patterns and estimate the chance that relatives may be affected.

Pedodontics

The branch of dentistry concerned with infants, children, and adolescents.

Pedophilia

A continuing sexual interest in children who have not reached puberty. The term describes an interest and is not synonymous with pedophilic disorder; sexual contact with a child is abuse and cannot be consensual.

Pedophilic Disorder

A mental-health disorder involving recurrent, intense sexual fantasies, urges, or behaviors toward children who have not reached puberty. Diagnostic criteria include clinically significant distress or impairment, or acting on the urges, together with required age and duration criteria.

Pedunculate

Pedunculate describes a structure, lesion, or polyp attached by a narrow stalk rather than a broad base.

Pedunculated

Attached to the skin or another surface by a narrow stalk, rather than having a broad base.

Peeling Skin

Loss or shedding of the outer layer of skin, which may result from dryness, sunburn, irritation, allergy, infection, inflammation, or a systemic illness.

PEEP

Pressure kept in the airways at the end of breathing out, usually by a ventilator or breathing machine. It helps keep the lung air sacs open and improve oxygen levels, but too much pressure can injure the lungs or lower blood flow.

PEF

PEF, or peak expiratory flow, is the fastest airflow produced during a forceful exhalation and is used chiefly to monitor variable airway obstruction such as asthma.

PEG Tube

A flexible feeding tube placed through the abdominal wall into the stomach with camera guidance. It provides nutrition, fluids, or medicines when swallowing is unsafe or inadequate, and requires regular skin care.

Pel-Ebstein Fever

A historical term for a pattern of fever that rises and falls in cycles and has been described in Hodgkin lymphoma. The association and diagnostic value are uncertain; the pattern is not a reliable sign of lymphoma.

Alternate Names:
Pel-Ebstein Pattern; Cyclical Lymphoma Fever

Peliosis Hepatis

A usually uncommon condition in which multiple blood-filled spaces form within the liver. It may be linked to medicines, hormones, toxins, infections, cancer, or other diseases. It often causes no symptoms but can rarely cause liver failure or life-threatening bleeding if a space ruptures.

Pelizaeus-Merzbacher Disease

A rare inherited disorder in which the brain does not make myelin, the protective covering around nerve fibers, normally. It usually begins in infancy with poor muscle tone, unusual eye movements, and delayed development, followed by stiffness, bal-

ance problems, and increasing movement difficulty. There is no cure; care supports movement, feeding, breathing, and communication.

Alternate Names:
PMD; PLP1-Related Hypomyelinating Leukodystrophy

Pellagra

A disease caused by too little niacin, leading to skin changes, diarrhea, and problems with thinking.

Pellet

A pellet is a small compacted mass of medication, material, or tissue; drug pellets may be formulated for implantation or controlled release.

Pelvic

Relating to the pelvis, the bony ring and associated organs, muscles, vessels, and nerves in the lower trunk.

Pelvic Binder

A circumferential device applied around the pelvis to reduce motion and hemorrhage from suspected unstable pelvic-ring injury. It is centered over the greater trochanters as part of hemorrhage control and definitive injury management.

Pelvic Bone

One of the two hip bones forming the sides and front of the pelvis. Each hip bone joins the sacrum and supports the trunk while protecting pelvic organs.

Pelvic Cavity

The space inside the lower part of the body enclosed by the pelvic bones. It contains the bladder, rectum, reproductive organs, blood vessels, nerves, and supporting muscles.

Pelvic Congestion

Enlargement or pooling of blood in the veins of the pelvis, which may cause pelvic pressure, discomfort, or pain.

Pelvic Congestion Syndrome

Chronic pelvic pain associated with enlarged or inefficient pelvic veins, often worsening with prolonged standing, before menstruation, or after intercourse. Diagnosis requires evaluation for other causes of pelvic pain and may involve pelvic imaging; treatment is individualized by gynecology or vascular specialists.

Pelvic CT Scan

Computed tomography of the pelvis using x-rays and computer reconstruction to evaluate bones, organs, soft tissues, masses, trauma, infection, and bleeding.

Pelvic Diaphragm

The group of muscles and supporting tissue forming the floor of the pelvis. It supports the bladder, bowel, and reproductive organs and helps control urine and stool.

Pelvic Examination

Clinical inspection and palpation of the external genitalia, vagina, cervix, uterus, and adnexa to evaluate bleeding, pain, discharge, lesions, pregnancy-related findings, or infection.

Pelvic Exenteration

Very extensive surgery removing some pelvic organs and nearby tissues, usually for selected cancers that have returned or grown locally when less extensive treatment cannot control them. Recovery is prolonged and reconstruction may be needed.

Pelvic Floor

A group of muscles and connective tissues supporting the pelvic organs and controlling urinary and fecal continence.

Pelvic Floor Dysfunction

Weakness, overactivity, poor coordination, or injury of the muscles and connective tissues supporting the bladder, bowel, and reproductive organs. Symptoms may include urinary or fecal problems, pelvic pain, constipation, pain with sex, or pelvic organ prolapse; assessment may involve pelvic-health clinicians.

Pelvic Floor Health And Disorders

The pelvic floor is a group of muscles and supporting tissues that hold the bladder, bowel, and reproductive organs in place and help control urine, stool, and sexual function. Weakness, tightness, injury, or poor coordination can cause pain, leakage, constipation, or prolapse.

Pelvic Floor Muscles

Muscles at the bottom of the pelvis that support the bladder, bowel, and reproductive organs and help control urine, stool, and sexual function.

Pelvic Floor Muscle Training Exercises

Pelvic floor muscle exercises strengthen the muscles supporting the bladder, bowel, and reproductive organs and may improve selected forms of urinary or fecal leakage.

Pelvic Fracture

A break in one or more bones of the pelvic ring, often caused by major trauma but sometimes occurring in weakened bone. The injury may be stable or unstable and can be associated with bleeding or damage to nearby organs, nerves, or blood vessels.

Pelvic Girdle

The ring of bones connecting the lower limbs to the trunk, consisting of the hip bones, sacrum, and associated joints.

Pelvic Girdle Pain In Pregnancy

Pain around the front or back of the pelvis during pregnancy. It may involve the joint at the front of the pelvis or the joints at the back, and can spread to the hips or thighs. Walking, climbing stairs, turning in bed, or moving the legs apart may make the pain worse.

Pelvic Infection

An infection involving pelvic organs or tissues, including pelvic inflammatory disease, urinary infection, abscess, or postoperative infection.

Pelvic Inflammatory Disease

An infection of the upper reproductive organs, including the uterus, fallopian tubes, ovaries, or nearby tissues. It usually develops when bacteria spread upward from the vagina or cervix; chlamydia and gonorrhea are common causes, but other bacteria can also be involved. Symptoms may include lower-abdominal pain, unusual discharge or bleeding, or pain during sex, although some people have few or no symptoms. Scarring may cause long-term pelvic pain, infertility, or ectopic pregnancy.

Pelvic Inflammatory Disease (PID)

Alternate name; see *Pelvic Inflammatory Disease*.

Pelvic Inlet

The upper opening of the bony birth canal, formed by the lower spine, hip bones, and front pelvic joint. Its shape and size help determine how a baby can pass through the pelvis during childbirth.

Pelvic Kidney

A kidney that remains in the pelvis rather than ascending to its usual lumbar position during development; it may be asymptomatic or associated with abnormal drainage, stones, infection, or vascular anatomy.

Pelvic Laparoscopy

A minimally invasive procedure using a camera inserted through small abdominal incisions to inspect and treat pelvic organs and structures.

Pelvic Lymphadenectomy

Pelvic lymphadenectomy is surgical removal of lymph nodes in the pelvis to check for or treat spread of cancer.

Pelvic Mass

A lump or abnormal enlargement in the pelvis arising from reproductive, urinary, gastrointestinal, lymphatic, or other tissues.

Pelvic Neoplasm

A pelvic neoplasm is an abnormal growth in the

pelvis, arising from organs, bones, soft tissues, or lymph nodes; it may be benign or malignant.

Pelvic Organ Prolapse

Dropping or bulging of the bladder, uterus, rectum, or nearby tissue into or toward the vagina because supporting muscles and tissues have weakened. It may cause pressure, a vaginal bulge, urinary or bowel problems, or discomfort during sex.

Pelvic Organ Prolapse Quantification System

A standard examination used to measure how far the vagina, uterus, bladder, or rectum has moved downward. Measurements are taken while bearing down and describe the severity of prolapse to help plan treatment.

Alternate Names:
POP-Q System; POP-Q Classification

Pelvic Outlet

The lower opening of the bony pelvis and birth canal, bordered by the pubic bone, sitting bones, and tailbone. Its shape and size affect passage through the pelvis during childbirth.

Pelvic Pain

Pain in the lower abdomen, pelvis, or area between the genitals and anus. Causes include reproductive, urinary, bowel, muscle, nerve, and other conditions. Sudden severe pain, pregnancy, fever, fainting, vomiting, or heavy bleeding can indicate an emergency.

Pelvic Pain During Early Pregnancy

Pain in the pelvis or lower abdomen during early pregnancy, caused by normal uterine changes, miscarriage, ectopic pregnancy, ovarian disease, infection, or other conditions. Severe or one-sided pain, shoulder pain, fainting, fever, or vaginal bleeding can indicate an emergency.

Pelvic Ring Fracture

A high-energy traumatic skeletal disruption of the pelvic ring structure (involving the sacrum, sacroiliac joints, and pubic rami), classified by Young-Burgess mechanism (lateral compression, anteroposterior compression, vertical shear); frequently complicated by life-threatening retroperitoneal venous plexus hemorrhage.

Pelvic Spleen

A spleen located unusually low in the abdomen or pelvis because its supporting tissues are loose or absent. It may feel like a pelvic lump and can twist, lose its blood supply, or rupture, causing sudden pain and internal bleeding.

Pelvic Ultrasound

An ultrasound imaging examination of the female or male pelvic organs, including the uterus, ovaries, bladder, or prostate; see *Transabdominal Pelvic Ultrasound* and *Transvaginal Ultrasound*.

Pelvic Viscus

An organ located in the pelvic cavity, such as the bladder, rectum, uterus, ovaries, prostate, or related structures.

Pelvimeter

An instrument used to estimate the size and shape of the pelvis, especially during obstetric assessment. Pelvic measurements are only one part of judging whether vaginal birth is likely and are interpreted with the clinical situation.

Pelvimetry

Measurement of the size and shape of the pregnant person's pelvis, usually for selected childbirth concerns. Results are considered with the baby's position, size, labor progress, and overall clinical situation.

Pelvis

The bony ring and associated soft tissues at the base of the trunk, connecting the spine with the lower limbs.

Pelvis MRI Scan

Magnetic resonance imaging of the pelvis used to evaluate organs, muscles, bones, joints, nerves, blood vessels, and soft-tissue disease without ioniz-

ing radiation.

Pelvis X-Ray

Plain radiographic imaging of the pelvic bones and hips used to evaluate fractures, alignment, arthritis, deformity, and selected bone lesions.

Pemberton Sign

Facial redness or bluish discoloration, neck-vein swelling, or breathing difficulty that appears when both arms are raised. It may suggest that an enlarged thyroid or another chest mass is pressing on major veins or the airway.

Pemberton'S Sign

Facial redness or bluish discoloration, neck-vein swelling, or breathing difficulty that appears when both arms are raised. It may suggest that an enlarged thyroid or another chest mass is pressing on major veins or the airway.

Pemetrexed

Pemetrexed is a folate-antimetabolite chemotherapy drug that inhibits several enzymes involved in nucleotide synthesis, used especially for mesothelioma and nonsquamous non-small-cell lung cancer; folic acid and vitamin B12 reduce toxicity.

Pemetrexed Disodium

The disodium salt of pemetrexed, an antifolate chemotherapy medicine used with other treatment for selected non-small-cell lung cancer and mesothelioma.

Pemoline

Pemoline is a stimulant formerly used for attention-deficit disorders; serious liver toxicity led to withdrawal or severe restriction in many countries.

Pemphigoid

A group of immune-system diseases that cause firm, often itchy blisters when antibodies attack the deeper layers of skin or mucous membranes. The type, location, age, and associated illness determine treatment.

Pemphigoid Gestationis

An autoimmune blistering disease of pregnancy characterised by intensely pruritic urticarial plaques and tense vesicles or bullae, typically arising in the second or third trimester around the umbilicus and spreading to the trunk and extremities.

Pemphigus

A group of autoimmune blistering diseases caused by antibodies that disrupt adhesion between epidermal cells. This produces fragile blisters and erosions on the skin, mucous membranes, or both, depending on the type.

Pemphigus Erythematosus

A localized superficial pemphigus variant with fragile blisters, erosions, and crusted plaques, often in seborrheic areas such as the face, scalp, and upper chest. Autoantibodies disrupt epidermal cell adhesion; diagnosis generally requires biopsy and immunofluorescence.

Pemphigus Foliaceus

An autoimmune blistering disease in which antibodies, usually against the skin protein desmoglein 1, loosen connections between cells in the upper epidermis. This produces very superficial, fragile blisters that break easily and leave scaly or crusted erosions, often on the scalp, face, or trunk. The disease usually affects the skin and spares mucous membranes, unlike pemphigus vulgaris.

Alternate Names:
Brazilian Pemphigus Foliaceus; Endemic Pemphigus Foliaceus; Fogo Selvagem; South American Pemphigus

Pemphigus Vulgaris

A rare autoimmune blistering disease that often begins with painful sores in the mouth and can also cause fragile blisters on the skin or other moist linings. The blisters break easily, leaving raw areas that can lead to infection, fluid loss, or difficulty eating and drinking.

Penbutolol

Penbutolol is a beta-blocker formerly used for high

blood pressure; it can slow the heart rate and worsen asthma in susceptible people.

Pencil Eraser Swallowing

Swallowing a small pencil eraser usually causes little poisoning risk, but it may lodge in the airway or digestive tract. Choking, breathing difficulty, persistent vomiting, or severe pain can indicate obstruction or injury.

Pencil Swallowing

Swallowing a pencil or part of one can injure the mouth, throat, or digestive tract and may block the airway. Breathing trouble, bleeding, or severe pain can indicate a serious injury or obstruction.

Pendred Syndrome

An autosomal recessive genetic disorder caused by biallelic mutations in the SLC26A4 gene encoding the anion exchanger pendrin, characterized by congenital bilateral sensorineural hearing loss, temporal bone malformations (enlarged vestibular aqueduct), and euthyroid or hypothyroid multinodular goiter.

Alternate Names:
Pendred's Syndrome; Goiter and Sensorineural Deafness Syndrome

Pendular

Moving or swinging freely like a pendulum; pendular nystagmus has a similar speed in both directions.

Pendular Nystagmus

Involuntary, rhythmic, sinusoidal oscillations of the eyes in which the movements in both directions occur at equal velocity without distinct fast or slow phases. It most commonly arises from congenital visual deprivation, optic nerve abnormalities, or demyelinating brainstem diseases.

Pendulous

Pendulous means hanging loosely from a supporting structure, as in a pedunculated lesion, drooping tissue, or an organ suspended by a stalk.

Penetrance

The proportion of people with a particular gene change who develop the related trait or condition. Penetrance may be complete, incomplete, or influenced by other factors.

Penetrating Abdominal Trauma

Injury to the abdomen caused by a projectile, sharp object, or other penetrating force. It may damage abdominal organs or blood vessels and requires urgent assessment for internal bleeding or organ injury; management depends on the mechanism, examination, stability, and imaging findings.

Penetrating Wounds

Injuries caused when an object enters the skin and damages underlying tissue. They may injure blood vessels, nerves, organs, or bones and can involve bleeding, contamination, retained objects, or infection.

Penicillin

A family of antibiotics that kill bacteria by stopping them from making cell walls. Different types treat different bacterial infections; they do not work against viruses. Allergy, resistance, and kidney problems can affect the choice of medicine.

Penicillin Allergy

An immune reaction to penicillin antibiotics that may cause rash, swelling, breathing difficulty, or anaphylaxis.

Alternate Names:
Penicillin Hypersensitivity; Beta-Lactam Allergy

Penicillin G

Penicillin G is an injectable penicillin antibiotic used for infections such as syphilis and selected streptococcal or other susceptible bacterial infections.

Penicillin V

Penicillin V is an oral penicillin antibiotic used for selected susceptible infections, including some throat and dental infections.

Penicillium

A genus of molds that includes species used to make medicines and foods and species that can cause allergy or opportunistic infection.

Penile

Penile means relating to the penis, the external male organ involved in urination and sexual reproduction.

Penile Adhesions

Abnormal attachment of penile skin to the glans, often after circumcision or during childhood. They may cause irritation or conceal part of the glans and are assessed and treated according to severity.

Penile Augmentation

A cosmetic or reconstructive procedure intended to increase penile length, girth, or both. Techniques and results vary, and complications may include scarring, deformity, infection, altered sensation, or erectile problems.

Penile Cancer

An uncommon cancer of the penis, usually arising from surface skin cells. It may appear as a persistent sore, lump, bleeding area, or skin change; HPV, smoking, foreskin problems, and chronic inflammation can increase risk.

Penile Disease

A disorder affecting the penis, including infection, inflammation, erectile or structural disease, trauma, skin disease, or malignancy.

Penile Edema

Swelling of the penis caused by inflammation, infection, trauma, allergic reaction, impaired lymphatic drainage, or a constricting ring or retracted foreskin. Sudden painful swelling with an irreducible foreskin is an emergency.

Penile Erection

Stiffening and enlargement of the penis when blood fills erectile tissue and is temporarily held there. It can occur with sexual or other stimulation; persistent difficulty getting or keeping an erection may be erectile dysfunction.

Penile Fracture

A tear in the tough tissue around the erectile chambers, usually after an erect penis is bent forcefully. It may cause a popping sound, sudden loss of erection, swelling, bruising, or blood at the urinary opening.

Penile Hygiene

Routine cleaning and drying of the penis and foreskin, with gentle retraction only when it moves freely and replacement afterward. Good hygiene helps reduce irritation and infection without harsh soaps or forceful retraction.

Penile Implant

A surgically implanted device used to produce penile rigidity in selected people with erectile dysfunction that has not responded to other treatments.

Penile Infection

Infection of the penis or foreskin caused by bacteria, fungi, viruses, or parasites, producing pain, redness, discharge, sores, or swelling.

Penile Intraepithelial Neoplasia

Abnormal surface cells on the penis that have not grown into deeper tissue. It may appear as a lasting red, white, scaly, or wart-like patch on the head or foreskin and can be linked to HPV or long-term inflammation. Some cases may develop into penile cancer.

Alternate Names:
PeIN

Penile Intraepithelial Neoplasia (PeIN or PIN)

Alternate name; see *Penile Intraepithelial Neoplasia*.

Penile Leukoplakia

A persistent white patch on penile skin or mucosa that may reflect irritation, inflammation, or a precancerous disorder.

Penile Lichen Sclerosus

A chronic inflammatory and sclerosing disorder of the penile skin and foreskin, causing pale tight skin, itching, fissures, pain, or narrowing. It can scar the foreskin or urethral opening and requires treatment and surveillance for complications.

Penile Prosthesis

An implanted device used to produce an erection when erectile dysfunction has not improved with other treatments. It may be inflatable or bendable. Surgery can cause infection, bleeding, pain, device failure, or erosion into nearby tissue.

Penile Torsion

Rotation of the penis around its longitudinal axis, usually a congenital condition in which the glans or urethral opening is rotated. Symptomatic or marked torsion may require urologic evaluation and surgical correction.

Penile Trauma

Injury to the penis caused by blunt force, bending, penetration, crushing, burns, bites, or medical instruments. It may damage the skin, erectile tissue, blood vessels, or urethra. A penile fracture is a tear in the covering of the erectile tissue, usually after forceful bending of an erect penis. It may cause pain, swelling, bruising, bleeding, or difficulty passing urine.

Penis

An external genital organ that contains the outlet for urine and can deliver sperm during sexual activity. It becomes firm when filled with blood during an erection and contains sensitive tissue, skin, blood vessels, and nerves.

Penis Carcinoma

Penis carcinoma is cancer of the penis, most often arising from skin or squamous cells and sometimes linked to HPV infection.

Penis Pain

Penis pain may result from infection, injury, inflammation, urinary problems, or sexual conditions; severe pain, swelling, discharge, or inability to urinate can indicate a serious condition.

Penile Abscess

A pocket of pus in the skin or deeper tissue of the penis, usually caused by infection. It can cause a painful lump, redness, swelling, or fever.

Penile Cellulitis

A bacterial infection of the skin and soft tissue of the penis. It can cause spreading redness, warmth, pain, and swelling.

Penile Eczema

Eczema affecting the skin of the penis, often causing itching, dryness, redness, or soreness; see *Eczema*.

Penile Fibrosis

Scarring within the erectile tissue or its covering. It may cause a firm area, bending during erection, shortening, or difficulty getting or keeping an erection. Peyronie disease is a form of fibrosis affecting the covering of the erectile chambers.

Penile Hemangioma

A usually noncancerous growth of blood vessels in the skin or tissue of the penis. It may appear as a red, blue, or purple mark or lump and may be present from birth.

Penile Hematoma

A collection of blood under the skin or within penile tissue, usually after an injury. It causes bruising and swelling and can occur with or without a tear in the covering of the erectile chambers.

Penile Lymphangitis

Inflammation or swelling of lymph vessels in the penis. A firm cord near the rim of the glans may be a benign form called sclerosing lymphangitis; this differs from penile Mondor disease, which affects a vein.

Penile Lymphedema

Persistent swelling of the penis caused by poor

drainage of lymph fluid. It may be present from birth or develop after infection, surgery, radiation, or blockage of lymph vessels.

Penile Lymphangioma

A usually noncancerous growth or malformation of lymph vessels in the penis. It may appear as small clear or skin-colored bumps or a soft swelling.

Penile Melanoma

A rare cancer of pigment-producing cells on the penis. It may appear as a changing dark or unevenly colored spot, lump, or sore; some melanomas have little or no color.

Penile Melanosis

Flat brown or black patches on penile skin caused by extra pigment. These patches are usually harmless, but their appearance can overlap with melanoma.

Penile Mondor Disease

A usually temporary clot and inflammation in a surface vein along the penis, most often the superficial dorsal vein. It may feel like a tender, firm cord on the shaft and is different from sclerosing lymphangitis, which affects a lymph vessel.

Alternate Names:
Penile Mondor's Disease; Penile Mondor's Disease

Penile Papules

Small bumps on the penis; this broad description has several causes. Pearly penile papules are a harmless normal variation arranged around the rim of the glans; see *Pearly Penile Papules*.

Penile Psoriasis

Psoriasis affecting penile skin, which may appear as smooth, red or darker patches with little scale; see *Psoriasis*.

Primary Amoebic Meningoencephalitis

Acute, severe infection of the brain and central nervous system caused by *Naegleria fowleri*. See *Primary Amebic Meningoencephalitis*.

Pollinosis

Allergic reaction in the upper respiratory tract triggered by inhalation of airborne plant pollens. See *Hay Fever*.

Pneumocystis jirovecii

Opportunistic fungal pathogen that causes severe pneumonia in immunocompromised individuals. See *Pneumocystis Pneumonia*.

Plasmodium falciparum

Protozoan parasite responsible for the most severe and life-threatening form of human malaria, transmitted by mosquitoes. See *Malaria*.

PNS

Group of rare neurological disorders triggered by an immune response to an underlying cancer rather than direct tumor invasion. See *Paraneoplastic Syndromes Of The Nervous System*.

PLEVA

Uncommon inflammatory skin disease causing recurrent eruptions of reddish papules that develop into crusted blisters. See *Pityriasis Lichenoides Et Varioliformis Acuta*.

PICA Syndrome

Neurological disorder caused by blockage of the posterior inferior cerebellar artery, resulting in vertigo, ataxia, and sensory loss. See *Wallenberg Syndrome*.

Psoriasis of the Penis

Alternate name; see *Psoriasis*.

Penile Vitiligo

Loss of skin pigment in patches on the penis; see *Vitiligo*.

Penile Calciphylaxis

A rare form of calciphylaxis affecting penile skin, in which calcium builds up in small blood vessels and blocks blood flow. It can cause severe pain, ulcers, or tissue death, usually in people with advanced kidney disease; see *Calciphylaxis*.

Penile Frenular Tear

A split or cut in the short band of tissue connecting the underside of the glans to the foreskin. It can cause pain and bleeding, especially during erection; a short frenulum can make tearing more likely.

Alternate Names:
Frenular Tear

Penoscrotal Transposition

A congenital difference in which the penis and scrotum are positioned abnormally relative to each other, often associated with hypospadias or other genital and urinary anomalies.

Pentad Of TTP

The five findings once considered typical of thrombotic thrombocytopenic purpura: low platelets, destruction of red blood cells, neurologic symptoms, kidney problems, and fever. Most patients do not have all five, and laboratory testing identifies the disorder.

Pentalogy of Cantrell

A rare congenital thoracoabdominal malformation syndrome characterized by the constellation of five midline defects: midline supraumbilical abdominal wall defect (omphalocele), lower sternal cleft defect, anterior diaphragmatic defect, diaphragmatic pericardial defect, and congenital intracardiac anomalies (such as ectopia cordis and VSD).

Alternate Names:
Thoracoabdominal Syndrome; Cantrell Pentalogy

Pentamidine

An antimicrobial medicine used for certain parasitic infections and Pneumocystis pneumonia, with potentially serious side effects.

Pentamidine Isethionate

An antiprotozoal and antimicrobial drug used in selected cases of Pneumocystis pneumonia, leishmaniasis, trypanosomiasis, and other infections; toxicity includes hypoglycemia, kidney injury, and arrhythmia.

Pentatrichomonas Hominis

Pentatrichomonas hominis is a flagellated intestinal protozoan generally regarded as nonpathogenic; finding it in stool usually indicates exposure to fecal contamination.

Pentazocine

An opioid pain medicine with mixed agonist and antagonist effects, used for some moderate or severe pain. It can cause drowsiness, dependence, and slowed breathing and may trigger withdrawal in a person dependent on other opioids.

Pentazocine Overdose

Taking too much pentazocine, an opioid pain medicine, can cause extreme sleepiness, confusion, slow breathing, pinpoint pupils, seizures, or coma. Severe overdose can be fatal; naloxone can reverse opioid-related respiratory depression.

Pentetic Acid

A chelating compound that binds metal ions and is used in selected radiopharmaceuticals, contrast agents, or laboratory applications.

Pentobarbital Overdose

Exposure to an excessive amount of pentobarbital, a sedative, can severely slow brain activity and breathing, causing low blood pressure, coma, or death. Risk increases with alcohol or other sedatives.

Pentosan Polysulfate

A semi-synthetic sulfated polysaccharide used for selected bladder pain syndrome and historically as an anticoagulant; prolonged use can cause pigmentary maculopathy and bleeding.

Pentose

A pentose is a five-carbon sugar, including ribose in RNA and deoxyribose in DNA, and participates in nucleotide and carbohydrate metabolism.

Pentose Phosphate Pathway

A cell pathway that uses glucose to make NADPH,

which protects cells from chemical damage, and ribose, which helps build DNA and RNA. It is especially important in the liver and red blood cells.

Pentoxifylline

A methylxanthine derivative that improves red-cell flexibility and is used in some countries for peripheral vascular disease; benefit varies by condition.

Penumbra

Brain tissue surrounding an area of infarction that is functionally impaired but potentially salvageable if blood flow is restored promptly.

Peplomycin

Peplomycin is a bleomycin-related chemotherapy medicine used in some countries for selected cancers; lung toxicity is an important risk.

Peppermint

Mentha piperita, used as a flavoring and in some preparations for dyspeptic symptoms; concentrated oil can be hazardous.

Peppermint Oil Overdose

Swallowing a large amount of peppermint oil can cause nausea, vomiting, abdominal pain, dizziness, allergic reactions, seizures, or lung injury if aspirated.

Pepsin

A stomach enzyme that begins breaking proteins into smaller fragments. It is released as inactive pepsinogen and activated by stomach acid, helping digestion before food enters the small intestine.

Pepsin A

Pepsin A is a stomach protease activated by acid that begins digestion of dietary proteins into smaller peptides.

Pepsinogen

An inactive precursor released by gastric chief cells and converted to pepsin in acidic conditions.

Peptic Esophagitis

Inflammation and injury of the esophageal lining caused mainly by repeated gastroesophageal reflux of acid or bile, producing heartburn, chest discomfort, swallowing pain, or strictures.

Peptic Stricture

A circumferential, fibrotic luminal narrowing of the distal esophagus resulting from chronic, untreated acid peptic injury and collagen deposition in severe gastroesophageal reflux disease (GERD), presenting with progressive solid food dysphagia.

Alternate Names:
Esophageal Peptic Stricture

Peptic Ulcer

A sore or open wound that develops in the protective lining of the stomach (gastric ulcer) or the upper section of the small intestine (duodenal ulcer). It occurs when the stomach's protective mucus layer is weakened, allowing acidic digestive juices to erode the underlying tissue. The most common causes are chronic infection with *Helicobacter pylori* bacteria and regular use of nonsteroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen. Typical symptoms include a burning stomach pain, feeling bloated, nausea, and indigestion.

Alternate Names:
Gastric or Duodenal Ulcer; Peptic Ulcer Disease; PUD

Peptic Ulcer Bleeding

Haemorrhage caused by erosion of an artery or other blood vessel beneath a gastric or duodenal peptic ulcer. It is a common cause of upper gastrointestinal bleeding and may present with haematemesis, coffee-ground vomiting, melaena, or haemodynamic instability.

Peptide

A short chain of amino acids linked by peptide bonds. Peptides can form parts of proteins or act independently as hormones, neurotransmitters, immune signals, or medicines.

Alternate Names:
Peptides

Peptide Biosynthesis

The process by which cells make peptides, short chains of amino acids, by linking amino acids according to genetic instructions. Some peptides act as hormones, neurotransmitters, or signals between cells.

Peptide Bond

The chemical link joining two amino acids. Repeated peptide bonds form short peptides and long proteins, which cells use for structure, chemical reactions, communication, transport, and many other functions.

Peptide Hormone

A hormone made of amino acids that binds a cell-surface receptor and regulates processes such as metabolism, growth, reproduction, stress, and fluid balance.

Peptide Metabolism

The body's production, breakdown, and use of peptides. These processes regulate signaling molecules, hormones, digestion, and protein turnover.

Peptide Transport

The movement of peptides into, out of, or within cells and tissues through transport proteins, vesicles, or other cellular mechanisms. It helps control peptide signaling, digestion, and removal from the body.

Peptide Yy

Peptide YY (PYY) is a hormone released mainly by cells in the intestine after eating. It helps reduce appetite and slow movement of food through the digestive tract and is being studied in relation to body weight and metabolism.

Peptidoglycan

A strong mesh-like material forming much of the bacterial cell wall. Some antibiotics kill bacteria by preventing them from making or repairing this protective layer.

Peptococcaceae

A family of anaerobic gram-positive cocci found in the human microbiota and sometimes associated with infection.

Peptococcus

A genus of anaerobic gram-positive cocci that can contribute to mixed infections, especially in damaged or poorly oxygenated tissue.

Peptococcus Niger

An anaerobic gram-positive coccus found in the human microbiota and rarely associated with mixed infection.

Peptoniphilus

A genus of anaerobic gram-positive cocci found on skin and mucosal surfaces that can cause opportunistic infection.

Peptoniphilus Harei

An anaerobic gram-positive coccus occasionally recovered from wounds, abscesses, or other clinical specimens. An anaerobic Gram-positive bacterium sometimes found in wounds and abscesses, where it may contribute to mixed infections.

Peptoniphilus Indolicus

An anaerobic gram-positive coccus found in the genital and other microbiota that can occasionally contribute to mixed infection.

Peptostreptococcus

A group of anaerobic gram-positive cocci associated with dental, skin, abdominal, pelvic, and other mixed infections.

Peracetic Acid

A strong oxidizing disinfectant and sterilant used for equipment and surfaces; concentrated exposure irritates or burns skin, eyes, and airways.

Peracute

Peracute describes disease or a clinical event that develops extremely rapidly, often over minutes to

hours, with little time for adaptation or diagnosis.

Percentile

A percentile indicates the percentage of a reference population with a value below a measurement, such as height, weight, or test score.

Perception

The brain's process of organizing and interpreting sensory information into an experience of objects, events, body sensations, or the environment.

Perceptual

Relating to the process of detecting and interpreting sensory information.

Perceptual Disorder

A clinically significant disturbance in the way sensory information is interpreted, including altered visual, auditory, tactile, or body perception.

Perceptual Distortion

An inaccurate or altered interpretation of a real sensory stimulus, which may occur with neurologic disease, psychiatric illness, drugs, migraine, seizures, or sensory impairment.

Perceptual Masking

Reduction in the ability to detect or identify one sensory stimulus because another stimulus overlaps it in time, space, or processing.

PERC Rule

A checklist used by emergency clinicians for people already judged very unlikely to have a blood clot in the lungs. If all criteria are reassuring, testing may be avoided; it is not suitable for home use or for people with a strong suspicion of clot.

Alternate Names:
Pulmonary Embolism Rule-out Criteria; PERC Score

Percussion

Physical examination in which the body surface is tapped and the resulting sound or vibration is interpreted to estimate underlying air, fluid, or solid tissue.

Percussion Myotonia

A muscle that stays contracted briefly after it is tapped. This may occur in myotonic dystrophy, myotonia congenita, and some other muscle disorders; the finding is interpreted with the rest of the examination.

Percussion Note

The sound heard when the chest is gently tapped during examination. A normal lung sounds hollow; a dull sound may suggest fluid or infection, while an unusually hollow sound may suggest excess air or a collapsed lung.

Percutaneous

Performed through the skin, usually using a needle, catheter, wire, or other instrument. This approach can diagnose or treat disease while avoiding a larger open operation, but bleeding and infection remain possible.

Percutaneous Biopsy

Removal of tissue through the skin using a needle or other instrument, often guided by ultrasound, CT, or another imaging method.

Percutaneous Closure

Closing a heart or blood-vessel opening using a device delivered through a catheter inserted through the skin. It can avoid open surgery in selected patients but has procedure-related risks.

Percutaneous Coronary Intervention

A procedure that guides a thin tube through a blood vessel to a narrowed heart artery, then widens it with a balloon and often supports it with a stent. It can restore blood flow during a heart attack or treat selected severe coronary disease.

Alternate Names:
PCI; Coronary Angioplasty With Stent Placement

Percutaneous Discectomy

Percutaneous discectomy removes or decompresses part of a herniated spinal disc through a small needle or incision.

Percutaneous Diskectomy

A minimally invasive procedure removing part of a herniated spinal disk through a small skin opening to relieve nerve pressure.

Percutaneous Drainage

Placement of a needle or catheter through the skin to drain a fluid collection or obstructed body space, often with imaging guidance.

Percutaneous Electrical Nerve Stimulation

Electrical stimulation delivered through the skin to reduce pain signals.

Alternate Names:
PENS

Percutaneous Endoscopic Gastrostomy

Placement of a feeding tube through the abdominal wall into the stomach using a camera passed through the mouth. It may provide long-term nutrition, fluids, or medicines when swallowing is unsafe or inadequate.

Percutaneous Kidney Procedures

Procedures performed through a small needle or tube passed through the skin into or near the kidney. They may obtain a biopsy, drain infection or urine, or remove stones; bleeding, infection, urine leakage, or injury to nearby organs are possible.

Percutaneous Nephrolithotomy

A procedure that removes a large or complex kidney stone through a small opening in the back. A narrow instrument reaches the kidney, breaks or removes the stone, and may leave a temporary drainage tube; bleeding, infection, and injury are possible.

Percutaneous Nephrolithotripsy

Percutaneous nephrolithotripsy removes or fragments kidney stones through a tract made through the skin into the kidney, usually for larger or complex stones.

Percutaneous Nephrostomy

A procedure that places a drainage tube through the skin of the back into the kidney. Urine drains into a bag when the normal path to the bladder is blocked or needs to be bypassed. It may be used for stones, tumors, infection, or a narrowed urine passage and requires follow-up care.

Alternate Names:
PCN; Nephrostomy Tube Placement; Percutaneous Renal Drainage

Percutaneous Transhepatic Cholangiogram

A percutaneous transhepatic cholangiogram uses a needle through the liver to inject contrast into bile ducts for imaging and may guide drainage or stent placement.

Percutaneous Transhepatic Cholangiography

PTC is imaging of the bile ducts after contrast is injected through a needle passed through the skin and liver; drainage or stenting may follow.

Percutaneous Transluminal Coronary Angioplasty

Balloon-based treatment that widens a narrowed coronary artery, often followed by stent placement. A catheter procedure using balloon inflation to widen a narrowed coronary artery, sometimes followed by stent placement.

Alternate Names:
PTCA; Percutaneous Coronary Intervention

Percutaneous Umbilical Blood Sampling

A procedure that uses ultrasound to guide a needle into the umbilical cord and collect a fetal blood sample during pregnancy. It may investigate anemia, infection, or genetic problems and carries risks such as bleeding, infection, and pregnancy loss.

Perforant Pathway

A group of nerve fibers carrying information from a brain area involved in memory to the hippocampus. It helps the brain form and retrieve memories and can be affected in some dementias and seizure disorders.

Perforated Bowel

A perforated bowel is a hole through the intestinal wall allowing contents to leak into the abdomen, causing peritonitis and potentially life-threatening sepsis.

Perforated Eardrum

Alternate name; see *Ruptured Eardrum*.

Perforated Peptic Ulcer

A hole that an ulcer makes through the wall of the stomach or duodenum, the first part of the small intestine. Stomach or intestinal contents can leak into the abdomen and inflame or infect its lining (peritonitis), causing sudden, severe abdominal pain.

Alternate Names:
Perforated Ulcer

Perforating Folliculitis

A rare follicular disorder in which itchy keratotic papules develop around follicles and abnormal keratin is expelled through the epidermis. It is associated with chronic kidney disease, diabetes, and other systemic illness and may need treatment of both the skin and underlying disease.

Perforation

A hole or complete tear through the wall of an organ or tissue. It can release contents into surrounding spaces and cause severe infection, bleeding, or shock.

Perforation Of A Viscus

A hole through the wall of a hollow abdominal organ, such as the stomach, small intestine, or colon. Contents can leak into the abdomen and cause severe infection; ulcers, inflammation, poor blood flow, and injury are possible causes.

Performance

How effectively a person, organ, treatment, test, or system carries out a defined task. Examples include exercise performance, heart performance, test performance, and response to treatment.

Performance Anxiety

Anxiety about sexual performance that can interfere with sexual function.

Performance Status

A rating of how well a person can move, work, and perform daily activities while ill. Clinicians use it to estimate prognosis, decide whether some treatments are safe, and track change over time, especially during cancer care.

Perfusion

The flow of blood through the small vessels of a tissue or organ. Good perfusion supplies oxygen and nutrients and removes waste; poor perfusion can cause pain, weakness, tissue injury, or organ failure.

Perfusion Defect

An area receiving unusually little blood flow, identified by an imaging or function test. It may reflect a blocked artery, narrowed vessel, poor heart output, inflammation, or damaged tissue.

Perfusion Imaging

Imaging that shows how blood flows through an organ or tissue. It can help assess problems such as stroke, reduced heart blood flow, or tumor blood supply.

Perfusion PET

Positron-emission tomography that measures tissue blood flow using a suitable radioactive tracer. Cardiac perfusion PET can show reduced blood flow, viability, and sometimes the effects of treatment.

Perianal

Located around the anus; the term describes the skin, glands, pain, inflammation, abscesses, fistulas,

and other findings in that region.

Perianal Abscess

A localized collection of pus near the anus caused by infected anal glands or surrounding tissue, producing severe throbbing pain, swelling, fever, and sometimes a fistula.

Perianal Glands

Small glands near the anus that contribute secretions to the local tissue; obstruction or infection can contribute to perianal abscesses and fistulas.

Perianal Streptococcal Cellulitis

A bacterial skin infection around the anus, usually caused by group A Streptococcus. It may cause bright-red skin, pain, itching, discharge, or pain during bowel movements.

Periapical Abscess

An acute or chronic localized collection of pus at the apex of a tooth's root, arising from pulpal infection and necrosis (usually due to untreated dental caries or trauma).

Periapical Granuloma

A chronic inflammatory lesion at the apex of a tooth, usually resulting from pulpal necrosis and persistent apical infection. It may be asymptomatic and is diagnosed through clinical, radiographic, and sometimes histopathologic assessment.

Periappendiceal

Periappendiceal means located around the appendix, as in inflammation, fluid, an abscess, or fat stranding near the appendiceal tissue.

Periarteritis Nodosa

An older name for polyarteritis nodosa, a necrotizing vasculitis of medium-sized arteries that can cause skin, nerve, muscle, kidney, and abdominal ischemic symptoms without typical glomerulonephritis.

Periarticular

Periarticular means located around a joint, including nearby tendons, bursae, ligaments, capsule, and soft tissues rather than the joint surface itself.

Pericardial

Relating to the pericardium, the thin two-layered sac surrounding the heart. A small amount of fluid between its layers allows the heart to beat smoothly, while excess fluid or inflammation can interfere with heart function.

Pericardial Cavity

The thin fluid-containing space between the layers of the sac surrounding the heart. A small amount of fluid lets the heart move smoothly; excess fluid or blood can press on the heart and impair its pumping.

Pericardial Effusion

Excess fluid in the sac surrounding the heart. Its effect depends on the volume and rate of accumulation and on how well the pericardium can stretch. A rapidly accumulating effusion, even a small one, can impair heart filling and cause cardiac tamponade, while a slowly developing effusion may cause no symptoms.

Pericardial Effusion Etiology

Fluid around the heart may result from infection, cancer, kidney failure, low thyroid activity, autoimmune disease, heart injury, surgery, radiation, trauma, or medicines. Tests and the person's history help identify the cause.

Pericardial Fluid Analysis

Laboratory examination of fluid removed from the pericardial space, usually during pericardiocentesis. Cell counts, chemistry, cytology, cultures, and targeted tests help investigate infection, cancer, tuberculosis, inflammation, or bleeding; findings are interpreted with the clinical context.

Pericardial Fluid Culture

A microbiologic culture of fluid from the pericardial space to identify bacteria, fungi, or other organisms in suspected infectious pericarditis.

Pericardial Fluid Gram Stain

A microscopic stain of pericardial fluid that can rapidly suggest bacterial organisms, although a negative result does not exclude infection.

Pericardial Friction Rub

A scratchy or grating sound heard when the inflamed layers around the heart rub together. It can support a diagnosis of acute pericarditis, especially when heard along the left side of the breastbone, but it may come and go and is not present in every case.

Pericardial Inflammation

Alternate name; see *Pericarditis*.

Pericardial Knock

An extra early heart sound caused when a stiff, scarred sac around the heart suddenly stops the heart from filling. It may suggest constrictive pericarditis and is considered with other examination and test findings.

Pericardial Knock Sound

An early diastolic, high-pitched, sharp, knocking extra heart sound heard on auscultation in patients with chronic constrictive pericarditis. Occurs 0.08 to 0.12 seconds after aortic valve closure (S_2), earlier than a standard third heart sound (S_3), caused by the sudden abrupt cessation of ventricular filling when the expanding ventricular myocardium collides with the rigid, non-compliant, calcified pericardium.

Alternate Names:
Pericardial Knock; Constrictive Knock Sound

Pericardial Mesothelioma

A rare malignant tumor arising from the mesothelial lining around the heart, which can cause effusion, constriction, or impaired cardiac filling.

Pericardial Metastases

Cancer that has spread to the sac around the heart from another part of the body. It may cause inflammation, fluid or blood around the heart, breathlessness, chest discomfort, or impaired heart filling.

Pericardial Rub

Alternate name; see *Pericardial Friction Rub*.

Pericardial Stripping

Surgery to remove part or most of the thickened or scarred sac around the heart. It may relieve constrictive pericarditis, in which the stiff sac prevents the heart from filling normally; bleeding, rhythm problems, and other major surgical risks are possible.

Pericardial Tamponade

Alternate name; see *Cardiac Tamponade*.

Pericardial Wall

The layered tissue forming the protective sac around the heart. Its inner surfaces produce a small amount of lubricating fluid that lets the heart beat with little friction.

Pericardial Window

An operation that creates an opening in the sac around the heart so extra fluid can drain into a nearby space and be absorbed. It may prevent repeated fluid buildup and allow a tissue sample to be taken.

Alternate Names:
Subxiphoid Pericardiostomy; Pleuropericardial Window; Pericardiostomy

Pericardiectomy

Surgery to remove part or most of the sac around the heart when thickening or scarring prevents the heart from filling normally. It is major surgery and may improve constrictive pericarditis but carries bleeding and other serious risks.

Pericardiocentesis

A needle or catheter is used to remove fluid or blood from the sac around the heart, usually to relieve dangerous pressure or investigate an effusion. Imaging guidance improves safety, but bleeding, abnormal rhythm, organ injury, or infection can occur.

Pericardiostomy

A surgical opening made in the pericardium to drain fluid or prevent recurrent accumulation around the heart.

Pericarditis

Inflammation of the sac around the heart. It often causes sharp chest pain that worsens with deep breathing or lying down and improves when sitting up and leaning forward. It may be caused by infections, autoimmune diseases, heart injury, kidney disease, cancer, or some medicines. Severe cases can cause fluid buildup around the heart.

Alternate Names:
Pericardial Sac Inflammation

Pericardium

The sac around the heart and the roots of the major blood vessels. It has an outer fibrous layer and an inner serous membrane. The serous membrane folds into a layer lining the sac and a layer covering the heart. A small amount of fluid between these layers reduces friction as the heart beats.

Perichondritis

Inflammation or infection of the tissue covering cartilage, often affecting the outer ear after an injury or piercing. It can cause redness, swelling, and pain and may damage the ear's shape.

Perichondritis Of The Ear

Infection or inflammation of the auricular perichondrium, often after trauma, piercing, or surgery. Pseudomonas aeruginosa is an important cause; delayed treatment can produce cartilage necrosis and permanent deformity.

Perichondrium

A tough layer of tissue surrounding most cartilage. It supplies nutrients, contains cells that help cartilage grow and repair, and can become inflamed or infected, especially around the outer ear.

Pericoronitis

Infection or swelling of the gum around a tooth that has only partly come through, often a wisdom tooth. Trapped food and bacteria can cause pain, swelling, fever, or trouble opening the mouth. The infection can sometimes spread.

Pericytes

Pericytes are contractile support cells wrapped around small blood vessels that help regulate capillary stability, blood flow, repair, and the blood-brain barrier.

Periductal Mastitis

Recurrent inflammation around the breast ducts beneath the nipple, often associated with duct blockage and smoking. It may cause tenderness, nipple retraction, or recurrent abscesses and a draining channel near the areola.

Perifolliculitis Capitis Abscedens et Suffodiens

A severe chronic scalp folliculitis, also called dissecting cellulitis, in which deep nodules, abscesses, and interconnected tunnels cause purulent drainage and permanent scarring alopecia. It is part of the follicular-occlusion spectrum and may coexist with acne conglobata or pilonidal disease.

Alternate Names:
Dissecting Cellulitis

Peri-Implantitis

Inflammation around a dental implant with progressive loss of the supporting bone. It may cause bleeding, swelling, pus, pain, or implant looseness and requires dental assessment.

Perilymph

Fluid in the bony labyrinth of the inner ear that surrounds the membranous labyrinth and helps transmit sound and balance signals.

Perilymphatic Fistula

An abnormal leak between the fluid spaces of the inner ear and the middle ear, often after injury, pressure changes, or surgery. It may cause dizziness, hearing loss, ringing, or symptoms triggered by sound or pressure.

Perimenopausal

Perimenopausal describes the years of hormonal and menstrual transition before and around menopause, when cycles, bleeding, hot flashes, sleep, and fertility may change.

Perimenopause

The transition toward menopause, when ovarian hormone levels change and menstrual periods often become irregular. The term may include the first 12 months after the final menstrual period. Menopause is confirmed retrospectively after 12 consecutive months without a period, when other causes are excluded.

Perimetry

A test that measures the full field of vision, including central and side vision. It helps detect and monitor problems such as glaucoma, optic-nerve disease, retinal disease, and disorders affecting the visual pathways in the brain.

Perimysium

A layer of connective tissue that surrounds groups of muscle fibers, forming bundles called fascicles. It carries small blood vessels and nerves within the muscle.

Perinatal

Perinatal refers to the period around birth, conventionally including late pregnancy and the first days or weeks after delivery depending on the definition used.

Perinatal Asphyxia

Impaired gas exchange around labor and delivery that, if persistent, can cause low blood oxygen, raised carbon dioxide, and reduced oxygen delivery to tissues. Use the term when there is evidence of impaired gas exchange; newborn neurologic dysfunction is described as neonatal encephalopathy, and hypoxic-ischemic encephalopathy specifies a hypoxic-ischemic cause.

Perinatal Death

Death of a fetus or newborn during the late pregnancy, birth, or early newborn period; the exact time range varies by definition.

Perinatal Psychiatry

The subspecialty focused on psychiatric disorders during pregnancy and the postpartum period. Common conditions include perinatal depression, perinatal anxiety, perinatal OCD, and postpartum psychosis. Medication selection must balance maternal mental health with fetal or neonatal exposure risks.

Perinatal Transmission

Transmission of an infection or condition from mother to infant during pregnancy, labor, delivery, or breastfeeding, as with HIV, hepatitis B, syphilis, or certain genetic and congenital disorders.

Perinatologist

A perinatologist is an obstetrician specializing in high-risk pregnancy, fetal medicine, prenatal diagnosis, and complications affecting the pregnant person or fetus.

Perindopril

Perindopril is an ACE inhibitor used for high blood pressure and cardiovascular risk reduction; it can cause cough, high potassium, or rarely angioedema.

Perineal

Relating to the area between the external genitals and anus, which can be affected by injury or infection.

Perineal Hemostat

A clamp used during procedures to compress a blood vessel or hold tissue and control bleeding.

Alternate Names:
Perineal Hemostatic Clamp; Pelvic Bleeding Forceps

Perineal Laceration

Tearing of the perineal tissues during vaginal delivery. The injury is graded by depth: it may involve skin, perineal muscle, the anal sphincter, or the rectal mucosa.

Perineal Laceration Classification

A system grading tears during childbirth by depth: first degree affects skin, second degree also affects muscle, third degree involves the anal-control muscle, and fourth degree extends into the rectum. Accurate examination and repair reduce later pain and bowel-control problems.

Perineal Needle Holder

A surgical instrument used to hold and guide a suture needle while repairing tissues of the perineum. Its locking handle allows controlled needle placement and helps protect the surgeon's hands.

Alternate Names:
Perineorrhaphy Needle Holder; Perineal Needle Holder

Perineal Protection

Measures used during the pushing stage of childbirth to reduce severe tearing of the tissue between the vagina and anus. They may include controlled delivery of the baby's head, support of the perineum, a warm compress, and a selective approach to episiotomy.

Perineal Suture

A thread or strand of material used to approximate tissues (bring wound edges together) and hold them in place until healing occurs. See Suture.

Alternate Names:
Perineal Suture; Perineorrhaphy Suture

Perineal Tear

A split in the tissue between the vagina and anus during vaginal birth. First-degree tears affect skin, second-degree tears reach muscle, third-degree tears involve the anal-control muscle, and fourth-degree tears extend into the rectum; severe tears need careful repair and follow-up.

Perineum

The area between the external genitalia and the anus. It contains skin, muscles, nerves, and connective tissue and may be affected by injury, infection, childbirth, or surgery.

Perineural

Perineural means around a nerve; the term may describe normal connective tissue, inflammation, tumor spread, or imaging findings surrounding a nerve.

Perineuronal Satellitosis

A microscopic pattern in which supporting brain cells cluster around a nerve cell. It can occur in some brain tumors, inflammation, or reactive changes and has meaning only with the surrounding tissue findings.

Perinuclear Space

The narrow space between the two membranes surrounding a cell nucleus. It connects with part of the cell's internal membrane network and helps form the nuclear envelope.

Periodic Abstinence

Periodic abstinence is avoiding intercourse during estimated fertile days to reduce pregnancy likelihood; cycle timing is imperfect and does not prevent infections.

Periodic Acid

A chemical used to stain tissue samples. In the periodic-acid–Schiff test, it helps highlight sugars, mucus, certain fungi, and supporting membranes so they can be seen under a microscope.

Periodic Breathing

Repeated cycles of shallow or absent breaths followed by deeper breaths. It can occur normally for short periods in some infants or during sleep, but persistent episodes may reflect a brain, heart, or lung disorder.

Periodic Limb Movement Disorder

Repeated involuntary limb movements during sleep that may disrupt rest.

Alternate Names:
PLMD; Periodic Leg Movements in Sleep; Nocturnal Myoclonus

Periodic Limb Movement Sleep Disorder

Alternate name; see *Periodic Limb Movement Disorder*.

Periodic Paralysis Syndrome

Periodic paralysis syndromes are rare inherited or acquired disorders causing episodic muscle weakness associated with abnormal potassium handling or thyroid disease. Attacks may follow rest after exercise, meals, or stress; ECG, potassium testing, and genetic or endocrine evaluation guide care.

Periodontal Abscess

A localized accumulation of pus within periodontal tissues, commonly associated with a periodontal pocket, foreign material, or impaired drainage. It may cause pain, swelling, suppuration, tooth mobility, and systemic symptoms and requires urgent dental assessment.

Periodontal Cyst

A periodontal cyst is a fluid-filled epithelial-lined lesion near the tooth-supporting tissues, with effects ranging from incidental discovery to local bone destruction.

Periodontal Disease

Infection or inflammation of the tissues supporting teeth, including gums and jawbone. It can cause bleeding, swelling, bad breath, loose teeth, bone loss, and tooth loss, but treatment can slow progression.

Periodontal Dressing

A protective material placed over the gums after selected dental or periodontal procedures. It can protect the surgical area while it heals and reduce irritation; loosening, pain, odor, or swelling can occur with local complications.

Periodontal Flap Surgery

Dental surgery in which the gum is gently lifted so a clinician can clean infection and deposits below the gumline and, when needed, reshape accessible bone before replacing the gum.

Periodontal Graft

Tissue placed around a tooth to cover an exposed root, thicken the gum, or repair gum loss. The tissue may come from the person's mouth, a donor, or a processed substitute.

Alternate Names:
Periodontal Soft Tissue Graft; Gingival Graft

Periodontal Ligament

Strong tissue fibers that attach a tooth's root to the surrounding jawbone. They cushion chewing forces, help the body sense pressure on the tooth, and can become inflamed or damaged in gum disease or grinding.

Periodontal Pocket

An abnormally deep space between a tooth and the surrounding gum caused by loss of attachment. Plaque can collect there, leading to bleeding, infection, bone loss, loose teeth, and eventual tooth loss.

Periodontal Probing

A dentist gently measures the space between the gum and tooth with a marked instrument. Deeper spaces, bleeding, and loss of support can indicate gum disease; measurements help assess severity and monitor treatment.

Periodontics

The dental specialty focused on preventing, diagnosing, and treating gum disease and tissues supporting the teeth.

Periodontist

A periodontist is a dentist specializing in prevention, diagnosis, and treatment of gum disease and supporting tissues, including periodontal surgery and implants.

Periodontitis

Long-lasting gum disease in which bacteria in plaque damage the gums and bone that hold teeth in place. It can cause bleeding gums, gums that pull away from teeth, loose teeth, bad breath, and tooth loss.

Its severity and course vary.

Alternate Names:
Pyorrhea; Periodontal Disease; Periodontal Gum Disease; Advanced Gum Disease

Periodontium

The tissues that hold and support a tooth, including gums, ligament, root covering, and jawbone. Disease of these tissues can cause bleeding, gum recession, loose teeth, bone loss, and tooth loss.

Periodontium Disease

Disease of the tissues supporting the teeth, including gingiva, periodontal ligament, cementum, and alveolar bone; periodontitis can cause attachment loss and tooth loss.

Perionychium

The skin and soft tissue surrounding a fingernail or toenail, including the nail folds and nearby cuticle; infection or inflammation causes paronychia.

Perioperative

Perioperative means relating to the period before, during, and after an operation, including preparation, anesthesia, recovery, and complication prevention.

Perioral Dermatitis

A papulopustular eruption around the mouth, sparing the vermilion border. It is more common in young women and associated with topical corticosteroid use. Other triggers include fluoridated toothpaste, cosmetics, and inhaler steroids.

Periorbita

The periosteum covering the bones of the eye socket. It is continuous with nearby cranial and facial periosteum and provides an attachment surface for orbital structures.

Periorbital

Located around the eye socket or eyelids. Periorbital swelling may result from injury, allergy, infection, or fluid retention.

Periorbital Cellulitis

A bacterial infection of the eyelid and tissues around the eye that causes redness, swelling, and tenderness. Orbital cellulitis is a deeper infection that can threaten vision and spread to the brain.

Periorbital Edema

Swelling of the tissues around the eye, caused by allergy, infection, trauma, venous or lymphatic congestion, kidney disease, thyroid eye disease, or other systemic conditions.

Periorbital Infection

Infection of the tissues around the eye; it can cause swelling and redness. Orbital cellulitis is a deeper form that threatens vision.

Periorbital Purpura

Nonblanching red-purple spots or patches caused by bleeding into the skin around the eyelids. Causes include trauma and bleeding disorders; spontaneous or easily induced periorbital purpura is a characteristic clue to immunoglobulin light-chain (AL) amyloidosis, but is not specific to it.

Periosteal Osteosarcoma

A cancerous bone tumor that develops beneath the thin tissue covering a bone, usually along the shaft of a long bone. It often makes cartilage and causes pain or swelling, requiring specialist cancer treatment.

Periosteal Reaction

The non-specific radiographic and histological response of the periosteum to cortical bone irritation, injury, infection, or underlying malignancy, manifesting as solid, laminated ("onion-skin"), spicular ("sunburst"), or Codman triangle bone formation.

Periosteum

A blood-vessel-rich, pain-sensitive tissue layer covering the outer surface of bone, except where joint cartilage covers it. It supplies nutrients, supports repair, and provides attachment for tendons and ligaments.

Periostitis

Inflammation of the periosteum, the pain-sensitive tissue covering the outer surface of bone. It may cause localized bone pain, tenderness, or swelling and can result from repeated stress, infection, injury, or another disease.

Peripancreatic Malignancy

Cancer involving the tissues around the pancreas, either by spreading from the pancreas or from another organ. It may cause abdominal or back pain, weight loss, jaundice, or newly developed diabetes and usually needs detailed imaging and specialist care.

Peripartum

Relating to the period around childbirth, including late pregnancy, labor, delivery, and the early weeks after birth. Clinicians may use a more specific time range for a particular condition or study.

Peripartum Cardiomyopathy

A usually dilated cardiomyopathy that develops toward the end of pregnancy or during the postpartum period and may cause systolic heart failure. Features can include breathlessness, difficulty lying flat, swelling, fatigue, or chest discomfort.

Alternate Names:
PPCM; Pregnancy-Associated Cardiomyopathy

Peripartum Cardiomyopathy Prognosis

Recovery of ventricular function varies widely. Prognosis is influenced by the initial ejection fraction, ventricular size, symptoms, treatment, complications, and follow-up; persistent dysfunction requires ongoing cardiac care.

Peripartum (Postpartum) Cardiomyopathy (PPCM)

A form of heart-muscle failure developing toward the end of pregnancy or in the months after delivery. It may cause breathlessness, orthopnea, swelling, chest discomfort, palpitations, or fatigue and can progress to severe heart failure; treatment is adapted to pregnancy or breastfeeding.

Peripheral

Peripheral means away from the center or central nervous system; in clinical use it may describe nerves, vessels, lesions, circulation, or symptoms outside the brain, spinal cord, or central structures.

Peripheral Angioplasty

A percutaneous vascular intervention that dilates stenosed or occluded peripheral arteries—primarily in the lower extremities, renal arteries, or carotid vessels—using balloon dilation and optional stent placement.

Alternate Names:
PTA; Peripheral Arterial Angioplasty

Peripheral Artery Disease

Narrowing of arteries supplying the limbs, usually caused by atherosclerosis. It may cause exertional leg pain relieved by rest, reduced pulses, nonhealing wounds, or chronic limb-threatening ischemia, a severe reduction in blood flow associated with persistent pain or tissue loss. Also called peripheral arterial disease.

Alternate Names:
PAD; Peripheral Arterial Occlusive Disease; PAOD

Peripheral Blood

Peripheral blood is blood obtained from a vein or capillary rather than directly from an organ or marrow, used for counts, smears, chemistry, and other testing.

Peripheral Blood Smear

Microscopic examination of stained blood spread on a slide. It shows the size, shape, and appearance of red cells, white cells, and platelets and can help investigate anemia, infection, and blood disorders.

Peripheral Blood Stem Cells

Immature blood-forming cells collected from the bloodstream after medicines encourage them to leave the bone marrow. They can be returned to the same person or given to another person to rebuild blood production after intensive treatment.

Peripheral Cyanosis

Blue or gray-blue color in the fingers, toes, hands, or feet, usually because blood flow there is low or the body is taking more oxygen from the blood. The lips and tongue usually keep their normal color; blue lips or tongue may signal low oxygen throughout the body.

Peripheral Edema

Swelling due to accumulation of fluid in the interstitial space of the limbs, most commonly the lower extremities.

Peripheral Ischemia

Inadequate arterial blood flow to an arm, leg, digit, or other peripheral tissue, causing pain, pallor, coolness, weak pulses, numbness, ulcers, or tissue loss.

Peripherally Inserted Central Catheter

A long, flexible catheter inserted into the basilic or cephalic vein and advanced so the tip sits in the superior vena cava. Inserted at the bedside, often by a specialized PICC nurse, with ultrasound and ECG or X-ray confirmation. Indications: long-term IV antibiotics (>2 weeks), TPN, chemotherapy, and frequent blood draws.

Peripheral Nerve

A nerve outside the brain and spinal cord that carries motor, sensory, and autonomic signals between the central nervous system and the rest of the body.

Peripheral Nerve Blocks

Injections of local anesthetic near a nerve or group of nerves to numb a specific area and reduce pain during or after a procedure. Ultrasound guidance may improve accuracy and safety.

Peripheral Nerve Injuries

Damage to nerves outside the brain and spinal cord caused by trauma, compression, stretching, disease, or toxins. It may cause pain, numbness, weakness, or loss of function; recovery depends on the severity and location of the injury.

Peripheral Nerve Tumors

Growths arising from or around nerves outside the brain and spinal cord; they may be benign or cancerous.

Peripheral Nervous System

All nerves outside the brain and spinal cord. It carries messages between the central nervous system and the skin, muscles, organs, and glands, controlling movement, sensation, and automatic functions such as heartbeat and digestion.

Peripheral Neuritis

Alternate name; see *Peripheral Neuropathy*.

Peripheral Neurofibromatosis

Alternate name; see *Neurofibromatosis Type 1*.

Peripheral Neuropathy

Damage or dysfunction of nerves outside the brain and spinal cord. It may cause burning pain, tingling, numbness, weakness, or problems with sweating and other automatic body functions, often beginning in the feet or hands.

Alternate Names:
Peripheral Nerve Damage

Peripheral Oedema

Alternate spelling of Peripheral Edema; swelling caused by excess interstitial fluid, usually in the limbs.

Peripheral Vascular Disease

A broad term for disease of blood vessels outside the heart and brain. It is often used to mean peripheral artery disease, in which narrowed leg arteries cause pain with walking, coldness, wounds that heal slowly, or tissue loss; the vessel involved should be specified because venous disorders are different.

Alternate Names:
PVD; Peripheral Angiopathy

Peripheral Vision

The parts of the visual field seen away from the direct line of sight. Loss can result from eye disease,

nerve damage, brain injury, or glaucoma and may increase falls or collisions.

Alternate Names:
Side Vision

Periplasm

The periplasm is the space between the inner and outer membranes of Gram-negative bacteria, containing enzymes, transport proteins, and structural components.

Periprosthetic Joint Infection

Infection involving an artificial joint and nearby tissues. It may cause persistent pain, swelling, drainage, fever, or loosening. Diagnosis uses examination, blood tests, joint-fluid testing, cultures, and imaging; treatment may require antibiotics and surgery.

Perirenal Abscess

A perirenal abscess is a collection of pus around the kidney, usually from spread of a urinary or kidney infection, causing fever, flank pain, and possible sepsis.

Perirenal Extramedullary Hematopoiesis

Production of blood cells in tissue around the kidney instead of mainly in the bone marrow. It is an unusual response to severe long-term anemia or bone-marrow disease and may appear as masses on imaging.

Perirenal Hematoma

A collection of blood around the kidney, usually caused by trauma, a bleeding lesion, a procedure, or anticoagulation.

Peristalsis

Peristalsis is coordinated, wave-like contraction of smooth muscle that propels food, fluid, or other contents through the gastrointestinal tract and some ducts.

Peritoneal

Peritoneal means relating to the peritoneum, the thin membrane lining the abdominal cavity and covering many abdominal organs.

Peritoneal Cancer

Cancer arising from or involving the peritoneum, the membrane lining the abdominal cavity and covering many abdominal organs. It may be primary or metastatic and can cause abdominal swelling, pain, bowel symptoms, or ascites; imaging, fluid analysis, and tissue diagnosis help determine the origin.

Peritoneal Carcinomatosis

Multiple cancer deposits on the peritoneum, the lining of the abdominal cavity and its organs, after cancer spreads there from another site. Common sources include ovarian, colorectal, stomach, pancreatic, and appendiceal cancers. It can cause abdominal fluid buildup, pain, or bowel obstruction; it is distinct from a cancer that begins in the peritoneum.

Peritoneal Cavity

The narrow space inside the abdominal lining around the abdominal and pelvic organs. A small amount of fluid normally lubricates it; blood, pus, excess fluid, or cancer cells can collect there during disease.

Peritoneal Coccidioidomycosis

Rare spread of Coccidioides fungi to the abdominal lining, causing inflammation called coccidioidal peritonitis. It may cause abdominal pain, nausea, or fluid buildup and can resemble abdominal cancer or tuberculosis on scans. Diagnosis is based on clinical findings with blood tests and, when needed, fluid or tissue testing.

Peritoneal Dialysis

A dialysis method that uses the peritoneum, the lining of the abdomen, as a semipermeable membrane. Waste and salts diffuse from blood into dialysis fluid placed in the abdominal cavity; glucose in the fluid creates an osmotic gradient that draws out excess water. The fluid is then drained and replaced. Peritonitis is a possible complication.

Peritoneal Dialysis-Associated Peritonitis

Infection or inflammation of the abdominal lining during peritoneal dialysis, usually related to contamination of the dialysis catheter or fluid. It may cause cloudy drainage, abdominal pain, fever, or nausea.

Peritoneal Dialysis Catheter

A soft tube placed through the abdominal wall into the abdominal cavity for dialysis. Dialysis fluid enters and leaves through it to remove waste and extra water; infection, blockage, leakage, or displacement can occur.

Peritoneal Diseases

Disorders affecting the thin lining of the abdomen, including infection, inflammation, cancer, bleeding, scar tissue, or abnormal fluid buildup. Symptoms depend on the cause and may include abdominal pain, swelling, fever, or vomiting.

Peritoneal Fluid

The small amount of slippery fluid normally present inside the abdominal cavity. Excess fluid, blood, pus, or cancer cells can collect there and may cause swelling, pain, infection, or other signs of abdominal disease.

Peritoneal Fluid Analysis

Laboratory testing of fluid collected from the abdominal cavity. Cell counts, protein, albumin, cultures, and other tests help determine whether the fluid is caused by liver disease, infection, cancer, bleeding, or another problem.

Peritoneal Fluid Culture

Culture of ascitic fluid to detect microorganisms, particularly in suspected spontaneous bacterial peritonitis or secondary peritoneal infection.

Peritoneal Infection

Infection of the lining of the abdominal cavity, often called peritonitis. Causes include a ruptured appendix or bowel, abdominal surgery, pelvic infection, or contamination during dialysis. Severe abdominal pain, fever, vomiting, or a rigid abdomen can occur with severe infection.

Alternate Names:
Peritonitis

Peritoneal Lavage

Washing or sampling the abdominal cavity with sterile fluid. It was once used more often to detect internal bleeding or intestinal contents after injury; imaging and other tests now commonly provide this information.

Peritoneal Necrosis

Death of peritoneal tissue caused by ischemia, severe infection, inflammation, trauma, or tumor, potentially leading to peritonitis, adhesions, sepsis, or organ failure.

Peritoneal Sac

The space formed by the abdominal lining around the abdominal and pelvic organs. It normally contains only a small amount of lubricating fluid, but blood, pus, excess fluid, or cancer can collect there.

Peritoneum

A thin, slippery lining that covers the inside of the abdomen and many abdominal organs. It allows organs to move smoothly; inflammation, infection, bleeding, fluid, or cancer in this lining can cause severe abdominal symptoms.

Peritoneum Neoplasm

An abnormal growth in the lining of the abdominal cavity. It may begin there or spread from cancer in another organ and can cause abdominal pain, swelling, fluid buildup, or bowel blockage.

Peritonitis

Infection or inflammation of the thin tissue that lines the inside of the abdomen and covers most of its organs. Causes include a hole in the stomach or bowel, appendicitis, injury, surgery, or infection in fluid in the abdomen. It can cause severe belly pain, tenderness, swelling, fever, nausea, or vomiting. It is an emergency because it can lead to sepsis, a severe body-wide response to infection, or shock.

Peritonitis In PD

Infection of the abdominal lining in a person receiving peritoneal dialysis. Cloudy drainage, abdominal pain, fever, nausea, or feeling unwell may occur; treatment includes antibiotics, and severe or repeated infection may lead to catheter removal.

Peritonsillar Abscess

A pocket of pus beside a tonsil, usually after a throat infection. It can cause severe pain on one side of the throat, fever, a thick-sounding voice, drooling, or trouble opening the mouth or breathing.

Periumbilical Erythema Migrans

An expanding erythema migrans rash centered around the navel, usually at the site of a bite from a Borrelia-infected tick. It is a presentation of early Lyme borreliosis. The rash may be uniformly red or ring-shaped, with or without central clearing; a bull's-eye pattern is not required.

Periungual Fibroma

A noncancerous, firm growth arising beside or beneath a fingernail or toenail. It may distort the nail and can occur alone or as one of several skin findings in tuberous sclerosis complex.

Periurethral

Located around the urethra, the tube that carries urine out of the body. The term may describe glands, infection, an abscess, a urethral diverticulum, or tissue and treatments used for urinary leakage.

Periventricular Leukomalacia

Injury to the brain's developing nerve fibers near its fluid-filled spaces, most often in premature infants. It may later affect movement, muscle tone, vision, learning, or development and is associated with cerebral palsy.

Perivitelline Space

The perivitelline space is the narrow region between an egg's plasma membrane and surrounding vitelline or zona material, important in fertilization and early development.

Perleche

Inflammation, soreness, and cracking at one or both corners of the mouth. Saliva, ill-fitting dentures, yeast or bacterial infection, skin irritation, and iron or vitamin shortages can contribute; treatment depends on the cause and keeping the area dry.

Permanent Teeth

The adult set of teeth that replaces the deciduous teeth.

Permease

A permease is a membrane transport protein that facilitates movement of a specific molecule or ion across a cell membrane.

Permethrin

A skin-applied medicine that kills scabies mites and head lice. It is usually applied as directed and washed off later; itching may continue briefly after treatment even when parasites are gone.

Permissive Hypercapnia

A ventilator approach that allows carbon dioxide in the blood to remain above normal so that gentler pressures and smaller breaths can protect injured lungs. It is used selectively and requires close monitoring because excessive acidity or carbon dioxide can be harmful.

Pernicious Anaemia

A form of vitamin B12 deficiency caused by immune damage to stomach cells needed for B12 absorption. It can cause anemia, tiredness, sore tongue, numbness, balance problems, and nerve damage.

Pernicious Anemia

Anemia caused by vitamin B12 deficiency when the body lacks intrinsic factor, a stomach protein needed to absorb B12. This often results from immune damage to the stomach lining and can also affect the nerves.

Alternate Names:
Biermer Disease; Addisonian Anemia

Pernio

Alternate name; see *Chilblain*.

Peroneal

Relating to the fibula or the muscles and nerve on the outer side of the lower leg.

Peroneal Muscular Atrophy

Alternate name; see *Charcot-Marie-Tooth Disease*.

Peroneal Nerve

The common fibular nerve, a branch of the sciatic nerve that winds around the fibular neck and supplies sensation and muscles responsible for ankle dorsiflexion and eversion.

Peroneal Nerve Palsy

A peripheral lower motor neuropathy caused by trauma or compression of the common fibular (peroneal) nerve as it courses superficially around the neck of the fibula, presenting with foot drop (loss of ankle dorsiflexion and eversion) and sensory numbness over the anterolateral lower leg and dorsum of the foot.

Alternate Names:
Common Fibular Nerve Palsy; Foot Drop Palsy

Peroneal Tendinitis

Irritation or inflammation of the tendons along the outer side of the ankle and foot. It can cause pain or swelling that worsens with walking or turning the foot; see also *Peroneal Tendon Syndromes*.

Peroneal Tendon Syndromes

Disorders of the peroneal tendons, including tendinopathy, subluxation, and tears, usually causing pain or swelling behind the outer ankle and sometimes ankle instability. They may follow overuse, an inversion injury, or structural abnormalities.

Posterior Tibial Tendon Dysfunction

Weakness, stretching, or damage of the tendon that helps support the arch along the inside of the ankle and foot. It can cause inner-ankle pain and a gradually flattening arch, sometimes called adult-acquired flatfoot.

Alternate Names:
PTTD

Peroxidase

An enzyme that uses hydrogen peroxide or another peroxide to oxidize a substrate; thyroid peroxidase is essential for thyroid-hormone synthesis.

Peroxisomal Disorder

An inherited condition in which small cell structures that process certain fats do not form or work properly. It may affect the brain, nerves, liver, eyes, hearing, bones, or development.

Peroxisome

A small structure inside a cell that breaks down certain fats and harmful substances. It also helps control hydrogen peroxide and makes substances needed for cell membranes and nerve function.

Peroxisome Proliferation

An increase in the number or size of peroxisomes, small cell structures that process certain fats and harmful chemicals. It can be triggered by some medicines, chemicals, hormones, or metabolic conditions and may alter cell function.

Perphenazine

A first-generation (typical) phenothiazine antipsychotic used for schizophrenia and, in some settings, severe nausea or vomiting. Adverse effects can include sedation, orthostatic hypotension, extrapyramidal symptoms, tardive dyskinesia, and neuroleptic malignant syndrome.

Perseveration

Involuntary repetition of a word, idea, movement, or response after the appropriate stimulus has changed, associated with frontal or basal-ganglia disease, aphasia, delirium, or psychiatric illness.

Persistent Asthma

Asthma symptoms or airway narrowing that occur regularly rather than only occasionally and usually

require ongoing controller treatment. Severity is judged by symptoms, night waking, reliever use, lung function, and activity limits; treatment is adjusted over time.

Persistent Cloaca

Persistent cloaca is a congenital malformation in which the rectum, vagina, and urinary tract join into one channel, requiring specialist evaluation and reconstructive care.

Persistent Depressive Disorder

A long-lasting depressive disorder with depressed mood or irritability for at least two years in adults or one year in children and adolescents. Other symptoms may include low energy, low self-esteem, sleep or appetite changes, poor concentration, or hopelessness.

Alternate Names:
Dysthymia; Dysthymic Disorder; PDD

Persistent Depressive Disorder (Dysthymia)

Alternate name; see *Persistent Depressive Disorder*.

Persistent Fetal Vasculature

Persistence after birth of fetal blood vessels that normally regress before or soon after birth. It usually affects one eye and may cause a small eye, cataract, abnormal pupil reflection, retinal changes, or reduced vision.

Persistent Generalized Lymphadenopathy

Enlarged lymph nodes in at least two areas outside the groin that persist for three months or longer. It can occur with HIV infection but also has many other causes, including infections, medicines, and immune or blood disorders; evaluation depends on the clinical findings.

Alternate Names:
PGL

Persistent Pulmonary Hypertension Of The Newborn

Failure of the normal fall in pulmonary vascular resistance after birth, causing right-to-left shunting and hypoxaemia. Treatment involves neonatal respiratory and circulatory support.

Persistent Pupillary Membranes

Strands left from a temporary membrane that covered the developing eye before birth. They may cross the pupil and are usually harmless, but dense strands can interfere with vision and may be treated surgically.

Persistent Vegetative State

An older term for a prolonged disorder of consciousness in which a person has periods of wakefulness but no clear signs of awareness. The preferred term is *unresponsive wakefulness syndrome*; diagnosis requires careful specialist assessment over time.

Alternate Names:
PVS; Unresponsive Wakefulness Syndrome

Personal Emergency Response System

A wearable or nearby device that lets a person summon help during an emergency.

Alternate Names:
PERS; Medical Alert System

Personality

Personality is the relatively enduring pattern of thoughts, emotions, motivations, and behaviors through which a person experiences and responds to the world.

Personality Change

Personality change is a new or marked alteration in behavior, emotional responses, judgment, or interpersonal style, which may reflect neurologic disease, psychiatric illness, substances, or medical conditions.

Personality Disorder

An enduring, inflexible, and pervasive pattern of inner experience and behavior that deviates markedly from cultural expectations, leads to significant distress or functional impairment, and has an onset traceable to adolescence or

early adulthood. DSM-5 categorizes personality disorders into three clusters: Cluster A (paranoid, schizoid, schizotypal—odd/eccentric), Cluster B (antisocial, borderline, histrionic, narcissistic—dramatic/emotional/erratic), and Cluster C (avoidant, dependent, obsessive-compulsive—anxious/fearful). Treatment primarily utilizes evidence-based psychotherapies (e.g., dialectical behavior therapy, mentalization-based therapy).

Alternate Names:
Personality Disorders

Personality Disorders

Plural form; see *Personality Disorder*.

Personality Test

A psychological assessment using structured questions or stimuli to describe enduring traits, patterns, or possible personality pathology; results require validated instruments and clinical interpretation.

Personalized Medicine

Healthcare that uses a person's genes, biological measurements, environment, and lifestyle to guide prevention or treatment. It can improve treatment selection but does not guarantee a response.

Personal Protective Equipment

Clothing or equipment that protects a person from infection, chemicals, blood, or other hazards. It may include gloves, gowns, masks, respirators, goggles, or face shields; selection and safe use depend on the hazard.

Person With Disability

A person with disability has a long-term physical, sensory, intellectual, or mental-health impairment that may interact with barriers to limit participation; accessible, person-centered care accounts for these barriers.

Perspiration

Sweat released by skin glands. Eccrine glands mainly help cool the body, while apocrine glands contribute to odor after their secretions are changed by skin bacteria; unusually heavy sweating is called hyperhidrosis.

Pertussis

Alternate name; see *Whooping Cough*.

Pertussis Toxin

A toxin produced by Bordetella pertussis that disrupts cell signaling and contributes to the cough and systemic effects of whooping cough.

Pertuzumab

A monoclonal antibody targeting the HER2 receptor and blocking its dimerization, used with other medicines for selected HER2-positive cancers.

Pervasive Developmental Disorders

An older name for a group of diagnoses affecting development and social communication. The group included autism, Asperger syndrome, and PDD-NOS, a diagnosis for people who did not fit other categories. DSM-5 replaced most of these diagnoses with autism spectrum disorder (ASD).

Alternate Names:
Pervasive Developmental Disorder; PDD

Pes

Pes means foot; it is also used in terms describing foot shape or deformity, such as pes planus or pes cavus.

Pes Anserinus

The combined tendon insertion of the sartorius, gracilis, and semitendinosus muscles on the anteromedial proximal tibia; inflammation there is pes-anserine bursitis.

Pes Cavus

A high-arched foot deformity characterized by an abnormally elevated medial longitudinal arch that does not flatten with weight-bearing, frequently associated with neuromuscular disorders including Charcot-Marie-Tooth disease, Friedreich ataxia, and spinal dysraphism.

Alternate Names:
High-Arched Foot; Talipes Cavus

Pes Planus

Alternate name; see *Flatfoot (Pes Planus)*.

Pessaries

Devices placed inside the vagina to support organs that have descended, such as the bladder, uterus, or rectum. Ring, cube, and other designs suit different shapes; prolonged use can cause sores, discharge, or infection.

Pessary

A device placed inside the vagina to support pelvic organs, treat prolapse, or sometimes prevent leakage of urine.

Pessimism

A tendency to expect negative outcomes or interpret situations unfavorably.

Pesticide

Any chemical substance or biological agent formulated to repel, prevent, destroy, or mitigate pests, including insecticides, herbicides, rodenticides, and fungicides. Human exposure can cause acute toxicity (e.g., organophosphate-induced cholinergic crisis via acetylcholinesterase inhibition, leading to SLUDGE syndrome and respiratory arrest) or chronic neurotoxic, carcinogenic, dermatologic, and reproductive sequelae.

Alternate Names:
Pesticides

Pesticide Poisoning

Toxic exposure to an insecticide, herbicide, fungicide, rodenticide, or related agricultural chemical. Clinical findings and treatment depend on the active ingredient: cholinergic toxidromes, corrosive injury, methemoglobinemia, hepatic or renal injury, seizures, shock, and coagulopathy are possible. Identify the product, decontaminate safely, and use agent-specific toxicology guidance.

Pesticides

Plural form; see *Pesticide*.

Pesticides On Fruits And Vegetables

Small pesticide residues on properly washed produce usually do not cause acute poisoning. Concentrated pesticide exposure can cause vomiting, sweating, breathing difficulty, weakness, or confusion.

Pestilence

Pestilence is an old term for a severe, widespread, often fatal infectious disease outbreak; modern usage usually specifies the pathogen and epidemiologic event.

Pet Allergy

An allergic reaction to proteins in an animal's skin flakes, saliva, or urine, commonly causing rhinitis, conjunctivitis, or asthma.

Alternate Names:
Animal Dander Allergy; Pet Dander Hypersensitivity

PET/CT

A scan that combines PET, which shows active body processes, with CT, which shows detailed anatomy. It helps locate disease and assess selected cancers, heart conditions, and brain disorders; it uses a radioactive tracer and X-rays.

Petechia

Alternate name; see *Petechiae*.

Petechiae

Pinpoint, flat, non-blanching red, purple, or brown macules measuring less than two to three millimetres in diameter, caused by minor capillary hemorrhage and extravasation of erythrocytes into the skin or mucous membranes. Major causes include thrombocytopenia (such as immune thrombocytopenia, leukemia, or aplastic anemia), platelet dysfunction, life-threatening infections (meningococcemia, infective endocarditis, viral hemorrhagic fevers), vasculitis, and acute mechanical elevation of venous pressure from violent coughing or vomiting.

Alternate Names:
Petechia; Pinpoint Hemorrhages

Petit Mal

Older term; see *Absence Seizure*.

Petit Mal Seizure

Alternate name; see *Absence Seizure*.

PET/MRI

A scan that combines information about tissue activity with detailed MRI images of soft tissues. It is useful for selected brain, cancer, and heart problems and does not use X-rays, but takes longer than many other imaging tests.

Petrissage

A massage technique involving kneading, squeezing, or lifting soft tissues. It can aggravate acute injury, infection, clot risk, or fragile skin.

Petrolatum

A semisolid purified mixture of hydrocarbons used on skin as a protective ointment and moisture barrier. It reduces water loss, shields minor irritation, and supports healing of dry, cracked, or chafed skin.

Petroleum Jelly Overdose

Swallowing a small amount of petroleum jelly usually causes little harm, but larger amounts can cause diarrhea or vomiting. If it enters the lungs, it may cause inflammation and breathing problems; contact poison control after a significant exposure.

Petrosal Sinus

Paired dural venous sinuses draining the cavernous sinus: the superior petrosal sinus courses along the crest of the petrous temporal bone into the transverse sinus, while the inferior petrosal sinus travels in the petro-occipital fissure through the anterior jugular foramen into the internal jugular vein.

Petrositis

Inflammation or infection of the petrous portion of the temporal bone, usually arising from complicated otitis media and potentially affecting nearby cranial nerves.

Petrous

Describing dense, hard bone, especially the part of the temporal bone that houses inner-ear structures.

PET Scan

Nuclear medicine imaging using radioactive tracers (most commonly FDG, a glucose analog) to detect metabolically active tissues.

Alternate Names:
PET Imaging; PET-CT

PET Scan For Breast Cancer

Positron-emission tomography, usually combined with computed tomography, used selectively to assess metabolically active breast cancer, staging, recurrence, or treatment response.

PET Scanner

A machine that detects radiation from a tracer inside the body and creates images showing how actively tissues use substances such as glucose. It is used to assess selected cancers and other disorders.

PET Tracers

Radioactive substances used during a PET scan to highlight particular body processes. Different tracers show glucose use, bone activity, or specific cell receptors; the appropriate tracer depends on the clinical question.

Peutz-Jeghers's Syndrome

An inherited condition causing dark patches around the mouth and many growths in the stomach or intestines. The growths may bleed, cause blockage, or increase the risk of digestive and other cancers.

Peutz-Jeghers Syndrome

An inherited condition causing dark spots on the lips, mouth, fingers, or skin and multiple growths in the digestive tract. These growths can bleed or block the bowel and increase the risk of several cancers.

Alternate Names:
PJS

PEWS

Alternate name; see *Pediatric Early Warning Score*.

Pexophagy

A cell-cleaning process that removes damaged or unneeded peroxisomes, the small structures that process certain fats and harmful chemicals. The cell breaks them down and reuses some of their materials.

Peyer Patches

Clusters of immune tissue in the wall of the lower small intestine. They sample material from the gut and help the immune system recognize and respond to germs while tolerating normal food and bacteria.

Peyer's Patches

Organized lymphoid tissue in the mucosa and submucosa of the ileum. These aggregates sample intestinal contents and contribute to immune surveillance of the gastrointestinal tract.

Alternate Names:
Ileal Lymphoid Nodules; Aggregated Lymphoid Nodules

Peyronie Disease

A condition in which scar-like tissue forms in the covering of the erectile chambers. It can cause a bend, dent, shortening, or pain during erection and may make sex difficult. The bend may change at first and later become stable.

Peyronie's Disease

Alternate name; see *Peyronie Disease*.

Alternate Names:
Peyronie's Disease

PFAPA Syndrome

A recurrent fever syndrome, usually beginning in childhood, characterized by periodic fever with some combination of mouth ulcers, sore throat, and swollen neck lymph nodes; it is commonly abbreviated PFAPA.

Pfeiffer Syndrome

An autosomal dominant craniosynostosis syndrome caused by FGFR1 or FGFR2 mutations.

Alternate Names:
Classic Type Pfeiffer Syndrome Features: craniosynostosis (bilateral coronal), midface hypoplasia, proptosis, hypertelorism, broad thumbs and great toes (medial deviation), and variable syndactyly.

Alternate Names:
Acrocephalosyndactyly Type V

Pfeiffer Syndrome Type I

The milder form of Pfeiffer syndrome, a genetic craniosynostosis disorder usually associated with broad or deviated thumbs and great toes and premature fusion of some skull sutures. Severity and developmental effects vary.

P-Glycoprotein

A transport protein in cell membranes that pumps many medicines and other substances out of cells. It affects how medicines are absorbed and removed and can cause interactions when its activity is blocked or increased.

pH

A measure of how acidic or alkaline a solution is, usually on a scale from 0 to 14. Body fluids have tightly controlled pH ranges, and major changes can be dangerous.

Phacoemulsification

A cataract extraction technique in which an ultrasonic probe fragments and aspirates the opacified crystalline lens through a small incision. An intraocular lens is usually implanted afterward.

Alternate Names:
Phaco; Phaco Surgery; Ultrasonic Cataract Extraction

Phacomatosis

A broad group of congenital hereditary neurocutaneous syndromes characterized by widespread hamartomatous developmental lesions simultaneously involving structures of ectodermal origin (cen-

tral nervous system, retina, and skin), including neurofibromatosis, tuberous sclerosis, and von Hippel-Lindau disease.

Alternate Names:
Neurocutaneous Syndrome

Phaeohyphomycosis

An infection caused by melanized (dematiaceous) fungi, which appear in tissue as pigmented hyphae, yeast-like cells, or both. Disease may be cutaneous or subcutaneous, or involve deeper sites such as the lungs, brain, bones, or multiple organs.

Phagocyte

A specialized immune cell capable of ingesting, engulfing, and digesting cellular debris, foreign particles, pathogens, and apoptotic cells via phagocytosis. Key phagocytic cells include neutrophils, monocytes, tissue macrophages, and dendritic cells, which utilize pattern recognition receptors (PRRs) to identify pathogen-associated molecular patterns (PAMPs), trigger oxidative bursts, and facilitate antigen presentation to adaptive immune cells.

Alternate Names:
Phagocytes; Phagocytic Cell

Phagocytes

Plural form; see *Phagocyte*.

Phagocytic Vesicle

A small membrane-bound compartment formed inside a cell after it surrounds and swallows a germ, dead cell, or particle. It later joins a digestive compartment so the material can be broken down.

Phagocytosis

The process by which a cell surrounds, takes in, and breaks down a particle or microorganism. Immune cells use it to remove germs, dead cells, and harmful debris from tissues.

Phagolysosome

A compartment formed when an immune cell's swallowed-particle compartment joins a digestive compartment. Enzymes and other chemicals inside it destroy germs and break down cellular debris.

Phagophore

A temporary membrane that grows around damaged or unnecessary material inside a cell during recycling. It closes around the material so the cell can break it down and reuse some of its parts.

Phakomatosis TS

Alternate name; see *Tuberous Sclerosis Complex*.

Phalangeal Fractures

Breaks in the bones of the fingers or toes, usually caused by crushing, direct impact, or twisting. Pain, swelling, bruising, deformity, and difficulty moving the digit may occur; alignment and nail-bed injury should be assessed.

Phalanges

The bones of the fingers and toes. The thumb and big toe each have two, while the other digits usually have three. Fractures, arthritis, infection, or nerve problems in these bones can cause pain, swelling, stiffness, or difficulty using the hand or foot.

Phalanx

One of the bones of a finger or toe. Each phalanx has a base, shaft, and end; the end bone supports the fingertip or toenail. The thumb and big toe have two phalanges, while other digits usually have three.

Phalanx Unspecified

A phalanx is one of the bones of a finger or toe; "unspecified" indicates that the particular digit or proximal, middle, or distal segment is not identified.

Phalen Maneuver

A diagnostic physical examination provocative test for carpal tunnel syndrome; the patient rests both elbows on a flat surface and maintains full passive wrist flexion (at 90 degrees) by pressing the dorsal surfaces of the hands together for 60 seconds; reproduction of paresthesias or pain in the median nerve distribution indicates a positive test.

Alternate Names:
Phalen's Test; Wrist Flexion Test

Phalen Sign

Tingling or numbness in the fingers after pressing the backs of the hands together with wrists bent down for one minute, used to check for carpal tunnel syndrome.

Phalen Test

A test in which the wrists are bent to see whether numbness or tingling develops. Reproduced symptoms may support carpal tunnel syndrome, but the result must be interpreted with examination and other tests.

Phantom

A test object made to resemble human tissue or organs so medical imaging equipment can be checked and calibrated. Different phantoms test image quality, measurements, or specific body regions.

Phantom Limb

The feeling that an amputated body part is still present. Sensations may include position, movement, itching, pressure, or pain and often change over time after amputation.

Alternate Names:
Phantom Limb Sensation; Phantom Limb Pain

Phantom Limb Pain

Painful sensations perceived in a limb that has been amputated, caused by persistent or reorganized activity in peripheral nerves and central sensory pathways. It may feel burning, shooting, cramping, or electric.

Phantom Pain

Pain perceived in a body part that has been amputated, caused by changes in peripheral nerves and central pain-processing pathways.

Phantom Pregnancy

Alternate name; see *Pseudocyesis*.

Phantosmia

Perception of a smell when no corresponding odor is present. It may occur with sinonasal disease, migraine, seizures involving olfactory networks, head injury, neurodegenerative disease, infection, or other neurological conditions.

Pharmaceutical Adjuvant

A pharmaceutical adjuvant is an inactive or auxiliary ingredient added to improve a medicine's stability, absorption, preservation, delivery, or therapeutic effect.

Pharmaceutical Excipient

A pharmaceutical excipient is a non-active ingredient in a dosage form, such as a filler, binder, coating, solvent, preservative, or disintegrant.

Pharmaceutical Solutions

Liquid preparations in which one or more active pharmaceutical ingredients are dissolved in a suitable vehicle for administration, with concentration, sterility, stability, and route determining safe use.

Pharmacist

A medicine expert who prepares and dispenses drugs, checks safety, and explains correct use and possible side effects.

Pharmacodynamic Drug Interaction

An interaction in which two medicines have additive, opposing, or otherwise changed effects on the same body system, even when their blood concentrations are not altered.

Pharmacodynamics

The study of the biochemical and physiological effects of drugs on the body and their mechanisms of action, describing what the drug does to the body.

Pharmacoepidemiology

The study of how medicines are used and affect health in large populations. It helps assess effectiveness, safety, adverse effects, and patterns of prescribing.

Pharmacogenetics

Pharmacogenetics studies how inherited genetic variation alters a person's response to medicines, including efficacy, metabolism, and adverse-effect risk, to support individualized prescribing.

Pharmacogenetic Testing

Testing for genetic variants that influence a person's response, metabolism, efficacy, or toxicity of particular medicines and may support individualized prescribing.

Pharmacogenic Myopathy

Muscle weakness or muscle injury caused by a medicine or drug. The presentation can include pain, cramps, elevated creatine kinase, or rhabdomyolysis, and evaluation considers the timing, dose, interactions, and other causes.

Pharmacogenomics

The study of how genetic variations influence individual responses to drugs, including drug efficacy, toxicity, and metabolism. Genetic polymorphisms in drug-metabolizing enzymes, transporters, and receptors can lead to significant inter-individual variability in drug response.

Pharmacogenomic Testing

Testing that examines genetic variants affecting drug metabolism, transport, targets, or adverse reactions to help select or dose certain medicines.

Pharmacokinetic Drug Interaction

An interaction in which one medicine changes another medicine's absorption, distribution, metabolism, or elimination, altering its concentration or duration of action.

Pharmacokinetics

The study of what the body does to a medicine, including its absorption, distribution, metabolism, and elimination. It helps explain drug concentrations over time and supports dose selection.

Pharmacological Stress Test

A heart stress test using medicine to imitate exercise when a person cannot exercise adequately. Imaging or heart recordings show blood flow and function, while possible effects include chest discomfort, breathlessness, or abnormal rhythm.

Pharmacologic Substance

A pharmacologic substance is a chemical that produces a biological effect by interacting with cells, receptors, enzymes, transporters, or other targets.

Pharmacologist

A pharmacologist studies how medicines and chemicals act in living systems, including mechanisms, metabolism, toxicity, and therapeutic effects.

Pharmacology

The study of medicines and other drugs, including how they act and affect the body. It covers drug mechanisms, absorption, distribution, metabolism, elimination, uses, adverse effects, and interactions. Clinical pharmacology studies these effects in people.

Pharmacopoeia

A pharmacopoeia is an official reference specifying standards for identity, purity, strength, testing, and preparation of medicines.

Pharmacoproteomics

The study of how a person's protein patterns influence medicine response, drug effects, or toxicity. It is an emerging part of precision medicine.

Pharmacotherapy

Pharmacotherapy is treatment with medicines chosen to prevent, relieve, or control a disease or symptom.

Pharmacovigilance

The science and activities relating to the detection, assessment, understanding, and prevention of adverse drug reactions and other drug-related problems.

Pharmacy

The healthcare field concerned with preparing, checking, supplying, and explaining medicines. Pharmacists help choose safe doses, identify interactions and allergies, support treatment decisions, and teach people how to use medicines correctly.

Pharmacy Facility

A pharmacy facility is an authorized location where medicines may be stored, prepared, dispensed, monitored, and supplied under applicable professional and safety standards.

Pharyngeal

Relating to the pharynx, or throat. The pharynx connects the nose and mouth with the voice box, food pipe, and breathing passages. Infection, swelling, narrowing, or a tumor there may cause sore throat, swallowing difficulty, noisy breathing, or voice changes.

Pharyngeal Cancer

Alternate name; see *Throat Cancer*.

Pharyngeal Carcinoma

Pharyngeal carcinoma is cancer arising in the throat and may cause persistent sore throat, swallowing difficulty, hoarseness, or a neck mass.

Pharyngeal Disease

A disorder affecting the throat, including infection, inflammation, blockage, injury, muscle or nerve problems, or a tumor. Symptoms may include sore throat, swallowing difficulty, choking, voice changes, or breathing problems.

Pharyngeal Hemorrhage

Bleeding from the pharynx caused by trauma, surgery, infection, vascular lesions, tumor, or severe mucosal disease and potentially threatening the airway.

Pharyngeal Mucositis

Inflammation and ulceration of the throat lining, commonly caused by radiation, chemotherapy, infection, trauma, or medications and producing pain, difficulty swallowing, and reduced intake.

Pharyngeal Stenosis

Narrowing of the pharyngeal passage caused by scarring, congenital abnormality, tumor, inflammation, or surgery, which may impair swallowing or breathing.

Pharyngeal Tonsil

Adenoid tissue in the roof of the throat behind the nose that helps immune defense, especially in children.

Pharyngectomy

Surgery to remove part or all of the throat, usually to treat cancer. Depending on the extent, reconstruction or a temporary feeding tube may be needed, and treatment can affect swallowing, speech, breathing, or appearance.

Pharyngitis

Inflammation of the throat that causes a sore throat and sometimes fever or swollen neck glands. Most cases are caused by viruses; group A streptococcus is an important bacterial cause.

Alternate Names:
Sore Throat; Acute Pharyngitis; Pharyngeal Inflammation

Pharyngolaryngeal Pain

Pain involving the pharynx and larynx, commonly associated with infection, inflammation, irritation, trauma, reflux, or malignancy.

Pharyngomaxillary Space Abscess

A pharyngomaxillary space abscess is a deep infection containing pus near the pharynx and maxilla that can cause severe pain, swelling, difficulty swallowing, and airway risk.

Pharynx

The muscular passage behind the nose and mouth that carries air toward the voice box and food toward the esophagus. It helps with breathing, swallowing,

and speech.

Pharynx Necrosis

Death of tissue in the throat caused by severe infection, ischemia, radiation, caustic injury, or tumor, with risk of deep infection, bleeding, airway compromise, and sepsis.

Pharynx Neoplasm

A pharynx neoplasm is an abnormal growth in the throat that may be benign or malignant.

Phase-Contrast Microscopy

A microscope technique that makes transparent cells and other specimens easier to see by converting small differences in light passing through them into visible contrast. It is useful for examining living, unstained cells.

Phase II Metabolism

A stage of drug breakdown in which the body attaches another chemical group to a medicine or its earlier breakdown product. This usually makes the substance easier to remove in urine or bile.

Phase I Metabolism

An early step in the body's breakdown of many medicines. Enzymes, mainly in the liver, chemically change a medicine by adding or exposing a reactive part; this may inactivate it, activate it, or prepare it for further breakdown.

Phe

Phe is the standard abbreviation for phenylalanine, an essential amino acid incorporated into proteins and metabolized through a pathway disrupted in phenylketonuria.

Phelan-McDermid Syndrome

A genetic disorder that commonly causes low muscle tone, delayed development, intellectual disability, very limited speech, and autism-related behaviors. Some people have reduced sensitivity to pain, seizures, feeding problems, or kidney and heart abnormalities. It usually results from loss of genetic material near the end of chromosome 22 or a change in the *SHANK3* gene.

Alternate Names:
22q13.3 Deletion Syndrome

Phenacetin

Phenacetin is a former analgesic and fever-reducing drug withdrawn or restricted because long-term use can cause kidney damage and increase cancer risk.

Phenazopyridine

Phenazopyridine is a urinary analgesic that temporarily relieves dysuria without treating its cause; it can turn urine orange and prolonged or excessive use may cause haemolysis or methemoglobinaemia.

Phencyclidine

A dissociative drug that can cause altered perception, agitation, hallucinations, impaired coordination, or dangerous behavior.

Phencyclidine Overdose

An excessive amount of the dissociative drug phencyclidine can cause agitation, hallucinations, high body temperature, high blood pressure, seizures, loss of coordination, coma, or injury.

Phencyclidine Substance Use

Phencyclidine is a dissociative drug that can cause agitation, hallucinations, loss of coordination, high blood pressure, seizures, dangerous behavior, or coma.

Phenelzine

An antidepressant that blocks monoamine oxidase, an enzyme breaking down several brain chemicals. It has important interactions with medicines and tyramine-rich foods and can cause dangerous high blood pressure if precautions are ignored.

Phenethylamines

Phenethylamines are a chemical family including neurotransmitters, medicines, and psychoactive substances that can affect adrenergic, dopaminergic, or serotonergic signaling.

Phenformin

Phenformin is a former biguanide diabetes medicine withdrawn because it can cause life-threatening lactic acidosis.

Phenindione

An older oral anticoagulant that interferes with vitamin-K-dependent clotting factors.

Pheniramine Overdose

An excessive amount of pheniramine, an antihistamine, can cause extreme sleepiness or agitation, dry mouth, large pupils, fast heartbeat, seizures, abnormal rhythms, or coma.

Phenobarbital

Phenobarbital is a long-acting barbiturate antiseizure medicine that enhances GABA-A receptor inhibition; sedation, respiratory depression, cognitive effects, dependence, and enzyme-inducing drug interactions are important risks.

Phenobarbital Overdose

Taking too much phenobarbital can cause severe drowsiness, poor coordination, low blood pressure, slowed breathing, coma, or death. Emergency treatment is required, especially if alcohol or another sedative was also taken.

Phenobarbitone

The British name for phenobarbital, a barbiturate anticonvulsant and sedative.

Phenol

An aromatic organic compound consisting of a hydroxyl group attached directly to a benzene ring (carbolic acid), as well as the class of chemical derivatives containing this basic core. Used historically as a surgical antiseptic and currently as a neurolytic agent, chemical peeling agent, and industrial precursor, concentrated phenol causes rapid chemical burns, tissue necrosis, and systemic toxicity including central nervous system depression, cardiac arrhythmias, and renal tubular injury.

Alternate Names:
Phenols; Carbolic Acid

Phenols

Plural form; see *Phenol*.

Phenomenon

An observable event, sign, or pattern in the body. Examples include fingers changing color in Raynaud phenomenon, early-morning blood-sugar rises in the dawn phenomenon, and upward eye movement when the eyelids close in Bell phenomenon.

Phenothiazine

A tricyclic chemical compound and prototype class of first-generation (typical) neuroleptic antipsychotics that act primarily by antagonizing central dopamine D_2 receptors in the mesolimbic and nigrostriatal pathways. Agents such as chlorpromazine, fluphenazine, and prochlorperazine are utilized for psychotic disorders and severe nausea, with adverse effect profiles featuring extrapyramidal symptoms (acute dystonia, parkinsonism, akathisia, tardive dyskinesia), sedation, anticholinergic effects, orthostatic hypotension, and neuroleptic malignant syndrome.

Alternate Names:
Phenothiazines; Phenothiazine Antipsychotic

Phenothiazine Overdose

An excessive amount of a phenothiazine medicine can cause sleepiness, confusion, low blood pressure, seizures, abnormal heart rhythms, or severe muscle stiffness and fever.

Phenothiazines

Plural form; see *Phenothiazine*.

Phenotype

The observable features of a person, such as appearance, growth, body functions, and behavior. These features result from the interaction between inherited genetic information and the environment.

Phenoxybenzamine

A long-acting alpha-blocker used mainly before

surgery for a catecholamine-secreting tumor such as pheochromocytoma. It can cause dizziness, low blood pressure, rapid heartbeat, and nasal congestion.

Phenoxymethylpenicillin

Penicillin V, an oral penicillin used for selected susceptible infections.

Phenprocoumon

Phenprocoumon is a long-acting vitamin-K antagonist anticoagulant that reduces clotting-factor production and requires coagulation monitoring.

Phentermine

A stimulant medicine that reduces appetite and may be used short term with diet and activity changes for weight management. It can raise heart rate and blood pressure and may cause insomnia, anxiety, dependence, or dangerous interactions with some medicines.

Phenthoate

Phenthoate is an organophosphate insecticide that can inhibit acetylcholinesterase and cause cholinergic poisoning after exposure.

Phentolamine

Phentolamine is a short-acting alpha-adrenergic blocker used for catecholamine-related hypertension and to limit tissue injury after certain vasoconstrictor leaks.

Phenylacetate

A salt or ester of phenylacetic acid used in some metabolic and experimental medical applications; it can bind nitrogen-containing metabolites.

Phenylalanine

An essential amino acid incorporated into proteins and converted to tyrosine; impaired metabolism causes phenylketonuria and requires dietary or medical management.

Phenylbutazone

An older anti-inflammatory pain medicine whose use is limited by serious toxicity. It can cause stomach bleeding, kidney or liver injury, fluid retention, blood-cell problems, allergic reactions, and other dangerous effects.

Phenylbutyrate

A nitrogen-scavenging medicine converted to phenylacetate, which combines with glutamine and facilitates nitrogen excretion in selected urea-cycle disorders.

Phenylephrine

A medicine that narrows blood vessels. It may reduce a blocked nose, raise dangerously low blood pressure in hospital care, or widen the pupil in an eye examination; it can worsen high blood pressure, heart problems, or urinary difficulty in some people.

Phenylketonuria

Phenylketonuria is an inherited disorder, usually caused by pathogenic variants in both copies of the PAH gene. Reduced activity of the enzyme phenylalanine hydroxylase impairs the conversion of phenylalanine to tyrosine, causing phenylalanine to build up in the blood. If untreated, high phenylalanine levels can harm brain development and cause intellectual disability, seizures, and behavioral problems. Newborn screening usually detects the disorder before symptoms begin.

Alternate Names:
PKU; Phenylalanine Hydroxylase Deficiency

Phenylketonuria (PKU)

Alternate name; see *Phenylketonuria*.

Phenylpropanolamine

A sympathomimetic decongestant formerly used in some products; it can raise blood pressure and has been restricted because of safety concerns.

Phenytoin

A medicine used to prevent or control some seizures. It reduces repeated electrical activity in brain cells;

levels in the blood may need monitoring because interactions and side effects can include dizziness, poor coordination, gum overgrowth, skin reactions, or serious toxicity.

Phenytoin Overdose

Too much phenytoin can cause nausea, severe dizziness, double vision, involuntary eye movements, poor coordination, confusion, abnormal heart rhythms, or coma. Significant or intentional overdoses can be life-threatening.

Phenytoin Sodium

The sodium salt of phenytoin, an anticonvulsant used for selected focal and generalized tonic-clonic seizures; toxicity can cause nystagmus, ataxia, arrhythmia, or severe skin reactions.

Phenytoin Toxicity

Dose-related toxicity causing horizontal nystagmus, ataxia, dysarthria, lethargy, confusion, or coma; severe overdose can cause hypotension, dysrhythmias, or seizures, particularly after rapid intravenous administration. Serial serum levels, ECG, and neurologic assessment guide supportive care; there is no routine specific antidote.

Pheochromocytoma

A rare neuroendocrine tumor that develops in the adrenal glands, the small glands located on top of each kidney. The tumor causes the adrenal gland to overproduce catecholamines—hormones such as adrenaline and noradrenaline that control the body's fight-or-flight response. This surge of hormones causes episodic or persistent high blood pressure, pounding headaches, heavy sweating, a rapid or pounding heartbeat, and feelings of extreme anxiety.

Alternate Names:
Chromaffin Cell Tumor; Adrenal Medullary Tumor; Pheo

Pheresis

A procedure that removes a selected part of blood, such as plasma, platelets, or white blood cells, and returns the remaining blood. It may treat disease or collect a needed blood component from a donor.

Pheromone

A pheromone is a chemical signal released by an organism that alters behavior or physiology in another member of the same species.

Phialophora

A genus of darkly pigmented fungi that can cause chromoblastomycosis or other subcutaneous and opportunistic infections.

Phialophora Verrucosa

A dark-pigmented fungus that commonly causes chromoblastomycosis, a long-lasting infection of skin and tissue beneath it. Infection usually follows implantation through injured skin and produces slowly enlarging warty or raised lesions.

Philadelphia Chromosome

A rearrangement of genetic material between chromosomes 9 and 22 that creates the BCR::ABL1 gene. It is found in most cases of chronic myeloid leukemia and some acute leukemias and helps guide treatment.

Philodendron Poisoning

Chewing philodendron leaves releases irritating crystals that can cause immediate burning and swelling of the mouth, tongue, or throat. Breathing or swallowing difficulty may occur.

Phimosis

A foreskin that is too tight to pull back over the head of the penis. This is a normal stage of development in babies and many young children as the foreskin separates with age. Scarring or inflammation can cause lasting tightness, which may lead to pain, repeated inflammation, or difficulty urinating.

Phimosis and Paraphimosis

See *Phimosis* and *Paraphimosis*.

Phlebitis

Inflammation of a vein causing pain, warmth, redness, or tenderness along its course. It may follow irritation from an intravenous line or occur with

a clot in a surface vein; sudden limb swelling or breathlessness may indicate a more serious clot.

Phlegmonous Gastritis

A rare, severe bacterial infection of the stomach wall, especially its deeper layers. It can cause sudden abdominal pain, fever, nausea, and vomiting and may lead to tissue damage or sepsis.

Phlebitis And Thrombophlebitis

Phlebitis is inflammation of a vein, while thrombophlebitis includes a clot within the inflamed vein. Superficial disease causes localized pain and redness; deep-vein thrombosis can embolize to the lungs and is suspected with limb swelling, pain, or breathlessness.

Phlebography

An imaging test in which contrast dye is injected into a vein to show the veins on X-ray. It can detect a blood clot or an abnormal vein but is now often replaced by ultrasound.

Phlebotomy

Taking blood from a vein, usually with a needle, for testing, donation, or treatment. The procedure may cause brief pain, bruising, bleeding, fainting, or rarely infection; trained staff use safe collection and labeling practices.

Alternate Names:
Venipuncture

Phlebovirus

A genus of segmented RNA viruses, many transmitted by sandflies or mosquitoes; some cause fever, encephalitis, or hemorrhagic disease.

Phlegm

Thick mucus brought up by coughing from the lower airways. Its amount and appearance can change with infection, asthma, smoking, chronic lung disease, or other conditions.

Phlegmasia Alba Dolens

Painful, marked swelling and pallor of a limb caused by extensive deep-vein thrombosis, usually involving major venous outflow. It can threaten the limb and circulation.

Alternate Names:
Milk Leg; Femoral Thrombophlebitis

Phlegmasia Cerulea Dolens

Phlegmasia cerulea dolens is a severe, extensive deep-vein thrombosis that obstructs venous outflow, causing painful swollen blue discoloration and risking limb ischemia or pulmonary embolism.

PH Meter

An instrument that measures acidity or alkalinity as pH in a solution or specimen; clinical applications include gastric, urinary, laboratory, and environmental measurements.

PH Monitoring

Measurement of acidity, usually in the esophagus, over time with a small sensor. It can help detect and measure acid reflux when symptoms or endoscopy do not give a clear answer.

Phobia

An intense, persistent, and irrational fear of a specific object, creature, activity, or situation that is disproportional to the actual threat posed, prompting immediate distress and active avoidance that impairs normal daily functioning. Categories include specific phobias (e.g., animal, natural environment, blood-injection-injury, situational), social anxiety disorder (social phobia), and agoraphobia. First-line management involves graded exposure therapy and cognitive-behavioral techniques.

Alternate Names:
Phobias; Phobic Disorder

Phobias

Plural form; see *Phobia*.

Phobic Disorder

A disorder characterized by clinically significant fear and avoidance of a particular object or situation.

Phocomelia

A rare congenital limb-development defect in which hands or feet are attached close to the trunk because of absent or severely shortened long bones.

Phonation

Production of voiced sound when exhaled air makes the vocal folds vibrate in the larynx; disorders cause hoarseness, weak voice, or loss of voice.

Phonocardiogram

A graphic recording of heart sounds and murmurs, traditionally made with a microphone over the chest. It can document timing and duration but is usually interpreted with examination and echocardiography.

Phonocardiography

Recording heart sounds and murmurs with a microphone, producing a tracing that can help evaluate heart valve problems.

Phonological Disorder

A communication disorder involving persistent difficulty producing or organizing speech sounds beyond what is expected for age and language development.

Phonophobia

Unusual sensitivity to sound or distress caused by ordinary sounds. It often occurs with migraine but may also accompany concussion, infection, anxiety, or other conditions; new severe sound sensitivity with headache or neurological symptoms can indicate serious disease.

Phorate

Phorate is a highly toxic organophosphate pesticide whose exposure can produce excessive cholinergic activity and medical emergency.

Phorbols

Phorbols are diterpene compounds related to phorbol esters that can activate cellular protein kinase C signaling.

Phorometer

An instrument used to measure ocular alignment and the amount of prism correction needed for binocular vision disorders.

Phosgene

A highly toxic industrial gas that reacts with moist respiratory tissues and can cause delayed pulmonary edema, cough, chest tightness, and respiratory failure after exposure.

Phosgene Oxime

A highly corrosive chemical warfare agent that causes immediate severe pain, skin and eye injury, airway damage, and tissue necrosis on contact.

Phosmet

Phosmet is an organophosphate insecticide that can inhibit acetylcholinesterase and cause cholinergic toxicity after substantial exposure.

Phosphamidon

A poisonous organophosphate insecticide. Exposure can cause sweating, excess saliva, vomiting, diarrhea, small pupils, muscle twitching, breathing difficulty, seizures, or weakness because it disrupts nerve signals.

Phosphate

An inorganic ion and component of nucleotides, phospholipids, proteins, and bone mineral. It participates in ATP energy transfer, phosphorylation-dependent signaling, intracellular buffering, and acid excretion by the kidney.

Phosphate Test

A blood test measuring inorganic phosphorus/phosphate, vital for bone mineralization, energy metabolism, and cellular signaling; see *Phosphate*.

Phosphate Binders

Medicines taken with meals that bind phosphate in food inside the intestine, reducing its absorption. They are used mainly in advanced kidney disease when blood phosphate is high. The choice depends

on calcium levels, vascular calcification, other illnesses, and treatment response.

Phosphate Homeostasis

The body keeps blood phosphate within a useful range through the coordinated actions of the parathyroid glands, vitamin D, kidneys, intestines, and bones. Kidney disease can disrupt this balance.

Phosphatidic Acid

A membrane phospholipid and signaling intermediate that serves as a precursor for other glycerolipids and influences membrane curvature, trafficking, and cell growth.

Phosphatidylcholine

A major membrane phospholipid and component of pulmonary surfactant, lipoproteins, and bile; it also participates in cell signaling.

Phosphatidylethanolamines

Membrane phospholipids containing ethanolamine that help determine membrane structure, fusion, and cell signaling. A group of cell-membrane fats that help maintain membrane shape, join membranes, and support cell signaling.

Phosphatidylinositol

A membrane phospholipid that serves as a precursor for signaling molecules and helps anchor proteins to cell membranes.

Phosphatidylserine

An essential glycerophospholipid component of cell membranes that is normally restricted to the inner (cytoplasmic) leaflet of the lipid bilayer by flippases. During early apoptosis or platelet activation, phosphatidylserine is externalized to the outer leaflet via scramblase activity, serving as an "eat-me" signal recognized by phagocytes and providing a catalytic platform for coagulation factor complexes (tenase and prothrombinase).

Alternate Names:
Phosphatidylserines; PtdSer; PS

Phosphatidylserines

Plural form; see *Phosphatidylserine*.

Phosphaturia

Excretion of phosphate in urine. The amount is regulated by the kidneys and hormones such as parathyroid hormone and is measured when evaluating phosphate balance, kidney-tubule function, or some stone disorders. Excessive renal phosphate loss may occur with proximal tubular dysfunction or hormonal disease.

Phosphaturic Mesenchymal Tumor

A rare tumor that releases a substance causing the kidneys to lose too much phosphate. Low phosphate can soften bones and cause bone pain, weakness, or fractures; removing the tumor often corrects the problem.

Phosphine

A highly toxic gas used in some industrial or pest-control settings that can cause severe lung, heart, liver, kidney, and neurologic injury.

Phosphodiesterase-5 Inhibitors

Medicines that block an enzyme called PDE-5, increasing a chemical signal that relaxes blood vessels. They are used for erectile dysfunction and some forms of high blood pressure in the lung; concurrent nitrate use can cause severe low blood pressure.

Phosphofructokinase-1

A key enzyme that controls how cells break down sugar to produce energy, especially when energy demand increases.

Phospholipase C Pathway

A system cells use to turn some hormone or nerve signals at their surface into internal actions. It can change calcium levels and control contraction, secretion, growth, or other cell responses.

Phospholipid

A type of lipid with a water-attracting phosphate-containing head and water-repelling fatty-acid tails.

Phospholipids form the basic double-layered structure of cell membranes and also help with cell signaling and transport.

Phosphorus

An essential element in bone, nucleic acids, phospholipids, and ATP.

Phosphorus Blood Test

A blood test measuring inorganic phosphate, interpreted with calcium, parathyroid hormone, vitamin D, and kidney function to evaluate mineral and renal disorders.

Phosphorus In Diet

Dietary phosphorus comes from protein-rich foods and many processed foods; people with kidney disease may need individualized limits.

Phosphorylation

Addition of a phosphate group to a molecule, often regulating protein activity or energy transfer.

Photoallergy

An immune-mediated skin reaction that occurs when ultraviolet light activates a sensitizing substance on or in the skin, causing an eczematous rash.

Photocoagulation

Treatment that uses intense light, usually a laser, to heat and seal targeted tissue. In the eye, it can close leaking or abnormal blood vessels and limit damage from conditions such as diabetic retinopathy.

Photodermatosis

A skin disorder caused or aggravated by exposure to ultraviolet or visible light, including polymorphous light eruption, phototoxic reactions, and photoallergic reactions.

Photodynamic Therapy

A treatment that combines a photosensitizing agent with light to generate reactive oxygen species and destroy cancer cells, used for actinic keratosis, superficial skin cancers, and selected visceral tumors.

Photodynamic Therapy For Cancer

Treatment in which a light-sensitive medicine collects in selected abnormal cells and is activated by a specific light, producing substances that destroy nearby cancer cells. It is used for certain accessible cancers and may cause pain, swelling, or temporary light sensitivity.

Photoelectric Effect

An interaction in which tissue absorbs an X-ray and releases an electron. It contributes to how much radiation is absorbed and helps create contrast between tissues on an X-ray image.

Photographic Fixative Poisoning

Harm from swallowing or inhaling chemicals used to process photographs. Effects depend on the product but may include irritation, vomiting, breathing problems, or chemical burns; keep the container and contact poison control.

Photomultiplier Tube

A sensitive device that converts tiny flashes of light into electrical signals. In some medical scanners, groups of these devices help detect and locate radiation emitted by a tracer.

Photopeak

The part of a radiation-measurement graph showing photons that deposited their full energy in the detector. Clinicians use it to select the energy range for interpreting some nuclear medicine scans.

Photopheresis

A treatment in which some blood cells are removed, mixed with a light-sensitive medicine, exposed to ultraviolet light, and returned to the body. It is used for selected immune, blood, and skin disorders under specialist care.

Photophobia

Unusual discomfort or pain caused by light, sometimes leading a person to avoid bright surroundings.

It may occur with migraine, corneal injury, eye inflammation, infection, concussion, or meningitis. Severe eye pain, vision loss, fever, stiff neck, or a sudden severe headache can indicate serious disease.

Photoplethysmography

A noninvasive optical method that detects blood-volume changes in tissue. It is used in devices such as pulse oximeters and some heart-rate monitors.

Photoreceptors

Specialized cells in the retina that detect light. Rods support dim-light and peripheral vision, while cones provide color and sharp central vision; damage can reduce sight or cause blind areas.

Photorefractive Keratectomy

Laser surgery that removes a very thin surface layer of the cornea and reshapes the layer beneath it. It can reduce short-sightedness, long-sightedness, or astigmatism, but recovery is slower than some procedures and pain, haze, infection, or imperfect vision can occur.

Photosensitivity

An unusually strong reaction of the skin to sunlight, causing redness, burning, itching, blistering, or a rash on exposed areas. It may result from a disease, inherited tendency, medicine, or chemical.

Photosensitization

Increased sensitivity to ultraviolet or visible light caused by a medication, chemical, or disease, producing an exaggerated skin reaction.

Photosensitizing Drugs

Alternate name; see *Drug-Induced Photosensitivity*.

Phototherapy

Treatment using carefully controlled light for conditions such as newborn jaundice, psoriasis, eczema, or seasonal depression. The wavelength, dose, duration, and eye or skin protection depend on the condition treated.

Phototoxic Dermatitis

A sunburn-like skin injury caused when a medicine or chemical makes the skin react strongly to ultraviolet light. It affects exposed areas and may cause redness, pain, swelling, blisters, or later darkening.

Phototoxicity

Skin injury occurring when a chemical makes skin unusually sensitive to ultraviolet light. It resembles severe sunburn and may cause redness, pain, blistering, or later darkening after medicine or chemical exposure.

Phrenic

Relating to the diaphragm or the phrenic nerves, which arise from the neck and carry the main motor supply to the diaphragm for breathing.

Phrenic Nerve

The nerve arising mainly from C3-C5 that supplies the diaphragm and carries sensory fibers from nearby structures.

Phrenic Nerve Palsy

Paresis or complete paralysis of the phrenic nerve (arising from cervical roots C3, C4, C5), leading to denervation, elevated position, and paradoxical movement of the ipsilateral hemidiaphragm during inspiration. Common etiologies include mediastinal malignancy (bronchogenic carcinoma), thoracic surgical trauma (cardiac or pulmonary resections), cervical spine trauma, and severe neuralgic amyotrophy.

Alternate Names:
Diaphragmatic Hemiparalysis

PHT

Alternate name; see *Portal Hypertension*.

Phthiriasis

Infestation with lice, especially pubic lice, causing itching and sometimes visible lice or eggs attached to hair. Treatment usually includes an approved lice-killing product, washing or sealing recently used clothing and bedding, and evaluation or treatment

of close or sexual contacts.

Phyllodes Tumor

A rare fibroepithelial neoplasm of the breast characterized by leaf-like stromal architecture with hypercellularity and elongated cleft-like epithelial spaces. Classified histologically by the World Health Organization as benign, borderline, or malignant based on stromal cellularity, atypia, mitotic activity, margin status, and stromal overgrowth. Unlike fibroadenomas, they carry a propensity for local recurrence and, in malignant cases, hematogenous metastasis (typically to lungs or bone); treatment requires wide local surgical excision with clear negative margins without routine axillary node dissection.

Alternate Names:
Phyllodes Tumors; Cystosarcoma Phyllodes

Phyllodes Tumors

Plural form; see *Phyllodes Tumor*.

Physiatrist

A doctor who specializes in rehabilitation and in improving movement, function, independence, and quality of life after illness, injury, or disability.

Physical Abuse

Deliberate use of physical force that causes or risks injury, pain, disability, or death. In clinical care, suspected abuse requires attention to immediate safety, documentation, and reporting duties under local law.

Physical Activity

Any movement produced by skeletal muscles that increases energy expenditure, including occupational, household, transportation, and recreational movement. Regular activity supports cardiovascular, metabolic, musculoskeletal, and mental health.

Physical Allergy Urticaria

Hives triggered by a physical stimulus such as pressure, cold, heat, sunlight, vibration, water, or exercise. The trigger causes mast-cell activation and itchy raised welts; severe breathing or circulation symptoms can indicate anaphylaxis.

Physical Child Abuse

Physical child abuse is intentional physical injury or harmful force inflicted on a child, requiring immediate safety assessment, medical care, and safeguarding action.

Physical Dependence

A state in which the body adapts to a substance or medication and develops withdrawal symptoms when it is reduced or stopped.

Physical Exam Frequency

The interval between physical examinations. It varies with age, symptoms, chronic conditions, medicines, pregnancy, and preventive-care guidance rather than following one schedule for everyone.

Physical Examination

A systematic assessment of the body using inspection, palpation, percussion, auscultation, and other examination methods.

Physical Half-Life

The time needed for half the radioactive atoms in a substance to change through radioactive decay. It describes the substance itself and does not include how quickly the body removes it.

Physical Medicine

Alternate name; see *Physical Medicine and Rehabilitation*.

Physical Medicine and Rehabilitation

The medical specialty focused on improving function and independence after illness or injury. It addresses movement, pain, communication, cognition, and daily activities through rehabilitation medicine and related therapies.

Alternate Names:
PM&R; Physiatry

Physical Therapy

Alternate name; see *Physiotherapy*.

Physical Therapy Assessment

A detailed evaluation of movement, strength, flexibility, sensation, balance, walking, pain, and daily activities. The findings guide treatment goals, exercise choices, equipment needs, safety advice, and progress monitoring.

Physician Assistant

A licensed medical clinician who works with physicians and other healthcare professionals. Depending on local law and practice setting, physician assistants may examine patients, diagnose and treat illness, prescribe medicines, and perform procedures.

Physicians' Desk Reference

A reference source containing prescribing information, indications, contraindications, dosing, warnings, and adverse effects for medicines and selected products.

Physiologic

Physiologic means relating to normal body function or a process occurring within the expected biological range.

Physiological Dead Space

The part of a breath that does not exchange oxygen and carbon dioxide with blood. It includes the air passages and lung areas that receive little or no blood flow.

Physiologic Jaundice Of Newborn

A common temporary yellowing of a newborn's skin and eyes that begins after the first day of life. It results from normal newborn red-cell breakdown and immature liver processing of bilirubin; jaundice that starts earlier or becomes severe can indicate pathologic hyperbilirubinemia.

Physiologic Jaundice Of The Newborn

Physiologic newborn jaundice is a temporary bilirubin rise after birth caused by immature bilirubin processing; jaundice beginning early or becoming severe may have a pathologic cause.

Physiology

The study of how healthy body parts, organs, and living organisms normally work together. It examines processes such as breathing, circulation, digestion, movement, hormone action, nerve signaling, and maintaining internal balance.

Physiotherapy

A healthcare profession that helps people improve movement, strength, function, and independence after injury, illness, surgery, or disability. Treatment may include exercise, movement training, hands-on techniques, and other methods tailored to the person.

Alternate Names:
Physical Therapy; PT; Movement Rehabilitation Therapy

Physostigmine

A reversible acetylcholinesterase inhibitor that may reverse severe central anticholinergic delirium in carefully selected patients after assessment for contraindications and cardiac conduction abnormalities.

Phytomenadione

A form of vitamin K needed by the liver to make several blood-clotting proteins. It is used to prevent or treat bleeding caused by vitamin K deficiency or by medicines that block vitamin K.

Phytophotodermatitis

A phototoxic reaction caused when psoralens or related furocoumarins from plants such as limes, celery, or wild parsnip contact the skin and are followed by ultraviolet-A exposure. Burning, sharply patterned redness, streaks, or blisters may be followed by prolonged postinflammatory hyperpigmentation; it is not an immune-mediated sun allergy.

Phytotherapy

A treatment approach using medicinal plants or plant-derived preparations. Safety and effectiveness vary by product and condition; interactions, contamination, incorrect dosing, and delayed effective care are possible.

PI

Abbreviation for primary immunodeficiency, a group of inherited or acquired disorders in which immune defenses are absent, reduced, or dysfunctional, leading to recurrent or unusual infections and sometimes autoimmune disease.

Pia Mater

The thin, delicate inner covering that closely follows the surface of the brain and spinal cord. Together with the other coverings and fluid around the nervous system, it helps protect these organs.

Pica

Repeated eating of things that have no useful nutritional value, such as soil, paper, ice, or hair, when this is not expected for a person's age or culture. It may cause poisoning, infection, blockage, or poor nutrition and can be linked with iron deficiency or mental-health conditions.

PICC Line Dressing Care

Replacement of the dressing covering a peripherally inserted central catheter site. A sterile technique helps reduce infection risk, and the site is checked for redness, drainage, pain, or catheter movement.

PICC Line Flushing

Passing a prescribed sterile solution through a peripherally inserted central catheter to help keep it open. The solution and method depend on the catheter and local clinical guidance.

PICC Line Insertion

Placement of a thin catheter through a vein in the arm, with its tip advanced to a large vein near the heart. Imaging or other guidance is used to confirm the tip position.

Pick Disease

A distinct subtype of frontotemporal lobar degeneration (FTLD-tau) characterized pathologically by circumscribed knife-edge frontotemporal cortical lobar atrophy and intracellular round, silver-staining, tau-positive inclusions (Pick bodies), presenting with progressive behavioral disinhibition, personality change, and language impairment.

Alternate Names:
Frontotemporal Dementia with Pick Bodies; FTLD-Tau

Pick's Disease

An older term often referring to frontotemporal dementia, a group of disorders causing progressive changes in behavior, personality, language, or executive function. The term is now used less consistently.

Pick's Disease

A historical name for a subtype of frontotemporal dementia characterized by progressive changes in behavior, personality, language, or executive function and, on pathology, characteristic Pick bodies in affected neurons.

Pickwickian Syndrome

An older name for obesity hypoventilation syndrome, involving obesity, daytime hypercapnia, and sleep-disordered breathing.

PID

Alternate name; see *Pelvic Inflammatory Disease*.

Piebaldism

A rare condition present from birth in which some areas of skin and hair lack pigment. It usually causes stable, sharply outlined white patches and often a white section of hair at the front; it is commonly inherited through a change in the KIT gene.

Piedra

A superficial fungal infection of hair shafts producing hard or soft nodules attached to the hair. Black piedra is caused by Piedraia hortae, while white piedra is caused by Trichosporon species; treatment may include hair trimming and antifungal therapy.

Pierre Robin Sequence

A condition present at birth in which a small lower jaw allows the tongue to fall backward and may block breathing. Many affected infants also have a U-shaped opening in the roof of the mouth and

feeding difficulty.

Pierson Syndrome

A rare inherited condition causing severe kidney protein loss from birth and unusually small pupils. It can lead to swelling, kidney failure, poor vision, and developmental problems.

Piezogenic Pedal Papules

Small, soft skin-colored papules caused by fat herniating through connective tissue at the edges of the heels when standing. They are common and usually harmless, but may be painful with prolonged standing or in people with connective-tissue disorders.

Pigeon Breast

Alternate name; see *Pectus Carinatum*.

Pigment

A substance that gives skin, hair, eyes, tissue, or other material its color. Pigments may be made by the body, received from outside, or altered by disease, injury, medicines, or aging.

Pigmentary Glaucoma

A secondary open-angle glaucoma caused by dispersion of iris pigment, which accumulates in the trabecular meshwork and impairs aqueous outflow. It may cause raised intraocular pressure and progressive optic-nerve damage.

Pigmentary Mosaicism

Uneven skin coloring caused by groups of skin cells carrying different genetic information. It may produce lighter or darker lines, swirls, or patches; most cases affect only the skin, while some are associated with developmental abnormalities.

Pigmentation

Coloration of skin, hair, eyes, or other tissue produced mainly by melanin, carotenoids, blood, or exogenous material; abnormal changes may reflect inflammation, endocrine disease, drugs, or tumors.

Pigmentation Disorder

A condition causing abnormal increase, decrease, or uneven distribution of pigment in the skin, mucosa, hair, or eye.

Pigment Cirrhosis

Liver cirrhosis associated with abnormal pigment or iron deposition, as may occur in hereditary hemochromatosis.

Pigment Dispersion Syndrome

An ocular condition characterized by the mechanical shedding of pigment granules from the posterior surface of the iris (due to rubbing against lens zonules), which deposit on the corneal endothelium (Krukenberg spindle) and obstruct the trabecular meshwork, predisposing to pigmentary glaucoma.

Pigmented Birthmarks

Areas of darker skin present at birth or appearing in early infancy. Examples include congenital moles, café-au-lait spots, and dermal melanocytosis; some other birthmarks are caused by blood vessels rather than pigment.

Alternate Names:
Birthmarks, Pigmented

Pigmented Purpuric Dermatosis

A group of chronic harmless eruptions caused by leakage of small amounts of blood from superficial vessels. They produce reddish-brown or copper-colored speckles and patches, commonly on the lower legs, and usually do not cause systemic illness.

Pilar Cyst

A usually harmless, firm lump beneath the skin that forms from a hair follicle, most often on the scalp. It may be inherited, become inflamed or painful, and can usually be removed if it causes symptoms or repeated problems.

Piles

Enlarged or swollen blood vessels and supporting tissue in the anus or lower rectum. Internal piles may cause painless bright-red bleeding or tissue

protruding during bowel movements; external piles may cause pain, itching, or a tender lump.

Piles (Haemorrhoids)

Alternate name; see *Piles*.

Pill

A solid medicine designed to be taken by mouth. It may contain one or more active ingredients and may release them immediately or slowly; crushing some pills can alter drug release or increase toxicity.

Alternate Names:
Tablet

Pilocarpine

A medicine that activates muscarinic receptors, causing pupil constriction and increased secretions. It may lower eye pressure in glaucoma or relieve dry mouth, but can cause sweating, blurred vision, headache, or breathing problems.

Pilocytic Astrocytoma

A usually slow-growing brain tumor arising from support cells, most often in children. It commonly affects the cerebellum or visual pathway and may cause headache, vomiting, seizures, balance problems, or vision changes.

Piloerection

Elevation of hair shafts producing gooseflesh, caused by contraction of arrector pili muscles under sympathetic stimulation from cold, fear, pain, fever, or certain drugs.

Pilomatrix Carcinoma

A rare skin cancer that develops from cells involved in hair formation. It usually appears as a firm lump on the head, neck, or arm and can grow into nearby tissue or spread elsewhere.

Pilomatrixoma

Pilomatrixoma is a usually benign skin tumor derived from hair-matrix cells, presenting as a firm subcutaneous nodule, often on the head or neck.

Pilomatrixoma (Pilomatricoma)

A usually benign, firm skin tumor arising from hair-matrix cells, most often on the head, neck, or upper limbs of children and young adults. It may be mistaken for a cyst; excision confirms the diagnosis and is usually curative.

Pilonidal Cyst

A cyst or sinus in the cleft between the buttocks, usually containing hair and skin debris. It may become infected, painful, swollen, and drain pus.

Alternate Names:
Pilonidal Sinus; Sacrococcygeal Fistula

Pilonidal Dimple

Alternate name; see *Sacral Dimple*.

Pilonidal Disease

A condition in which hair and skin debris collect in a small pit or tunnel in the cleft between the buttocks. It can cause repeated swelling, pain, drainage, or an abscess.

Pilonidal Fistula

An abnormal tunnel from a pilonidal sinus to the skin, usually in the natal cleft, that can drain pus or recur after abscess formation.

Pilonidal Sinus Disease

A chronic sinus or cyst in the natal cleft, usually containing hair and debris. It may cause recurrent pain, swelling, drainage, or abscess formation.

Pilus

A tiny hair-like structure on some bacteria. It may help bacteria attach to human cells, move, or transfer genetic material to other bacteria, which can contribute to infection or antibiotic resistance.

Pimozide

An antipsychotic medicine used for selected disorders involving severe tics or abnormal thoughts. It can cause movement problems, sleepiness, and dangerous heart-rhythm changes, so dosing and heart monitoring require careful medical supervision.

Pimple

A common lay term for a small inflamed or blocked skin lesion, often an acne papule or pustule.

Pimples (Acne)

Alternate name; see *Acne*.

Pin Care

Pin care keeps the skin around external fixation or traction pins clean and monitored for redness, swelling, drainage, loosening, or infection.

Pinched Nerve

Compression or irritation of a nerve that can cause pain, tingling, numbness, or weakness along the nerve's distribution.

Alternate Names:
Compressed Nerve; Nerve Compression; Radiculopathy

Pinch Strength

Pinch strength is the force produced when the thumb presses against one or more fingers and can help assess hand, nerve, muscle, and functional impairment.

Pindolol

Pindolol is a beta-blocker used for selected cardiovascular conditions; it can slow the heart rate and worsen asthma in susceptible people.

Pineal Cyst

A fluid-filled sac in the small gland deep in the brain that helps regulate sleep-related signals. Most are found incidentally and cause no harm, but a large cyst can rarely cause headache, eye problems, or fluid buildup.

Pineal Germinoma

A pineal germinoma is a malignant germ-cell tumor in the pineal region, often causing headache, eye-movement abnormalities, or hydrocephalus and usually responsive to radiotherapy and chemotherapy.

Pineal Gland

A small hormone-producing gland deep in the brain that releases melatonin. Melatonin helps coordinate the body's day-night clock and influences sleep timing, seasonal rhythms, and related biological functions.

Pineal Gland Tumor

A growth in or near the pineal gland. It may block the normal flow of brain fluid and cause headache, nausea, vomiting, sleepiness, or problems moving the eyes; symptoms and treatment depend on its type and size.

Pinealoma

An older, imprecise term for a tumor in or near the pineal gland. Such tumors include several different types, so the specific diagnosis depends on imaging and tissue examination.

Pineal Parenchymal Tumor

A tumor arising from cells of the pineal gland, ranging from slow-growing to aggressive. It may block the flow of brain fluid and cause headache, vomiting, sleep changes, or abnormal eye movements.

Pineoblastoma

An aggressive cancer in the pineal region of the brain, occurring mainly in children. It may block brain-fluid flow and cause headache, vomiting, sleepiness, or eye-movement problems.

Pineocytoma

Pineocytoma is a usually slow-growing tumor of pineal cells that may obstruct cerebrospinal-fluid flow and cause raised intracranial pressure.

Pine Oil Poisoning

Swallowing or inhaling concentrated pine oil can irritate the mouth and stomach and may cause drowsiness, seizures, or lung injury if it enters the lungs.

Pinguecula

A benign yellowish, raised deposit on the conjunc-

tiva near the edge of the cornea. It does not grow onto the cornea and is associated with long-term exposure to ultraviolet light, wind, and dust; it may cause irritation.

Pinhole Meatus

An unusually tiny external opening, most often the opening of the urethra. It can make urine flow weak or spraying, cause discomfort, or make catheter placement difficult.

Pink Eye

A common name for conjunctivitis, inflammation of the eye covering causing redness, irritation, watering, or discharge.

Alternate Names:
Conjunctival Inflammation; Acute Conjunctivitis

Pink Puffer

An older, nonformal term for a person with emphysema who has severe breathlessness, a thin build, and pursed-lip breathing. The term is not a separate diagnosis and is less useful than describing the person's COPD and test results.

Pinna

The visible external part of the ear that collects sound.

Pinocytosis

A process in which a cell takes in small drops of surrounding fluid and dissolved substances. The cell membrane folds inward to form tiny bubbles that carry the material inside for use, transport, or breakdown.

Pins and Needles

A common name for paresthesia, an abnormal tingling, prickling, or numb sensation. Brief episodes often follow pressure on a nerve; persistent symptoms can occur with nerve or circulation disorders.

Pint

A unit of volume whose exact amount varies by measurement system; a US liquid pint and an imperial pint are different volumes.

Pinta

A long-lasting skin infection caused by Treponema carateum bacteria. It spreads through close skin contact and produces changing stages of discolored, scaly, or thickened patches, usually without damage to internal organs.

Pinworm

A small, parasitic nematode (*Enterobius vermicularis*) that infects the human gastrointestinal tract, especially in young children. Female worms migrate out through the anus at night to deposit eggs in the perianal skin, causing intense nocturnal pruritus ani, excoriation, and restlessness. Transmission occurs via the fecal-oral route by ingestion of infective eggs on contaminated hands, clothing, or bedsheets. Diagnosis is made using the cellophane tape test, and treatment involves anthelmintics (pyrantel pamoate, albendazole, or mebendazole) administered to the patient and household contacts in two doses spaced two weeks apart.

Alternate Names:
Pinworms; Enterobius vermicularis; Enterobiasis; Threadworm

Pinworm Infection

Pinworm infection is an intestinal infestation by Enterobius vermicularis, causing nighttime anal itching, disturbed sleep, and sometimes abdominal or genital irritation. Treatment of the person and close household contacts, hygiene, and repeat dosing reduce reinfection.

Alternate Names:
Enterobiasis; Oxyuriasis; Threadworm Infection

Pinworm Infestation

Alternate name; see *Pinworm Infection*.

Pinworms

Plural form; see *Pinworm*.

Pinworm Test

A test for Enterobius vermicularis, usually the early-

morning adhesive-tape test applied to the perianal skin before bathing or defecation.

Pioglitazone

A medicine for type 2 diabetes that helps muscle and fat cells respond better to insulin, lowering blood sugar. It can cause weight gain and swelling and may worsen heart failure, so it is unsuitable for some people.

Piperacillin

Piperacillin is an extended-spectrum penicillin antibiotic often combined with tazobactam to treat serious infections including Pseudomonas; allergy, diarrhoea, cytopenias, electrolyte effects, and renal dosing are important.

Piperazine

An older antiparasitic medicine that paralyzes certain intestinal worms, especially roundworms and pinworms. Its use depends on local guidance and the particular infection.

Piperonyl Butoxide

A pesticide synergist that inhibits insect detoxification enzymes and increases the activity of certain insecticides; it can irritate skin, eyes, or airways.

Piperonyl Butoxide With Pyrethrins Poisoning

Exposure to these insecticide ingredients can irritate the skin, eyes, or airways and may cause coughing, nausea, vomiting, dizziness, or wheezing. Severe exposure can cause breathing difficulty or systemic toxicity.

Pipotiazine

A long-acting phenothiazine antipsychotic given by injection in selected settings. It can cause movement disorders, drowsiness, and other adverse effects, particularly with prolonged exposure.

Pipradrol

An older central nervous system stimulant with limited current use.

Piracetam

A nootropic compound used in some countries for selected neurologic indications; evidence and approval vary.

PI-RADS

A standard scoring system for prostate MRI findings. It estimates how likely an area is to contain an important prostate cancer and helps guide decisions about follow-up or biopsy; it does not diagnose cancer by itself.

Pirfenidone

Pirfenidone is an antifibrotic medicine used to slow decline in idiopathic pulmonary fibrosis; nausea, photosensitivity, fatigue, and liver-enzyme elevation may occur and require monitoring.

Piriformis Syndrome

Pain or altered sensation in the buttock or down the leg when the piriformis muscle irritates or presses on the sciatic nerve. Similar symptoms can result from other causes, especially spinal nerve disorders.

Alternate Names:
Piriformis Muscle Spasm; Deep Gluteal Syndrome

Pirimicarb

Pirimicarb is a selective carbamate insecticide targeting aphids; exposure can inhibit acetylcholinesterase and cause cholinergic symptoms.

Piromidic Acid

An older quinolone-like antibacterial investigated or used for urinary and gastrointestinal infections; current use depends on local availability, susceptibility, and safety guidance.

Piroxicam

A long-acting nonsteroidal anti-inflammatory drug used for pain and inflammation; gastrointestinal bleeding, kidney injury, cardiovascular events, and hypersensitivity are important risks.

Piroxicam Overdose

Taking too much piroxicam, an anti-inflammatory

pain medicine, can cause stomach pain, vomiting, bleeding, kidney injury, drowsiness, seizures, or breathing problems. Large or intentional overdoses can be life-threatening.

Pisa Syndrome

A sustained involuntary sideways flexion of the trunk, often associated with medicines, Parkinson disease, or other neurologic disorders.

Pisiform

A small, pea-shaped wrist bone embedded in a tendon on the little-finger side of the palm. It helps form the passageway for the ulnar nerve and artery and may hurt after injury or with arthritis.

Pisiform Bone

A small pea-shaped carpal bone embedded in the tendon of flexor carpi ulnaris on the ulnar side of the wrist; fracture or arthritis can cause localized wrist pain.

Pits

Small depressions or holes in a surface. In medicine, pits may occur in nails, skin, teeth, or other tissues and can result from normal anatomy, injury, infection, inflammation, or inherited conditions.

Pitted Keratolysis

A superficial, non-inflammatory bacterial infection of the stratum corneum of the plantar foot (most commonly caused by *Kytococcus sedentarius* or *Corynebacterium* species), presenting with punched-out superficial crateriform pits, hyperhidrosis, and severe sulfurous malodor (bromhidrosis).

Pitting Edema

Swelling in which pressure applied to the skin leaves a temporary indentation, usually because of excess interstitial fluid.

Pituicytoma

A rare, usually slow-growing tumor near the pituitary gland. It may cause headache, vision problems, or hormone disturbances by pressing on nearby structures and is usually assessed with brain imaging and tissue examination.

Pituitary

The pituitary is an endocrine gland at the base of the brain that releases hormones controlling growth, thyroid and adrenal function, reproduction, lactation, and water balance.

Pituitary Adenoma

A usually noncancerous growth arising from the front part of the pituitary gland. It may release too much of a hormone or press on nearby tissue, causing headache, vision changes, or hormone problems.

Pituitary Apoplexy

Sudden bleeding or loss of blood supply inside a pituitary growth, causing severe headache, vision changes, vomiting, eye-movement problems, or confusion. It is an emergency because hormone failure can cause life-threatening low blood pressure.

Pituitary Carcinoma

Pituitary carcinoma is a rare malignant pituitary tumor defined by spread to distant or separate sites, often producing excess hormones.

Pituitary Disease

A disorder of the pituitary gland that alters hormone secretion or causes mass effects, including adenomas, inflammation, hemorrhage, genetic disease, or hypopituitarism.

Pituitary Dwarfism

Pituitary dwarfism is severe short stature caused by deficient growth hormone or broader pituitary dysfunction, with evaluation focused on endocrine and genetic causes.

Pituitary Gland

Also called the hypophysis, this pea-sized gland sits at the base of the brain beneath the hypothalamus. Its front part (anterior pituitary) grows from Rathke's pouch and makes six hormones: growth hormone, adrenocorticotropic hormone, thyroid-

stimulating hormone, prolactin, follicle-stimulating hormone, and luteinizing hormone. Signals from the hypothalamus reach it through portal blood vessels. Its back part (posterior pituitary) develops from brain tissue and stores and releases antidiuretic hormone and oxytocin, made in the hypothalamus, which help control water balance, childbirth, and milk release.

Pituitary Hormone

A hormone secreted by the anterior or posterior pituitary that regulates growth, thyroid and adrenal function, reproduction, lactation, water balance, or other endocrine organs.

Pituitary Insufficiency

Alternate name; see *Hypopituitarism*.

Pituitary Macroadenoma

A pituitary adenoma measuring at least 10 mm. It may compress the optic chiasm and cause visual-field loss or headache, or alter pituitary hormone production; MRI, visual-field testing, and endocrine assessment are central to evaluation.

Pituitary Microadenoma

A pituitary adenoma smaller than 10 mm. It may be hormonally inactive and found incidentally or may produce prolactin, ACTH, growth hormone, or other hormones; evaluation depends on imaging and endocrine findings.

Pituitary Neoplasm

A pituitary neoplasm is an abnormal growth in or near the pituitary gland and may affect hormones, vision, or nearby brain structures.

Pituitary Neuroendocrine Tumor

Alternate name; see *Pituitary Tumor*.

Pituitary Tumor

A pituitary tumor is a growth in the pituitary gland that may be noncancerous but can cause hormone excess, hormone deficiency, or visual problems.

Pituitary Tumors Pathology

Pathologic assessment of pituitary neuroendocrine tumors, including cell lineage, hormone production, reticulin architecture, cytologic features, proliferative activity, and invasion. Immunohistochemistry helps classify the tumor.

Pityriasis

A group of skin conditions marked by fine, flaky scaling. Examples include pityriasis rosea and pityriasis versicolor, which have different causes and may produce itching or lighter, darker, or pink patches.

Pityriasis Alba

Pityriasis alba is a common benign skin condition causing faint, dry, lighter patches, especially on children's faces, often more noticeable after tanning.

Pityriasis Lichenoides

An uncommon inflammatory skin eruption of uncertain cause, producing recurrent crops of small scaly papules. Its spectrum ranges from a chronic form with reddish-brown lesions to an acute form with blisters, crusts, or ulcers.

Pityriasis Lichenoides Chronica

The chronic form of pityriasis lichenoides, causing recurrent crops of small, reddish-brown papules with fine adherent scale. Lesions usually heal without scarring but may leave temporary light or dark marks.

Alternate Names:
PLC

Pityriasis Lichenoides Et Varioliformis Acuta

The acute form of pityriasis lichenoides (PLEVA), producing sudden crops of red-brown papules that may become blistered, necrotic, or crusted and heal with small varioliform scars. A rare febrile ulceronecrotic form is called Mucha-Habermann disease.

Alternate Names:
PLEVA

Pityriasis Rosea

An acute, usually self-limited rash of oval, scaly spots. It may start with one larger spot called a herald patch, followed days to weeks later by smaller spots along skin-cleavage lines on the trunk and nearby limbs, sometimes forming a Christmas-tree pattern on the back. The cause is unknown, and the rash usually clears within several weeks.

Alternate Names:
Pityriasis Rosea of Gibert; Christmas Tree Rash

Pityriasis Rubra Pilaris

A group of rare inflammatory skin disorders that cause well-defined, reddish-orange scaly patches and rough bumps around hair follicles. Patches may spread widely while leaving islands of normal skin. The palms and soles may become thick, yellowish, dry, and cracked. The course varies and may last for months or years.

Pityriasis Versicolor

An overgrowth of *Malassezia* yeasts, which normally live on the skin, in its outer layer. It causes finely scaling pale, darker, or pink patches, usually on the chest, back, neck, or upper arms. Pigment changes may persist after the yeast overgrowth has cleared, and the condition can recur.

Pivampicillin

An orally absorbed prodrug of ampicillin used for selected bacterial infections; its use is limited in some settings by adverse effects and availability.

Pivot Joint

A joint in which one bone rotates around another bone. The joints between the first two neck bones and parts of the forearm are examples.

Pixantrone

Pixantrone is an anthracenedione antineoplastic drug developed for selected aggressive lymphomas, with potential marrow, infection, and cardiac risks.

PJI

Alternate name; see *Periprosthetic Joint Infection*.

PJS

Alternate name; see *Peutz-Jeghers Syndrome*.

PKD

Alternate name; see *Polycystic Kidney Disease*.

Placebo

An inactive substance, treatment, or procedure designed to resemble an active treatment. In a clinical trial, it is given to a control group so researchers can compare outcomes and estimate the specific effect of the treatment being studied.

Alternate Names:
Sham Treatment; Inactive Control

Placebo Control

A placebo control is an inactive treatment designed to resemble the intervention in a clinical trial, helping separate treatment effects from expectation and natural change.

Placebo Effect

A real change in symptoms or wellbeing that can occur after a person receives an inactive treatment, partly because of expectations, attention, and the treatment setting. It does not prove that the inactive treatment changed the disease itself.

Placenta

The temporary organ connecting mother and fetus, allowing exchange of oxygen, nutrients, wastes, and hormones.

Placenta Abruptio

Placental abruption is premature separation of the placenta from the uterine wall, causing bleeding, abdominal pain, uterine tenderness, fetal compromise, or maternal shock.

Placenta Accreta

Placenta accreta spectrum occurs when placental tissue abnormally attaches to or invades the uterine wall, creating major risk of hemorrhage during attempted delivery or removal.

Placenta Accreta Spectrum

Abnormal adherence or invasion of placental villi into the uterine wall, ranging from accreta to increta and percreta; it can cause severe postpartum hemorrhage and requires planned obstetric management.

Placenta Disorder

A disorder of placental implantation, structure, perfusion, or separation, including previa, accreta spectrum, abruption, infarction, or placental insufficiency.

Placenta Increta

Abnormal placental invasion into the myometrium without reaching the serosa, increasing the risk of massive hemorrhage at delivery and often requiring cesarean hysterectomy.

Placental Abnormalities

Disorders of placental location, attachment, structure, or separation that may affect pregnancy or cause bleeding.

Placental Abruption

Premature detachment of a normally implanted placenta from the uterine myometrium prior to delivery of the fetus, classically presenting with painful dark vaginal bleeding, uterine hypertonicity, and fetal distress.

Alternate Names:
Abruptio Placentae; Premature Placental Separation; Accidental Antepartum Hemorrhage

Placental Accreta Spectrum

Abnormal attachment of the placenta to the uterine wall, ranging from accreta (abnormally attached to the wall), to increta (growing into the uterine muscle), to percreta (growing through the wall and sometimes into nearby organs). A previous cesarean birth, especially with placenta previa, increases risk.

Placental Hormone

A hormone produced by placental tissue, such as hCG, progesterone, estrogens, or human placental lactogen, that supports pregnancy, fetal growth, and maternal metabolic adaptation.

Placental Infarction

A region of placental tissue damaged by inadequate maternal blood flow and coagulation, which may be incidental or, when extensive, associated with fetal growth restriction or pregnancy complications.

Placental Insufficiency

Placental insufficiency is inadequate placental delivery of oxygen and nutrients, which can cause fetal growth restriction, abnormal Doppler findings, reduced fluid, or fetal distress.

Placental Lactogen

Placental lactogen is a hormone made by the placenta that alters maternal metabolism and supports breast development and fetal nutrient availability during pregnancy.

Placental Mesenchymal Dysplasia

A rare abnormal development of the placenta in which supporting tissue becomes enlarged and cyst-like. It can resemble a molar pregnancy on scans and may be associated with poor fetal growth, fetal abnormalities, or pregnancy complications.

Placental Separation Signs

Clinical signs indicating the placenta has separated from the uterine wall and is ready for delivery. Classic signs: lengthening of the umbilical cord (cord lengthens as the placenta descends), a sudden gush of blood, and uterine elevation and firming (the uterus rises and becomes globular as the placenta moves into the lower segment).

Placental Site Nodule

A benign, usually incidental remnant of intermediate trophoblast at a prior implantation site, composed of small nests of chorionic-type or extravillous trophoblast.

Placenta Percreta

Placenta percreta is the most invasive form of pla-

centa accreta spectrum, with villi growing through the uterine wall and sometimes into nearby organs such as the bladder.

Placenta Praevia

Alternate spelling; see *Placenta Previa*.

Placenta Previa

A condition in which the placenta covers the opening of the cervix. It can cause painless bleeding in the second half of pregnancy and may make vaginal birth unsafe. A placenta near, but not covering, the opening is called low-lying placenta.

Placentation

The developmental process by which the placenta forms and attaches to the uterus, establishes maternal–fetal circulation, and develops the exchange and endocrine functions needed for pregnancy.

Plagiocephaly

Asymmetric flattening of an infant's skull. The common positional form develops from repeated pressure on one area; rare skull-shape changes from early fusion of a cranial suture are called synostotic plagiocephaly.

Alternate Names:
Flat Head Syndrome; Deformational Plagiocephaly

Plague

A serious infection caused by Yersinia pestis, transmitted mainly by infected fleas or respiratory droplets in pneumonic disease.

Plain Radiography

An imaging method that uses X-rays to create a two-dimensional projection of internal structures. It is used to assess bones, the chest, abdomen, teeth, and other selected body regions.

Alternate Names:
Roentgenography; Projection Radiography

Planar

Flat or arranged in one plane. In medical imaging, the term describes a two-dimensional view or projection, unlike three-dimensional imaging that shows depth and allows reconstruction from multiple directions.

Plane Joint

A joint with mostly flat surfaces that slide over one another. Small movements occur in several directions, as in some wrist and foot joints.

Plantar

Relating to the sole or underside of the foot, including the plantar surfaces of the toes.

Plantar Fasciitis

Pain from irritation and small injuries in the strong band of tissue supporting the sole of the foot. Heel pain is often worst with the first steps after waking or resting and may worsen after prolonged standing.

Plantar Fibromatosis

A benign overgrowth of fibrous tissue in the plantar fascia that forms firm nodules in the sole of the foot. It may be painless or cause pressure pain while walking; treatment depends on symptoms and can include footwear changes, injections, or surgery.

Plantar Flexion

Downward movement of the foot at the ankle, pointing the toes away from the shin. It is produced mainly by the calf muscles and is used in standing on tiptoe, walking, running, and jumping.

Plantar Hyperhidrosis

Alternate name; see *Hyperhidrosis*.

Plantaris Muscle

A small posterior-leg muscle with a long tendon that assists weakly with knee flexion and plantar flexion; it can be strained during sudden athletic movement.

Plantar Nerve

A nerve supplying sensation to the sole of the foot and motor branches to intrinsic foot muscles; com-

pression can cause burning pain, numbness, or altered toe movement.

Plantar Neuroma

Alternate name; see *Morton Neuroma*.

Plantar Reflex

Movement of the toes after the sole of the foot is gently stroked. In most adults the toes bend downward; upward movement of the big toe may indicate a problem in brain or spinal nerve pathways controlling movement.

Plantar Response

Movement of the toes and foot after the sole is stimulated. The pattern helps clinicians assess pathways between the brain, spinal cord, and leg; an unusual upward movement of the big toe in an adult may indicate neurologic disease.

Plantar Wart

A wart on the sole of the foot caused by human papillomavirus. Pressure from standing and walking can push it inward and make it painful; small black dots may represent tiny clotted blood vessels.

Alternate Names:
Foot Wart

Plant Fertilizer Poisoning

Fertilizer exposure may irritate the mouth, skin, eyes, stomach, or lungs. Some products can dangerously alter blood oxygen or body salts; keep the container and contact poison control after swallowing or significant exposure.

Plant Poisoning

Illness caused by eating, touching, or inhaling a toxic plant or plant product; effects range from local irritation to organ failure.

Plant Thorn Arthritis

Plant thorn arthritis is persistent joint inflammation after a thorn puncture introduces plant material, sometimes requiring removal of foreign material and treatment of infection or inflammation.

Plant Thorn Synovitis

Inflammation of a joint after penetration by a plant thorn or splinter, sometimes involving an infection introduced by the injury. Symptoms may develop gradually as persistent joint pain, swelling, and limited movement; evaluation may require removal of retained material and targeted treatment.

Alternate Names:
Thorn-Induced Arthritis; Foreign Body Synovitis

Plaque

A localized buildup or raised area of material. In the skin, a plaque is a broad, raised lesion often formed by joined papules; in an artery, plaque is a fatty deposit in the vessel wall that can narrow the artery.

Plaque And Tartar On Teeth

Dental plaque is a bacterial biofilm that forms on teeth, while tartar is hardened mineralized plaque; both contribute to cavities, gingivitis, and periodontitis.

Plaque Assay

A laboratory test that estimates the number of infectious virus particles in a sample. The sample is placed on living cells, and each infectious particle may produce a visible area of damaged cells that can be counted.

Plaque Psoriasis

The most common form of psoriasis, producing well-demarcated raised red plaques with silvery scale, commonly on elbows, knees, scalp, and lower back and sometimes associated with arthritis.

Plasma

The liquid part of blood carrying cells, proteins, nutrients, hormones, wastes, and other dissolved substances through the body.

Plasma Amino Acids

A blood test that measures amino acids in plasma. It can help evaluate inherited metabolic disorders, poor nutrition, liver disease, or other conditions

affecting amino-acid processing.

Plasmablastic Lymphoma

Plasmablastic lymphoma is an aggressive B-cell lymphoma often associated with immune deficiency, HIV infection, or immunosuppression.

Plasma Cell

A fully differentiated, terminally mature B lymphocyte specialized for the synthesis and high-level secretion of antigen-specific antibodies (immunoglobulins). Characterized cytologically by an eccentric nucleus with a clock-face or cartwheel chromatin pattern, abundant basophilic cytoplasm, and a prominent pale perinuclear Golgi apparatus. Neoplastic proliferation of clonal plasma cells gives rise to plasma cell dyscrasias, including monoclonal gammopathy of undetermined significance (MGUS) and multiple myeloma.

Alternate Names:
Plasma Cells; Effector B Cell

Plasma Cell Mastitis

A chronic benign inflammatory breast lesion with prominent plasma-cell infiltration, often involving ducts beneath the nipple and potentially causing a mass, nipple retraction, or discharge. It can clinically mimic carcinoma.

Plasma Cell Myeloma

A cancer of antibody-producing plasma cells, usually in the bone marrow. It can produce an abnormal antibody and damage bones, kidneys, blood-cell production, or calcium balance, causing bone pain, fractures, anemia, infections, or kidney problems.

Plasma Cell Neoplasm

A clonal disorder of antibody-producing plasma cells, ranging from localized plasmacytoma to multiple myeloma with marrow, bone, kidney, calcium, or blood abnormalities.

Plasma Cells

Plural form; see *Plasma Cell*.

Plasma Concentration

The amount of a substance present in a defined volume of plasma at a given time. It is used to interpret exposure, toxicity, therapeutic drug monitoring, and pharmacokinetic relationships.

Plasmacytoma

A solitary mass of neoplastic plasma cells, which may occur in bone (solitary plasmacytoma of bone) or soft tissue (extramedullary plasmacytoma). It can progress to multiple myeloma.

Plasma Expanders

Fluids given through a vein to increase circulating blood volume. Crystalloid solutions are commonly used, while selected colloids have limited roles; treatment depends on the cause of fluid loss and patient condition.

Plasma Kallikrein

A blood enzyme that helps produce bradykinin, a substance that widens blood vessels and increases leakage from them. It contributes to inflammation and swelling and is involved in some inherited swelling disorders.

Plasmalogen

A special type of fat found in cell membranes, especially in the brain, nerves, and heart. The body makes it partly in structures called peroxisomes; very low levels occur in some inherited metabolic disorders.

Plasma Membrane

The selectively permeable lipid bilayer surrounding a cell, containing proteins that control transport, signaling, adhesion, recognition, and communication with the extracellular environment.

Plasma Osmolarity

The concentration of dissolved particles in the liquid part of blood. It mainly reflects water balance and substances such as sodium, glucose, and urea; abnormal values can indicate dehydration, excess water, or metabolic disease.

Plasmapheresis

A procedure that separates plasma from blood cells. In therapeutic plasma exchange, plasma is removed and replaced with a suitable fluid; this can treat selected immune, blood, and neurologic disorders. Plasma may also be collected from donors.

Alternate Names:
Therapeutic Plasma Exchange; TPE; Plasma Exchange; Apheresis

Plasma Substitutes

Intravenous fluids intended to expand plasma volume, including crystalloids and colloid solutions; choice depends on the clinical indication and risks.

Plasma / Urine Catecholamine Assay

Blood or urine tests measuring catecholamines or their breakdown products. They may help investigate pheochromocytoma or paraganglioma, but medicines, stress, posture, diet, and collection conditions can affect results.

Alternate Names:
Fractionated Catecholamines; Free Metanephrines

Plasmid

A small, circular, extrachromosomal DNA molecule within a bacterium or other microorganism that can replicate autonomously of genomic chromosomal DNA. Plasmids frequently carry accessory genes that confer selective survival advantages, such as antibiotic resistance factors, virulence determinants, or heavy metal tolerance, and are readily transferred horizontally between bacteria via conjugation, transformation, or transduction.

Alternate Names:
Plasmids

Plasmids

Plural form; see *Plasmid*.

Plasmin

An enzyme that breaks down fibrin, the protein mesh holding a blood clot together. It is formed from plasminogen and helps remove clots after a damaged blood vessel has been repaired.

Plasminogen

An inactive blood protein that can be changed into plasmin, an enzyme that breaks down the protein framework of blood clots. The body activates it when a clot needs to be removed.

Plasminogen Activator

An enzyme or medicine that changes plasminogen into plasmin, which breaks down the protein mesh of blood clots. These medicines can dissolve dangerous clots but may cause serious bleeding.

Plasminogen Inactivators

Substances or medicines that reduce the conversion of plasminogen into plasmin, thereby slowing breakdown of blood clots. They may be used or studied when limiting bleeding is important.

Plasmodium

A group of parasites spread through bites from infected Anopheles mosquitoes and responsible for malaria. The parasites first infect the liver, then red blood cells, causing fever and potentially severe organ complications.

Plasmodium Vivax

A parasite spread by infected Anopheles mosquitoes that causes malaria. It infects red blood cells and can remain dormant in the liver, allowing illness to return months or years after the first infection.

Plasmodium Vivax Malaria

Malaria caused by the parasite Plasmodium vivax and spread by infected mosquitoes. Fever attacks may recur about every two days, and dormant liver forms can cause later relapses; treatment must clear both blood and liver stages when safe.

Alternate Names:
Vivax Malaria; Benign Tertian Malaria

Plaster Of Paris

A powder that hardens when mixed with water. In healthcare it is used to make casts and splints that hold an injured bone or joint still while it heals; swelling, numbness, or increasing pain under a cast

can indicate pressure-related injury.

Plastic and Reconstructive Surgery

Surgery that restores form or function after congenital difference, injury, disease, or removal of tissue.

Plastic Bronchitis

A rare condition producing large, branching mucous casts that form in the airways, causing life-threatening airway obstruction, often associated with congenital heart disease or post-fontan circulation.

Plastic Casting Resin Poisoning

Exposure to uncured casting resin or its solvents can irritate or burn the skin, eyes, lungs, and digestive tract. Swallowing or breathing fumes may cause vomiting, dizziness, or lung injury and requires poison-control advice.

Plastic Resin Hardener Poisoning

Resin hardeners may contain corrosive or irritating chemicals that burn the skin, eyes, mouth, throat, or stomach. Fumes can injure the lungs, and substantial exposure can cause systemic toxicity.

Plastic Surgery

A surgical specialty that repairs, reconstructs, or reshapes body tissues to restore or alter form and function. Its name comes from the Greek *plastikos*, meaning "to mold" or "give form," and is unrelated to synthetic plastic. Reconstructive procedures address congenital defects, injury, disease, or tissue loss after tumor removal; cosmetic procedures reshape normal structures to change appearance. The specialty encompasses procedures throughout the body.

Platelet

A small, anucleate, discoid cellular fragment derived from bone marrow megakaryocytes that plays an indispensable role in primary hemostasis and vascular repair. Circulating with a normal lifespan of 7–10 days, platelets adhere to exposed subendothelial collagen via von Willebrand factor, undergo activation and granule release (ADP, thromboxane A_2, serotonin), and aggregate via glycoprotein IIb/IIIa receptors to form a primary hemostatic plug while providing a catalytic phospholipid surface for the coagulation cascade.

Alternate Names:
Platelets; Thrombocyte; Thrombocytes

Platelet Aggregation

The clumping of platelets at an injured blood vessel to form an early plug that helps stop bleeding.

Platelet Aggregation Test

A laboratory test measuring platelet clumping in response to agonists such as ADP, collagen, or epinephrine, used to evaluate platelet function disorders and medication effects.

Platelet Antibodies Blood Test

A blood test detecting antibodies directed against platelet antigens, used selectively in suspected immune thrombocytopenia, neonatal alloimmune thrombocytopenia, or platelet-transfusion refractoriness.

Platelet Count

The number of platelets in a given volume of blood, used to assess bleeding or clotting risk.

Platelet Function Assay

An automated in vitro laboratory test measuring primary platelet-related hemostasis under high shear stress conditions, determining the closure time required for platelets in citrated whole blood to occlude an aperture coated with collagen/epinephrine or collagen/ADP.

Alternate Names:
PFA-100

Platelet Function Disorders

Conditions in which platelets do not adhere, activate, or aggregate normally, causing impaired primary hemostasis. They may be inherited or acquired and can cause easy bruising, nosebleeds, heavy menstrual bleeding, or bleeding after procedures.

Platelet Plug Formation

The first step in stopping bleeding after a blood vessel is injured. Platelets attach to the damaged area, become active, and clump together to form a temporary plug.

Alternate Names:
Primary Hemostasis; Platelet Aggregation

Platelet-Rich Plasma

A preparation made by concentrating platelets from a person's own blood and injecting it into a selected tissue. It releases growth factors and is used in some musculoskeletal, wound, and hair-loss treatments, but evidence and benefit vary by condition and technique.

Platelets

Plural form; see *Platelet*.

Platybasia

An unusually flattened base of the skull. It may cause no symptoms, but in some people it narrows the space around the lower brain or spinal cord and contributes to headache, imbalance, weakness, or other nerve problems.

Platypnea

Dyspnea that occurs in the upright position and is relieved by lying down. It is the opposite of orthopnea. It is rare and may be associated with hepatopulmonary syndrome, intracardiac shunting, or pulmonary arteriovenous malformations.

Platypnea-Orthodeoxia Syndrome

A clinical syndrome characterized by dyspnea (platypnea) and arterial oxygen desaturation (orthodeoxia) that are precipitated or worsened when assuming an upright seated or standing posture and relieved in the recumbent (supine) position, typically caused by a posture-dependent intracardiac right-to-left shunt through a patent foramen ovale or pulmonary AVMs.

Alternate Names:
Orthodeoxia; Postural Shunt Hypoxemia

Platysma

A thin superficial muscle of the neck that tenses the skin and assists lower-jaw and lower-lip movement.

Pleiotropic Cytokine

An immune-signaling protein that affects several types of cells or produces more than one effect, such as changing inflammation, blood-cell production, immune activity, or tissue repair.

Pleiotropy

The ability of one gene change to influence several traits or body systems. For example, one inherited disorder may affect the brain, skin, blood, and other organs at the same time.

Pleomorphic

Pleomorphic means having multiple forms or marked variation in cell or tissue appearance; in pathology, it may be a feature of malignancy but is not diagnostic alone.

Pleomorphic Adenoma

A usually noncancerous tumor of a salivary gland, most often the parotid gland near the ear. It usually grows slowly as a painless lump, but long-standing tumors can rarely become cancerous.

Alternate Names:
Benign Mixed Tumor

Pleomorphic Adenoma Of The Vulva

An exceptionally rare benign mixed epithelial and mesenchymal tumor of the vulva, resembling pleomorphic adenoma of salivary tissue and requiring histopathologic confirmation.

Pleomorphic Adenoma Pathology

A usually benign salivary-gland neoplasm containing variable epithelial and myoepithelial elements in a chondromyxoid, myxoid, or cartilaginous-appearing stroma. Incomplete excision and long duration increase recurrence or malignant-transformation risk.

Pleomorphic Dermal Sarcoma

An uncommon high-grade cutaneous sarcoma, usu-

ally on chronically sun-damaged skin of older adults, composed of markedly pleomorphic cells and capable of local recurrence or metastasis.

Pleomorphic Xanthoastrocytoma

A circumscribed astrocytic tumor, often arising superficially in the cerebral hemispheres of younger patients and associated with seizures. Most are low grade, but anaplastic transformation can occur.

Pleomorphism

Variation in the size and shape of cells or their nuclei within a tissue. Marked pleomorphism is a feature of many high-grade malignancies but can also occur in some reactive or degenerative conditions.

Plethoric

Plethoric means unusually full, congested, or ruddy, often describing the appearance associated with increased blood volume or red-cell mass.

Plethysmography

A test that measures changes in the size of a body part or the amount of blood or air it contains. It can assess circulation in the limbs, lung volume, or changes in blood flow during breathing or exercise.

Pleura

The thin, double-layered membrane around each lung. The visceral layer covers the lung; the parietal layer lines the chest cavity, including the diaphragm. A small amount of fluid between the layers reduces friction as the lungs move during breathing.

Pleural

Relating to the pleura, the membranes surrounding the lungs and lining the inside of the chest.

Pleural Cavity

The narrow space between the two slippery layers surrounding each lung. A small amount of fluid normally allows smooth breathing, while extra air, blood, pus, or fluid can restrict lung expansion.

Pleural Decortication

An operation that removes a thick scar-like layer from the lung's covering so a trapped lung can expand again. It may be used for long-standing infected fluid, blood, or inflammation around the lung when other treatment is insufficient. Risks include bleeding, infection, air leakage, and breathing complications.

Alternate Names:
Decortication of the Lung; Pulmonary Decortication; Thoracoscopic Decortication

Pleural Effusion

An abnormal buildup of fluid in the space between a lung and the chest wall. It may result from heart failure, infection, inflammation, cancer, or injury, and can cause shortness of breath, cough, or chest pain.

Pleural Fluid Analysis

Laboratory testing of fluid collected from around the lung. Cell counts, protein, acidity, glucose, cultures, and other tests help determine whether the fluid is caused by infection, cancer, heart failure, inflammation, or another problem.

Pleural Fluid Culture

Culture of pleural fluid to detect bacteria, fungi, or mycobacteria in suspected pleural-space infection; specimens should be collected appropriately, often in blood-culture bottles.

Pleural Fluid Glucose

Pleural-fluid glucose may be reduced in empyema, complicated parapneumonic effusion, rheumatoid pleuritis, tuberculosis, and malignancy. It is interpreted with pH, cell count, protein, LDH, microbiology, imaging, and the clinical setting.

Pleural Fluid Gram Stain

A pleural-fluid Gram stain looks for bacteria in fluid around the lung and may support evaluation of empyema or bacterial pleural infection.

Pleural Fluid PH

Pleural-fluid pH helps assess infection and other causes of effusion. A markedly low pH supports a complicated parapneumonic effusion in the appropriate clinical setting, but drainage decisions also depend on imaging, fluid appearance, microbiology, glucose, and the patient's condition.

Pleural Fluid Smear

Microscopic examination of fluid removed from the space around the lung. It may show inflammatory cells, bacteria, fungi, cancer cells, or other material and is interpreted with fluid chemistry, cultures, imaging, and symptoms.

Pleural Friction Rub

A scratchy or grating sound heard through a stethoscope when inflamed layers around the lung rub together during breathing. It may occur with infection, a blood clot in the lung, or other causes of pleural inflammation.

Pleural Mesothelioma

A cancer arising from the pleura, the thin lining around the lungs and inner chest wall. It is strongly associated with asbestos exposure and may cause chest pain, breathlessness, or fluid around the lung.

Pleural Needle Biopsy

A pleural needle biopsy removes a small sample of the pleural lining through a needle for evaluation of cancer, infection, or inflammation.

Pleural Neoplasm

A pleural neoplasm is an abnormal growth in the lining around the lung, such as mesothelioma or metastatic cancer.

Pleural Perforation

A breach in the pleural lining allowing air or fluid to enter the pleural space, potentially causing pneumothorax or hydropneumothorax, often from trauma, procedures, or underlying lung disease.

Pleural Plaque

A usually harmless area of thickened or calcified tissue on the lining around the lung, most often caused by past asbestos exposure. It is not the same as asbestos-related lung scarring.

Pleural Rub

A rough, creaking or grating auscultatory sound heard during both inspiration and expiration, caused by the friction between roughened, inflamed visceral and parietal pleura. It is heard in pleuritis, pulmonary infarction, or pneumonia and ceases when the patient holds their breath.

Alternate Names:
Pleural Friction Rub

Pleural Sac

The potential space and enclosing pleural membranes around a lung, normally containing a small amount of lubricating fluid.

Pleural Space

The narrow potential space between the lung's inner covering and the chest wall's lining. It normally contains a small amount of lubricating fluid; air, blood, or excess fluid can impair breathing.

Pleural Tuberculosis

Tuberculous infection or inflammation of the pleura, often producing a lymphocyte-rich pleural effusion, chest pain, fever, and breathlessness and requiring microbiologic or tissue evaluation.

Alternate Names:
Tuberculous Pleural Effusion; Tubercular Pleural Effusion; Pleural Effusion, Tubercular; Tuberculous Pleurisy

Pleurectomy

Surgical removal of part or all of the pleura, used in the treatment of malignant pleural mesothelioma and recurrent malignant pleural effusion.

Pleurisy

Inflammation of the thin layers around the lungs, often causing sharp chest pain that worsens with

deep breathing or coughing. Causes include viral infection, pneumonia, a blood clot, autoimmune disease, or injury; associated features vary with the underlying cause.

Alternate Names:
Pleuritic Chest Pain; Pleural Inflammation; Pleuritis

Pleuritic Pain

Sharp chest pain that worsens with breathing or coughing, often caused by inflammation of the pleura or nearby tissues.

Pleuritis

Alternate name; see *Pleurisy*.

Pleurodesis

A procedure that makes the two layers around a lung stick together so air or fluid cannot collect repeatedly. It may use a chemical or surgery and can cause pain, fever, infection, or breathing complications.

Pleurodynia

Severe, repeated pain in the chest or upper abdomen caused by inflammation of breathing muscles, often during infection with coxsackievirus. Pain may worsen with breathing or movement and usually resolves as infection improves.

Pleuropulmonary Blastoma

A rare aggressive childhood cancer arising in the lung or pleura, usually associated with DICER1-related tumor predisposition.

Plexiform Fibrohistiocytic Tumor

A rare low-grade malignant fibroblastic and histiocytic tumor, usually arising in the dermis or subcutis of the upper extremities of young people; local recurrence is common and metastasis is uncommon.

Plexiform Neurofibroma

A plexiform neurofibroma is a diffuse nerve-sheath tumor, strongly associated with neurofibromatosis type 1, that can grow along multiple nerve branches and sometimes become malignant.

Alternate Names:
PN PNF

Plexus

A network formed by intersecting nerves, blood vessels, lymphatic vessels, or other structures. Examples include the brachial nerve plexus and the celiac vascular plexus.

Pliability

Pliability is the ability of a material or tissue to bend, stretch, or deform without breaking; it is relevant to skin, vessels, lungs, and medical devices.

Plica

A fold of tissue, especially a fold in the lining of a joint. Plicae are often normal, but an irritated plica around the knee can cause pain, clicking, swelling, or a catching feeling with movement.

Plitidepsin

Plitidepsin is an antineoplastic compound that targets eukaryotic elongation factor 1A and has been studied for selected cancers and viral infections.

Ploidies

Ploidy describes the number of complete chromosome sets in a cell, such as haploid, diploid, or polyploid; abnormal ploidy can characterize tumors or developmental disorders.

PLS

Alternate name; see *Primary Lateral Sclerosis*.

Plummer-Vinson Syndrome

A condition involving iron-deficiency anemia, difficulty swallowing, and thin webs in the upper swallowing tube. Treating the iron deficiency and stretching the web can improve swallowing and may reduce complications.

Pluralibacter Gergoviae

A gram-negative environmental bacterium that can contaminate medicines or cosmetics and rarely cause

opportunistic infection.

Pluripotential

Able to develop into many, but not every, type of cell in the body. Pluripotent stem cells can produce cells from the three early tissue groups and are studied for development, disease, and regenerative treatment.

Plutonium

A radioactive heavy metal whose inhalation or ingestion can cause internal radiation exposure and toxicity.

Pm

An abbreviation that may mean afternoon, postmortem, or picometer; meaning depends on clinical context.

PMBCL

Alternate name; see *Mediastinal Lymphoma*.

PMBL

Alternate name; see *Mediastinal Lymphoma*.

PMDD

Premenstrual dysphoric disorder is a severe cyclic mood disorder occurring before menstruation with irritability, depression, anxiety, and functional impairment that improve after menses.

PML

PML commonly means progressive multifocal leukoencephalopathy, a JC-virus demyelinating brain infection during severe immune suppression, but it may have other meanings.

PMS

Abbreviation; see *Premenstrual Syndrome*.

PN

Alternate name; see *Plexiform Neurofibroma*.

Pneumatic

Relating to air or gas under pressure. Medical examples include an air-pressure ear examination, inflatable compression sleeves used to reduce clot risk, and an inflatable tourniquet used during some operations.

Pneumatic Otoscopy

Examination of the eardrum with a lighted instrument while gently changing the air pressure in the ear canal. Reduced eardrum movement may suggest fluid behind it or poor middle-ear ventilation.

Pneumatic Retinopexy

A procedure for selected retinal detachments in which an intravitreal gas bubble is injected and laser or cryotherapy seals the retinal break while positioning helps the bubble support the repair.

Pneumatic Tourniquet

An inflatable cuff used to temporarily reduce blood flow to a limb during surgery or selected procedures.

Pneumatocele

A thin-walled, air-filled space in the lung that often develops after infection, inflammation, or injury. Many resolve naturally, but large or infected spaces can impair breathing or require drainage or surgery.

Pneumatosis

Gas trapped within the wall of an organ or other tissue, most often the bowel. It may be harmless, but when caused by poor blood flow, infection, or a tear, it can signal a life-threatening abdominal emergency.

Pneumatosis Cystoides Coli

Multiple gas-filled cysts within the wall of the large intestine. They may be harmless and found by chance, or may signal bowel blockage, poor blood flow, infection, or another serious illness when pain or other warning signs occur.

Pneumatosis Cystoides Intestinalis

Gas-filled cysts within the bowel wall. They may be harmless and found incidentally, but can also result from poor blood flow, infection, blockage,

lung disease, or medicines. Severe pain, fever, or shock may indicate bowel injury.

Pneumatosis Intestinalis

Gas within the wall of the intestine, seen as small bubbles or lines on an imaging test. It may be harmless, but pain, fever, shock, or signs of poor blood flow may indicate bowel injury.

Pneumaturia

Passage of gas in urine. It may occur with an abnormal connection between the bowel and urinary tract or a gas-forming urinary infection. Recent bladder catheterization or other urinary instrumentation may also introduce air into the urinary tract and cause pneumaturia.

Pneumocephalus

Air or another gas inside the skull, usually after a head injury, brain surgery, or a skull fracture near the sinuses. A large or trapped collection can press on the brain and cause headache, vomiting, confusion, or reduced alertness.

Pneumococcal Infection

Infection caused by Streptococcus pneumoniae, ranging from ear or sinus infection to pneumonia, meningitis, or bloodstream infection.

Pneumococcal Infections (Streptococcus pneumoniae)

Infections caused by Streptococcus pneumoniae, ranging from otitis and sinusitis to pneumonia, bloodstream infection, and meningitis. Risk is increased by young or older age, absent spleen, chronic disease, smoking, or immune compromise; vaccination and prompt treatment reduce complications.

Pneumococcal Meningitis

A dangerous infection of the brain and spinal-cord coverings caused by Streptococcus pneumoniae. It can cause fever, headache, stiff neck, confusion, seizures, hearing loss, or death; treatment involves urgent antibiotics.

Pneumococcal Pneumonia

Pneumonia caused by the bacterium Streptococcus pneumoniae. It can cause fever, cough, chest pain, and difficulty breathing; symptoms and imaging findings vary.

Alternate Names:
Streptococcus Pneumoniae Pneumonia; Pneumococcal Lung Infection

Pneumococcal Sepsis

Life-threatening organ dysfunction caused by the body's harmful response to infection with *Streptococcus pneumoniae*. It may arise from pneumococcal pneumonia, bloodstream infection, meningitis, or another invasive pneumococcal infection.

Pneumoconiosis

A group of work-related lung diseases caused by breathing mineral or industrial dust over time. Dust can scar lung tissue and cause cough, breathlessness, reduced oxygen, and progressive breathing disability.

Pneumocystis

A genus of fungi that includes Pneumocystis jirovecii, which can cause pneumonia in people with weakened cellular immunity.

Pneumocystis Infection

Infection by Pneumocystis jirovecii, most often causing pneumonia with dry cough, fever, and progressive shortness of breath in immunocompromised people.

Pneumocystis Jirovecii Pneumonia

A lung infection caused by the fungus *Pneumocystis jirovecii*. It mainly affects people with weakened immune defenses, including some people with HIV, cancer, or organ transplants, and people taking immune-suppressing medicines. It often causes gradually worsening shortness of breath, fever, and a dry cough; blood oxygen may become low.

Pneumocystis Pneumonia

Alternate name; see *Pneumocystis Jirovecii Pneu-*

monia.

Pneumocyte

A cell lining the air sacs of the lungs. Type I cells allow oxygen and carbon dioxide to pass between air and blood, while type II cells make surfactant, which helps keep the air sacs open.

Pneumolysis

Surgical separation or freeing of lung tissue or pleural adhesions.

Pneumomediastinum

Air trapped in the central space of the chest between the lungs. It may follow severe coughing, an injury, a medical procedure, or a tear in the airway or swallowing tube and can cause chest pain or breathlessness.

Pneumonectomy

Surgery to remove an entire lung. It is usually performed for selected lung cancers or severe one-sided lung disease when removing only part of the lung is not suitable.

Pneumonia

An acute infection of one or both lungs caused by bacteria, viruses, or fungi. The infection inflames the microscopic air sacs (alveoli) in the lungs, causing them to fill with fluid or pus. This impairs the lungs' ability to transfer oxygen into the bloodstream, resulting in symptoms such as fever, chills, a persistent cough producing phlegm, difficulty breathing, sharp chest pain when inhaling, and severe fatigue.

Pneumonia in Immunocompromised Patients

Lung infection in a person with impaired immune defenses from disease, medicines, transplantation, cancer, or other causes. The organism spectrum is broad, symptoms may be muted, and evaluation often requires early imaging, microbiologic testing, and tailored antimicrobial or supportive treatment.

Pneumonitis

Inflammation of lung tissue, often caused by a medicine, radiation, an immune reaction, inhaled irritants, or material entering the lungs rather than by infection. It may cause dry cough and breathlessness.

Pneumopericardium

Air around the heart, usually after a chest injury, surgery, a medical procedure, or a tear in the esophagus. A large or trapped collection can prevent the heart from filling and pumping properly, causing tamponade.

Pneumoperitoneum

Air or gas inside the abdominal cavity around the organs. It may be expected after abdominal surgery, but unexpected gas can indicate a torn intestine, especially when accompanied by pain or illness.

Pneumoplasty

Surgery to repair or reshape part of the lung or an airway. It may be used to remove a damaged area, improve airflow, or restore the shape of tissue after injury or disease.

Pneumotachometer

An instrument that measures the speed and amount of air moving during breathing. It can help assess airflow limitation and is used in lung-function testing, often together with other measurements.

Pneumothorax

Air in the space between the lung and chest wall (pleural space), which can partly or completely collapse the lung. It may happen spontaneously, after an injury, or after a medical procedure and can cause sudden chest pain or breathlessness; severe cases can impair circulation and breathing.

Pneumovirinae

Pneumovirinae is a subfamily of viruses that includes respiratory pathogens such as respiratory syncytial virus and human metapneumovirus.

Pneumovirus

A group or genus of respiratory viruses; human pneumovirus terminology often refers to human metapneumovirus or related paramyxoviruses.

PNF

Alternate name; see *Plexiform Neurofibroma*.

Pocket Erosion

Loss of tissue at the margin or base of a periodontal or surgical pocket, potentially exposing deeper structures and promoting infection, bleeding, or impaired healing.

Podagra

A sudden gout attack in the big-toe joint, causing intense pain, redness, warmth, and swelling.

Podiatric Surgery

Surgical treatment of conditions affecting the foot and ankle within the field of podiatry. Procedures may address deformity, injury, arthritis, infection, or other disorders; training and scope vary among jurisdictions.

Podiatrist

A healthcare professional specializing in diseases and injuries of the feet, ankles, and related lower limbs. Care may include examination, wound treatment, medicines, footwear advice, procedures, and prevention of complications.

Podiatry

The healthcare field focused on the feet, ankles, and related lower-limb conditions. It includes prevention, diagnosis, treatment, wound care, mobility support, and management of problems linked with diabetes or circulation.

Podocyte

A specialized cell covering the tiny blood vessels that filter blood in the kidney. Its delicate extensions help keep proteins in the bloodstream; damage can cause protein to leak into urine.

Podofilox

Podofilox is a topical antimitotic medicine used to treat selected external anogenital warts caused by human papillomavirus; irritation and correct application are important.

Podophyllin

Podophyllin is a plant-derived resin with antimitotic activity formerly used topically for warts; it can be severely toxic if absorbed and is generally replaced by safer products.

Podophyllum

A plant genus containing podophyllotoxin, used in some topical wart treatments but toxic if misused.

Podosome

A temporary attachment structure on the surface of some cells, including immune cells and bone-removing cells. It helps the cell grip tissue and break down nearby material while moving or carrying out its function.

POEMS Syndrome

A rare disorder linked to abnormal plasma cells that affects several body systems. It may cause nerve damage, enlarged organs, hormone problems, skin changes, fluid buildup, eye swelling, and unusual bone changes.

Alternate Names:
Crow-Fukase Syndrome

Poikilocytosis

The presence of red blood cells with unusually varied shapes on a blood smear. It may occur with anemia, inherited blood disorders, or damage to red blood cells.

Poikiloderma

A skin pattern combining mottled pigmentation, visible small vessels, and epidermal thinning, seen in connective-tissue disease, chronic sun damage, inflammation, and some cutaneous lymphomas.

Poikilotherm

An organism whose body temperature changes with surroundings, unlike humans, who normally maintain a relatively stable temperature.

Poinsettia Plant Exposure

Chewing poinsettia usually causes mild mouth irritation, nausea, or stomach upset, not severe poisoning. Rinse the mouth and contact poison control if symptoms are severe, a large amount was swallowed, or another product was involved.

Point

A specific location, spot, or value; in medicine it may refer to a tender point, pressure point, or measurement point.

Point Mutation

A change affecting one DNA building block. Depending on its location, it may have no effect, change the protein made by a gene, stop protein production early, or contribute to an inherited condition or cancer.

Point-Of-Care Testing

A test performed near the patient, such as in a clinic, ambulance, home, or hospital ward, instead of a central laboratory. Results are available quickly, but trained users, quality checks, and clinical interpretation remain essential.

Point-Of-Care Ultrasound

Ultrasound performed and interpreted at the bedside by the treating clinician to answer a focused question or guide a procedure. It can assess the heart, lungs, abdominal fluid, blood vessels, and bladder, but does not replace a complete imaging study when one is needed.

Poison

A substance that can cause injury, illness, or death when enough enters the body. Harm depends on the substance, amount, route, timing, and person's health.

Poison-Center Consultation

Specialist toxicology advice used to identify hazards, interpret exposure and laboratory data, select antidotes, guide observation or disposition, and coordinate public-health response. Consultation is appropriate for significant, uncertain, mixed, pediatric, or unusual exposures.

Poison Control

A specialist service that gives immediate advice after exposure to a medicine, chemical, plant, or other possible poison. They assess the substance and amount and advise on first aid, observation, emergency care, or further treatment.

Poison Control Emergency Services

Specialized regional 24-hour telephone triage and emergency clinical toxicological consultation services staffed by toxicologists and specialist nurses to guide immediate management of toxic ingestions, overdoses, bites, and chemical exposures.

Alternate Names:
Poison Helpline; Poison Control Hotline; Toxicological Emergency Consultation

Poisoning

Harmful effects caused by swallowing, inhaling, injecting, or absorbing a toxic substance. The effects depend on the substance, amount, route, timing, and person's health; inducing vomiting can worsen some poisonings.

Poisoning First Aid

Basic actions used after exposure to a toxic substance, such as leaving contaminated air and removing chemicals from skin or eyes. The correct response depends on the substance and route of exposure; inducing vomiting or giving food can worsen some poisonings.

Poison Ivy Rash

An itchy allergic contact dermatitis caused by exposure to urushiol, an oil found in poison ivy and related plants. The rash commonly appears as red streaks or patches with swelling, small bumps, or blisters; the pattern and severity vary with the

amount and route of exposure.

Pokeweed Poisoning

Eating pokeweed, especially its roots or unripe parts, can cause burning in the mouth, vomiting, diarrhea, weakness, low blood pressure, or seizures. Severe exposure can cause cardiovascular or neurologic complications.

Poland Syndrome

A congenital condition characterized by absence or underdevelopment of part of the pectoral muscles on one side, sometimes accompanied by abnormalities of the hand on the same side.

Polar

Relating to a pole or direction, or describing a molecule with slightly different electrical charges at its ends. In biology and chemistry, polarity affects how substances dissolve, move across cell membranes, and interact with other molecules.

Polarity

The arrangement or direction of positive and negative electrical, chemical, or biological properties. Cell polarity helps organize tissue structure and directs processes such as movement, division, absorption, and secretion.

Polarography

Polarography is an electrochemical analytical method that measures current while voltage changes at an electrode to identify or quantify reducible substances.

Pol Gene

The HIV gene encoding enzymes required for viral replication, including protease, reverse transcriptase, and integrase; antiretroviral drugs target these products.

Polidocanol

Polidocanol is a detergent sclerosant injected to close selected varicose veins or vascular lesions by damaging the vessel lining and promoting fibrosis.

Polio

An infection caused by poliovirus, also called poliomyelitis. It spreads mainly when virus from an infected person's stool enters the mouth, and it can also spread through respiratory secretions. Most infected people have no symptoms or have a short, mild illness with fever, sore throat, tiredness, nausea, headache, or stomach pain. Fewer than 1% of infections cause the virus to affect the brain or spinal cord, leading to meningitis, muscle weakness, or acute flaccid paralysis, which is often uneven between the limbs and may become permanent. Paralysis of the muscles used for breathing can be fatal. Vaccination prevents polio.

Alternate Names:
Poliomyelitis

Poliomyelitis

Alternate name; see *Polio*.

Poliosis

A localized patch of white or depigmented hair caused by reduced melanin in follicles, occurring in vitiligo, alopecia areata, inflammatory disease, genetic syndromes, or after injury.

Poliovirus

An enterovirus that causes poliomyelitis. It is transmitted mainly by the fecal-oral route; most infections are asymptomatic, but a small proportion cause meningitis or acute flaccid paralysis by damaging motor neurons in the spinal cord. Diagnosis uses molecular testing, usually reverse-transcription PCR of stool or other appropriate specimens.

Pollakisuria

Pollakisuria is unusually frequent urination, often in small amounts, caused by irritation, infection, stones, bladder disorders, anxiety, or other urinary conditions.

Pollakiuria

Frequent urination, often in small amounts. It may occur with urinary infection, irritation, diabetes, pregnancy, medicines, or anxiety; in some children it is a temporary benign pattern, while pain, fever,

blood, thirst, or weight loss may indicate an underlying disorder.

Pollen

Tiny plant grains released for reproduction that can trigger allergies, asthma symptoms, or eye inflammation.

Pollen-Food Allergy Syndrome

An allergic reaction to certain raw fruits, vegetables, or nuts in people sensitized to related pollen proteins. It usually causes itching or tingling of the mouth and throat and is also called oral allergy syndrome.

Pollex

The anatomical term for the thumb, the first and most mobile digit of the hand. It has two bones and can touch the fingertips, allowing precise grasping; injury or arthritis can cause pain and loss of hand function.

Pollution

Contamination of air, water, soil, or surroundings by substances that may harm health or ecosystems.

Poly A

A sequence of adenine nucleotides added to the end of many messenger RNA molecules, helping regulate stability, transport, and translation.

Polyadenylation

Addition of a polyadenosine tail to the $3'$ end of many eukaryotic messenger RNAs, promoting stability, nuclear export, and efficient translation.

Polyamine

A small positively charged molecule, such as putrescine, spermidine, or spermine, required for cell growth and nucleic-acid function.

Polyamine Catabolism

The enzyme-controlled breakdown of polyamines, natural substances involved in cell growth and function. This process produces chemicals that can affect cell signals, oxidative stress, inflammation, development, and cancer biology.

Polyangiitis

Inflammation affecting multiple blood vessels. The term appears in the names of several vasculitis diseases, including microscopic polyangiitis and granulomatosis with polyangiitis; by itself, it does not identify one specific disease.

Polyarteritis

Inflammation of several arteries, which can reduce blood flow and damage organs. Causes and effects vary; polyarteritis nodosa is a rare form that mainly affects medium-sized arteries and may cause fever, muscle pain, skin changes, nerve problems, or abdominal pain.

Polyarteritis Nodosa

A systemic necrotizing vasculitis of medium-sized muscular arteries that can narrow or weaken vessels and impair blood flow. It may affect the skin, peripheral nerves, kidneys, muscles, or gastrointestinal tract; pulmonary arteries are usually spared.

Alternate Names:
PAN; Kussmaul-Maier Disease

Polyarthritis

Inflammation involving multiple joints, commonly defined as five or more. It is a clinical pattern rather than a single diagnosis and may result from autoimmune, infectious, crystal-related, or other inflammatory disorders.

Polyarticular Joint Pain

Pain affecting multiple joints, caused by systemic inflammatory disease, infection, osteoarthritis, crystal disease, medication, or other conditions. The pattern, duration, swelling, and associated symptoms guide evaluation.

Polybrominated Biphenyl

A group of brominated industrial chemicals that can persist in the environment and cause toxic effects after exposure.

Polychlorinated Biphenyl

A group of persistent industrial chemicals that can accumulate in body fat and are associated with cancer, endocrine, immune, and neurologic effects.

Polychondritis

A relapsing immune-related disease that inflames and damages cartilage. It may affect the ears, nose, joints, voice box, windpipe, or inner ear, causing pain, deformity, breathing problems, hearing loss, or balance symptoms.

Polychromasia

The presence of unusually bluish, immature red blood cells on a blood smear. It usually means bone marrow is releasing cells quickly, often because of blood loss, red-cell destruction, or treatment response.

Polychromatophilia

Polychromatophilia is bluish-gray staining of red blood cells on a blood smear, reflecting increased circulating immature reticulocytes from stimulated red-cell production.

Polycystic Kidney Disease

An inherited disorder in which many fluid-filled cysts grow in the kidneys, which may enlarge and gradually lose function. The main forms are autosomal dominant polycystic kidney disease, usually recognized in adulthood, and autosomal recessive polycystic kidney disease, which can affect infants or children. Complications may include high blood pressure, pain, blood in the urine, kidney failure, or cysts in the liver.

Alternate Names:
PKD

Polycystic Liver Disease

An inherited condition in which many fluid-filled cysts develop in the liver. The cysts may enlarge the liver and cause abdominal fullness or pain; liver function is often preserved, but kidney cysts may also occur.

Polycystic Ovarian Syndrome

Alternate name; see *Polycystic Ovary Syndrome*.

Polycystic Ovary

Polycystic ovaries contain many small follicles and may occur as a normal variant or with polycystic ovary syndrome. PCOS additionally involves ovulatory dysfunction, androgen excess, irregular periods, infertility, acne, or metabolic risk and requires clinical—not ultrasound alone—diagnosis.

Alternate Names:
Polycystic Ovarian Morphology; PCOM

Polycystic Ovary Syndrome

A common hormonal and metabolic disorder that can disrupt ovulation and increase androgen levels or effects. It may cause irregular or absent periods, acne, extra facial or body hair, scalp hair thinning, or difficulty becoming pregnant. Some people have many small ovarian follicles, but these are not required. In adults, diagnosis generally requires two of three features: ovulation problems, androgen excess, or polycystic-appearing ovaries, which may be assessed by ultrasound or an anti-Müllerian hormone test. Other causes are excluded first. In adolescents, persistent menstrual irregularity and androgen excess are both needed; ultrasound appearance alone does not establish the diagnosis. Insulin resistance and increased risk of type 2 diabetes may also occur.

Alternate Names:
PCOS; Polycystic Ovarian Syndrome; Stein-Leventhal Syndrome

Polycystic Ovary Syndrome (PCOS)

Alternate name; see *Polycystic Ovary Syndrome*.

Polycythaemia

An increased red-cell mass or concentration, which may be primary or secondary to another condition.

Polycythemia

Too many red blood cells in the blood. It can be caused by a bone-marrow problem, low oxygen, smoking, dehydration, some medicines, or another illness. In some cases, it raises the risk of blood clots.

Polycythemia Vera

A long-term bone-marrow cancer that produces too many red blood cells and sometimes too many white cells and platelets. The thicker blood can cause headaches, itching, clots, bleeding, or an enlarged spleen.

Alternate Names:
Primary Polycythemia; Polycythaemia Vera

Polydactyly

A birth condition in which a person has one or more extra fingers or toes. The extra digit may be on the thumb or big-toe side, the little-finger or little-toe side, or between the usual digits. It may occur alone or as part of a genetic syndrome. Treatment depends on its size and function and may involve reconstructive surgery.

Polydipsia

Excessive thirst that leads to drinking unusually large amounts of fluid. Common causes include uncontrolled diabetes, water-balance disorders, medicines, and some mental health conditions.

Polyene

A molecule containing multiple carbon-carbon double bonds; polyene medicines such as amphotericin B act against fungal cell membranes.

Polyethylene

A plastic polymer used in packaging and medical devices; implanted polyethylene components may wear over time and produce foreign-body reactions.

Polyethylene Glycol

A polymer used in medicines, especially laxatives that draw water into stool to ease constipation.

Polygenic

Influenced by variants in many genes, often together with environmental factors. Height, blood pressure, and risk for many common diseases are polygenic traits.

Polygenic Disease

A disease influenced by small effects from many genes together with environment and lifestyle. Examples include common diabetes, high blood pressure, heart disease, and some cancers; risk is inherited, not certainty.

Polygenic Hypercholesterolemia

Elevated low-density lipoprotein cholesterol caused by the combined effect of multiple genetic variants and environmental factors rather than one dominant pathogenic variant. Levels and cardiovascular risk vary; other contributing causes may coexist.

Polygenic Inheritance

Inheritance in which many genes, each with a small effect, together influence a trait or disease risk. Height, skin color, blood pressure, diabetes risk, and heart-disease risk are examples; environment also contributes.

Polygenic Obesity

Obesity influenced by many small genetic differences together with eating patterns, activity, sleep, medicines, and the surrounding environment.

Polygenic Risk Score

An estimate of a person's inherited tendency toward a disease, calculated from many small genetic differences. It changes estimated risk but does not predict certainty; family history, environment, and other health factors also influence risk.

Polyglandular Autoimmune Syndrome

An autoimmune disorder in which two or more endocrine glands are damaged, causing combinations of thyroid, adrenal, parathyroid, pancreatic, or gonadal dysfunction.

Polyglandular Autoimmune Syndrome Type 1

An inherited autoimmune syndrome, usually beginning in childhood, involving chronic mucocutaneous candidiasis and autoimmune damage to the parathyroid and adrenal glands. Other organs may be affected, and the exact combination varies.

Polyglandular Autoimmune Syndrome Type 2

An autoimmune syndrome, usually beginning in adulthood, characterized by autoimmune adrenal insufficiency together with autoimmune thyroid disease and/or type 1 diabetes. Other autoimmune disorders may coexist.

Polygraphy

Polygraphy is the simultaneous recording of several physiologic signals, such as breathing, heart rate, oxygen level, and movement, often during sleep testing.

Polyhydramnios

An unusually large amount of amniotic fluid during pregnancy. It may cause abdominal discomfort, breathlessness, or swelling and can increase the risks of early birth, abnormal fetal position, cord problems, or heavy bleeding after delivery.

Polyketide Synthase

An enzyme system that builds complex natural products from repeated carbon units, producing many antibiotics, toxins, and other biologically active molecules.

Polymastia

The presence of extra breast tissue, sometimes with an additional nipple, along the embryonic milk line. Accessory breast tissue can enlarge or develop the same benign or malignant conditions as normal breast tissue.

Polymenorrhea

Menstrual periods that occur unusually often, commonly at intervals shorter than about 21 days. Causes include hormonal changes, thyroid disease, fibroids, bleeding disorders, medicines, and the menopausal transition; persistent frequent bleeding can reflect an underlying disorder.

Polymenorrhoea

British spelling of polymenorrhea: menstrual periods occurring unusually often, commonly at intervals shorter than about 21 days.

Polymer

A large molecule made of repeating smaller units called monomers; polymers are widely used in biology, medicines, and medical materials.

Polymerase Chain Reaction

A laboratory method that makes millions of copies of a selected piece of DNA so it can be detected and studied. It is used to identify infections, inherited conditions, cancer-related gene changes, and other genetic material. The target and interpretation depend on the diagnostic question.

Polymerase Chain Reaction Test

A molecular diagnostic test that amplifies specific nucleic acid (DNA or RNA) sequences to detect pathogens or genetic variants; see *Polymerase Chain Reaction*.

Polymerization

Chemical joining of many small monomers into a larger polymer, a process important in biomolecules, plastics, dental materials, drug delivery, and laboratory techniques.

Polymicrobial Infections

Infections caused by two or more kinds of germs at the same time. They commonly affect contaminated wounds, the abdomen, or the lungs and may require treatment directed at several different organisms.

Polymicrogyria

A brain-development abnormality in which the outer brain surface has too many small, unusually formed folds. It may cause seizures, developmental delay, movement problems, or learning difficulties, depending on the areas involved.

Polymorphic

Having more than one form or appearance. The term may describe a rash, crystal, cell, gene variant, heart rhythm, or tumor. Its medical importance depends on the structure being described and the other clinical findings.

Polymorphic Eruption of Pregnancy

An itchy inflammatory eruption of pregnancy, usually beginning in abdominal stretch marks late in pregnancy and spreading to the trunk or limbs while sparing the umbilicus. It is uncomfortable but generally does not harm the fetus and usually resolves after delivery.

Polymorphic Light Eruption

Alternate name; see *Polymorphous Light Eruption*.

Polymorphism

The presence of two or more inherited genetic forms or visible traits within a population.

Polymorphonuclear

Having a segmented or multilobed nucleus. The term commonly describes certain white blood cells, especially neutrophils, eosinophils, and basophils.

Polymorphonuclear Leukocyte

A white blood cell with a multilobed nucleus, especially a neutrophil, eosinophil, or basophil, involved in innate immune defense and inflammation.

Alternate Names:
PMN

Polymorphous

Having lesions or clinical features that differ in shape, size, or stage and therefore show multiple forms.

Polymorphous Light Eruption

An acquired, often seasonal photodermatosis causing an itchy eruption of papules or plaques, sometimes vesicles, several hours to days after ultraviolet exposure. It often recurs in spring or early summer and may lessen as the skin acclimatizes to sunlight.

Alternate Names:
PMLE; Sun Poisoning

Polymyalgia Rheumatica

An inflammatory rheumatic disease that causes pain and stiffness around the shoulders and hips, often also the neck and upper arms, mainly in adults aged 50 or older. Stiffness is usually worse in the morning or after rest; muscle strength is generally preserved. It is closely associated with giant cell arteritis.

Alternate Names:
PMR

Polymyositis

An uncommon immune-related disease causing gradual, usually symmetrical weakness in muscles close to the body, especially the shoulders, hips, and thighs. It can make climbing stairs, lifting, or swallowing difficult and may raise muscle-enzyme levels.

Alternate Names:
PM; Idiopathic Inflammatory Myopathy

Polymyxin

A group of antibiotics that disrupt bacterial cell membranes, used mainly for selected gram-negative infections.

Polymyxin B

An antibiotic active against selected gram-negative bacteria; kidney and nerve toxicity limit its use to difficult infections.

Polyneuritis

Inflammation or injury affecting multiple peripheral nerves, causing symmetric pain, numbness, weakness, or autonomic dysfunction; causes include immune disease, infection, toxins, and deficiency.

Polyneuropathy

A generalized disorder affecting multiple peripheral nerves, often causing symmetric numbness, tingling, burning pain, weakness, or impaired reflexes in the limbs.

Polynucleotide

A chain of linked nucleotides forming DNA, RNA, or a related laboratory molecule. Its sequence stores or carries genetic information and determines how cells make proteins or regulate biological processes.

Polyoma Virus

A polyomavirus; some human polyomaviruses are

widespread and cause serious disease mainly in immunocompromised people.

Polyomavirus Hominis 2

A human polyomavirus designation associated with a virus found in people; clinically important disease is uncommon and mainly associated with immune suppression.

Polyp

A growth projecting from a mucous membrane; it may be benign, precancerous, or rarely cancerous.

Polyp Biopsy

A polyp biopsy removes part or all of a polyp for microscopic examination to determine whether it is benign, precancerous, or cancerous.

Polypectomy

The surgical or endoscopic excision and removal of a polyp from a mucous membrane surface, most commonly during colonoscopy; see *Polyp* and *Polyp Biopsy*.

Polypeptide

A chain of amino acids joined by peptide bonds. One or more folded polypeptide chains make up many proteins.

Polyphagia

Unusually strong or persistent hunger that may lead to eating much more than usual. Causes include poorly controlled diabetes, an overactive thyroid, certain medicines, inherited conditions, and some mental-health disorders.

Polypharmacology

The study or use of a medicine that affects several targets in the body. This can be helpful when one disease involves multiple pathways, but it may also increase side effects and medicine interactions.

Polypharmacy

Use of several medicines at the same time, often five or more. Some combinations are necessary, but taking many medicines increases the risk of interactions, side effects, confusion, missed doses, and prescribing errors, especially in older adults.

Polyposis

A condition in which many polyps develop, especially in the bowel or other digestive organs. Polyposis may be inherited or acquired, and some types increase the risk of colorectal or other cancers.

Polypropylene

A synthetic plastic polymer used in medical supplies, sutures, meshes, and containers; implanted materials may rarely cause infection or foreign-body reactions.

Polyp Surveillance Colonoscopy

A follow-up colon examination after polyps have been found or removed. The timing depends on the number, size, type, and microscopic features of the polyps and on the person's overall risk.

Polyradiculitis

Inflammation or other disease affecting several spinal nerve roots. It may cause weakness, numbness, pain, and reduced reflexes; causes include infections, autoimmune disorders, and toxins.

Polyradiculopathy

Disease affecting multiple spinal nerve roots, producing pain, weakness, sensory loss, or reflex changes in a distribution determined by the involved roots.

Polysaccharide

A carbohydrate made of many linked simple sugar units. Examples include starch, glycogen, cellulose, and some bacterial capsules.

Polysome

A group of ribosomes attached to one messenger RNA molecule at the same time. Together they make many copies of the protein instructions, helping cells produce proteins efficiently.

Polysomnography

An overnight sleep study that records brain activity, eye movements, muscle activity, heart rhythm, airflow, breathing effort, and blood oxygen. It helps identify sleep-related breathing problems, unusual movements, seizures, and other sleep disorders.

Polysplenia

A congenital condition with multiple small spleens and variable abnormalities of organ arrangement, heart, blood vessels, or intestinal rotation.

Polystyrene

A synthetic plastic polymer used in containers and laboratory materials; burning it can release hazardous fumes.

Polytene Chromosome

An enlarged chromosome formed by repeated DNA replication without cell division, displaying visible bands and commonly used to study gene activity in insect tissues.

Polythelia

The presence of one or more additional nipples, usually along the embryonic milk line. It is often harmless, although accessory tissue can rarely have the same disorders as normal breast tissue.

Polythiazide

A thiazide diuretic formerly used to treat high blood pressure and fluid retention by increasing renal salt and water excretion.

Polytrauma

Serious injuries affecting two or more body regions or organ systems, usually caused by a major accident, fall, blast, or violence. The injuries may include bleeding, fractures, brain injury, chest injury, or damage to internal organs.

Polyunsaturated Fat

A type of fat usually liquid at room temperature, found in fish, vegetable oils, nuts, and seeds. Some are essential because the body cannot make them.

Polyurethane

A family of synthetic polymers used in medical tubing, implants, dressings, and other products; tissue response depends on formulation and site.

Polyuria

Producing unusually large amounts of urine, commonly more than about three liters daily in an adult. Causes include diabetes, excess fluids, medicines, kidney problems, hormone disorders, and some inherited conditions.

Polyvalent

Effective against or involving multiple types, strains, antigens, or targets.

Polyvinyl

A family of polymers used in plastics and medical materials; properties vary according to attached chemical groups.

Pomalidomide

An immunomodulatory medicine used with other treatments for selected multiple myeloma and related blood cancers; it can cause severe birth defects and blood abnormalities.

Pompe Disease

A rare inherited disorder in which a missing enzyme causes stored sugar to build up inside muscle cells. Babies may develop severe weakness, an enlarged heart, and breathing or feeding problems; later-onset disease mainly weakens the limbs and breathing muscles. Enzyme replacement and supportive care can slow or improve the disease.

Alternate Names:
Glycogen Storage Disease Type II; Acid Maltase Deficiency; GSD II

Pompholyx

Alternate name; see *Dyshidrotic Eczema*.

Pompholyx Eczema

Alternate name; see *Dyshidrotic Eczema*.

Pons

The middle part of the brainstem, containing pathways and nuclei involved in movement, sensation, breathing, and cranial-nerve function.

Pontiac Fever

A mild, self-limited flu-like illness caused by Legionella bacteria without the pneumonia typical of Legionnaires' disease.

Pontine

Relating to the pons, a part of the brainstem between the midbrain and medulla. The pons helps carry movement and feeling signals and contains centers involved in eye movement, facial movement, hearing, balance, and breathing. A stroke or bleed there can cause weakness, loss of sensation, trouble speaking or swallowing, coma, or a locked-in state. Rapid correction of very low sodium can also damage it.

Pontine Myelinolysis

A severe non-inflammatory demyelinating neurological disorder of the central pons caused by rapid, overly aggressive intravenous correction of chronic hyponatremia, presenting with spastic quadriparesis, pseudobulbar palsy, dysarthria, dysphagia, and the "locked-in" syndrome.

Alternate Names:
Central Pontine Myelinolysis; Osmotic Demyelination Syndrome; ODS

Poor Circulation

Reduced or abnormal blood flow, usually referring to arterial insufficiency or venous disease, causing coolness, color change, pain, swelling, ulcers, or delayed wound healing.

Poor Color Vision

Alternate name; see *Color Blindness*.

Popcorn Lung Bronchiolitis Obliterans

Bronchiolitis obliterans is irreversible scarring and narrowing of small airways that can follow toxic inhalation, infection, transplantation, or autoimmune disease. It causes persistent cough and breathlessness with obstructive lung testing; exposure avoidance and specialist care are important.

Popliteal

Relating to the hollow behind the knee. This area contains the popliteal artery, vein, and nerves and can be affected by an artery aneurysm, a blood clot, or a Baker cyst.

Popliteal Aneurysm

A weakened, bulging section of the artery behind the knee. It may form blood clots, block blood flow, or send clots into the lower leg, causing pain, coldness, numbness, or tissue damage. Larger aneurysms may need repair.

Popliteal Artery

The main artery behind the knee. It continues from the thigh artery and divides into arteries supplying the lower leg and foot; blockage or injury can cause pain, coldness, numbness, or loss of circulation.

Popliteal Artery Aneurysm

An abnormal enlargement of the artery behind the knee that may cause limb ischemia, clotting, or embolization.

Popliteal Artery Entrapment Syndrome

An uncommon vascular cause of exertional lower extremity claudication in young, athletic individuals without cardiovascular risk factors, resulting from an anomalous anatomical relationship between the popliteal artery and the medial head of the gastrocnemius muscle that compresses the artery during plantarflexion.

Popliteal Cyst

A fluid-filled swelling behind the knee, also called a Baker cyst, caused by communication between the joint and a bursa and often associated with arthritis, meniscal injury, or inflammation.

Alternate Names:
Baker Cyst

Popliteal Fossa

Diamond-shaped space behind the knee, bounded superolaterally by the biceps femoris, superomedially by the semimembranosus and semitendinosus, and inferiorly by the two heads of the gastrocnemius. It contains the popliteal artery and vein, tibial nerve, and common fibular nerve; the popliteal pulse is palpated with the knee slightly flexed.

Popliteal Vein

A deep vein behind the knee formed by the union of the anterior and posterior tibial veins. It continues as the femoral vein and can be affected by deep-vein thrombosis.

Population Attributable Fraction

The estimated proportion of disease in a whole population that could be prevented if a specific harmful exposure were removed, assuming the exposure truly causes the disease and other conditions stayed the same.

Population Attributable Risk

The estimated amount of disease in a population linked to a specific exposure. It helps show the potential public-health benefit of reducing that exposure, but it depends on accurate data and a causal relationship.

Population Genetics

The study of how gene frequencies and genetic variation change within and between populations through inheritance, mutation, selection, migration, and genetic drift.

Population Group

A defined set of people sharing a characteristic such as age, location, exposure, ancestry, occupation, or health condition for epidemiologic or clinical analysis.

Porcelain Gallbladder

Hard calcium deposits in the wall of the gallbladder, usually after long-standing inflammation or gallstones. It may cause no symptoms but can be associated with gallbladder disease; imaging findings guide discussion of monitoring or removal.

Porcelain Inlay

A tooth-colored ceramic restoration bonded into a prepared cavity within a tooth. It can repair selected areas of decay or damage while preserving more tooth structure than a full crown.

Porcine

Porcine means derived from or relating to pigs; porcine tissues, enzymes, and biologic products may be used in medicine after appropriate processing and screening.

Pore

A pore is a small opening or channel in a surface, membrane, tissue, or material that permits passage of fluid, gas, particles, or cellular contents.

Porencephaly

A fluid-filled cavity within the brain caused by abnormal development or damage before or after birth. Effects vary with its size and location and may include seizures, weakness, movement problems, or developmental delay.

Porfimer Sodium

A photosensitizing medicine used with light therapy to destroy selected abnormal tissues, including some tumors; it causes prolonged light sensitivity.

Porin

A porin is a channel-forming protein in an outer membrane, especially of Gram-negative bacteria, allowing passage of selected small molecules.

Pork Tapeworm

A parasite acquired by eating undercooked pork; its larvae can invade tissues and cause cysticercosis.

Porokeratosis

A group of skin conditions that cause one or more ring-shaped, scaly patches with a raised border. Some forms can rarely develop into skin cancer, particularly long-standing or changing lesions.

Poroma

A usually noncancerous tumor arising from a sweat gland. It often appears as a flesh-colored, pink, or red lump on the palms, soles, or other skin and may be removed if painful, bleeding, or uncertain in diagnosis.

Porphyria

A group of rare metabolic disorders caused by a deficiency in one of the specific enzymes needed to produce heme, a vital component of hemoglobin that carries oxygen in blood. When an enzyme is faulty, chemical building blocks called porphyrins build up to toxic levels in the body. Depending on the specific type, porphyria can cause severe episodes of abdominal pain, nerve dysfunction, and psychological symptoms (acute porphyrias), or severe skin sensitivity and blistering upon sun exposure (cutaneous porphyrias).

Alternate Names:
Porphyrias

Porphyria Cutanea Tarda

The most common porphyria, caused by reduced activity of hepatic uroporphyrinogen decarboxylase (UROD), leading to accumulation of porphyrins in the liver and skin. It causes fragile, blistering skin on sun-exposed areas. Associated factors include hepatitis C, excess iron, alcohol use, estrogen exposure, and certain genetic UROD variants.

Porphyrias

Plural form; see *Porphyria*.

Porphyrin

A ring-shaped compound involved in heme and other biological molecules; abnormal accumulation occurs in porphyrias.

Porphyrins Blood Test

A blood porphyrin test measures porphyrins or related compounds and helps evaluate suspected porphyria and disorders of haem production.

Porphyrins Urine Test

A urine porphyrin test measures porphyrins or their precursors and helps investigate suspected porphyria or abnormal haem metabolism.

Porphyromonas

A genus of anaerobic gram-negative bacteria found especially in the mouth and associated with periodontal and other infections.

Porphyromonas Bennonis

An anaerobic oral bacterium rarely isolated from human specimens and occasionally associated with mixed infection.

Porphyromonas Catoniae

An anaerobic gram-negative bacterium found in the mouth and occasionally associated with periodontal or mixed infection.

Porphyromonas Endodontalis

A mouth bacterium that grows without oxygen and is associated with infected tooth pulp and root canals. It may contribute to dental infection, but diagnosis depends on symptoms, examination, imaging, and laboratory findings.

Porphyromonas Levii

A Porphyromonas species found mainly in animals and rarely associated with human infection. An animal-associated bacterium rarely linked to human infection, usually in wounds or other opportunistic settings.

Porphyromonas Somerae

A bacterium that grows without oxygen and is occasionally found in human wounds, abscesses, or other samples. When it causes infection, treatment depends on laboratory identification, infection location, and antibiotic susceptibility.

Portacaval Shunting

A surgical or image-guided connection that diverts blood around the liver to lower dangerously high pressure in the portal veins. It may reduce bleed-

ing risk but can worsen confusion caused by liver disease.

Portal Circulation

The flow of blood from the digestive organs and spleen through the portal vein to the liver before it returns to the general circulation.

Portal Hypertension

Abnormally high pressure in the veins carrying blood from the digestive organs to the liver, most often because of cirrhosis. It can enlarge veins in the esophagus or stomach, cause abdominal fluid buildup, enlarge the spleen, or lead to bleeding.

Alternate Names:
PHT

Portal Hypertensive Colopathy

Changes in the colon caused by high pressure in veins around the liver, usually from advanced liver disease. Enlarged fragile blood vessels may cause visible or hidden bleeding and anemia.

Portal Hypertensive Gastropathy

Changes in the stomach lining caused by high pressure in the veins around the liver. The lining may look mottled and bleed slowly or suddenly, causing anemia or vomiting of blood in severe cases.

Portal System

A network of veins that carries blood from the stomach, intestines, spleen, pancreas, and gallbladder to the liver. The liver processes nutrients and many absorbed substances before the blood returns to the general circulation.

Portal Vein

The large vein that carries blood from the digestive organs, spleen, pancreas, and gallbladder to the liver. A clot or increased pressure in this vein can cause enlarged abdominal veins, bleeding, or fluid buildup.

Portal Vein Obstruction

Partial or complete blockage of blood flow through the portal vein or its branches, caused by thrombosis, tumor, compression, inflammation, or scarring. It may produce portal hypertension, enlarged veins, abdominal fluid, intestinal injury, or gastrointestinal bleeding.

Portal Vein Thrombosis

A blood clot that partly or completely blocks the portal vein or one of its branches. It may occur with cirrhosis, cancer, abdominal infection or inflammation, surgery, or a clotting disorder. It can cause portal hypertension, enlarged veins, spleen enlargement, intestinal injury, or gastrointestinal bleeding.

Portion Of Cytosol

A region of the cell's aqueous internal fluid outside membrane-bound organelles, containing ions, metabolites, proteins, and enzymes that support cellular reactions.

Portion Size

The amount of food or drink served or eaten at one time, distinct from a standardized serving size and important for estimating energy, carbohydrate, sodium, and nutrient intake.

Portopulmonary Syndrome

High blood pressure in the arteries of the lungs occurring with portal hypertension or serious liver disease. It can cause breathlessness, tiredness, chest discomfort, or fainting and affects decisions about liver treatment or transplantation.

Port-Wine Stain

A permanent birthmark caused by widened small blood vessels, appearing as flat pink, red, or purple skin.

Position

The location or arrangement of a body part, organ, fetus, or patient. Position can affect examination findings, movement, comfort, circulation, breathing, childbirth, medical procedures, and interpretation of imaging.

Positional Asphyxia

Fatal or potentially fatal impairment of breathing caused by body position that restricts chest movement, airway patency, or venous return. Risk is increased by restraint, intoxication, obesity, and inability to reposition; findings are nonspecific and require scene and medical correlation.

Positive

Positive means that a test, finding, result, or response is present or above a defined threshold; interpretation depends on the test and clinical setting.

Positive Airway Pressure Treatment

Treatment that uses pressurized air delivered through a mask or similar device to keep the airway open during sleep or breathing difficulty. It is commonly used for obstructive sleep apnea; mask discomfort, dry airways, leaks, or skin irritation may occur.

Positive End-Expiratory Pressure

Pressure kept in the airways at the end of breathing out, usually by a ventilator. It helps keep the lung's air sacs open and improve oxygen levels, but excessive pressure can injure the lungs or lower blood pressure.

Positive Feedback

A body-control process in which a response strengthens the original change, making the process grow until a specific event is completed. Examples include contractions during labor and blood clotting.

Positive Finding

A positive finding is an observed symptom, examination sign, image, laboratory result, or test response that supports the presence of a specified condition or feature.

Positive Predictive Value

The chance that a person with a positive test result truly has the condition being tested for. It depends on test accuracy and how common the condition is among the people tested.

Positive Predictive Value In Surveillance

The proportion of reported signals or alerts that represent true events meeting the surveillance case definition. It is influenced by the specificity of the signal and the underlying prevalence of the condition.

Positive Pressure Ventilation

Breathing support that pushes air or oxygen into the lungs under pressure. It may be delivered through a mask or a breathing tube and can support or replace a person's own breathing during respiratory failure.

Positive Psychology

The study of wellbeing, strengths, resilience, relationships, and factors that help people function and thrive. Its practices may support coping and quality of life but do not replace treatment for illness.

Positive-Strand RNA Virus

A virus whose RNA can be read directly by an infected cell as instructions for making viral proteins. This allows the virus to begin producing new parts soon after entering the cell.

Positive Symptoms

Symptoms reflecting an excess or distortion of normal mental functions, such as hallucinations, delusions, disorganized speech, or grossly disorganized behavior. They are contrasted with negative symptoms, which reflect loss or reduction of function.

Positron

A particle with the same mass as an electron but a positive charge. Some medical tracers release positrons; when one meets an electron, energy is produced and detected during a PET scan.

Positron Camera

A positron camera detects paired gamma rays from positron annihilation and is used in positron-emission tomography to map tracer distribution.

Positron Emission Mammography

PET imaging of breast. Higher sensitivity than

mammography for dense breasts. Limited availability. A breast imaging test combining positron emission scanning with mammography to show tissue activity and structure.

Positron Emission Tomography

An imaging test that uses a small amount of radioactive tracer to show tissue activity, such as glucose use, blood flow, or specific proteins. It is often combined with CT or MRI to locate abnormal areas more precisely.

Positron Emission Tomography Scan

A nuclear medicine imaging scan that utilizes positron-emitting radiotracers (such as FDG) to assess metabolic activity in tissues, widely used in oncology and neurology; see *Positron Emission Tomography*.

Post-Acute Rehabilitation

Time-limited interdisciplinary care after an acute illness, injury, or hospitalization to restore mobility, self-care, cognition, communication, and safe community function. Intensity and setting depend on medical stability and rehabilitation potential.

Post-Adoptive Depression

Depression that begins after adopting a child. Stress, sleep loss, adjustment demands, past trauma, or unmet expectations may contribute; symptoms include persistent sadness, loss of interest, or thoughts of self-harm.

Postanesthesia Care Unit

The postanesthesia care unit is a monitored recovery area where patients are observed during the immediate postoperative period. Admission assessment includes vital signs, level of consciousness, pain assessment, and surgical site evaluation.

Post-Cardiac Arrest Management

Care after return of spontaneous circulation that supports breathing and circulation, identifies and treats the cause of the arrest, manages temperature and seizures when indicated, and assesses neurologic recovery over time.

Post-Cardiac Injury Syndrome

Alternate name; see *Dressler Syndrome*.

Post-Chemotherapy Cognitive Impairment

Alternate name; see *Chemo Brain*.

Postcholecystectomy Syndrome

Persistence or recurrence of symptoms after cholecystectomy. Causes include retained common bile duct stones, sphincter of Oddi dysfunction, bile salt malabsorption, irritable bowel syndrome, and other gastrointestinal conditions. Evaluation includes liver function tests, MRCP, and endoscopic ultrasound.

Post Cibum

A medication instruction meaning “after meals,” abbreviated P.C. The abbreviation can have other meanings in medical records.

Alternate Names:
PC; After Meals

Postcoital Bleeding

Bleeding from the vagina after sexual intercourse. Causes include infection, dryness, injury, polyps, pregnancy-related conditions, or cancer.

Alternate Names:
Contact Bleeding; Postcoital Vaginal Bleeding

Postcoital Test

A fertility test that examines cervical mucus after intercourse for sperm presence and movement. It is rarely used now because results are variable and better-established fertility evaluations are available.

Post-Concussional Syndrome

Persistent physical, cognitive, emotional, or sleep symptoms after a concussion or mild traumatic brain injury.

Post-Concussion Syndrome

Ongoing symptoms after a concussion, such as headache, dizziness, tiredness, poor concentration, sleep problems, or mood changes. Symptoms usu-

ally improve gradually; evaluation and a stepwise return to activity help guide recovery.

Post-Dural Puncture Headache

A headache that begins after a spinal tap or accidental puncture during an epidural. It is usually worse when sitting or standing and improves when lying down because spinal fluid has leaked; neck stiffness, nausea, ringing ears, or light sensitivity may occur.

Posterior

Located behind or toward the back of the body or a body structure. The term is used to describe anatomical direction, position, movement, imaging findings, and areas affected by disease or injury.

Posterior Chamber

The eye space between the iris and lens, filled with clear fluid that nourishes tissues and helps maintain pressure.

Posterior Cord Syndrome

An incomplete spinal cord injury syndrome resulting from selective damage to the posterior columns (fasciculus gracilis and cuneatus), caused by posterior spinal artery infarction, tabes dorsalis, or subacute combined degeneration, characterized by loss of proprioception, vibration sense, and two-point discrimination below the lesion with preserved motor strength and pain/temperature sensation.

Alternate Names:
Dorsal Column Syndrome; Posterior Column Myelopathy

Posterior Cruciate

Usually referring to the posterior cruciate ligament, a strong knee ligament that limits backward movement of the shinbone. Injury can cause pain, swelling, and knee instability.

Posterior Cruciate Ligament Injury

A stretch or tear of the ligament deep inside the knee that prevents the shinbone from moving too far backward. It may follow a blow to the shin, a fall on a bent knee, or severe twisting and can cause pain, swelling, and instability.

Posterior Cruciate Ligament Tear

A partial or complete tear of the strong ligament deep inside the knee that limits backward movement of the shinbone. It often follows a forceful blow to the shin or a fall on a bent knee and may cause pain, swelling, and knee instability. Treatment depends on severity and other injuries.

Posterior Descending Artery

A heart artery that runs along the back groove between the lower chambers and supplies part of the back and lower heart muscle. It usually branches from the right coronary artery but may arise from another heart artery.

Posterior Drawer Test

A knee examination in which the lower leg is gently pushed backward while the knee is bent. Excessive backward movement may indicate injury to the ligament that stabilizes the back of the knee.

Posterior Epistaxis

Nasal hemorrhage originating from arteries situated in the posterior nasal cavity or nasopharynx (most commonly branches of the sphenopalatine artery or Woodruff plexus), typically severe, profuse, draining down the oropharynx, and requiring posterior nasal packing or arterial embolization.

Posterior Fossa Tumor

A growth in the lower back part of the skull, where the cerebellum and brainstem are located. It may cause headache, vomiting, unsteady movement, eye problems, or changes in breathing by pressing on nearby tissue or blocking brain fluid.

Posterior Heel Bursitis

Inflammation of a bursa near the back of the heel, causing pain and swelling.

Alternate Names:
Retrocalcaneal Bursitis; Achilles Bursitis

Posterior Keyhole Foraminotomy

An operation through a small opening in the back that enlarges the passage where a spinal nerve leaves

the spine. It relieves pressure from causes such as a disk bulge or arthritis and may reduce radiating pain or weakness.

Posterior Mediastinum

The back part of the lower mediastinum, in front of the thoracic spine. It contains the esophagus, descending aorta, azygos veins, thoracic duct, and nerves.

Posterior Myocardial Infarction

A heart attack affecting the back wall of the heart, usually because a coronary artery is blocked. It may be missed on a standard ECG, so additional ECG leads or imaging may be needed when symptoms suggest it.

Posterior Pituitary

The back part of the pituitary gland, which stores and releases hormones made in the brain. Vasopressin helps control body water and blood pressure, while oxytocin supports uterine contractions and release of breast milk.

Posterior Prolapse

Alternate name; see *Rectocele*.

Posterior Reversible Encephalopathy Syndrome

Brain swelling caused by disturbed blood-flow regulation, often linked to very high blood pressure, pregnancy-related hypertension, kidney disease, severe infection, or immune-suppressing medicines. Headache, seizures, confusion, or vision loss may occur; delayed treatment can result in lasting injury.

Posterior Rhinorrhea

Posterior rhinorrhea is mucus draining from the nose into the throat, commonly causing throat clearing or cough from allergy, infection, irritation, or sinus disease.

Posterior Subcapsular Cataract

A cloudy area at the back of the eye's lens, just beneath its outer capsule. Because it often lies in the path of light, it can cause glare, blurred vision, and difficulty reading, especially in bright light.

Posterior Synechiae

Abnormal fibrous adhesions between the posterior surface of the iris and the anterior lens capsule, commonly formed during episodes of acute or chronic iritis and causing an irregular, non-reactive pupil.

Posterior Tibial Artery

A major artery running down the back of the lower leg and behind the inner ankle. It supplies the lower leg and sole of the foot; its pulse is checked when assessing blood flow to the foot.

Posterior Urethral Valves

Abnormal tissue folds present in the urethra of some male babies that block urine leaving the bladder. They can cause a weak urine stream, swollen kidneys, urinary infection, or kidney damage; treatment commonly involves endoscopic valve ablation.

Posterior Uveitis

Inflammation at the back of the eye involving the retina, the layer beneath it, or both. It may cause floaters, blurred or missing vision, or eye pain and can result from infection, immune disease, or another inflammatory condition.

Posterior Vaginal Prolapse

Alternate name; see *Rectocele*.

Posterior Vitreous Detachment

Separation of the jelly inside the eye from the retina, usually as an age-related change. It may cause new flashes or floaters; a retinal tear or detachment can occur at the same time.

Posteroanterior

Posteroanterior means directed from back to front; a PA chest radiograph uses this projection to reduce magnification of the heart.

Post-Exposure Prophylaxis

Medicine or vaccination given after a possible expo-

sure to prevent infection from developing. It is used for selected exposures to HIV, hepatitis B, rabies, and other infections; the regimen and timing depend on the pathogen.

Post-Finasteride Syndrome

A name used for sexual, mood, or cognitive symptoms reported to persist after stopping finasteride. The cause and diagnostic criteria are uncertain, and similar symptoms have other possible causes.

Postganglionic Fiber

An autonomic nerve fiber extending from a ganglion to its target organ after the synapse, carrying sympathetic or parasympathetic signals to smooth muscle, glands, or the heart.

Post-Head Trauma Syndrome

Older term for symptoms that continue after a concussion or mild traumatic brain injury; see *Post-Concussion Syndrome*.

Postherpetic Neuralgia

Persistent nerve pain in an area affected by shingles after the rash has healed.

Alternate Names:
PHN; Shingles-Related Nerve Pain

Posthitis

Inflammation of the foreskin, causing redness, swelling, itching, soreness, discharge, or difficulty retracting it. Causes include infection, irritants, and trapped moisture; it may occur with balanitis. Recurrent episodes can be associated with diabetes or an underlying skin disorder.

Post-Hoc

Performed or analyzed after an event; in statistics, a post-hoc analysis follows the planned primary analysis.

Posthumous

Occurring, discovered, or published after a person's death. A posthumous diagnosis may be based on records, stored samples, or autopsy findings.

Post-Infectious Cough

A chronic cough persisting 3–8 weeks after a URI, caused by transient bronchial hyperresponsiveness and airway inflammation. It is self-limited and usually resolves without treatment. Inhaled corticosteroids, antitussives, and time are the mainstays of management.

Postinflammatory Hyperpigmentation

Darkening of skin after inflammation or injury, caused by increased melanin production or its deposition in the epidermis or dermis.

Post-Intensive Care Syndrome

New or worsened physical, thinking, emotional, or mental-health problems that persist after critical illness or an intensive-care stay. It may include muscle weakness, poor memory or concentration, anxiety, depression, sleep problems, or post-traumatic stress.

Post-Kala-Azar Dermal Leishmaniasis

A skin condition caused by Leishmania donovani that can develop after visceral leishmaniasis (kala-azar), often after apparent recovery. It occurs mainly in South Asia and East Africa and may cause pale or red patches, raised bumps, or nodules. Parasites can remain in the skin and be transmitted by sand flies in areas where the disease occurs.

Alternate Names:
PKDL; Post-Kala-Azar Dermatosis

Postmenopausal

Postmenopausal describes the period after menopause, when ovarian estrogen production and menstrual periods have permanently ceased.

Postmenopausal Bleeding

Vaginal bleeding after menopause. Causes include tissue thinning, polyps, hormone effects, and cancer.

Postmenopausal Osteoporosis

Bone loss caused by lower estrogen levels associated with menopause. Sometimes called type I osteoporosis.

Postmenopause

The stage of life after menopause, when menstrual periods have permanently stopped because the ovaries no longer release eggs regularly and produce much less estrogen.

Post-Micturition Dribbling

Involuntary leakage of urine immediately after a person finishes urinating, usually after leaving the toilet. It is a post-micturition symptom, distinct from terminal dribbling, which is a prolonged, slow trickle at the end of the urinary stream. It may coexist with other lower urinary tract symptoms.

Post-Mortem

Occurring after death or relating to examination of a body afterward. A post-mortem examination can help determine the cause of death, identify disease, and provide information for families or legal investigations.

Postmortem Artifact

A change that happens to a body after death and can look like disease or injury. Causes include decomposition, medical resuscitation, embalming, insects, animals, or movement of blood after death; examiners must distinguish it from changes before death.

Postmortem Changes

Changes that occur after death, including cooling, livor mortis, rigor mortis, drying, autolysis, and putrefaction. Their timing varies with temperature, environment, body condition, and other factors and cannot alone establish an exact time of death.

Postmortem Interval

The estimated time between death and the examination or discovery of a body. Investigators consider body temperature, stiffness, pooling of blood, chemical changes, environment, and insect activity, but the estimate is not exact.

Postmortem Lividity

Purplish-red discoloration of dependent parts of the body after death, caused by blood settling under gravity. Its appearance and timing vary with the environment and other factors, so it cannot establish the time of death by itself.

Alternate Names:
Cadaveric Lividity; Postmortem Suggillation

Postmortem Toxicology

Testing blood, tissues, or other samples after death for medicines, alcohol, poisons, or their breakdown products. Results must be interpreted with the medical history, dose, sample site, decomposition, and possible movement of substances after death.

Postmortem Vitreous Analysis

Laboratory examination of vitreous humor for electrolytes, glucose, ketones, drugs, alcohols, and other analytes. Vitreous potassium may provide a rough postmortem interval estimate, but results require cautious interpretation.

Post-Myocardial Infarction Pericarditis

Inflammation of the sac around the heart that occurs after a heart attack. It may begin soon after the heart attack or develop later as part of a delayed immune reaction.

Postmyocardial Infarction Syndrome

Alternate name; see *Dressler Syndrome*.

Post-Nasal Drip

Alternate name; see *Chronic Rhinitis*.

Postnatal

Relating to the period after birth, especially the newborn and infant period. Postnatal care includes checking breathing, feeding, temperature, weight, jaundice, development, and signs of infection or other illness.

Postnatal Anxiety

Excessive anxiety occurring after childbirth. It may involve persistent worry, panic, intrusive thoughts, restlessness, or physical symptoms and can be treated with therapy, support, and sometimes medicine.

Postnatal Care

Health care for the parent and baby after birth. It includes checking bleeding, blood pressure, wounds, pain, feeding, mood, newborn growth, and warning signs, while providing guidance about recovery, contraception, vaccination, and follow-up.

Post-Natal Depression

Depression beginning during pregnancy or after childbirth, with persistent low mood or loss of interest and possible effects on sleep, bonding, and daily functioning.

Postnatal Depression

Alternate name; see *Post-Natal Depression*.

Post-Obstructive Pneumonia

Lung infection developing beyond a blocked airway. A tumor, inhaled object, thick mucus, or narrowing can prevent drainage and allow infection; antibiotics may not cure it until the blockage is found and relieved.

Postop

Postop is an abbreviation for postoperative, meaning relating to the period after a surgical procedure.

Postoperative

Postoperative means occurring or provided after surgery, including recovery, wound care, pain control, rehabilitation, and complication monitoring.

Post-Operative Atelectasis

Partial collapse of air sacs in the lung after surgery. Anesthesia, pain, shallow breathing, mucus, and lying still can contribute, causing shortness of breath or low oxygen. Pain control, movement, and breathing exercises may help prevent or treat it.

Postoperative Care

Care after surgery that monitors breathing, circulation, pain, fluids, the wound, movement, eating, and possible complications. It may include early walking, exercises, medicines, and prevention of blood clots.

Postoperative Cognitive Dysfunction

Problems with memory, attention, thinking, or planning after surgery. They may be temporary or persistent, especially after major operations; assessment compares the person with their usual abilities and checks for delirium, medicines, infection, or other causes.

Postoperative Complications

Problems that develop after an operation, including infection, bleeding, blood clots, breathing problems, organ dysfunction, wound separation, or medication reactions. Risk depends on the procedure and the person's health; severe pain, fever, breathlessness, or heavy bleeding can signal serious complications.

Postoperative Corneal Edema

Swelling of the cornea after eye surgery, caused by endothelial dysfunction, inflammation, elevated intraocular pressure, or surgical trauma. It can blur vision and may resolve or persist depending on the injury.

Postoperative Delirium

A sudden change in attention and thinking after surgery. A person may become confused, restless, unusually sleepy, or see things that are not there; symptoms may fluctuate and can reflect medical complications or medication effects.

Postoperative Hemorrhage

Bleeding after surgery that may occur at the operative site or internally and can cause shock, anemia, or the need for urgent intervention.

Postoperative Ileus

Temporary slowing or stopping of bowel movement after surgery, especially abdominal surgery. It can cause bloating, nausea, vomiting, pain, and inability to pass gas or stool; medicines, electrolyte problems, and the operation may contribute.

Postoperative Infection

An infection developing after surgery, involving the incision, an organ space, implanted material, or the bloodstream.

Postoperative Nausea And Vomiting

Nausea, retching, or vomiting occurring after surgery. Risk is influenced by factors such as previous motion sickness or postoperative nausea, anesthetic technique, opioid use, and patient characteristics. Prevention and treatment are tailored to the individual risk and procedure.

Postoperative Period

The postoperative period is the time after an operation when recovery, pain control, wound care, mobility, nutrition, complications, and follow-up are monitored.

Postoperative Pulmonary Complication

A breathing problem developing after surgery, such as partial lung collapse, pneumonia, aspiration, worsening asthma or COPD, or respiratory failure. Risk is reduced by suitable pain control, movement, breathing exercises, and careful monitoring.

Post-Orgasmic Illness Syndrome

A rare condition in which flu-like symptoms, extreme tiredness, headache, nasal or eye symptoms, and difficulty thinking begin soon after orgasm and last for days. The cause is uncertain, and similar symptoms can occur in other conditions.

Postpartum

Relating to the period after childbirth. Recovery includes changes in bleeding, pain, breasts, hormones, sleep, mood, and body function; important complications include heavy bleeding, infection, high blood pressure, blood clots, depression, and psychosis.

Alternate Names:
Puerperium; Postnatal Period

Postpartum Anxiety

Excessive, persistent, or distressing anxiety during pregnancy or after childbirth that interferes with sleep, daily function, bonding, or self-care. It may occur with panic, intrusive worries, or depression; thoughts of self-harm or harm to the baby indicate a psychiatric emergency.

Postpartum Blues

A common, short-lived period of tearfulness, mood changes, irritability, or anxiety beginning soon after childbirth and usually improving within two weeks. Persistent, severe, psychotic, or suicidal symptoms can indicate a postpartum mental-health disorder.

Postpartum Care

Clinical care during the weeks after childbirth that assesses bleeding, uterine involution, blood pressure, infection, wound healing, breastfeeding, mental health, contraception, and recovery.

Postpartum Contraception

Contraceptive counseling and care after childbirth, taking account of breastfeeding, venous-thromboembolism risk, medical conditions, fertility intentions, and the timing of method initiation.

Postpartum Depression

Depression that begins during pregnancy or after childbirth and lasts beyond ordinary short-term mood changes. It may cause persistent sadness, loss of interest, guilt, anxiety, sleep or appetite changes, difficulty bonding, or thoughts of self-harm.

Alternate Names:
PPD; Postnatal Depression

Postpartum Endometritis

Infection of the inner lining of the uterus after childbirth, more common after cesarean birth. It may cause fever, lower-abdominal pain, uterine tenderness, fast heartbeat, or foul-smelling discharge; treatment includes antibiotics.

Post-Partum Haemorrhage

Excessive bleeding after childbirth, most commonly caused by failure of the uterus to contract, retained placental tissue, genital-tract trauma, or clotting problems.

Postpartum Hemorrhage

Excessive bleeding after childbirth, usually caused by poor uterine contraction, retained placental tissue, genital-tract trauma, or a clotting disorder. It

can cause shock and is an obstetric emergency.

Postpartum Infection

A bacterial infection of the reproductive tract, surgical site, or adjacent structures occurring following childbirth or abortion (puerperal infection). Commonly manifested as endometritis, wound infection (cesarean incision or perineal laceration/episiotomy), mastitis, or pelvic thrombophlebitis, clinically defined by fever of $\geq 38.0°C$ on two or more postpartum days excluding the first 24 hours. Often polymicrobial involving aerobes and anaerobes; treatment requires broad-spectrum intravenous antibiotics (e.g., clindamycin plus gentamicin for endometritis).

Alternate Names:
Postpartum Infections; Puerperal Infection; Puerperal Sepsis

Postpartum Infections

Plural form; see *Postpartum Infection*.

Postpartum Preeclampsia

New-onset hypertension with pre-eclampsia features after childbirth, sometimes occurring several days or weeks postpartum. Severe headache, visual symptoms, chest pain, shortness of breath, or seizures can occur.

Postpartum Psychosis

A rare but severe psychiatric emergency that can begin suddenly during the days or weeks after childbirth. Symptoms may include hallucinations, delusions, paranoia, severe confusion, mania, depression, disorganized behavior, or rapidly changing moods. It can worsen quickly and threaten the safety of the parent or baby.

Alternate Names:
Puerperal Psychosis; Postnatal Psychosis

Postpartum Thyroiditis

Inflammation of the thyroid during the first year after childbirth, caused by an immune reaction. It may first cause anxiety, sweating, and a fast heartbeat, followed by tiredness, cold intolerance, or low thyroid function; recovery varies.

Postpartum Urinary Retention

Inability to empty the bladder adequately after childbirth, sometimes associated with epidural anesthesia, perineal trauma, swelling, or prolonged labor. Prolonged retention can overdistend and injure the bladder.

Postpericardiotomy Syndrome

An immune-mediated post-cardiac-injury syndrome that develops days to weeks after heart surgery. It may cause fever, pleuritic or positional chest pain, shortness of breath, and fluid around the heart or lungs; symptoms can recur.

Post-Pneumonectomy Syndrome

A rare problem after removal of one lung in which the remaining chest structures shift and press on the airway or major blood vessels. It may cause breathlessness, noisy breathing, repeated infections, or difficulty swallowing.

Post-Polio Syndrome

Progressive muscle weakness, fatigue, and pain that begin many years after recovery from acute poliomyelitis. It typically affects muscles previously weakened by polio, and sometimes regions thought to have been spared, and is thought to result from slow decline of overworked surviving motor neurons. There is no specific diagnostic test, so other causes of new weakness are excluded first; management is supportive and includes adjusted exercise, energy conservation, and symptom control.

Post-Prandial

Occurring after a meal. Post-prandial blood glucose is used in diabetes testing, while low blood pressure or chest pain after eating may indicate a circulation or heart problem.

Postprandial Period

The postprandial period is the interval after eating when digestion and nutrient absorption occur and glucose, insulin, and other metabolic responses change.

Postrenal AKI

Sudden loss of kidney function caused by blocked urine flow. Prostate enlargement, stones, tumors, scarring, or bladder-nerve problems may be responsible; kidney damage becomes more likely when the blockage is severe or lasts a long time.

Post-Splenectomy Complications

Post-splenectomy complications include infection by encapsulated bacteria, blood clots, bleeding, and changes in blood-cell counts; vaccination and follow-up reduce risk.

Post-Streptococcal Glomerulonephritis

Kidney inflammation that can develop after a group A streptococcal throat or skin infection. It may cause dark urine, swelling, reduced urine, high blood pressure, tiredness, or kidney failure.

Poststreptococcal Glomerulonephritis

Alternate spelling; see *Post-Streptococcal Glomerulonephritis*.

Poststreptococcal Pustulosis

A rare immune-related outbreak of pus-filled spots after a streptococcal throat infection. The spots usually appear on reddened skin of the trunk or limbs and can resemble infection or a medicine reaction.

Post-Surgical Pain

Pain after an operation caused by tissue injury and inflammation. Its severity depends on the procedure and the person; severe pain can limit breathing, movement, sleep, and recovery.

Post-Surgical Rehabilitation

A planned program to restore movement, strength, independence, and safe return to daily activities after surgery. It may include wound care, pain control, exercises, mobility training, and advice tailored to the operation and the person's recovery.

Postsynaptic Membrane

The receiving surface of a nerve or muscle cell where a neighboring nerve releases a chemical signal. Receptors in this surface detect the signal and help start or change an electrical response.

Postsynaptic Potential

A graded, local change in the electrical membrane potential of a postsynaptic neuron or muscle cell generated by the binding of neurotransmitters to ligand-gated receptors, classified as depolarizing excitatory postsynaptic potentials (EPSP) or hyperpolarizing inhibitory postsynaptic potentials (IPSP).

Alternate Names:
PSP

Post-Term Infant

An infant born at or after 42 weeks of gestation, beyond the usual term-pregnancy period; risks depend on placental function, fetal condition, and circumstances of delivery.

Post-Term Pregnancy

Pregnancy lasting 42 completed weeks or longer. The placenta may provide less support, the baby may become unusually large, and amniotic fluid may decrease. Clinicians monitor parent and baby and discuss delivery timing to reduce complications.

Postterm Pregnancy

A pregnancy continuing to 42 weeks or longer. Risks may include reduced placental function, low amniotic fluid, fetal overgrowth, meconium passage, stillbirth, and difficult delivery, so fetal surveillance and delivery planning are considered.

Post-Test Probability

The estimated chance that a person has a disease after a test result is known. It depends on the original likelihood of disease and how accurately the test distinguishes people with and without the condition.

Post-Thrombotic Syndrome

Chronic pain, heaviness, edema, skin change, and sometimes ulceration developing after deep-vein thrombosis because of persistent venous obstruction and valvular damage. Compression, exercise, skin care, and selected interventions may reduce

disability.

Post-Transfusion Purpura

A rare immune reaction that causes a severe fall in platelets about 5–10 days after a blood transfusion. It can produce pinpoint skin bleeding, bruising, nosebleeds, or dangerous internal bleeding; treatment may include immunoglobulin or other immune-directed therapy.

Post-Traumatic Headache

A headache beginning or continuing after a head or neck injury. It may resemble migraine or tension headache and can occur with dizziness, poor concentration, sleep problems, nausea, or light sensitivity.

Post-Traumatic Stress Disorder

A mental-health disorder that may follow actual or threatened death, serious injury, sexual violence, or another traumatic event. It causes ongoing unwanted memories, nightmares, avoidance, emotional changes, and heightened alertness that interfere with daily life.

Post-Traumatic Stress Disorder (PTSD)

Alternate name; see *Post-Traumatic Stress Disorder*.

Posttraumatic Stress Disorder (PTSD)

Alternate name; see *Post-Traumatic Stress Disorder*.

Posttraumatic Stress Syndrome

Older or alternate name for *Post-Traumatic Stress Disorder*.

Postural

Postural means relating to body position or posture, including symptoms or vital signs that change when a person sits, stands, or lies down.

Postural Drainage

Using specific body positions so gravity helps mucus move from smaller airways into larger ones, where it can be coughed out. A respiratory clinician selects positions based on the affected lung area and the person's condition.

Postural Hypotension

A drop in blood pressure after standing that may cause dizziness, blurred vision, weakness, or fainting. It can result from dehydration, medicines, nerve disorders, blood loss, or heart problems and increases fall risk.

Postural Orthostatic Tachycardia Syndrome

A chronic clinical syndrome of orthostatic intolerance, with frequent symptoms that worsen upright and improve when lying down. Within 10 minutes of standing, heart rate rises by at least 30 beats per minute in adults or 40 beats per minute at ages 12–19, without orthostatic hypotension. Symptoms persist for at least 3 months, and another condition or medicine does not better explain the tachycardia. Symptoms may include lightheadedness, palpitations, fatigue, blurred vision, or exercise intolerance.

Postural Tremor

An involuntary, rhythmic oscillation that appears when an affected body part is actively maintained against gravity, such as holding the arms outstretched. It is the characteristic tremor of essential tremor and physiologic tremor exaggerated by thyrotoxicosis, stress, or medications.

Posture

The alignment and position of the body while resting or moving. Posture depends on bones, joints, muscles, nerves, vision, and balance and can affect comfort, breathing, movement, and injury risk.

Post-Vasectomy Pain Syndrome

Persistent or recurring testicular or scrotal pain lasting at least three months after vasectomy. The pain may result from nerve irritation, inflammation, or pressure in the reproductive tract.

Alternate Names:
PVPS; Chronic Post-Vasectomy Pain

Post-Void Residual

The amount of urine remaining in the bladder after urination, measured by ultrasound or catheterization. A persistently high residual may indicate incomplete emptying, but its significance depends on the volume, timing, symptoms, and clinical context.

Post-Void Residual Volume

The amount of urine remaining in the bladder immediately after urination, measured by ultrasound or catheterization. An elevated residual suggests incomplete emptying but its significance varies with timing, bladder volume, symptoms, and repeated measurements.

Potassium

The chemical symbol for potassium, a major intracellular electrolyte needed for nerve signaling, muscle contraction, and cardiac electrical activity.

Potassium Acetate

A potassium salt used to replace potassium or provide acetate in selected medical and laboratory applications; dosing requires monitoring of kidney function and serum potassium.

Potassium Binders

Medicines taken by mouth that trap potassium in the intestine so it leaves the body in stool. They help lower persistently high blood potassium in selected people, especially with kidney disease, but require monitoring for constipation, swelling, and other electrolyte changes.

Potassium Carbonate Poisoning

Swallowing potassium carbonate can irritate or burn the mouth, throat, and stomach and may raise blood potassium dangerously. Vomiting, weakness, abnormal heartbeat, or breathing difficulty can occur with severe exposure.

Potassium Channel

A membrane protein that allows potassium ions to cross cells and helps control electrical excitability, heart rhythm, and hormone release.

Potassium Chloride

A salt used to prevent or treat low blood potassium. It may be taken by mouth or given into a vein; too much can cause dangerous heart-rhythm problems, especially when kidney function is reduced.

Potassium Citrate

A medicine that makes urine less acidic and increases urinary citrate, helping prevent some kidney stones. It can dangerously raise blood potassium in people with kidney disease or those taking certain medicines.

Potassium Cyanide

A highly poisonous chemical that prevents cells from using oxygen. Swallowing or inhaling it can rapidly cause headache, confusion, seizures, collapse, heart failure, and death.

Potassium Deficiency

An abnormally low blood potassium level, which can cause weakness, cramps, constipation, abnormal heart rhythms, or paralysis.

Potassium Dichromate

A toxic, corrosive chemical that can burn the skin, eyes, mouth, and digestive tract. Swallowing or inhaling it may damage the kidneys, liver, blood, or lungs.

Potassium Hydroxide Poisoning

A severe chemical burn caused by swallowing or contacting potassium hydroxide, a strong alkali. It can damage the mouth, throat, stomach, skin, eyes, and lungs.

Potassium In Diet

Dietary potassium comes from fruits, vegetables, beans, dairy, and other foods; intake may need adjustment in kidney disease or with medicines that change potassium levels.

Potassium Iodide

Potassium iodide supplies iodide and is used in selected thyroid conditions, radiation emergencies,

and some expectorant preparations; excess can disturb thyroid function.

Potassium Ion

The positively charged form of potassium, the principal intracellular cation that helps establish resting membrane potential, nerve transmission, muscle contraction, and cardiac rhythm.

Potassium Permanganate

A chemical sometimes used as a very dilute skin antiseptic or drying solution. Concentrated material can burn tissue, stain skin, and cause poisoning if swallowed.

Potassium-Sparing Diuretic

A class of diuretic medications that promote sodium and water excretion while conserving potassium in the late distal tubule and collecting duct of the nephron. Includes mineralocorticoid receptor antagonists (aldosterone antagonists such as spironolactone and eplerenone) and direct epithelial sodium channel (ENaC) blockers (amiloride, triamterene). Clinically utilized in heart failure with reduced ejection fraction, cirrhosis with ascites, and primary hyperaldosteronism, with hyperkalemia representing the primary adverse effect.

Alternate Names:
Potassium-Sparing Diuretics

Potassium-Sparing Diuretics

Plural form; see *Potassium-Sparing Diuretic*.

Potassium Test

A potassium test measures potassium in blood, usually to assess heart, muscle, kidney, or medication-related electrolyte problems.

Potassium Urine Test

A urine potassium test measures potassium excretion and helps determine whether abnormal blood potassium is related to kidney losses or other causes.

Potbellies And Toddlers

A rounded abdomen in a toddler is often normal body shape or posture; persistent distension with pain, vomiting, poor growth, constipation, or a mass can indicate an underlying disorder.

Potency

The amount of a drug required to produce a specified effect. A more potent drug produces that effect at a lower dose, but potency does not indicate the maximum effect.

Potential

Potential describes a capacity, possibility, or stored energy that may become clinically relevant depending on circumstances and additional findings.

Potential Acuity Meter

An eye-testing device that estimates the vision a person might achieve after treatment of an eye problem such as a cataract. Results can be limited by retinal, nerve, or other disease.

Potocki-Lupski Syndrome

A genetic condition caused by an extra copy of a small section of chromosome 17. It may cause low muscle tone, feeding and growth problems, developmental or learning difficulties, autism-related features, behavior differences, and congenital heart defects.

Alternate Names:
PTLS; Duplication 17p11.2 Syndrome

Pott Disease

Tuberculosis infection of the bones of the spine. It can cause persistent back pain, collapse or bending of the spine, an abscess, and pressure on the spinal cord leading to weakness or paralysis.

Potter Sequence

A cascade of neonatal physical anomalies resulting directly from severe oligohydramnios in utero (frequently caused by bilateral renal agenesis or posterior urethral valves), comprising pulmonary hypoplasia, compressed dysmorphic facial features (Potter facies), and extremity limb positioning deformities.

Potter Syndrome

A pattern of birth abnormalities caused by very low amniotic fluid, often because both fetal kidneys are absent or cannot make urine. It may cause underdeveloped lungs, distinctive facial features, and limb changes and is usually life-threatening.

Pott Puffy Tumor

A subperiosteal abscess of the frontal bone associated with underlying frontal bone osteomyelitis, arising as a severe suppurative complication of untreated frontal sinusitis or direct cranial trauma, presenting with fluctuant forehead swelling and headache.

Alternate Names:
Frontal Subperiosteal Abscess; Frontal Bone Osteomyelitis

Pott's Disease

Tuberculosis infection of the spine, usually affecting the vertebrae. It can cause gradually worsening back pain; vertebral damage may lead to collapse, spinal curvature, an abscess, or pressure on the spinal cord or nerves.

Pouch

A sac-like body structure or a surgically created reservoir. Examples include a cheek pouch, a pouch in the digestive tract, and an ileal pouch made from small intestine.

Pouch of Douglas

A space in the pelvis between the uterus and rectum. In a person without a uterus, the comparable space lies between the bladder and rectum; fluid or blood can collect there.

Pound

A unit measuring weight or force, with meaning determined by context. In healthcare, pounds may describe body weight, pressure, equipment loads, or medicine instructions and should be distinguished from metric units.

Povidone

Povidone is a water-soluble polymer used in medicines, eye products, and other preparations; it is also part of povidone-iodine antiseptic.

Povidone-Iodine

Povidone-iodine is an iodine-containing antiseptic used on skin or tissue before selected procedures; it can irritate skin and affect the thyroid with extensive use.

Powassan Encephalitis

Inflammation of the brain caused by Powassan virus, a tick-borne flavivirus. It can cause fever, headache, vomiting, confusion, seizures, or weakness and may require hospitalization.

Powassan Virus

A tick-borne virus that can cause encephalitis or meningitis. Severe infection may cause headache, fever, confusion, seizures, or weakness; there is no specific antiviral treatment.

Powassan Virus Disease

Powassan virus disease is a rare tick-borne infection that can cause fever, headache, vomiting, confusion, seizures, meningitis, or encephalitis. Treatment is supportive, and prevention relies on avoiding ticks and removing them promptly.

Powder Diffraction

An analytical method that identifies crystalline substances by measuring how an X-ray or other beam is diffracted by powdered material.

Power

The rate at which work is performed; in exercise, it combines force and movement speed.

Power Training

Exercise designed to improve the ability to produce force rapidly.

Alternate Names:
Explosive Strength Training; Ballistic Training

Pox

A disease producing vesicles, pustules, or pitted scars; the term is used in names such as smallpox and cowpox.

Poxviridae

A family of large DNA viruses that includes orthopoxviruses, molluscipoxvirus, and parapoxviruses; some cause significant human disease.

Poxviridae Infection

An infection caused by a poxvirus, ranging from localized skin lesions to severe systemic disease depending on the virus and host.

Poxvirus

A family of large DNA viruses that includes variola, vaccinia, mpox, and molluscum contagiosum viruses.

Ppar Alpha

A protein inside cells that helps control how the body uses fats. Fibrate medicines activate it to lower some blood fats, especially triglycerides.

Ppar Delta

A protein inside cells that helps regulate fat use, energy balance, inflammation, and the development of some tissues. It is mainly studied in laboratory and drug research.

PPD

An abbreviation for *purified protein derivative*, the tuberculin used in a tuberculosis skin test, or for *postpartum depression*, a depressive disorder arising during the postpartum period. Spell out the term when the context is not clear.

PPD Skin Test

A PPD skin test places a small amount of tuberculin under the skin to assess immune evidence of tuberculosis exposure; interpretation depends on risk and the size of the reaction.

PPH

Abbreviation; see *Postpartum Hemorrhage*.

PPS (Post-Polio Syndrome)

Alternate name; see *Post-Polio Syndrome*.

Practitioner

A person qualified and authorized to practice a healthcare profession.

Prader-Labhart-Willi Fancone Syndrome

Historical or variant naming for Prader-Willi syndrome, a chromosome 15 imprinting disorder causing infantile hypotonia and feeding difficulty followed by hyperphagia, obesity risk, hypogonadism, developmental differences, and short stature.

Prader-Labhart-Willi Syndrome

Alternate name; see *Prader-Willi Syndrome*.

Prader Willi Syndrome

Alternate spelling; see *Prader-Willi Syndrome*.

Prader-Willi Syndrome

A genetic disorder that often causes weak muscle tone and feeding difficulty in infancy, followed later by unusually strong hunger, obesity, short stature, learning difficulties, hormone problems, and behavioral changes.

Alternate Names:
Prader-Labhart-Willi Syndrome

Pragmatic

Focused on what works in ordinary real-world conditions. A pragmatic clinical trial studies how an intervention performs in usual healthcare rather than under highly controlled conditions.

Pragmatic Trial

A pragmatic trial evaluates an intervention under usual real-world care conditions to estimate how well it works in routine practice.

Pralatrexate

A folate-blocking chemotherapy medicine used for

some relapsed or treatment-resistant peripheral T-cell lymphomas. It can cause mouth sores, low blood counts, infection, fatigue, nausea, and other serious treatment-related effects.

Pralidoxime

An oxime that can reactivate inhibited acetylcholinesterase when administered early after organophosphate poisoning, particularly for nicotinic weakness and respiratory-muscle dysfunction. It is used with atropine and supportive care according to exposure and local guidance.

Pramipexole

A medicine that stimulates dopamine receptors and is used mainly for Parkinson disease or restless legs syndrome. It can cause nausea, sleepiness, dizziness, sudden sleep, hallucinations, or impulse-control problems.

Prandial

Prandial means relating to a meal, as in preprandial before eating or postprandial after eating.

Prasugrel

An antiplatelet medicine that prevents blood cells from clumping. It is used in selected people with acute coronary syndrome receiving coronary stents, but it increases bleeding risk and is unsuitable for some patients.

Pravastatin

A statin that lowers LDL cholesterol by inhibiting HMG-CoA reductase.

Pravastatin Sodium

A statin medicine that lowers harmful LDL cholesterol by reducing cholesterol production in the liver. It helps reduce heart attack and stroke risk alongside diet, exercise, and other risk-factor treatment.

Praziquantel

A medicine used to treat several infections caused by parasitic worms, including schistosomiasis, tapeworms, and flukes. It damages the worms so the body can remove them; dizziness, sleepiness, nausea, or abdominal discomfort may occur.

Prealbumin

Another name for transthyretin, a protein made mainly by the liver that carries thyroid hormone and vitamin A in the blood. Its blood level changes with inflammation, illness, kidney disease, and nutrition, so it is not a nutrition measure by itself.

Prealbumin Tyr-77 Amyloidosis

A rare hereditary transthyretin amyloidosis caused by a Tyr77 transthyretin variant. Misfolded protein can deposit in nerves, the heart, or other organs and may cause neuropathy, cardiomyopathy, or gastrointestinal symptoms.

Preauricular Sinuses

Small congenital pits or channels near the front of the ear caused by incomplete fusion during development. They may remain harmless or become infected, swollen, painful, or draining; recurrent infection may require surgical excision.

Prebiotics

Substrates selectively utilized by host microorganisms that confer a health benefit. Many recognized prebiotics are fermentable carbohydrates, but not all dietary fibers are prebiotics.

Pre-Cancerous

Describing abnormal cells or tissue that are not cancer but have a higher-than-usual chance of becoming cancer. The risk varies by the tissue and the severity of change; monitoring or removal may reduce the risk.

Precancerous Condition

A precancerous condition contains abnormal changes that may progress to cancer but are not cancer themselves.

Precancerous Polyp

A precancerous polyp is a growth with cellular changes that can become cancerous over time if

not removed or monitored appropriately.

Precapillary Sphincter

A ring of muscle at the entrance to some capillaries that helps control how much blood flows into a capillary network.

Precaution

An action taken in advance to lower the chance of harm, infection, or error. Examples include handwashing, protective equipment, checking a medicine, using a seat belt, and avoiding a known trigger.

Precipitate Labor

Labor and birth completed unusually quickly, commonly defined as delivery within three hours after regular contractions begin. It may increase the risk of birth before arrival at a facility, injury, or heavy bleeding, though outcomes vary.

Alternate Names:
Precipitate Labour; Precipitous Labor; Precipitous Labour; Tumultuous Labor; Rapid Delivery

Precipitating Factor

A precipitating factor is an event or exposure that triggers the onset or worsening of symptoms or disease in a susceptible person.

Precision Medicine

An approach to preventing, diagnosing, or treating disease that uses information about a person's genes, proteins, environment, lifestyle, and other characteristics to guide care. It is sometimes called personalized medicine, though precision medicine is often preferred because it does not imply a unique treatment for each individual.

Precision Oncology

An approach to cancer diagnosis and treatment that uses information about a tumor's molecular features, such as gene changes, proteins, or other biomarkers, to guide disease characterization, treatment selection, or clinical-trial matching. These findings are interpreted alongside cancer type, stage, and other clinical features; an actionable biomarker does not guarantee a treatment response.

Preclinical

Before human testing, or describing disease changes that occur before symptoms become noticeable or cause recognized illness.

Precocious Puberty

Development of puberty-related body changes earlier than expected. It may result from early brain signals, hormone-producing disorders, medicines, or other conditions and requires evaluation to protect growth and emotional wellbeing.

Alternate Names:
Early Puberty Premature Puberty

Preconception Care

Health care before pregnancy to improve the chance of a healthy pregnancy. It reviews medical conditions, medicines, vaccinations, genetic risks, nutrition, folic acid, substance exposure, and lifestyle, and helps plan changes before conception.

Preconception Counseling

Healthcare advice before pregnancy to improve the health of the pregnant person and future baby. It reviews medicines, vaccines, chronic diseases, nutrition, genetic risks, harmful exposures, and recommended supplements.

Precordial Catch Syndrome

Brief, sharp, localized chest pain near the heart that worsens with breathing and usually occurs in otherwise healthy children or adolescents.

Precordium

The area of the front chest wall over the heart and nearby large blood vessels. A clinician examines this area by looking, feeling for the heartbeat or unusual movement, and listening for heart sounds and murmurs.

Precursor

A substance that the body can change into another substance with a useful biological effect. For example, some vitamins, hormones, and medicines begin as precursors and are changed by enzymes in

particular tissues.

Prediabetes

Blood glucose higher than normal but below the diagnostic threshold for diabetes, usually identified by A1C, fasting glucose, or an oral glucose-tolerance test; it increases future diabetes and cardiovascular risk.

Alternate Names:
Borderline Diabetes; Impaired Glucose Tolerance; Impaired Fasting Glucose

Prediabetes Syndrome

Blood glucose levels above normal but below the diabetes threshold, associated with increased future risk of type 2 diabetes and cardiovascular disease.

Predictive Test

A test that estimates whether a person or disease is likely to respond to a particular treatment.

Predispose

To predispose is to increase a person's susceptibility or likelihood of developing a disease or response when additional triggers occur.

Prednimustine

Prednimustine is a former antineoplastic drug combining a corticosteroid-related group with an alkylating component and causing immunosuppression and marrow toxicity.

Prednisolone

Prednisolone is a corticosteroid used to reduce inflammation and immune activity; prolonged or high-dose use can cause infection, bone loss, and other effects.

Prednisone

A corticosteroid used for inflammatory, allergic, and autoimmune conditions. Long-term or high-dose use can suppress adrenal function, so stopping after prolonged use may require gradual dose reduction to avoid adrenal insufficiency.

Pre-eclampsia

Alternate spelling; see *Preeclampsia*.

Preeclampsia

A disorder that can develop during pregnancy, usually after 20 weeks, or during the weeks after childbirth. It involves new high blood pressure together with protein in the urine or signs of organ injury. Possible findings include a low platelet count, abnormal kidney or liver function, severe headache, vision changes, upper-abdominal pain, or fluid in the lungs. During pregnancy, it can affect the placenta and fetal growth. It may progress to eclampsia, which is preeclampsia with seizures.

Preeclampsia and Eclampsia

Alternate name; see *Pregnancy: Preeclampsia And Eclampsia*.

Preeclampsia And High Blood Pressure

Alternate name; see *Preeclampsia*.

Preeclampsia With Severe Features

A severe form of preeclampsia involving very high blood pressure or damage to organs such as the brain, liver, kidneys, lungs, or blood-clotting system. Severe headache, vision changes, breathing difficulty, or upper-abdominal pain may occur.

Preexcitation Syndrome

A heart-rhythm condition in which an extra electrical pathway activates the lower heart chambers too early. It can cause episodes of a very fast heartbeat, dizziness, or fainting and may require specialist assessment.

Pre-Existing Diabetes And Pregnancy

Pre-existing type 1 or type 2 diabetes during pregnancy increases risks to parent and fetus, so glucose control, medicines, fetal growth, blood pressure, and eye and kidney health need coordinated care.

Prefrontal

Relating to the anterior part of the frontal lobe involved in planning, judgment, working memory,

and behavior.

Prefrontal Cortex

The prefrontal cortex is the front part of the frontal lobe involved in planning, judgment, working memory, impulse control, and social behavior.

Pregabalin

Pregabalin is used for certain nerve pain and seizures and may cause dizziness, sleepiness, swelling, or dependence.

Preganglionic Fiber

A nerve fiber that carries automatic body signals from the brain or spinal cord to a relay station before they reach an organ. These signals help control the heart, blood vessels, glands, digestion, and bladder.

Pregnancy

The period during which an embryo or fetus develops in the uterus, usually lasting about 40 weeks from the first day of the last menstrual period until birth.

Pregnancy And Herpes

Genital herpes during pregnancy can affect delivery planning and rarely infect the newborn; antiviral treatment and examination of lesions near labor help reduce transmission risk.

Pregnancy And Travel

Travel during pregnancy depends on gestational age, health, destination infections, transport, and access to care; prevention includes vaccines as appropriate, food and water safety, movement, and medical planning.

Pregnancy and Urolithiasis

Kidney or ureteral stones during pregnancy can cause colicky flank pain, hematuria, nausea, obstruction, infection, or preterm contractions. Ultrasound is generally preferred for initial imaging, and treatment balances symptom control, drainage, infection management, and fetal safety.

Pregnancy And Work

Work during pregnancy is usually possible but may require adjustments for heavy lifting, prolonged standing, heat, chemicals, radiation, infection, night work, or other occupational hazards.

Pregnancy at Age 35 or Older

Pregnancy in a person who will be 35 years or older at the estimated time of delivery. It is associated with increased risks of some chromosomal conditions and pregnancy complications; individual risk depends on overall health and pregnancy history.

Alternate Names:
Advanced Maternal Age

Pregnancy: Bleeding During The First Trimester

First-trimester bleeding may occur with implantation, cervical changes, miscarriage, ectopic pregnancy, or other causes. Assessment uses symptoms, examination, serial pregnancy hormone testing, and ultrasound; heavy bleeding, severe pain, faintness, or shoulder pain is urgent.

Pregnancy Complication

A maternal, fetal, placental, or labor-related problem that disrupts an otherwise expected pregnancy, such as preeclampsia, hemorrhage, diabetes, growth restriction, or preterm labor.

Pregnancy Diagnosis

Confirmation of pregnancy using a urine or blood test for human chorionic gonadotropin, followed by ultrasound when needed to establish location, viability, and gestational age. A positive test with pain or bleeding requires assessment for ectopic pregnancy.

Pregnancy-Induced Hypertension

Alternate name; see *Gestational Hypertension*.

Pregnancy Nutrition

Food and supplements during pregnancy that support the pregnant person and fetal growth. Needs vary, but a varied diet usually includes enough pro-

tein, folate, iron, iodine, calcium, vitamin D, and other nutrients; individual advice is important.

Pregnancy Of Unknown Location

A positive pregnancy test without a confirmed intrauterine or ectopic pregnancy on ultrasound. Serial human chorionic gonadotropin measurements and repeat imaging help determine whether the pregnancy is early, failing, or ectopic.

Pregnancy Outcome

Pregnancy outcome describes what happens to a pregnancy, such as live birth, miscarriage, stillbirth, preterm birth, or other maternal or fetal result.

Pregnancy: Placenta Previa

Placenta previa occurs when the placenta lies over or near the cervical opening and can cause painless bright-red bleeding, especially later in pregnancy. Digital vaginal examination is avoided until location is known; recurrent bleeding requires obstetric planning and sometimes cesarean delivery.

Pregnancy: Preeclampsia And Eclampsia

Preeclampsia is new hypertension during pregnancy with proteinuria or organ dysfunction; eclampsia is the occurrence of seizures. Severe headache, visual symptoms, upper-abdominal pain, shortness of breath, or seizure can occur in severe disease.

Alternate Names:
Toxemia of Pregnancy; Hypertensive Disorders of Pregnancy

Pregnancy-Related Hypertension

High blood pressure that develops during pregnancy. Gestational hypertension is new high blood pressure after 20 weeks without signs of preeclampsia; preeclampsia includes protein in the urine or other signs of organ involvement.

Pregnancy Status

Pregnancy status indicates whether a person is pregnant, not pregnant, or of unknown status and can affect medication, imaging, and treatment decisions.

Pregnancy Test

A urine or blood test that detects human chorionic gonadotropin, a hormone made soon after an embryo attaches to the uterus. Testing too early can be falsely negative; an unexpected result may need repeat testing or medical assessment.

Pregnancy Trauma

Physical injury during pregnancy, including falls, motor-vehicle crashes, assault, or abdominal impact. Maternal stabilization comes first, followed by assessment for placental abruption, bleeding, uterine injury, fetal compromise, and preterm labor.

Pregnancy Trimester

One of three approximate stages of pregnancy: first through 13 weeks, second from 14 through 27 weeks, and third from 28 weeks until birth. The stages help organize fetal development, screening, and care.

Pregnancy With Asthma

Asthma during pregnancy may change as hormone, breathing, and immune conditions change. Poorly controlled asthma can reduce oxygen for the pregnant person and fetus, so prescribed controller treatment and regular obstetric and respiratory follow-up are important.

Pregnane

Pregnane is a 21-carbon steroid hydrocarbon that forms the structural backbone of progesterone and several corticosteroid and progestin compounds.

Pregnanolone

Pregnanolone is a neuroactive steroid metabolite that can modulate GABA-A receptors and influence neuronal excitability, mood, and sedation.

Pregnant

Pregnant means carrying a developing embryo or fetus in the uterus after conception; pregnancy status affects medicines, imaging, and clinical decisions.

Pregnenolone

Pregnenolone is a steroid hormone precursor made

from cholesterol that can be converted into progesterone, corticosteroids, and sex hormones.

Prehn Sign

A test in which lifting the painful testicle is said to relieve pain in epididymitis but not testicular torsion. This finding is unreliable and cannot rule out torsion. Sudden severe testicle pain, swelling, nausea, or a high-riding testicle can indicate torsion, which may require Doppler ultrasound and surgery.

Alternate Names:
Prehn's Sign

Prehypertension

An older blood-pressure category formerly used for readings above normal but below hypertension. Current thresholds and terminology vary by guideline; see *Elevated Blood Pressure*.

Preimplantation Genetic Diagnosis

Genetic testing of embryos created through in-vitro fertilization before transfer to the uterus, used to identify selected inherited disorders or chromosomal abnormalities. It requires genetic counseling and does not guarantee implantation, a healthy pregnancy, or absence of all disease.

Preimplantation Genetic Testing

Genetic testing of cells from an embryo created through in-vitro fertilization before possible transfer to the uterus, used in selected situations to identify specific inherited disorders or chromosome-number abnormalities.

Preload

The amount of blood filling the heart's lower chambers and stretching their muscle just before each heartbeat. It mainly depends on blood returning to the heart and influences how strongly the heart can pump.

Preload Reduction

A decrease in the amount of blood returning to the heart, which lowers the heart's filling pressure and workload. It may occur with fluid loss or medicines and can help some forms of heart failure.

Premalignant

Describing cells or tissue changes that have a higher chance of becoming cancer but have not grown into nearby tissues. Not every premalignant change becomes cancer; follow-up or removal depends on its type, location, size, and risk.

Premalignant Lesions of the Endometrium

Abnormal endometrial gland growth, usually endometrial hyperplasia with atypia, that can precede endometrial carcinoma. Diagnosis requires sampling of the uterine lining; treatment depends on fertility goals, cancer risk, and whether invasion is present.

Premature

Occurring earlier than expected or before the usual developmental or pregnancy-related time. A premature birth occurs before thirty-seven completed weeks and may increase risks involving breathing, feeding, temperature, and development.

Premature Adrenarche

Early appearance of pubic or axillary hair, body odor, or mild acne from adrenal androgen production without true central puberty; evaluation excludes virilizing disorders.

Premature Atrial Contraction

An early heartbeat that starts in the upper chambers of the heart rather than at the usual pacemaker. It may feel like a skipped or extra beat and is often harmless; frequent episodes or fainting can occur with an arrhythmia.

Premature Baby

An infant born before 37 completed weeks of pregnancy, with risks related to immature lungs, brain, feeding, temperature control, immunity, and other organ systems.

Premature Birth

Birth before 37 completed weeks of pregnancy; the earlier the birth, the greater the risks of respiratory, neurological, and developmental complications.

Premature Closure

Closing of a body opening, growth plate, or developmental connection earlier than expected. The result depends on the site and may include blockage, abnormal body shape, or restricted growth; treatment depends on the cause.

Premature Ejaculation

A persistent or recurrent pattern of ejaculation that occurs sooner than desired, with limited control and associated personal distress. Assessment considers the person's typical experience and sexual context.

Alternate Names:
Rapid Ejaculation; PE

Premature Infant

An infant born before 37 completed weeks of pregnancy. Earlier birth increases the risk of breathing, feeding, temperature-control, infection, and developmental problems.

Premature Labor

Regular uterine contractions with cervical change before 37 completed weeks of pregnancy, which can lead to preterm birth; clinical assessment considers membranes, infection, and fetal well-being.

Premature Menopause

Loss of ovarian function and menstruation before age 40, now often termed primary ovarian insufficiency.

Premature Ovarian Failure

Older name; see *Premature Ovarian Insufficiency*.

Premature Ovarian Insufficiency

Reduced or intermittent ovarian function before age 40, causing irregular or absent periods, reduced fertility, and sometimes hot flushes, vaginal dryness, or low bone density. Causes include genetic conditions, autoimmune disease, chemotherapy, radiation, surgery, or no identifiable cause.

Premature Puberty

Alternate name; see *Precocious Puberty*.

Premature Rupture Of Membranes

Breaking of the amniotic sac before labor begins. If it happens before 37 weeks, it is called preterm rupture; a gush or continuing leak of fluid can precede infection or early birth.

Premature Thelarche

Isolated breast development in a young child without other signs of puberty, often transient but assessed for growth acceleration, estrogen exposure, or true precocious puberty.

Premature Ventricular Contraction

An extra, abnormal heartbeat that originates in one of the heart's lower pumping chambers (the ventricles) ahead of the normal regular rhythm. This premature impulse disrupts the normal heart cycle, often felt as a flutter, a skipped beat, or a forceful thump in the chest followed by a brief pause. While isolated PVCs are common and generally harmless in people with healthy hearts, frequent occurrences can be associated with underlying heart conditions.

Alternate Names:
Premature Ventricular Contractions; PVC; Ventricular Premature Depolarization; VPD; Ventricular Extrasystole

Premature Ventricular Contractions

Plural form; see *Premature Ventricular Contraction*.

Prematurity

Alternate name; see *Preterm Birth*.

Premenstrual

Occurring during the days before menstruation; the term commonly refers to cyclical symptoms such as mood change, breast tenderness, bloating, headache, or fatigue.

Premenstrual Breast Changes

Premenstrual breast changes include cyclic fullness, tenderness, swelling, or lumpiness caused by hormonal variation; a persistent one-sided mass, skin change, or bloody discharge can have other causes.

Premenstrual Dysphoric Disorder

A severe form of premenstrual symptoms that repeatedly causes depression, irritability, anxiety, mood swings, or loss of control along with physical symptoms and major disruption of work, relationships, or daily life before menstruation.

Premenstrual Syndrome

A recurring group of physical and emotional symptoms in the days or weeks before menstruation that improves when bleeding begins. Symptoms may include irritability, mood changes, bloating, breast tenderness, headache, tiredness, or appetite changes.

Premenstrual Syndrome (PMS)

Alternate name; see *Premenstrual Syndrome*.

Pre-MiRNA

A pre-miRNA is an early hairpin-shaped microRNA transcript processed in the nucleus before becoming a mature regulator of gene expression.

Premolar Tooth

One of the permanent teeth between the canine teeth and molars. Premolars usually have two raised points and help tear and crush food; decay, crowding, or infection may require dental treatment.

Prenatal

Prenatal means occurring during pregnancy before birth, including care, testing, development, counseling, and treatment of the pregnant person or fetus.

Prenatal Care

Regular health care during pregnancy to monitor the pregnant person and developing baby. Visits may include blood-pressure and urine checks, blood tests, ultrasound, screening, vaccination, nutrition and medicine review, and advice about warning signs.

Prenatal Depression

Depression during pregnancy. Symptoms may include persistent sadness, loss of interest, guilt, hopelessness, sleep or appetite changes, and thoughts of self-harm; prompt professional support is important.

Prenatal Development

Prenatal development is growth and differentiation of the embryo and fetus from conception to birth, influenced by genes, nutrition, maternal health, and exposures.

Prenatal Diagnosis

Testing during pregnancy to identify a possible genetic, chromosome, or structural condition in the fetus. It may use ultrasound, blood-based screening, or diagnostic tests such as chorionic-villus sampling and amniocentesis, depending on the clinical question and stage of pregnancy.

Prenatal Exposure

Contact of a fetus with a medicine, substance, infection, or environmental factor during pregnancy. Effects depend on the agent, dose, timing, and fetal susceptibility.

Prenatal Genetic Counseling

A consultation that reviews the risk of inherited or chromosomal conditions, available screening and diagnostic tests, possible results, and reproductive options before or during pregnancy.

Prenatal Sex Determination

Estimation of fetal sex before birth, usually by ultrasound visualization of external genitalia or analysis of placental cell-free DNA for sex-chromosome signals. Ultrasound findings depend on gestational age, fetal position, and image quality; cell-free DNA provides a screening result, not a diagnosis. Sex chromosomes and genital appearance may not align in some differences of sex development.

Alternate Names:
Fetal Sex Determination

Prenatal Testing

Screening and diagnostic tests performed during pregnancy to assess fetal health and development or identify genetic, chromosomal, and structural conditions. Tests may include ultrasound, maternal

blood tests, cell-free DNA screening, chorionic-villus sampling, and amniocentesis.

Prenatal Vitamins

Supplements designed to provide nutrients needed during pregnancy, commonly including folic acid, iron, iodine, and vitamin D. The appropriate product and dose depend on diet, medical conditions, laboratory results, and pregnancy needs; excessive doses can be harmful.

Prenylation

A cell process that attaches a fat-like group to a protein, helping direct where the protein works and how it interacts with other proteins. Abnormal prenylation can contribute to some inherited disorders and cancers.

Preop

Preop is an abbreviation for preoperative, meaning relating to preparation and assessment before surgery.

Preoperative Assessment

A medical review before surgery that checks illnesses, medicines, allergies, previous anesthesia problems, heart and lung function, and the airway. Tests are ordered when indicated, and correctable risks are addressed before anesthesia and the operation.

Preoperative Care

Assessment and preparation before an operation. It may include reviewing illnesses and medicines, checking allergies, performing needed tests, explaining anesthesia and recovery, planning fasting and medicines, and reducing risks such as infection or blood clots.

Preoperative Evaluation

Medical assessment before surgery to identify and reduce risks. It reviews health history, medicines, allergies, physical findings, needed tests, anesthesia concerns, and preparations that improve safety during and after surgery.

Preoptic Area

The preoptic area is a hypothalamic region involved in temperature regulation, sleep, reproductive behavior, and hormone control.

Prepubertal

Prepubertal means before the physical and hormonal changes of puberty have begun or progressed to reproductive maturity.

Prepuce

A fold of skin covering and protecting the end of an external sex organ. The penile prepuce is the foreskin over the head of the penis; the clitoral prepuce is the hood over the clitoris.

Prerenal Azotemia

A rise in kidney waste products because the kidneys receive too little effective blood flow, without initial damage to the kidney tissue itself. Dehydration, blood loss, severe infection, heart failure, or liver disease may cause it and can lead to kidney injury if untreated.

Presbyacusis

Alternate spelling; see *Presbycusis*.

Presbycusis

Gradual hearing loss in both ears as a person ages, often affecting high-pitched sounds first. It can make speech harder to understand, especially in noisy places.

Presbyopia

The gradual loss of the eye's ability to focus on nearby objects with age. It commonly causes difficulty reading small print or doing close work and is corrected with reading glasses, contact lenses, or other prescribed lenses.

Presbyphonia

Age-related changes in the voice caused by thinning or weakening of the vocal folds and changes in the voice box. It may produce a weak, breathy, rough, or quieter voice.

Preschooler Development

Preschooler development includes rapid gains in language, motor skills, thinking, self-care, play, and social-emotional regulation; milestones vary, but loss of skills warrants assessment.

Preschooler Test Or Procedure Preparation

Preparing a preschooler for a test or procedure uses simple explanations, play, comfort objects, and caregiver support while following any fasting or medicine instructions.

Prescription

A written or electronic instruction from an authorized healthcare prescriber for a medicine, device, or treatment. It states what is needed and how to use it, allowing a pharmacy or service to provide care safely.

Prescription Drug Misuse

Use of prescription medicines in a way not directed by a clinician, including taking someone else's medicine, taking extra doses, or using them for intoxication; dependence, overdose, and interactions may result.

Prescription Medications

Pharmaceutical drugs that require authorization from a licensed healthcare provider before they can be dispensed to a patient. These medications are regulated because they carry risks that necessitate professional oversight, including potential side effects, drug interactions, and the need for precise dosing.

Presenilin

Presenilin is a component of the gamma-secretase complex that processes membrane proteins; inherited variants can cause familial early-onset Alzheimer disease.

Presentation

The part of a fetus that is directed toward the birth canal, or the symptoms and signs with which a patient seeks care.

Preseptal Cellulitis

An infection of the eyelid and tissues around the eye, without infection inside the eye socket. It causes redness, swelling, pain, and fever; pain with eye movement, reduced vision, or a bulging eye may indicate deeper orbital infection.

Alternate Names:
Periorbital Cellulitis

Preservation

Maintenance of tissue, cells, organs, or function by preventing deterioration.

Preservative

A substance added to food, medicine, or cosmetics to prevent microbial growth or chemical breakdown.

Pressor

Raising blood pressure, usually by tightening blood vessels or increasing heart output. Pressor medicines may treat dangerously low blood pressure but require monitoring because they can reduce circulation to some tissues.

Pressoreceptor

A pressure-sensitive receptor, especially a baroreceptor in the carotid sinus or aortic arch, that detects arterial stretch and helps regulate heart rate and blood pressure.

Pressure

Force applied over a particular area. Medical pressure measurements include blood pressure, pressure inside the skull, eye pressure, and airway pressure, and abnormal values can damage organs or impair function.

Pressure Atrophy

Thinning or wasting of tissue caused by prolonged pressure. Pressure can compress small blood vessels, reduce oxygen delivery, and gradually damage the affected tissue; the result depends on its location and duration.

Pressure-Flow Study

A bladder test that measures pressure while the bladder fills and while a person urinates, together with urine flow. It helps identify blockage or weak bladder muscle when difficulty emptying cannot be explained by symptoms alone.

Pressure Injury

Localized damage to the skin or underlying soft tissue, usually over a bony area or beneath a medical device, caused by sustained pressure or pressure combined with shear.

Pressure Sore

Alternate name; see *Pressure Injury*.

Pressure Sores

Plural form; see *Pressure Injury*.

Pressure Support Ventilation

A ventilator mode in which the machine gives extra pressure with each breath the person starts, making breathing easier and reducing the work of the breathing muscles. It is often used while reducing ventilator support.

Pressure Ulcer

Alternate name; see *Pressure Injury*.

Pressure Ulcer Prevention

Measures that reduce prolonged pressure and tissue injury, including repositioning, support surfaces, skin inspection, moisture control, nutrition, and mobility.

Pressure Urticaria

A form of chronic inducible urticaria in which sustained pressure causes localized swelling, erythema, and pain, usually after a delay of several hours. Lesions may last 8 to 72 hours and commonly affect the hands, feet, buttocks, or areas compressed by clothing or sitting.

Pre-Synaptic

Located before a synapse, especially on the nerve ending that releases a chemical messenger. Presynaptic activity controls how much signal reaches the next nerve cell, muscle, or gland.

Presynaptic Terminals

Presynaptic terminals are the ends of neurons that release neurotransmitters into synapses in response to electrical activity.

Presyncope

A feeling that fainting is about to occur without actually losing consciousness. It may cause lightheadedness, weakness, sweating, nausea, or blurred vision and can result from low blood pressure, dehydration, abnormal heart rhythm, medicines, or other illness.

Preterm Birth

Delivery before 37 completed weeks of gestation. It may occur spontaneously after preterm labor or preterm prelabor rupture of membranes, or be initiated for maternal or fetal indications. Births are classified as extremely preterm (before 28 weeks), very preterm (28 to less than 32 weeks), or moderate to late preterm (32 to less than 37 weeks).

Alternate Names:
Premature Birth; Preterm Delivery

Preterm Infant

A baby born before 37 completed weeks of pregnancy. Earlier birth increases the chance of breathing, feeding, temperature-control, infection, and developmental problems; care depends on the baby's maturity, weight, and health.

Preterm Labor

Regular uterine contractions causing cervical change before 37 weeks gestation. Risk factors include prior preterm delivery, multiple gestation, infection, and cervical insufficiency. Diagnosis requires regular contractions with documented cervical change.

Preterm Labor and Birth

Regular uterine contractions causing cervical change before 37 completed weeks, potentially leading to preterm birth. Management depends on gestational

age, membranes, infection, fetal status, and cause and may include corticosteroids, magnesium sulfate, antibiotics, or transfer to specialist care.

Preterm Premature Rupture Of Membranes

Breaking of the amniotic sac before labor begins and before 37 completed weeks of pregnancy. It may cause a gush or continuing leak of fluid and increases the risks of infection, early birth, and problems from too little amniotic fluid.

Pretest Probability

The estimated probability that a patient has a disease before the result of a diagnostic test is known. It is based on prevalence, symptoms, examination findings, risk factors, and prior test results and informs test selection and interpretation.

Pretibial Myxedema

An autoimmune skin manifestation of Graves disease, also called thyroid dermopathy, caused by glycosaminoglycan accumulation in the dermis. It produces firm, usually non-pitting thickening or plaques over the shins and may also affect the feet; diffuse, plaque, nodular, and elephantiasic forms occur.

Alternate Names:
Graves Dermopathy; Thyroid Dermopathy; Localized Myxedema

Pretibial Myxoedema

British spelling; see *Pretibial Myxedema*.

Prevalence

The proportion of people in a defined population who have a disease or characteristic at a particular time or during a stated period. It includes both newly diagnosed and previously existing cases.

Prevention Of Liver Cancer

Measures that lower the risk of liver cancer, especially preventing or treating chronic hepatitis B or C, limiting alcohol, avoiding tobacco, maintaining a healthy weight, and managing metabolic liver disease. People at high risk may need regular surveillance.

Preventive Dentistry

Dental care that lowers the risk of tooth decay, gum disease, and tooth loss. It includes brushing with fluoride toothpaste, cleaning between teeth, protective sealants when appropriate, healthy eating advice, and regular dental examinations.

Preventive Health Care

Preventive health care aims to prevent disease or detect it early through vaccination, screening, healthy behaviors, and routine medical care.

Preventive Medicine

The medical field focused on preventing illness and promoting health through individual care, screening, vaccination, and community programs.

Prevertebral Air

Air seen in the soft tissues in front of the spine on a neck X-ray. It can indicate injury or a hole in the swallowing or breathing passages, a deep infection, or recent surgery.

Priapism

An erection that lasts more than four hours and is not caused by sexual stimulation. The common low-flow type is painful and occurs when blood cannot drain from the penis; the less common type follows an injury and may not be painful.

Alternate Names:
Persistent Penile Erection; Low-Flow or High-Flow Priapism

Prickly Heat

Miliaria, an itchy rash caused by blockage of sweat ducts.

Prick Test

A skin test in which small amounts of suspected allergens are introduced into the skin.

Alternate Names:
Skin-Prick Test; Percutaneous Allergy Test

Primary

First in time, origin, importance, or site; in disease classification it often means arising independently rather than secondary to another cause.

Primary Adrenal Insufficiency

Alternate name; see *Addison Disease*.

Primary Adrenal Lymphoma

A rare lymphoma arising primarily in the adrenal gland, most commonly diffuse large B-cell lymphoma. It often presents bilaterally and may cause adrenal insufficiency.

Primary Aldosteronism

An adrenal disorder in which one or both adrenal glands produce excess aldosterone partly independently of renin–angiotensin regulation. It promotes sodium retention and hypertension while suppressing renin; potassium may be low but is often normal. Common causes include bilateral adrenal hyperplasia and a unilateral aldosterone-producing adenoma.

Primary Alveolar Hypoventilation

A rare disorder of inadequate automatic breathing, often related to PHOX2B or other autonomic-control abnormalities, causing elevated carbon dioxide especially during sleep.

Primary Amebic Meningoencephalitis

A rare, usually fatal infection of the brain caused by the amoeba *Naegleria fowleri*. It occurs when contaminated warm freshwater enters the nose, often during swimming; it is not acquired by drinking the water. Symptoms can include severe headache, fever, stiff neck, confusion, and seizures and progress rapidly.

Alternate Names:
PAM; Naegleriasis; Primary Amoebic Meningoencephalitis; Fatal Amebic Meningoencephalitis

Primary Amenorrhea

No menstrual period by age 15 or within three years after breast development begins. Evaluation may be appropriate earlier if puberty has not begun by age 13. Causes include ovarian, hormonal, genetic, or reproductive-tract conditions.

Alternate Names:
Primary Amenorrhea

Primary Amyloidosis

Primary amyloidosis, usually AL amyloidosis, results from abnormal plasma-cell proteins depositing as amyloid in organs such as the heart, kidneys, nerves, or gastrointestinal tract.

Primary Dysmenorrhea

Recurrent, cramping lower abdominal pain occurring with menstruation in the absence of identifiable pelvic pathology, mediated by excessive uterine prostaglandin release; see *Dysmenorrhea*.

Primary and Secondary Fibrinolysis

The physiologic enzymatic breakdown of fibrin blood clots by plasmin. Primary fibrinolysis occurs without preceding clotting, whereas secondary fibrinolysis is a reactive response to widespread clot formation, as seen in disseminated intravascular coagulation (DIC).

Alternate Names:
Hyperfibrinolysis; Clot Dissolution; Fibrinolytic System

Primary And Secondary Hyperaldosteronism

Excess aldosterone production, from an adrenal source in primary disease or from increased renin stimulation in secondary disease, causing hypertension, sodium retention, and sometimes low potassium.

Primary Angioplasty

Angioplasty used as the initial treatment to reopen an artery during an acute heart attack.

Primary Angle-Closure Glaucoma

A type of glaucoma caused by closure of the anterior-chamber angle, the drainage opening between the iris and cornea. The peripheral iris may block fluid outflow, raising intraocular pressure (pressure inside

the eye) and damaging the optic nerve, which carries visual signals to the brain. It may progress slowly or start suddenly with severe eye pain, blurred vision, halos, headache, nausea, or vomiting.

Primary Biliary Cholangitis

A chronic autoimmune liver disease in which small intrahepatic bile ducts are progressively damaged. It can cause cholestasis, itching, fatigue, and eventually cirrhosis; antimitochondrial antibodies often support the diagnosis.

Primary Biliary Cirrhosis

Alternate name; see *Primary Biliary Cholangitis*.

Primary Biliary Cirrhosis (PBC)

Alternate name; see *Primary Biliary Cholangitis*.

Primary Biliary Cirrhosis Treatment

Alternate name; see *Primary Biliary Cholangitis*.

Primary Care

The usual first place people go for healthcare. It includes prevention, check-ups, treatment of common illnesses, care of long-term conditions, basic mental-health support, and referral or coordination with specialists when needed.

Primary Ciliary Dyskinesia

An inherited disorder in which tiny moving hairs lining the airways do not clear mucus properly. It can cause repeated sinus and lung infections, permanent airway widening, hearing problems, infertility, and organs arranged differently from usual.

Primary Ciliary Dyskinesia (Kartagener Syndrome)

An inherited disorder of motile cilia that impairs clearance of airway secretions. It causes chronic wet cough, recurrent sinus and ear disease, bronchiectasis, infertility in some patients, and sometimes situs inversus; long-term airway care and infection prevention are important.

Primary CNS Lymphoma

An aggressive lymphoma confined to the brain, spinal cord, meninges, cerebrospinal fluid, or eyes at diagnosis. It often causes focal neurologic deficits, cognitive change, seizures, or raised intracranial pressure and requires specialist imaging, biopsy, and systemic evaluation.

Primary Cutaneous Amyloidosis

Deposition of amyloid proteins limited mainly to the skin, causing itchy rippled, lichen-like, or darker patches. It differs from systemic amyloidosis, although assessment may be needed when symptoms or findings suggest disease beyond the skin.

Primary Cutaneous B-Cell Lymphoma

A type of lymphoma that starts in the skin and has not spread elsewhere when diagnosed. It may cause one or more painless lumps or plaques; behavior and treatment depend on the subtype.

Primary Endpoint

The main outcome chosen in advance to judge whether a treatment or other intervention works in a clinical trial. It may be a symptom, laboratory result, complication, quality-of-life measure, or survival.

Primary Hyperaldosteronism

Alternate name; see *Primary Aldosteronism*.

Primary Hyperoxaluria

A group of inherited disorders in which the liver makes too much oxalate. This can cause repeated kidney stones, calcium deposits, kidney damage, and eventually failure of the kidneys.

Primary Hyperparathyroidism

A condition in which one or more parathyroid glands release too much parathyroid hormone, usually causing high blood calcium. It may cause no symptoms or contribute to kidney stones, bone loss, or other problems. Diagnosis uses blood tests; treatment depends on symptoms, calcium level, kidney and bone effects, and overall health.

Alternate Names:
PHPT; Primary Hyperparathyroid Disease; Parathyroid Hyperactivity

Primary Hypersomnia

Excessive daytime sleepiness that is not explained by too little sleep, another sleep disorder, a medicine, substance use, or another illness. It can cause unintended sleep, long sleep, and difficulty becoming fully alert after waking.

Primary Hypertension

Persistently high blood pressure without one identifiable underlying disease. It results from a combination of genetic, environmental, vascular, and lifestyle factors and can often be controlled with lifestyle changes and medicines.

Primary Hypertrophic Osteoarthropathy

A rare inherited condition causing enlarged, rounded fingertips, thickened facial or scalp skin, and new bone growth along the limbs. It may cause joint pain, stiffness, swelling, and excessive sweating.

Primary Hypoparathyroidism

Inadequate parathyroid hormone production causing low calcium and high phosphate, with possible tingling, cramps, tetany, seizures, cataracts, or chronic bone and dental effects.

Primary Hypothyroidism

Reduced thyroid-gland production of thyroxine and triiodothyronine, usually causing high TSH and symptoms such as fatigue, cold intolerance, constipation, dry skin, and slowed heart rate.

Primary Immune Response

The body's first targeted immune response to a new germ or other foreign substance. It develops over days, produces antibodies and immune cells, and creates memory that allows a faster response next time.

Primary Immunodeficiency

A group of usually inherited disorders in which part of the immune system is missing or does not work properly. They can cause repeated or unusually severe infections and may also cause autoimmune disease or inflammation.

Primary Immunodeficiency Disease

An inherited or genetic disorder of immune development or function that causes unusual, recurrent, severe, or persistent infections and sometimes autoimmunity.

Primary Immunodeficiency Disease PIDD

Primary immunodeficiency diseases are inherited disorders of immune development or function that cause unusual, severe, recurrent, or persistent infections and sometimes autoimmunity or inflammation. Evaluation may include blood counts, immunoglobulins, functional tests, and genetic testing.

Alternate Names:
PID; Inborn Errors of Immunity; IEI

Primary Lactase Deficiency

Reduced lactase enzyme activity developing with age, causing lactose malabsorption and possible bloating, abdominal pain, gas, or diarrhea after dairy consumption.

Primary Lateral Sclerosis

A rare progressive nerve disorder causing increasing muscle stiffness and weakness, usually beginning in the legs. Speech, swallowing, walking, and emotional control may become affected over time.

Primary Lymphoid Organs

The bone marrow and thymus, where lymphocytes are made and mature.

Primary Lymphoma Of The Brain

Primary central-nervous-system lymphoma is a lymphoma arising in the brain, spinal cord, eyes, or surrounding fluid without systemic disease at diagnosis.

Primary Metabolism

The essential chemical activity inside cells that pro-

duces energy, builds needed substances, breaks down waste, and keeps cells alive and functioning.

Primary Microrna

The first RNA copy made from a microRNA gene. It is processed inside and outside the cell nucleus into a shorter molecule that helps control which proteins cells make.

Primary Myelofibrosis

A long-term bone-marrow disorder in which scar tissue replaces healthy marrow. Blood-cell production may move to the spleen or liver, causing anemia, tiredness, easy bleeding or infection, bone pain, and an enlarged spleen.

Alternate Names:
Agnogenic Myeloid Metaplasia

Primary Open-Angle Glaucoma

A usually slowly progressive optic neuropathy (disease of the optic nerve) in which the anterior-chamber angle, where fluid drains, remains open. It often has no early symptoms, and peripheral (side) vision may be affected first. Intraocular pressure (pressure inside the eye) is often elevated, but optic-nerve damage can also occur at statistically normal pressure levels.

Primary Osteoporosis

Weakening and thinning of bone caused mainly by aging, loss of estrogen after menopause, or age-related changes, rather than by another disease or medicine. It increases the risk of fractures, especially in the hip, spine, and wrist.

Primary Ovarian Insufficiency

Loss of normal ovarian activity before age 40, characterized by irregular or absent menses, reduced estrogen, and intermittently or persistently elevated gonadotropins. Causes include genetic, autoimmune, iatrogenic, toxic, infectious, and unknown factors.

Primary Polycythemia

Alternate name; see *Polycythemia Vera*.

Primary Prevention

Actions taken before a disease begins to prevent it, such as vaccination, avoiding tobacco, reducing harmful exposures, using sun protection, and controlling health risks. It differs from screening, which looks for disease that may already be present.

Primary Progressive Aphasia

A neurodegenerative disorder causing gradual worsening of language abilities, including speaking, naming, comprehension, reading, or writing.

Primary Progressive Multiple Sclerosis

A form of multiple sclerosis that gradually worsens from the beginning, without clear attacks and recoveries. It commonly affects walking, strength, balance, bladder control, and thinking; medicines and rehabilitation may slow disability.

Alternate Names:
PPMS; Primary Progressive MS

Primary Sclerosing Cholangitis

A long-term disease in which inflammation and scarring narrow the bile tubes inside and outside the liver. It can cause itching, tiredness, jaundice, repeated infections, and liver damage and is often associated with inflammatory bowel disease.

Primary Spinal Bone Tumor

A rare tumor that starts in a bone of the spine rather than spreading there from another organ. It may be benign or cancerous. A growing tumor can cause lasting back pain, weaken a vertebra, or press on the spinal cord or nearby nerves.

Primary Systemic Amyloidosis

A form of AL amyloidosis in which abnormal immunoglobulin light chains made by a plasma-cell clone deposit in organs such as the heart, kidneys, nerves, liver, or gastrointestinal tract. Symptoms depend on the organs involved and require hematology evaluation.

Primary Tuberculosis

The first infection with the bacterium that causes

tuberculosis. It often begins in the lungs and nearby lymph nodes; the immune system may contain it without symptoms, or it may progress to active disease.

Primary Tumor

The original tumor, or site where a cancer began, from which cancer cells may spread to form secondary or metastatic tumors. A cancer may be described as having an unknown primary when the original site cannot be identified.

Primary Vulvar Clear Cell Adenocarcinoma

A rare cancer of the vulva made up of clear-looking cells. Diagnosis requires examination of a tissue sample and tests that distinguish it from cancer that has spread from the kidney or another organ.

Primidone

Primidone is an antiseizure medicine used for epilepsy and sometimes essential tremor; it can cause sleepiness, dizziness, and drug interactions.

Primigravida

A person who is pregnant for the first time. First pregnancies may have a longer labor and require monitoring for conditions such as high blood pressure, but the term itself does not indicate a problem.

Primipara

A person who has given birth once after the fetus could survive outside the womb, regardless of outcome.

Primitive

Relating to an early developmental stage or a basic, less specialized form. In medicine, primitive cells may be immature and capable of developing into several more specialized cell types.

Primitive Node

The primitive node is an embryonic organizer at the cranial end of the primitive streak that helps establish body axes and germ-layer formation.

Primitive Streak

The primitive streak is an embryonic structure through which cells migrate during gastrulation to form the three germ layers and establish body organization.

Primordial

Present at the earliest stage of development or existing in an original, basic form. Examples include primordial germ cells and primordial follicles.

Primordial Prevention

Preventing the emergence of disease risk factors by addressing social, economic, behavioural, and environmental conditions early. Examples: promoting healthy diets and physical activity in children, reducing tobacco exposure, and creating safe environments for exercise.

PR Interval

The ECG interval from the start of atrial depolarization to the start of ventricular depolarization, reflecting atrioventricular conduction.

Prinzmetal Angina

Episodes of chest pain caused by a temporary spasm, or tightening, of a heart artery. The pain often occurs at rest and may happen when fixed fatty plaque is not blocking the artery. Also called vasospastic or variant angina.

Alternate Names:
Vasospastic Angina; Variant Angina

Prion

An infectious protein folded into an abnormal shape that can make other proteins fold incorrectly. Prions cause rare, serious brain diseases that worsen over time; they are not ordinary bacteria or viruses and currently have no cure.

Prion Disease

A group of rare, rapidly progressive, and fatal neurodegenerative brain disorders caused by prions—abnormal, misfolded forms of a naturally occurring cellular protein. When a prion enters the brain or

misfolds spontaneously, it forces surrounding normal proteins into the same distorted shape, causing clumps of defective proteins to destroy brain tissue and create microscopic sponge-like holes. Prion diseases can arise spontaneously (as in sporadic Creutzfeldt–Jakob disease), be inherited through genetic mutations, or rarely be transmitted through exposure to infected brain or nervous tissue. They cause rapidly worsening memory loss, dementia, loss of balance and motor coordination, and involuntary muscle jerks.

Alternate Names:
Prion Diseases; Transmissible Spongiform Encephalopathies; TSE; Prion Disorders

Prism

A clear optical device that bends light. In eye care, prisms can measure or correct eye misalignment, reduce double vision, and be built into glasses or used during examinations.

Privacy

Privacy is a person's right and expectation that personal information, communications, and bodily matters are protected from unauthorized access or disclosure.

Privacy Breach

A privacy breach is unauthorized access, use, disclosure, loss, or exposure of personal or health information.

Private Mutation

A genetic variant confined to a family, individual, tumor, or small population rather than commonly seen in the general population; its significance requires genetic and clinical interpretation.

PRK

Photorefractive keratectomy is laser eye surgery that reshapes the cornea to reduce short-sightedness, long-sightedness, or astigmatism. The surface layer is removed and grows back during healing; pain, haze, infection, or imperfect vision can occur.

Probe

A blunt instrument used to examine an opening, cavity, wound, tooth, or narrow passage. Different probes can measure depth, check whether a passage is open, guide a procedure, or trace a sinus or fistula.

Probenecid

A uricosuric medicine used to prevent gout attacks in selected patients and to alter renal excretion of some drugs.

Probiotic

A viable, non-pathogenic live microorganism (predominantly strains of *Lactobacillus*, *Bifidobacterium*, or *Saccharomyces boulardii*) that, when administered in adequate amounts, confers a health benefit on the host by colonizing and restoring microbial equilibrium to the gastrointestinal microbiota, inhibiting enteric pathogens, and modulating local mucosal immunity.

Alternate Names:
Probiotics

Probiotics

Plural form; see *Probiotic*.

Probucol

Probucol is a lipid-lowering drug that reduces cholesterol but may prolong the QT interval and is not widely used in current practice.

PROC

PROC is the gene symbol for protein C, an anticoagulant protein that limits clot formation; inherited deficiency increases thrombosis risk.

Procainamide

An antiarrhythmic medicine that can slow abnormal electrical conduction in the heart. It is used in selected rhythm disorders and requires monitoring because it can affect blood pressure, the heart rhythm, and immune or blood systems.

Procaine

An ester local anesthetic that temporarily blocks

nerve signals and reduces pain. It is now used mainly in limited or historical settings because newer anesthetics are commonly preferred and allergic reactions can occur.

Procalcitonin

A biomarker that may rise during some bacterial infections and systemic inflammation. It can support assessment of infection and antibiotic decisions, but it cannot by itself diagnose or exclude bacterial infection or determine sepsis severity.

Procalcitonin Test

A blood biomarker test measuring procalcitonin, a peptide whose levels rise in response to severe systemic bacterial infections and sepsis; see *Procalcitonin*.

Procarbazine

A chemotherapy medicine used in some lymphomas and brain tumors. It damages the DNA of rapidly growing cells and can cause nausea, low blood counts, infertility, or other side effects; alcohol and many medicines may interact with it.

Procarbazine Hydrochloride

A salt form of procarbazine, a chemotherapy medicine that damages cancer cells. It is used for selected lymphomas and brain tumors and can cause low blood counts, nausea, infertility, or serious medicine and food interactions.

Procedural Memory

Memory for how to perform learned skills, such as riding a bicycle, typing, or playing an instrument. It usually works without consciously recalling each step and differs from memory for facts or events.

Procedural Sedation

Use of medicines to reduce anxiety, discomfort, and awareness during a medical procedure while maintaining breathing and protective reflexes. Continuous monitoring is required because sedation can unexpectedly become deeper and slow breathing.

Procedure

A planned medical or surgical action performed to diagnose, treat, prevent, monitor, or relieve a health problem. It may involve an examination, sample collection, medicine delivery, device placement, or operation, with risks depending on the method and person.

Alternate Names:
Medical Procedure; Clinical Procedure; Intervention

Procentriole

An immature structure that forms next to an existing centriole as a cell prepares to divide. It later matures into a centriole, which helps organize the fibers that separate chromosomes.

Procerus Muscle

A small facial muscle over the bridge of the nose that draws the medial eyebrows downward and produces horizontal wrinkles between the eyebrows.

Process

A process is an ordered series of biological, physical, chemical, or operational changes that produces a result.

Processing Bodies

Processing bodies are cytoplasmic RNA-protein granules where messenger RNAs may be stored, decapped, degraded, or regulated.

Prochlorperazine

A phenothiazine medicine used mainly for severe nausea or vomiting and, in selected cases, psychotic disorders. It can cause drowsiness, low blood pressure, and movement disorders.

Prochlorperazine Overdose

An excessive amount of prochlorperazine can cause severe sleepiness, confusion, low blood pressure, abnormal heart rhythms, seizures, or muscle stiffness with fever.

Procidentia

The most severe form of uterine prolapse, in which

the uterus and cervix descend through and outside the vaginal opening. It may cause pressure, bleeding, sores, difficulty urinating, or bowel problems and requires gynecologic assessment.

Alternate Names:
Complete Uterovaginal Prolapse; Third-Degree Uterine Prolapse

Procollagen

An unfinished form of collagen made inside cells. After chemical changes and removal of its end sections outside the cell, it joins with other molecules to form strong collagen fibers in skin, bone, tendons, and other tissues.

Proctalgia

Pain in or around the rectum or anal canal. Causes include fissures, hemorrhoids, abscesses, inflammation, injury, and functional muscle pain; sudden severe pain or pain with fever, bleeding, or a lump can indicate significant disease.

Proctalgia Fugax

A benign functional anorectal disorder characterized by sudden, severe, fleeting, cramp-like spasms of intense pain localized to the rectum and anus lasting from seconds to several minutes (maximum 30 minutes) and resolving completely, occurring predominantly at night due to levator ani and anal sphincter spasm.

Alternate Names:
Fugacious Rectal Pain; Nocturnal Rectal Spasm

Proctitis

Inflammation of the rectum. It can cause a constant urge to pass stool, rectal pain, bleeding, mucus or pus, and pelvic discomfort. Causes include inflammatory bowel disease, sexually transmitted infections, radiation treatment, and diversion of stool through an opening in the abdomen. Diagnosis may require an examination, stool or swab tests, and a small tissue sample. Treatment depends on the cause.

Alternate Names:
Rectal Inflammation

Proctocolitis

Inflammation of the rectum and nearby lower colon. It may cause bleeding, mucus, diarrhea, urgency, pain, or difficulty passing stool and can result from infection, inflammatory bowel disease, reduced blood flow, radiation, or other causes.

Proctology

The part of medicine concerned with diseases of the anus and rectum. Care may include assessment and treatment of hemorrhoids, fissures, fistulas, abscesses, bowel-control problems, infections, inflammation, and cancers.

Proctoscope

An instrument used to inspect the anal canal and rectum.

Proctoscopy

Examination of the anal canal and rectum with a short viewing instrument. It can help investigate bleeding, pain, inflammation, ulcers, polyps, or a lump and may allow a small tissue sample to be taken.

Proctostomy

An operation that creates an opening from the rectum through the abdominal wall or nearby skin so stool can leave the body. It may be temporary or permanent and requires care of the opening and surrounding skin.

Prodromal

Describing early, nonspecific signs or symptoms that occur before the characteristic clinical features of a disease become apparent.

Prodrome

An early symptom or group of symptoms that appears before a disease episode or major event. Examples include tiredness before migraine, tingling before a seizure, or fever before an infection becomes obvious.

Prodrug

A medicine given in a form that the body changes into its active form. This design may improve absorption, delivery to a target tissue, duration of action, or tolerability.

Productive Cough

A cough that brings up mucus or phlegm from the airways. It can occur with infections, asthma, chronic lung disease, or other conditions and does not by itself identify the cause.

Profunda

A deep artery or vessel, commonly referring to the profunda femoris artery in the thigh. This artery supplies muscles and nearby tissues and can be important in bleeding, circulation, or vascular procedures.

Progenitor

A partly developed cell that can multiply and mature into one or a limited range of specialized cell types. Progenitor cells help replace or repair tissues but have less developmental potential than stem cells.

Progeny

Biological offspring or descendants. In genetics, the term usually means children or later descendants whose traits may be studied to understand how characteristics or disorders are inherited. In cell biology, it can mean daughter cells produced by one parent cell.

Progeria

A rare genetic disorder in which features resembling accelerated aging begin during childhood. The usual form is Hutchinson–Gilford progeria syndrome, caused by a disease-causing variant in the *LMNA* gene that produces abnormal lamin A. Most cases result from a new variant rather than inheritance from an affected parent. Children are often healthy-looking at birth and later develop slowed growth, loss of body fat, hair loss, thin aged-looking skin, joint stiffness, and characteristic facial features. Accelerated atherosclerosis can cause early cardiovascular disease, while intellectual development is usually preserved.

Alternate Names:
Hutchinson–Gilford Progeria Syndrome Hutchinson–Gilford Syndrome HGPS

Progestational

Relating to progesterone-like effects or preparation of the uterus for pregnancy. Progestational medicines can alter menstrual bleeding, prevent ovulation, support the uterine lining, or protect it from excessive estrogen stimulation.

Progesterone

A steroid hormone produced mainly by the corpus luteum and placenta that supports the endometrium and pregnancy.

Progesterone Antagonist

A progesterone antagonist blocks progesterone receptors and may be used for selected reproductive, gynecologic, or other medical purposes.

Progesterone Receptor

A protein inside or on a cell that binds progesterone. Some breast cancers have these receptors, which helps describe the cancer's biology.

Progesterone Supplementation

Use of progesterone during pregnancy in selected people at risk of preterm birth, especially when ultrasound shows a short cervix. Vaginal progesterone may be considered in that situation; routine use after a previous preterm birth without a short cervix is not recommended, and 17-hydroxyprogesterone caproate is no longer FDA-approved for this purpose.

Progesterone Test

A blood test that measures the level of progesterone, a hormone involved in ovulation and pregnancy. It may help assess ovulation, infertility, abnormal uterine bleeding, fertility treatment, or certain pregnancy problems. Results depend on the timing of the menstrual cycle and whether the person is pregnant.

Alternate Names:
Serum Progesterone Progesterone Blood Test

Progestin

A progestin is a synthetic progesterone-like hormone used in contraception, hormone therapy, and treatment of selected gynecologic conditions.

Progestogen

A natural or synthetic hormone with effects like progesterone. Progestogens help regulate the menstrual cycle and pregnancy and are used in some contraceptives and hormone treatments.

Progestogen-Only Pill

Oral contraceptive tablets formulated solely with a progestin without an estrogen component. They prevent conception primarily by thickening cervical mucus to impede sperm penetration, altering endometrial receptivity, and in certain formulations inhibiting the mid-cycle luteinizing hormone surge.

Alternate Names:
Progestin-Only Pill; POP; Mini-Pill

Proglottid

One segment of a tapeworm. Each mature segment contains reproductive organs and may release eggs in stool.

Prognathism

Forward projection of the upper or lower jaw relative to the facial skeleton, affecting bite, appearance, chewing, speech, and sometimes airway function.

Prognosis

The expected course and outcome of a disease or condition.

Prognostic Factor

A prognostic factor is a clinical, pathologic, or biologic feature associated with the likely course, outcome, or survival of a disease.

Prognostic Test

A test that provides information about a disease's likely course or outcome. Results may estimate risks, guide treatment choices, or monitor response, but they cannot predict an individual future with certainty.

Programmed Cell Death

A controlled process by which cells die as part of normal development, tissue maintenance, or disease. Apoptosis is the best-known form; other regulated forms include necroptosis and pyroptosis.

Progression

Worsening or advancement of a disease, such as increasing tumor size, new lesions, or spread to another site.

Progression-Free Survival

The length of time after a defined starting point, such as diagnosis or treatment, during which a person remains alive without the cancer worsening. It is a group measure used in research and cannot predict exactly what will happen to one person.

Progressive

Increasing, worsening, or spreading over time, or moving forward in a particular direction. A progressive disease may cause gradually increasing symptoms, but the word alone does not explain the cause, speed, or expected outcome.

Progressive Disease

A disease that is worsening, spreading, or becoming more active over time. In cancer, progression may mean that tumors have grown, new tumors have appeared, or existing disease has clearly worsened on examination or imaging.

Progressive Lenticular Degeneration

An older name for Wilson disease, an inherited disorder causing copper buildup. Excess copper can damage the liver, brain, eyes, kidneys, and other organs unless treatment lowers copper levels.

Progressive Multifocal

Leukoencephalopathy

A serious brain infection caused by reactivation of JC virus in people with severely weakened immune systems. It damages the brain's nerve insulation and may cause worsening weakness, clumsiness, vision or speech problems, confusion, or seizures.

Progressive Muscular Atrophy

A motor-neuron disorder predominantly affecting lower motor neurons and causing progressive muscle wasting and weakness.

Progressive Supranuclear Palsy

A progressive brain disorder that causes balance problems, frequent falls, stiffness, slowed movement, speech or swallowing difficulty, and trouble moving the eyes, especially looking down. It resembles Parkinson disease but has different features and treatment needs.

Alternate Names:
Steele-Richardson-Olszewski Syndrome Supranuclear Palsy

Proinflammatory

Describing a substance, cell, or immune response that starts or increases inflammation. Such activity can help fight infection or repair injury, but excessive or prolonged inflammation can damage healthy tissue.

Proinsulin

An unfinished hormone made by pancreatic beta cells before it is split into insulin and C-peptide. Measuring proinsulin can provide information about insulin production and certain disorders of glucose regulation.

Projectile Vomiting

Forceful vomiting expelled with unusual intensity, which may occur with gastric outlet obstruction, raised intracranial pressure, infection, migraine, or other causes; severity and associated signs guide evaluation.

Projection

A view or image made by directing X-rays or other imaging energy through the body toward a detector. Different projections show body structures from different angles and can help locate an abnormality.

Prokaryote

A prokaryote is a cell or organism without a membrane-bound nucleus, including bacteria and archaea.

Prokinetic

A medicine that promotes gastrointestinal motility and movement of contents through the digestive tract; use depends on the underlying disorder and safety profile.

Prolactin

A hormone released mainly by the pituitary gland that supports breast development and milk production. Abnormal levels can affect periods, fertility, sexual function, pregnancy, breastfeeding, and sometimes vision because of pituitary growths.

Prolactin Blood Test

A prolactin blood test measures the hormone prolactin and helps evaluate abnormal milk production, menstrual or fertility problems, and some pituitary disorders.

Prolactin Deficiency

Inadequate production of prolactin by the pituitary, most clearly recognized by failure to produce breast milk after delivery. It may occur with broader pituitary disease, surgery, hemorrhage, or injury and is evaluated with other pituitary hormones.

Prolactinoma

A benign, non-cancerous tumor of the pituitary gland that produces excessive amounts of prolactin, the hormone that stimulates breast milk production. Elevated prolactin levels can disrupt normal reproductive hormones, causing irregular or absent menstrual periods, unexpected breast milk production (galactorrhea), and infertility in women, or reduced sex drive and erectile dysfunction in men,

as well as headaches or vision changes if the tumor grows large.

Alternate Names:
Prolactin-Secreting Adenoma; Lactotroph Adenoma

Prolactinoma Treatment

Treatment may include a dopamine agonist, surgery, radiation, or observation, depending on tumor size, symptoms, hormone levels, treatment response, and patient preferences. Dopamine agonists often lower prolactin levels and reduce tumor size.

Prolactin Physiology

Prolactin is a hormone made by the pituitary gland that supports breast development and milk production. Levels normally rise during pregnancy, breastfeeding, sleep, stress, and breast stimulation.

Prolactin Receptor

A cell-surface receptor activated by prolactin to regulate mammary development, milk production, reproduction, immune effects, and other tissue responses.

Prolapse

Downward displacement or protrusion of an organ or tissue from its normal position, often through a supporting structure or body opening.

Prolapsed Bladder

Alternate name; see *Anterior Vaginal Prolapse*.

Prolapsed Cord

A prolapsed umbilical cord descends beside or ahead of the fetus after membrane rupture, risking cord compression and reduced fetal oxygen; it is an obstetric emergency.

Prolapsed Disk

A spinal disk that bulges or ruptures and may compress a nearby nerve; also called a herniated disk.

Alternate Names:
Herniated Nucleus Pulposus; Slipped Disc; Herniated Disc

Prolapsed Uterus

Alternate name; see *Uterine Prolapse*.

Prolapse Of Orbital Fat

Bulging of the eye's normal cushioning fat through a weak spot in the thin tissue around the eye. It usually appears as a soft, painless lump in an upper or lower eyelid, often with aging, but other lumps may look similar.

Proliferating Pilar Tumor

A usually low-grade follicular tumor arising from a trichilemmal cyst, most often on the scalp. It may be large, ulcerated, recurrent, or locally aggressive, so complete excision and histologic assessment are important.

Proliferating Trichilemmal Tumor

A usually low-grade follicular tumor arising from a trichilemmal cyst, most often on the scalp; large or recurrent lesions may show locally aggressive or malignant behavior.

Proliferation

Increase in the number of cells or organisms through growth and division. It may be normal, part of healing, or abnormal as in uncontrolled tumor growth.

Proliferative

Characterized by increased cell multiplication or new tissue growth. The meaning depends on context: some proliferative changes are normal or healing, while others are precancerous or cancerous.

Proliferative Diabetic Retinopathy

An advanced form of diabetic eye disease in which poor blood supply causes fragile new blood vessels to grow on the retina or nearby structures. They can bleed, scar, detach the retina, and threaten vision; specialist treatment can reduce these risks.

Proliferative Fasciitis

A benign, reactive fibroblastic proliferation resembling nodular fasciitis but containing distinctive ganglion-like cells; it usually grows quickly and re-

solves or stabilizes after local treatment.

Proliferative Myositis

A benign reactive proliferation within skeletal muscle that may present as a rapidly enlarging mass and mimic sarcoma. Imaging and biopsy are used to establish the diagnosis.

Proliferative Retinopathy

Advanced retinal disease in which abnormal new blood vessels grow and may bleed or impair vision.

Proline

An amino acid used to build proteins. Its ring-shaped side chain helps give collagen and other proteins their structure.

Prolonged Capillary Refill Time

A delay of greater than two to three seconds for normal skin color to return after moderate digital blanching pressure is applied to a distal nail bed or pulp and released. It is a bedside indicator of reduced peripheral microvascular perfusion, shock, dehydration, or hypothermia.

Prolonged Deceleration

A temporary slowing of the fetal heart rate lasting at least two minutes but less than ten minutes. It may result from reduced blood flow, excessive contractions, cord problems, or placental separation and can indicate fetal compromise.

Prolonged Grief Disorder

A bereavement-related condition characterized by severe, disabling, and persistent yearning or preoccupation with a deceased loved one lasting at least 12 months after the loss; see *Complicated Grief*.

Prolonged Labor

Abnormally protracted or arrested progress of labor during the active cervical dilation or fetal expulsion phase; see *Labor Dystocia*.

Prolonged Second Stage

The pushing stage of labor lasting longer than expected. The safe duration depends on whether it is a first birth, use of epidural anesthesia, progress, and the health of the parent and fetus; the team reassesses before deciding on further care.

Prolymphocyte Count

The number or proportion of prolymphocytes, immature-appearing lymphoid cells, in blood or marrow; an increased count may occur in selected lymphoid leukemias and requires morphology and immunophenotyping.

Prolymphocytic Leukemia

Prolymphocytic leukemia is a rare aggressive leukemia with large abnormal lymphocytes in the blood, bone marrow, spleen, or lymph nodes.

Promazine

A first-generation phenothiazine antipsychotic with sedative properties; it is now used infrequently in many settings and availability varies by country. It can cause drowsiness, orthostatic hypotension, anticholinergic effects, extrapyramidal symptoms, and other serious antipsychotic adverse effects.

Promecarb

Promecarb is a carbamate insecticide that inhibits acetylcholinesterase and can cause cholinergic poisoning after substantial exposure.

Prometaphase

Prometaphase is the stage of mitosis after nuclear-envelope breakdown when spindle microtubules attach to chromosome kinetochores.

Promethazine

Promethazine is an antihistamine used for allergy symptoms, nausea, motion sickness, and sometimes sedation; it can cause marked sleepiness and breathing problems in young children.

Promethazine Overdose

An excessive amount of promethazine can cause extreme drowsiness, confusion, agitation, fast heartbeat, seizures, breathing problems, or coma. Chil-

dren are particularly vulnerable.

Prominent Iris Collarette

A visible thickening or ridge of the iris at the junction of the pupillary and ciliary zones, representing the site where the embryonic pupillary membrane was attached. It is typically a normal anatomical variant but can be a clinical sign in conditions such as Axenfeld-Rieger syndrome or iridocorneal endothelial syndrome.

Promonocyte Count

The number or proportion of promonocytes, immature monocyte precursors, in blood or marrow; increased cells may support evaluation of acute or chronic myeloid leukemia.

Promontory

A part of the body that projects outward like a small ridge or bump. Examples include the sacral promontory in the pelvis and the cochlear promontory in the inner ear; the exact meaning depends on the structure named.

Promoter

A specific nucleotide sequence located upstream of a gene that serves as the binding site for RNA polymerase and associated transcription factors, thereby dictating the initiation, orientation, and level of gene transcription.

Alternate Names:
Promoters; Gene Promoter

Promoters

Plural form; see *Promoter*.

Promyelocytes

Immature cells in the bone-marrow pathway that normally develops into several types of white blood cells. Large numbers in blood or marrow may occur in leukemia and need examination with other blood and cell tests.

Pronation

Turning the forearm so the palm faces down when the elbow is bent, or backward when the arm hangs at the side. During this movement, the radius rotates across the ulna.

Pronator

A muscle that turns a limb or part of it into a pronated position. In the forearm, pronator muscles rotate the palm downward and help stabilize the elbow during movement.

Pronator Drift

A subtle test for nerve or brain weakness where holding the arms straight out with palms up and eyes closed causes one hand to turn inward and slowly drift down.

Prone

Position in which a person lies face down, with the front of the body toward the supporting surface. The term describes body orientation; the head may be turned to either side, and the body may be tilted during a procedure.

Pronephric

Relating to the earliest temporary kidney system formed in an embryo. In humans it does not provide effective kidney function and is replaced during development by later kidney structures.

Pronephros

The first temporary kidney structure formed in a human embryo. It is not functional as a kidney and largely disappears as the permanent kidneys develop.

Prone Position

Alternate name; see *Prone*.

Prone Positioning

Placing a person face down to improve breathing, especially during severe acute respiratory distress syndrome. It can improve oxygen levels by helping more of the lung take part in breathing, but requires careful monitoring of the airway, skin, eyes, and pressure points.

Propafenone

A heart-rhythm medicine that slows electrical signals through the heart. It is used for selected irregular rhythms, including episodes of atrial fibrillation, but can worsen or cause dangerous rhythms and is unsuitable for some people with structural heart disease.

Propane

Propane is a flammable hydrocarbon gas used as fuel; inhalation or displacement of oxygen can cause suffocation, and liquid contact can cause cold burns.

Propane Poisoning

Breathing concentrated propane can displace oxygen and cause dizziness, headache, confusion, unconsciousness, abnormal heart rhythms, or suffocation. Propane is highly flammable and can form explosive mixtures with air.

Propanol

Propanol is an alcohol solvent with two structural isomers; ingestion or substantial exposure can depress the nervous system and irritate tissues.

Propanolol

A nonselective beta-adrenergic blocker used for hypertension, arrhythmias, angina, tremor, migraine prevention, and other indications.

Propantheline

An older medicine that reduces certain nerve signals to relax the gut and decrease sweating. It can cause dry mouth, blurred vision, constipation, difficulty urinating, fast heartbeat, or confusion and is rarely used today.

Propellant

A propellant is a gas or volatile substance that expels a product from a container or delivers medicine in an inhaler.

Properdin

A blood protein that strengthens one part of the body's early immune defense. It helps mark and damage certain germs; too little properdin can increase susceptibility to serious bacterial infections.

Properdin Deficiency

A rare inherited immune-system disorder in which a complement protein is missing or low. It increases the risk of severe infections, especially meningococcal disease, and is evaluated with immune tests and a history of recurrent infections.

Propetamphos

Propetamphos is an organophosphate insecticide that can inhibit acetylcholinesterase and cause cholinergic toxicity after exposure.

Prophage

A prophage is bacteriophage genetic material integrated into a bacterial chromosome or maintained in a dormant state inside a bacterium.

Prophase

Prophase is the early stage of cell division when chromosomes condense, the spindle begins forming, and the nucleolus disappears.

Prophenofos

Prophenofos is an organophosphate pesticide whose toxicity results mainly from acetylcholinesterase inhibition and excess cholinergic activity.

Prophylactic

Prophylactic means intended to prevent disease, infection, injury, or another unwanted outcome before it occurs.

Prophylactic Mastectomy

Prophylactic mastectomy removes one or both breasts to greatly reduce cancer risk in selected people at very high genetic or clinical risk.

Prophylaxis

Medicine or other preventive care used to lower risk of disease, infection, or recurrence before it occurs.

Propionates

Salts or esters of propionic acid used in food preservation, metabolism, and some medicines; clinical effects depend on the specific compound and exposure.

Propionibacterium

A former bacterial genus name now largely replaced by Cutibacterium; its members are common skin organisms and can cause acne or device-related infection.

Propionic Acidemia

A rare inherited disorder in which the body cannot properly break down certain proteins and fats. Harmful acids can build up, especially during illness or fasting, causing vomiting, extreme sleepiness, poor feeding, seizures, or coma. Newborn screening can detect it; treatment uses a controlled diet, avoids fasting, and manages attacks urgently.

Alternate Names:
Propionic Aciduria (PA); Propionyl-CoA Carboxylase Deficiency

Propofol

A short-acting medicine given through a vein to start or maintain anesthesia and provide procedural sedation. It acts quickly but can lower blood pressure, slow breathing, or cause dangerous reactions without monitoring.

Propofol Infusion Syndrome

A rare, potentially fatal illness after prolonged or high-dose propofol infusion. It may cause severe blood acidity, muscle breakdown, high potassium, kidney failure, heart failure, or dangerous heart rhythms. Stopping propofol and urgent intensive care are required when it is suspected.

Propoxur

Propoxur is a carbamate insecticide that inhibits acetylcholinesterase and may cause sweating, salivation, vomiting, breathing difficulty, or weakness after exposure.

Propoxycaine

A local anesthetic formerly used in some topical or dental preparations; toxicity can affect the nervous system and heart.

Propoxyphene

Propoxyphene is a former opioid analgesic withdrawn in many countries because of overdose toxicity, respiratory depression, and dangerous cardiac arrhythmias.

Propranolol

A beta-blocking medicine that slows heart rate and reduces the body's response to adrenaline. It treats selected heart conditions, tremor, migraine prevention, anxiety symptoms, and other problems, but can worsen asthma or low blood sugar.

Proprioception

Awareness of body position and movement without looking, based on signals from muscles, tendons, joints, skin, and balance organs. Reduced proprioception can cause clumsiness, poor coordination, falls, or difficulty walking.

Proprioceptor

A sensory receptor that detects position, movement, or muscle stretch.

Proptosis

The abnormal forward protrusion or displacement of one or both eyeballs from the orbit. Major causes include thyroid eye disease (Graves ophthalmopathy), orbital cellulitis, orbital tumors, idiopathic orbital inflammation, and vascular malformations such as carotid-cavernous fistulas.

Alternate Names:
Exophthalmos; Ocular Proptosis; Proptosis of Eye; Bulging Eyes

Proptosis of Eye

Alternate name; see *Proptosis*.

Propulsion

Movement that drives the body or another object

forward. In some neurologic disorders, impaired forward movement can cause short, shuffling steps or a tendency to lean and fall forward.

Propyl Alcohol

Propyl alcohols are flammable solvents; ingestion or substantial exposure can irritate tissues and depress the central nervous system, with toxicity depending on the isomer and dose.

Propylene Glycol

Propylene glycol is a solvent and humectant used in medicines, foods, and cosmetics; large exposures can cause metabolic or kidney problems.

Propylthiouracil

Propylthiouracil is an antithyroid drug that reduces thyroid-hormone synthesis and conversion of T4 to T3; liver injury and fetal risks require careful use.

Pro Re Nata

A medication or treatment instruction meaning that it should be used only when a specified symptom or clinical circumstance occurs, within clearly prescribed dose and frequency limits.

Alternate Names:
PRN; As Needed

Prosencephalon

The front part of the early developing brain. It later forms the cerebral hemispheres, thalamus, hypothalamus, and related structures that control thought, sensation, movement, hormones, and other functions.

Prosopagnosia

Difficulty or inability to recognize familiar faces despite adequate vision and general intelligence. It may be developmental or result from brain injury or disease.

Prosoplasia

Development of a more specialized cell function or structure within a tissue. The change may occur during normal development or as an adaptation, and its medical meaning depends on the tissue and surrounding disease process.

Prosoposchisis

A rare congenital facial cleft or fissure caused by abnormal fusion of facial processes during embryonic development, potentially affecting the nose, mouth, eyes, and feeding or breathing.

Prostacyclin Analogs

Medications that mimic prostacyclin (PGI2), causing vasodilation and inhibiting platelet aggregation in the pulmonary vasculature. They include epoprostenol (continuous IV), treprostinil (subcutaneous, IV, inhaled, oral), and iloprost (inhaled). They are used for severe PAH.

Prostaglandin

An autocrine and paracrine bioactive lipid mediator synthesized from membrane arachidonic acid via the cyclooxygenase (COX-1 and COX-2) pathway. Major prostaglandins include PGE_2, $PGF_{2\alpha}$, PGD_2, and PGI_2 (prostacyclin), which regulate inflammatory responses, nociception, body temperature, platelet aggregation, vascular tone, renal blood flow, cytoprotection of the gastric mucosa, and uterine smooth muscle contraction during labor.

Alternate Names:
Prostaglandins

Prostaglandin Analogs

Eye-drop medicines that lower pressure inside the eye by helping fluid drain. They treat glaucoma or ocular hypertension and may cause eye redness, eyelash growth, or darkening of the iris or skin around the eye.

Prostaglandin Degradation

Enzymatic inactivation and removal of prostaglandins, which limits the duration and intensity of their local effects on vessels, inflammation, smooth muscle, kidneys, stomach, and reproductive tissues.

Prostaglandin E2

A prostaglandin that mediates inflammation, pain,

fever, vasodilation, gastric protection, cervical ripening, and uterine contraction and is used in selected obstetric and cardiovascular treatments.

Prostaglandin F2-Alpha

A prostaglandin that promotes smooth-muscle contraction and luteolysis; analogues are used in glaucoma, postpartum hemorrhage, labor-related care, and veterinary medicine.

Prostaglandin Receptor

A protein on or inside a cell that recognizes a prostaglandin and starts signals affecting blood-vessel width, inflammation, pain, smooth-muscle activity, platelets, or reproduction.

Prostaglandins

Plural form; see *Prostaglandin*.

Prostaglandins E

The E series of prostaglandins, lipid mediators that influence inflammation, vascular tone, gastric protection, kidney blood flow, cervical ripening, and uterine contraction.

Prostaglandins F

The F series of prostaglandins, lipid mediators involved in smooth-muscle contraction, luteal function, vascular responses, inflammation, and labor-related uterine activity.

Prostate

A gland below the bladder surrounding part of the urine tube. It adds fluid to semen and may enlarge, become inflamed, or develop cancer, causing urinary, sexual, or pelvic symptoms.

Prostate Adenocarcinoma

The most common type of prostate cancer, arising from gland cells in the prostate. It often grows slowly but can spread, and its growth is usually stimulated by male sex hormones; grade and stage help determine treatment.

Prostate Biopsy

Removal of small samples of prostate tissue with a needle to look for cancer under a microscope. The needle may pass through the skin between the scrotum and anus or through the rectum; bleeding, infection, and temporary difficulty urinating are possible risks.

Prostate Brachytherapy

Radiation treatment in which small radioactive sources are placed inside or next to the prostate to destroy cancer cells. It is used for selected cancers and may cause temporary urinary or bowel symptoms and later erectile problems.

Prostate Cancer

Cancer that forms in the prostate gland. It may grow slowly or behave aggressively and may cause no symptoms early on. Risk increases with age, family history, inherited gene changes, and certain racial or ethnic backgrounds. Prostate-specific antigen testing and sometimes a digital rectal examination may help evaluate risk, but diagnosis requires a prostate biopsy. Tumor grade and stage help guide treatment.

Prostate Cancer Screening

Prostate cancer screening may use a PSA blood test with or without a digital rectal examination after discussing possible benefits, false positives, and harms.

Prostate Cancer Staging

Determining how far prostate cancer has grown or spread. Clinicians combine examination, PSA level, tumor grade, biopsy findings, and imaging to decide whether it is confined to the prostate, nearby, or in distant organs.

Prostate Cancer Treatment

Care for cancer of the prostate, chosen according to cancer grade, stage, growth rate, age, and health. Options may include active surveillance, surgery, radiation, hormone-blocking treatment, or medicines for advanced disease.

Prostate Carcinoma

Alternate name; see *Prostate Cancer*.

Prostatectomy

Surgery to remove part or all of the prostate, commonly for prostate cancer or severe urinary obstruction. Possible effects include urinary leakage, erectile dysfunction, bleeding, and infertility.

Prostate Disease

Any disorder affecting the prostate, including benign enlargement, inflammation, infection, or cancer. It may cause difficulty urinating, weak flow, urgency, pelvic pain, blood in urine, or no symptoms initially.

Prostate Enlargement

Alternate name; see *Benign Prostatic Hyperplasia*.

Prostate Enlargement/BPH

Alternate name for benign prostatic hyperplasia, noncancerous enlargement of the prostate that can obstruct urine flow and cause weak stream, urgency, frequency, nighttime urination, or incomplete emptying.

Prostate Gland

The prostate, a gland below the bladder that surrounds the urethra and contributes secretions to semen.

Prostate Gland Enlargement

Alternate name; see *Benign Prostatic Hyperplasia*.

Prostate Infection

Infection or inflammation of the prostate, usually causing pelvic or urinary symptoms and sometimes fever or bloodstream infection.

Prostate Neoplasm

An abnormal mass of cells arising in the prostate. It may be noncancerous, such as a glandular growth, or cancerous; symptoms and treatment depend on its type, size, and spread.

Prostate-Specific Antigen

A protein made mainly by the prostate and measured in blood. A high or rising level can occur with prostate cancer, but also with prostate enlargement, infection, urine retention, ejaculation, or recent procedures. The result is considered with age, examination, trends, and other tests rather than used alone.

Prostate-Specific Antigen Blood Test

A PSA blood test measures prostate-specific antigen; an elevated result may reflect enlargement, inflammation, infection, or cancer and is not diagnostic by itself.

Prostate-Specific Antigen Test

A blood test that measures PSA levels to screen for or monitor prostate disorders, including benign prostatic hyperplasia and prostate cancer; see *Prostate-Specific Antigen Blood Test*.

Prostatic Fluid

Prostatic fluid is a mildly alkaline secretion that forms part of semen and contains substances supporting sperm function and survival.

Prostatic Obstruction

Blockage of urine flow caused by enlargement, inflammation, scarring, stones, or a tumor of the prostate or nearby structures.

Prostatic Urethral Stent

A small device placed in the prostatic urethra to help maintain urine flow when the prostate obstructs it.

Prostatism

Urinary symptoms caused by blockage or poor function at the bladder outlet, often related to an enlarged prostate. Symptoms include weak flow, straining, urgency, frequent urination, nighttime urination, or incomplete emptying.

Prostatitis

Inflammation of the prostate gland. It may be

caused by a bacterial infection or by inflammation involving the prostate, pelvic muscles, or nerves without a proven infection. Symptoms may include pain in the pelvis, area between the scrotum and anus, penis, scrotum, lower abdomen, or lower back; painful or frequent urination; difficulty emptying the bladder; painful ejaculation; and, in acute bacterial prostatitis, fever and chills. Recognized types include acute bacterial prostatitis, chronic bacterial prostatitis, chronic prostatitis/chronic pelvic pain syndrome, and asymptomatic inflammatory prostatitis, which causes no symptoms and is found during evaluation for another problem.

Prostatodynia

Prostatodynia is an older term for pelvic or prostate-region pain without proven bacterial infection, now often considered within chronic pelvic pain syndrome.

Prosthesis

An artificial device replacing or supporting a missing body part or function. Prostheses may replace limbs, joints, teeth, eyes, or heart valves and require fitting, care, adjustment, and monitoring.

Prosthetic

Relating to an artificial device that replaces or supports a missing or damaged body part. Examples include artificial limbs, joints, heart valves, teeth, and blood-vessel grafts; complications can include wear, loosening, skin problems, or infection.

Prosthetic Graft

A prosthetic graft is an artificial tube or patch used to replace or bypass a damaged blood vessel or other tubular structure; infection and thrombosis are important risks.

Prosthetic Heart Valve

An artificial valve that replaces a diseased heart valve and keeps blood moving in the correct direction. Mechanical valves are durable but usually require lifelong anticoagulation; tissue valves generally avoid lifelong anticoagulation unless another indication exists but can degenerate over time.

Prosthetic Limb

An artificial limb used to replace some or all of a missing arm or leg. It may improve movement, balance, or daily activities and is fitted to the person's remaining limb, strength, goals, and comfort. Training helps with safe use and skin care.

Prosthetics

The design, fitting, and use of artificial replacements for missing body parts, such as arms, legs, teeth, or eyes. Successful use depends on comfort, strength, balance, skin health, goals, and rehabilitation.

Prosthetic Training

Rehabilitation teaching a person to use an artificial limb safely and effectively. Training includes skin and residual-limb care, putting it on, walking, balance, stairs, transfers, daily activities, and community mobility.

Prosthetic Valve Endocarditis

A severe endocardial infection affecting an artificial mechanical or bioprosthetic heart valve, categorized as early (within one year of implantation, predominantly caused by *Staphylococcus epidermidis* or *Staphylococcus aureus*) or late (more than one year post-surgery, mimicking native valve endocarditis).

Alternate Names:
PVE

Prosthodontics

The dental specialty that replaces missing teeth and restores chewing, speech, and appearance. Treatment may use crowns, bridges, implants, dentures, or facial prostheses and is planned around oral health and remaining tissues.

Protamine

A medicine that binds to and reverses the blood-thinning effect of heparin. It is given carefully because it can cause low blood pressure, allergic reactions, slow heart rate, or dangerous clotting.

Protanopia

Protanopia is complete absence of red-cone function,

causing a form of red-green color-vision deficiency and altered perception of red and related colors.

Protean

Highly variable in form, appearance, or behavior; in medicine it may describe a disease with changing or diverse manifestations.

Proteaphagy

The process by which a cell uses its recycling system to remove whole proteasomes, the structures that normally break down unwanted proteins. It helps adjust protein disposal during stress or changes in nutrition.

Protease

An enzyme that breaks proteins into smaller pieces by cutting the chemical links between their amino acids. Proteases help digest food and control many processes inside and outside cells.

Protease Inhibitors

Antiviral medicines that block an enzyme viruses need to cut newly made proteins into working parts. They are used for selected viral infections and may interact with many other medicines.

Proteasome

A barrel-shaped protein machine inside cells that breaks down unwanted, damaged, or short-lived proteins. This controls cell growth and signaling and prevents harmful protein buildup.

Proteasome Binding

The attachment of a medicine or other molecule to a cell's protein-destroying machine. This can increase, reduce, or otherwise change the breakdown of proteins and may alter cell survival or function.

Proteasome Inhibitor

A medicine that blocks the proteasome, a cell structure that breaks down unwanted proteins. These drugs are used especially in multiple myeloma and some blood cancers.

Protective

Serving to prevent or reduce injury, infection, or other harm.

Protective Agent

A substance, device, or treatment used to reduce harm to the body. Examples include sunscreen protecting skin from ultraviolet light, barrier creams protecting skin, and medicines that protect the stomach or bones during selected treatments. The appropriate agent depends on the hazard and the person's health.

Protegrin

A small antimicrobial peptide, usually derived from pig immune cells, that can disrupt microbial membranes.

Protein

A large molecule made of one or more chains of amino acids folded into a specific three-dimensional shape. Proteins provide structure and perform functions such as catalyzing reactions, transporting substances, sending signals, regulating cells, and defending against infection; their amino-acid sequence helps determine their shape and function.

Proteinaceous Plug

A blockage made primarily of protein-rich material, mucus, cellular debris, or secretions that can obstruct an airway, duct, catheter, or other passage.

Protein Acetylation

Addition of an acetyl group to a protein, often changing its activity, localization, stability, or interactions; histone acetylation is a major regulator of gene expression.

Protein Binding

The temporary attachment of a medicine to proteins in the blood. The unattached portion can usually leave the bloodstream, reach tissues, and produce effects; changes in protein levels or other medicines can alter the amount available.

Protein Biosynthesis

The way cells make proteins: they copy information from DNA into messenger RNA, then use ribosomes to join amino acids in the instructed order. The new chain folds and may be modified before it works.

Protein C

A natural blood-clotting regulator that helps prevent excessive clotting. Low levels may be inherited or acquired and increase clot risk; starting warfarin in severe deficiency can rarely cause skin injury.

Protein C Blood Test

A protein C blood test measures a natural anticoagulant and may help evaluate unexplained or recurrent blood clots or suspected inherited deficiency.

Protein C Deficiency

A condition in which too little or poorly functioning protein C reduces the body's natural control of blood clotting. It may be inherited or acquired and increases the risk of deep-vein thrombosis and pulmonary embolism.

Protein Deficiency

Inadequate protein intake, digestion, absorption, or use, causing loss of muscle, impaired immunity and wound healing, edema, or growth failure when severe or prolonged.

Protein Denaturation

Loss of a protein's normal three-dimensional structure from heat, chemicals, pH, or mechanical stress, often impairing its biological function without breaking its peptide backbone.

Protein Dephosphorylation

Removal of a phosphate group from a protein by a phosphatase, often reversing or modifying signaling, enzyme activity, localization, or cell-cycle control.

Protein Electrophoresis

A laboratory test that separates proteins in serum or urine according to their electrical properties, helping detect abnormal protein patterns.

Protein-Energy Malnutrition

Severe lack of calories, protein, or both. It can cause weight loss, muscle wasting, weakness, swelling, poor growth, weak immunity, and slow healing; nutrition must often be restored gradually and carefully.

Protein Engineering

Design or modification of proteins through genetic, biochemical, or computational methods to alter activity, stability, specificity, expression, or therapeutic usefulness.

Protein Expression

The process by which a cell uses genetic instructions to make a protein, then folds, changes, and transports that protein so it can perform its function.

Protein Folding

The process by which a newly made protein bends into the three-dimensional shape needed for its job. Incorrect folding can stop the protein from working or cause harmful protein deposits in cells.

Protein Glycosylation

The attachment of sugar chains to proteins. This helps proteins fold, remain stable, reach the correct part of a cell, and work properly; inherited problems with this process can affect many organs.

Protein Import

Movement of a newly made protein into a cell structure or across a cell membrane. Address labels on the protein and transport systems guide it to the correct location, where it can fold and work properly.

Protein In Diet

Dietary protein supplies amino acids needed for muscle, enzymes, hormones, immunity, and tissue repair; requirements vary with age, health, and kidney function.

Protein Isoform

One of several related protein forms produced from different genes, alternative splicing, or post-

translational processing, with potentially different locations or functions.

Protein Kinase

An enzyme that adds a small chemical group to a protein and changes how it works. Protein kinases help control cell signals, metabolism, growth, division, and other functions.

Protein-Losing Enteropathy

Excessive loss of plasma proteins through the gastrointestinal tract, causing low albumin, swelling, diarrhea, or nutritional deficiency.

Protein Malnutrition

Poor health caused by inadequate protein or energy intake, leading to weight loss, muscle wasting, weak immunity, or impaired healing.

Protein Metabolism

The synthesis, folding, modification, breakdown, and recycling of proteins and amino acids in cells and tissues.

Protein Methylation

Addition of small chemical groups called methyl groups to selected parts of a protein. This can change the protein's activity or location and can alter how cells switch genes on or off.

Protein Overexpression

Production of an abnormally large amount of a protein, caused by gene amplification, transcriptional activation, altered degradation, or other mechanisms and potentially driving disease or serving as a biomarker.

Protein Phosphorylation

Attachment of a small phosphate group to a protein by a cell enzyme. This acts like a reversible switch that can change the protein's activity, location, or interactions and helps control cell signals and division.

Protein Prenylation

Attachment of a fat-like chemical group to a protein, helping position it in a cell membrane. This placement allows some proteins to send signals or help move materials within the cell.

Protein Purification

Separation of a desired protein from cells or a mixture using properties such as charge, size, solubility, affinity, or binding, while preserving its structure and activity.

Protein Refolding

Return of a denatured or newly synthesized protein to its functional three-dimensional structure, sometimes requiring chaperones or controlled laboratory conditions.

Protein S

A natural blood protein that helps activated protein C limit clotting. Too little or abnormal protein S can increase the risk of clots in deep veins or the lungs.

Protein S Blood Test

A protein S blood test measures a natural anticoagulant and may help evaluate suspected inherited or acquired tendency to form blood clots.

Protein S Deficiency

A condition in which the blood has too little or poorly functioning protein S, reducing natural control of clotting. It may be inherited or acquired and can increase the risk of deep-vein thrombosis or pulmonary embolism.

Protein Secretion

Release of a protein from a cell or into a particular cell compartment. Cells use this process to send hormones, digestive enzymes, antibodies, and other proteins to where they are needed.

Protein Sequence

The precise order of amino acids joined together to make a protein. This order helps determine the

protein's three-dimensional shape, location, interactions, and biological job.

Protein Splicing

A process in which a newly made protein removes an internal section and joins the remaining sections together. The finished protein may then fold into the form needed for its normal function.

Protein Subunit

One protein component of a larger protein assembly. Several subunits may join to create the final structure and allow the assembly to perform its biological function.

Protein Synthesis

The process by which a cell uses messenger RNA instructions to join amino acids into a protein. The resulting protein folds into a working shape and may be changed or moved before performing its function.

Protein Translocation

Movement of a newly synthesized or mature protein across a membrane or to a different cellular compartment, directed by targeting signals and transport machinery.

Protein Transport

Cellular movement of proteins between compartments, across membranes, or outside the cell, ensuring that each protein reaches its functional location.

Protein Unfolding

Loss of a protein's native three-dimensional structure, caused by heat, chemicals, mutations, or cellular stress, which can impair function or promote aggregation.

Proteinuria

An unusually high amount of protein in urine. It can result from kidney disease, diabetes, high blood pressure, infection, exercise, fever, or pregnancy and may require repeat testing to find the cause.

Proteobacteria

A large group of bacteria containing many gram-negative species, including Escherichia, Salmonella, Pseudomonas, and Vibrio. Some are harmless or helpful, while others cause intestinal, urinary, lung, wound, or bloodstream infections.

Proteogenomics

Integration of genomic, transcriptomic, and proteomic data to identify proteins, discover coding variants, characterize tumors or microbes, and connect DNA changes with protein function.

Proteoglycan

A large molecule made of a protein with many attached sugar chains. It helps connective tissues and cartilage hold water, resist pressure, maintain structure, and send signals between cells.

Proteolipid Protein

A protein containing a substantial fat component, especially important in the myelin sheath around nerve fibers.

Proteolipids

Proteins tightly associated with lipid molecules or lipid membranes, important in myelin, mitochondrial membranes, ion transport, and other membrane structures.

Proteolysis

Enzymatic breakdown of proteins into smaller peptides or amino acids. It is needed for digestion, cell regulation, tissue remodeling, and removal of damaged proteins.

Proteolytic

Relating to the breakdown of proteins by cutting the links between their amino acids. Proteolytic enzymes help digest food, activate clotting and immune proteins, remove damaged proteins, and control cell death; medicines can block some of these enzymes.

Proteome

The complete set of proteins produced by a cell, tissue, organism, or biological condition at a particular time.

Proteomic Profile

A proteomic profile is a pattern of proteins measured in a biological sample to study disease, treatment response, or biological processes.

Proteomics

The large-scale study of proteins, including their abundance, structure, modifications, interactions, and functions.

Proteostasis

The balance of protein production, folding, movement, and breakdown that keeps cells functioning. Failure of proteostasis can contribute to aging, neurodegeneration, and other diseases.

Proteus

A group of Gram-negative bacteria that can cause urinary, wound, bloodstream, or other infections. Proteus urinary infections may produce urease, raising urine pH and encouraging certain kidney stones.

Proteus Hauseri

A gram-negative bacterium in the Proteus group that is rarely isolated from human clinical specimens.

Proteus Mirabilis

A gram-negative bacterium that commonly causes urinary-tract infection and can produce urease-related kidney or bladder stones.

Proteus Penneri

A gram-negative Proteus species that can rarely cause urinary, wound, bloodstream, or other opportunistic infections.

Proteus Syndrome

A rare mosaic overgrowth disorder, usually caused by AKT1 variants, producing asymmetric enlargement of bones, skin, or other tissues and an increased risk of tumors.

Proteus Vulgaris

A gram-negative bacterium that can cause urinary, wound, bloodstream, and other infections and often produces urease.

Prothionamide

A thioamide antimycobacterial drug used as part of selected multidrug regimens for drug-resistant tuberculosis; gastrointestinal, hepatic, neurologic, and thyroid adverse effects require monitoring.

Prothrombin

A blood protein made with the help of vitamin K. When a blood vessel is injured, it is changed into thrombin, which helps form a stable blood clot.

Prothrombin Deficiency

A rare bleeding disorder caused by too little or poorly functioning prothrombin, a protein needed for blood clotting. It can cause easy bruising, nosebleeds, heavy menstrual bleeding, or prolonged bleeding after injury or surgery.

Prothrombin Time

A blood test measuring how quickly a sample forms a clot. It is often reported as the INR and helps assess clotting disorders, liver disease, vitamin K deficiency, and the effect of warfarin.

Alternate Names:
PT

Proton Pump Inhibitors

Proton pump inhibitors suppress gastric acid secretion and treat reflux, ulcers, and other acid-related disorders; prolonged use can be associated with adverse effects and may have limited benefit when no acid-related disorder is present.

Alternate Names:
PPIs; Proton Pump Inhibitor Medicines

Proton Therapy

Radiation treatment using high-energy protons to

damage cancer cells. The beam can deliver much of its dose at a selected depth, potentially reducing radiation to nearby healthy tissue; suitability depends on the tumor and treatment plan.

Proto-Oncogene

A normal gene that helps control cell growth, division, or survival. If it becomes abnormally active because of a genetic change or extra copies, it can act as an oncogene and contribute to cancer.

Protozoa

A traditional group of single-celled organisms with nuclei. Some cause human disease, including malaria, giardiasis, and amoebiasis; modern biological classification places them in several different groups.

Protozoal Infection

Infection caused by a disease-producing protozoan parasite. Protozoal infections may affect the intestine, blood, brain, eyes, skin, or genital tract and include malaria, amoebiasis, giardiasis, leishmaniasis, toxoplasmosis, trichomoniasis, and trypanosomiasis; transmission and treatment depend on the organism and site of disease.

Alternate Names:
Protozoan Disease; Protozoiasis

Protractile

Able to move forward or outward from its usual position. The tongue and lower jaw are examples of body structures that can be actively protruded.

Protractor

An instrument or muscle that moves a body part forward or outward. In anatomy, a protractor muscle may move the jaw, shoulder blade, or another structure away from its usual position.

Protrusion

A part that projects outward or a disc or tissue displaced beyond its normal boundary.

Protuberance

A protuberance is a structure or area that projects outward from a surface, such as a normal bone prominence, swelling, or mass.

Provisional Diagnosis

A temporary working diagnosis made from available evidence before all test results are known, and subject to change.

Provisional Tic Disorder

A disorder with motor or vocal tics lasting less than one year, beginning in childhood and not better explained by another condition.

Provocation

An action or stimulus that brings on a symptom, response, or test finding. Controlled provocation may be used during examination; continuing a stimulus despite dangerous pain can cause harm.

Proximal

Proximal means nearer to the point of attachment or origin; in a limb, the shoulder or hip end is proximal to the hand or foot.

Proximal Deep Vein Thrombosis

A blood clot in a major deep vein of the leg at or above the knee, such as the popliteal, femoral, or iliac vein. It has a higher risk of traveling to the lungs than a clot limited to the calf. It may cause one-sided swelling, warmth, redness, or pain, but some people have no symptoms. Ultrasound and the clinical assessment help establish the diagnosis, and treatment usually includes anticoagulation when safe.

Alternate Names:
Proximal DVT; Above-Knee Deep Vein Thrombosis; Proximal Lower Extremity DVT

Proximal DVT

Alternate name; see *Proximal Deep Vein Thrombosis*.

Proximal Humerus Fractures

Breaks near the upper end of the upper-arm bone, close to the shoulder. They may cause pain, swelling, bruising, and difficulty moving the arm; treatment depends on displacement, joint involvement, bone quality, nerve or blood-vessel injury, and the person's needs.

Proximal Radioulnar Joint

The joint near the elbow where the two forearm bones rotate around each other. It allows the palm to turn up or down; injury or dislocation can limit rotation and cause pain.

Proximal Renal Tubular Acidosis

Proximal renal tubular acidosis occurs when the kidney cannot reclaim enough bicarbonate, causing excess acid in the blood and often low potassium.

Proximal Tubule

The first part of the kidney's microscopic filtering tube after the filtering unit. It returns much of the filtered water, salt, bicarbonate, sugar, amino acids, and phosphate to the blood.

Proximal Tubule Reabsorption

The kidney's return of much of the filtered water and useful substances, including salt, bicarbonate, glucose, amino acids, and phosphate, from the first tubule back into the blood.

Prune Belly Syndrome

A condition present at birth, usually in boys, involving weak or absent abdominal muscles, undescended testicles, and abnormalities of the urinary tract. Kidney problems, repeated infections, breathing difficulty, and impaired growth may occur.

Prurigo

A group of intensely itchy skin disorders with papules or nodules caused by inflammation and scratching.

Prurigo Nodularis

A long-lasting skin disorder with intensely itchy, firm bumps called nodules. Repeated scratching or rubbing causes and maintains an itch–scratch cycle; treatment aims to reduce itching, heal the skin, and prevent new nodules.

Prurigo Pigmentosa

A rare inflammatory skin disorder causing recurrent, intensely itchy red bumps or small blisters, often in a net-like pattern on the chest, back, or neck. As active lesions heal, they may leave a net-like brown discoloration. The condition is often associated with ketosis, such as during a ketogenic diet, fasting, or diabetic ketoacidosis, but it can occur without a recognized cause of ketosis.

Alternate Names:
Nagashima Disease

Pruritic

Itchy or causing an urge to scratch; pruritus can result from skin inflammation, allergy, infection, systemic disease, medications, or neuropathic mechanisms.

Pruritic Eruption

An itchy skin eruption that may result from allergic, inflammatory, infectious, drug-related, or autoimmune disease; diagnosis depends on its morphology, distribution, timing, and associated findings.

Pruritis

Common misspelling of *Pruritus*.

Pruritis Ani

Alternate spelling; see *Anal Itching*.

Pruritus

An itchy feeling that makes a person want to scratch. It can be caused by dry skin, allergies, infection, medicines, or liver, kidney, nerve, and other health problems. Widespread or lasting itching may need medical assessment.

Pruritus and Systemic Disease

Generalized or persistent itching can be a manifestation of kidney or liver disease, iron deficiency,

thyroid disease, hematologic disease, diabetes, infection, or malignancy. Examination and targeted tests are guided by the history and associated findings.

Pruritus Ani

Alternate term; see *Anal Itching*.

Pruritus In CKD

Persistent itching associated with advanced chronic kidney disease, often worse in people receiving dialysis. It may occur without a visible rash and can disturb sleep and quality of life; treatment is individualized after other causes are assessed.

Prussian Blue

A blue pigment used in laboratory staining and as an antidote for selected radioactive cesium or thallium poisoning.

PSA

Prostate-specific antigen, a protein made mainly by prostate cells and measured in blood. A raised level may occur with enlargement, inflammation, infection, or cancer and does not diagnose cancer alone.

Alternate Names:
Prostate-Specific Antigen; Total PSA

Psammoma

A tumor or lesion containing rounded, layered calcium deposits called psammoma bodies. These deposits can occur in several tumors and are identified by microscopic examination rather than symptoms alone.

PSA Test

A laboratory blood test that measures prostate-specific antigen (PSA), a protein made mainly by prostate cells. An elevated level may occur with prostate cancer, benign prostate enlargement, or infection or inflammation of the prostate, so the result does not diagnose cancer by itself and varies in significance with clinical context and other findings.

PSA Velocity

The rate at which prostate-specific antigen concentration changes over time. It may provide additional information in prostate evaluation but does not diagnose cancer independently.

Pseudarthrosis

Failure of a broken bone to heal, leaving persistent movement or a false joint at the fracture site. It can cause pain, weakness, deformity, and loss of function and may require surgery.

Pseudoachondroplasia

An inherited skeletal dysplasia, usually caused by a pathogenic variant in *COMP*, that affects cartilage and bone growth. Birth length and facial features are typically normal, but growth slows in early childhood, leading to disproportionate short stature, short limbs, joint laxity, and early osteoarthritis. Despite its name, it is distinct from achondroplasia. See also: *Achondroplasia*.

Pseudoamenorrhea

A nonstandard or older label for apparent absence of periods when menstrual blood is trapped behind a blockage; the medical term is *Cryptomenorrhea*.

Alternate Names:
Cryptomenorrhea

Pseudoaneurysm

A weak area or leak in an artery in which blood collects outside the normal artery but remains connected to it. It may follow injury, surgery, infection, or a catheter procedure and can enlarge, burst, or send clots downstream.

Pseudoangiomatous Stromal Hyperplasia

A benign breast stromal proliferation forming slit-like spaces within dense collagen that may mimic vascular channels. It can be incidental or present as a palpable or imaging-detected mass.

Pseudobulbar Affect

Sudden, difficult-to-control episodes of laughing or crying that do not match how a person feels or

the situation. It can occur after stroke or with other brain and nerve diseases and is different from depression.

Alternate Names:
PBA; Emotional Incontinence; Pathological Laughter and Crying

Pseudocholinesterase Deficiency

Reduced activity of butyrylcholinesterase, inherited or acquired, causing prolonged paralysis after medicines such as succinylcholine or mivacurium. People may need extended breathing support after anesthesia; enzyme or genetic testing can help confirm the condition.

Pseudoclubbing

Nail-tip broadening or flattening that resembles clubbing but does not have the characteristic change in the angle between the nail and surrounding skin. It may occur with some bone, joint, skin, or inherited conditions.

Pseudo-Cushing Syndrome

A reversible state with clinical or biochemical features resembling cortisol excess without autonomous Cushing disease. Severe alcohol use, depression, obesity, sleep disorders, or acute illness may contribute, and repeat or specialized testing may be needed.

Pseudocyesis

A condition in which a person has pregnancy-like symptoms, such as missed periods, abdominal enlargement, nausea, or breast changes, without an actual pregnancy. A pregnancy test and examination distinguish it from pregnancy and identify other possible causes.

Pseudodementia

Memory and thinking complaints caused by depression or another potentially reversible problem rather than progressive brain-cell loss. Depression and true dementia can occur together or resemble each other.

Pseudoephedrine

An oral decongestant that shrinks swollen blood vessels in the nose and improves blockage from colds or sinus problems. It may raise blood pressure, cause sleeplessness or palpitations, and interact with some medicines.

Pseudofolliculitis of the Beard

An inflammatory reaction caused by shaved or trimmed hairs curling back into the skin, producing itchy or tender papules and pustules in the beard area. Avoiding close shaving, changing shaving technique, and treating inflammation can reduce recurrence and scarring.

Pseudogout

A joint disease caused by calcium pyrophosphate crystals collecting in cartilage. It can cause sudden pain, swelling, warmth, and stiffness, often in a knee or wrist, and may also produce longer-term joint symptoms.

Alternate Names:
Calcium Pyrophosphate Dihydrate Deposition Disease; CPPD

Pseudogout Flare

A sudden attack of joint pain and swelling caused by calcium pyrophosphate crystals. The knee or wrist is often affected; the joint may be red and warm, and fluid testing can confirm the diagnosis.

Pseudogynecomastia

Bilateral enlargement of male breasts due to excessive subareolar and chest wall adipose tissue accumulation without true glandular or ductal tissue proliferation, commonly observed in obesity and distinguishable from true gynecomastia by the absence of a firm, distinct subareolar glandular disc on palpation.

Alternate Names:
Lipomastia; Adipomastia

Pseudohypertrophic Muscular Dystrophy

An older name for Duchenne or related muscular dystrophy with enlarged-appearing muscles caused by fat and connective tissue.

Pseudohypoglycemia

A falsely low glucose measurement that does not reflect the blood glucose available to tissues. It may result from poor peripheral circulation, shock, severe edema, or delayed processing of a blood sample; venous or alternative-site measurements may be more reliable.

Pseudohypoparathyroidism

A group of inherited disorders in which body tissues resist parathyroid hormone (PTH). This often leads to elevated PTH, low blood calcium, and high phosphate; some forms also cause short fingers or other physical features. Pseudohypoparathyroidism is part of the broader group of inactivating PTH/PTH-related peptide signaling disorders (iPPSDs).

Alternate Names:
PHP

Pseudo-Kaposi Sarcoma (Acroangiodermatitis)

A benign vascular eruption, usually on the lower legs or feet, that can resemble Kaposi sarcoma. It is often associated with chronic venous insufficiency, arteriovenous malformations, or dialysis access and may cause violaceous plaques or ulcers.

Pseudomelanosis Duodeni

A usually harmless dark discoloration of the first part of the small intestine seen during endoscopy. It results from pigment-containing material in the lining and may be associated with chronic illness, medicines, or mineral deposits.

Pseudomembranous Colitis

Severe inflammation of the colon, usually caused by overgrowth of Clostridioides difficile after antibiotics. It can cause frequent watery diarrhea, fever, abdominal pain, dehydration, and serious complications.

Alternate Names:
Clostridioides Difficile Colitis; Antibiotic-Associated Colitis

Pseudomonas

A group of Gram-negative bacteria that can cause opportunistic infections, especially in damaged tissues or people with weakened immunity.

Pseudomonas Aeruginosa

A gram-negative bacterium that can cause pneumonia, bloodstream, urinary, wound, and ear infections, especially in hospitalized or immunocompromised people; it often has antibiotic resistance.

Pseudomonas Aeruginosa Infection

Infection caused by Pseudomonas aeruginosa, an opportunistic gram-negative bacterium that can affect the lungs, wounds, urinary tract, blood, or other sites.

Pseudomonas Aeruginosa Resistance

The ability of Pseudomonas aeruginosa to survive medicines that would normally kill it. Resistance may be natural or develop through genetic changes; susceptibility testing identifies active antibiotics.

Pseudomonas Folliculitis

An infection of hair follicles by Pseudomonas aeruginosa, often after exposure to contaminated hot tubs or pools. It causes itchy red papules and pustules under swimwear and usually resolves; severe or recurrent cases can persist or spread.

Pseudomyxoma Peritonei

A rare condition in which jelly-like tumor material gradually fills the abdomen, usually after a mucus-producing appendix tumor ruptures. It can cause increasing abdominal size, pain, bowel blockage, or poor nutrition; treatment may involve extensive abdominal surgery.

Pseudophakia

Having an artificial lens inside the eye after the natural lens has been removed, usually during cataract surgery. The replacement lens focuses light, but later clouding of its supporting capsule or other eye problems can still affect vision.

Pseudoporphyria

A blistering and skin-fragility disorder that resem-

bles porphyria cutanea tarda but occurs without the characteristic porphyrin excess. It may be triggered by kidney failure, dialysis, medicines, or ultraviolet exposure and usually affects the backs of the hands.

Pseudopseudohypoparathyroidism

An inherited condition caused by paternally transmitted mutations in the *GNAS* gene, characterized by the somatic phenotype of Albright hereditary osteodystrophy (short stature, round face, brachydactyly, subcutaneous ossifications) in the presence of completely normal calcium, phosphorus, and parathyroid hormone levels due to intact maternal allele expression in renal tubules.

Alternate Names:
PPHP

Pseudorabies

Aujeszky disease, a herpesvirus infection mainly affecting pigs and other animals. People are rarely infected, but exposed humans may develop serious nervous-system disease; it is different from rabies.

Pseudothrombocytosis Due To Red Cell Fragments

A falsely high platelet count caused when automated equipment mistakes very small broken red-cell fragments for platelets. A blood-smear examination can distinguish this error from a genuinely high platelet count.

Pseudotumor Cerebri

An older name for idiopathic intracranial hypertension, a condition in which pressure around the brain rises without a tumor. It can cause daily headache, brief dimming of vision, whooshing in the ears, and swelling of the optic nerves that may threaten sight.

Pseudoxanthoma Elasticum

A rare inherited disorder in which elastic tissue becomes hardened and damaged. It can cause yellowish or loose skin, bleeding or vision loss from eye blood vessels, and narrowing or bleeding in arteries.

Alternate Names:
PXE; Gronblad-Strandberg Syndrome

Psilocybin

A naturally occurring psychedelic tryptamine found in some fungi. It is converted in the body to psilocin, which acts mainly at serotonin 5-HT2A receptors and alters perception, cognition, and mood. It is under clinical investigation for potential therapeutic uses.

Psittacosis

An infection caused by Chlamydia psittaci, usually acquired by breathing dust from infected birds or their droppings. It commonly causes fever, headache, cough, and pneumonia and requires appropriate antibiotic treatment.

Psittacosis (Parrot Fever)

A systemic infection caused by Chlamydia psittaci, usually acquired from infected birds or their dried secretions. It commonly causes atypical pneumonia with fever, headache, cough, and sometimes hepatitis or neurologic disease; exposure history is diagnostically important.

PSMA

A protein found in large amounts on many prostate cancer cells and in smaller amounts in some normal tissues. Special tracers can use it to show prostate cancer on scans or deliver radiation to cancer cells.

Psoas

A large muscle running from the lower spine to the thigh bone. It helps bend the hip, lift the leg, maintain upright posture, and stabilize the spine during movement.

Psoas Abscess

A collection of pus in or around the psoas muscle, caused by infection spreading through the blood or from nearby tissues. It may cause back or hip pain, fever, difficulty walking, or few symptoms and usually requires imaging and targeted treatment.

Psoas Sign

An abdominal physical examination sign elicited by passive hyperextension of the right hip with the patient in the left lateral decubitus position, or active

right hip flexion against resistance; exacerbation of right lower quadrant abdominal pain indicates retrocecal appendicitis inflaming the underlying psoas muscle.

Psoriasis

A chronic immune-mediated skin disease that accelerates epidermal turnover, producing sharply defined, raised, scaly plaques. Plaques often affect the scalp, elbows, knees, trunk, palms, or soles and may look red, purple, brown, or gray depending on skin tone. Nail pitting, thickening, or separation may occur; psoriasis is not contagious.

Psoriatic Arthritis

An inflammatory arthritis associated with psoriasis that can affect peripheral joints, the spine, whole digits (dactylitis), and tendon or ligament attachments (enthesitis). Joint disease may precede, accompany, or follow skin or nail psoriasis.

Alternate Names:
PsA; Arthropathia Psoriatica

Psoriatic Plaque

The characteristic cutaneous lesion of plaque psoriasis (psoriasis vulgaris), consisting of a sharply demarcated, erythematous, indurated plaque covered with adherent, silvery-white micaceous scales, typically distributed symmetrically over extensor surfaces (elbows, knees, scalp, lumbosacral region).

PSP

PSP commonly means progressive supranuclear palsy, a neurodegenerative disorder causing early postural instability, vertical gaze impairment, rigidity, and cognitive change.

Psychiatric

Relating to the assessment, diagnosis, treatment, or prevention of disorders of mood, thought, perception, behavior, or emotional functioning.

Psychiatric Emergency

A mental-health condition involving an immediate and serious risk to life, safety, basic functioning, or the safety of others. Examples include imminent suicide risk, severe psychosis, dangerous agitation, catatonia, or severe substance intoxication or withdrawal. It is a subset of mental-health crises distinguished by the immediacy and severity of risk.

Psychiatrist

A medical doctor who assesses, diagnoses, and treats mental-health conditions. A psychiatrist may provide talking therapy, prescribe medicines, coordinate other treatments, and assess how mental or physical illness affects safety and daily life.

Psychiatry

The branch of medicine concerned with mental, emotional, and behavioral disorders, including substance use disorders. Psychiatrists assess psychological and physical contributors to symptoms and use medical, psychological, and social approaches in the prevention, diagnosis, and treatment of these conditions.

Psychoacoustics

The study of how people perceive and interpret sound, including loudness, pitch, masking, localization, speech, and hearing thresholds.

Psychoactive

Affecting mood, thought, perception, behavior, alertness, or other mental processes. Psychoactive substances include prescribed medicines, alcohol, and recreational drugs.

Psychoactive Substance

A substance that alters mood, perception, cognition, behavior, or consciousness.

Psychoanalysis

A psychological theory and talking treatment emphasizing unconscious thoughts, feelings, memories, and conflicts. Traditional treatment explores patterns in relationships and behavior, while modern approaches vary in methods, goals, and evidence.

Psychodermatology

The area of care that considers links between skin conditions and emotional health. Stress can worsen

problems such as eczema, psoriasis, acne, or hives, while visible skin disease can cause anxiety or low mood; both aspects may need treatment.

Psychodidae

A family of small hairy flies that includes sand flies; some species transmit pathogens such as Leishmania and therefore have public-health importance.

Psychodrama

A therapy using guided acting to explore emotions, relationships, and behavior in a supportive setting.

Psychodynamic Therapy

Talking therapy that explores how past experiences, relationships, feelings, and patterns outside a person's immediate awareness may influence current distress and behavior. The therapist and patient use the therapeutic relationship to develop insight and healthier ways of coping.

Psychogenic

Caused or strongly influenced by psychological factors such as stress, trauma, or emotional conflict. The symptoms are real and not deliberately produced; physical and psychological causes can coexist.

Psychogenic Erectile Dysfunction

Difficulty getting or keeping an erection mainly related to stress, anxiety, depression, relationship concerns, or other emotional factors. Physical causes, medicine effects, and psychological factors can coexist.

Psychogenic Nonepileptic Seizures

Alternate spelling; see *Psychogenic Non-Epileptic Seizures*.

Psychogenic Non-Epileptic Seizures

Episodes that resemble epileptic seizures but are not caused by the abnormal electrical discharges of epilepsy. They are real and involuntary and may involve shaking, stiffening, unresponsiveness, or altered movement; video-EEG can help establish the diagnosis.

Psycholinguistics

The study of how the brain and mind produce, understand, acquire, and remember language, including speech, reading, grammar, and meaning.

Psychological

Relating to thoughts, feelings, behavior, or the way these affect health. Psychological factors can influence pain, sleep, coping, treatment choices, and recovery, but describing a factor as psychological does not mean symptoms are imagined.

Psychological Adjustment

The process of adapting thoughts, emotions, and behavior to stress, illness, disability, loss, developmental change, or other life circumstances.

Psychological Dependence

A pattern in which a person feels a strong emotional or mental need for a substance or behavior, often with craving, preoccupation, or distress when it is unavailable.

Psychological Health

Alternate name; see *Mental Health*.

Psychological Homeostasis

The ongoing adjustment of thoughts, emotions, and behavior that helps a person maintain psychological stability while responding to stress or change. Severe disruption can contribute to anxiety, depression, or impaired daily functioning.

Psychological Support

Emotional and practical help for people coping with illness, disability, pain, or difficult treatment. It may include counseling, coping skills, support groups, and assessment or treatment of anxiety, depression, and adjustment problems.

Psychological Transfer

The process in which feelings, expectations, or relationship patterns from earlier experiences become

directed toward someone in the present, especially a therapist. Recognizing this pattern can help understand distress and relationships during therapy.

Psychological Trauma

Emotional or psychological effects that may follow an event or ongoing situation involving actual or threatened death, serious injury, violence, abuse, or another overwhelming experience. Responses vary and may include fear, intrusive memories, avoidance, emotional numbness, sleep problems, or changes in mood and behavior.

Psychology

The scientific study of behavior, emotion, learning, and mental processes. Psychological care may include assessment, counseling, and behavioral therapies.

Psychometrics

The design and use of tests that measure mental abilities, feelings, behavior, or personality. It also examines whether a test gives consistent results and truly measures the quality it claims to measure.

Psychomotor

Relating to the connection between mental activity and physical movement, including the speed, coordination, and purposeful control of actions.

Psychomotor Agitation

Restless, excessive, or purposeless movement associated with inner tension, anxiety, mania, delirium, depression, substance effects, or medication reactions.

Psychomotor Disorder

A condition affecting the speed, starting, coordination, or expression of movement and mental activity. A person may move unusually slowly or quickly, seem restless, or have difficulty organizing purposeful actions.

Psychomotor Performance

The ability to coordinate mental processing with physical movement, assessed through tasks involving speed, precision, reaction time, balance, or sequencing.

Psychomotor Retardation

A noticeable slowing of mental processes, speech output, and physical movements, manifested by decreased spontaneous gestures, prolonged latency in answering questions, sluggish gait, and reduced facial expressiveness. It is a core feature of severe major depressive disorder and melancholia.

Psychoneuroimmunology

The study of how thoughts, emotions, the brain, hormones, and the immune system influence one another in health and illness. It examines links involving stress, inflammation, infection, and recovery.

Psycho-Oncology

The clinical field addressing psychological, social, behavioral, and communication needs of people with cancer and their families during diagnosis, treatment, survivorship, and end-of-life care.

Psychopathic

Describing severe, persistent antisocial traits such as limited empathy, deceitfulness, and disregard for others; it is not a precise diagnosis.

Psychopathology

The study and description of mental symptoms, behaviors, and processes associated with psychological disorders.

Psychopharmacology

The study of how medicines affect mood, behavior, thinking, sleep, and other mental functions in people.

Psychophysics

The study of how physical stimuli, such as light, sound, pressure, or heat, are experienced by a person. It measures detection thresholds, ability to distinguish stimuli, and perceived strength.

Psychophysiology

The study of links between psychological processes and measurable bodily functions such as heart rate, skin conductance, muscle activity, and brain signals.

Psychosexual

Relating to how psychological factors interact with sexual development, feelings, behavior, relationships, or function. Mental health, past experiences, body image, culture, medicines, and physical conditions can all influence sexuality.

Psychosexual Development

Development of sexual identity, interest, relationships, and behavior across the lifespan as influenced by biology, cognition, attachment, culture, and experience.

Psychosis

A state in which a person loses contact with reality. It may involve strongly held false beliefs, hearing or seeing things others do not, confused speech, or markedly disorganized behavior and can result from mental, medical, neurologic, or substance-related causes.

Psychosocial Rehabilitation

Support that helps a person with mental illness build skills, relationships, confidence, and independence. It may include daily-living training, education, work support, peer support, therapy, and help taking part in family and community life.

Psychosocial Support

Practical, emotional, and social help for people facing illness or difficult treatment. It may include counseling, support groups, help with work or money worries, family support, and care for anxiety, depression, fear, loneliness, or grief.

Psychosomatic

Relating to physical symptoms influenced by psychological processes or stress.

Psychosomatic Disorder

An older broad term for physical symptoms influenced by psychological and social factors. The symptoms are real; modern assessment considers both body and mind rather than assuming symptoms are imagined.

Psychosomatic Medicine

Medical care that considers how body processes, thoughts, emotions, relationships, and social conditions interact in illness. Physical symptoms are real, and assessment looks for both medical and psychological factors without assuming symptoms are imagined.

Psychosurgery

Surgery intended to alter brain circuits for severe, treatment-resistant psychiatric illness; it is rarely used and highly specialized.

Psychotherapy

Structured treatment using therapeutic communication and psychological techniques to reduce distress, change unhelpful patterns, and improve coping or relationships. Common approaches include cognitive behavioral and interpersonal therapies.

Psychotic

Describing psychosis, a syndrome involving impaired reality testing. It may include delusions, hallucinations, disorganized thinking or speech, or markedly disorganized behavior. Psychosis can occur with schizophrenia-spectrum disorders, severe mood disorders, substances or medicines, delirium, neurologic disease, or other medical conditions.

Psychotic Disorder

A psychiatric or organic mental disorder characterized by severe impairment in reality testing, manifesting with positive symptoms (delusions, hallucinations, disorganized thinking or speech, and grossly disorganized or catatonic behavior) and negative symptoms (affective flattening, alogia, avolition). The spectrum encompasses schizophrenia, schizoaffective disorder, schizophreniform disorder, brief psychotic disorder, delusional disorder, and

secondary psychosis induced by general medical conditions or substances. Management combines dopamine-modulating antipsychotic pharmacotherapy, psychosocial support, and psychotherapy.

Alternate Names:
Psychotic Disorders

Psychotic Disorders

Plural form; see *Psychotic Disorder*.

PTCA

Percutaneous transluminal coronary angioplasty, a procedure using a small balloon to open a narrowed heart artery. A stent is often placed afterward to help keep the artery open and restore blood flow.

Alternate Names:
Percutaneous Transluminal Coronary Angioplasty; Coronary Angioplasty

PTCL

Alternate name; see *T-Cell Lymphoma*.

PTE

Alternate name; see *Pulmonary Thromboendarterectomy*.

PTEN

Tumor suppressor gene; mutations lead to Cowden syndrome and predispose individuals to benign and malignant tumors. See *Cowden Syndrome*.

Pteridine

A nitrogen-containing chemical structure found in folate vitamins, natural pigments, and other active body compounds. Pteridine-containing molecules participate in cell growth, chemical reactions, color production, and inherited metabolic disorders.

Pterygium

A raised, often triangular growth of tissue with blood vessels that begins on the conjunctiva and extends onto the cornea. Long-term exposure to ultraviolet light, wind, or dust may contribute; it can cause irritation and redness, and growth over the cornea may blur vision or induce astigmatism.

Pterygium Unguis

A scar-like band of tissue that joins the nail fold to the nail bed or nail plate, often dividing or deforming the nail as it grows. It can follow inflammation, injury, or scarring of the nail matrix and is distinct from the eye condition also called pterygium.

Dorsal Pterygium

A scarred band that grows from the proximal nail fold onto the nail bed and nail plate, often forming a V-shaped split in the nail. It can follow nail-matrix scarring, especially from lichen planus or injury, and may permanently alter nail growth.

Ventral Pterygium (Pterygium Inversum Unguis)

An abnormal forward growth of the skin beneath the nail that attaches to the underside of the nail plate. This can seal the space under the nail tip and make trimming or cleaning painful. It differs from dorsal pterygium, which grows from the proximal nail fold.

Pincer Nail Deformity

A nail that curves too far from side to side, so its edges press into the skin alongside it. This most often affects the big toe and may cause pain, inflammation, or an ingrown nail. It can be inherited or develop with injury or other nail disease.

Pterygium Excision

Surgical removal of a pterygium, a fibrovascular growth that extends from the conjunctiva onto the cornea. The exposed area is often covered with a conjunctival autograft or other tissue graft to reduce recurrence, which can still occur.

Alternate Names:
Pterygium Removal; Pterygium Surgery

Pthirus Pubis

The insect commonly called the pubic louse. It lives mainly in coarse genital hair and causes intense itching and visible lice or eggs; it spreads mainly through close body or sexual contact.

Alternate Names:
Pubic Louse

PTH-Related Peptide

A hormone-like substance sometimes made in excess by cancer cells. It acts partly like parathyroid hormone and can raise blood calcium, causing thirst, constipation, weakness, confusion, dehydration, or kidney problems.

Ptilosis

An abnormal hair pattern or hair disorder, including excess growth, unusual direction, or loss. The term is nonspecific; its meaning depends on body site, appearance, timing, and cause.

PTLD

Post-transplant lymphoproliferative disorder, an abnormal overgrowth of immune cells after organ or stem-cell transplantation. It ranges from a reversible response to lymphoma and may cause fever, swollen lymph nodes, organ problems, or unexplained weight loss.

Ptosis

Drooping of an eyelid or another body structure. Eyelid ptosis may result from muscle, nerve, tendon, aging, injury, or a neurologic disorder.

PTSD

Alternate name; see *Post-Traumatic Stress Disorder*.

Ptyalin

An older name for salivary amylase, the enzyme that begins starch digestion in the mouth.

Ptyalism

Excessive saliva or drooling. It may result from increased saliva production or difficulty swallowing, and can occur with pregnancy, mouth irritation, reflux, medicines, or disorders affecting the brain, nerves, or muscles.

Pubertal Failure

Puberty that does not begin or stops progressing as expected. Causes may involve the brain's hormone centers, pituitary gland, testes or ovaries, chromosomes, chronic illness, inadequate nutrition, excessive exercise, or other factors.

Puberty

The stage when hormone changes cause the body to mature sexually and become capable of reproduction. It includes growth, development of breasts or testes and genitals, body hair, voice changes, and menstrual periods or sperm production.

Puberty In Boys

Puberty in boys is the hormone-driven development of testes, penis, body hair, voice, muscle, and fertility, usually progressing through predictable physical stages.

Puberty In Girls

Puberty in girls is the hormone-driven development of breasts, body hair, growth, menstrual cycles, and reproductive maturity, usually progressing through predictable stages.

Pubes

The area in front of the pelvis over the pubic bone, or the coarse hair that grows there during puberty. Pubic-hair development is one feature of sexual maturation and varies among individuals.

Pubic

Relating to the pubis, the front part of the pelvis, or the area covered by hair above the genitals.

Pubic Lice

Parasitic insects that infest coarse body hair, causing intense itching and visible eggs called nits. They spread mainly through close body contact, often sexual contact.

Alternate Names:
Pediculosis Pubis; Crab Lice

Pubic Symphysis

The joint at the front of the pelvis where the two pubic bones meet. A strong pad of cartilage joins the bones and allows very little movement.

Pubis

The front part of the pelvic bone, meeting its opposite side at the pubic symphysis.

Public Assistance

Government or community support providing eligible people with food, housing, income, healthcare, disability, or other essential services.

Public Exposure

Radiation received by other people from a patient who has undergone nuclear medicine treatment. The amount depends on the radioactive substance and treatment; the medical team gives specific instructions to limit exposure when needed.

Public Health

The science and practice of protecting and improving the health of populations. It includes disease surveillance, prevention, health promotion, policy, environmental health, and organized community action to address shared health risks.

Public Health Emergency

A serious event threatening the health of many people, such as a pandemic, disaster, or deliberate biological attack.

Puborectalis Muscle

A loop-shaped pelvic muscle that surrounds the lower rectum and helps control bowel movements. At rest it pulls the rectum forward to make a bend that helps hold stool; relaxing it helps stool pass.

Pudendal

Relating to the external genitalia, anus, or perineum. The pudendal nerve carries sensation from these areas and helps control several muscles involved in continence and sexual function.

Pudendal Arteries

Arteries supplying blood to the external genital and perineal region.

Pudendal Block

Injection of local anesthetic near the pudendal nerve to numb the lower vagina, vulva, anus, and perineum. It may reduce pain during late labor, assisted delivery, or repair of a birth-related tear.

Pudendal Nerve

The nerve carrying sensation and motor signals to much of the perineum and pelvic floor.

Pudendal Nerve Block

A regional obstetric anesthesia technique in which local anesthetic is infiltrated transvaginally near the ischial spine and sacrospinous ligament to block the pudendal nerve (S2-S4), providing sensory anesthesia to the perineum, vulva, and lower vagina for forceps delivery or episiotomy repair.

Pudendal Neuralgia

Pain caused by irritation or entrapment of the pudendal nerve, often felt in the perineum and worsened by sitting. It may include burning, tingling, altered sensation, or sexual and urinary symptoms; similar pain can have other pelvic causes.

Puerperal

Relating to the period after childbirth, usually the first six weeks. During this time the body recovers from pregnancy and birth, the womb becomes smaller, bleeding gradually settles, and problems such as infection, heavy bleeding, or blood clots may occur.

Puerperal Disorder

A physical or mental health disorder occurring during the postpartum period, including infection, bleeding, hypertension, depression, or psychosis.

Puerperal Fever

Fever occurring after childbirth, often caused by infection of the uterus, birth canal, urinary tract, breast, wound, or bloodstream. Untreated infection can spread and become life-threatening.

Puerperal Infection

An infection after childbirth, commonly involving the uterus, surgical wound, urinary tract, breast, or bloodstream, often causing fever, pain, or foul discharge.

Puerperal Psychosis

A rare, severe psychiatric disorder with rapid onset, usually soon after childbirth. It may involve marked mood changes, confusion, delusions, hallucinations, or disorganized behavior. The acute disturbance can impair judgment and awareness of reality and may pose serious safety risks to the affected parent or infant.

Puerperal Sepsis

A serious infection of the reproductive tract during labor or the six weeks after childbirth. Fever, pelvic pain, foul-smelling discharge, weakness, or fast breathing may occur; treatment includes antibiotics.

Alternate Names:
Postpartum Sepsis; Puerperal Septicemia

Puerperium

The period after childbirth, usually about six weeks, when the body recovers from pregnancy and birth. The uterus shrinks, bleeding settles, milk production develops, and health problems may still arise.

Puffy Eyes

Alternate name; see *Bags Under Eyes*.

Pugilistic Stance

A flexed posture of the arms, hands, and legs sometimes seen in bodies exposed to intense heat. It results from heat-related muscle and tendon contraction, not from purposeful movement, and does not by itself show when or how death occurred.

Pulling A Patient Up In Bed

A safe repositioning technique using adequate staff, friction-reducing equipment, and coordinated movement to move a patient toward the head of the bed while preventing falls, shear, and staff injury.

Pull Test

A standardized clinical test used to evaluate postural stability and balance recovery. The examiner stands behind the patient and delivers a brisk, backward tug to the patient's shoulders; an inability to recover balance within one or two steps indicates impaired postural reflexes in Parkinson's disease or atypical parkinsonism.

Pulmonary

Relating to the lungs or the blood vessels and airways that support breathing. Pulmonary disease may involve infection, asthma, chronic obstructive lung disease, high pressure in lung vessels, blood clots, fluid, scarring, or cancer.

Pulmonary Acinus

The smallest part of the lung that exchanges gases. It begins after a small airway and contains respiratory bronchioles, alveolar ducts, and alveoli where oxygen enters blood and carbon dioxide leaves it.

Pulmonary Actinomycosis

Pulmonary actinomycosis is a chronic bacterial infection of the lungs caused by Actinomyces and may form mass-like lesions or spread across tissue planes.

Pulmonary Alveolar Hemorrhage

Bleeding into the lung's air sacs. It may cause coughing up blood, breathlessness, low oxygen, anemia, and widespread lung shadows and can result from immune disease, infection, medicines, injury, or a clotting problem.

Pulmonary Alveolar Microlithiasis

A rare inherited lung disease in which tiny mineral deposits build up inside the air sacs. It may cause no symptoms at first, but later can lead to cough, breathlessness, low oxygen, and progressive lung scarring.

Pulmonary Alveolar Proteinosis

A rare lung disease in which a fatty material builds up inside the air sacs and interferes with oxygen exchange. It can cause gradually worsening breathlessness, cough, tiredness, and low oxygen and may

be immune-related or secondary to another illness.

Pulmonary Angiography

Contrast imaging of the pulmonary arteries, usually by catheter. It can diagnose pulmonary vascular abnormalities but is now used less often for pulmonary embolism because CT pulmonary angiography is less invasive.

Pulmonary Arterial Hypertension

Group 1 pulmonary hypertension, characterized by disease of the small pulmonary arteries and precapillary hemodynamics on right-heart catheterization: mean pulmonary arterial pressure above 20 mmHg, pulmonary arterial wedge pressure at or below 15 mmHg, and pulmonary vascular resistance above 2 Wood units. It may be idiopathic, heritable, drug-associated, or linked to connective-tissue disease, HIV, portal hypertension, congenital heart disease, or schistosomiasis. It may cause exertional breathlessness, fatigue, chest discomfort, dizziness, fainting, or swelling.

Pulmonary Arteries

The two large blood vessels carrying oxygen-poor blood from the right side of the heart to the lungs. In the lungs, the blood releases carbon dioxide and picks up oxygen.

Pulmonary Arteriovenous Fistula

An abnormal direct connection between an artery and vein in the lung that lets blood bypass normal oxygen exchange. It can cause low oxygen, breathlessness, blue skin, stroke-causing clots, or rarely a brain abscess.

Pulmonary Arteriovenous Malformation

An abnormal direct connection between an artery and vein in the lung. Blood bypasses normal oxygen exchange, which can cause low oxygen, breathlessness, coughing blood, stroke, or a brain abscess; some cases are linked to an inherited blood-vessel disorder.

Pulmonary Artery

The large blood vessel carrying oxygen-poor blood from the right side of the heart to the lungs. There, blood releases carbon dioxide, receives oxygen, and returns through pulmonary veins.

Pulmonary Artery Catheter

A thin tube passed through the right side of the heart into a lung artery to measure pressures, blood flow, and heart performance. It is used selectively in severe heart or lung disease and critical illness because insertion has risks.

Pulmonary-Artery Dissection

A rare, life-threatening tear in the wall of an artery carrying blood from the heart to the lungs. It may cause sudden chest pain, breathlessness, low blood pressure, or collapse.

Pulmonary Artery Pulsatility Index

A measurement calculated during right-heart catheterization from pulmonary-artery pressure and right-atrial pressure. A low result may indicate weak right-ventricle pumping and a higher risk of right-sided heart failure in seriously ill patients.

Alternate Names:
PAPi; PAP Index

Pulmonary Artery Wedge Pressure

An indirect hemodynamic measure of left atrial pressure and left ventricular end-diastolic filling pressure, obtained by inflating a balloon at the tip of a pulmonary artery catheter (Swan-Ganz) until it occludes a small pulmonary arterial branch.

Alternate Names:
PAWP; PCWP; Pulmonary Capillary Wedge Pressure

Pulmonary Aspergilloma

A pulmonary aspergilloma is a ball of Aspergillus fungus and debris growing in a pre-existing lung cavity, sometimes causing coughing of blood.

Pulmonary Aspergillosis

Infection or allergic disease in the lungs caused by Aspergillus mold. It may cause an allergic reaction in the airways, a mold ball in an old lung cavity, or

invasive infection that damages lung tissue, especially when immune defenses are weak.

Pulmonary Atresia

A heart defect present from birth in which the valve or passage from the right ventricle to the pulmonary artery does not open normally. Blood cannot reach the lungs through the usual route, so newborns may become blue or severely unwell; treatment often involves catheter procedures or surgery.

Pulmonary Blastoma

A rare malignant lung tumor composed of primitive epithelial and mesenchymal tissue, usually treated with specialist oncology care.

Pulmonary Capillary Wedge Pressure

A pressure measured with a special catheter in a small lung artery to estimate pressure on the left side of the heart. It can help assess heart failure or fluid overload in critically ill patients, but breathing support and other conditions affect its meaning.

Pulmonary Circuit

The circulation in which blood travels from the right ventricle to the lungs for gas exchange and returns to the left atrium.

Pulmonary Circulation

The blood-flow circuit from the right ventricle through the pulmonary arteries and lung capillaries to the left atrium, where blood releases carbon dioxide and gains oxygen.

Pulmonary Coccidioidomycosis

Lung infection caused by breathing in spores of Coccidioides fungi, which live in soil in some regions. It may cause cough, fever, tiredness, or chest pain. Most disease stays in the lungs, but in some people it spreads to the skin, bones, joints, or brain.

Pulmonary Compliance

How easily the lungs expand when pressure changes during breathing. Low compliance means the lungs are stiff and harder to inflate; high compliance can mean they expand easily but may not recoil effectively.

Pulmonary Contusion

Bruising of the lung after a blow or crush injury to the chest. Bleeding and swelling inside the lung can reduce oxygen exchange and worsen during the first day or two; treatment supports breathing and addresses associated injuries.

Pulmonary Disease and Pregnancy

Lung disease can worsen during pregnancy or be affected by pregnancy-related changes in oxygen demand and ventilation. Asthma, pneumonia, pulmonary embolism, and chronic lung disease can cause severe or new breathlessness, chest pain, or low oxygen.

Pulmonary Edema

A buildup of fluid in the lungs that can make breathing difficult. It is often caused by heart failure but may also result from kidney problems, lung injury, medicines, or high altitude. Fluid in the air sacs can reduce oxygen in the blood and, when severe, cause respiratory failure.

Alternate Names:
Fluid in the Lungs; Pulmonary Congestion; Alveolar Flooding

Pulmonary Embolism

A potentially life-threatening medical emergency caused by a sudden blockage in one or more arteries in the lungs, most commonly by a blood clot that has traveled through the bloodstream from the deep veins of the legs or pelvis (deep vein thrombosis). The blockage prevents oxygen-poor blood from reaching the lung tissue to pick up oxygen, putting sudden strain on the heart and reducing oxygen levels in the body. Common symptoms include sudden shortness of breath, sharp chest pain (especially when taking a deep breath), rapid breathing, coughing up blood, and lightheadedness.

Alternate Names:
PE; Pulmonary Thromboembolism; Blood Clot in Lungs

Pulmonary Embolism Treatment

Treatment for a blood clot in the lung usually uses anticoagulant medicine to stop growth and prevent new clots. Severe or unstable cases may need clot-dissolving medicine or a procedure; choice and duration depend on the person's risks and cause.

Pulmonary Embolus

A blockage of a pulmonary artery, usually by a blood clot that traveled from a deep vein, causing sudden breathlessness, chest pain, low oxygen, or collapse.

Pulmonary Emphysema

Alternate name; see *Emphysema*.

Pulmonary Eosinophilia

A group of disorders in which eosinophils accumulate in lung tissue or air spaces, causing infiltrates, cough, wheezing, breathlessness, or low oxygen. Causes include parasites, medicines, asthma, allergic disease, and eosinophilic lung syndromes; treatment targets the cause and inflammation.

Pulmonary Fibrosis

Scarring and stiffening of lung tissue, often as part of an interstitial lung disease. The scarring can make it harder for the lungs to expand and for oxygen to pass into the blood. It may cause worsening shortness of breath, a dry cough, and tiredness. Causes include some autoimmune diseases, medicines, radiation, and inhaled dusts or chemicals; sometimes no cause is found. Idiopathic pulmonary fibrosis is a specific type with no known cause.

Pulmonary Fistula

An abnormal passage between the lung or an airway and another structure, such as the space around the lung, skin, or swallowing tube. It can allow air or infected fluid to travel where it should not.

Pulmonary Function Test

Singular variant; see *Pulmonary Function Tests*.

Pulmonary Function Tests

Breathing tests that measure how much air the lungs hold, how quickly air can be moved, and how well oxygen passes into the blood. They help assess asthma, chronic obstructive lung disease, scarring, and other breathing problems. Results depend on effort, technique, age, and body size.

Pulmonary Hemorrhage

Bleeding into the airways or lung tissue, which may cause coughing blood, low oxygen, anemia, or respiratory failure.

Pulmonary Hemosiderosis

A condition in which repeated bleeding into the lung's air sacs leaves iron deposits behind. It may cause cough, breathlessness, coughing blood, anemia, and low oxygen and can result from immune disease or other causes.

Pulmonary Histoplasmosis

Lung infection caused by breathing in spores of the Histoplasma fungus, often from soil contaminated by bird or bat droppings. It may cause no symptoms or a flu-like illness with cough, fever, and chest discomfort; severe or widespread illness is more likely with weakened immunity.

Pulmonary Hypertension

Abnormally high pressure in the pulmonary circulation, defined as a mean pulmonary arterial pressure above 20 mmHg at rest, measured by right-heart catheterization. It may result from left-heart disease, lung disease or hypoxia, chronic pulmonary-artery obstruction, pulmonary arterial disease, or other conditions. The cause determines its classification; persistent pressure elevation can strain the right ventricle.

Alternate Names:
PH; High Blood Pressure in the Lungs

Pulmonary Hypertension Classification

A clinical grouping based on cause: disease of the pulmonary arteries, left-sided heart disease, lung disease or low oxygen, chronic blood clots, or several other mechanisms. Identifying the group guides

testing and treatment because medicines useful for one group may be harmful in another.

Pulmonary Hypertension Due to Another Condition

Pulmonary hypertension associated with another condition, such as left-heart disease, lung disease or hypoxia, chronic blood clots, or systemic disease. Classification by cause guides evaluation and treatment.

Pulmonary Hypoplasia

Underdevelopment of one or both lungs, resulting in too little lung tissue for normal breathing. It may occur with congenital abnormalities, low amniotic fluid, or compression before birth.

Pulmonary Infarction

Death of a small area of lung tissue after its blood supply is blocked, usually by a pulmonary embolism. It may cause sharp pain with breathing, coughing up blood, breathlessness, or a shadow on imaging.

Pulmonary Infection

An infection of the lungs or lower respiratory tract caused by bacteria, viruses, fungi, or other organisms.

Pulmonary Langerhans Cell Histiocytosis

A rare lung disease strongly linked to cigarette smoking, in which unusual immune cells damage small airways and form lung cysts. It can cause cough, breathlessness, chest pain, or a collapsed lung. Disease activity may stabilize after smoking cessation; progressive disease may involve systemic treatment.

Alternate Names:
PLCH; Histiocytosis X of the Lung; Pulmonary Eosinophilic Granuloma

Pulmonary Lobes

The anatomical divisions of the lungs separated by interlobar fissures. The right lung has superior, middle, and inferior lobes; the left lung has superior and inferior lobes and a lingula.

Pulmonary Lymphangioleiomyomatosis

Alternate name; see *Lymphangioleiomyomatosis*.

Pulmonary Lymphangiomyomatosis

Alternate spelling for lymphangioleiomyomatosis, a rare cystic lung disease that mainly affects women and can cause progressive breathlessness, recurrent pneumothorax, chylous effusions, and abnormal growth of smooth-muscle-like cells.

Pulmonary Mass

A space-occupying lesion in or near the lung, which may represent infection, inflammation, benign growth, or cancer and requires appropriate imaging assessment.

Pulmonary Mucormycosis

An invasive lung infection caused by inhaled molds of the order Mucorales. It mainly affects people with weakened immune defenses or uncontrolled diabetes and can cause rapidly progressive pneumonia, invade blood vessels, destroy lung tissue, or spread to other organs.

Pulmonary Nocardiosis

A lung infection caused by Nocardia bacteria, usually affecting people with weakened immunity and sometimes spreading to the brain or skin.

Pulmonary Nodule

A small, rounded spot in the lung seen on imaging, measuring 3 cm or less. It may result from infection, inflammation, scarring, or a benign or cancerous growth.

Alternate Names:
Pulmonary Nodules

Pulmonary Oedema

Fluid collecting in lung tissue or air sacs, making breathing difficult and reducing oxygen transfer. It often results from heart failure but can also follow infection, toxins, kidney disease, or severe injury.

Pulmonary Reactance

A measure of how the stretch and movement of the

lungs and chest wall affect airflow during breathing. It is obtained during specialized tests and can help describe stiffness or altered movement of the respiratory system.

Pulmonary Regurgitation (Pulmonic Regurgitation)

Backward flow from the pulmonary artery into the right ventricle during diastole because the pulmonary valve does not close completely. Mild regurgitation may be asymptomatic, whereas severe or long-standing regurgitation can enlarge or weaken the right ventricle and cause exercise intolerance, arrhythmias, or right-sided heart failure.

Pulmonary Rehabilitation

A supervised, multidisciplinary program combining exercise training, education, behavioral support, and self-management for chronic respiratory disease. It improves exercise capacity, dyspnea, functional status, and quality of life.

Pulmonary-Renal Syndrome

A group of diseases that cause inflammation or bleeding in the lungs together with inflammation or injury in the kidneys. It is often associated with small-vessel vasculitis or another autoimmune disease.

Pulmonary Sequestration

A birth-related area of lung tissue that does not connect normally to the airways and receives blood from an unusual artery. It may cause repeated lung infections, cough, or breathing problems, although some cases cause no symptoms.

Pulmonary Stenosis

Narrowing that obstructs blood leaving the right ventricle on its way to the lungs, usually at the pulmonary valve. It is often congenital and increases right-ventricular pressure; severe disease may cause a murmur, fatigue, breathlessness, fainting, or right-heart failure.

Pulmonary Surfactant

A slippery mixture made by cells lining the lung's air sacs that reduces surface tension and helps keep the sacs open. Too little in premature babies can cause serious breathing difficulty.

Pulmonary Thrombectomy

The surgical or catheter-directed extraction of a blood clot from the pulmonary arterial bed to restore blood flow in massive pulmonary embolism; see *Thrombectomy*.

Pulmonary Thromboendarterectomy

Major surgery to remove old clots and scar tissue from the arteries of the lungs. It may improve or cure long-term clot-related high blood pressure in the lungs in selected people, but it carries serious surgical risks.

Alternate Names:
PTE; Pulmonary Endarterectomy; PEA

Pulmonary Trunk

The large vessel leaving the right ventricle that divides into the right and left pulmonary arteries.

Pulmonary Tuberculosis

Tuberculosis infection involving the lungs, caused by Mycobacterium tuberculosis. It may cause prolonged cough, fever, night sweats, weight loss, or coughing blood and can spread through the air.

Pulmonary Valve

A one-way valve between the right lower heart chamber and the artery leading to the lungs. It opens to let blood leave the heart and closes to prevent backward flow; narrowing or leakage can strain the right side of the heart.

Pulmonary Valve Insufficiency

Leakage of blood backward through the pulmonary valve into the right lower heart chamber while the heart relaxes. Mild leakage may cause no symptoms, but severe disease can enlarge the heart and reduce exercise ability.

Pulmonary Valve Regurgitation

Leakage through the pulmonary valve that allows

blood to flow back into the right lower heart chamber as the heart relaxes. Mild leakage may cause no symptoms; severe leakage can enlarge and weaken the right side of the heart.

Alternate Names:
Pulmonic Regurgitation; Pulmonary Incompetence; PR

Pulmonary Valve Stenosis

Alternate name; see *Pulmonic Valve Stenosis*.

Pulmonary Vascular Resistance

The opposition to blood flow through the lung blood vessels. High resistance makes the right side of the heart pump harder and can lead to high pressure in the lungs, right-heart enlargement, and heart failure.

Pulmonary Vasculitis

Inflammation of blood vessels in the lungs. It may affect tiny vessels around the air sacs and cause bleeding, breathlessness, or low oxygen. It often occurs as part of a blood-vessel disease that also affects other parts of the body. Symptoms depend on the vessels and organs involved.

Pulmonary Vasodilator Therapy

Treatment with medicines that widen blood vessels in the lungs and lower pressure on the right side of the heart. It is used for selected types of pulmonary hypertension after specialist testing because it may be harmful in other types.

Pulmonary Vein

One of the four large veins (superior and inferior left, superior and inferior right) that carry oxygen-rich blood from the capillary beds of the pulmonary alveoli back to the left atrium of the heart, representing an essential exception to the rule that veins carry deoxygenated blood.

Alternate Names:
Pulmonary Veins

Pulmonary Vein Isolation

A catheter procedure for selected people with atrial fibrillation. The clinician creates small areas of scar around the veins entering the upper heart chamber to block abnormal electrical signals. It can reduce episodes but may not cure them; bleeding, stroke, narrowing of a vein, or other complications are possible.

Alternate Names:
PVI; Antral Pulmonary Vein Isolation; AFib Catheter Ablation

Pulmonary Veins

Plural form; see *Pulmonary Vein*.

Pulmonary Veno-Occlusive Disease

A rare progressive disease in which small veins in the lungs become narrowed or blocked. Pressure then rises in the lung circulation, causing breathlessness and low oxygen; some medicines for pulmonary hypertension can trigger life-threatening fluid in the lungs.

Pulmonary Ventilation

The movement of air into and out of the lungs. It brings oxygen into the air sacs and removes carbon dioxide; inadequate ventilation can cause low oxygen or a buildup of carbon dioxide.

Pulmonary Ventilation/Perfusion Scan

An imaging test comparing air reaching different lung regions with blood flow through those regions. A mismatch may suggest a blood clot in the lung, while other patterns can indicate lung or blood-vessel disease.

Pulmonary Wedge Pressure

A pressure measured through a special catheter in a small lung artery to estimate the pressure in the left side of the heart. It helps assess fluid overload or heart failure in seriously ill patients.

Pulmonic Valve Stenosis

A narrowing or stiffening of the pulmonic valve, which controls blood flow from the heart's right lower chamber into the pulmonary artery leading to the lungs. This narrowing forces the heart to work harder to pump blood to the lungs. Typically

present from birth, mild cases may cause no symptoms, while more severe narrowing can lead to a heart murmur, shortness of breath during exertion, fatigue, chest discomfort, or swelling in the legs.

Pulmonologist

A pulmonologist is a physician specializing in diseases of the lungs and breathing system, including asthma, COPD, infections, and sleep-related breathing disorders.

Pulmonology

The medical specialty concerned with the lungs and breathing system. Pulmonologists diagnose and treat asthma, chronic lung disease, infections, sleep-related breathing disorders, and other respiratory conditions.

Pulp

The soft living tissue in the center of a tooth, containing nerves and blood vessels. It can become inflamed or infected after decay, cracks, or injury and may then require root-canal treatment or removal.

Pulp Canal

The pulp canal is the passage within a tooth root containing dental pulp, nerves, and blood vessels; infection may require root-canal treatment.

Pulp Disease

A problem affecting the living tissue inside a tooth, including inflammation, infection, loss of blood supply, or tissue death. It may cause toothache or sensitivity and can follow decay, a crack, a filling, or injury.

Pulpectomy

Complete removal of infected or damaged pulp from inside a tooth, usually a primary tooth. The space is cleaned and filled with a material that can safely resorb as the adult tooth develops.

Pulpitis

Inflammation of the dental pulp, usually caused by caries, trauma, cracks, or restorative treatment. Reversible pulpitis causes brief pain provoked by cold or sweet stimuli; irreversible pulpitis causes spontaneous or lingering pain and may progress to pulp necrosis, requiring endodontic treatment or extraction.

Pulposus

Relating to the nucleus pulposus, the gelatinous central portion of an intervertebral disk. Relating to the soft, jelly-like center of an intervertebral disk, which helps cushion spinal movement.

Pulpotomy

Removal of inflamed soft tissue from the crown of a baby tooth while keeping the root tissue alive. It treats suitable decay or injury and preserves the tooth until it naturally falls out.

Pulp Stone

A small area of hardened mineral inside the soft center of a tooth. It often causes no symptoms and is found on dental imaging, but it may complicate root-canal treatment if it blocks the canal.

Pulsatile Proptosis

An abnormal forward protrusion of the eyeball characterized by visible or palpable pulsations synchronous with the arterial pulse, classically accompanied by an audible orbital bruit. It is a cardinal sign of a direct carotid-cavernous fistula or congenital sphenoid wing dysplasia in neurofibromatosis type 1.

Pulsatile Tinnitus

A rhythmical acoustic sound perceived in one or both ears that beats synchronously with the patient's heartbeat, frequently signifying an underlying vascular anomaly such as dural arteriovenous fistula, internal carotid artery dissection, carotid stenosis, glomus jugulare tumor, or idiopathic intracranial hypertension.

Pulse

A pulse is the rhythmic expansion of an artery produced by each heartbeat; its rate, rhythm, strength,

and symmetry provide clues about circulation and cardiac function.

Pulse Examination

Checking arterial pulses for speed, regularity, strength, and equality on both sides. It helps assess blood flow, heart rhythm, circulation to limbs, and possible blockage or reduced blood supply.

Pulse Irregular

An irregular pulse has uneven timing or varying beats and may reflect premature beats, atrial fibrillation, other arrhythmias, or measurement variation.

Pulseless Disease

Takayasu arteritis, an inflammation of large arteries that can narrow or block blood flow. It may cause weak pulses, unequal blood pressure, limb pain, dizziness, vision problems, or organ damage.

Pulseless Electrical Activity

A cardiac-arrest state in which the electrocardiogram shows organized electrical activity but there is no palpable pulse or effective blood flow. The electrical pattern can resemble a rhythm that normally produces circulation; the absence of a pulse distinguishes pulseless electrical activity from a perfusing rhythm. It is classified as a non-shockable arrest rhythm.

Pulse Oximeter

A small device, often placed on a fingertip, that estimates blood oxygen and pulse rate using light. Movement, cold fingers, poor circulation, nail products, and device limitations can make the reading inaccurate.

Pulse Oximetry

A painless method of estimating blood oxygen with a light-based sensor, usually on a finger, toe, or ear. Accuracy varies with circulation, skin pigmentation, movement, and other factors.

Pulse Pressure

The systolic blood pressure minus the diastolic blood pressure. A widened or narrowed value may provide clues about circulation and is considered with the full blood-pressure reading and clinical context.

Pulse Rate

Pulse rate is the number of palpable arterial beats per minute and usually approximates heart rate, although some arrhythmias produce a pulse deficit.

Pulsus

A term used in medicine to describe the pulse and named patterns of arterial beats. The pattern may provide clues about heart rhythm, pumping strength, blood-vessel resistance, breathing, or circulation.

Pulsus Alternans

A pulse rhythm where strong and weak beats alternate back and forth, showing that the main heart pump is weak and struggling.

Pulsus Bisferiens

A pulse with two distinct peaks during each heartbeat. It may occur with certain severe aortic-valve disorders or hypertrophic obstructive cardiomyopathy and requires interpretation with other examination findings.

Alternate Names:
Biphasic Pulse; Bisferious Pulse

Pulsus Paradoxus

An unusually large drop in blood pressure during breathing in, usually more than 10 millimeters of mercury. It can occur when the heart is compressed by fluid, or during severe asthma, chronic lung disease, or other heart conditions.

Pulsus Parvus et Tardus

A weak, slow-rising pulse in the neck. It may occur with severe narrowing of the aortic valve but is not specific and can accompany other findings of heart disease.

Alternate Names:

Anacrotic Pulse; Slow-Rising Arterial Pulse

Pulvinar

A region at the back of the thalamus, a deep brain structure. It helps direct visual attention, combine sensory information, and communicate with areas of the cerebral cortex.

Pumice

A porous volcanic stone used as an abrasive; excessive dust inhalation can irritate the lungs.

Pump Failure

Inability of the heart to pump enough blood to meet the body's needs. It may cause breathlessness, fatigue, fluid buildup, or low blood pressure; the cause and severity determine treatment.

Alternate Names:
Acute Ventricular Failure

Pump Lung

An older occupational term for byssinosis, a work-related airway disease caused by inhalation of cotton, flax, or hemp dust. Symptoms may include chest tightness, cough, wheezing, and breathlessness that worsen during or after workplace exposure.

Pump-Oxygenator

The part of a heart-lung machine that moves blood and adds oxygen while removing carbon dioxide during some heart operations. It temporarily replaces the pumping and gas-exchange work of the heart and lungs. Use can be associated with bleeding, inflammation, clots, or organ complications.

Punch Biopsy

A dermatological procedure in which a circular, hollow blade instrument is rotated through the skin into the subcutaneous fat to obtain a full-thickness cylindrical specimen of skin tissue for histopathological examination.

Alternate Names:
Punch Biopsy

Punctal Occlusion

Partial or complete blocking of the small tear-drain openings near the inner eyelids, often with plugs or a procedure, to keep tears on the eye surface. It may help selected people with dry eye; watering, irritation, or infection can occur.

Punctate

Made up of, or marked by, small spots, dots, or points. The term describes appearance and does not by itself identify a diagnosis.

Punctate Palmoplantar Keratoderma

An inherited condition causing many small, hard areas of thickened skin on the palms and soles. It often begins in adolescence or adulthood and can make walking or using the hands painful; rarely, a skin cancer develops.

Puncture

A small hole or wound made by a pointed object, needle, bite, or sharp instrument. A puncture may be intentional for an injection or sample, or accidental and may carry infection, bleeding, or deeper injury risks.

Puncture Biopsy

Alternate name; see *Needle Biopsy*.

Puncture Wound

A wound produced when a pointed object penetrates the skin and underlying tissue, creating a small surface opening with potentially deep tissue damage and infection risk.

Pungent

Describes a strong, sharp smell or taste that may irritate the nose, mouth, eyes, or other moist linings.

Punicic Acid

A conjugated polyunsaturated fatty acid found mainly in pomegranate seed oil and studied for lipid and inflammatory effects; clinical supplement benefits remain uncertain.

Punishment

Punishment is a consequence intended to reduce a behavior; in healthcare, coercive or harmful punishment is inappropriate and behavior support should prioritize safety and dignity.

Pupil

The central opening in the colored iris through which light enters the eye. Muscles change its size to control incoming light, and unequal or poorly reactive pupils may indicate eye or nerve disease.

Pupillary

Relating to the pupil, the opening in the iris that controls how much light enters the eye. The pupil normally becomes smaller in bright light and larger in dim light; unequal size or poor reaction can indicate an eye, nerve, or brain problem.

Pupillary Light Reflex

The normal narrowing of the pupil when light enters the eye. It tests the eye, optic nerve, brain pathways, and nerves that control the pupil.

Pure Cutaneous Histiocytosis

A rare disorder in which abnormal histiocytes accumulate in the skin without recognized internal-organ involvement. It can produce papules, nodules, or plaques and must be distinguished from systemic histiocytic disease.

Pure Red Cell Aplasia

A rare disorder in which the bone marrow stops making red blood cells while other blood cells may remain normal. It causes severe anemia, tiredness, breathlessness, and pale skin and may be inherited or acquired from infection, immune disease, cancer, or medicines.

Alternate Names:
PRCA; Erythroblastopenia

Pure Tone Audiometry

A hearing test in which a person signals whenever they hear tones of different pitches and loudness. It measures the quietest sounds detectable through air and bone and helps identify the type and degree of hearing loss.

Pure-Tone Audiometry

A hearing test that measures the softest tones a person can hear at selected frequencies through air and bone conduction. The results are plotted on an audiogram and help distinguish conductive from sensorineural hearing loss.

Alternate Names:
Pure-Tone Threshold Audiometry; Pure-Tone Hearing Test

Purgative

A strong laxative that causes rapid emptying of the bowel. It may be used for bowel preparation before some procedures, but excessive use can cause diarrhea, dehydration, and dangerous changes in body salts.

Purge

To empty the bowel, stomach, or body of a substance; the term may also mean forceful vomiting or diarrhea.

Purging

Deliberate behaviors intended to compensate for eating, such as self-induced vomiting or misuse of laxatives, diuretics, or excessive exercise.

Purging Disorder

Repeated self-induced vomiting or misuse of laxatives, diuretics, or other methods to influence weight or body shape without recurrent binge eating. It can cause dangerous salt disturbances, tooth damage, dehydration, heart-rhythm problems, and tears in the food pipe.

Purine

A heterocyclic aromatic organic compound composed of fused pyrimidine and imidazole rings that serves as the biochemical backbone for adenine and guanine in DNA, RNA, ATP, and coenzymes. Catabolism of purines in humans proceeds through xanthine oxidase to yield uric acid; excess accumulation or impaired renal excretion of uric acid

causes hyperuricemia, leading to gouty arthritis and nephrolithiasis.

Alternate Names:
Purines

Purine Nucleosides

Molecules made from a purine base, such as adenine or guanine, joined to a sugar. Examples include adenosine and guanosine, which help form genetic material and participate in cell energy and signaling.

Purine Nucleotides

Molecules containing adenine or guanine joined to a sugar and phosphate groups. They build DNA and RNA and include ATP and GTP, which store energy and help transmit signals inside cells.

Purines

Plural form; see *Purine*.

Purinoceptor

A protein on a cell's surface that detects substances such as ATP, ADP, or adenosine outside the cell. It helps regulate cell communication, inflammation, blood-vessel activity, and other body responses.

Purkinje Cell

A major nerve cell in the cerebellum, the brain region that coordinates movement and balance. It sends signals that help fine-tune posture, coordination, and learned movements.

Purkinje Fibers

Special electrical fibers spread through the lower chambers of the heart. They rapidly carry each heartbeat's signal so the ventricles contract together and pump blood efficiently.

Purkinje Fibres

Specialized heart-muscle fibers that rapidly spread electrical signals through the ventricles. Their coordinated activity helps the lower chambers contract together and pump blood efficiently to the lungs and body.

Purpura

Red, purple, or brown spots or patches caused by blood leaking under the skin or the moist lining of the mouth. They do not fade when pressed. Causes include low platelet counts, blood-clotting problems, fragile blood vessels, or inflammation of small blood vessels.

Purpura Fulminans

A rapidly worsening, life-threatening condition in which widespread blood clots and clotting-system failure cause purple skin patches, bleeding, and tissue death. It can follow severe infection, loss of natural anticoagulants, or another serious illness.

Purpura Hemorrhagica ITP

Alternate name; see *Immune Thrombocytopenia*.

Purpuric Spots

Alternate name; see *Purpura*.

Pursed-Lip Breathing

A way to breathe out slowly through nearly closed lips, as if gently whistling. It may help slow breathing and ease shortness of breath in some people with lung disease.

Purse-lip Respiration

Alternate name; see *Pursed-Lip Breathing*.

Purulent

Containing or producing pus, a thick fluid made of immune cells, dead tissue, and often germs. Purulent drainage can occur in an abscess or infected wound, but its appearance alone does not identify the organism or the treatment needed.

Purulent Pericarditis

A serious bacterial infection of the sac around the heart, causing pus and fluid to collect there. Fever, chest pain, breathlessness, and pressure on the heart may occur; treatment commonly includes drainage and antibiotics.

Pus

A thick fluid made of dead cells, germs, immune cells, and damaged tissue. It commonly collects during infection and may appear in wounds, abscesses, infected organs, or other inflamed body spaces.

Push Enteroscopy

An examination of the upper small intestine using a long flexible camera passed through the mouth. It allows clinicians to see the lining, take samples, stop bleeding, or treat selected lesions.

Pustular Psoriasis

A group of inflammatory skin diseases marked by visible, sterile pustules on reddened skin. Forms include generalized pustular psoriasis, which affects widespread skin, and palmoplantar pustulosis, which mainly affects the palms and soles.

Pustule

A small, circumscribed, elevated skin lesion (< 1.0 cm in diameter) containing purulent exudate (pus) composed of necrotic inflammatory cells, fluid, and cellular debris within the epidermis or hair follicle. Pustules may be infectious (e.g., bacterial folliculitis, candidiasis, herpes simplex) or sterile/autoimmune (e.g., pustular psoriasis, subcorneal pustular dermatosis).

Alternate Names:
Pustules

Pustules

Plural form; see *Pustule*.

Pustulosis

A skin disorder characterized by sterile or infectious pustules, which may be localized or widespread and associated with inflammation, fever, psoriasis, drug reactions, or infection.

Putamen

A deep brain structure that helps select and smooth purposeful movements and supports learning of repeated movement habits. Damage to it can cause abnormal movements, weakness, or changes in behavior.

Putrefaction

Decomposition of body tissues after death caused mainly by bacteria and natural enzymes. It can produce color changes, swollen tissues from gas, visible veins, a strong odor, and gradual breakdown into liquid material; the rate depends on the environment.

Putrescine

A chemical with a strong unpleasant smell made when proteins break down. It is found in decaying material and is also produced in small amounts during normal cell processes; its presence alone does not diagnose disease.

PUVA

A light treatment that combines a light-sensitizing medicine called psoralen with ultraviolet-A exposure. It can treat selected skin diseases but may cause burns, eye injury, premature skin aging, and increased skin-cancer risk.

PVC

A premature ventricular contraction is an early heartbeat arising in a ventricle; occasional PVCs are common, while frequent or symptomatic beats can be associated with underlying heart disease.

PVD

Alternate name; see *Peripheral Artery Disease*.

PVD (Peripheral Vascular Disease)

Alternate name; see *Peripheral Vascular Disease*.

PVI

Alternate name; see *Pulmonary Vein Isolation*.

PVPS

Alternate name; see *Post-Vasectomy Pain Syndrome*.

P Wave

The first small wave on an ECG, showing the elec-

trical activation of the heart's upper chambers. Its shape and timing can help identify abnormal heart rhythms, enlargement of a chamber, or problems with electrical conduction.

Pyarthrosis

Infection of a joint with pus in the joint space, usually bacterial septic arthritis, causing acute pain, swelling, restricted movement, fever, and risk of cartilage destruction.

Pycnodysostosis

A rare inherited bone disorder in which bones are unusually dense but fragile. It can cause short stature, frequent fractures, short fingers, delayed closure of skull bones, crowded teeth, and problems with the jaw.

Pyelitis

Inflammation of the renal pelvis, the funnel-shaped part of the kidney that drains urine. It is often associated with urinary infection and may cause flank pain, fever, or painful urination.

Pyelo

Pyelo is an informal shortening usually referring to pyelonephritis, an infection of the kidney and renal pelvis that can cause fever and flank pain.

Pyelogram

An image of the kidney drainage area and ureters after contrast material is given. It can show blockage, stones, narrowing, leaks, or structural changes in the urinary collecting system.

Pyelography

Imaging of the renal pelvis and ureters using contrast, by X-ray or another imaging method. It can show obstruction, stones, leaks, strictures, or structural abnormalities.

Pyelolithotomy

Surgical removal of a kidney stone through an incision into the renal pelvis. Less invasive stone treatments are often preferred when suitable.

Pyelonephritis

A bacterial infection of one or both kidneys. It often starts as a bladder infection that spreads up to a kidney. It can cause fever, chills, pain in the side or back, nausea or vomiting, and burning or frequent urination.

Pyelotomy

An incision into the renal pelvis, usually made to remove an obstruction or kidney stone.

Pylephlebitis

An infected blood clot in the large vein carrying blood from the abdominal organs to the liver. It may follow appendicitis, diverticulitis, or another abdominal infection and can cause fever, abdominal pain, jaundice, and life-threatening sepsis.

Pyloric Antrum

The pyloric antrum is the lower stomach region that grinds food and regulates its passage toward the pyloric canal and duodenum.

Pyloric Canal

The narrow passage between the pyloric antrum and the pyloric sphincter. It carries stomach contents toward the duodenum.

Pyloric Sphincter

A ring of muscle at the outlet of the stomach. It opens in a controlled way to let partly digested food enter the first part of the small intestine and helps prevent the intestine's contents from flowing backward.

Alternate Names:
Pyloric Valve; Gastric Pylorus

Pyloric Stenosis

Narrowing of the outlet between the stomach and small intestine. In infants, the usual form is thickening of the outlet muscle, causing progressively forceful, non-green vomiting. In adults, narrowing is usually acquired, for example from ulcer scarring or a tumor. It can prevent food from leaving the stomach and cause dehydration.

Pyloric Stenosis In Infants

Alternate name; see *Hypertrophic Pyloric Stenosis*.

Pyloroplasty

Surgery to widen the pylorus, the outlet of the stomach, to improve passage of stomach contents. It may be used with treatment for obstruction or selected gastric-motility disorders.

Pylorus

The distal part of the stomach leading into the duodenum.

Pyoderma

A bacterial infection of the skin that can produce pus-filled spots, crusts, open sores, or deeper inflammation. Staphylococcus and Streptococcus are common causes; infection can spread, particularly with fever, pain, or rapidly worsening redness.

Pyoderma Gangrenosum

A rare inflammatory skin disease that causes very painful ulcers, often with a dark purple edge. It may occur with bowel inflammation, arthritis, or blood disorders; injury can make it worse, so treatment differs from ordinary wound infection.

Pyogenesis

The formation of pus, a thick fluid made mainly of immune cells, dead tissue, and germs. It commonly occurs during bacterial infection or severe inflammation.

Pyogenic

Producing pus or associated with a pus-forming infection. Pyogenic infections commonly cause redness, warmth, swelling, pain, and a collection of pus, although the cause and treatment vary.

Pyogenic Granuloma

A common benign vascular proliferation (lobular capillary hemangioma) of the skin or mucous membranes that arises rapidly following minor trauma or during pregnancy ('pregnancy tumor' / granuloma gravidarum), presenting as an erythematous, smooth or lobulated, pedunculated or sessile vascular papule prone to profuse bleeding.

Alternate Names:
Lobular Capillary Hemangioma; Granuloma Gravidarum

Pyogenic Granuloma (Lobular Capillary Hemangioma)

A rapidly growing, benign vascular nodule of skin or mucosa that often follows minor trauma or occurs during pregnancy. It is bright red, friable, and prone to bleeding; treatment may include curettage, cautery, excision, or other local therapy.

Pyogenic Liver Abscess

A pyogenic liver abscess is a pus-filled infection in the liver, usually from biliary, abdominal, or bloodstream spread, causing fever, pain, and possible sepsis.

Pyometra

A collection of pus inside the uterus, usually caused by infection combined with blockage of drainage through the cervix. It may cause lower abdominal pain, fever, tenderness, or foul-smelling discharge; in older adults it can be linked to cervical narrowing or a tumor.

Pyonephrosis

Pus within the kidney's urine-collecting system, usually associated with urinary obstruction and infection. The collecting system may be dilated, and infection can extend into kidney tissue or the bloodstream. It is distinct from uncomplicated hydronephrosis, which is dilation of the collecting system without pus. Flank pain, fever, and systemic infection may occur.

Pyosalpinx

A fallopian tube that is swollen and filled with pus, usually as a complication of pelvic inflammatory disease. It may cause pelvic pain, fever, or unusual vaginal discharge, although symptoms vary. Unlike hydrosalpinx, which contains non-purulent fluid, pyosalpinx reflects infection and can damage the tube or extend into nearby tissues.

Pyostomatitis Vegetans

A rare inflammatory mouth condition causing many small yellowish pus-filled spots on red, swollen tissue, especially the inner cheeks and gums. It is strongly associated with inflammatory bowel disease and may appear before bowel symptoms.

Pyramid

A structure shaped like a pyramid. In the brain, the medullary pyramids contain nerve fibers that carry movement commands from the brain to the spinal cord; other pyramids include pyramid-shaped areas in the kidney.

Pyramidal Cell

A triangular-shaped excitatory neuron with a prominent apical dendrite, found especially in the cerebral cortex and hippocampus and involved in long-range brain signaling.

Pyramidal Tract

A major upper motor neuron descending pathway originating primarily from the precentral primary motor cortex (Brodmann area 4) and premotor areas, traversing the internal capsule, cerebral peduncles, and medullary pyramids to synapse onto lower motor neurons in the brainstem (corticobulbar tract) and spinal cord (corticospinal tract). Mediating voluntary, skilled, and fine motor movements, decussation occurs in the lower medulla; upper motor neuron lesions within the tract produce spasticity, hyperreflexia, muscle weakness, and a positive Babinski sign.

Alternate Names:
Pyramidal Tracts; Corticospinal Tract

Pyramidal Tracts

Plural form; see *Pyramidal Tract*.

Pyrazinamide

An antibiotic used with other medicines during the initial treatment of tuberculosis. It helps shorten treatment but can injure the liver or raise uric acid, so monitoring and prescribed dosing are important.

Pyrazines

A family of chemical compounds found naturally in some foods and used in flavors, medicines, and industry. Their effects on health depend on the specific compound, amount, and route of exposure.

Pyrazole

A five-membered heterocyclic organic ring compound containing two adjacent nitrogen atoms and three carbon atoms. The pyrazole ring system serves as a prominent pharmacophore in medicinal chemistry, forming the core structural foundation for nonsteroidal anti-inflammatory drugs (e.g., celecoxib), analgesics (e.g., metamizole), and target-directed kinase inhibitors.

Alternate Names:
Pyrazoles

Pyrazoles

Plural form; see *Pyrazole*.

Pyrenochaeta

A group of fungi found mainly in soil and plants that rarely infect people. When infection occurs, it usually affects tissue beneath injured skin or people with weakened immunity.

Pyrethrins

Natural insect-killing chemicals derived from chrysanthemum flowers and used in some pest-control products. Exposure can irritate skin and airways and, in large amounts, may cause vomiting, tremors, seizures, or breathing problems.

Pyrethrum

The dried flower heads of certain Chrysanthemum species, used as a natural source of pyrethrins, insecticidal compounds that affect insect sodium channels. Pyrethrum and pyrethrins differ from synthetic pyrethroids; exposure may irritate the skin or airways and can cause toxicity with substantial exposure.

Pyrexia

Alternate medical name; see *Fever*.

Pyrexia Of Unknown Origin In A Hemodialysis Patient

Descriptive phrase for unexplained fever in a person receiving hemodialysis, not a separate disease. Infection of the dialysis access or bloodstream is an important possibility, but other causes must also be considered; see *Fever Of Unknown Origin*.

Pyridine

A nitrogen-containing ring-shaped chemical structure found in many medicines, vitamins, and biologically active substances. Pyridine groups can change how compounds dissolve, react, travel through the body, and produce medical effects.

Pyridostigmine

A medicine that increases acetylcholine, a chemical helping nerves activate muscles. It mainly treats myasthenia gravis and may cause stomach cramps, diarrhea, sweating, increased saliva, muscle twitching, or slow heartbeat.

Pyridostigmine Bromide

Pyridostigmine bromide increases communication between nerves and muscles and is used mainly for myasthenia gravis; it may cause abdominal cramps, diarrhea, or excess secretions.

Pyridoxal Phosphate

The active form of vitamin B6 used by many enzymes. It helps the body process amino acids, make certain brain chemicals and red blood cells, and maintain normal nerve function.

Pyridoxine

One form of vitamin B6, converted in the body to pyridoxal phosphate, a coenzyme for amino-acid metabolism. It is needed for processing food, making red blood cells, and supporting nerves and the immune system; deficiency can cause anemia or nerve problems, while excessive supplements can damage nerves.

Alternate Names:
Vitamin B6

Pyridoxine Deficiency

Deficiency of vitamin B6, which is needed for amino-acid metabolism, neurotransmitter synthesis, hemoglobin production, and normal nerve function. It may cause dermatitis, glossitis, anemia, seizures, neuropathy, or immune dysfunction.

Pyrimethamine

A parasite-fighting medicine that blocks folate use in certain protozoa. It is used for selected infections, often with another medicine, and can suppress bone marrow or cause serious skin reactions.

Pyrimidine

A six-membered aromatic heterocyclic organic compound containing two nitrogen atoms at positions 1 and 3 of the ring. Pyrimidines constitute the essential nitrogenous bases cytosine, thymine, and uracil in DNA and RNA. De novo synthesis begins with carbamoyl phosphate and aspartate; antimetabolite chemotherapeutics (e.g., 5-fluorouracil, capecitabine, gemcitabine) act by inhibiting pyrimidine nucleotide biosynthesis and incorporation into nucleic acids.

Alternate Names:
Pyrimidines

Pyrimidine Analog

A medicine or chemical resembling a pyrimidine nucleotide that can interfere with DNA or RNA synthesis, often for cancer or antiviral treatment.

Pyrimidine Dimer

A DNA lesion formed when adjacent pyrimidine bases bond abnormally after ultraviolet exposure, potentially causing mutations if unrepaired.

Pyrimidine Nucleosides

Nucleosides containing cytosine, thymine, or uracil bases linked to a sugar, serving as components or precursors of DNA and RNA.

Pyrimidine Nucleotides

Genetic and energy-related building blocks containing pyrimidine bases, including cytidine, uridine,

and thymidine. Cells use them to make DNA, RNA, cell membranes, and other substances needed for growth and repair.

Pyrimidines

Plural form; see *Pyrimidine*.

Pyrogen

A pyrogen is a substance that induces fever, commonly through immune signaling; bacterial endotoxin is an important example in contaminated medicines or fluids.

Pyroglyphidae

Pyroglyphidae is a mite family that includes house-dust mites whose allergens can trigger allergic rhinitis, asthma, or atopic dermatitis.

Pyromania

A mental disorder involving recurrent deliberate fire-setting, mounting tension or arousal before the act, and pleasure, gratification, or relief afterward, without a primary external motive such as financial gain, revenge, concealment of a crime, or political purpose. The behavior is not better explained by conduct disorder, mania, psychosis, or substance use.

Pyrophosphatase

An enzyme that breaks inorganic pyrophosphate into phosphate, helping drive many cellular chemical reactions forward.

Pyropoikilocytosis

A rare inherited disorder that makes red blood cells unusually small, irregular, and fragile. The cells break down easily, causing hemolytic anemia with tiredness, jaundice, pale skin, or an enlarged spleen, often beginning in infancy or childhood.

Pyroptosis

A form of controlled cell death that causes inflammation. The cell swells, breaks open, and releases signals that alert the immune system, often in response to infection or severe cell stress.

Pyrosequencing

A laboratory method for reading selected DNA sequences by detecting light produced as DNA building blocks are added. It can identify some genetic changes or microbes but is not suitable for every sequencing need.

Pyrosis

Alternate medical name; see *Heartburn*.

Pyrroles

A group of five-membered nitrogen-containing ring compounds found in heme, bile pigments, medicines, and other biologically active molecules.

Pyrrolidonecarboxylic Acid

A cyclic amino-acid derivative, also called pyroglutamic acid, found in proteins and metabolic pathways; abnormal accumulation may occur in selected metabolic or medication-related conditions.

Alternate Names:
Pyroglutamic Acid

Pyrrolnitrin

Pyrrolnitrin is an antimicrobial compound produced by some bacteria and studied for antifungal activity and biological control.

Pyruvate

A small molecule produced when cells break down glucose. Cells can use it to make more energy, convert it into other substances, or produce lactate when oxygen or energy-processing pathways are limited.

Pyruvate Carboxylase Deficiency

An inherited disorder caused by deficient pyruvate carboxylase, an enzyme needed for gluconeogenesis and other metabolic pathways. It can cause lactic acidosis, low blood glucose, poor growth, seizures, abnormal movements, developmental impairment, or liver failure.

Pyruvate Decarboxylase

Pyruvate decarboxylase is an enzyme that converts

pyruvate to acetaldehyde and carbon dioxide during fermentation in some organisms.

Pyruvate Dehydrogenase

An enzyme complex that changes pyruvate, made when cells break down sugar, into acetyl-CoA for energy production. Inherited deficiency can cause excess lactic acid, poor growth, developmental problems, or neurologic disease.

Pyruvate Dehydrogenase Complex Deficiency (PDCD)

An inherited disorder in which the pyruvate dehydrogenase complex cannot efficiently convert pyruvate into acetyl-CoA. It may cause lactic acidosis, poor growth, developmental impairment, seizures, low muscle tone, ataxia, or other neurologic disease.

Pyruvate Kinase

An enzyme that helps red blood cells make energy from glucose. If it is inheritedly deficient, red cells may break down too early, causing chronic hemolytic anemia, jaundice, gallstones, tiredness, or an enlarged spleen.

Pyruvate Kinase Blood Test

A pyruvate kinase blood test measures the enzyme in red blood cells and may help evaluate pyruvate kinase deficiency, an inherited cause of hemolytic anemia.

Pyruvate Kinase Deficiency

A rare inherited condition in which red blood cells cannot make enough energy and break down early. It causes anemia of varying severity, jaundice, tiredness, gallstones, an enlarged spleen, and sometimes excess iron in the body.

Pyuria

Presence of white blood cells or pus in urine, often indicating urinary-tract inflammation or infection.

PYY

Peptide YY is a hormone released by the intestine after eating. It helps signal fullness and slows movement of food through the digestive tract; abnormal signaling is being studied in obesity and other metabolic disorders.

Q

22q11.2 Deletion Syndrome

A genetic condition caused by a missing piece of chromosome 22. It may cause heart defects, palate problems, reduced immune defenses, low calcium, distinctive facial features, learning or developmental difficulties, and increased risk of mental illness. The effects differ widely between people.

Alternate Names:
DiGeorge Syndrome Spectrum; Velocardiofacial Syndrome (VCFS); Shprintzen Syndrome; 22q11.2DS

Q Angle

The angle between a line from the anterior superior iliac spine to the center of the patella and a line from the patella to the tibial tubercle. It is used to describe knee alignment, but its measurement and value for predicting patellofemoral pain or instability are debated.

Alternate Names:
Quadriceps Angle

Q-Angle Measurement

See *Q Angle*.

Q Arm Of A Chromosome

The longer arm of a chromosome, identified by the letter q. A genetic report may use this label to show where a gene change or missing, extra, or rearranged DNA segment is located.

Q-Banding

A laboratory staining method that creates bright and dim bands on chromosomes when viewed under ultraviolet light. The pattern helps show chromosome structure and some rearrangements.

Q Fever

A bacterial infection caused by *Coxiella burnetii*, typically transmitted to humans by inhaling dust contaminated with birth fluids, urine, milk, or droppings from infected farm animals such as sheep, goats, and cattle. Acute infection commonly causes a sudden flu-like illness with high fever, severe headache, fatigue, chills, and chest or muscle pain, and can lead to pneumonia or hepatitis. A small percentage of people develop a chronic form of the infection, which can cause serious heart valve inflammation (endocarditis) years later, especially in those with preexisting heart valve problems.

Alternate Names:
Query Fever; Coxiellosis; Australian Q Fever

QRS Axis

The general direction of the heart's electrical signal as the lower chambers contract, measured on an electrocardiogram. A shifted direction can occur with changes in the heart muscle, conduction system, or strain on the heart.

QRS Complex

The group of waves on an electrocardiogram showing the electrical signal that makes the heart's lower chambers contract. An unusually wide or shaped complex may indicate a conduction problem, abnormal rhythm, or electrolyte disturbance.

QRS Duration

The time taken for the electrical signal to spread through the heart's lower chambers, measured on

an electrocardiogram. A longer-than-usual time can occur with a conduction problem or an abnormal rhythm.

Q-Switch Laser

A laser that stores energy before releasing it in brief, high-power pulses. It is used to remove tattoo pigment and treat some pigmented skin lesions; specialized Q-switched lasers are also used in eye procedures.

QTc Dispersion

The difference between the longest and shortest heart-rate-corrected QT intervals across the leads of an electrocardiogram. It has been used to estimate differences in ventricular recovery across the heart, but measurement reliability and clinical value are limited.

Alternate Names:
Interlead QT Dispersion

QT Interval

The time on an electrocardiogram representing electrical activation and recovery of the heart's lower chambers. Because heart rate changes this time, clinicians often use a corrected value when assessing rhythm risk.

QT Prolongation

An unusually long QT interval on an electrocardiogram. It may result from an inherited condition, a medicine, or abnormal body salts and can increase the risk of a rapid, dangerous rhythm that may cause fainting or cardiac arrest.

Quadrant

One of four sections used to describe a location, especially in the abdomen. The four abdominal quadrants help clinicians record where pain, tenderness, a lump, or another finding is located.

Quadrantanopia

Loss of vision in one quarter of the normal visual field, often from damage to the brain pathways carrying sight. The missing area may occur on the same side in both eyes and can affect reading, driving, walking, or safety.

Quadrantectomy

Surgery to remove one section of an organ, most often part of the breast containing a tumor plus a margin of healthy tissue. Lymph-node surgery or additional treatment may depend on tumor features and test results.

Quadrate Lobe

An area on the underside of the liver between the gallbladder fossa and the fissure for the round ligament. It lies in front of the porta hepatis and corresponds mainly to segment IVb of the functional left liver.

Alternate Names:
Lobus Quadratus Hepatis

Quadratus Femoris

A small muscle deep in the buttock that turns the thigh outward and helps draw it toward the body.

Quadratus Lumborum

A muscle along the back of the abdomen that bends the body to one side and helps steady the lowest rib during breathing.

Quadratus Plantae

A deep muscle in the sole of the foot that helps the long toe-flexing muscle pull the toes straight downward.

Alternate Names:
Flexor Accessorius

Quadriceps

The group of four muscles at the front of the thigh (rectus femoris, vastus lateralis, vastus medialis, and vastus intermedius), also called the quadriceps femoris. They straighten the knee; the rectus femoris also helps bend the hip.

Alternate Names:
Quadriceps Muscles Quadriceps Femoris Quadriceps Femoris Muscle

Quadriceps Active Test

A knee examination used to look for injury to the posterior cruciate ligament. The person tightens the thigh muscle while the knee is bent, and forward movement of a previously sagging shinbone may support the finding. The test does not confirm a tear by itself.

Alternate Names:
Active Quadriceps Drawer Test; PCL Active Contraction Sign

Quadriceps Contusion

A bruise to the muscles at the front of the thigh, usually caused by a direct blow. It can cause pain, swelling, bleeding within the muscle, and difficulty bending the knee.

Quadriceps Injury

Damage to the quadriceps muscle or tendon caused by sudden force, overuse, or direct trauma. It may cause front-of-thigh pain, bruising, weakness, or difficulty extending the knee. Severe pain, a visible or felt gap, or inability to bear weight may occur with a major tear.

Quadriceps Tendinopathy

Overuse-related pain and changes in the tendon connecting the quadriceps muscles to the kneecap. Pain is usually felt just above the kneecap and may worsen with jumping, running, or straightening the knee against resistance.

Quadriceps Tendon Rupture

A tear of the tendon connecting the quadriceps muscles to the top of the kneecap. A complete tear can cause a gap above the kneecap and prevent active knee straightening; it often follows a fall or sudden force on a bent knee.

Alternate Names:
Suprapatellar Tendon Rupture

Quadriceps Tendon Ruptures

Plural form; see *Quadriceps Tendon Rupture*.

Quadrigeminal Cistern

A cerebrospinal fluid space around the upper back part of the midbrain, beneath the back of the corpus callosum. It contains deep cerebral veins and lies next to the ambient cisterns.

Alternate Names:
Cisterna Quadrigeminalis

Quadrigeminal Plate

The dorsal roof (tectum) of the midbrain bearing four rounded sensory eminences: the paired superior colliculi (visual reflexes and saccadic eye movements) and inferior colliculi (auditory relay processing).

Alternate Names:
Tectal Plate; Lamina Tecti

Quadrilateral Space Syndrome

A neurovascular compression syndrome caused by entrapment of the axillary nerve and posterior circumflex humeral artery within the quadrilateral space (bounded by teres minor, teres major, long head of triceps, and humerus), presenting with posterior shoulder ache, paresthesias over the lateral shoulder, and deltoid weakness.

Alternate Names:
Quadrangular Space Syndrome; Axillary Nerve Compression Syndrome

Quadriparesis

Weakness affecting both arms and both legs. It may result from disease or injury to the neck spinal cord, brain, nerves, or muscles and can impair movement, breathing, and bladder or bowel control.

Quadriplegia

Paralysis affecting both arms and both legs, usually with weakness of the trunk, because of damage to the cervical spinal cord or another major nervous-system injury. It can impair breathing and bladder or bowel control.

Alternate Names:
Tetraplegia

Quadruple Screen Test

See *Quad Screen*.

Quadruplet Pregnancy

A pregnancy involving four fetuses. It has increased risks of preterm birth, restricted fetal growth, high blood pressure, metabolic problems, and illness in the pregnant person.

Quad Screen

A second-trimester maternal blood screening test measuring alpha-fetoprotein, human chorionic gonadotropin, unconjugated estriol, and inhibin A. It estimates the chance of trisomy 21, trisomy 18, and open neural-tube defects; it is a screening test, not a diagnosis.

Alternate Names:
Quadruple Marker Test

Qualitative HCG Blood Test

A blood test that detects whether human chorionic gonadotropin (hCG) is present. It is commonly used to test for pregnancy but does not measure the hormone level.

Alternate Names:
Qualitative Serum Pregnancy Test; Blood hCG Screen; Qualitative Beta-hCG

Quality-Adjusted Life Year

A measure of health that combines length of life with health-related quality of life. One year in perfect health equals one quality-adjusted life year; the measure is used to compare health outcomes and treatments.

Alternate Names:
QALY

Quality Of Life

A person's experience of physical health, emotional well-being, relationships, independence, and ability to do meaningful activities. Illness and treatment may affect these areas differently for each person.

Quantitative Bence-Jones Protein Test

A urine test measuring abnormal light-chain proteins made by some plasma-cell cancers. It can help diagnose or monitor disorders such as multiple myeloma, but results are interpreted with blood tests and other findings.

Quantitative Computed Tomography

A CT scan that measures bone density while showing bone structure. It can help assess osteoporosis, unusual bone loss, or fracture risk when standard bone-density testing is unsuitable or more detail is needed.

Quantitative HCG Blood Test

A blood test that measures the amount of human chorionic gonadotropin (hCG). It can help assess early pregnancy, possible ectopic pregnancy or miscarriage, and some pregnancy-related or germ-cell tumors.

Alternate Names:
Quantitative Beta-hCG; Serum hCG Level

Quantitative Immunoglobulins

A blood test measuring the main classes of antibodies. Low levels may suggest an immune deficiency, while high or uneven levels may occur with infection, inflammation, liver disease, or some blood cancers; findings are interpreted with other clinical information.

Quantitative Nephelometry Test

A laboratory test that estimates the amount of selected proteins by measuring how much light they scatter. It can measure antibodies, complement proteins, and other proteins involved in immune, kidney, or blood disorders.

Quantitative PET

Analysis of a PET scan that estimates how much radioactive tracer is taken up by tissue. Standardized measurements can help compare disease activity or treatment response, but results are affected by the tracer, timing, blood sugar, and scanning method.

Quantitative Sensory Testing

A set of tests that measures a person's responses to sensations such as vibration, temperature, and pain. It helps assess sensory nerve function but does not diagnose nerve damage by itself.

Alternate Names:
QST; Psychophysical Sensory Threshold Assay

Quarantine

Temporary separation or movement restrictions for people exposed to an infectious disease while monitoring whether they become ill. It differs from isolation, which separates people who are already infected.

Quartan Fever

A fever pattern in which attacks recur about every 72 hours, classically seen with the malaria parasite Plasmodium malariae. Fever timing alone cannot diagnose malaria, which is identified with laboratory testing.

Queckenstedt Test

A historical test for blockage of the spinal fluid pathway, performed during lumbar puncture by briefly compressing the neck veins and observing the cerebrospinal-fluid pressure response. It is now rarely used because imaging such as MRI can assess the spine without this maneuver.

Alternate Names:
Queckenstedt's Sign; Queckenstedt-Stookey Test; Jugular Venous Spinal Manometry Test

Queensland Tick Typhus

A spotted-fever infection caused by the bacterium *Rickettsia australis* and spread by infected ticks in eastern Australia. It commonly causes fever and headache and may cause a rash or a dark scab at the bite site. Several *Ixodes* tick species can carry the bacterium.

Alternate Names:
QTT; Australian Tick Typhus

Quellung Reaction

A laboratory reaction in which antibodies bind to a bacterium's capsule, making the capsule appear enlarged under a microscope. It can help identify encapsulated bacteria such as *Streptococcus pneumoniae*.

Alternate Names:
Neufeld Quellung Phenomenon; Capsular Swelling Test

Quetiapine Fumarate

A form of quetiapine, a medicine used for schizophrenia, bipolar disorder, and selected depression treatment. It can cause sleepiness, dizziness on standing, weight or blood-sugar changes, and movement problems.

Quickening

The first fetal movements perceived by the pregnant person, often felt as a flutter or light tapping. Most people first notice movement around 18–20 weeks of pregnancy; it may be noticed earlier in a later pregnancy and may be harder to feel when the placenta is on the front wall of the uterus.

Quick Relievers

Asthma medicines used for rapid relief of symptoms such as wheezing and breathlessness. Some relax airway muscles; others combine this action with an inhaled corticosteroid. The medicines used vary among asthma regimens.

Alternate Names:
Quick-Relief Medicines; Reliever Medicines; Rescue Medicines

Quick Sequential Organ Failure Assessment

A rapid bedside screening tool used by healthcare providers to identify adult patients with suspected infection who may be developing sepsis and face a high risk of life-threatening complications. It evaluates three simple clinical signs: a drop in blood pressure (low systolic pressure), rapid breathing, and altered mental clarity or confusion. A positive score alerts medical teams that urgent evaluation and closer monitoring are needed.

Alternate Names:
qSOFA; Quick SOFA Score

Quick Test

An older name for a one-stage prothrombin-time test, which measures how long blood takes to clot after tissue factor is added. It is the basis of modern prothrombin-time testing.

Alternate Names:
Quick Prothrombin Time; One-Stage Prothrombin Assay

Quinalphos

A poisonous insecticide that disrupts nerve-signal control. Significant exposure can cause sweating, excess saliva, vomiting, muscle twitching, weakness, seizures, breathing failure, or death.

Quinapril

Quinapril is an angiotensin-converting-enzyme inhibitor used for hypertension and heart failure; cough, hyperkalaemia, renal-function changes, angioedema, and fetal toxicity are important risks.

Quincke Edema

Older term; see *Angioedema*.

Alternate Names:
Angioneurotic Edema

Quincke Needle

A spinal needle with a sharp, oblique cutting tip and a stylet, used for lumbar puncture or spinal anesthesia. Compared with pencil-point needles, cutting needles are generally associated with a higher risk of post-dural puncture headache; risk also depends on needle gauge and technique.

Quincke Pulse

A classical peripheral physical finding of severe chronic aortic regurgitation (aortic insufficiency), characterized by visible rhythmic alternating blanching and capillary flushing in the subungual nail bed accentuated by gentle compression of the distal edge of the fingernail. It results from the hyperdynamic wide pulse pressure and rapid diastolic runoff (water-hammer or Corrigan pulse hemodynamics) inherent to severe valvular aortic regurgitation.

Alternate Names:
Quincke's Sign; Capillary Pulse; Subungual Capillary Pulsation

Quincke Pulse Sign

See *Quincke Pulse*.

Quincke's Disease

Older term; see *Angioedema*.

Quincke's Edema

Older term; see *Angioedema*.

Quincke's Pulse

See *Quincke Pulse*.

Quincke's Sign

See *Quincke Pulse*.

Quinidine

A heart-rhythm medicine that changes electrical conduction in the heart. It is used selectively because it can cause dangerous abnormal rhythms, low blood pressure, low platelets, diarrhea, or other serious side effects.

Quinidine Syncope

Fainting caused by a dangerous heart rhythm associated with quinidine, usually torsades de pointes due to QT-interval prolongation. In severe cases, the rhythm can lead to cardiac arrest.

Quinine

A medicine derived from cinchona bark that can treat selected malaria infections. It is used less often because safer options are available and it can cause low blood sugar, ringing in the ears, blood-cell problems, or abnormal heart rhythms.

Quinine Amblyopia

An older term for visual loss caused by quinine toxicity. It may affect both eyes and narrow the visual field; severe injury can cause lasting visual impairment.

Alternate Names:
Quinine Amaurosis

Quinolone

A class of antibiotics that inhibit bacterial DNA gyrase and topoisomerase IV; fluoroquinolones are the major clinically used subgroup. Serious adverse effects particularly associated with systemic

fluoroquinolones include tendon injury, peripheral neuropathy, QT prolongation, and severe antibiotic-associated diarrhea.

Alternate Names:
Quinolone Antibiotics

Quinolone-Induced Tendinopathy

Tendon pain or damage associated mainly with fluoroquinolone antibiotics such as ciprofloxacin or levofloxacin. The Achilles tendon is often affected, and tendon rupture can occur; risk is higher in older adults and people taking corticosteroids.

Quinsy

A painful collection of pus (abscess) that forms in the tissues next to one of the tonsils in the back of the throat, usually as a complication of severe or untreated bacterial tonsillitis. The infection causes intense one-sided throat pain, difficulty and pain when swallowing, severe swelling that can push the tonsil and uvula toward the opposite side, fever, difficulty opening the mouth (trismus), and a muffled voice. If left untreated, the swelling can potentially obstruct breathing.

Alternate Names:
Peritonsillar Abscess; PTA

Quinupristin-Dalfopristin

An intravenous antibiotic combination used rarely for selected serious infections caused by resistant gram-positive bacteria. It can cause muscle or joint pain, liver problems, infusion reactions, and medicine interactions.

Quit Smoking

Alternate name; see *Smoking Cessation*.

Quorum Sensing

Communication among bacteria using chemical signals that build up as the bacterial population grows. The signals can coordinate group behaviors such as biofilm formation and production of factors that cause disease.

Quotidian Fever

A fever pattern in which fever rises or attacks occur about every 24 hours. It can occur with malaria and other infections, but the timing of fever alone does not identify the cause.

Quotidian Malaria

A malaria fever pattern with paroxysms about every 24 hours, associated especially with *Plasmodium knowlesi*, which has a 24-hour blood-stage cycle. Overlapping parasite broods can produce a similar pattern with other species; fever periodicity alone does not identify the species.

Alternate Names:
24-Hour Malarial Paroxysm; Daily Malarial Fever

Q Wave

A downward movement that may begin the electrical pattern of a heartbeat on an electrocardiogram. It can be normal in some recording positions or suggest previous heart-muscle injury, depending on its size and location.

Alternate Names:
Q Waves

R

Rabeprazole

A medicine that greatly reduces acid made by the stomach. It treats reflux and ulcers and may be combined with antibiotics for Helicobacter pylori infection; possible effects include headache, diarrhea, and rarely low magnesium or bowel infection.

Rabies

A rare, severe, and almost invariably fatal viral infection of the brain and nervous system transmitted to humans through the saliva of an infected mammal, most often via a bite or scratch. Once the rabies virus enters the body, it travels along nerves to the spinal cord and brain, where it causes acute, progressive inflammation (encephalitis). Early symptoms include fever, headache, and tingling or numbness at the bite site, rapidly progressing to anxiety, confusion, agitation, painful throat spasms when attempting to swallow liquids (hydrophobia), paralysis, and coma.

Alternate Names:
Hydrophobia; Lyssa; Rabic Encephalitis

Rabies Vaccination

Immunization used before or after exposure to reduce the risk of rabies. Post-exposure management also includes wound care and, when indicated, rabies immunoglobulin.

Rabies Virus

The virus that causes rabies, a usually fatal viral infection of the central nervous system transmitted most often through the saliva of an infected animal.

Rachitic Rosary

A row of bead-like swellings where the ribs meet their cartilage, seen in some children with rickets. The swellings result from abnormal bone growth and mineralization.

Alternate Names:
Beaded Ribs; Costochondral Rosary

Radial

Relating to the radius bone or the thumb side of the forearm and hand. The word can also describe structures arranged like spokes spreading from a central point.

Radial Artery

An artery that runs along the thumb side of the forearm to the wrist and hand. Its pulse can be felt at the wrist, and it supplies blood to the forearm and parts of the hand.

Radial Artery Access

Use of the radial artery at the wrist as the entry route for cardiac catheterization or another endovascular procedure.

Radial Artery Thrombosis

A blood clot blocking the artery on the thumb side of the forearm, sometimes after an arterial catheter or injury. It may cause a painful, pale, cold, numb, or weak hand and can threaten hand circulation.

Radial Club Hand

A birth-related difference in which the thumb-side forearm bone is small or absent and the hand bends toward the thumb side. The thumb may also be un-

derdeveloped, and treatment depends on movement, function, and associated conditions.

Radial Head Subluxation

A common elbow injury in young children, often called nursemaid's elbow, in which the radial head slips partly out from beneath the band of tissue that holds it in place. It often follows a sudden pull on the arm; the child may stop using the arm but usually has little swelling. A trained clinician can put the bone back in place.

Alternate Names:
Nursemaid's Elbow; Pulled Elbow; Annular Ligament Displacement

Radial Nerve

A major nerve of the arm that helps straighten the elbow, wrist, and fingers and carries feeling from part of the back of the hand. Injury can cause wrist drop, finger weakness, or numbness.

Radial Nerve Dysfunction

Impaired function of the radial nerve causing weakness of wrist or finger extension and sensory changes over part of the posterior arm or hand; causes include compression, trauma, and systemic neuropathy.

Radial Nerve Palsy

Dysfunction of the radial nerve causing weakness of wrist and finger extension, often producing wrist drop, with sensory loss over part of the back of the hand in some cases.

Radial Scar

A benign breast lesion with a scar-like pattern of tissue that may resemble cancer on imaging. It may be associated with a small increase in breast cancer risk.

Alternate Names:
Complex Sclerosing Lesion

Radial Tunnel Syndrome

A pain syndrome attributed to compression or irritation of the posterior interosseous branch of the radial nerve in the proximal forearm. It causes aching pain near the outer elbow or upper forearm, usually without objective motor weakness or sensory loss; weakness suggests another or additional nerve disorder.

Radial Vein

Veins running alongside the radial artery on the thumb side of the forearm. They drain blood from the forearm and join other deep veins near the elbow.

Radiation

Energy traveling as particles or electromagnetic waves, including X-rays, gamma rays, ultraviolet light, and radio waves. Depending on its type and amount, radiation can diagnose disease, treat cancer, or damage living tissue.

Radiation Biology

The study of how radiation affects cells, tissues, organisms, and populations. It examines injury, repair, mutations, cancer risk, treatment effects, and protective measures after exposure to ionizing or nonionizing radiation.

Radiation Contamination

Radioactive material on or inside a person, object, surface, or body site where it is not intended to be. External contamination can spread to other people or surfaces; internal contamination occurs when radioactive material is inhaled, swallowed, or enters through a wound.

Radiation Dosage

See *Radiation Dose*.

Radiation Dose

A measure of radiation delivered to or absorbed by matter. Absorbed dose measures energy deposited per unit mass and is expressed in grays; equivalent and effective dose account for radiation type and tissue sensitivity and are expressed in sieverts. In medical imaging, dose depends on the procedure, equipment, and patient and is optimized to limit exposure while obtaining the needed information.

Radiation Emergency

An event involving actual or suspected harmful radiation exposure or contamination that requires urgent protective and medical measures.

Radiation Enteritis

Inflammation or injury of the small or large intestine after radiation treatment. Early symptoms may include diarrhea, cramps, nausea, or urgency; months or years later, scarring can cause narrowing, poor absorption, bleeding, or blockage.

Radiation Exposure

Contact with ionizing or non-ionizing radiation from medical imaging, treatment, sunlight, workplaces, or other sources. The possible harm depends mainly on the type, dose, body area, and duration of exposure.

Radiation Fibrosis

Long-term thickening and stiffening of tissue caused by radiation injury, sometimes appearing months or years after treatment. It can affect skin, lungs, bowel, or other organs and may cause pain, reduced movement, or shortness of breath.

Radiation Field

The area and distribution of radiation delivered during imaging or radiation treatment. In therapy, its size, shape, direction, and dose are planned to cover the target while limiting exposure to nearby healthy tissue.

Radiation-Induced Angiosarcoma

A rare, fast-growing cancer of blood-vessel lining cells that develops years after radiation in previously treated tissue. It may appear as a bruise, purple patch, swelling, or lump in the treated area.

Radiation Leukemia

Leukemia associated with prior exposure to ionizing radiation. The risk depends on the dose and exposure circumstances, and the disease may develop years later.

Radiation Monitoring

Measurement of radiation levels or individual exposure using devices such as personal dosimeters and area monitors.

Radiation Necrosis

Permanent death of tissue caused by radiation injury, often developing months or years after treatment. In the brain it may cause headache, seizures, swelling, weakness, or speech and vision problems and can resemble returning cancer on scans.

Radiation Oncologist

A doctor who plans and oversees radiation treatment for cancer and selected noncancerous conditions. They choose treatment areas and doses, coordinate care, monitor side effects, and adjust therapy during treatment.

Radiation Oncology

The branch of oncology that uses ionizing radiation to treat malignant tumors and selected benign conditions. Radiation oncologists plan and oversee treatment delivered externally or from radioactive sources placed in or near tissue. Treatment may aim to cure, control tumor growth, reduce recurrence, or relieve symptoms.

Radiation Physics

The study of how radiation is produced, travels, interacts with tissues, and is measured. It supports medical imaging, radiation treatment, dose calculation, and protection from unnecessary exposure.

Radiation Pneumonitis

Inflammation of lung tissue occurring weeks or months after radiation to the chest. It may cause dry cough, fever, breathlessness, or low oxygen and can later leave permanent scarring.

Radiation Poisoning

Illness caused by substantial exposure to ionizing radiation, potentially producing skin injury, bone-marrow suppression, gastrointestinal symptoms, or organ failure.

Radiation Pregnancy Screening

Assessment of pregnancy status before a procedure involving ionizing radiation or radioactive material when pregnancy is possible. Its relevance depends on the procedure and potential fetal exposure.

Radiation Proctitis

Inflammation and injury of the rectum after pelvic radiation therapy, causing rectal pain, urgency, diarrhea, mucus, or bleeding.

Radiation Protection

The practice of keeping radiation exposure as low as reasonably achievable while obtaining the required diagnostic or therapeutic result. It relies on justification, optimization, time reduction, distance, shielding, and appropriate contamination control.

Radiation Recall

Inflammation in an area previously treated with radiation that returns after a later trigger, often a medicine. The reaction may affect the skin or an internal lining.

Radiation-Recall Dermatitis

A skin form of *Radiation Recall*, in which a previously irradiated area becomes inflamed after a later trigger, often a medicine.

Radiation Safety

Measures used to prevent unintended or unnecessary exposure to ionizing radiation during imaging, treatment, research, or work with radioactive materials.

Radiation Sickness

Acute illness caused by a high dose of ionizing radiation to much of the body. It can damage the bone marrow, digestive tract, skin, or other tissues; severity depends on the dose and exposed body area.

Radiation Therapy

See *Radiotherapy*.

Radiation Tolerance

The amount of radiation that a tissue or organ can receive before injury becomes likely. It varies with the tissue, dose, treatment schedule, and previous radiation.

Radical Cystectomy

Surgery to remove the urinary bladder, usually for muscle-invasive or high-risk bladder cancer. Because urine can no longer leave through the bladder, another route for urine drainage is created.

Radical Cystoprostatectomy

Surgery to remove the urinary bladder and prostate, usually to treat invasive bladder cancer. Nearby lymph nodes and other tissues may also be removed, and a new route for urine drainage is created.

Radical Hysterectomy

An operation that removes the uterus and cervix together with surrounding parametrial tissues and the upper vagina, usually with pelvic lymph-node assessment or removal. It is used mainly for selected invasive cervical cancers and is more extensive than a simple or total hysterectomy.

Radical Lymphadenectomy

Extensive surgery to remove lymph nodes and nearby tissue to look for or treat cancer spread. It may provide important staging information but can cause pain, nerve or vessel injury, and long-term swelling from lymph-fluid blockage.

Radical Mastectomy

Radical mastectomy removes the breast, chest muscles, and many underarm lymph nodes; it is now rarely used because less extensive cancer surgery is often effective.

Radical Nephrectomy

Radical nephrectomy removes an entire kidney and sometimes nearby tissues, usually to treat a kidney tumor.

Radical Prostatectomy

Surgery to remove the whole prostate gland and usually the nearby seminal vesicles, most often to treat prostate cancer that has not spread widely. The urinary passage is rejoined to the bladder; possible effects include urine leakage, erection problems, bleeding, and infection.

Radicular Cyst

A cyst that forms at the root tip of a dead or severely infected tooth, usually because of long-standing inflammation around the tooth root.

Radiculitis

Irritation or inflammation of a nerve root where it leaves the spine. It can cause pain spreading along an arm or leg, tingling, numbness, weakness, or changed reflexes because of a disk problem, narrowing, infection, or other disease.

Radiculopathy

Dysfunction of a spinal nerve root, usually from disc herniation, narrowing, or inflammation. It may cause shooting pain, tingling, numbness, weakness, or altered reflexes along the affected nerve pathway.

Radioactive Iodine

A radioactive form of iodine taken up by thyroid cells. It is used to image the thyroid or destroy overactive thyroid tissue and selected thyroid cancer cells; radiation-safety precautions are needed after some treatments.

Radioactive Iodine Ablation

Treatment using radioactive iodine to destroy remaining thyroid tissue or selected thyroid cancer cells after surgery. Thyroid cells absorb the iodine; the decision depends on cancer type, spread, recurrence risk, and the person's overall health.

Radioactive Iodine Uptake

A test measuring the percentage of administered radioactive iodine taken up by the thyroid over time, used to evaluate hyperthyroidism and selected thyroid disorders.

Radioactive Iodine Uptake Test

See *Radioactive Iodine Uptake*.

Radioactive Isotope

Unstable form of a chemical element that releases radiation as it decays, widely used in nuclear diagnostic imaging. See *Radioisotope*.

Radioactivity

Energy released when unstable atoms change into more stable forms. The energy may be particles or rays and can be used in medical imaging or treatment, but enough exposure can damage living tissue.

Radioallergosorbent Test

An older blood test that used a radioactive label to measure IgE antibodies to a specific allergen. It has largely been replaced by newer specific-IgE tests; a positive result shows sensitization, not necessarily clinical allergy.

Alternate Names:
RAST

Radiobiology

See *Radiation Biology*.

Radiocarpal Joint

The main wrist joint between the forearm bone on the thumb side and several wrist bones. It allows the hand to bend forward, backward, and from side to side and may be injured by falls or arthritis.

Radiochemical Purity

The proportion of a radioactive medicine present in the intended chemical form. Unwanted forms can make a scan less accurate, send radiation to the wrong tissues, or reduce treatment effectiveness.

Radiochemistry

The chemistry of radioactive substances and compounds. In medicine it includes making and labeling radiopharmaceuticals, studying radioactive decay, separating products, and checking radiochemical purity and safety.

Radiocontrast

A substance given during an imaging test to make selected tissues, blood vessels, or body spaces easier to see. Depending on the agent, allergic reactions, kidney injury, or leakage-related damage may occur.

Radiodermatitis

Skin injury caused by ionizing radiation, such as radiation treatment. It may cause redness, dryness, itching, hair loss, peeling, sores, or long-term skin changes; severity depends on the dose, treatment area, and repeated exposure.

Radioembolisation

Alternate name; see *Radioembolization*.

Radioembolization

A treatment that delivers tiny radioactive beads through an artery supplying a liver tumor. The beads lodge near the tumor and deliver radiation to it; suitability depends on liver function, tumor extent, and blood flow.

Radio-Femoral Delay

A delay in the femoral pulse compared with the wrist pulse. It is a classic sign of narrowing of the aorta, especially coarctation, and can also occur with severe blockage of the aortoiliac arteries.

Radiofrequency

Electromagnetic energy in the radio-frequency range, used in communication and in selected medical tests and treatments. Medical uses include heating tissue or delivering energy during procedures.

Alternate Names:
Radiofrequency Energy; RF Radiation

Radiofrequency Ablation

A procedure that uses high-frequency electrical energy to heat and destroy selected tissue, often under imaging guidance.

Radiofrequency Ablation For Chronic Pain

A procedure that applies radiofrequency energy to selected sensory nerves or other targets to interrupt pain signaling for a limited period in carefully selected chronic pain conditions.

Radiograph

An image made with X-rays. Dense structures such as bone appear light, while air appears dark and soft tissues appear in shades of gray. Radiographs are used to assess bones, the chest, teeth, and selected abdominal or foreign-body problems; they use a small amount of radiation.

Alternate Names:
X-Ray; Roentgenogram; Radiographic Image

Radiographer

A trained professional who performs diagnostic imaging examinations or delivers radiotherapy, depending on specialty and jurisdiction.

Radiography

Creation of images using X-rays. It is useful for bones, chest disease, dental structures, and many other conditions; radiation exposure is kept as low as reasonably achievable.

Radioimmunoassay

A laboratory test that uses an antibody and a small radioactive label to measure a hormone, medicine, or protein in a sample. It can be very sensitive but is often replaced by newer nonradioactive tests.

Radioimmunoguided Surgery

Surgery in which a radioactive tracer attached to an antibody helps the surgeon locate tissue carrying a particular marker, often tumor tissue. Special equipment detects the tracer during the operation.

Radioimmunotherapy

Treatment that attaches a radioactive substance to an antibody so the antibody carries radiation toward cells with a particular marker, often cancer cells. Radiation can still affect nearby normal tissue and cause side effects.

Radioiodine

A radioactive form of iodine used in nuclear medicine to image or treat thyroid tissue. It is taken up by thyroid cells; precautions are needed to limit radiation exposure to others.

Radioiodine Therapy

Treatment using radioactive iodine, which is taken up mainly by thyroid cells to destroy overactive thyroid tissue or selected thyroid cancer cells. It requires individualized dosing and temporary radiation-safety precautions; pregnancy and breast-feeding are contraindications.

Radioisotope

An unstable form of an element that emits radiation as it decays. Radioisotopes are used in medical imaging, diagnosis, and selected treatments.

Alternate Names:
Radioactive Isotope

Radioligand Therapy

A cancer treatment in which a radioactive atom is attached to a molecule that binds a target on cancer cells. The molecule carries radiation to cells with that target; use depends on the cancer and the target's presence.

Radiologic Health

The safe use of medical imaging and radiation-based treatment to protect patients, workers, and the public from unnecessary ionizing radiation while preserving clinical benefit. Safety measures include appropriate justification, shielding, and dose optimization.

Radiologic-Pathologic Correlation

Comparison of scan findings with tissue examined under a microscope to determine whether a sample explains an abnormal area. A mismatch means the imaging and tissue findings are discordant.

Radiologic Response

The change seen on medical scans after treatment, such as shrinkage, disappearance, stability, growth, or new lesions. Standard measurement rules help classify the response, but scans do not always show the full biological effect.

Radiologic Technologist

A trained health professional who performs selected medical-imaging examinations and helps protect patients from unnecessary radiation exposure.

Radiologist

A doctor trained to interpret medical images and sometimes perform image-guided procedures. Radiologists evaluate X-rays, ultrasound, CT, MRI, and other scans to diagnose disease, guide treatment, or obtain tissue samples.

Radiology

The medical field that uses images to find and monitor disease and guide procedures. Radiologists interpret X-rays, ultrasound, CT, MRI, and other scans and may perform image-guided biopsies, drainages, injections, or treatments.

Radiology-Patient Identification

Verification of the correct patient, examination, body site, indication, pregnancy status when relevant, allergies, renal function, and prior imaging before image acquisition or intervention. It is a core diagnostic and procedural safety step.

Radiology Report

A written explanation of an imaging study, describing why it was done, the important findings, and their possible meaning.

Radiolucent

Describing a material that lets more X-rays pass through and therefore appears darker on an X-ray or CT image. Air is highly radiolucent; some stones, foreign bodies, and abnormal tissues can also have this appearance.

Radiomimetic

Radiomimetic describes a chemical or treatment that produces cellular or DNA damage resembling

the effects of ionizing radiation.

Radionuclide

An unstable atomic nuclide characterized by excess nuclear energy that spontaneously decays toward stability through the emission of ionizing radiation (such as alpha particles, beta particles, or gamma photons). In medicine, radionuclides (e.g., technetium-99m, iodine-123, iodine-131, fluorine-18) are coupled to specific pharmaceutical ligands for diagnostic imaging (single-photon emission computed tomography [SPECT] and positron emission tomography [PET]) or utilized for targeted internal radiopharmaceutical therapy (e.g., lutetium-177 dotatate, radioiodine ablation of thyroid tissue).

Alternate Names:
Radionuclides; Radioactive Isotope; Radioisotope

Radionuclide Angiography

An imaging test in which a small amount of radioactive tracer is used to follow blood flow through the heart or blood vessels. A camera detects the tracer and produces information about circulation or heart pumping.

Radionuclide Cystogram

A nuclear medicine examination that tracks radiolabeled urine to detect vesicoureteral reflux or evaluate bladder emptying.

Radionuclide Generator

A device that produces a short-lived radioactive substance from a longer-lasting radioactive substance. It supplies certain tracers for nuclear scans or treatment when needed and must be operated under strict safety and quality controls.

Radionuclide Heart Scan

A nuclear medicine study that uses a radioactive tracer to evaluate myocardial blood flow, heart muscle viability, or ventricular function.

Radionuclide Imaging

A scan that uses a small amount of radioactive tracer to show the structure or activity of an organ. A camera detects the tracer, helping evaluate blood flow, bone, thyroid, kidney, heart, or cancer-related changes.

Radionuclide Imaging Or Scan

A scan that detects radiation from a small amount of radioactive tracer given to a person. The tracer collects in selected organs or tissues, allowing clinicians to examine blood flow, structure, or function and identify some diseases.

Alternate Names:
Scintigraphy; Nuclear Medicine Scan; Gamma Scan

Radionuclides

Plural form; see *Radionuclide*.

Radionuclide Studies

Diagnostic studies that use a small amount of radioactive tracer and specialized imaging equipment to assess blood flow, organ function, or tissue viability.

Radionuclide Therapy

Treatment that delivers radiation from inside the body using a radioactive substance directed toward selected tissue. It can treat some thyroid diseases, cancers, or painful bone lesions. The medicine, dose, precautions, and side effects depend on the target and the person's kidney, blood, and overall health.

Radionuclidic Purity

The proportion of radioactivity in a preparation that comes from the intended radioactive atom rather than unwanted radioactive contaminants. High purity helps ensure the expected scan or treatment and limits unnecessary radiation to other tissues.

Radio-Opaque

Blocking X-rays and appearing relatively white on a radiograph; radiopaque is the modern spelling.

Radiopaque

Describing a material that attenuates X-rays strongly and therefore appears relatively white on a radiograph or CT image. Bone, metal, and some contrast agents are radiopaque.

Radiopharmaceutical

A medicine containing a small amount of radioactive material. It can show how an organ or tissue works on a scan or deliver radiation to selected diseased cells; its distribution determines the information or treatment it provides.

Radiopharmaceutical Extravasation

Leakage of a radioactive medicine from the vein into nearby tissue during an injection. It can reduce the accuracy of a scan and, with treatment doses, injure local tissue; staff assess and document the event.

Radiopharmaceutical Labeling Kit

A prepared set of sterile ingredients used to attach a radioactive atom to a substance that travels to a particular organ or follows a body process. The finished product is tested before it is given for imaging.

Radiopharmaceutical Quality Control

Testing to verify a radioactive medicine's identity, radionuclidic and radiochemical purity, pH, and other required release specifications. Sterility and endotoxin testing or controls apply according to the preparation and applicable standards.

Radiopharmacy

The preparation, testing, storage, and dispensing of medicines containing radioactive materials. Radiopharmacy requires accurate activity measurement, cleanliness, sterility checks, quality control, safe handling, and protection of workers and patients.

Radioprotective Agent

A medicine or substance intended to reduce injury to healthy tissue from ionizing radiation. It may limit chemical damage or support cell repair, but its benefit and risks depend on the type, dose, and treatment setting.

Radio-Radial Delay

A difference in timing or strength between the right and left wrist pulses. It can suggest obstruction of an artery supplying one arm, but the finding alone does not identify the cause.

Radiosensitization

Making cells more vulnerable to radiation damage. Some medicines or treatments are combined with radiotherapy to increase damage to cancer cells, while treatment planning aims to limit harm to nearby healthy tissue.

Radiosurgery

Radiosurgery delivers highly focused radiation to a small target, usually in the brain or body, without making a conventional surgical incision.

Radiotherapy

Treatment using high-energy radiation to damage and control abnormal cells, especially cancer. It may be given from outside or inside the body and can cause temporary or lasting effects in nearby healthy tissue.

Radiotherapy Bolus

A layer of material placed on the skin during selected radiation treatments so more radiation reaches the skin surface. It is positioned carefully to deliver the planned dose to the target area.

Radiotherapy Dosage

Radiotherapy dosage is the amount of ionizing radiation prescribed for a treatment target, usually divided into carefully planned fractions.

Radiotracer

A small amount of radioactive material attached to a substance that travels through a specific body process. A scanner detects where it goes, helping show blood flow, organ function, bone activity, or selected disease-related changes.

Radioulnar Joint

A joint between the radius and ulna bones of the forearm. It allows the hand and forearm to turn palm-up and palm-down.

Radium

A naturally radioactive chemical element that releases penetrating radiation as it breaks down. In-

ternal exposure can damage bone and other tissues and increase cancer risk.

Radium-223

A radioactive medicine that behaves like calcium and collects in areas of increased bone activity. It is used for selected prostate cancers that have spread to bone and may cause low blood counts or other side effects.

Radius

The forearm bone on the thumb side. It joins the elbow and wrist and rotates around the ulna, allowing the palm to turn up or down.

Radius Fracture

A break in the radius, one of the two bones of the forearm, often occurring near the wrist after a fall onto an outstretched hand.

Radon

A naturally occurring radioactive gas that can accumulate indoors and increase lung-cancer risk when inhaled over time.

Ragged Red Fibers

An appearance seen in a muscle biopsy when abnormal mitochondria build up around muscle fibers. It supports the diagnosis of some mitochondrial muscle diseases but is not specific to one condition. The biopsy result must be interpreted with symptoms, blood tests, genetic testing, and other findings.

Alternate Names:
RRF; Ragged-Red Muscle Fibers

Raised Hemidiaphragm

A raised hemidiaphragm is elevation of one side of the diaphragm, caused by abdominal pressure, lung volume loss, phrenic-nerve dysfunction, or diaphragmatic disease.

Rale

An older auscultatory term denoting a crackle, an intermittent, non-musical, explosive adventitious breath sound heard during auscultation of the chest, produced by the sudden explosive opening of collapsed small peripheral airways or air bubbling through fluid in alveoli and bronchoalveolar spaces. Divided into fine crackles (high-pitched, short duration, characteristic of interstitial pulmonary fibrosis or congestive heart failure) and coarse crackles (low-pitched, longer duration, seen with bronchitis or pneumonia).

Alternate Names:
Rales; Crackle; Crackles; Crepitations

Retrocalcaneal Bursitis

Inflammation of the fluid-filled bursa located behind the heel bone and in front of the Achilles tendon. See *Posterior Heel Bursitis*.

RCC

The most common form of kidney cancer in adults, originating in the lining of the proximal convoluted tubules. See *Renal Cell Carcinoma*.

RBC Casts

Microscopic cylindrical structures found in urine sediment indicating bleeding within the kidney glomeruli. See *Red Blood Cell Casts*.

RAPD

Clinical sign where the pupils dilate abnormally when a light source swings from the unaffected to the affected eye. See *Relative Afferent Pupillary Defect*.

Râle

Older term; see *Crackles*.

Rales

Plural form; see *Rale*.

Raloxifene

A medicine that acts like estrogen in bones but blocks some estrogen effects elsewhere. It may reduce spine fractures and selected breast-cancer risk after menopause, but can increase blood-clot risk.

Raloxifene Hydrochloride

See *Raloxifene*.

Raltegravir Potassium

Raltegravir potassium is an HIV integrase inhibitor used with other antiretroviral medicines to suppress HIV replication.

Raltitrexed

A chemotherapy medicine used for some colorectal cancers. It blocks a cell process needed to make DNA, slowing the growth of cancer cells; possible effects include diarrhea, mouth sores, low blood counts, tiredness, and liver problems.

Ramipril

Ramipril is an angiotensin-converting-enzyme inhibitor used for hypertension, heart failure, and cardiovascular risk reduction; cough, hyperkalaemia, renal-function changes, angioedema, and fetal toxicity are important risks.

Rampant Caries

Severe tooth decay affecting many teeth or surfaces at once. It may be linked with frequent sugar, dry mouth, vomiting, poor oral hygiene, limited dental care, medicines, or other health problems.

Ramsay Hunt Syndrome

Shingles affecting a nerve in the face near the ear. It can cause painful blisters in or around one ear or in the mouth, along with weakness on the same side of the face. Hearing loss, ringing, or dizziness may also occur, and sometimes no rash appears.

Alternate Names:
Herpes Zoster Oticus; Ramsay Hunt Syndrome Type II

Ramsay Hunt Syndrome Type I

A rare neurological disorder characterized by progressive myoclonus epilepsy, intentional cerebellar tremor, progressive ataxia, and mild cognitive decline. Historically termed dyssynergia cerebellaris myoclonica; distinct from Ramsay Hunt syndrome type II (herpes zoster oticus).

Alternate Names:
Dyssynergia Cerebellaris Myoclonica; Dentatorubral Tremor Syndrome

Ramsay Hunt Syndrome Type II

Alternate name; see *Ramsay Hunt Syndrome*.

Ramucirumab

A monoclonal antibody that blocks vascular endothelial growth factor receptor 2 and is used in selected advanced cancers, including gastric, colorectal, lung, and liver cancers.

Ramus

A ramus is a branch-like extension of a bone, nerve, artery, or other structure, such as the mandibular ramus.

Random Allocation

Assignment of participants to study groups by chance to reduce selection bias and balance known and unknown factors.

Randomised Controlled Trial

A study in which participants are assigned by chance to interventions or controls and outcomes are compared.

Randomization Validation

Checking that a clinical trial's assignment process truly places participants into study groups by chance and is implemented as planned. This helps reduce selection bias and protects the reliability of comparisons between treatments.

Randomized Controlled Trial

An experimental study in which participants are assigned by chance to different interventions or a control condition and followed for specified outcomes.

Range Of Motion

The amount a joint can move in different directions. It may be measured by a healthcare professional or by the person moving alone; pain, swelling, stiffness,

weakness, injury, or a shortened muscle can reduce it.

Ranibizumab

An intravitreal monoclonal antibody fragment that inhibits vascular endothelial growth factor and treats neovascular macular degeneration, diabetic macular edema, retinal vein occlusion, and related retinal disease.

Ranke Complex

The late, healed, fibrocalcified sequela of primary pulmonary tuberculosis, consisting of a calcified subpleural Ghon parenchymal focus and calcified ipsilateral draining hilar or mediastinal lymph nodes visible on chest radiography.

Alternate Names:
Calcified Primary Tuberculous Complex; Healed Ghon Complex

Ranolazine

Ranolazine is an antianginal drug that inhibits the late sodium current in cardiac cells and reduces chronic angina without substantially lowering heart rate or blood pressure; QT prolongation and drug interactions require caution.

Ranson Criteria

An older scoring system that estimates the severity and risk of death in acute pancreatitis using clinical and blood-test findings at admission and again after 48 hours. It is less commonly used now because newer scores and organ-failure assessment may be more practical.

RANTES

RANTES, now called CCL5, is a chemokine that attracts immune cells and participates in inflammation, antiviral defense, and immune signaling.

Ranula

A soft, sometimes blue, mucus-filled swelling on the floor of the mouth under the tongue. It forms when mucus leaks from a saliva-making gland under the tongue, often after its tube is injured or blocked.

Raoultella

Raoultella is a genus of gram-negative bacteria that can cause opportunistic urinary, respiratory, wound, or bloodstream infections.

Rape

A form of sexual violence involving nonconsensual penetration, including penetration of the vulva, anus, or mouth with a body part or object. Legal definitions vary by jurisdiction. It can cause physical injury, pregnancy, sexually transmitted infection, and psychological trauma.

Raphe

A seam-like line or ridge where structures join, such as the median raphe or raphe nuclei of the brainstem.

Raphe Nuclei

The raphe nuclei are brainstem groups of neurons that produce serotonin and influence mood, pain, sleep, arousal, and autonomic functions.

Rapid Eye Movement Sleep

A sleep stage with rapid eye movements, vivid dreaming, and active brain patterns. Most skeletal muscles are temporarily relaxed during it, while breathing and heart rate can become more variable.

Alternate Names:
REM Sleep; Paradoxical Sleep

Rapid Eye Movement Sleep Behavior Disorder

Alternate name; see *REM Sleep Behavior Disorder*.

Rapid Gastric Emptying

Faster-than-normal movement of stomach contents into the small intestine. It can occur after stomach surgery and may cause dumping symptoms, but rapid emptying and dumping syndrome are not identical terms.

Rapid Heartbeat

Alternate name; see *Tachycardia*.

Rapidly Progressive Glomerulonephritis

Severe inflammation of the kidney's filtering units that causes kidney function to worsen over days or weeks. It may cause blood or protein in urine, swelling, high blood pressure, or reduced urine.

Rapid Plasma Reagin Test

A blood test that detects antibodies associated with syphilis. It is useful for screening and monitoring treatment, but false-positive and false-negative results occur, so reactive results need a confirmatory treponemal test.

Rapid Sequence Induction

See *Rapid Sequence Intubation*.

Rapid Sequence Intubation

An airway technique in which a sedative and a fast-acting muscle-relaxing medicine are given in quick succession before placing a breathing tube. It is used when rapid airway control is needed and aims to reduce the risk of stomach contents entering the lungs; ventilation between medicines may be used when clinically needed.

Rapid-Sequence Intubation

See *Rapid Sequence Intubation*.

Rapid Antigen Test

A rapid diagnostic immunoassay that directly identifies viral or bacterial antigens in clinical specimens within minutes; see *Antigen Detection Test*.

Rapid Shallow Breathing

Breathing that is faster than normal but moves only small amounts of air each time. It may occur with lung disease, pain, anxiety, metabolic illness, or tiring breathing muscles and can be a warning sign of respiratory failure.

Rapid Strep Test

A test performed on a throat swab to detect Group A Streptococcus. It provides a rapid result, but a negative result may require confirmatory testing depending on the patient's age, symptoms, and local guidance.

Rapp-Hodgkin Syndrome

A form of ectodermal dysplasia, usually caused by a change in the *TP63* gene. It can affect hair, teeth, nails, skin, and sweating and may occur with cleft lip or palate.

Alternate Names:
Rapp-Hodgkin Type Ectodermal Dysplasia

Rare Disease

A condition affecting relatively few people in a defined population; many rare diseases are genetic, require specialized diagnosis, and may have limited evidence or treatment options.

Rarefaction

A reduction in density or pressure, such as the low-pressure part of a sound wave. In medicine, understanding rarefaction helps explain ultrasound imaging, sound transmission, and pressure changes in tissues.

Rasburicase

A recombinant urate-oxidase enzyme that converts uric acid to the more soluble allantoin. It is used in selected patients at risk of or experiencing tumor-lysis-related hyperuricemia. It can cause serious hypersensitivity or hemolysis in people with glucose-6-phosphate dehydrogenase deficiency and requires appropriate screening and monitoring.

Rash

A visible change in skin color, texture, or surface, such as spots, bumps, blisters, or scaling. Causes include infection, allergy, medicines, and inflammation.

Alternate Names:
Skin Eruption

Rasmussen Encephalitis

A rare, progressive, chronic immune-mediated neuroinflammatory disorder occurring predominantly in children, characterized by unilateral hemispheric inflammation, drug-resistant focal motor seizures

(frequently epilepsia partialis continua), progressive contralateral hemiparesis, cognitive deterioration, and progressive unilateral cortical atrophy on neuroimaging.

Alternate Names:
Chronic Focal Encephalitis; Rasmussen Syndrome

Rasp

A roughened surgical instrument used to file, shape, or smooth bone or other hard tissue.

Ras Protein

A small GTP-binding protein that relays signals controlling cell growth, division, and survival. Abnormal Ras activity can contribute to cancer.

RAST

An older blood test that used a radioactive label to detect IgE antibodies to a specific allergen. Modern laboratories use newer specific-IgE tests; a positive result shows sensitization, which does not always mean clinical allergy.

Alternate Names:
Radioallergosorbent Test

Rastelli Procedure

Open-heart surgery for certain complex birth defects involving the heart's major arteries, a hole between the lower chambers, and a narrowed route to the lungs. A patch directs blood from the left ventricle to the aorta, and a tube with a valve connects the right ventricle to the lung arteries. The tube may need later replacement.

Alternate Names:
Rastelli Operation; Rastelli Repair

Rat Bite Fever

A systemic bacterial infection caused by Streptobacillus moniliformis or Spirillum minus, transmitted through rat bites or contact with rat-contaminated food or water. It presents with relapsing fever, rash, polyarthritis, and lymphadenopathy. The characteristic rash is petechial or maculopapular on the extremities.

Rat-Bite Fever

Alternate name; see *Rat Bite Fever*.

Rathke Cleft Cyst

A benign, non-neoplastic, mucin-filled sellar or suprasellar epithelial cyst derived from remnants of the embryonic Rathke pouch, which may compress the optic chiasm (causing bitemporal hemianopia) or normal pituitary gland (producing hypopituitarism).

Alternate Names:
RCC; Pituitary Cleft Cyst

Rathke Pouch

An embryonic ectodermal diverticulum arising from the roof of the stomodeum (primitive oral cavity) that ascends toward the developing brain to form the anterior pituitary gland (adenohypophysis: pars distalis, pars intermedia, pars tuberalis); incomplete obliteration gives rise to craniopharyngiomas or Rathke cleft cysts.

Ratio

A ratio compares two quantities by division, such as a measurement of risk, concentration, or body proportions.

Rationalization

A psychological defense in which a person creates plausible explanations for behavior or feelings while avoiding the underlying motive or conflict.

Rat Lungworm Disease

Infection caused by the rat lungworm parasite Angiostrongylus cantonensis, usually after eating contaminated raw or undercooked produce or animals. It can cause eosinophilic meningitis with headache, neck stiffness, or neurologic symptoms.

RATS

Alternate name; see *Robotic-Assisted Thoracoscopic Surgery*.

Ravuconazole

Ravuconazole is a triazole antifungal medicine stud-

ied and used in some settings for invasive fungal infections.

Raw Egg

An egg that has not been cooked; it may carry bacteria such as Salmonella.

Raynaud Disease

Primary Raynaud phenomenon, in which repeated episodes of reduced blood flow to the fingers or toes occur without an identified underlying condition.

Raynaud Phenomenon

Repeated episodes of reduced blood flow to the fingers or toes, usually triggered by cold or stress. Affected areas may turn white or blue and then red as blood flow returns, with numbness, tingling, or pain. It is primary when no underlying cause is found and secondary when associated with another condition, such as systemic sclerosis.

Alternate Names:
Raynaud's Phenomenon; Digital Vasospasm

Raynaud's Disease

Alternate name for *Raynaud Disease*.

Raynaud's Phenomenon

Alternate name; see *Raynaud Phenomenon*.

Raynaud's Syndrome

Alternate name for secondary Raynaud phenomenon.

Raynaud Syndrome

Raynaud phenomenon associated with an underlying condition, such as systemic sclerosis or lupus; also called secondary Raynaud phenomenon.

Razor Bumps

Inflamed bumps caused by hairs curling back into the skin after shaving or other hair removal. They are more common with coarse or curly hair and may cause itching, pain, dark marks, or scarring.

RBC Count

A measurement of the number of red blood cells in a volume of blood, interpreted with hemoglobin, hematocrit, and red-cell indices to evaluate anemia or erythrocytosis.

RBC Indices

Measurements describing the size, hemoglobin content, and variation of red blood cells. They help classify anemia and interpret a complete blood count alongside hemoglobin and other results.

RBC Nuclear Scan

An imaging test using the person's red blood cells labeled with a radioactive tracer. It can help locate active bleeding in the digestive tract or assess how well the heart's ventricles pump blood.

RBC Urine Test

A urine examination detecting or counting red blood cells, used to evaluate hematuria from urinary-tract infection, stones, glomerular disease, tumors, trauma, or other causes.

RDA

Recommended dietary allowance, the daily nutrient intake sufficient for nearly all healthy people in a defined group.

Alternate Names:
Recommended Dietary Allowance; Recommended Daily Allowance

Reabsorption

The transport of a substance from a body cavity or tubular fluid back into tissue or the bloodstream, such as renal tubular recovery of water and filtered solutes.

Reaction

A response of the body or mind to a stimulus, illness, medicine, treatment, or event. Examples include an allergic reaction, an immune reaction, a treatment response, and a psychological reaction; the cause and severity determine its importance.

Reactivation Tuberculosis

Active tuberculosis developing when a previously contained infection becomes active again, often years later. It commonly affects the upper lungs and may cause a long-lasting cough, coughing blood, fever, night sweats, weight loss, and spread to others through the air.

Reactive Arthritis

Painful inflammation of joints that develops during or after certain intestinal or genital infections. It may also cause eye inflammation, skin changes, or urinary symptoms, and the triggering infection may already have cleared.

Alternate Names:
Reiter Syndrome; Post-Infectious Arthritis

Reactive Attachment Disorder

A childhood trauma- and stressor-related disorder marked by emotionally withdrawn behavior toward adult caregivers: the child rarely seeks or responds to comfort when distressed. It follows a history of extremely insufficient care, such as severe social neglect, repeated changes in caregivers, or institutional rearing. Indiscriminate friendliness toward unfamiliar adults is characteristic of a separate condition, disinhibited social engagement disorder.

Reactive Gastropathy Pathology

Gastric mucosal injury characterized by foveolar hyperplasia, edema, smooth-muscle fibers in the lamina propria, vascular congestion, and relatively little active inflammation. Chemical injury, bile reflux, and medicines are common associations.

Reactive Hypoglycemia

A fall in blood sugar occurring within a few hours after eating. It may cause shakiness, sweating, hunger, weakness, dizziness, or confusion; diagnosis depends on low glucose being documented during symptoms.

Reactive Oxygen Species

Unstable oxygen-containing molecules produced during normal cell activity, infection, or inflammation. Small amounts can help cells signal and defend against germs, but excess amounts can damage cell membranes, proteins, and DNA.

Reactive Perforating Collagenosis

A skin condition in which damaged collagen from deeper skin is pushed through the surface. It causes small, firm, very itchy bumps with a central plug, often on the arms, legs, or hands, and may be associated with diabetes or kidney disease.

Reality Testing

The ability to recognize whether perceptions, thoughts, and beliefs match shared reality. Clinicians assess it during a mental-status examination; impaired reality testing can occur with psychosis, severe mood episodes, delirium, or some brain disorders.

Rebound Effect

Worsening or return of symptoms after stopping or reducing a treatment that had been suppressing them.

Rebound Headache

Alternate name; see *Medication Overuse Headaches*.

Rebound Insomnia

Return or worsening of insomnia after stopping a sleep medicine.

Rebound Tenderness

Pain that worsens when pressure on the abdomen is suddenly released. It can occur when the lining of the abdomen is irritated, but it does not identify the cause by itself.

Recalcitrant

Resistant to treatment, control, healing, or change; the term often describes a persistent disease or infection.

Receiver Operating Characteristic

A graph showing how a diagnostic test's ability to detect disease changes as its cutoff is changed. It compares true-positive and false-positive results; the area under the curve summarizes overall discrimi-

nation, not clinical usefulness by itself.

Recent Memory

Recent memory is the ability to recall information or events from the near past and can be impaired by aging, delirium, brain disease, depression, or medicines.

Receptor

A specialized transmembrane or intracellular macromolecular protein that selectively binds specific extracellular signaling ligands (such as neurotransmitters, hormones, cytokines, autocoids, or exogenous drugs) with high affinity, initiating conformational changes that transduce biochemical signals across the plasma membrane into intracellular effector pathways (e.g., G-protein coupled cascades, ligand-gated ion fluxes, receptor tyrosine kinase phosphorylation, or nuclear gene transcription).

Alternate Names:
Receptors

Receptor Binding

The attachment of a signaling molecule, medicine, or other ligand to a receptor on or inside a cell. Binding can activate, block, or change the receptor and its downstream cellular response.

Receptor Desensitization

A reduced cell response after a receptor is stimulated continuously or repeatedly. The change can develop quickly and helps prevent excessive signaling, but it may also reduce the effect of a medicine or natural body signal.

Receptor Downregulation

A decrease in the number or sensitivity of cell receptors after a signal stimulates them for a long time. The cell may remove receptors from its surface or break them down, becoming less responsive to the signal or medicine.

Receptors

Plural form; see *Receptor*.

Receptor Tyrosine Kinases

Cell-surface proteins that receive signals from hormones and growth factors. When switched on, they activate internal pathways controlling growth, survival, movement, and repair; abnormal activity can contribute to cancer and other disease.

Receptor Upregulation

An increase in the number or sensitivity of cell receptors after prolonged blocking of a signal or reduced stimulation. This adjustment can make a cell respond more strongly when the signal or medicine is later present.

Recession Of Medial Rectus Muscle

An eye operation that moves the medial rectus muscle backward to weaken its pull and correct certain inward eye deviations.

Recessive

Describing a gene change whose effect usually appears only when a person has two altered copies, one inherited from each parent. A person with one copy may carry it without having the condition.

RECIST

Standard rules for judging how a solid tumor changes on scans during treatment. Using measured lesions, they classify disease as completely gone, partly reduced, stable, or worsened; the categories support research and clinical decisions but do not replace overall assessment.

Recognizing Medical Emergencies

Identifying signs of a time-sensitive, potentially life-threatening condition, such as severe breathing difficulty, chest pain, stroke signs, major bleeding, seizure, collapse, poisoning, or altered consciousness.

Recognizing Teen Depression

Recognizing depression in adolescents involves looking for persistent low mood or irritability, loss of interest, sleep or appetite changes, poor concentration, hopelessness, or self-harm thoughts.

Recombinant

Produced by combining genetic material from different sources or by using engineered DNA in a cell or organism.

Recombinant DNA

DNA made by joining genetic material from different sources. It is used in biotechnology to produce medicines such as insulin and growth hormone, develop some vaccines, and create vehicles for gene therapy.

Recombinant Protein

A protein produced by putting its gene into a laboratory cell and growing the cell so it makes the protein. This method supplies some hormones, vaccines, antibodies, enzymes, and research materials.

Recombinant Tissue Plasminogen Activator

A laboratory-made form of tissue plasminogen activator that helps convert plasminogen to plasmin and dissolve blood clots. It is used in selected emergencies, such as some ischemic strokes, heart attacks, or pulmonary emboli, when benefits outweigh bleeding risk.

Alternate Names:
rtPA; Alteplase; Recombinant tPA

Recombinase

An enzyme that cuts, joins, or rearranges DNA segments. It helps cells exchange genetic material, repair some DNA damage, and assemble the gene parts needed to make a varied immune response.

Recombinational Repair

A way cells repair a serious DNA break by using a matching, undamaged DNA copy as a guide. It restores genetic information accurately; inherited problems with this repair can increase cancer risk and treatment sensitivity.

Recommended Daily Allowance

The Recommended Dietary Allowance is the average daily nutrient intake sufficient for nearly all healthy people in a specified age and sex group.

Recommended Dietary Allowance

The average daily intake expected to meet the nutrient needs of nearly all healthy people in a defined group.

Alternate Names:
RDA

Record

A health record is a documented account of a person's history, findings, tests, diagnoses, treatments, decisions, and outcomes.

Recovery Position

A side-lying position used for an unconscious but normally breathing person to help keep the airway open and reduce aspiration risk.

Recreation Therapy

Recreation therapy uses adapted games, arts, exercise, and leisure activities to support physical, emotional, cognitive, or social functioning.

Recrudescence

Recurrence of symptoms or infection after apparent improvement, often from persistence of the original organism or disease process.

Rectal

Rectal means relating to the rectum, the final section of the large intestine before the anal canal.

Rectal Biopsy

Removal of a small piece of tissue from the rectum for examination under a microscope. It can help investigate missing nerve cells, inflammation, infection, abnormal growth, or other rectal disease.

Rectal Bleeding

Blood coming from the anus or mixed with stool. It may come from hemorrhoids, small tears, bowel inflammation, growths, or cancer. Heavy, ongoing, or unexplained bleeding needs medical assessment.

Alternate Names:

Hematochezia

Rectal Cancer

Cancer developing in the rectum, the final part of the large intestine. Symptoms may include bleeding, altered bowel habits, pain, or weight loss; treatment may combine surgery, radiation, chemotherapy, immunotherapy, or targeted therapy.

Rectal Carcinoma

Rectal carcinoma is cancer arising in the rectum and may cause bleeding, altered bowel habits, pain, or anemia.

Alternate Names:
Rectal Cancer

Rectal Culture

Laboratory culture of a rectal specimen to detect selected bacterial pathogens or colonization, depending on the clinical indication.

Rectal Disease

A disorder affecting the rectum, including inflammation, infection, bleeding, obstruction, prolapse, functional disease, or neoplasm.

Rectal Fistula

A rectal fistula is an abnormal tract connecting the rectum with skin or another organ, often causing drainage, infection, or passage of stool through an abnormal route.

Rectal Hemorrhage

Bleeding from the rectum, which may result from hemorrhoids, fissure, inflammation, ischemia, polyps, cancer, trauma, or other gastrointestinal disease.

Rectal Inflammation

Alternate name; see *Proctitis*.

Rectal Itching

Alternate name; see *Anal Itching*.

Rectal Mucositis

Rectal mucositis is inflammation and injury of the rectal lining, often after radiation, chemotherapy, infection, inflammatory disease, or trauma.

Rectal Necrosis

Rectal necrosis is death of rectal tissue from inadequate blood flow, severe inflammation, infection, pressure, or another destructive process.

Rectal Neoplasm

An abnormal growth in the rectum that may be noncancerous, precancerous, or cancerous. It can cause bleeding, altered bowel habits, pain, anemia, or no symptoms and may require examination and biopsy.

Rectal Obstruction

Impaired passage through the rectum caused by fecal impaction, stricture, tumor, foreign body, inflammation, or functional outlet disorder.

Rectal Perforation

A tear or hole through the rectal wall that can release bowel contents and cause peritonitis, sepsis, or severe bleeding.

Rectal Polyposis

Rectal polyposis is the presence of multiple polyps in the rectum, which may be sporadic or part of an inherited syndrome and can increase cancer risk.

Rectal Polyps

Alternate name; see *Colon Polyps*.

Rectal Prolapse

The rectum slipping downward and partly or completely coming through the anus. It may cause a visible bulge, bleeding, mucus, discomfort, or difficulty controlling or passing stool and can result from weakened pelvic support, straining, or nerve problems.

Rectal Prolapse Repair

A surgical or procedural treatment that restores a

prolapsed rectum to its normal position and secures or removes affected tissue according to the prolapse and patient factors.

Rectal Route

The rectal route administers a medicine or fluid through the anus into the rectum, where it may act locally or be absorbed systemically.

Rectal Stenosis

Abnormal narrowing of the rectal lumen caused by inflammation, scarring, surgery, radiation, ischemia, trauma, or neoplasm.

Rectal Tenesmus

Rectal tenesmus is a persistent or urgent feeling of needing to pass stool despite an empty or nearly empty rectum, caused by inflammation, infection, mass, or motility disorder.

Rectal Ulcer

An open sore in the lining of the rectum. Causes include solitary rectal ulcer syndrome, inflammatory bowel disease, infection, reduced blood flow, radiation, or injury; evaluation depends on symptoms and examination findings.

Rectocele

Bulging of the rectum into the back wall of the vagina because supporting tissues have weakened. It may cause pelvic pressure, difficulty emptying the bowel, or a vaginal bulge.

Rectosigmoid Junction

The point where the sigmoid colon joins the rectum.

Rectosigmoid Neoplasm

A rectosigmoid neoplasm is an abnormal growth where the sigmoid colon joins the rectum and may be benign or malignant.

Rectouterine Pouch

The rectouterine pouch, or pouch of Douglas, is the peritoneal recess between the uterus and rectum where fluid or disease may collect.

Rectovaginal Fistula

Abnormal connection between the rectum and vagina causing passage of stool or gas through the vagina. Causes include obstetric injury particularly third and fourth degree perineal tears, Crohn disease, radiation therapy, and surgical complications. Presents with vaginal discharge of stool, flatus, or recurrent vaginal infections.

Rectum

The final straight section of the large intestine, approximately 12-15 cm long, extending from the sigmoid colon to the anal canal. The rectum stores feces before defecation.

Rectus Abdominis

The rectus abdominis is a paired abdominal muscle that flexes the trunk, stabilizes the pelvis, and helps compress abdominal contents.

Rectus Abdominis Muscle

The paired vertical muscles at the front of the abdomen, commonly called the “six-pack.” They bend the trunk forward, stabilize the pelvis, and help increase pressure inside the abdomen; stretching can cause separation during pregnancy or after major weight change.

Rectus Abdominis Sheath

A fibrous aponeurotic envelope formed by the abdominal wall muscles and surrounding the rectus abdominis muscle. It contains the superior and inferior epigastric vessels and related nerves.

Rectus Sheath Hematoma

A collection of blood within the sheath surrounding the rectus abdominis muscle, often caused by muscle strain, coughing, trauma, anticoagulation, or vessel injury. It may cause localized abdominal pain and a tender mass.

Recur

To recur means to return or happen again, as symptoms, disease, infection, or a tumor after a period of improvement or treatment.

Recurrence

The return of a disease after it improved or seemed to disappear. Cancer may return at the original site, nearby lymph nodes, or another part of the body; recurrence does not always mean that treatment is no longer possible.

Recurrence-Free Survival

The length of time after treatment during which a disease does not return. In cancer studies, it usually ends when cancer is found again or when a person dies, depending on the study rules. It measures control of disease, not a guarantee that treatment has cured it.

Recurrence Risk

The chance that a disease or condition will return after treatment or occur again in a future pregnancy or family member. The estimate depends on the condition, previous history, test results, inheritance pattern, and other risk factors.

Recurrent

Happening again after a period of improvement, remission, or apparent absence. A recurrent condition may return at the original site or elsewhere; examples include repeated urinary infections, repeated seizures, or cancer returning after treatment.

Recurrent Breast Cancer

Breast cancer that returns after a period when tests found no detectable disease. It may recur near the original site or elsewhere and is assessed with examination, imaging, biopsy, and other tests.

Recurrent Caries

Tooth decay that develops beneath or beside an existing filling, crown, or other restoration. It may result from leaking edges, plaque, frequent sugar, or dry mouth and can cause sensitivity, pain, or further tooth damage.

Recurrent Disease

Return of a disease after a period of improvement, remission, or apparent absence, either at the original site or elsewhere.

Recurrent Early Pregnancy Loss

Repeated miscarriages occurring early in pregnancy. Evaluation may consider uterine anatomy, chromosomal factors, antiphospholipid syndrome, endocrine or metabolic disease, parental genetics, and other causes, although no cause is found in many cases.

Recurrent Fractures

Repeated bone fractures, suggesting persistent trauma, osteoporosis, bone fragility, metabolic disease, tumor, or an inherited skeletal disorder.

Recurrent Laryngeal Nerve

A branch of the vagus nerve supplying most intrinsic muscles of the larynx; injury can cause hoarseness.

Recurrent Laryngeal Nerve Palsy

Weakness or paralysis of the vocal fold muscles supplied by the recurrent laryngeal nerve, usually from surgery, tumor compression, or other nerve injury. It can cause hoarseness; bilateral injury may obstruct breathing, and swallowing problems may increase aspiration risk.

Alternate Names:
RLN Palsy

Recurrent Oral Ulcers

Alternate name; see *Canker Sore*.

Recurrent or Metastatic Breast Cancer

Breast cancer that returns after treatment or has spread from the breast to distant organs or tissues. Assessment and treatment depend on the site of disease, hormone-receptor and HER2 status, prior therapy, symptoms, and the person's goals.

Recurrent Pregnancy Loss

Two or more miscarriages. Possible causes include chromosome changes, an unusual shape of the uterus, hormone or thyroid problems, antiphospholipid syndrome, or other medical conditions, although no cause is found in many people. Evaluation is individualized and may identify treatment that improves the chance of a future healthy pregnancy.

Alternate Names:
Recurrent Miscarriage; Recurrent Miscarriages; Habitual Abortion; RPL

Recurrent Prostate Cancer

Alternate name; see *Prostate Cancer*.

Recurrent Respiratory Papillomatosis

A disease in which wart-like growths caused by human papillomavirus develop in the larynx or other breathing passages. The growths can cause hoarseness, noisy breathing, airway narrowing, or repeated recurrence.

Recurrent Urinary Tract Infection

Repeated urinary tract infections separated by periods without infection. They may affect the bladder or kidneys and can be related to bacteria that persist, incomplete bladder emptying, stones, urinary blockage, or other urinary-tract problems.

Red Birthmarks

Red birthmarks are vascular skin marks present at or soon after birth, ranging from harmless capillary marks to lesions requiring monitoring or specialist treatment.

Red Blood Cell

A blood cell that carries oxygen from the lungs to the body's tissues. It contains hemoglobin, has a flattened, indented shape, and lacks a nucleus, which helps it bend through small blood vessels. Red blood cells also carry some carbon dioxide back to the lungs and help keep the blood's acid level balanced. They are made mainly in the bone marrow and normally live for about 120 days.

Red Blood Cell Count

A laboratory measurement of the number of circulating erythrocytes per volume of blood; see *Red Blood Cell* and *Complete Blood Count*.

Red Blood Cell Casts

Tube-shaped groups of red blood cells seen in urine. They form inside the kidney's small tubes and strongly suggest bleeding or inflammation in the kidney's filtering units, such as glomerulonephritis or vasculitis.

Alternate Names:
RBC Casts

Red Blood Cell Labeling

A nuclear-medicine technique in which a person's red blood cells are marked with a small amount of radioactive material. Scans can then show active digestive-tract bleeding or assess how well the heart's ventricles pump blood.

Red Bone Marrow

Bone marrow that makes red blood cells, white blood cells, and platelets. It is found mainly in certain bones and in the spongy parts of many bones.

Red Cell Distribution Width

A complete blood count measurement of variation in red blood cell size, also called anisocytosis. An increased value may occur in several types of anemia and is interpreted with the other blood-count results; it cannot by itself distinguish iron deficiency from thalassemia trait.

Alternate Names:
RDW

Red Cell Indices

Standardized automated complete blood count parameters derived from hemoglobin, hematocrit, and erythrocyte count that quantify red blood cell physical properties: mean corpuscular volume (MCV), mean corpuscular hemoglobin (MCH), and mean corpuscular hemoglobin concentration (MCHC).

Red Eye

Redness of the white part of the eye caused by irritation, dryness, allergy, infection, injury, inflammation, or increased surface blood flow.

Red Flag

A symptom, sign, or test result associated with a potentially serious condition. Its significance depends

on the clinical context.

Red Hepatization

A stage of acute lobar pneumonia in which the affected lung becomes firm and red as air spaces fill with red blood cells, immune cells, and fibrin. The appearance resembles liver tissue.

Alternate Names:
Second Stage of Lobar Pneumonia; Consolidation Stage

Red Infarction

Tissue death caused by loss of blood flow in which blood also leaks into the damaged area, making it dark red. It is more likely in organs with a second blood supply or when a vein is blocked.

Alternate Names:
Hemorrhagic Infarction

Red Man Syndrome

An older term for vancomycin infusion reaction, a rate-related reaction that can cause flushing, itching, and redness of the face, neck, and upper body during or after an infusion.

Alternate Names:
Vancomycin Infusion Reaction Vancomycin Flushing Reaction Vancomycin Flushing Syndrome Histaminoid Infusion Reaction

Red-Man Syndrome

See *Red Man Syndrome*.

Red Nucleus

A group of nerve cells in the midbrain that helps coordinate movement through connections with the cerebellum and spinal cord. Damage to nearby pathways can cause weakness, tremor, or abnormal movement.

Reductase Deficiency

A disorder or laboratory finding caused by inadequate activity of a reductase enzyme, impairing a specific metabolic or hormone pathway.

Reduction

Restoration of a displaced fracture or joint to better alignment, or decrease in amount, size, or activity.

Reduction Division

The first division of meiosis, when a reproductive cell's chromosome number is reduced by half. It produces cells with one chromosome from each pair and helps create genetic variation in eggs and sperm.

Reduction Mammaplasty

Surgery that removes breast tissue, fat, and excess skin to reduce breast size and relieve symptoms such as neck, shoulder, or back discomfort; it may also reshape the breasts.

Redundant Mitral Valve

Excess leaflet tissue of the mitral valve, most commonly the posterior leaflet, which may prolapse into the left atrium during systole. Often associated with myxomatous degeneration and mitral valve prolapse. May be asymptomatic or cause mild mitral regurgitation detected incidentally on echocardiography.

Red Urine

Urine that looks pink or red. It may contain blood, but foods, medicines, or other substances can also change its color. A urine test can help find the cause.

Reduviidae

A family of insects including assassin bugs; some species transmit pathogens such as the parasite causing Chagas disease.

Reed-Sternberg Cells

Large abnormal immune cells derived from B lymphocytes and commonly found in classic Hodgkin lymphoma. Their appearance in a tissue sample helps pathologists confirm that diagnosis.

Reexpansion Pulmonary Edema

A sudden buildup of fluid in a lung after it rapidly expands from a collapsed state, often after drainage of a large or long-standing pneumothorax. It can

cause severe breathlessness, low oxygen, and respiratory failure.

Refeeding Syndrome

Dangerous changes in body salts and fluid balance when food is restarted after severe or prolonged undernutrition. Low phosphate, potassium, or magnesium can cause weakness, swelling, abnormal heart rhythms, breathing failure, or death.

Reference Interval

The range of results usually found in a selected healthy reference group, often covering the middle 95 percent. A result outside it does not by itself prove disease and must be interpreted with symptoms, history, and the laboratory's own method.

Referral

A request for assessment or treatment by another healthcare professional or service. Referrals help patients access specialized expertise, tests, procedures, rehabilitation, or coordinated care for a particular concern.

Referred Otalgia

Ear pain arising from a problem elsewhere, such as a tooth, jaw joint, throat, or neck, while the ear itself may appear normal. It occurs because these areas share sensory nerve pathways with the ear.

Referred Pain

Pain felt in an area away from the tissue causing it because nearby or connected nerves share pathways to the brain. Examples include shoulder pain from irritation below the diaphragm or arm and jaw pain during a heart attack.

Reflex

An involuntary, stereotyped, and rapid neuromuscular or autonomic functional response to a specific sensory stimulus, mediated across an intact neural circuit known as a reflex arc (comprising a sensory receptor, afferent limb, central integrating synapse, efferent limb, and effector organ). Clinical evaluation of deep tendon reflexes (muscle stretch reflexes), superficial reflexes (e.g., plantar response), and cranial nerve reflexes (corneal, pupillary light reflex) provides localizing diagnostic information regarding the integrity of peripheral nerves, spinal cord roots, and central upper motor neuron pathways.

Alternate Names:
Reflexes

Reflex Action

A rapid, automatic response to a stimulus that occurs through a nerve pathway called a reflex arc. Reflexes protect the body, maintain posture, and provide information about nerve and spinal-cord function.

Reflex Anoxic Seizure

A brief fainting episode that can look like a seizure after sudden pain, fright, or emotional stress. The heart slows briefly, the person becomes pale and unresponsive, and jerking may occur before rapid recovery.

Reflex Arc

The nerve pathway that produces a rapid, automatic response. It includes a sensor, a sensory nerve, a processing center in the spinal cord or brain, a motor nerve, and the muscle or gland that responds.

Reflex Epilepsy

Reflex epilepsy is epilepsy in which specific stimuli such as flashing light, sound, reading, or touch reliably trigger seizures.

Reflexes

Plural form; see *Reflex*.

Reflux

The backward flow of a body fluid, especially stomach contents into the esophagus or urine from the bladder toward the kidneys. Symptoms and risks depend on the type, frequency, and underlying cause.

Reflux Esophagitis Pathology

Mucosal injury associated with gastroesophageal reflux, often showing basal-zone hyperplasia, elongation of lamina-propria papillae, intercellular edema,

and variable eosinophils or neutrophils.

Reflux Laryngitis

Irritation or inflammation of the larynx attributed to reflux of stomach contents into the throat or upper airway. Hoarseness, throat clearing, cough, globus sensation, or throat discomfort may occur, though these symptoms also have other causes.

Reflux Nephropathy

Renal scarring and chronic kidney damage caused by vesicoureteral reflux, recurrent urinary infection, or both. It may lead to hypertension, proteinuria, impaired growth, and chronic kidney disease.

Refraction

The bending of light as it passes through the cornea, aqueous humour, lens, and vitreous humour. In an eye examination, refraction determines the optical power needed to focus a clear image on the retina; refractive power is measured in dioptres.

Refractive Disorder

A vision problem caused by the eye not focusing light correctly on the retina. Nearsightedness, farsightedness, astigmatism, and presbyopia are common refractive disorders and may be corrected with glasses, lenses, or surgery.

Refractive Error

A refractive error occurs when the eye does not focus light correctly on the retina, causing nearsightedness, farsightedness, astigmatism, or presbyopia.

Refractive Errors And Astigmatism

Refractive errors are vision disorders caused by the eye's inability to properly focus light onto the retina, resulting in blurred vision.

Refractive Surgery

Surgery that changes the cornea or, in some procedures, the eye's lens to reduce refractive errors such as myopia, hyperopia, and astigmatism. Procedures include laser reshaping of the cornea and implantation or exchange of lenses. Outcomes and risks, including dry eye, glare, or residual refractive error, vary by procedure and patient.

Alternate Names:
Corrective Eye Surgery

Refractometer

A refractometer measures how much light bends through a substance and is used for fluid concentration, optical properties, or eye refraction.

Refractometry

Measurement of the eye's refractive power to determine the optical correction needed for myopia, hyperopia, astigmatism, or presbyopia.

Refractory

Resistant to a treatment or not responding adequately to it. The term may refer to cancer or other diseases.

Refractory Anemia

An older name for some myelodysplastic syndrome subtypes involving persistent anemia. It is not a preferred general term for any anemia that fails to improve with treatment.

Refractory Cancer

Refractory cancer is cancer that does not respond adequately to a treatment or begins progressing during treatment.

Refractory Disease

Disease that does not improve adequately with appropriate standard treatment or that continues to worsen despite therapy. The term does not mean that every possible treatment has failed.

Refractory Period

The brief recovery time after a nerve or muscle cell sends an electrical signal. During this time it cannot, or can only partly, send another signal, which helps control the speed and direction of nerve and heart activity.

Refractory Phaeohyphomycosis

Phaeohyphomycosis that persists, progresses, or recurs despite antifungal treatment. The infection may be localized, deep, or disseminated; “refractory” describes its clinical response and does not by itself establish antifungal resistance.

Refrigerant Poisoning

Poisoning from inhaling or contacting a refrigerant gas or liquid. Exposure can cause dizziness, abnormal heart rhythms, suffocation, frostbite, chemical burns, or lung injury.

Refsum Disease

A rare inherited disorder in which phytanic acid builds up in the body, usually because it cannot be broken down normally. It can cause night blindness, loss of smell, nerve damage, poor coordination, hearing loss, and scaly skin.

Regadenoson Pharmacological Stress

A stress test using regadenoson, a medicine that temporarily widens the heart arteries to assess blood flow during cardiac imaging when a person cannot exercise adequately.

Regeneration

Growth or replacement of damaged or lost cells and tissues, helping restore structure or function after injury.

Regimen

A planned schedule for medicines, treatments, diet, exercise, or other healthcare steps. It states what to do, how much or how often, and for how long, and may be changed according to response or side effects.

Regional

Relating to a particular body area, geographic area, or localized distribution rather than the whole body.

Regional Anatomy

The study of all structures within a particular body region and the relationships among them, such as the anatomy of the head and neck, thorax, abdomen, or limb.

Regional Anesthesia

Numbing a larger body area by injecting local anesthetic near the nerves supplying it. The person is usually awake, although sedation may be added; the block can provide numbness during surgery and pain relief afterward.

Alternate Names:
Conduction Anesthesia

Regional Chemotherapy

Treatment that delivers anticancer medicine directly to a body region or organ to produce a high local concentration while reducing, but not eliminating, exposure elsewhere. It is suitable only for selected cancers and carries procedure-related and medicine-related risks.

Regional Enteritis

An older name for Crohn disease, a chronic inflammatory bowel disease that can affect any part of the digestive tract.

Regional Ileitis

An older name for Crohn disease affecting the ileum, especially its terminal part.

Regulation Of Health Professions

Legal and professional systems that govern healthcare workers’ education, licensing, permitted duties, conduct, and accountability. Regulation aims to protect patients, maintain competence, support ethical care, and address unsafe practice.

Regulatory Approval

Authorization by a competent regulatory authority for a medicine, device, or procedure to be marketed or used for specified purposes after review of evidence.

Regulatory Authority

A regulatory authority is a government or official body that sets and enforces standards for medicines,

devices, facilities, professionals, or public health.

Regulatory Gene

A gene that controls when, where, or how strongly another gene is used. Changes in regulatory genes or their control regions can alter development, cell growth, metabolism, or disease risk.

Regulatory T Cells

Immune cells that limit excessive immune reactions and help prevent attacks against the body's own tissues. They develop mainly in the thymus or from other T cells in tissues. Problems with their function can contribute to autoimmune disease.

Regurgitation

Backward flow of a body fluid, especially blood through a heart valve that does not close fully or stomach contents into the esophagus. The medical meaning depends on the organ involved.

Rehab

Alternate name; see *Rehabilitation*.

Rehabilitation

A coordinated process that helps a person restore or adapt physical, cognitive, psychological, and social function after illness, injury, surgery, or disability.

Rehabilitation Clinic

An outpatient facility where a team helps people regain or adapt movement, communication, thinking, daily activities, or independence after illness, injury, surgery, or disability. Services may include physical, occupational, speech, or other rehabilitation therapies.

Rehabilitation Engineering

The use of engineering and technology to improve independence after illness or disability. It includes artificial limbs, braces, wheelchairs, communication aids, home adaptations, and devices that help control the environment.

Rehabilitation Motivation

A person's willingness and ability to take part in rehabilitation and work toward functional goals. Pain, mood, fatigue, cognition, support, confidence, and the expected benefit can all influence participation.

Rehabilitation Potential

The expected capacity to improve function, independence, participation, or quality of life through rehabilitation. It depends on diagnosis, prognosis, cognition, motivation, comorbidity, social support, and environmental resources.

Rehabilitation Unit

A hospital unit for people who need coordinated medical care and intensive therapy after a serious illness or injury, such as stroke, brain or spinal-cord injury, or major surgery. The team works to restore safe movement, daily skills, communication, and independence.

Rehydration

Replacement of water and electrolytes lost through dehydration, commonly using oral fluids or intravenous treatment when necessary.

Reid Index

A microscope measurement comparing the thickness of mucus-making glands with the wall of a large airway. A higher value may be seen in chronic bronchitis, but it is not used alone to diagnose the condition.

Alternate Names:
Bronchial Gland-to-Wall Ratio; Reid Histopathologic Index

Reifenstein Syndrome

An inherited disorder of androgen action, usually involving partial androgen insensitivity in an individual with a 46,XY chromosome pattern.

Reiki

A complementary practice involving light touch or holding the hands near the body. It is sometimes used for relaxation, but it has not been shown to

treat disease.

Reinfection

A new episode of infection by the same or a related pathogen after the original infection has resolved. Reinfection is distinct from relapse, in which the original infection persists or returns from an incompletely eradicated focus.

Reinke Edema

Chronic polypoid degeneration and diffuse, gelatinous mucoid edema within the superficial lamina propria (Reinke's space) of both true vocal cords, strongly associated with chronic cigarette smoking and vocal strain, presenting with progressive hoarseness and a deepened voice.

Alternate Names:
Polypoid Corditis; Diffuse Vocal Fold Edema

Reinnervation

Restoration of nerve supply to a muscle or tissue after nerve repair, regeneration, or collateral nerve growth.

Rejection

An immune response in which the body recognizes transplanted tissue or an organ as foreign and attacks it. Rejection can damage or destroy the transplant, may be sudden or gradual, and is monitored and treated with immune-suppressing medicines.

Alternate Names:
Allograft Rejection; Graft Rejection

Relapse

Return or reappearance of a disease, or its signs and symptoms, after a period of improvement or remission. In substance-use disorders, relapse means renewed use after a period of abstinence.

Relapse-Free Survival

The time from a defined point in a cancer study to relapse or another specified event, often including death. The study protocol defines when the period starts and which events count.

Relapsing Fever

An acute febrile illness caused by Borrelia species, characterized by recurrent episodes of fever separated by afebrile intervals.

Relapsing Polychondritis

A rare immune disease in which episodes of inflammation damage cartilage. It commonly affects the ears, nose, eyes, joints, or windpipe and may cause pain, swelling, hearing or breathing problems; airway involvement can be life-threatening.

Relapsing-Remitting Multiple Sclerosis

A form of multiple sclerosis in which neurological symptoms appear in attacks and then improve partly or completely for periods of time. Symptoms may include vision changes, numbness, weakness, balance problems, or fatigue. Treatment can reduce relapses and new nerve damage, although the course varies between people.

Alternate Names:
RRMS; Relapsing-Remitting MS

Relative Afferent Pupillary Defect

Unequal response of the pupils because one eye or optic nerve sends less light information to the brain than the other. During a swinging-light test, both pupils may appear to dilate when the light moves to the affected eye; it can indicate retinal or optic-nerve disease.

Alternate Names:
RAPD; Marcus Gunn Pupil

Relative Biological Effectiveness

A comparison of how strongly two types of radiation produce the same biological effect at the same absorbed dose. It depends on the radiation type, dose, tissue, and biological outcome.

Relative Bradycardia

A heart rate that is lower than expected for the degree of fever. It can occur in several infections and other conditions, but is not specific to a particular diagnosis.

Alternate Names:

Sphygmothermic Dissociation; Inappropriate Bradycardia in Fever

Relative Risk

A comparison of the chance of an outcome in an exposed group with its chance in an unexposed group. A value above 1 suggests higher risk, a value below 1 suggests lower risk, and 1 suggests no difference.

Relaxation

A reduction in muscle tension, physiologic arousal, or psychological stress; techniques may include breathing, biofeedback, or progressive muscle relaxation.

Relaxation Response

The body's calming changes after activities such as slow breathing, meditation, or progressive muscle relaxation. Heart rate, breathing, muscle tension, and stress-related alertness may decrease.

Relaxation Techniques For Stress

Relaxation techniques for stress include slow breathing, progressive muscle relaxation, meditation, guided imagery, and other methods that reduce physical arousal.

Relaxation Therapy

Techniques such as breathing, muscle relaxation, or imagery used to reduce stress, arousal, or symptom burden.

Relaxin

Relaxin is a reproductive hormone that helps remodel connective tissue and may contribute to cervical, pelvic, and vascular changes during pregnancy.

Religion

A system of spiritual beliefs and practices that may influence health decisions, coping, diet, treatment preferences, and end-of-life care.

Relocation Test

A shoulder examination often performed after an apprehension test. The examiner gently supports the front of the shoulder while the arm is in a vulnerable position. Relief of fear or pain may support shoulder instability, but the result must be interpreted with the rest of the examination.

Alternate Names:
Fowler Test; Jobe Relocation Test

REM

Rapid eye movement, a sleep stage associated with vivid dreams and intense brain activity.

Alternate Names:
Rapid Eye Movement; REM Sleep

REM Behavior Disorder

A sleep disorder where a person physically acts out dreams because normal muscle relaxation during REM sleep is lost.

Alternate Names:
RBD; REM Sleep Behavior Disorder

Remedy

A treatment or measure intended to relieve a symptom or illness; safety and effectiveness depend on the specific remedy and condition.

Remifentanil

A very short-acting opioid pain medicine given by infusion during anesthesia or intensive procedures. Its effects wear off quickly after the infusion stops, but it can slow breathing, lower blood pressure, and cause opioid-related complications.

Remission

A period when the signs, symptoms, or measurable activity of a disease decrease or disappear. Partial remission indicates improvement with residual disease; complete remission means the disease is not detectable by currently available methods or criteria. Definitions vary by condition, and remission does not always mean cure or permanent resolution.

Remittent Fever

Fever that rises and falls during the day but remains above normal temperature, rather than returning

completely to normal.

Remodeling

The body's ongoing process of removing old tissue and building new tissue to adapt to use, injury, growth, or disease. Bone remodeling responds to stress, hormones, nutrition, and medicines throughout life.

Remote Surgery

Surgery performed when the surgeon is physically separated from the patient and controls robotic instruments through a telecommunications system. It may also include remote surgical assistance or guidance, with a qualified local team available to manage the patient and respond to emergencies.

Alternate Names:
Telesurgery Telepresence Surgery

Removal Technique

The method used to take away a foreign object, diseased tissue, stone, clot, or other material from the body. The appropriate method depends on its location, size, cause, and risk of bleeding, infection, or injury to nearby structures.

REM Rebound

An increase in rapid-eye-movement sleep after sleep loss, REM deprivation, or stopping a medicine that suppresses REM sleep. It may cause vivid dreams, nightmares, or temporary changes in sleep patterns.

REM Sleep

A sleep stage with rapid eye movements, active brain activity, and temporary relaxation of most skeletal muscles. Vivid dreams are common, and REM sleep supports memory, learning, emotional processing, and healthy development.

REM Sleep Behavior Disorder

A sleep disorder in which the normal muscle paralysis of REM sleep is reduced or absent, allowing a person to move or vocalize while dreaming.

Alternate Names:
Rapid Eye Movement Sleep Behavior Disorder

Renal

Renal means relating to the kidneys, which filter blood, regulate fluid and electrolytes, produce hormones, and excrete urine.

Renal Abscess

A localized collection of pus within or around the kidney, usually caused by infection. Diagnosis and treatment may require imaging, antibiotics, and drainage.

Renal Adenoma

A renal adenoma is a usually benign kidney tumor, often discovered incidentally; its size, imaging features, and growth determine whether follow-up is needed.

Renal Agenesis

A condition present at birth in which one or both kidneys fail to form. One absent kidney may cause no symptoms if the other works well, but absence of both kidneys is usually fatal before or shortly after birth.

Renal and Ureteral Injury

Injury to a kidney or ureter from blunt trauma, a penetrating wound, or a medical procedure. It may cause blood in the urine, flank pain, bleeding around the kidney, or urine leakage; severity and treatment depend on the injury.

Renal And Urological Diseases

Renal and urological diseases affect the kidneys, urinary tract, bladder, urethra, or male reproductive urinary organs.

Renal Anemia

Anemia associated with chronic kidney disease. Diseased kidneys make less erythropoietin, a hormone that stimulates red-cell production, and iron deficiency or inflammation may add to the problem, causing tiredness and breathlessness.

Renal Angioplasty

A minimally invasive vascular procedure using a bal-

loon catheter to widen narrowed renal arteries, often accompanied by stent placement; see *Angioplasty*.

Renal Arteriography

Renal arteriography uses contrast X-rays to visualize kidney arteries and may identify narrowing, bleeding, aneurysm, or vascular anatomy during an intervention.

Renal Artery

One of the two main arteries carrying blood from the abdominal aorta to the kidneys. Each divides into smaller branches inside the kidney so blood reaches the filtering tissue.

Renal Artery Aneurysm

A focal enlargement of a renal artery, often asymptomatic but capable of causing hypertension, thromboembolism, or rupture. Management depends on size, symptoms, anatomy, pregnancy, and growth, and may involve surveillance, endovascular treatment, or surgery.

Renal Artery Disease

Disease affecting one or more arteries supplying the kidneys, including narrowing, blockage, aneurysm, or dissection.

Renal Artery Doppler

Doppler ultrasound that measures blood flow in the renal arteries. It may help assess narrowing or blockage that can contribute to renovascular hypertension.

Renal Artery Embolism

Sudden blockage of an artery supplying the kidney, often by a clot from the heart in atrial fibrillation or another heart condition. It may cause abrupt side pain, blood in urine, nausea, or kidney injury.

Renal Artery Stenosis

Narrowing of an artery supplying a kidney. It can reduce kidney blood flow and contribute to high blood pressure or worsening kidney function. Causes include atherosclerosis and fibromuscular dysplasia.

Alternate Names:
RAS; Renal Artery Narrowing

Renal Biopsy

Alternate name; see *Kidney Biopsy*. It is used selectively for unexplained acute kidney injury, nephrotic syndrome, glomerular hematuria, or transplant dysfunction; bleeding is the main complication.

Renal Calculi

Alternate medical term; see *Kidney Stone*.

Renal Calculus

A kidney stone, a hard mass of mineral crystals formed in the urinary tract. It may pass without symptoms or cause severe wave-like pain, blood in the urine, blockage, vomiting, or urinary infection.

Renal Cancer

Alternate name; see *Kidney Cancer*.

Renal Carcinoma

Cancer arising from kidney tissue, most often renal cell carcinoma, which begins in cells lining the kidney's small filtering units.

Renal Cell Carcinoma

The most common type of kidney cancer in adults, originating in the tiny tubes within the kidney that filter blood and produce urine. As the tumor grows, it can cause blood in the urine (hematuria), a dull ache or lump in the side or lower back (flank pain), fever, unexplained weight loss, and fatigue. In some cases, the tumor produces excess hormones that trigger high blood pressure, high red blood cell counts, or elevated blood calcium levels.

Alternate Names:
RCC; Hypernephroma; Grawitz Tumor; Renal Cell Adenocarcinoma

Renal Cell Carcinoma Pathology

Pathologic classification of renal cell carcinoma by growth pattern, cytology, immunophenotype, necrosis, sarcomatoid or rhabdoid change, and invasion. Clear cell, papillary, chromophobe, and other recog-

nized subtypes have different features and behavior.

Renal Changes In Pregnancy

Pregnancy increases renal blood flow and glomerular filtration. These changes lower usual serum creatinine values and may increase urinary loss of glucose and amino acids.

Renal Circulation

Blood flow through the kidneys, which supports filtration, oxygen delivery, hormone production, and regulation of fluid and electrolytes.

Renal Clearance

A measure of how quickly the kidneys remove a substance from the blood. It is usually calculated from blood and urine levels and helps assess kidney function or adjust some medicine doses.

Renal Colic

Severe, intermittent flank pain, most often caused by acute obstruction of the ureter by a stone. It may radiate toward the groin and occur with nausea, vomiting, or blood in the urine. The term is also called ureteric colic; other ureteral obstructions can cause a similar pattern.

Renal Corpuscle

The first part of a kidney filtering unit, made of a tiny ball of blood vessels inside a cup-shaped capsule. Water and small dissolved substances pass out of the blood here to begin urine formation.

Renal Cortex

The outer layer of the kidney. It contains many of the structures that filter blood and process the first fluid that will become urine, while extensions of the cortex separate the inner kidney pyramids.

Renal Cryptococcosis

Infection of the kidney by Cryptococcus species, usually as part of disseminated cryptococcosis in an immunocompromised person.

Renal Cyst

Alternate name; see *Kidney Cysts*.

Renal Dialysis

Alternate term for dialysis: kidney replacement therapy using hemodialysis or peritoneal dialysis to remove excess fluid and dissolved waste products when kidney function is inadequate.

Renal Diet

An eating plan adjusted for kidney disease. Depending on kidney function and treatment, it may limit sodium, potassium, phosphorus, or fluid while providing enough calories and protein; needs differ between people and during dialysis.

Renal Disease

Any acute or chronic pathological condition impairing the structure or physiological function of the kidneys, encompassing glomerular, tubulointerstitial, vascular, obstructive, and cystic disorders. Major manifestations include acute kidney injury (AKI), chronic kidney disease (CKD), nephrotic and nephritic syndromes, and end-stage renal disease (ESRD), leading to disruptions in fluid homeostasis, electrolyte and acid-base regulation, blood pressure control, and nitrogenous metabolic waste excretion.

Alternate Names:
Renal Diseases; Kidney Disease; Nephropathy

Renal Diseases

Plural form; see *Renal Disease*.

Renal Dose Adjustment

Modification of a medication dose, dosing interval, or both to account for reduced kidney clearance. It depends on kidney-function estimates, drug pharmacokinetics, treatment indication, and, for some medicines, therapeutic drug monitoring.

Renal Dysplasia

Abnormal development of kidney tissue before birth. It may affect one or both kidneys and can cause reduced kidney function, high blood pressure, urine reflux, or other urinary-tract problems.

Renal Dysplasia And Cystic Disease

A group of developmental or inherited kidney disorders in which the kidneys have abnormal tissue, cysts, or both. They may affect one or both kidneys and can reduce kidney function or cause high blood pressure.

Renal Failure

See *Kidney Failure*.

Renal Function

The kidneys' ability to filter blood, remove waste, regulate fluids and electrolytes, maintain acid-base balance, and produce or activate hormones.

Renal Glomerulus

A tiny ball of blood vessels inside each kidney filtering unit. Water and small dissolved substances pass from the blood through its walls to begin urine formation, while blood cells and most proteins remain in the bloodstream.

Renal Hamartoma

An imprecise, older term for a benign-appearing disorganized growth in the kidney. It has sometimes been used for renal angiomyolipoma, now classified as a neoplasm rather than a hamartoma.

Renal Hypertension

High blood pressure caused by kidney disease or reduced blood flow to the kidneys, often from narrowing of a renal artery.

Renal Hypertrophy

Renal hypertrophy is enlargement of kidney tissue, often compensating for loss or reduced function of the other kidney but sometimes caused by disease.

Renal Hypoperfusion

Reduced blood flow to the kidneys, which can lower filtration and cause acute kidney injury. Causes include dehydration, blood loss, shock, heart failure, renal artery disease, and severe hypotension.

Renal Infarction

Death of part of the kidney caused by a blocked blood vessel. It may cause sudden flank or abdominal pain, nausea, blood in the urine, or reduced kidney function.

Renal Insufficiency

Renal insufficiency is reduced kidney function that impairs waste removal, fluid and electrolyte balance, acid handling, or hormone production.

Renal Leukemia Infiltration

Spread of leukemia cells into kidney tissue. It may enlarge both kidneys and reduce kidney function, sometimes causing sudden kidney injury, blood or protein in urine, or high blood pressure; treatment focuses on the underlying leukemia.

Renal Lithiasis

Alternate name; see *Kidney Stones*.

Renal Manifestations of Sickle Cell Disease

Kidney complications of sickling disorders, including excessive urination, impaired concentration, hematuria, proteinuria, papillary necrosis, acute kidney injury, and progressive chronic kidney disease. Blood pressure and urine abnormalities require ongoing monitoring.

Renal Mass

An abnormal area seen in or on a kidney during imaging. It may be a harmless cyst, infection, scar, benign growth, or cancer; its appearance, size, growth, and sometimes biopsy determine the next step.

Renal Medulla

The inner part of the kidney containing tubes and blood vessels that help concentrate urine. It receives the fluid processed by the outer kidney and directs the finished urine toward the kidney's central collecting area.

Renal Necrosis

Renal necrosis is death of kidney tissue caused by severe ischemia, toxins, infection, obstruction, or other injury and can cause acute kidney failure.

Renal Oncocytoma

A renal oncocytoma is a usually benign kidney tumor arising from oncocytic cells; imaging may not always distinguish it reliably from renal cancer.

Renal Osteodystrophy

The bone changes that are part of chronic kidney disease mineral and bone disorder. Changes in calcium, phosphate, vitamin D, parathyroid hormone, and bone remodeling can affect bone strength and growth; the pattern and treatment vary with the person and kidney disease.

Renal Papillary Necrosis

Renal papillary necrosis is death of the kidney papillae from ischemia, infection, obstruction, diabetes, sickle-cell disease, or analgesic injury and may cause blood or obstruction.

Renal Parenchyma

The working tissue of the kidney, containing the tiny filtering units and supporting structures that remove waste from blood, balance body fluids, and produce urine.

Renal Pelvis

The funnel-shaped expansion of the ureter within the kidney, formed by the union of major calyces. It collects urine from the renal papillae and directs it into the ureter.

Renal Pelvis Or Ureter Cancer

Cancer of the renal pelvis or ureter usually arises from urothelial cells lining the urinary tract and may cause blood in the urine.

Renal Perfusion Scintiscan

A nuclear medicine study using a radiotracer to evaluate renal blood flow and relative perfusion of the kidneys.

Renal Pyramids

Cone-shaped structures in the renal medulla that contain tubules and collecting ducts and drain urine toward the renal papillae.

Renal Reabsorption

The return of water and useful substances, such as salt, sugar, and bicarbonate, from kidney tubes into the blood. This prevents their unnecessary loss and helps control body fluids and chemistry.

Renal Replacement Therapy

Alternate name; see *Kidney Replacement Therapy*.

Renal Replacement Therapy Indications

Clinical problems that may require urgent dialysis include severe electrolyte or acid-base disturbances, certain poisonings, fluid overload causing organ dysfunction, or complications of waste buildup. Decisions also consider kidney recovery, overall health, and the person's goals.

Renal Salt-Wasting Syndrome

Excessive loss of sodium and other salts through the kidneys, causing low blood sodium, dehydration, low blood pressure, or muscle symptoms. Causes include inherited tubular disorders, medicines, kidney disease, and hormonal problems.

Renal Sarcoma

Renal sarcoma is a rare malignant tumor arising from connective or supporting tissues of the kidney.

Renal Scan

A nuclear medicine test using a small radioactive tracer to assess kidney blood flow, drainage, or separate function. The tracer and scan method are chosen according to the clinical question.

Renal Scintigraphy

Nuclear imaging that follows a radioactive tracer through the kidneys. It can compare kidney function, assess blood flow and urine drainage, detect obstruction, or monitor a transplanted kidney.

Renal Stone

A renal stone is a solid crystal aggregate formed in the kidney that can pass through the urinary tract or obstruct urine flow.

Renal Transitional Cell Carcinoma

Older name; see *Upper Tract Urothelial Carcinoma*.

Renal Transplantation

Surgical placement of a functioning donor kidney into a person with advanced kidney failure. It can restore kidney function but requires suitability assessment and long-term immunosuppression.

Alternate Names:
Kidney Transplant; Kidney Transplantation

Renal Trauma

Kidney injury caused by a blow, fall, crash, sports injury, or penetrating wound. Assessment may include urine testing and CT imaging; treatment ranges from observation to procedures or surgery depending on severity.

Renal Tubular Acidosis

A group of disorders in which kidney tubules do not remove enough acid or return enough bicarbonate to the blood. This makes the blood too acidic and may cause weakness, kidney stones, bone disease, or high potassium.

Renal Tubular Acidosis Type 1

A metabolic acidosis caused by an impaired ability of distal intercalated renal tubular cells to secrete hydrogen ions into the collecting duct lumen. Characterized by normal anion gap metabolic acidosis, inappropriately high urinary pH (greater than 5.5 in the setting of systemic acidemia), hypokalemia, hypocitraturia, and recurrent nephrolithiasis or nephrocalcinosis.

Alternate Names:
Distal RTA; Type 1 RTA

Renal Tubular Acidosis Type 2

A normal anion gap hyperchloremic metabolic acidosis caused by defective proximal tubular reabsorption of filtered bicarbonate, resulting in bicarbonate wasting into the urine. Urinary pH is typically elevated initially but drops below 5.5 when systemic acidosis becomes severe; frequently associated with generalized proximal tubular dysfunction (Fanconi syndrome) including glucosuria, aminoaciduria, phosphaturia, and osteomalacia.

Alternate Names:
Proximal RTA; Type 2 RTA

Renal Tubular Acidosis Type 4

A kidney-tubule disorder that causes a mild buildup of acid in the blood and often a high potassium level. It is commonly associated with reduced aldosterone activity, diabetes, or some medicines.

Alternate Names:
Hyperkalemic RTA

Renal Tubular Disorders

Diseases affecting the kidney tubules, which reabsorb water and useful substances and remove selected wastes into urine. They can disturb acid-base balance, electrolytes, urine concentration, or blood pressure.

Renal Tubule

A tiny nephron tube that reabsorbs needed water and substances and removes others into urine.

Renal Tubule Acidosis

Alternate name; see *Renal Tubular Acidosis*.

Renal Ultrasound

Noninvasive imaging used to assess kidney size, structure, blood flow, and urinary obstruction. It is particularly useful when obstruction, cystic disease, or structural abnormality is suspected and is often used in the evaluation of acute or chronic kidney disease.

Renal Vascular Disease

Alternate name; see *Renovascular Disease*.

Renal Vein

One of two large veins that carry blood away from

the kidneys to the body's main abdominal vein. A clot in a renal vein can impair drainage and damage kidney function.

Renal Vein Thrombosis

Renal vein thrombosis is a clot in a kidney vein that can cause flank pain, blood or protein in urine, kidney dysfunction, swelling, or pulmonary embolism.

Renal Venogram

Contrast imaging of the renal veins used selectively to evaluate venous anatomy, thrombosis, obstruction, or vascular abnormalities.

Renaut Body

A Renaut body is a specialized cluster of cells in the peripheral nerve endoneurium, associated with pressure sensitivity and sometimes nerve pathology.

Renin

An enzyme from kidney cells that starts a hormone chain controlling blood pressure, salt balance, and fluid levels.

Renin-Angiotensin-Aldosterone System

A hormone system that raises blood pressure and preserves body fluid when circulation or kidney blood flow falls. It narrows blood vessels and signals the adrenal glands to retain salt and water; overactivity contributes to hypertension and heart failure.

Renin-Angiotensin-Aldosterone System Physiology

See *Renin-Angiotensin-Aldosterone System*.

Renin-Angiotensin System

A hormone and enzyme system that regulates blood pressure, fluid balance, and vascular tone. Renin initiates formation of angiotensin II, which promotes vasoconstriction and aldosterone release; excessive activation contributes to hypertension and heart failure.

Renin Blood Test

A blood test measuring renin concentration or activity, interpreted with aldosterone, posture, sodium status, medications, and blood pressure to evaluate hypertension or mineralocorticoid disorders.

Rennin

An enzyme, also called chymosin, that helps curdle milk in the stomachs of young mammals. It is distinct from renin, the kidney enzyme that helps regulate blood pressure.

Renography

A kidney scan that follows a small amount of radioactive tracer as it enters and leaves the kidneys. It can compare kidney function and help identify reduced blood flow or blocked urine drainage.

Renovascular Disease

Disease of the blood vessels supplying or draining the kidneys. It includes narrowing, blockage, aneurysm, or other vessel abnormalities and may reduce kidney blood flow or contribute to high blood pressure.

Renovascular Hypertension

High blood pressure caused by reduced blood flow through one or both kidney arteries, usually from narrowing. It may be suspected when hypertension begins suddenly or is difficult to control; treatment addresses blood pressure and, in selected cases, the narrowed artery.

Renshaw Cell

A nerve cell in the spinal cord that helps limit and regulate the activity of motor neurons.

Reoviridae Infection

An infection caused by a reovirus; illness varies by virus and host and is often mild or asymptomatic in humans.

Rep

An abbreviation most often meaning one repetition of an exercise or movement. In medical records

it can also mean representative or another phrase, depending on context.

Repair Of Webbed Fingers Or Toes

Surgery to separate joined fingers or toes and reconstruct the skin between them. It may improve movement, growth, function, or appearance; wound problems, scarring, and recurrence of joining are possible.

Repeat Surgery

Repeat surgery is a second or subsequent operation on the same or related area to treat persistent disease, recurrence, complications, or failure of prior treatment.

Reperfusion

Restoration of blood flow to tissue after ischemia or a marked reduction in perfusion. It returns oxygen and nutrients and may preserve cells that remain viable, occurring spontaneously or after treatment of an obstructed vessel. The return of flow can also trigger inflammatory, oxidative, and microvascular changes that contribute to reperfusion injury.

Reperfusion Injury

Damage that occurs when blood flow returns to tissue after a period of inadequate flow. The returning oxygen and inflammation can worsen injury, causing swelling, bleeding, or loss of function in organs such as the heart, brain, kidneys, or limbs.

Reperfusion Therapy

Treatment that restores blood flow to tissue deprived of oxygen, such as clot-dissolving medicine, angioplasty, stenting, or surgery. Benefit depends on the tissue, duration of blockage, and risk of bleeding.

Repetitive Motion Disorders

Conditions caused or worsened by repeated movement, force, vibration, or awkward posture. They may affect muscles, tendons, nerves, or joints and can cause pain, numbness, weakness, or reduced function.

Repetitive Nerve Stimulation

A test that gives a nerve several small electrical impulses while recording the muscle's response. A changing response may support a disorder in communication between nerves and muscles, such as myasthenia gravis or Lambert-Eaton syndrome. The result is interpreted with the examination and other tests.

Alternate Names:
RNS; Repetitive Stimulation Test

Repetitive Strain Injury

Pain or dysfunction caused by repeated forceful movements, sustained positions, or overuse of muscles, tendons, nerves, or other tissues.

Replantation Of An Avulsed Tooth

Reinsertion of a completely displaced permanent tooth into its socket after injury. The tooth may be stabilized with a splint; root-canal treatment and follow-up may be needed, depending on the tooth and injury.

Replantation Of Digits

Microsurgical replacement of a completely amputated finger or toe, reconnecting bone, tendons, nerves, arteries, and veins when feasible.

Replication Initiation

The time and process when copying of DNA or another genetic molecule begins. Specific proteins recognize a starting region, separate the strands, and recruit enzymes that build matching new genetic material.

Replicon

A unit of genetic material that can replicate from one origin, such as a chromosome segment, plasmid, or viral genome.

Repolarization

The return of the membrane potential toward the resting value after depolarization. In neurons and skeletal/cardiac muscle, repolarization is primarily caused by the efflux of potassium through

voltage-gated potassium channels and inactivation of sodium channels.

Reportable Diseases

Reportable diseases are illnesses that must be notified to public-health authorities under applicable laws to support surveillance and outbreak control.

Reporting Standards

Agreed rules for recording and communicating clinical or imaging findings. Structured reports improve completeness and consistency and can make important results, follow-up needs, and comparisons easier for clinicians to understand.

Repressed Memory Therapy

A controversial approach aimed at recovering allegedly repressed memories; suggestive techniques can create false memories and require caution.

Repression

The reduction or stopping of gene activity, cell activity, behavior, or a body process. In genetics, regulatory proteins can silence genes; in psychology, the term may describe unconsciously keeping distressing thoughts outside awareness.

Reproduction

The biological process by which living organisms produce new offspring, either sexually or without combining reproductive cells. In humans, it involves reproductive organs, hormones, eggs, sperm, pregnancy, and childbirth.

Reproductive Cells

Cells used for reproduction, mainly sperm in males and eggs in females. Each normally carries half the usual number of chromosomes.

Reproductive History

Reproductive history records pregnancies, births, miscarriages, abortions, menstrual function, fertility, contraception, and related conditions relevant to health assessment.

Reproductive Hormones

Hormones that regulate sexual development, reproductive organs, ovulation, menstruation, sperm production, pregnancy, and lactation. Examples include estrogen, progesterone, testosterone, luteinizing hormone, and follicle-stimulating hormone.

Reproductive Medicine

The medical field concerned with reproductive health, fertility, and disorders of the reproductive system. It includes reproductive endocrinology, infertility evaluation, assisted conception, fertility preservation, and related hormonal or anatomic conditions; its scope varies across health systems.

Reproductive Organs

Organs involved in reproduction, including the ovaries, uterus, uterine tubes, vagina, testes, ducts, prostate, and penis. The structures present and their functions vary among individuals.

Reproductive System

The organs and tissues that produce gametes and reproductive hormones and support sexual development and reproduction. Depending on the anatomy present, it may enable sperm or egg production, fertilization, pregnancy, childbirth, and lactation.

Reproductive Technique

A reproductive technique is a medical or laboratory method used to assist conception, preserve fertility, diagnose reproductive disease, or manage pregnancy.

Reproductive Toxicity

Harmful effects of a substance on fertility, pregnancy, the developing baby, birth outcomes, or later growth. Risks depend on the substance, dose, timing, route, and individual health.

Reproductive Years

The part of life when a person may be able to become pregnant or produce sperm. Fertility varies widely and is affected by age, health, reproductive organs, hormones, and medicines; age alone does not determine fertility.

Reprogram

To reprogram a cell means to alter its gene-expression state so it acquires a different developmental potential or function.

Resectable

Describing a tumor or lesion that can be removed completely by surgery with acceptable risk and an appropriate margin, based on its extent and relationship to vital structures.

Resection

Surgical removal of tissue, an abnormal growth, or part or all of an organ. The purpose and extent depend on the condition and procedure; removed tissue may be examined to clarify a diagnosis.

Alternate Names:
Surgical Excision; Surgical Removal

Resectoscope

An endoscopic surgical instrument with a viewing system and working loop used to remove or cauterize tissue, especially during prostate or bladder procedures.

Reserve Volume

The additional amount of air that can be inhaled or exhaled beyond a normal tidal breath.

Reservoir

A human, animal, or environmental habitat in which an infectious agent normally lives, multiplies, and persists. A reservoir may serve as the source from which the agent is transmitted to a susceptible host.

Reservoir Of Infection

A reservoir of infection is a person, animal, environment, or material in which an infectious organism normally lives and from which transmission can occur.

Resident

A resident is a physician or other trainee receiving supervised specialty education after initial professional qualification; the term can also mean a person living in a place.

Residential Mobility

Residential mobility is movement between homes or communities and can affect continuity of care, social support, exposure, and health access.

Residual

Residual means remaining after a process, treatment, measurement, or event, such as residual urine, disease, risk, or volume.

Residual Limb

The portion of a limb remaining after amputation. Care includes edema control, skin inspection, shaping, strengthening, desensitization, contracture prevention, and prosthetic preparation.

Residual Limb Pain

Pain in the remaining portion of a limb after amputation.

Alternate Names:
Stump Pain

Residual Neoplasm

A residual neoplasm is tumor tissue that remains after treatment intended to remove or destroy the original tumor.

Residual Risk

Residual risk is the chance of harm that remains after preventive measures, treatment, screening, or controls have been applied.

Residual Tumor

A residual tumor is cancer or other tumor tissue that remains after surgery, radiation, chemotherapy, or another treatment.

Residual Volume

The amount of air remaining in the lungs after breathing out as forcefully as possible. It keeps small airways open and cannot be measured accurately by ordinary spirometry alone.

Resistance

The ability of a microorganism to survive a medicine that previously inhibited or killed it. Resistance can make infections harder to treat and may spread between organisms through genetic material.

Alternate Names:
Antimicrobial Resistance; Drug Resistance

Resistance Training

Exercise in which muscles work against weights, bands, body weight, or other resistance. Regular training can improve strength, endurance, balance, bone health, function, and independence when progressed safely.

Resistant Hypertension

Blood pressure above goal despite three or more antihypertensive drug classes, including a diuretic, at maximum or maximally tolerated doses; the term also includes blood pressure controlled with four or more medicines. Diagnosis requires consideration of adherence and exclusion of a white-coat effect.

Alternate Names:
Treatment-Resistant Hypertension

Resistant Starch

Starch that resists digestion in the small intestine and is fermented by gut bacteria in the colon.

Resistin

A signaling protein associated with adipose tissue and inflammation; its human clinical significance remains under study.

Resolution

The ability of an imaging system to distinguish separate structures, or the improvement or disappearance of a disease or symptom.

Resonance

Amplification or characteristic vibration produced when a system is driven at a suitable frequency; used in sound and MRI contexts.

Resorcinol

A phenolic compound used in selected topical dermatologic preparations; concentrated exposure can irritate or poison.

Resorption

The body's breakdown and removal of tissue or material, especially old bone. The released components may be absorbed, reused, or removed from the body.

Resorption Atelectasis

Collapse of lung tissue distal to a completely obstructed airway as trapped gas is absorbed into pulmonary blood. Common causes include a mucus plug, foreign body, or tumor; imaging typically shows increased opacity with volume loss.

Respiration

The processes of breathing, gas exchange, and cellular energy production involving oxygen and carbon dioxide.

Respiratory

Respiratory means relating to breathing, the airways, lungs, gas exchange, or the organs and muscles that move air.

Respiratory Acidosis

A condition in which breathing does not remove enough carbon dioxide, making the blood too acidic. It can result from lung disease, blocked airways, weak breathing muscles, brain disorders, or medicines that slow breathing.

Respiratory Alkalosis

A condition in which breathing removes too much carbon dioxide, making the blood less acidic. It can occur with anxiety, pain, fever, low oxygen, pregnancy, severe infection, or other conditions that cause rapid breathing.

Respiratory Arrest

Cessation of effective spontaneous breathing, resulting in inadequate ventilation and oxygenation. It may occur while circulation is still present or as

part of cardiorespiratory arrest. Causes include respiratory, neurologic, neuromuscular, toxic, and obstructive disorders; prolonged respiratory arrest can cause hypoxic injury.

Respiratory Burst

A rapid release of chemically reactive oxygen molecules by certain immune cells after they engulf germs. This helps kill the germs inside the cell, although excessive activity can also damage nearby tissue.

Respiratory Changes In Pregnancy

Pregnancy changes breathing as the growing uterus raises the diaphragm and hormones increase the drive to breathe. Breaths may become deeper, overall ventilation increases, and the amount of air left after a normal breath out decreases.

Respiratory Compliance

The physical measure of the distensibility and elastic stretchability of the lungs and chest wall, expressed mathematically as the change in lung volume per unit change in distending pressure ($\Delta V/\Delta P$); reduced in acute respiratory distress syndrome, pulmonary edema, and pulmonary fibrosis.

Alternate Names:
Lung Compliance

Respiratory Depression

Breathing that is abnormally slow or shallow, causing inadequate ventilation and possible carbon-dioxide retention or low oxygen. Medicines, brain disorders, and metabolic illness can cause it.

Respiratory Disease

Any disease affecting the airways, lungs, breathing muscles, or gas exchange. Examples include asthma, chronic obstructive pulmonary disease, pneumonia, tuberculosis, and lung cancer.

Respiratory Disorder

A disease affecting the airways, lungs, pleura, respiratory muscles, or control of breathing and causing impaired ventilation, oxygenation, or gas exchange.

Respiratory Distress

Difficult or labored breathing caused by problems such as asthma, infection, a blood clot, a collapsed lung, an allergic reaction, or heart failure. Fast breathing, struggling to speak, blue lips, or severe exhaustion may occur.

Respiratory Distress Syndrome

An ambiguous term that may refer to neonatal respiratory distress syndrome, usually caused by insufficient surfactant in a newborn's lungs, or acute respiratory distress syndrome (ARDS), an acute lung injury that causes low blood oxygen. These are distinct conditions, so the intended disorder should be specified.

Respiratory Drive

The brain's signal to the breathing muscles that controls how often and how deeply a person breathes. It responds mainly to carbon-dioxide and oxygen levels and can be reduced by brain disease, severe illness, or sedating medicines.

Respiratory Failure

A life-threatening inability of the lungs to provide enough oxygen or remove enough carbon dioxide. It may cause severe breathlessness, confusion, blue or gray lips, extreme sleepiness, or collapse. Causes include lung disease, infection, heart problems, weak breathing muscles, brain injury, and drug overdose.

Respiratory Failure Types 1 and 2

A classification based on blood gases. Type 1 is hypoxemic respiratory failure, with low arterial oxygen and usually normal or low carbon dioxide. Type 2 is hypercapnic respiratory failure, with elevated arterial carbon dioxide, often from inadequate ventilation. Exact thresholds vary by clinical context.

Respiratory Gating

A radiation-treatment method that tracks breathing and delivers the beam only during a selected part of the breathing cycle. It helps account for movement of tumors in the chest or upper abdomen and may reduce radiation to nearby healthy tissue.

Respiratory Health

The ability of the lungs, airways, and breathing muscles to move air and exchange oxygen and carbon dioxide effectively.

Respiratory Illness

A short-term or long-term illness affecting breathing or the respiratory tract. Symptoms may include cough, fever, congestion, wheezing, shortness of breath, or chest discomfort, depending on the cause.

Respiratory Infection

An infectious process affecting any portion of the respiratory tract, conventionally classified into upper respiratory tract infections (URIs, e.g., rhinitis, pharyngitis, sinusitis, laryngitis) and lower respiratory tract infections (LRIs, e.g., acute bronchitis, bronchiolitis, pneumonia, lung abscess). Caused by an extensive spectrum of viral, bacterial, fungal, and atypical pathogens, severity ranges from mild, self-limited coryza to life-threatening respiratory distress and sepsis requiring mechanical ventilation.

Alternate Names:
Respiratory Infections; Respiratory Tract Infection; RTI

Respiratory Infections

Plural form; see *Respiratory Infection*.

Respiratory Insufficiency

Inadequate breathing or gas exchange that causes low oxygen, high carbon dioxide, or both. It can result from lung or airway disease, weak breathing muscles, or problems in the brain's breathing control and may progress to respiratory failure.

Respiratory Medicine

Alternate name; see *Pulmonology*.

Respiratory Muscle

A muscle used for breathing, especially the diaphragm and muscles between the ribs. These muscles expand and contract the chest to move air into and out of the lungs.

Respiratory Neoplasm

A respiratory neoplasm is an abnormal growth in the airways or lungs and may be benign or malignant.

Respiratory Paralysis

Respiratory paralysis is failure of the muscles needed for breathing because of nerve, muscle, brainstem, toxin, or spinal-cord dysfunction and is an emergency.

Respiratory Physiology

The study of how breathing works, including movement of air, exchange of oxygen and carbon dioxide in the lungs, transport of gases in blood, and control of breathing.

Respiratory Protection

Measures and equipment used to reduce inhalation of harmful dusts, fumes, gases, aerosols, or infectious particles.

Respiratory Quotient

The ratio of carbon dioxide produced to oxygen used by the body's cells. The value changes according to whether the body is mainly using carbohydrate, fat, or protein and helps estimate metabolism and energy needs.

Respiratory Rate

The number of breaths taken per minute. The expected rate varies with age, activity, temperature, illness, and other factors.

Respiratory Rehabilitation

A program of exercise, education, breathing techniques, and self-management that improves function and quality of life in people with chronic respiratory disease.

Respiratory Syncytial Virus

A respiratory virus that commonly causes bronchiolitis and pneumonia in infants and young children. Infection is usually mild in adults but may be severe in infants, older adults, and people with chronic heart or lung disease.

Respiratory Syncytial Virus Bronchiolitis

An acute lower respiratory tract infection occurring predominantly in infants under two years of age caused by respiratory syncytial virus (RSV), characterized by bronchiolar mucosal inflammation, edema, and epithelial sloughing leading to wheezing, tachypnea, cough, and intercostal retractions.

Respiratory Syncytial Virus Infection

A common contagious respiratory illness caused by respiratory syncytial virus (RSV) that usually causes cold-like symptoms. It can also cause bronchiolitis or pneumonia, especially in infants and young children. Severe illness is more likely in older adults and people with certain heart, lung, or immune-system conditions. People can get RSV more than once.

Alternate Names:
RSV; Human Orthopneumovirus

Respiratory Syncytial Virus (RSV)

Alternate name; see *Respiratory Syncytial Virus*.

Respiratory System

The nose, mouth, pharynx, larynx, trachea, bronchi, bronchioles, lungs, pleura, and breathing muscles, including the diaphragm and chest-wall muscles. It moves air into and out of the lungs and exchanges oxygen and carbon dioxide between the alveoli and blood.

Respiratory Therapy

Respiratory therapy includes treatments and breathing support that improve ventilation, oxygenation, airway clearance, or lung function.

Respiratory Tract Infections

Infections affecting any part of the respiratory tract, classified by anatomical location into upper respiratory tract infections (URTIs) and lower respiratory tract infections (LRTIs).

Respiratory Transport

Respiratory transport is movement of oxygen and carbon dioxide between lungs, blood, and tissues, largely through hemoglobin and dissolved gas.

Respiratory Viruses

Viruses that cause respiratory tract infections. Major respiratory viruses include influenza, respiratory syncytial virus (RSV), parainfluenza virus, adenovirus, and human metapneumovirus. SARS-CoV-2 causes COVID-19. Symptoms range from mild upper respiratory illness to severe pneumonia.

Respiratory Viruses And Face Masks

Face masks can reduce spread of respiratory viruses by blocking droplets and some aerosols, especially in crowded or healthcare settings; fit and local guidance matter.

Respirologist

A doctor specializing in diseases of the lungs and breathing system. They assess breathing problems, interpret tests, manage chronic and acute illness, and may evaluate people for lung transplantation.

Respirovirus

A genus of paramyxoviruses that includes human parainfluenza viruses, which can cause croup and other respiratory infections.

Respite Care

Temporary care for a person who needs support so that a usual family or unpaid caregiver can rest, attend appointments, or manage other responsibilities. It may be provided at home, in a facility, or through short-term services.

Response Assessment

Evaluation of how a disease responds to treatment. Clinicians may use symptoms, examination, blood tests, scans, tumor measurements, or activity levels to decide whether treatment is helping, failing, or needs adjustment.

Response Evaluation Criteria

Standardized rules for judging whether a disease, especially a tumor, has responded to treatment, remained stable, or progressed. RECIST mainly

uses tumor measurements on imaging; other systems may use metabolic or blood-based findings.

Responsible Drinking

Responsible drinking means limiting alcohol according to health guidance, avoiding driving or hazardous activities after drinking, and avoiding alcohol when it is unsafe or contraindicated.

Rest

Rest is reduced physical or mental activity used to recover, though excessive inactivity can impair strength and function in some conditions.

Restenosis

Re-narrowing of a blood vessel after it has been opened by angioplasty or another procedure.

Resting Energy Expenditure

The energy the body uses at rest for essential functions such as breathing, circulation, and cell activity. It varies with body size, age, body composition, illness, and other factors.

Alternate Names:
REE; Resting Metabolic Rate

Resting Membrane Potential

The small electrical difference across a nerve or muscle cell when it is not sending a signal. Unequal amounts of charged particles inside and outside the cell create it and allow the cell to respond quickly to stimulation.

Resting Phase

The resting phase is a period of relative inactivity, such as G0 in the cell cycle or a physiologic interval between active events.

Resting Tremor

An involuntary, rhythmic oscillation (typically four to six hertz) occurring in a body part that is fully supported against gravity and relaxed, which diminishes or temporarily ceases with voluntary movement. It typically presents as a pill-rolling hand tremor in Parkinson's disease and other parkinsonian syndromes.

Restless Anal Syndrome

A label used in a single published case report for restless discomfort around the anus that worsened at rest and improved with movement. It is not an established diagnostic syndrome; anorectal, neurologic, and other causes of anal discomfort are considered separately.

Restless Legs

Alternate name; see *Restless Legs Syndrome*.

Restless Legs Syndrome

A neurological and sleep-related condition causing an irresistible urge to move the legs, often with crawling, pulling, aching, or tingling sensations. Symptoms begin or worsen during rest, improve temporarily with movement, and are worse in the evening or at night; they may disrupt sleep and daytime function. Iron deficiency, kidney disease, pregnancy, some medicines, and genetic factors may contribute.

Alternate Names:
RLS; Willis-Ekbom Disease

Restless Legs Syndrome (RLS)

Alternate name; see *Restless Legs Syndrome*.

Restless Leg Syndrome

Alternate name; see *Restless Legs Syndrome*.

Restlessness

Restlessness is an uncomfortable need to move or inability to remain still, caused by anxiety, akathisia, restless-legs syndrome, pain, stimulants, withdrawal, or medical illness.

Restorative Dentistry

Specialty of restoring damaged teeth. Procedures: fillings, inlays, onlays, crowns, bridges, implants. Goals: function, aesthetics, durability.

Restraint

A device, medicine, or other measure used to limit

a person's movement. Restraints can cause injury, distress, falls, and loss of independence.

Restraint-Related Harm

Physical or psychological injury associated with using a device, medication, or environmental restriction to limit a person's movement. Older adults are at risk of falls, pressure injury, delirium, aspiration, and functional decline.

Restriction Enzyme

An enzyme made by bacteria that cuts DNA at particular short sequences. Scientists use these enzymes to analyze, join, or modify DNA in laboratory research and medical testing.

Restrictive Cardiomyopathy

A disease in which stiff heart muscle cannot relax and fill normally. It may cause breathlessness, tiredness, swelling, or abnormal rhythms and can result from conditions such as amyloidosis, sarcoidosis, iron overload, or scarring.

Restrictive Lung Disease

A pattern of reduced total lung capacity caused by stiff lung tissue, chest-wall limitation, respiratory-muscle weakness, obesity, or other factors. It may cause exertional breathlessness and low oxygen; lung volumes, imaging, muscle strength, and the underlying cause guide management.

Resuscitation

Emergency measures used to restore or support breathing and circulation. Depending on the cause, these may include airway support, rescue breathing, chest compressions, defibrillation, and medicines.

Resuscitative Thoracotomy

Emergency chest surgery used for selected trauma patients who are in cardiac arrest or close to it, especially after a penetrating chest injury. It may relieve blood around the heart, control bleeding, or allow direct heart compressions. It is a last-resort procedure with a high risk of death and complications.

Alternate Names: Emergency Department Thoracotomy; EDT; Clamshell Thoracotomy; Trauma Thoracotomy

Retained Placenta

Failure of the placenta to come out after childbirth, usually when it remains in the uterus for about 30 minutes or longer or bleeding is excessive. It can cause severe bleeding or infection.

Retained Products Of Conception

Pregnancy tissue that remains in the uterus after childbirth, miscarriage, or abortion. It may cause continuing or heavy bleeding, cramping, fever, or infection and may be treated with medicine or a procedure to remove it.

Retainer

A dental appliance worn after orthodontic treatment to help keep teeth in their corrected positions.

Retching

Repeated involuntary effort to vomit without necessarily producing stomach contents.

Retention Of Urine

Inability to empty the bladder completely or at all despite making urine. It may cause painful fullness, leaking, or kidney damage and can result from blockage, weak bladder muscles, medicines, or nerve disease.

Retention Time

The time a substance takes to pass through a laboratory separation system from injection until it is detected. Comparing it with a tested reference can help identify a substance, but timing alone is not definitive proof.

Rete Testis

A network of small spaces inside the testis that collects sperm from the seminiferous tubules and passes them to the small ducts leading to the epididymis.

Reticular

Net-like or arranged in a network pattern, describing

the appearance or distribution of a skin lesion, rash, or vascular pattern.

Reticular Activating System

A network of brain structures that helps maintain wakefulness, alertness, attention, and transitions between sleep and waking. Damage or severe disturbance can cause unusual sleepiness, reduced awareness, or coma.

Reticular Dermis

The deeper layer of the dermis containing dense connective tissue, collagen, elastin, blood vessels, nerves, glands, and hair follicles.

Reticular Erythematous Mucinosis

A rare primary cutaneous mucinosis presenting with erythematous, reticulated macules and plaques with dermal mucin accumulation on the mid-chest and upper back in middle-aged individuals, exacerbated by ultraviolet light exposure.

Alternate Names:
REM Syndrome; Plaque-like Cutaneous Mucinosis

Reticular Formation

A network of nerve cells in the brainstem that helps control alertness, sleep, attention, muscle tone, posture, breathing, heart function, and responses to pain.

Reticulin

A network-forming type of collagen that supports bone marrow, liver, lymph nodes, and other organs.

Reticulocyte

An immature red blood cell that has been freshly produced and released from the bone marrow into the circulating bloodstream. Reticulocytes normally develop into mature red blood cells within one to two days. Measuring the number of reticulocytes in a blood sample allows doctors to evaluate how actively and effectively the bone marrow is producing new red blood cells, helping diagnose causes of anemia or assess recovery after blood loss.

Alternate Names:
Reticulocytes

Reticulocyte Count

The number or percentage of immature red blood cells in blood. It reflects recent bone- marrow red-cell production and helps assess anemia, especially when interpreted with the hemoglobin and clinical context.

Reticulocyte Production Index

A calculated measure that adjusts the reticulocyte percentage for the degree of anemia and the longer time immature reticulocytes spend in the bloodstream. It helps assess whether the bone marrow is producing enough red blood cells; interpretation depends on the clinical context and laboratory method.

Alternate Names:
RPI; Corrected Reticulocyte Count

Reticulocytes

Plural form; see *Reticulocyte*.

Reticulocytopenia

An abnormally low reticulocyte count indicating reduced effective red-cell production, which may occur with marrow failure, nutrient deficiency, inflammation, or kidney disease.

Reticulocytosis

Reticulocytosis is an increased number of immature red blood cells in blood, usually indicating stimulated marrow production after blood loss or hemolysis.

Reticulo-Endothelial System

Alternate spelling; see *Reticuloendothelial System*.

Reticuloendothelial System

An older term for the body's network of phagocytic cells, especially monocytes and tissue macrophages, that remove microbes, particles, and worn-out cells from tissues and blood. The term is imprecise because the originally proposed system included cells that are not phagocytes; modern usage favors

mononuclear phagocyte system.

Reticulophagy

A cell-cleaning process that removes worn or damaged parts of the endoplasmic reticulum, the cell's internal membrane network. The material is broken down and recycled, helping cells control quality and respond to stress.

Reticulum

A network-like structure; in anatomy or cell biology it may refer to a tissue network, endoplasmic reticulum, or ruminant stomach compartment.

Retina

The light-sensitive neural tissue lining the back of the eye that converts light into nerve signals.

Retina Disorder

A disease affecting the retina, including vascular, degenerative, inflammatory, infectious, traumatic, inherited, or neoplastic conditions that can impair vision.

Retina Hemorrhage

Bleeding within or beneath the retina caused by vascular disease, diabetes, hypertension, trauma, retinal vein occlusion, inflammation, or other disorders.

Retinal Artery Occlusion

Blockage of a central or branch artery supplying the retina, reducing blood flow and causing retinal ischemia. It typically causes sudden, painless vision loss in one eye or loss of part of the visual field; a central retinal artery occlusion is considered an eye stroke.

Retinal Cone

A light-sensing cell in the retina that provides color vision and sharp detail, especially in daylight. Damage to cone cells can reduce color perception and central vision.

Retinal Damage

Injury or disease affecting the retina, potentially causing blurred vision, field loss, flashes, floaters, or permanent visual impairment.

Retinal Degeneration

Progressive damage or loss of light-sensitive cells in the retina at the back of the eye. It may cause blurred or reduced central vision, night blindness, or loss of side vision and can result from inherited disease, aging, or other injury.

Retinaldehyde

A form of vitamin A used in the eye's light-sensing cycle. Light changes it inside photoreceptor cells, helping start the nerve signals that allow vision.

Retinal Detachment

Separation of the light-sensitive retina from the supporting retinal pigment epithelium beneath it. A rhegmatogenous detachment follows a retinal break, a tractional detachment results from scar tissue pulling on the retina, and an exudative detachment results from fluid collecting beneath it. It can cause flashes, floaters, a curtain-like shadow, or reduced vision.

Retinal Detachment Repair

Surgical or pneumatic treatment to close retinal breaks and reattach the retina. Techniques include vitrectomy, scleral buckling, and pneumatic retinopexy, selected according to the type and location of detachment.

Alternate Names:
Retinal Detachment Surgery

Retinal Diseases

Disorders that damage the retina, the light-sensitive tissue at the back of the eye. They may cause flashes, floaters, distorted vision, blind spots, night-vision problems, or gradual or sudden sight loss.

Retinal Disorders

Diseases affecting the light-sensing layer at the back of the eye. Causes include blood-vessel problems,

inherited conditions, aging, inflammation, infection, injury, and cancer, potentially causing blurred vision or blindness.

Retinal Dysplasia

Abnormal development and arrangement of the retina, the light-sensing layer at the back of the eye. It may impair vision and can occur with conditions present from birth, genetic disorders, or problems affecting development before birth.

Retinal Dystrophy

Gradual loss or damage of retinal cells, often caused by an inherited condition. It may begin with night blindness, difficulty seeing in dim light, or loss of side vision and can progress to serious sight impairment.

Retinal Fold

A retinal fold is a crease or ridge in the retina caused by traction, developmental abnormality, detachment, swelling, or another ocular process.

Retinal Fundus

The inside back surface of the eye viewed during fundoscopy, including the retina, optic nerve, macula, and retinal blood vessels.

Retinal Ganglion

A nerve cell in the retina that collects signals from other retinal cells and sends them through the optic nerve to the brain. It is essential for carrying visual information out of the eye.

Retinal Hemorrhages

Bleeding in the light-sensitive tissue at the back of the eye. It may result from diabetes, high blood pressure, injury, bleeding disorders, or increased pressure in the skull; in infants and children, the pattern can help distinguish among causes.

Retinal Implant

An implanted visual prosthesis that detects or processes light and electrically stimulates remaining retinal or visual-pathway cells in selected severe retinal disorders. It provides limited visual information and is distinct from an intraocular lens.

Retinal Ischemia

Too little blood and oxygen reaching the retina, often because a retinal artery is blocked or blood-vessel disease is severe. It may cause sudden, painless sight loss and is an emergency because prolonged injury can become permanent.

Retinal Laser Photocoagulation

An ophthalmic procedure utilizing targeted laser energy to induce localized thermal denaturation of retinal tissue. Widely used to seal microvascular leakages in diabetic macular edema, ablate ischemic peripheral retina in proliferative diabetic retinopathy, or secure retinal tears to prevent rhegmatogenous retinal detachment.

Alternate Names:
Laser Photocoagulation; Retinal Laser Therapy

Retinal Layers

The organized layers of nerve cells, supporting cells, and blood vessels that make up the retina. Together they detect light, begin visual processing, and send signals through the optic nerve to the brain.

Retinal Macula

The macula is the central region of the retina responsible for detailed straight-ahead vision, reading, and color discrimination.

Retinal Neoplasm

A retinal neoplasm is an abnormal growth arising in or near the retina, such as retinoblastoma or a metastatic tumor.

Retinal Neovascularization

Abnormal growth of new blood vessels on the retinal surface or extending from the retina toward the vitreous, usually in response to retinal ischemia. It occurs in proliferative diabetic retinopathy and other ischemic retinal disorders; fragile vessels may bleed or form scar tissue that pulls on the retina.

Alternate Names:
Retinal Neovascularisation

Retinal Neurodegeneration

Progressive dysfunction and loss of retinal neurons, such as photoreceptors or retinal ganglion cells, that can impair vision. It occurs in different diseases, including inherited retinal degenerations and glaucoma; the cells affected and course depend on the underlying condition.

Retinal Perforation

A full-thickness hole or tear in the retina. Fluid can pass through the opening and separate the retina from the tissue beneath it, causing flashes, floaters, or loss of vision.

Retinal Pigment

Retinal pigment refers to melanin-containing pigment in the retinal pigment epithelium, which supports photoreceptors and absorbs excess light.

Retinal Pigment Epithelium

A layer of cells beneath the retina that supports the light-sensing cells, absorbs extra light, and helps remove worn-out cell material.

Retinal Prosthesis

An implanted device designed to provide limited visual signals when the retina is severely damaged. A camera and electronic system stimulate remaining visual pathways; it may provide light or simple pattern perception, not normal sight.

Retinal Racemose Hemangioma

A congenital retinal arteriovenous malformation in which dilated, tortuous arteries connect directly to veins without an intervening capillary bed. It is usually unilateral and may occur alone or with an arteriovenous malformation of the brain, as in Wyburn–Mason syndrome; effects on vision vary.

Alternate Names:
Racemose Angioma; Retinal Arteriovenous Malformation

Retinal Tear

A full-thickness break in the light-sensitive retina, often caused by traction as the vitreous gel separates from it. Fluid can pass through the break and cause retinal detachment; flashes or new floaters may occur.

Retinal Vasculitis

Inflammation of blood vessels in the retina. Leaking or blocked vessels can cause blurred vision, bleeding, swelling, or permanent sight loss; it may be linked to infection, autoimmune disease, or inflammation elsewhere in the body.

Retinal Vein Occlusion

Blockage of the central retinal vein or one of its branches, causing blood to back up in the retina. Retinal bleeding, macular edema, or reduced blood flow may blur vision and, in severe cases, lead to growth of abnormal blood vessels.

Retronychia

A condition in which the upper end of a nail plate becomes trapped in the skin fold at the nail base, often after injury or repeated pressure. A new nail may grow underneath the old one, causing pain, swelling, redness, or overgrowth of tissue at the nail fold, most often on a big toe.

Retinitis

Inflammation or infection of the retina, the light-sensitive tissue at the back of the eye. It may cause blurred vision, floaters, flashes, or loss of sight and can lead to permanent visual damage.

Retinitis Pigmentosa

A group of inherited retinal disorders in which light-sensing cells gradually degenerate, usually first affecting rod cells. It commonly causes night blindness and progressive loss of peripheral vision; central vision may decline later.

Retinoblastoma

The most common eye cancer in infants and young children, starting in the retina, the light-sensitive tissue at the back of the eye. It is caused by genetic changes in the *RB1* gene, which can be inherited from a parent or occur spontaneously during fetal development. The most frequent sign is a white

reflection or glow in the pupil (leukocoria), often seen in photographs taken with a flash instead of the typical red eye, along with crossed or misaligned eyes (strabismus), redness, or decreased vision.

Alternate Names:
Childhood Eye Cancer Retinal Glioma Malignant Retinoblastoma

Retinoblastoma Protein

A protein made from the RB1 gene that helps prevent cells from dividing when they should not. Loss of its protective function can contribute to retinoblastoma and other cancers.

Retinoic Acid

An active form of vitamin A that helps control how cells develop and which genes they use. Related medicines are used for selected skin conditions and some cancers but can cause irritation or serious pregnancy risks.

Retinoid

A member of a family of natural or synthetic chemical compounds related to vitamin A that play a key role in regulating how skin and other epithelial cells grow, divide, and shed. Retinoids are widely used in medicine to treat various skin conditions, such as severe acne and psoriasis, as well as certain blood and skin cancers, but their use requires caution because they can cause severe birth defects if taken during pregnancy.

Alternate Names:
Retinoids

Retinoids

Plural form; see *Retinoid*.

Retinol

A form of vitamin A needed for vision, healthy skin and body linings, growth, and immune function. It comes from animal foods and some supplements; too much can be harmful, especially during pregnancy.

Retinopathy

Damage or disease of the retina, the light-sensing layer at the back of the eye. Diabetes, high blood pressure, prematurity, blocked vessels, aging, inflammation, and inherited conditions can cause it and may lead to sight loss.

Retinopathy Of Prematurity

A disease of premature infants in which retinal blood vessels develop abnormally after birth. Mild disease may regress, but abnormal vessels can scar and pull on the retina, causing detachment and permanent vision loss. Risk is greatest with extreme prematurity and very low birth weight.

Retinoschisis

Splitting between layers of the retina. It may result from aging or an inherited condition and can cause reduced sharpness or loss of part of the visual field; it differs from retinal detachment but may look similar on examination.

Retinoscope

An instrument that shines light into the eye to estimate refractive error by observing how light reflects from the retina.

Retinoscopy

An eye examination that uses a retinoscope to estimate refractive error by observing how light reflects from the retina.

Retirement

Retirement is withdrawal from regular employment or a career; changes in income, activity, social contact, and health coverage can affect wellbeing.

Retracted Nipple

Alternate name; see *Nipple Inversion Or Retraction*.

Retractile Testicle

Alternate name; see *Retractile Testis*.

Retractile Testis

A testis that moves between the scrotum and groin because of a strong reflex but can be brought into the scrotum. It may later become an ascending

(undescended) testis.

Retractor

A surgical instrument used to hold tissue or an organ aside so the area can be seen and reached during an examination or operation. Some retractors are held by hand; others stay in place by themselves.

Retrobulbar Hemorrhage

Bleeding behind the eyeball within the orbit, often after trauma or surgery, that can rapidly increase orbital pressure and threaten vision.

Retrobulbar Neuritis

Inflammation of the optic nerve behind the eyeball, causing reduced or blurred vision and pain, especially when the eye moves. It may be associated with multiple sclerosis or another immune condition and can cause lasting vision loss.

Retroesophageal

Retroesophageal means located behind the esophagus, such as a mass, lymph node, vessel, or collection in the posterior mediastinum.

Retrognathia

Retrognathia is backward positioning of the lower jaw relative to the upper jaw and may affect facial structure, bite, airway, or sleep breathing.

Retrograde

Moving backward or against the normal direction, such as retrograde amnesia or retrograde blood flow.

Retrograde Amnesia

Loss of memory for events that occurred before an injury, illness, or other triggering event, with variable preservation of more remote memories.

Retrograde Cystography

Retrograde cystography uses contrast placed through the urethra to outline the bladder and detect leaks, injury, or structural abnormalities.

Retrograde Degeneration

Breakdown of a nerve fiber that spreads back toward the nerve cell body after the fiber is injured. It can reduce movement, sensation, or organ function depending on which nerve is affected and how severe the injury is.

Retrograde Ejaculation

A condition in which semen enters the bladder instead of leaving through the penis during orgasm. It may cause little or no semen to appear and can result from diabetes, surgery, nerve problems, or medicines. It may affect fertility.

Retrograde Intrarenal Surgery

RIRS is a minimally invasive procedure using a flexible scope passed through the urinary tract to inspect and fragment or remove kidney stones.

Retrograde Urethrogram

An X-ray study that outlines the urethra after contrast material is introduced through its opening. It can show narrowing, tears, blockage, or abnormal connections, especially after suspected urethral injury.

Retroperitoneal Fibrosis

Formation of abnormal scar-like tissue in the space behind the abdominal organs. It often surrounds the tubes draining urine from the kidneys, causing back or abdominal pain, urine blockage, and reduced kidney function; medicines, immune disease, or cancer can cause it.

Retroperitoneal Hematoma

A collection of extravasated blood within the retroperitoneal anatomical space, commonly provoked by pelvic fractures, penetrating or blunt abdominal trauma, rupture of an abdominal aortic aneurysm, or femoral vascular catheterization; classified into zones I (central), II (flank), and III (pelvic).

Retroperitoneal Hemorrhage

Bleeding in the space behind the abdominal lining. It may follow injury, blood-thinning treatment, a

procedure, or rupture of a blood vessel and can cause back or abdominal pain, weakness, low blood pressure, and life-threatening blood loss.

Retroperitoneal Inflammation

Retroperitoneal inflammation is inflammatory disease in the space behind the peritoneum, caused by infection, pancreatitis, urinary disease, trauma, medicines, or fibrosis.

Retroperitoneal Neoplasm

A retroperitoneal neoplasm is an abnormal growth in the tissue space behind the abdominal lining and may be benign or malignant.

Retroperitoneal Space

The space behind the peritoneal lining of the abdomen. It contains the kidneys, adrenal glands, ureters, major blood vessels, and parts of the pancreas and bowel.

Retroperitoneum

See *Retroperitoneal Space*.

Retropharyngeal Abscess

A pocket of pus in the tissues behind the throat, usually after infection or injury. It can cause fever, severe throat or neck pain, trouble swallowing, drooling, noisy breathing, or a stiff neck. It can block the breathing passage.

Retropharyngeal Space

A potential fascial space in the neck located between the buccopharyngeal fascia of the pharynx anteriorly and the alar layer of the prevertebral fascia posteriorly, extending from the skull base down into the superior mediastinum (providing an anatomical conduit for the spread of retropharyngeal abscesses into the mediastinum).

Retrospective Studies

See *Retrospective Study*.

Retrospective Study

A study that examines existing records or past exposures to investigate disease causes, treatments, or outcomes. It can be efficient, but missing information and differences between groups may limit reliable conclusions.

Retrosternal Thyroid Surgery

An operation to remove part or all of a thyroid gland that extends behind the breastbone. It may relieve pressure on the airway or swallowing tube and requires planning around nearby nerves, blood vessels, and the parathyroid glands.

Retrotracheal

Retrotracheal means located behind the trachea, such as a mass, lymph node, vessel, or collection in the posterior mediastinum.

Retrotransposition

The copying and insertion of a genetic sequence into a new place in the genome using an RNA copy as an intermediate. New insertions can be harmless or disrupt a gene and cause disease.

Retroversion

Backward tilting or turning of an organ, especially the uterus toward the spine. A backward-tilted uterus is often normal, but in some people it is linked with pain, endometriosis, or difficult examinations.

Retroversion Of The Uterus

A uterine position in which the uterus tilts backward toward the spine; it is often a normal variant but can be associated with pain or endometriosis.

Retroviridae

A family of RNA viruses that make a DNA copy of their genetic material and insert it into infected cells. HIV is a member; these viruses can cause persistent infection, immune disease, or cancer.

Retroviridae Infection

An infection caused by a retrovirus, which may persist through genomic integration and cause immune, neurologic, or malignant disease.

Retrovirus

A type of virus that uses RNA as its genetic material instead of DNA. It uses an enzyme called reverse transcriptase to make a DNA copy of its RNA. This copy can become part of the DNA of an infected cell, allowing the virus to make more copies. HIV is an example of a retrovirus.

Rett Syndrome

A rare genetic disorder that affects brain development and occurs almost exclusively in girls. Development may appear typical for the first 6 to 18 months, followed by loss of previously learned language, purposeful hand use, coordination, or movement. Repeated hand movements such as handwringing or clapping are common. Slowed head growth, seizures, breathing changes, feeding problems, sleep problems, and curvature of the spine (scoliosis) may occur. Most cases are caused by a new change in the *MECP2* gene; rare males with related gene changes can also be affected.

Return Of Spontaneous Circulation

Restoration of a sustained heartbeat and blood flow after cardiac arrest, shown by a pulse, blood pressure, or other signs of circulation. Intensive post-arrest care then supports breathing, blood pressure, brain function, temperature, and treatment of the cause.

Reuptake

The removal of a released nerve chemical from the space between nerve cells by returning it to the releasing cell or taking it into a nearby cell. This limits and ends the signal.

Revalidation

Formal reassessment that a healthcare professional remains fit, competent, and up to date to practice.

Revascularisation

Restoration of blood flow to an organ or limb by a procedure such as angioplasty, stenting, or surgical bypass.

Revascularization

Restoration of blood flow to an area by bypass surgery, balloon treatment, stent placement, or another procedure. It can relieve symptoms, preserve tissue, and reduce damage caused by a blocked or narrowed vessel.

Revascularization Surgery

Revascularization surgery restores blood flow around a blocked or narrowed vessel, such as in coronary artery bypass or limb bypass surgery.

Reverberation Artifact

An ultrasound image error caused by repeated reflections, sometimes reduced by changing the angle or using specialized imaging.

Reversal Learning

Reversal learning is the ability to change a learned response when the previously rewarded or correct choice is no longer so.

Reverse Total Shoulder Replacement

Shoulder-replacement surgery that places the rounded joint surface on the shoulder blade and the socket on the upper-arm implant. This changes shoulder mechanics and can help when severe arthritis occurs with an irreparable rotator cuff.

Reverse Transcriptase

An enzyme that synthesizes DNA using RNA as a template.

Reverse Transcriptase Inhibitor

A class of antiviral medications used primarily to treat infections caused by retroviruses, such as HIV, and hepadnaviruses, such as hepatitis B. These drugs work by blocking reverse transcriptase, a crucial viral enzyme that the virus requires to convert its genetic material into a form that can integrate into human host cells and replicate, thereby suppressing viral levels in the body.

Alternate Names:
Reverse Transcriptase Inhibitors; RTI; RTIs

Reverse Transcriptase Inhibitors

Plural form; see *Reverse Transcriptase Inhibitor*.

Reverse Transcription

The production of DNA using RNA as a template, carried out by reverse transcriptase. Some viruses use this process to copy their genetic material, and laboratories use it to study RNA.

Reverse Trendelenburg Position

A supine position in which the head and upper body are elevated higher than the feet. The head-up tilt uses gravity to shift abdominal organs downward, improving surgical visualization during head, neck, upper gastrointestinal, and laparoscopic procedures while facilitating ventilation.

Alternate Names:
Head-Up Tilt Position; Anti-Trendelenburg Position

Reversible Cell Injury

Temporary cell damage that can resolve when the harmful cause is removed. Cells may swell, store excess fat, or produce less energy, but their membranes and genetic material remain sufficiently intact to recover.

Revision Arthroplasty

Surgical replacement, exchange, or repair of a failed or painful joint prosthesis. Indications include infection, aseptic loosening, instability, periprosthetic fracture, wear, and recurrent dislocation.

Revision Total Hip Arthroplasty

Surgery to remove and replace some or all parts of a previous hip replacement that have loosened, worn out, become infected, dislocated repeatedly, or failed. It is more complex than first-time replacement and may require bone reconstruction.

Revision Total Knee Arthroplasty

Surgery to remove and replace parts of a previous knee replacement because of loosening, wear, infection, instability, stiffness, or persistent pain. It may require specialized implants or bone grafting and has higher risks than the first operation.

Reye-Johnson Syndrome

Alternate name; see *Reye Syndrome*.

Reye's Syndrome

Alternate spelling; see *Reye Syndrome*.

Reye Syndrome

A rare, serious illness that causes sudden brain dysfunction and liver injury, often in children recovering from a viral infection. Aspirin exposure during the illness is associated with increased risk.

Alternate Names:
Reye-Johnson Syndrome; Fatty Liver with Encephalopathy

Reynolds Pentad

The combination of Charcot's triad—fever or chills, right upper abdominal pain, and jaundice— with hypotension and altered mental status. It is a classic presentation of severe acute cholangitis, but occurs in only a minority of cases; its absence does not exclude the disease.

Rezafungin

A long-acting echinocandin antifungal medicine that inhibits fungal cell-wall synthesis. It is used for selected invasive candidiasis infections; its long duration permits an intermittent dosing schedule under specialist supervision.

R-Factor

A plasmid carrying one or more genes that make bacteria resistant to antibiotics. Some R factors can transfer between bacteria, spreading drug resistance.

Rgs Proteins

Regulators of G-protein signaling are proteins that speed the switch-off of signals from G-protein-coupled receptors. They help control responses to hormones, neurotransmitters, and other signals and may influence disease when altered.

Rhabdoid Tumor

A rare, fast-growing cancer that usually affects infants and young children. It may begin in the kidney,

brain, or other tissues; changes in genes that control cell growth, especially SMARCB1, are common.

Rhabdomyolysis

A serious medical condition caused by the rapid, extensive breakdown of damaged skeletal muscle tissue. When muscle cells rupture, their internal proteins and electrolytes—especially a protein called myoglobin—spill directly into the bloodstream. This surge of muscle proteins can clog the filtering units of the kidneys, potentially leading to acute kidney injury or failure. Common triggers include severe physical trauma or crush injuries, extreme overexertion, prolonged pressure on muscles from immobilization, heatstroke, or certain medications, classically causing severe muscle pain, weakness, and dark tea- or cola-colored urine.

Alternate Names:
Rhabdomyo; Acute Muscle Breakdown; Myoglobinuria Syndrome

Rhabdomyolysis And AKI

Severe muscle breakdown releases muscle proteins and salts, potentially causing acute kidney injury, abnormal body salts, and abnormal heart rhythms. Findings may include muscle pain, weakness, dark urine, and a high creatine kinase level.

Rhabdomyoma

A usually noncancerous tumor made of heart-muscle cells, seen mainly in infants and children. It is strongly associated with tuberous sclerosis and may shrink on its own, but large or multiple tumors can block blood flow or disturb the heart rhythm.

Rhabdomyosarcoma

Rhabdomyosarcoma is a malignant tumor showing skeletal-muscle differentiation, occurring most often in children but also in adults.

Rhabdomyosarcoma Pathology

A malignant mesenchymal tumor showing skeletal-muscle differentiation. Histologic patterns include embryonal, alveolar, spindle-cell, and pleomorphic forms, with primitive cells, rhabdomyoblasts, and variable myogenin or MyoD1 expression.

Rhegmatogenous Retinal Detachment

The most common type of retinal detachment, caused by a hole or tear that lets the eye's internal fluid pass beneath the retina. It can cause flashes, floaters, a curtain-like shadow, or sight loss.

Rhesus Factor

See *Rh Factor*.

Rhesus Incompatibility

Rhesus incompatibility occurs when an RhD-negative pregnant person forms antibodies against RhD-positive fetal red cells, risking haemolytic disease in a later or affected pregnancy; anti-D immunoglobulin prevents sensitization.

Rhesus System

The Rh blood-group system, a group of inherited red-cell antigens including D, C, c, E, and e. RhD status is commonly reported as positive or negative and is important in transfusion compatibility and prevention of hemolytic disease of the fetus and newborn.

Rheumatic Chorea

Involuntary, irregular, fidgety movements caused by an immune reaction after group A streptococcal infection. It is a feature of acute rheumatic fever and may affect the face, arms, legs, speech, or handwriting.

Rheumatic Disease

A broad group of disorders affecting joints, muscles, bones, connective tissue, or immune function, including arthritis and lupus.

Rheumatic Fever

An inflammatory disease that can develop as a complication of an untreated or poorly treated throat infection caused by group A *Streptococcus* bacteria (strep throat or scarlet fever). In susceptible individuals, the immune system produces antibodies against the bacteria that mistakenly react against the body's own tissues, causing inflammation in the heart, joints, skin, and central nervous system. Symptoms include painful, swollen, migratory joint

pain, fever, chest pain, rapid heartbeats, and jerky uncoordinated movements. Inflammation of the heart valves can lead to long-term scarring and chronic rheumatic heart disease.

Alternate Names:
Acute Rheumatic Fever; ARF; Rheumatic Heart Disease Precursor

Rheumatic Heart Disease

Permanent damage to heart valves after rheumatic fever, an immune reaction following group A streptococcal throat infection. It most often affects the mitral valve and can cause breathlessness, tiredness, swelling, abnormal rhythms, or heart failure.

Rheumatism

Pain, stiffness, or discomfort in joints and surrounding soft tissues.

Rheumatoid Arthritis

A chronic autoimmune disease in which the body's immune system mistakenly attacks the lining of the joints (the synovium). This attack causes persistent inflammation, leading to joint pain, warmth, swelling, and morning stiffness that lasts for hours, typically affecting the same joints on both sides of the body—especially the hands, wrists, and feet. Over time, chronic inflammation can erode bone and destroy cartilage, causing joint deformities and weakness, and may also affect other organs such as the heart and lungs.

Alternate Names:
RA; Atrophic Arthritis

Rheumatoid Arthritis Of The Foot

Inflammation from rheumatoid arthritis affecting joints in the foot or ankle. It can cause pain, swelling, and stiffness, often in matching joints on both feet, and may damage joints or change foot shape over time.

Rheumatoid Arthritis Of The Hip

Inflammation of the hip joint caused by rheumatoid arthritis, an immune disease that can affect joints throughout the body. It may cause pain, stiffness, and swelling and can damage the joint over time.

Rheumatoid Arthritis of the Cervical Spine

Alternate name; see *Cervical Spine Involvement in Rheumatoid Arthritis*.

Rheumatoid Arthritis and Pregnancy

Rheumatoid arthritis often changes during pregnancy and may flare after delivery. Care balances disease control, joint function, medication safety, contraception or fertility goals, and fetal or newborn considerations, with coordinated rheumatology and obstetric review.

Rheumatoid Arthritis Cause Gastrointestinal Issues

Rheumatoid arthritis can affect the gastrointestinal system indirectly through inflammation, associated autoimmune disease, reduced mobility, or medicines such as nonsteroidal anti-inflammatory drugs. Abdominal pain, bleeding, persistent diarrhea, or weight loss may reflect gastrointestinal disease rather than arthritis itself.

Rheumatoid Arthritis Inflammation Of The Brain

Direct brain inflammation is uncommon in rheumatoid arthritis, but vasculitis, medication effects, infection, stroke, or another autoimmune process can cause neurologic symptoms. Confusion, seizure, weakness, severe headache, or vision change can signal a serious neurologic complication.

Rheumatoid Arthritis (RA)

Alternate name; see *Rheumatoid Arthritis*.

Rheumatoid Factor

An antibody that mistakenly recognizes part of another antibody. A blood test may support the diagnosis of rheumatoid arthritis, but it can also be positive in other diseases or in healthy people.

Rheumatoid Factor Test

A blood test that detects rheumatoid factor autoantibodies, frequently ordered in the evaluation of rheumatoid arthritis and other autoimmune disorders; see *Rheumatoid Factor*.

Rheumatoid Lung Disease

Lung involvement associated with rheumatoid arthritis, including interstitial lung disease, pleural disease, nodules, or airway abnormalities.

Rheumatoid Nodule

A firm, non-tender subcutaneous inflammatory nodule occurring in approximately 20–30% of patients with seropositive rheumatoid arthritis, characteristically located over pressure points and extensor surfaces (such as the olecranon process, Achilles tendon, and proximal forearm) or occasionally in internal viscera (lungs, pleura, pericardium). Histologically characterized by central fibrinoid necrosis surrounded by a palisade of CD68+ histiocytes and tissue macrophages enclosed in a fibrous capsule with lymphocytic infiltrate; correlates strongly with high-titer rheumatoid factor, anti-CCP antibodies, and severe erosive disease.

Alternate Names:
Rheumatoid Nodules

Rheumatoid Nodules

Plural form; see *Rheumatoid Nodule*.

Rheumatoid Pneumoconiosis

Rheumatoid pneumoconiosis is lung disease involving rheumatoid arthritis and dust-related lung nodules, historically called Caplan syndrome.

Rheumatoid Synovitis

Long-lasting immune inflammation of the tissue lining a joint in rheumatoid arthritis. It causes pain and swelling and can gradually damage cartilage, bone, and joint movement.

Rheumatoid Vasculitis

Inflammation of small or medium-sized blood vessels associated with rheumatoid arthritis. It can reduce blood flow and affect the skin, nerves, eyes, or internal organs.

Rheumatologist

A medical doctor who diagnoses and treats diseases affecting joints, muscles, bones, and connective tissues, especially autoimmune and inflammatory conditions such as rheumatoid arthritis, lupus, gout, and vasculitis.

Rheumatology

The medical specialty focused on inflammatory, autoimmune, and other disorders of the joints, muscles, bones, and connective tissues. It includes conditions such as rheumatoid arthritis, lupus, vasculitis, gout, and systemic sclerosis.

Rh Factor

A system of antigens on the surface of red blood cells, especially the D antigen. A person is Rh-positive when the D antigen is present and Rh-negative when it is absent. Rh incompatibility can affect pregnancy and transfusion safety.

Alternate Names:
Rh D Antigen; Rhesus Antigen

Rh Immune Globulin

An antibody medicine given to eligible RhD-negative pregnant people to reduce the chance of forming antibodies against RhD-positive fetal red blood cells. It is also used after some pregnancy events and in selected transfusion settings.

Rh Incompatibility

An immune reaction that can occur when an Rh-negative pregnant person carries an Rh-positive fetus and forms antibodies against fetal red blood cells. Anti-D immune globulin can prevent sensitization.

Rhinencephalon

An older term for brain regions involved mainly in smell and closely connected with emotion and memory. Modern anatomy usually names the individual structures instead of using this broad term.

Rhinitis

Inflammation or irritation of the lining of the nose. It can cause a blocked or runny nose, sneezing, itching, and reduced smell and may result from allergy, infection, smoke, strong smells, medicines, or other triggers.

Rhinitis Medicamentosa

Persistent or worsening nasal congestion caused by prolonged or excessive use of topical nasal decongestant sprays, such as oxymetazoline. The duration that can trigger it varies.

Alternate Names:
Rebound Nasal Congestion; Topical Decongestant Rhinitis

Rhinocephaly

A very rare birth defect involving severe abnormal development of the face and forebrain, with a nose-like structure that may lie unusually high or between the eyes. It is usually associated with major neurologic and developmental abnormalities.

Rhinocerebral Mucormycosis

A rapidly progressing fungal infection of the nose and sinuses that can spread to the eye socket or brain. It is caused by Mucorales fungi and occurs mainly in people with severe immune suppression or diabetic ketoacidosis; blood-vessel invasion can cause tissue death.

Alternate Names:
Invasive Rhinocerebral Zygomycosis

Rhinophyma

Progressive thickening and enlargement of the nose caused by long-standing changes often associated with rosacea. It may produce a rough, irregular appearance and can sometimes interfere with breathing or require surgical treatment.

Rhinoplasty

Surgery to reshape, repair, or reconstruct the nose for breathing, injury, birth differences, or appearance. Recovery includes swelling and bruising, and results depend on anatomy, technique, healing, and patient goals.

Rhinorrhea

Excessive watery or mucoid discharge from the nose, commonly caused by infection, allergy, irritants, or changes in temperature.

Rhinorrhoea

British spelling of rhinorrhea, meaning drainage of watery or mucus-like fluid from the nose. Causes include allergy, infection, irritation, and rarely a cerebrospinal-fluid leak.

Rhinoscleroma

A chronic, slowly progressive granulomatous infection of the nose and upper airway caused by Klebsiella rhinoscleromatis. It may progress from foul-smelling discharge and obstruction to scarring, deformity, and airway narrowing and usually needs prolonged antibiotics.

Rhinoscopy

Examination of the nasal cavity and nasopharynx using an instrument or endoscope to assess the mucosa, septum, turbinates, masses, bleeding, or obstruction.

Rhinosporidiosis

A chronic localized granulomatous disease of the mucous membranes caused by Rhinosporidium seeberi, an aquatic protistan parasite in the clade Mesomycetozoea, endemic primarily to rural wetland communities in India and Sri Lanka. It classically manifests in the anterior nasal cavity or nasopharynx as painless, friable, highly vascular, sessile or pedunculated polypoid lesions with a characteristic "strawberry-like" appearance dotted with visible white spherules (sporangia), causing nasal obstruction, epistaxis, and foreign-body sensation.

Alternate Names:
Nasal Rhinosporidiosis; Rhinosporidium Seeberi Infection

Rhinovirus

A common family of respiratory viruses that serves as the predominant cause of the common cold. The virus infects the mucosal lining of the nose and throat, multiplying best at the slightly cooler temperatures found in the nasal passages. It typically causes symptoms such as a runny or congested nose, sneezing, scratchy or sore throat, mild cough, and headache, and can trigger worsening breathing problems in people with asthma or chronic lung disease.

Alternate Names:
Rhinoviruses; Human Rhinovirus; HRV

Rhinovirus A

A species group of rhinoviruses that commonly causes the common cold and can worsen asthma or trigger wheezing.

Rhinovirus C

A rhinovirus group associated with common-cold symptoms and, in some children, more severe wheezing or lower-respiratory illness.

Rhinoviruses

Plural form; see *Rhinovirus*.

Rh Isoimmunization

Maternal alloantibody production against fetal Rh D-positive red blood cells in an Rh D-negative mother, occurring when fetal RBCs enter the maternal circulation (fetomaternal hemorrhage).

Rhizomucor

A genus of molds that can cause mucormycosis, especially in people with diabetes, neutropenia, or severe immune suppression.

Rhizomucor Pusillus

A mold that can cause invasive mucormycosis involving the lungs, sinuses, skin, or other organs in severely immunocompromised people.

Rhizopus

A genus of molds that includes important causes of mucormycosis, a rapidly invasive infection of sinuses, lungs, skin, or other tissues.

Rhizopus Oryzae

A mold, also called Rhizopus arrhizus, that is a common cause of invasive mucormycosis.

Rhizotomy

A procedure that cuts or heats selected nerve roots to reduce severe pain, muscle stiffness, or abnormal reflexes. It is used only in carefully selected cases because it can cause permanent numbness, weakness, or other nerve problems.

Rhodium

A chemical element used in industrial and dental materials; its compounds can irritate tissues and may cause allergic reactions.

Rhodococcus

A genus of gram-positive bacteria that includes Rhodococcus equi, an opportunistic pathogen causing pneumonia mainly in immunocompromised people.

Rhodococcus Equi

A gram-positive bacterium that can cause cavitary pneumonia and disseminated infection, especially in people with advanced immune suppression.

Rhodopsin

A light-sensitive protein in rod cells of the retina that enables vision in dim light.

Rhodospirillaceae

A family of metabolically diverse bacteria found in soil and water; some species carry out photosynthesis or nitrogen fixation.

Rhodospirillum

A genus of spiral-shaped aquatic bacteria capable of photosynthesis or nitrogen fixation; human infection is rare.

Rhombencephalon

The hindbrain region of an early embryo. It develops into the pons, medulla, cerebellum, and related structures that help control breathing, balance, movement, swallowing, and other essential functions.

Rhonchi

Low-pitched, continuous breathing sounds caused by air moving through narrowed or mucus-filled larger airways. They may change after coughing.

Rhonchus

A low-pitched, continuous breathing sound caused by air moving through narrowed or mucus-filled larger airways.

Alternate Names:
Rhonchi

Rhubarb Leaves Poisoning

Illness caused by eating large amounts of rhubarb leaves, which contain oxalates. Severe exposure can cause vomiting, abdominal pain, low blood calcium, or kidney injury.

Rhythm Method

A fertility-awareness method that estimates fertile days from menstrual-cycle timing to avoid or achieve pregnancy.

Rib

One of 12 paired, curved bones forming the thoracic cage, protecting the heart, lungs, and great vessels. True ribs (1–7) attach directly to the sternum via costal cartilage. False ribs (8–10) attach indirectly to the sternum via the costal cartilage of rib 7. Floating ribs (11–12) have no anterior attachment.

Alternate Names:
Costal Bone; Costa

Rib Angle

The point where a rib bends most sharply as it curves from the spine toward the front of the chest.

Ribavirin

A synthetic antiviral nucleoside analogue used for selected viral infections, often in combination with other medicines. It interferes with viral replication, and the specific regimen depends on the infection. Important risks include hemolytic anemia, which can worsen heart disease, and serious embryo-fetal toxicity; exposure during pregnancy is contraindicated.

Rib Cage

The rib cage consists of ribs, sternum, thoracic vertebrae, muscles, and connective tissues that protect chest organs and assist breathing.

Ribcage Pain

Ribcage pain may arise from muscles, ribs, joints, lungs, heart, or other organs; sudden severe pain or breathing difficulty may indicate a serious condition.

Rib Fracture

A break in one or more ribs, usually causing localized chest pain worsened by breathing, coughing, or movement and sometimes associated with injury to underlying organs.

Rib Head

The back end of a rib that joins with the bodies of one or two thoracic vertebrae.

Rib Neck

The narrowed part of a rib between its head and tubercle.

Riboflavin

A water-soluble vitamin that forms the coenzymes FAD and FMN. These cofactors participate in oxidation-reduction reactions, including electron transfer, fatty-acid oxidation, and energy metabolism.

Alternate Names:
Lactoflavin; Vitamin G

Riboflavin Deficiency

Deficiency of vitamin B2, which can cause inflammation or fissuring of the mouth and lips, sore throat, dermatitis, anemia, and other mucosal or systemic findings.

Ribonuclease

An enzyme that cuts RNA, a molecule involved in reading genetic instructions, into smaller pieces. Ribonucleases help control how long RNA lasts, recycle cell material, and protect cells from some unwanted genetic material.

Ribonuclease H

An enzyme that removes the RNA strand when

RNA and DNA are joined together. Cells use it during DNA copying, and some viruses depend on related activity when making DNA from their RNA.

Ribonuclease III

An enzyme that cuts double-stranded RNA into smaller pieces. The products can help control gene activity, make proteins, or process genetic material in cells and some microorganisms.

Ribonucleic Acid

RNA is a nucleic acid that carries genetic instructions, helps make proteins, and regulates cell activity; some viruses use RNA as their genetic material.

Ribonucleoprotein

A structure made of RNA joined to one or more proteins. It helps make, process, transport, or control RNA; antibodies against certain ribonucleoproteins can occur in autoimmune diseases.

Ribonucleoside

A molecule made of a ribose sugar joined to one of the bases used in RNA. Examples include adenosine, guanosine, cytidine, and uridine; adding phosphate groups produces RNA building blocks.

Ribonucleotide Reductase

An enzyme that changes RNA building blocks into the related building blocks needed to make DNA. Cells require it to copy and repair DNA, so it is important for growth and is a target of some cancer medicines.

Ribonucleotides

Nucleotides containing ribose sugar and RNA bases, serving as RNA building blocks and cellular energy or signaling molecules.

Ribophagy

A cell-cleaning process that breaks down some ribosomes, the structures that make proteins, so their parts can be recycled. It helps cells adjust protein production when nutrients or growth conditions change.

Ribose

A five-carbon sugar used to build RNA, ATP, and other molecules involved in storing genetic information and transferring energy. Cells make ribose from other nutrients and use it in many normal chemical processes.

Ribosomal Protein

A protein that combines with ribosomal RNA to form a ribosome, the cell structure that builds proteins. Inherited changes in some ribosomal proteins can cause bone-marrow failure or developmental syndromes.

Ribosomal RNA

RNA that forms the main structural and working part of ribosomes, the cell structures that make proteins. It helps position messenger RNA and joins amino acids together; its genes are also used in some laboratory studies to identify organisms.

Ribosome

A cellular structure made of RNA and proteins that reads messenger RNA and links amino acids together to make proteins.

Ribosome Subunit

One of the two RNA-and-protein parts of a ribosome. The small and large parts join around messenger RNA and work together to assemble amino acids into a protein.

Rib Tubercle

A small projection near the back of a rib that joins with the transverse process of a thoracic vertebra.

Richter's Syndrome

Transformation of chronic lymphocytic leukemia or small lymphocytic lymphoma into an aggressive lymphoma, most often diffuse large B-cell lymphoma.

Richter Transformation

The rapid clinico-pathological transformation of chronic lymphocytic leukemia (CLL) or small lymphocytic lymphoma (SLL) into an aggressive, high-

grade diffuse large B-cell lymphoma (DLBCL), presenting with rapidly enlarging lymphadenopathy, systemic B symptoms, and elevated serum LDH.

Alternate Names:
Richter's Syndrome; High-Grade Transformation of CLL

Ricin

Ricin is a highly toxic plant protein that blocks protein synthesis; ingestion, inhalation, or injection can cause severe organ injury and death.

Rickets

A condition in children whose growing bones do not harden normally, usually because of too little vitamin D, calcium, or phosphate. It can cause weak or bowed bones, bone pain, and problems with growth.

Rickettsia

A group of small intracellular bacteria transmitted mainly by arthropods and causing diseases such as typhus and spotted fevers.

Rickettsiaceae

A family of bacteria that live inside cells and includes several organisms spread by ticks, fleas, lice, or mites. They can cause fever, rash, blood-vessel inflammation, and serious organ complications.

Rickettsia Felis

A flea-associated bacterium that can cause a spotted-fever-like illness in people. Infection may produce fever, headache, rash, fatigue, or muscle aches and is assessed with exposure history and laboratory testing.

Rickettsia Infections

Rickettsial infections are illnesses caused by intracellular bacteria spread mainly by ticks, fleas, lice, or mites and often causing fever and rash.

Rickettsia Japonica

A bacterium spread by ticks and associated with Japanese spotted fever. Infection may cause fever, headache, rash, and a dark mark where the tick bit; treatment uses suitable antibiotics.

Rickettsialpox

An infection caused by *Rickettsia akari* and spread by house mouse mites. It may begin with a dark sore at the bite site, followed by fever and a blister-like rash.

Rickettsia Prowazekii

A bacterium that causes epidemic typhus and is mainly spread through infected body-lice feces. Disease can cause high fever, headache, rash, confusion, and serious organ complications without prompt antibiotic treatment.

Rickettsia Rickettsii

A bacterium spread by infected ticks that causes Rocky Mountain spotted fever. Fever, severe headache, rash, muscle aches, or confusion may develop; untreated infection can rapidly become life-threatening.

Rickettsia Typhi

A bacterium spread mainly by infected fleas and responsible for murine typhus. The illness commonly causes fever, headache, chills, and sometimes a rash; untreated infection can become severe.

Riddoch Phenomenon

A form of visual statuagnosia in which a patient with homonymous hemianopia or cortical blindness from an occipital lobe lesion is able to perceive moving visual targets within the blind field while remaining unable to visualize stationary, static stimuli.

Alternate Names:
Statuagnosia; Visual Motion Perception Preservation

Ridged Cranial Sutures

Raised skull seams in an infant that may reflect normal molding or premature suture fusion (craniosynostosis).

Ridged Nail

A ridged nail has longitudinal or transverse grooves in its surface, which may result from aging, trauma, inflammation, nutritional problems, or systemic disease.

Ridge Preservation

A dental procedure performed after a tooth is removed to reduce loss of the jawbone that held the tooth. Material is placed in the empty socket, sometimes with a covering, to help maintain shape for healing or a future implant.

Riedel's Thyroiditis

A rare form of thyroid inflammation in which tough scar-like tissue makes the thyroid hard and may spread into nearby structures. It can cause a neck lump, difficulty swallowing or breathing, or reduced thyroid function.

Riedel Thyroiditis

A rare, chronic fibroinflammatory disorder of the thyroid gland (an organ manifestation of IgG4-related disease) characterized by dense, invasive collagenous fibrous tissue replacing normal thyroid tissue and extending into adjacent strap muscles and trachea, presenting as a stony-hard, fixed ('woody') goiter.

Alternate Names:
Invasive Fibrous Thyroiditis; Woody Thyroiditis

Rieger Syndrome

A genetic condition affecting development of the front of the eye and often the teeth. It may cause glaucoma, unusual teeth, or changes around the navel and can result from changes in genes such as PITX2 or FOXC1.

Riehl Melanosis (Pigmented Contact Dermatitis)

An acquired gray-brown to slate-colored facial or neck hyperpigmentation associated with contact or photocontact exposure to fragrances, cosmetics, dyes, or other chemicals. Itching or redness may precede pigmentation; patch or photopatch testing can help identify an associated trigger.

Rifabutin

A rifamycin antibiotic used mainly for selected mycobacterial infections and tuberculosis regimens; it has important drug interactions and can discolor body fluids.

Rifampicin

Alternate name; see *Rifampin*.

Rifampin

Rifampin is a rifamycin antibiotic that inhibits bacterial DNA-dependent RNA polymerase and is a key component of tuberculosis treatment; it causes orange body fluids and has many drug interactions and hepatotoxicity risk.

Rifampin Toxicity

Adverse pharmacological effects of the first-line rifamycin antibiotic rifampin, including benign orange-red discoloration of body secretions (urine, tears, sweat), drug-induced hepatotoxicity, an immune-mediated flu-like syndrome with intermittent dosing, and potent induction of hepatic cytochrome P450 enzymes (CYP3A4).

Rifamycin

Rifamycin is an antibiotic that inhibits bacterial RNA polymerase; related rifamycin medicines are used for tuberculosis and other infections.

Rifaximin

Rifaximin is a minimally absorbed rifamycin antibiotic used for selected intestinal infections, prevention of recurrent hepatic encephalopathy, and some diarrhoeal syndromes; indication and resistance patterns guide use.

Rift Valley Fever

A mosquito-borne viral disease affecting animals and humans, usually causing fever but sometimes severe eye, brain, or hemorrhagic disease.

Right Atrium

The upper-right chamber of the heart. It receives oxygen-poor blood from the body and passes it

through the tricuspid valve into the right ventricle, which sends it to the lungs.

Right Bundle Branch

A group of heart fibers that carries the electrical signal to the right lower chamber so it contracts. If conduction is delayed or blocked, the ECG shows right bundle-branch block; this may be harmless or reflect heart or lung disease.

Right Bundle Branch Block

Delay or interruption of electrical signals through the right bundle branch. It changes the ECG pattern and may occur without symptoms or with heart or lung disease.

Alternate Names:
RBBB

Right Coronary Artery

A blood vessel that branches from the aorta and supplies much of the right side and lower part of the heart. A blockage can cause a heart attack or abnormal heart rhythm.

Right Coronary Artery Occlusion

A blockage of the artery supplying much of the right and lower heart. It can cause a heart attack, slow or abnormal rhythms, low blood pressure, or failure of the right side of the heart.

Right Heart Failure

Failure of the right side of the heart to pump blood effectively to the lungs. It may result from left-sided heart failure, high pressure in the lung arteries, a heart attack, lung clots, heart-muscle disease, or a stiff sac around the heart. It can cause swollen legs, neck veins, an enlarged liver, abdominal fluid, and weight gain.

Right Heart Ventricular Angiography

An imaging test in which contrast dye and X-rays show the right lower heart chamber and how it pumps blood. It is used selectively to assess structure, movement, or blood flow during heart evaluation.

Right Hypochondriac Region

The upper-right area of the abdomen, beneath the lower ribs. It contains much of the liver, the gallbladder, and part of the intestine. Pain there may arise from these organs.

Right Iliac Region

The lower-right area of the abdomen, containing the appendix, beginning of the large intestine, and part of the small intestine. Pain there may occur with appendicitis, bowel disease, urinary problems, or a hernia; location alone does not identify the cause.

Righting Reflex

The righting reflex is an automatic response that restores head and body orientation when balance or position changes.

Right Lower Quadrant

The lower-right quarter of the abdomen, containing the appendix, cecum, portions of the small and large intestines, the right ureter, and, in females, the right ovary and uterine tube.

Right Lower Quadrant Abdominal Pain

Pain in the lower-right part of the abdomen. Appendicitis is one possible cause, but bowel, urinary, reproductive, and other conditions can also cause it.

Right Lymphatic Duct

A short vessel that returns lymph from the right arm, right side of the head and neck, and right upper chest to the bloodstream near the right side of the neck. Damage or blockage can cause swelling in these areas.

Right Sixth Cranial Nerve Palsy

Weakness of the nerve that moves the right eye outward. It can cause double vision, usually worse when looking to the right or at a distance, and may result from diabetes, high pressure in the skull, inflammation, stroke, or other disease.

Right Upper Quadrant

The upper-right quarter of the abdomen, containing the liver, gallbladder, duodenum, and portions of the small and large intestines.

Right Ureterovesical Calculus

A stone lodged at the junction of the right ureter and bladder, causing flank pain, hematuria, and urinary urgency or frequency. May require endoscopic or lithotripsy intervention.

Right Ventricle

The lower-right chamber of the heart. It receives oxygen-poor blood from the right atrium and pumps it through the pulmonary valve into the lung arteries to receive oxygen.

Right Ventricular Assist Device

A mechanical pump that supports blood flow from the right ventricle to the pulmonary circulation in selected patients with severe right-sided heart failure.

Right Ventricular Strain

Increased pressure or workload on the right ventricle. It may be suggested by ECG or imaging findings, but these findings are nonspecific and do not by themselves diagnose pulmonary embolism or another cause.

Rigid And Flexible Sigmoidoscopy

A sigmoidoscopy examines the rectum and lower colon with a flexible or rigid instrument. It can evaluate bleeding, pain, altered bowel habits, inflammation, polyps, or tumors; preparation, reach, comfort, and biopsy capability differ by technique.

Rigidity

Abnormally increased resistance when a relaxed limb is moved by another person. It can occur with Parkinson disease, brain or spinal injury, severe infection, certain medicines, or other movement disorders.

Rigler Sign

A classic abdominal radiographic sign of massive pneumoperitoneum (free intra-abdominal air) on plain supine radiographs, where both the inner (mucosal) and outer (serosal) surfaces of the bowel wall are clearly outlined by gas.

Alternate Names:
Double Wall Sign; Bas-Relief Sign

Rigler Triad

Three imaging findings that strongly suggest gallstone ileus: blockage of the small intestine, air in the bile ducts, and a gallstone in the intestine. Not every person has all three findings.

Rigor

Marked stiffness or rigidity; rigor mortis is postmortem muscle stiffening, while rigor may also mean a severe chill.

Rigor Mortis

Stiffening of the body's muscles after death. It develops as the muscles lose the energy needed to relax and later fades as decomposition advances; its timing is affected by temperature, activity, illness, and the environment.

Rilpivirine

An HIV medicine that blocks an enzyme the virus needs to copy itself. It is taken with other antiretroviral medicines, and missed doses or drug interactions can allow resistance to develop.

Riluzole

A medicine used to treat amyotrophic lateral sclerosis; it can modestly prolong survival but does not reverse the disease.

Rimmed Vacuoles

Small empty-looking spaces with a visible border seen inside muscle cells on biopsy. They indicate that muscle cells are breaking down or recycling parts of themselves and can occur in conditions such as inclusion-body myositis and GNE myopathy. The finding must be interpreted with symptoms and

other tests.

Alternate Names:
Autophagic Rimmed Vacuoles

Ring Block

Local anesthetic injected around the base of a finger or toe to numb the entire digit.

Ring Chromosome

A chromosome whose two ends have joined to form a ring, often with loss or disruption of genetic material. It may cause developmental or other health problems, depending on the chromosome and changes involved.

Ringing In The Ear

Alternate name; see *Tinnitus*.

Alternate Names:
Tinnitus; Ringing In The Ears

Ringing In The Ears

Plural form; see *Tinnitus*.

Rings Around Cornea

Visible rings or arcs in the clear front part of the eye or around the colored part. A gray-white ring may be arcus senilis; a gold or green-brown ring may be a Kayser-Fleischer ring caused by copper buildup. The cause depends on the ring's appearance and the person's age.

Ring Vaccination

A public-health strategy in which close contacts and contacts of contacts around an identified case are vaccinated to create a protective ring and limit transmission.

Ringworm

A contagious fungal infection of the skin, scalp, hair, or nails. It commonly causes an itchy, scaly rash with a ring-like edge; scalp infection may cause broken hairs or hair loss. The appearance and complications vary by the affected site.

Alternate Names:
Dermatophytosis

Ringworm Of The Body

A contagious fungal infection of body skin causing an itchy, scaly, ring-shaped rash. It spreads through contact with infected people, animals, or objects and usually responds to antifungal treatment.

Ringworm Of The Foot

Alternate name; see *Athlete's Foot*.

Ringworm Of The Scalp

A fungal infection of the scalp and hair that can cause scaling, broken hairs, and hair loss.

Ringworm (Tinea)

Alternate name; see *Ringworm*.

Rinne and Weber Tests

Complementary bedside tuning fork examinations (typically using a 512 Hz fork) to evaluate auditory hearing loss: Rinne compares air conduction to bone conduction in each ear, while Weber tests lateralization of sound when the vibrating fork is placed on the midline forehead.

Rinnes Test

Alternate spelling; see *Rinne Test*.

Rinne Test

A hearing test that compares sound conducted through the air with sound conducted through bone using a vibrating tuning fork. It can help distinguish conductive hearing loss from sensorineural loss.

RIPE Therapy

A combination of rifampin, isoniazid, pyrazinamide, and ethambutol used in some initial regimens for drug-susceptible tuberculosis. The medicines and treatment duration depend on drug susceptibility, disease site, and the current treatment guideline.

Rippling Muscle Disease

A rare, benign myopathy characterized by mechanically-induced muscle contractions that spread across the muscle as a visible wave (rippling), typically triggered by stretch, percussion, or

movement.

Risedronate Sodium

The sodium salt of risedronate, a bisphosphonate used to prevent or treat osteoporosis and other disorders of excessive bone resorption.

Risk

Risk is the probability of an unwanted event or outcome, considered together with its severity and the circumstances that influence it.

Risk Adjustment

Risk adjustment accounts for differences in baseline patient characteristics so outcomes or payments can be compared more fairly across groups.

Risk Factor

A characteristic, exposure, or behavior linked with a higher chance of disease or another outcome. It may be changeable, such as smoking, or unchangeable, such as age or inherited traits.

Risk Management

Finding possible sources of harm, judging how likely and serious they are, and taking steps to reduce them. In healthcare, it includes safe systems, reporting problems, learning from errors, and checking whether safety measures work.

Risk Register

A documented list of identified risks, their likelihood, impact, controls, owners, and review status.

Risks Of Hip And Knee Replacement

Possible problems after joint replacement include infection, blood clots, bleeding, nerve or vessel injury, dislocation, stiffness, loosening, wear, persistent pain, and need for repeat surgery. Risk varies with the operation and the person's health.

Risks Of Tobacco

Tobacco use increases risks of cancer, heart and blood-vessel disease, stroke, lung disease, pregnancy complications, addiction, and harm from second-hand smoke.

Risks Of Underage Drinking

Alcohol use by minors can impair brain development, judgment, learning, safety, and mental health and increases risks of injury, dependence, and unsafe sexual or substance-related behavior.

Risk-Taking

Risk-taking is behavior involving deliberate or inadvertent exposure to possible harm, influenced by perception, reward, development, mental health, and circumstances.

Risky Drinking

Alcohol use that increases the chance of health, safety, work, relationship, or social problems. Risk depends on amount, frequency, pattern, personal health, medicines, pregnancy, age, and circumstances such as driving.

Alternate Names:
Hazardous Drinking; At-Risk Alcohol Consumption

Risperidone

Risperidone is an atypical antipsychotic that blocks dopamine and serotonin receptors and treats schizophrenia, bipolar disorder, and selected severe behavioral symptoms; hyperprolactinaemia, metabolic effects, movement disorders, and sedation may occur.

Ristocetin-Induced Platelet Aggregation

A blood test that checks how platelets clump when exposed to ristocetin, a substance that requires von Willebrand factor and a platelet surface protein. It helps investigate von Willebrand disease and some platelet disorders.

Risus Sardonicus

A fixed, strained grin caused by painful facial-muscle spasms. It is classically associated with tetanus or strychnine poisoning and reflects severe muscle overactivity.

Ritonavir

Ritonavir is an HIV protease inhibitor mainly used at low doses to boost levels of other antiviral medicines by slowing their breakdown.

Ritual

A ritual is a repeated, structured behavior or ceremony; repetitive rituals may also occur as compulsions in obsessive-compulsive disorder.

Rituximab

Rituximab is a monoclonal antibody against CD20 that depletes B cells and is used for B-cell malignancies and selected autoimmune diseases; infusion reactions, infections, hepatitis-B reactivation, and rare PML are important risks.

Rivaroxaban

Rivaroxaban is an oral direct factor Xa inhibitor used to prevent or treat venous thromboembolism and reduce stroke risk in selected atrial fibrillation; bleeding and renal-function-dependent dosing are important considerations.

Rivastigmine

A medicine that increases acetylcholine signaling and may temporarily improve thinking or daily function in Alzheimer disease or Parkinson disease dementia. Common effects include nausea, vomiting, diarrhea, appetite loss, dizziness, and slow heartbeat.

River Blindness

Onchocerciasis, a parasitic infection caused by Onchocerca volvulus and transmitted by blackflies. It can cause severe itching, skin disease, and visual impairment.

RLS

Restless legs syndrome, an urge to move the legs with uncomfortable sensations, especially at night.

Alternate Names:
Restless Legs Syndrome; Willis-Ekbom Disease

RMDs

Abbreviation; see *Repetitive Motion Disorders*.

RNA

Ribonucleic acid, a molecule that helps cells read genetic instructions and make proteins. Some RNA carries messages from DNA, some helps build proteins, and some controls cell activity or forms part of viruses.

RNA Binding

The attachment of a protein or other molecule to RNA, affecting RNA stability, transport, folding, processing, or translation.

RNA Biosynthesis

The cellular production of RNA from a DNA template or, for some viruses, from an RNA template.

RNA Degradation

The enzyme-controlled breakdown of RNA molecules. It controls how long genetic messages last, removes damaged or unnecessary messages, recycles their building blocks, and helps regulate protein production and cell behavior.

RNA Folding

The process by which an RNA strand forms secondary and three-dimensional structures that influence its function.

RNA Helicase

An enzyme that uses energy to separate, reshape, or move RNA structures and RNA-protein complexes. It helps cells copy, process, transport, and destroy RNA and is important for some viruses.

RNA Interference

A gene-silencing process in which small RNAs guide proteins to degrade or block specific messenger RNA molecules.

RNase P

An RNA-protein enzyme complex that processes precursor transfer RNA by removing its extra 5-

prime sequence.

RNA Splicing

Removal of introns and joining of exons from a precursor RNA to produce mature messenger RNA or other functional RNA.

RNA Transport

Movement of RNA within a cell or between cells, often mediated by transport proteins and required for translation or signaling.

RNA Virus

A virus whose genetic material is RNA; its replication often involves an RNA-dependent polymerase and may have a high mutation rate.

Road Rage

Aggressive or violent behavior by a driver in response to traffic events. It is not a psychiatric diagnosis and is distinct from intermittent explosive disorder, although impulsive aggression may occur in either context.

Robinow Syndrome

A rare genetic skeletal dysplasia characterized by short stature, short limbs and fingers, and distinctive facial features. Genital underdevelopment, vertebral or rib abnormalities, dental abnormalities, and congenital heart defects may also occur. Autosomal dominant and autosomal recessive forms are recognized, and features vary among affected individuals.

Robot-Assisted Rehabilitation

Robotic devices for repetitive task training. Upper extremity, lower extremity, gait training. Objective measurement, high repetition.

Robotic-Assisted Thoracoscopic Surgery

Chest surgery performed through several small openings using instruments controlled by a surgeon from a console. The camera provides a magnified three-dimensional view and the instruments can move precisely. It may reduce the size of the incisions, but bleeding, infection, air leakage, and conversion to open surgery remain possible.

Alternate Names:
RATS; Robotic Thoracic Surgery; Robotic Lobectomy

Robotic Hysterectomy

Hysterectomy performed through minimally invasive abdominal access using a surgeon-controlled robotic platform. The extent of uterine, cervical, tubal, and ovarian removal depends on the indication and operative plan.

Robotic Surgery

A surgical technique in which a surgeon controls a computer-assisted system that moves a camera and small instruments. It is usually performed through small incisions and may allow precise movements, but the system does not operate independently.

Alternate Names:
Robot-Assisted Surgery; Computer-Assisted Surgery; RAS

Rocker-Bottom Foot

A rigid congenital foot deformity with a convex sole, usually caused by congenital vertical talus. It includes a dorsiflexed midfoot and a hindfoot fixed in equinovalgus; it may occur with neuromuscular or genetic conditions, including trisomy 13 or 18.

Rocky Mountain Spotted Fever

A potentially severe tick-borne infection caused by *Rickettsia rickettsii*. Fever, severe headache, and muscle aches are common; a rash may begin on the wrists and ankles and spread to the trunk, palms, and soles, but it may be absent early or never appear.

Alternate Names:
RMSF

Rod

A specialized retinal photoreceptor cell concentrated in the outer retina that mediates scotopic (dim-light) and peripheral vision. Containing the photopigment rhodopsin (composed of opsin and 11-cis-retinal), rods possess exquisite light sensitivity capable of sig-

naling single photons but do not mediate chromatic discrimination or high visual acuity.

Alternate Names:
Rods; Rod Cell; Rod Photoreceptor

Rodenticide Toxicity

Poisoning whose effects depend on the active ingredient. Anticoagulant products can cause delayed bleeding, bromethalin can cause neurologic injury, cholecalciferol can cause high blood calcium and kidney injury, and metal phosphides can cause shock and organ failure.

Rodent Ulcer

An older name for basal cell carcinoma, a common locally invasive skin cancer.

Rod Photoreceptor

A light-sensitive cell in the retina that supports vision in dim light and the peripheral field. Rods do not provide color vision; their loss can cause night blindness and narrowing of the visual field.

Rods

Plural form; see *Rod*.

Rods And Cones

Two types of light-sensing cells in the retina. Rods help with dim-light and side vision, while cones provide sharp and color vision in brighter light.

Roentgen Rays

Alternate name; see *X-Ray*.

Alternate Names:
Roentgen Radiation; Electromagnetic X-Radiation

Rofecoxib

Rofecoxib is a selective COX-2 anti-inflammatory drug withdrawn in many countries because of increased cardiovascular risk.

Romano-Ward Syndrome

The most common congenital long QT syndrome, inherited in an autosomal dominant pattern without associated neurosensory deafness (due to mutations in cardiac potassium or sodium channel genes *KCNQ1*, *KCNH2*, or *SCN5A*), predisposing to syncope, polymorphous ventricular tachycardia (torsades de pointes), and sudden cardiac death.

Romanus Lesion

An early inflammatory radiographic finding in ankylosing spondylitis characterized by enthesitis with focal erosion and surrounding reactive sclerosis at the anterior superior and inferior corners of vertebral bodies ('shiny corners'), preceding syndesmophyte formation.

Alternate Names:
Shiny Corner Sign; Spondylitis Anterior Enthesitis

Rombergism

Unsteadiness or falling when standing with feet together and eyes closed, indicating impaired proprioception or vestibular function.

Romberg Sign

Loss of balance when standing with the feet together and the eyes closed, suggesting impaired proprioception or vestibular function.

Romberg's Sign

Increased unsteadiness when a person stands with the feet together and closes the eyes, suggesting impaired proprioception or vestibular function.

Romberg Test

A balance test in which a person stands with the feet together, first with the eyes open and then closed. Marked worsening when the eyes close suggests impaired proprioceptive or vestibular input; cerebellar ataxia usually affects balance even with the eyes open.

Romidepsin

A histone deacetylase inhibitor used for selected T-cell lymphomas; it can cause cytopenias, infection risk, and ECG-related effects.

Romiplostim

A thrombopoietin-receptor agonist that stimulates

platelet production and is used mainly for chronic immune thrombocytopenia.

Rongeur

A strong, jawed surgical instrument used to bite and remove small pieces of bone or other hard tissue.

Ronnel

Ronnel is an organophosphate insecticide that can inhibit acetylcholinesterase and cause cholinergic toxicity after exposure.

Root Canal

The channel inside a tooth root containing the pulp and its nerves and blood vessels.

Root Canal Therapy

Dental treatment in which infected or inflamed pulp is removed from a tooth, the canal is cleaned and sealed, and the tooth is restored.

Root Canal Treatment

Alternate term; see *Root Canal Therapy*.

Root Caries

Tooth decay affecting exposed root surfaces after gum recession or loss of protective covering. It is more common with aging, dry mouth, or limited cleaning and may be slowed with fluoride and dental care.

Root Filling

Dental treatment sealing a cleaned tooth root canal to prevent bacteria entering again and causing reinfection.

Root Fracture

A crack or break in the root of a tooth. A horizontal fracture may sometimes be stabilized and monitored, while a vertical fracture often allows bacteria to enter and may require removal of the tooth. Treatment depends on the fracture's location and extent.

Rooting Reflex

An infant reflex in which touching the cheek or corner of the mouth causes the infant to turn toward the touch and open the mouth. It supports feeding and usually fades during the first several months as voluntary control develops.

Ropinirole

A medicine that stimulates dopamine receptors and is used for Parkinson disease and restless legs syndrome. It may cause nausea, dizziness, sleepiness, low blood pressure, hallucinations, swelling, or impulse-control problems such as gambling.

Ropivacaine

A long-acting local anesthetic used for regional nerve blocks and epidural anesthesia; excessive blood levels can cause neurologic or cardiac toxicity.

Ropivacaine Hydrochloride

The hydrochloride salt of ropivacaine, a long-acting local anesthetic used for regional and epidural anesthesia.

Rorschach Test

A projective psychological test using inkblots; its diagnostic validity is limited and interpretation requires specialist training.

Rosacea

A chronic inflammatory skin disorder that mainly affects the central face, causing persistent or recurrent redness, flushing, visible small blood vessels, and sometimes papules or pustules. Burning, eye inflammation, or thickening of the skin, especially the nose (rhinophyma), may also occur. It is distinct from acne and is not contagious.

Rosai-Dorfman Disease

A rare histiocytic disorder, often involving enlarged lymph nodes in the neck but sometimes affecting skin or other organs. Tissue typically shows large histiocytes containing intact blood cells or immune cells (emperipolesis); severity ranges from self-limited disease to serious multisystem involvement.

Alternate Names:
Sinus Histiocytosis with Massive Lymphadenopathy; SHML

Rose Bengal

Rose bengal is a dye used in eye-surface testing and laboratory or diagnostic procedures; it highlights damaged or poorly protected conjunctival cells.

Roseola

A common childhood viral illness, usually caused by human herpesvirus 6 and sometimes HHV-7. Several days of high fever are followed by a pink-red rash, often on the trunk, as the fever resolves; febrile seizures may occur.

Alternate Names:
Exanthema Subitum; Sixth Disease

Roseola Infantum

Alternate name; see *Roseola*.

Roseolovirus

A genus of herpesviruses that includes human herpesvirus 6 and 7, commonly associated with roseola and sometimes serious disease after reactivation.

Rosiglitazone

A medicine for type 2 diabetes that helps the body respond better to insulin and lower blood sugar. It can cause weight gain, swelling, fractures, or worsening heart failure and is used selectively.

Rosiglitazone Maleate

The maleate salt of rosiglitazone, a thiazolidinedione that improves insulin sensitivity in type 2 diabetes but may cause weight gain, edema, fractures, and heart-failure worsening.

Ross Procedure

An operation for severe aortic-valve disease, especially in some children and young adults. The patient's own pulmonary valve is moved to the aortic position, and a donor valve or tube replaces it. The moved valve can grow in children and usually avoids lifelong blood-thinning medicine, but either valve may later narrow or leak.

Alternate Names:
Pulmonary Autograft Procedure; Ross Operation

Ross River Virus

A mosquito-borne alphavirus that causes Ross River fever, with fever, rash, and often prolonged joint pain or swelling.

Rostral

Positioned toward the nose or front of the head. In descriptions of the brain, it usually means toward the forehead or front rather than toward the back of the head.

Rosuvastatin Calcium

Rosuvastatin calcium is a statin medicine that lowers LDL cholesterol and reduces the risk of cardiovascular events.

Rotation

Movement around an axis; in anatomy it describes turning a body part inward, outward, or around its longitudinal axis.

Rotator Cuff

The group of four shoulder muscles and tendons that stabilize the glenohumeral joint and rotate the arm.

Alternate Names:
Musculotendinous Cuff; SITS Muscles

Rotator Cuff Arthropathy

Shoulder-joint damage that develops after long-standing, irreparable tears of the rotator-cuff tendons. It can cause pain, weakness, grinding, and inability to raise the arm; severe cases may need specialized shoulder replacement.

Rotator Cuff Exercises

Rotator cuff exercises strengthen and stretch shoulder muscles and are selected according to the injury, pain, range of motion, and rehabilitation plan.

Rotator Cuff Injury

Damage to one or more shoulder tendons or muscles that stabilize and move the arm. It may cause pain, weakness, night discomfort, or limited movement after overuse, aging, or sudden injury.

Rotator Cuff Problems

Rotator cuff problems include tendinopathy, bursitis, and tears that cause shoulder pain, weakness, painful motion, and difficulty with overhead activity.

Rotator Cuff Repair

Surgery to reattach a torn shoulder tendon to the upper-arm bone, usually with small instruments or an open approach. Recovery requires structured rehabilitation and may take months; stiffness, weakness, recurrent tearing, or infection can occur.

Rotator Cuff Tear

A partial or complete tear of one or more tendons stabilizing the shoulder, causing pain, weakness, and difficulty raising or rotating the arm.

Rotator Cuff Tendinitis

Painful irritation of one or more rotator-cuff tendons, usually related to repeated overhead use or age-related tendon changes. The term rotator cuff tendinopathy is also used.

Rotavirus

A genus of double-stranded RNA viruses in the *Reoviridae* family characterized by a distinctive wheel-like triple-layered icosahedral capsid, representing the leading global cause of severe dehydrating gastroenteritis in infants and young children under age five. The virus infects and destroys mature enterocytes of the villous tips of the small intestine and produces the enterotoxin NSP4, inducing secretory osmotic diarrhea, projectile vomiting, and rapid dehydration. Universal infant rotavirus vaccination (oral live-attenuated vaccines) has dramatically diminished worldwide hospitalizations and pediatric mortality.

Alternate Names:
Rotaviruses; Human Rotavirus

Rotavirus Antigen Test

A rotavirus antigen test detects rotavirus proteins in stool and can help diagnose viral gastroenteritis, especially in infants and young children.

Rotaviruses

Plural form; see *Rotavirus*.

Rotavirus Infection

A highly contagious viral gastroenteritis causing vomiting and watery diarrhea, especially in infants and young children; vaccination prevents most severe disease.

Rotavirus Vaccine

A live-attenuated oral viral vaccine administered to young infants in a 2- or 3-dose series to prevent severe dehydrating gastroenteritis and diarrhea caused by rotavirus infection, carrying a slight, transient risk of intussusception.

Rotenone

Rotenone is a naturally occurring pesticide that inhibits mitochondrial complex I and can be toxic to people and animals after exposure.

Rothmund-Thomson Syndrome

A rare inherited condition that causes a mottled, red, and thin skin rash beginning in infancy, short stature, sparse hair, skeletal or dental problems, and sometimes cataracts. It also increases the risk of certain cancers.

Roth Spots

Small areas of bleeding in the retina with pale centers, seen during an eye examination. They may occur with infection of the heart valves, severe anemia, leukemia, diabetes, or other illnesses and are not specific to one diagnosis.

Roth's Spots

Small retinal haemorrhages with pale centres, associated with conditions such as infective endocarditis, severe anaemia, leukaemia, and diabetes.

Rotor Syndrome

A rare inherited condition in which the liver does not take up and store bilirubin normally. It causes lifelong, usually mild yellowing of the skin or eyes but does not usually damage the liver. It is caused by changes in genes that control how liver cells move bilirubin.

Alternate Names:
Rotor's Syndrome; Familial Conjugated Hyperbilirubinemia

Rotterdam Criteria

A commonly used approach for diagnosing polycystic ovary syndrome in adults. After other causes are excluded, diagnosis generally requires at least two of: irregular or absent ovulation, signs or blood-test evidence of high androgen levels, or polycystic-appearing ovaries on ultrasound. Ultrasound alone does not establish the diagnosis.

Rotter Nodes

Small interpectoral lymph nodes situated between the pectoralis major and pectoralis minor muscles that provide an alternate pathway for breast lymphatic drainage directly to Level II and III axillary lymph nodes.

Alternate Names:
Interpectoral Lymph Nodes; Rotter's Nodes

Rouleau

A stack or column of red blood cells, commonly seen in blood with increased plasma proteins.

Rouleaux

A pattern where red blood cells stack like coins, often because blood plasma contains extra proteins.

Rouleaux Formation

Linear, coin-like stacks or rolls of red blood cells visualized on a peripheral blood smear, occurring when elevated plasma concentrations of asymmetric acute-phase proteins (fibrinogen or monoclonal immunoglobulins) neutralize the normal negative repulsive zeta potential of erythrocytes, characteristically seen in multiple myeloma and severe inflammatory states.

Round

Circular or approximately spherical; in anatomy or pathology, describing the shape of a structure.

Round Back

Alternate name; see *Kyphosis*.

Round Ligament

A round ligament is a cord-like supporting structure, including the uterine ligaments that pass toward the groin and help maintain uterine position.

Round Ligament of the Uterus

A fibrous and muscular cord originating from the superior-lateral aspect of the uterine cornu anterior to the fallopian tube, traversing through the inguinal canal to terminate in the subcutaneous tissue of the labium majus, functioning to hold the uterus in an anteverted and anteflexed position.

Round Ligament Pain

Sharp or aching pain in the lower abdomen or groin caused by stretching of the round ligaments as the uterus enlarges during pregnancy. Persistent or severe pain, especially with bleeding, can have causes other than ligament stretching.

Round Pneumonia

A lung infection that appears as a rounded shadow on a chest X-ray rather than the usual patchy pattern. It occurs especially in children and can resemble a tumor; imaging findings may change as the infection resolves.

Roundworm

Any cylindrical, unsegmented parasitic nematode, most prominently referring to *Ascaris lumbricoides*, the largest intestinal nematode infecting humans. Acquired through the fecal-oral ingestion of embryonated eggs from contaminated soil, larvae penetrate the intestinal mucosa, migrate hematogenously through the lungs (producing Löffler syndrome with eosinophilia), are swallowed, and mature into adult worms in the jejunum. Heavy worm burdens cause intestinal obstruction, malnutrition, or biliary tract migration; treatment entails anthelmintics (alben-

dazole, mebendazole, or ivermectin).

Alternate Names:
Roundworms; Nematode; Ascariasis

Roundworms

Plural form; see *Roundworm*.

Roussy-Levy Syndrome

An autosomal dominant hereditary motor and sensory neuropathy (a phenotypic variant of Charcot-Marie-Tooth disease type 1A) characterized by early-onset sensory ataxia, prominent postural hand tremor, distal muscle weakness and wasting, pes cavus, and absent deep tendon reflexes.

Alternate Names:
Hereditary Areflexic Dystasia; CMT-Tremor Variant

Route Of Administration

The way a medicine enters the body, such as by mouth, under the tongue, injection, inhalation, skin application, or through a vein. The route affects how quickly and how much of the medicine reaches the bloodstream.

Roux-en-Y Gastric Bypass

Weight-loss surgery that creates a small stomach pouch and connects it to the small intestine, bypassing most of the stomach and the first part of the intestine. It reduces food intake and changes nutrient absorption.

Alternate Names:
RYGB

Roux Stasis Syndrome

Delayed movement of food through the surgically created Roux limb after Roux-en-Y gastric or other surgery. It can cause fullness after eating, nausea, vomiting, and abdominal discomfort.

Alternate Names:
Roux-en-Y Stasis Syndrome; Chronic Roux Limb Stasis

Rovsing Sign

Pain in the lower right abdomen that occurs when the lower left abdomen is pressed. This examination finding can support suspicion of appendicitis but is not diagnostic by itself.

Roxithromycin

A macrolide antibiotic used in some countries for selected bacterial infections. It stops bacteria making proteins, but resistance, medicine interactions, stomach upset, liver problems, and heart-rhythm changes can occur.

RPR Test

A blood test used to screen for syphilis and monitor treatment. It detects antibodies to lipoidal antigens that may occur with syphilis or other conditions; reactive results are interpreted with a treponemal test and clinical findings.

RS3PE Syndrome

Remitting seronegative symmetrical synovitis with pitting edema, an inflammatory syndrome causing sudden swelling of the hands or feet, joint pain, and stiffness, usually in older adults. It may occur with another rheumatic disease, infection, or cancer.

Alternate Names:
Remitting Seronegative Symmetrical Synovitis with Pitting Edema

RSI

Repetitive strain injury, a group of pain and dysfunction syndromes associated with repeated movement or sustained posture.

RSV

A common respiratory virus that can cause mild cold symptoms or serious bronchiolitis and pneumonia, especially in infants and older adults.

RSV Antibody Test

An RSV antibody test detects antibodies to respiratory syncytial virus and may help assess past exposure or immune response, but is not usually the main test for acute infection.

RSV Infection

Alternate name; see *Respiratory Syncytial Virus Infection*.

RT-PCR

A laboratory test that converts RNA into DNA and then makes many copies of a selected genetic sequence so it can be detected. It can identify RNA viruses and measure selected genes in clinical samples.

Rubber

Rubber is an elastic material used in gloves, devices, and equipment; natural-rubber latex can cause irritant or allergic reactions.

Rubber Band Ligation

A procedure for selected internal hemorrhoids in which a small elastic band is placed around the base of the hemorrhoidal tissue above the pain-sensitive area of the anal canal. The band cuts off its blood supply, causing the tissue to shrink and separate over several days; bleeding, pain, or recurrence can occur.

Alternate Names:
Hemorrhoidal Banding; RBL; Band Ligation of Hemorrhoids; Elastic Band Ligation

Rubber Cement Poisoning

Poisoning from swallowing or inhaling rubber cement, which contains volatile solvents. It may cause dizziness, drowsiness, confusion, breathing problems, or chemical pneumonitis if it enters the lungs.

Rubber Dams

Sheets used in dentistry to isolate teeth from saliva and the rest of the mouth during procedures.

Rubella

A contagious viral infection that is often mild or asymptomatic. It may cause a fine maculopapular rash, low-grade fever, and enlarged lymph nodes behind the ears, at the back of the head, or in the neck. Infection during pregnancy can cause miscarriage or congenital rubella syndrome, including hearing, eye, heart, or neurologic abnormalities.

Alternate Names:
Three-Day Measles

Rubella Virus

An RNA virus in the genus *Rubivirus* that causes rubella. Infection during pregnancy can cross the placenta and cause congenital rubella syndrome.

Rubeola

See *Measles*.

Rubeosis Iridis

Growth of abnormal new blood vessels on the colored part of the eye. It usually results from poor blood flow in the retina, often caused by diabetes or a blocked retinal vein, and can lead to painful glaucoma and vision loss.

Rubidium

A chemical element whose radioactive isotopes can be used in medical imaging; nonmedical rubidium compounds can affect potassium-related physiology.

Rubin Maneuver

An emergency childbirth technique for shoulder dystocia, when a baby's shoulder is stuck behind the birthing person's pelvic bone. A clinician applies pressure and rotates the baby's shoulder to reduce its width and help complete delivery safely.

Rubinstein-Taybi Syndrome

A genetic developmental disorder associated with characteristic facial features, short stature, broad thumbs and toes, and intellectual disability. It is commonly caused by pathogenic variants in CREBBP or EP300.

Rubivirus

A genus of viruses that includes rubella virus, which causes rubella and congenital rubella syndrome.

Rubredoxins

Small proteins containing iron that help move electrons in some bacteria and other organisms. They

take part in chemical reactions that release energy and protect cells from harmful oxygen-related chemicals.

Rubricyte Count

A measurement of rubricytes, an older name for immature red blood cells, in blood or bone marrow. It may help assess how actively the marrow is making red cells, but modern tests usually report reticulocytes or other marrow findings.

Rule Of Nines

A quick method for estimating the percentage of body surface burned by assigning simple proportions to body regions. The estimate helps guide fluids and emergency care, but children and unusual body shapes require more accurate methods.

Rule Out

Rule out means evaluate a possibility and determine whether it is present; it does not mean the condition has already been excluded.

Rumination

Repeated regurgitation and rechewing of food after eating, without the usual vomiting process. It is a behavior or symptom that may occur in rumination disorder or with other gastrointestinal, developmental, or behavioral conditions.

Rumination Disorder

A feeding or eating disorder involving repeated, usually effortless return of recently eaten food to the mouth, followed by rechewing, reswallowing, or spitting. It differs from ordinary vomiting and causes clinically significant distress, impairment, or nutritional or medical consequences.

Rumination Syndrome

Alternate name; see *Rumination Disorder*.

Ruminococcus Gnavus

An intestinal bacterium involved in mucin and carbohydrate metabolism and studied in relation to gut inflammation.

Rumpel-Leede Sign

Small pinpoint bleeding spots that appear below a blood-pressure cuff after it has briefly been inflated. They reflect capillary bleeding under pressure and can occur with thrombocytopenia, platelet dysfunction, or other causes; the finding is nonspecific.

Rumpel-Leede Test

A tourniquet test historically used to assess capillary fragility and as an adjunct in dengue evaluation. A blood-pressure cuff is held midway between systolic and diastolic pressure for five minutes, then petechiae are counted in a defined area; dengue protocols commonly use at least 10 petechiae per square inch as a positive result, though criteria vary.

Alternate Names:
Capillary Fragility Test; Tourniquet Test

Runner's Knee

Alternate name; see *Patellofemoral Pain Syndrome*.

Runny Nose

Excess fluid or mucus draining from the nose, commonly caused by infection, allergy, irritants, or sinus disease.

Rupture

A tear or complete break in an organ, vessel, muscle, or other tissue, often causing bleeding or loss of function.

Ruptured Abdominal Aortic Aneurysm

A burst in a weakened section of the main artery in the abdomen, causing severe internal bleeding. Sudden abdominal or back pain, fainting, sweating, or collapse may occur.

Ruptured Disk

An older, imprecise term for a herniated intervertebral disk, in which disk material extends beyond its usual boundary and may irritate or compress nearby nerves.

Alternate Names:
Herniated Disc; Slipped Disc; Herniated Nucleus Pulposus

Ruptured Eardrum

A ruptured eardrum is a tear in the tympanic membrane caused by infection, pressure, trauma, or foreign objects and may cause pain, drainage, hearing loss, or dizziness.

Ruptured Perforated Eardrum

See *Ruptured Eardrum*.

Russell-Silver Syndrome

A condition present from birth that causes poor growth before and after birth, a relatively large head, feeding difficulty, uneven growth of the limbs or body, and characteristic facial features. It is usually related to changes in gene regulation.

Russell Viper Venom Time

A blood-clotting test used as part of testing for lupus anticoagulants. The venom activates clotting in the test tube; a prolonged result that shortens when extra phospholipid is added supports the presence of a lupus anticoagulant but does not establish the diagnosis by itself.

Alternate Names:
dRVVT

Rx

A common abbreviation for prescription or prescribed treatment. It comes from the Latin word meaning “take” and is used on medication orders and in medical writing.

Ryle’s Tube

An eponym for a flexible nasogastric tube passed through the nose, pharynx, and esophagus into the stomach. Its tip remains in the stomach, where it can drain or sample gastric contents or deliver fluids, nutrition, or medicines.

S

S3 Gallop Pathology

An extra heart sound heard just after the normal second heart sound as the lower chambers fill rapidly. It can be normal in children and pregnancy but may suggest excess fluid or heart failure in an older adult.

S4 Gallop Pathology

An extra heart sound heard just before the normal first heart sound when an upper chamber pushes blood into a stiff lower chamber. It may occur with long-standing high blood pressure, a narrowed aortic valve, or thickened heart muscle.

SAA

Usually an abbreviation for serum amyloid A, a blood protein that rises during inflammation. Persistently high levels can contribute to abnormal protein deposits in organs during some long-lasting inflammatory diseases.

Sabin Vaccine

The oral polio vaccine containing live attenuated poliovirus strains. It produces strong intestinal immunity but, rarely, vaccine-derived poliovirus can occur, so vaccine policy depends on local public-health guidance.

Sabre Tibia

Forward bowing and thickening of the shinbone, classically associated with congenital syphilis or Paget disease of bone.

Alternate Names:
Saber Shin

Saccade

A quick, coordinated eye movement that shifts the eyes from one target to another. Abnormal saccades can occur with disorders affecting the eye muscles, balance system, or brain and nerves.

Saccular Aneurysm

A rounded pouch bulging from one side of an artery because that part of the vessel wall is weak. It may enlarge, form clots, or burst; risk depends on its location, size, shape, and growth.

Saccule

A small, fluid-filled part of the inner ear that senses gravity and straight-line movement, especially up-and-down movement. It helps the brain maintain balance and know the head's position.

Sachet Poisoning

Illness caused by swallowing, inhaling, or getting the contents of a sachet on the skin or in the eyes. Effects depend on the substance and amount; some sachets contain medicines or dangerous chemicals.

Sacral

Sacral means relating to the sacrum, the triangular bone at the base of the spine that connects with the pelvis.

Sacral Agenesis

Partial or complete absence or underdevelopment of the sacrum. It can occur alone or as one feature of caudal regression syndrome, which may also affect the lower spine, legs, urinary tract, and bowel. Maternal diabetes is a risk factor.

Sacral Dimple

A small indentation in the skin over the lower spine that is present at birth. Most are harmless, but a deep, large, high, hairy, discolored, or draining dimple may need imaging for an underlying spinal abnormality.

Sacral Fistula

An abnormal channel near the lower spine that connects the skin with deeper tissue or another body space. It may cause persistent drainage, pain, repeated infection, or a skin opening and can result from birth differences, injury, or pilonidal disease.

Sacral Nerves

The five pairs of spinal nerves associated with the sacral segments. They supply parts of the pelvis, pelvic floor, bladder, bowel, and lower limbs.

Sacral Nerve Stimulation

An implanted treatment that sends electrical pulses to sacral nerves to improve bladder control in selected people with urinary urgency, incontinence, or retention, and bowel control in some people with fecal incontinence.

Sacral Nerve Stimulator

An implanted device that sends mild electrical signals to nerves near the lower spine to improve bladder or bowel control in selected people. It may help incontinence or some emptying problems when other treatments have not worked.

Sacral Plexus

A network of spinal nerves in the pelvis that supplies the lower limbs, pelvis, and parts of the bladder, bowel, and reproductive organs.

Sacral Region

The lower back and posterior pelvic region overlying the sacrum, a fused triangular bone that connects the lumbar spine with the pelvis.

Sacral Vertebra

One of the fused vertebrae forming the sacrum, which supports the spine, joins the pelvic bones, and transmits trunk weight to the lower limbs.

Sacral Vertebrae

Five spinal bones that fuse to form the sacrum at the back of the pelvis. They transfer weight from the spine to the hips and contain openings through which sacral nerves pass.

Sacrococcygeal

Sacrococcygeal means relating to the sacrum and coccyx at the lower end of the vertebral column.

Sacrococcygeal Chordoma

A malignant tumor arising from remnants of the embryonic notochord at the base of the spine. It may cause tailbone pain, a mass, bowel or bladder symptoms, or nerve problems and is assessed with imaging and biopsy.

Sacrococcygeal Teratoma

A tumor present from birth at the base of the spine and made of several tissue types. It may grow outside or inside the pelvis; a large fetal tumor can strain the heart and increase amniotic fluid.

Sacrocolpopexy

An operation that supports the vaginal apex by attaching it, usually with mesh, to the longitudinal ligament or sacrum near the sacral promontory. When the uterus is retained and supported, the procedure is generally called sacrohysteropexy. It may be performed through open or minimally invasive surgery; bleeding, infection, mesh problems, bowel or bladder injury, and recurrent prolapse are possible.

Sacroiliac Joint

The joint connecting the triangular sacrum at the base of the spine to each hip bone. It transfers weight between the spine and legs and may become painful or inflamed after injury, pregnancy, arthritis, or infection.

Sacroiliac Joint Dysfunction

A broad term for pain or impaired movement attributed to one or both joints connecting the lower spine to the pelvis. Examination is needed because hip, spine, and other conditions can cause similar pain; see also *Sacroiliac Joint Pain*.

Sacroiliac Joint Injury

Sprain, strain, or traumatic disruption of the ligaments and tissues supporting the sacroiliac joint. It can cause localized low-back or buttock pain that worsens with transfers, stairs, prolonged standing, or asymmetric loading.

Sacroiliac Joint Pain

Sacroiliac-joint pain arises near the junction of the lower spine and pelvis and may follow injury, pregnancy, arthritis, leg-length or gait changes, or inflammation. Pain can radiate to the buttock or thigh; examination distinguishes it from hip or spine disease.

Sacroiliitis

Inflammation of one or both joints connecting the lower spine to the pelvis. It can cause pain in the lower back, buttock, or back of the thigh and may result from inflammatory arthritis, infection, injury, or wear.

Sacrospinous Ligament Fixation

An operation through the vagina that attaches the top of the vagina or cervix to a strong pelvic ligament to treat prolapse. It avoids an abdominal incision but may cause buttock pain, bleeding, infection, nerve injury, or recurrent prolapse.

Alternate Names:
Sacrospinous Colpopexy; Sacrospinous Suspension

Sacrum

A large triangular bone at the back of the pelvis formed by five fused spinal bones. It connects the spine to the hip bones, transfers body weight to the legs, and contains openings for nerves supplying the pelvis and lower limbs.

SAD

An abbreviation for seasonal affective disorder, a recurring pattern of depression or mood change linked to a particular season, often winter and reduced daylight. Treatment may include therapy, medicines, or supervised light therapy.

Alternate Names:
Seasonal Depression; Winter Depression

Saddle Anesthesia

Reduced or absent feeling in the area that would touch a saddle, including the inner thighs, buttocks, genitals, and area around the anus. It can indicate compression of nerves at the bottom of the spine, such as in cauda equina syndrome.

Alternate Names:
Perineal Sensory Loss; Saddle Sensory Loss

Saddle Joint

A joint in which each bone has one rounded and one hollow surface, fitting together like a saddle. It allows movement in two main directions, as at the base of the thumb.

Saddle Nose Deformity

A physical collapse and depression of the cartilaginous nasal dorsum resulting from destruction or ischemic necrosis of the nasal septal cartilage, seen in granulomatosis with polyangiitis (GPA), relapsing polychondritis, congenital syphilis, chronic intranasal cocaine use, and nasal trauma.

Alternate Names:
Pug Nose; Depressed Nasal Dorsum

Saddle Pulmonary Embolism

A blood clot lodged where the main pulmonary artery divides toward both lungs. Its central location does not by itself determine severity; effects depend on how much blood flow is blocked and the person's heart and lung response. Symptoms can include sudden breathlessness, chest pain, fainting, or low blood pressure.

Alternate Names:
Saddle Embolus; Bifurcation Pulmonary Embolism

S-Adenosylmethionine

A substance made naturally in the body that helps chemical reactions involving cell membranes, genetic material, and brain chemicals. It is also sold as a supplement, but its benefits and interactions vary by condition.

Sadism

Sexual arousal or gratification from inflicting pain, humiliation, or suffering; clinical significance depends on distress, impairment, or nonconsent.

Sad Mood

Sad mood is a feeling of unhappiness or low mood that may be a normal response or a symptom of depression, grief, illness, or another condition.

SAD (Seasonal Affective Disorder)

Alternate name; see *Seasonal Affective Disorder*.

Safe Sex

Sexual practices that reduce the risk of sexually transmitted infections and unintended pregnancy, including condoms or other barriers, testing, vaccination, and informed consent.

Safety Of Drugs

The process of balancing a medicine's expected benefits against side effects, interactions, and reasons it may be unsafe. Safe use includes checking the person, dose, allergies, other medicines, monitoring needs, and instructions.

Safety Plan

A collaboratively written, practical plan for responding to escalating suicidal thoughts or emotional crisis. It identifies warning signs, internal coping strategies, supportive contacts, professional resources, and methods to restrict access to lethal means.

Safety Study

A safety study evaluates whether a medicine, device, procedure, or treatment causes harmful effects and identifies risks before or during clinical use.

Saffron

Saffron is a spice made from the dried stigmas of Crocus sativus. It is used in food and studied as a possible supplement, but it is not a substitute for proven medical treatment.

Safrole

Safrole is a natural aromatic compound found in some plants and oils; high or prolonged exposure is toxic and has carcinogenic concern.

Sagittal

Oriented in a vertical direction that divides the body or a structure into right and left parts. A midsagittal plane divides the parts equally; a parasagittal plane does not.

Sagittal Axis

An imaginary line running from front to back through the body or a body part. Side-to-side movements, such as moving a limb away from or toward the body, occur around this axis.

Sagittal Plane

An imaginary vertical plane dividing the body or an organ into right and left portions. A midsagittal plane divides them equally; a parasagittal plane divides them unequally.

Sagittal Sinus Thrombosis

A blood clot in the superior sagittal sinus, a large vein channel that drains blood from the brain. It may cause headache, seizures, vision problems, weakness, or confusion; diagnosis usually requires brain imaging of the veins.

Alternate Names:
Superior Sagittal Sinus Thrombosis

Salaam Attacks

Brief repeated spasms in an infant, often involving sudden bending of the body, arm movements, or head drops. These are epileptic spasms; the underlying epilepsy can affect development.

Salbutamol

A short-acting inhaled bronchodilator that relaxes airway muscles to relieve wheezing and breathlessness, especially in asthma. It may cause tremor, a fast heartbeat, or palpitations; it does not treat the underlying airway inflammation.

Alternate Names:
Albuterol

Salicylate

A group of chemicals that includes aspirin and can reduce pain, fever, or inflammation. Excessive amounts may cause poisoning with vomiting, ringing ears, fast breathing, confusion, dehydration, or dangerous blood chemistry changes.

Salicylate Toxicity

Poisoning caused by too much aspirin or another salicylate. It may cause vomiting, ringing in the ears, fever, sweating, fast or deep breathing, dehydration, confusion, seizures, or coma.

Salicylic Acid

A medicine applied to the skin to soften and remove excess surface skin. It is used for acne, psoriasis, warts, corns, and similar thickened or blocked skin; irritation is common and large exposures can be toxic.

Saline

A sterile solution of sodium chloride in water. Different concentrations are used for intravenous fluids, wound or eye irrigation, inhalation, laboratory work, or dilution of medicines.

Saline Infusion Sonohysterography

An ultrasound test in which sterile salt water is placed inside the uterus to outline its cavity. It can show polyps, fibroids, scar tissue, or an unusually shaped cavity and may cause temporary cramping or light bleeding.

Saline Nasal Washes

Rinsing the nasal passages with sterile, distilled, or appropriately treated saline to loosen mucus and reduce nasal irritants; unsafe water can cause serious infection.

Saliva

Fluid made by the salivary glands that moistens food, begins digestion, protects the mouth and teeth, and helps swallowing and taste. Too little saliva can cause dry mouth, mouth soreness, and tooth decay.

Salivary Duct Stones

Calcified deposits obstructing a salivary duct, most often the submandibular duct, causing recurrent painful swelling of a gland during meals and sometimes infection.

Salivary Gland

Any of the exocrine glands that produce, modify, and secrete saliva into the oral cavity to facilitate mastication, enzymatic carbohydrate digestion (via salivary amylase and lingual lipase), mucosal lubrication, antimicrobial defense (via lysozyme, lactoferrin, and secretory IgA), and taste sensation. Anatomically divided into three paired major salivary glands (the parotid, submandibular, and sublingual glands) and hundreds of microscopic minor salivary glands distributed throughout the submucosa of the lips, palate, buccal mucosa, and tongue. Pathologies include sialolithiasis, acute sialadenitis, autoimmune destruction (Sjögren syndrome), and benign or malignant neoplasms.

Alternate Names:
Salivary Glands

Salivary Gland Biopsy

Removal of salivary-gland tissue or a needle sample for microscopic examination of suspected autoimmune disease, inflammation, infection, or neoplasm.

Salivary Gland Cancer

Cancer arising in a salivary gland, most often the parotid near the ear. It may cause a persistent lump, pain, numbness, dry mouth, or facial weakness; imaging and biopsy identify the type and guide treatment.

Salivary Gland Infection

An acute or chronic inflammation and infection of a salivary gland (sialadenitis), most frequently involving the parotid or submandibular glands. Typically bacterial in etiology (predominantly *Staphylococcus aureus* or anaerobic streptococci) precipitated by ductal obstruction (sialolithiasis) or dehydration with reduced salivary flow, or viral (classically mumps virus paramyxovirus parotitis). Presents with painful, erythematous glandular enlargement, warmth, purulent ductal discharge (expressible at Stensen or Wharton duct orifice), fever, and trismus; management entails hydration, sialagogues, warm compresses, and systemic antistaphylococcal antibiotics.

Alternate Names:
Salivary Gland Infections; Sialadenitis; Sialoadenitis

Salivary Gland Infections

Plural form; see *Salivary Gland Infection*.

Salivary Gland Neoplasm

An abnormal growth in a salivary gland that may be noncancerous or cancerous. It can cause a lump, pain, facial weakness, dry mouth, or swallowing problems and may require imaging and biopsy.

Salivary Glands

Plural form; see *Salivary Gland*.

Salivary Gland Scintigraphy

An imaging test that measures salivary-gland function after a small radioactive tracer is given. It may help assess dryness from Sjögren syndrome, blocked ducts, inflammation, radiation injury, or other gland problems.

Salivary Gland Stones

Stones formed from minerals in a saliva-making gland or the tube that carries saliva into the mouth. They can block saliva and cause swelling or pain, especially during meals. The medical term is sialolithiasis.

Salivary Stones

Alternate name; see *Sialolithiasis*.

Salivary Gland Tumors

Tumors arising in the salivary glands. Many are benign, especially in the parotid gland; pleomorphic adenoma is a common benign type. Malignant types include mucoepidermoid, adenoid cystic, and acinic cell carcinoma.

Alternate Names:
Salivary Neoplasms

Salivation

Production and release of saliva by the salivary glands. Saliva moistens food, begins digestion, protects teeth, and helps swallowing; excessive or reduced salivation can have many causes.

Salk Vaccine

The inactivated poliovirus vaccine, given by injection to protect against poliomyelitis. It contains killed virus and cannot cause polio; it differs from the older oral live-attenuated vaccine.

Salmonella

A group of bacteria that can cause intestinal infection or enteric fever. Most infections spread through contaminated food or water, or contact with infected animals or people.

Salmonella Choleraesuis

A Salmonella serotype adapted to pigs that can cause severe, invasive infection in humans, including bloodstream infection and pneumonia.

Salmonella Enterica

A major Salmonella species causing human disease. It can produce diarrhea and fever, enteric fever, or bloodstream infection after contaminated food, water, animals, or infected people spread the bacteria.

Salmonella Enterocolitis

Salmonella enterocolitis is intestinal infection causing diarrhea, fever, abdominal cramps, and sometimes bacteremia after contaminated food, water,

or animal exposure.

Salmonella Food Poisoning

Alternate name; see *Salmonellosis*.

Salmonella Infection

A bacterial infection caused by non-typhoidal or typhoidal serovars of the gram-negative bacillus *Salmonella enterica*. Non-typhoidal salmonellosis (commonly *S. enterica* serovars Typhimurium and Enteritidis) is acquired via contaminated poultry, eggs, dairy, or reptiles, causing acute inflammatory enterocolitis with watery or bloody diarrhea, cramping, and fever. In contrast, typhoidal strains (*S. enterica* serovars Typhi and Paratyphi) cause typhoid (enteric) fever characterized by sustained high fever, relative bradycardia (Faget sign), rose spots, hepatosplenomegaly, and risk of intestinal perforation. Treatment for severe or invasive disease relies on fluoroquinolones, azithromycin, or third-generation cephalosporins.

Alternate Names:
Salmonella Infections; Salmonellosis

Salmonella Infections

Plural form; see *Salmonella Infection*.

Salmonella Typhi

The bacterium that causes typhoid fever, usually acquired through contaminated food or water and capable of spreading through the bloodstream.

Salmonella Typhimurium

A common Salmonella serotype that usually causes foodborne gastroenteritis but can cause invasive disease in vulnerable people.

Salmonella Typhisuis

A Salmonella serotype mainly associated with swine; human infection is uncommon but may cause enteric or invasive disease.

Salmonella Vaccines

Vaccines used mainly to prevent typhoid fever, including typhoid conjugate, Vi polysaccharide, and oral live-attenuated vaccines; routine vaccination does not prevent all Salmonella gastroenteritis.

Salmonellosis

Infection with Salmonella bacteria, usually acquired from contaminated food, water, or contact with infected animals. Non-typhoidal infection commonly causes diarrhea, fever, and abdominal cramps; typhoidal Salmonella causes enteric fever. Some infections spread to the blood, especially in vulnerable people.

Salmon Patches

Flat pink or red capillary birthmarks, commonly on the eyelids, forehead, or nape; many fade during infancy.

Salpingectomy

Surgical removal of a fallopian tube. It may be used to treat a tubal ectopic pregnancy, hydrosalpinx, or other tubal disease. The approach and whether the tube is removed depend on the clinical condition, fertility plans, and the state of the opposite tube.

Salpingitis

Inflammation or infection of one or both fallopian tubes, usually as part of pelvic inflammatory disease spreading upward from the vagina or cervix. It may cause lower-abdominal pain, fever, unusual discharge, infertility, or pregnancy outside the uterus.

Salpingitis Isthmica Nodosa

A condition in which the narrow part of a fallopian tube becomes thickened and develops small side pockets. Its cause is uncertain. It is associated with infertility and a higher risk of pregnancy implanting in the tube.

Alternate Names:
SIN

Salpingography

Contrast imaging of the fallopian tubes, usually performed as part of hysterosalpingography to assess whether the tubes are open and to examine the uterine cavity.

Salpingo-Oophorectomy

Surgery to remove one or both fallopian tubes and ovaries. It may treat cancer, an ovarian or tubal problem, or reduce cancer risk in people with certain inherited gene changes. Removing both ovaries causes permanent loss of ovarian hormone production.

Salpingo-OöPhorectomy

Surgical removal of a fallopian tube and ovary, also called salpingo-oophorectomy.

Salpingostomy

An operation that opens a fallopian tube to remove an ectopic pregnancy while leaving the tube in place. It may preserve fertility in selected cases, but persistent pregnancy tissue, bleeding, scarring, or another ectopic pregnancy can occur.

Alternate Names:
Tubal Incision; Ectopic Tubostomy

Salt

An ionic chemical compound; dietary sodium chloride is essential in small amounts but excess intake can increase blood pressure.

Saltatory Conduction

The rapid movement of an electrical signal along a nerve fiber covered by myelin. The signal travels between small uncovered gaps in the covering, allowing fast communication with other nerves and muscles.

Salter-Harris Fracture

A bone fracture in a child or adolescent that involves the growth plate (physis), the specialized area of developing cartilage near the ends of long bones where new bone growth occurs. Because the growth plate is weaker than surrounding mature bone, fractures can pass through or compress this vulnerable area. Medical classification helps assess the injury and ensure proper healing, minimizing the risk of uneven bone growth or joint deformity.

Alternate Names:
Salter-Harris Fractures; Physeal Fracture; Growth Plate Fracture

Salter-Harris Fractures

Plural form; see *Salter-Harris Fracture*.

Salvage Therapy

Treatment used when a disease, especially cancer, has not improved with earlier treatment or has returned. The choice depends on the disease, previous treatments, overall health, and treatment goals.

SAM-e

Abbreviation; see *S-Adenosylmethionine*.

Sample Fixation

Preserving a tissue or cell sample soon after collection so it does not decay or change shape. The preserved sample can then be processed, stained, and examined under a microscope for diagnosis.

Samter Triad

A clinical symptom complex (aspirin-exacerbated respiratory disease / AERD) characterized by the triad of bronchial asthma, chronic rhinosinusitis with recurrent nasal polyposis, and acute severe bronchospasm or naso-ocular reactions following the ingestion of aspirin or nonsteroidal anti-inflammatory drugs (NSAIDs).

Alternate Names:
Aspirin-Exacerbated Respiratory Disease; AERD

Sandfly Fever

An acute viral illness transmitted by phlebotomine sandflies, causing fever, headache, muscle pain, and sometimes rash.

Sandhoff Disease

A rare inherited disorder caused by deficiency of the beta-hexosaminidase A and B enzymes, usually due to variants in the *HEXB* gene. GM2 ganglioside then builds up in nerve cells, causing progressive loss of skills, weakness, seizures, and movement problems; age of onset and severity vary.

Sandifer Syndrome

Episodes of abnormal neck and back posturing, sometimes with twisting movements, associated

with gastroesophageal reflux in infants or young children. Episodes often occur during or after feeding; the posturing is not itself proof of a seizure.

Alternate Names:
Sandifer's Syndrome; Gastroesophageal Reflux Dystonia

Sandpaper Tooth

A tooth with a rough, grainy enamel surface that can hold plaque and feel uneven to the tongue. It may result from weak enamel, early mineral loss, fluorosis, or wear.

Sanfilippo Syndrome

A rare inherited disorder in which the body cannot break down part of a complex sugar. The buildup mainly affects the brain and causes progressive developmental and behavioral changes.

Alternate Names:
Mucopolysaccharidosis Type III; MPS III

Sanguiferous

Conveying or carrying blood, especially as applied to blood vessels. The term describes a vessel that transports blood; it does not mean fluid containing blood, for which *sanguineous* is used. Modern medical writing usually uses "blood-carrying" or names the vessel.

Sanguine

Older term meaning blood-red; see *Sanguineous*.

Sanguineous

Containing fresh blood. The term often describes red wound drainage and is distinct from serosanguineous drainage, which contains a mixture of blood and clear fluid. A large amount or sudden increase in sanguineous drainage may indicate ongoing bleeding, depending on the wound and clinical context.

Sanguinopurulent

Describes fluid containing both blood and pus, such as drainage from a wound. The appearance can vary with the amount of blood and pus. It differs from serosanguineous fluid, which contains serum and a small amount of blood. The term describes the fluid and does not identify its cause or location.

Sanitation

Public-health measures that safely manage human waste, water, food, hygiene, and environmental contamination to prevent infection and disease transmission.

SA Node

A small group of specialized cells in the upper right heart chamber that normally starts each heartbeat. It produces regular electrical signals that spread through the heart and coordinate its rhythm.

Sano Shunt

A temporary tube connecting the lower-right heart chamber to the lung artery during the first operation for some babies with severe left-sided heart defects. It sends blood to the lungs while the heart is reconstructed; blockage or abnormal flow can be dangerous.

Alternate Names:
RV-PA Conduit; Norwood-Sano Modification

Santorini Duct

An accessory pancreatic duct that drains the anterosuperior head of the pancreas directly into the duodenum via the minor duodenal papilla (located approximately 2 cm proximal to the major duodenal papilla of Vater).

Alternate Names:
Accessory Pancreatic Duct; Duct of Santorini

Saphenous

Relating to the superficial veins of the lower limb, especially the great or small saphenous vein.

Saphenous Nerve

The largest cutaneous sensory terminal branch of the femoral nerve, descending through the adductor canal and piercing the deep fascia at the knee to travel alongside the great saphenous vein, supplying sensation to the medial lower leg, ankle, and medial

foot arch.

Saphenous Vein

A superficial vein of the lower limb that drains the foot and leg. The great and small saphenous veins are clinically important in venous disease and may be used as graft material in selected vascular or cardiac bypass procedures.

SAPHO Syndrome

A rare inflammatory condition combining bone or joint pain with acne or pus-filled skin lesions. It often affects the breastbone, collarbone, spine, or jaw and can resemble infection or cancer, so diagnosis and treatment require specialist assessment.

Sapovirus

A virus that can cause vomiting and watery diarrhea, especially in children. It spreads through contaminated food, water, surfaces, or close contact.

Sapovirus Infection

An acute enteric infection caused by sapoviruses, positive-sense single-stranded RNA viruses in the family Caliciviridae that infect humans across all age groups. Clinical manifestations include acute watery diarrhea, nausea, vomiting, abdominal cramping, and low-grade fever, often responsible for outbreaks of foodborne or waterborne gastroenteritis in daycares, schools, and hospitals that resolve with supportive rehydration within 48 to 72 hours.

Alternate Names:
Sapovirus Gastroenteritis; Human Sapovirus Infection

Sapropterin

A synthetic form of tetrahydrobiopterin used for some people with phenylketonuria and certain tetrahydrobiopterin deficiencies; response and diet requirements vary.

Saquinavir

An HIV protease inhibitor used with other antiretroviral medicines; drug interactions, gastrointestinal effects, and cardiovascular concerns limit its use.

Saquinavir Mesylate

The mesylate salt form of saquinavir, an HIV medicine that blocks viral protein processing. It is used with other antiretroviral drugs, but interactions, liver problems, and dangerous heart-rhythm changes require careful monitoring.

Sarcocystis Hominis

A protozoan parasite acquired by eating undercooked beef; people may develop intestinal symptoms, while cattle serve as an intermediate host.

Sarcocystis Suihominis

A protozoan parasite acquired by eating undercooked pork that can cause intestinal sarcocystosis; pigs serve as an intermediate host.

Sarcocystosis

Parasitic infection by Sarcocystis species, acquired from undercooked meat or contaminated food and sometimes causing muscle pain, fever, diarrhea, or no symptoms.

Sarcoglycan Complex

A group of proteins that helps strengthen the outer covering of muscle cells during movement. Inherited problems with these proteins can cause progressive muscle weakness and sometimes heart-muscle disease.

Sarcoglycanopathy

A group of inherited muscle diseases caused by changes in sarcoglycan genes. They usually cause progressive weakness of the hips and shoulders and may affect the heart.

Alternate Names:
Sarcoglycan-Deficient Limb-Girdle Muscular Dystrophy; LGMD R3-R6

Sarcoid Arthropathy

Joint inflammation associated with sarcoidosis. It may cause joint pain or swelling, often at the ankles during acute disease, and can occur with other sarcoidosis findings.

Sarcoid Of Boeck

Historical name for sarcoidosis, an inflammatory disease in which clusters of immune cells form in organs such as the lungs, lymph nodes, skin, or eyes.

Sarcoidosis

An inflammatory disease characterized by the formation of tiny, microscopic clumps of inflammatory cells, called granulomas, in various organs of the body. While it most frequently affects the lungs and nearby lymph nodes in the chest, it can also involve the skin, eyes, heart, liver, and nervous system. As granulomas accumulate, they can alter the normal structure and function of the affected organ, causing symptoms such as persistent dry cough, shortness of breath, fatigue, swollen lymph nodes, painful skin rashes, or vision changes.

Alternate Names:
Besnier-Boeck-Schaumann Disease; Boeck Sarcoid

Sarcoidosis Skin Manifestations

Skin involvement in sarcoidosis can cause firm bumps, raised or discolored patches, scars that change, or lupus pernio on the nose or face. The appearance varies and may require a skin examination or biopsy.

Sarcolemma

The thin outer covering of a muscle cell. It carries electrical signals that start contraction and helps maintain the cell's structure and internal chemical balance.

Sarcoma

A malignant tumor arising from connective or supporting tissues, including bone, cartilage, fat, muscle, and blood vessels. Examples include osteosarcoma, liposarcoma, and rhabdomyosarcoma.

Sarcomere

The smallest working unit that makes skeletal and heart muscle contract. It contains protein threads that slide past one another, shortening the muscle and producing force.

Sarcopenia

Loss of muscle strength and muscle mass that reduces physical function, often with aging but also with inactivity, poor nutrition, or chronic disease. It can cause weakness, slower walking, falls, and difficulty with daily activities.

Sarcopenic Obesity

Excess body fat together with low muscle mass, strength, or physical ability. It can increase the risk of falls, disability, metabolic disease, and complications after surgery.

Sarcoplasm

The material inside a muscle cell surrounding its specialized structures. It contains energy-producing parts, stored fuel, oxygen-holding myoglobin, and the protein machinery that produces contraction.

Sarcoplasmic Reticulum

A network inside muscle cells that stores calcium. It releases calcium to start contraction and takes calcium back up so the muscle can relax.

Sarcoptes

The mite genus containing Sarcoptes scabiei, the cause of scabies.

Sarcoptes Scabiei

The microscopic mite that causes scabies. It burrows into the outer layer of skin and lays eggs, producing intense itching and a rash or thin lines. It spreads mainly through prolonged close skin contact.

Sarcoptic Mange

Alternate name; see *Scabies*.

Sargramostim

A recombinant granulocyte-macrophage colony-stimulating factor used to promote white-cell recovery after selected cancer treatments or transplantation; bone pain and fever may occur.

Sarnat Staging

A three-level examination used to describe the sever-

ity of brain dysfunction in a newborn after reduced oxygen or blood flow. Mild disease causes increased alertness, moderate disease causes poor responsiveness and seizures, and severe disease causes coma and weak or absent reflexes; the stage helps guide urgent treatment and prognosis.

Alternate Names:
Sarnat and Sarnat Grading; Sarnat Score; HIE Staging

SARS

Severe acute respiratory syndrome, a serious lung infection caused by the SARS coronavirus. It can cause fever, cough, breathing difficulty, and pneumonia and spreads mainly through close contact with respiratory droplets.

SARS-CoV-2

The coronavirus that causes COVID-19. It spreads mainly through particles released when an infected person breathes, talks, coughs, or sneezes and can cause anything from no symptoms to severe lung or other organ disease.

SARS (Severe Acute Respiratory Syndrome)

Alternate name; see *Severe Acute Respiratory Syndrome*.

SARS Virus

SARS-associated coronavirus (SARS-CoV, also called SARS-CoV-1), the virus responsible for the 2002–2004 outbreak of severe acute respiratory syndrome. It is distinct from SARS-CoV-2, which causes COVID-19.

Sartorius Muscle

A long, narrow muscle that runs diagonally across the front of the thigh from the pelvis to the inner side of the upper shin. It bends the hip and knee, moves the thigh away from the body, and turns it outward.

Alternate Names:
Tailor's Muscle

Sassafras Oil Overdose

Poisoning from swallowing or otherwise being exposed to too much sassafras oil. It may cause nausea, vomiting, seizures, breathing problems, liver injury, or other serious effects.

Satellite DNA

Repeated stretches of DNA found mainly in tightly packed parts of chromosomes. They help organize chromosome structure and can vary between people, usually without providing instructions for making proteins.

Satellite Virus

A small virus-like infectious agent that can multiply only when a separate helper virus is present. It uses the helper's machinery and may change how severe or persistent the combined infection becomes.

Satiation

The feeling of fullness that terminates a meal, produced by gastrointestinal stretch, nutrients, hormones, and brain signals regulating food intake.

Satiety

The feeling of fullness that reduces the desire to eat after a meal. It is influenced by stomach stretching, food composition, hormones, and brain signals; persistent early fullness can indicate illness.

Saturated Fat

A dietary fat whose fatty-acid chains contain no carbon-carbon double bonds. It is found in foods such as fatty meat, butter, full-fat dairy, coconut oil, and palm oil; replacing some saturated fat with unsaturated fat can help lower LDL cholesterol and cardiovascular risk.

Saturation

A state in which available binding, transport, or processing capacity is nearly full. Once capacity is reached, extra medicine or substance may remain in the blood or produce a disproportionately larger effect.

Sausage Digit

Diffuse swelling of an entire finger or toe, often caused by inflammation in joints, tendons, and surrounding tissues.

Alternate Names:
Dactylitis

Saxitoxin

A powerful poison made by some marine algae that can build up in shellfish. Eating contaminated seafood may cause tingling, weakness, trouble breathing, or paralysis.

SBBO

Alternate name; see *Small Intestinal Bacterial Overgrowth*.

SBMA

Genetic condition characterized by slowly progressive weakness and wasting of limb, facial, and swallowing muscles in males. See *Spinal And Bulbar Muscular Atrophy*.

Scab

A crust of dried blood, serum, pus, or tissue fluid over a healing skin injury.

Scabies

An infestation of the skin by the human itch mite *Sarcoptes scabiei* var. *hominis*, which burrows into the outer skin layer. It causes intense, often nocturnal itching and a papular rash; thin, winding burrows may be visible. Transmission occurs mainly through prolonged direct skin-to-skin contact.

Alternate Names:
Sarcoptic Acariasis; Seven-Year Itch

SCAD

Alternate name; see *Spontaneous Coronary Artery Dissection*.

Scaffold

A three-dimensional framework used in tissue engineering to hold cells in place while they grow and organize into new tissue. It may be made from natural or synthetic material and may gradually dissolve.

Scaffold Seeding

Placing living cells onto or inside a three-dimensional framework so they can attach, multiply, and begin forming tissue in laboratory or regenerative-medicine research.

SCAI Shock Stages

A consensus system for classifying cardiogenic shock from stage A (at risk) through stage B (beginning), C (classic), D (deteriorating), and E (extremis), using clinical and hemodynamic findings to describe severity and progression.

Alternate Names:
SCAI Cardiogenic Shock Stages; SCAI Shock Classification

Scalded Mouth Syndrome

Alternate name; see *Burning Mouth Syndrome*.

Scalded Skin Syndrome

Alternate name; see *Scalded-Skin Syndrome*.

Scalded-Skin Syndrome

A serious infection, usually in young children, in which toxins from Staphylococcus bacteria make the outer skin layer separate. The skin becomes painful, red, and easily blistered or peeled; fluid loss and secondary infection are possible complications.

Scalds

Burns caused by hot liquids or steam. They may damage only the surface skin or extend into deeper tissue; severity depends on depth, size, location, and age. Large, deep, facial, genital, hand, or circumferential burns can cause major tissue injury; unusual patterns in children may indicate inflicted injury.

Scalene Muscles

A group of three paired cervical muscles (anterior, middle, and posterior scalenes) originating from cervical transverse processes and inserting onto the first and second ribs; the interscalene triangle be-

tween the anterior and middle scalenes transmits the brachial plexus roots and subclavian artery (site of thoracic outlet syndrome).

Scales

Scales are flakes or plates of shed skin on the surface, occurring with dryness, eczema, psoriasis, fungal infection, or other dermatologic conditions.

Scaling

Scaling is flaking or shedding of the outer skin layer and may occur with dryness, eczema, psoriasis, fungal infection, or other skin disease.

Scaling And Root Planing

A deep dental cleaning that removes hardened plaque and bacteria above and below the gumline and smooths tooth roots. It reduces gum inflammation and may slow periodontal disease, but severe damage may need additional treatment.

Scalp

The skin and underlying tissues covering the skull. It contains hair follicles, glands, blood vessels, nerves, and connective tissue and can be affected by injury, infection, or skin disease.

Scalp and Body Ringworm

Alternate name; see *Ringworm*.

Scalpel

A sharp surgical knife used to make precise incisions or cuts in tissue. It may be a reusable handle with a detachable blade or a disposable single-piece instrument. Blade designs and numbers differ in size and shape; for example, a No. 10 blade is commonly used for larger incisions, a No. 11 for puncture or stab incisions, and a No. 15 for shorter precise cuts.

Alternate Names:
Surgical Knife; Lancette

Scalpel Handle

The reusable handle that holds a detachable scalpel blade. Different handle and blade sizes are chosen for the type and precision of the incision.

Scalp Psoriasis

Psoriasis affecting the scalp, causing sharply demarcated red plaques covered by silvery scale that may extend beyond the hairline. It can itch, crack, or bleed and is not contagious. Treatment may include medicated shampoos, topical corticosteroids, vitamin-D analogues, or systemic therapy for extensive disease.

Alternate Names:
Scalp Plaque Psoriasis

Scalp Ringworm

A contagious fungal infection of the scalp, also called tinea capitis. It can cause scaling, itching, broken hairs, bald patches, or swollen tender areas; oral antifungal treatment is used because topical medicines do not reach infected hair follicles well.

Scalp Tenderness

Pain when the scalp is touched or brushed. It can occur with giant cell arteritis, migraine, skin problems, nerve pain, or other conditions, so it is not diagnostic by itself.

Scan

An imaging examination that creates pictures of body structures or functions using methods such as ultrasound, X-rays, CT, MRI, or radioactive tracers. The method and interpretation depend on the clinical question.

Scan Gallium

A nuclear-medicine scan using radiolabeled gallium to identify areas of inflammation, infection, or some tumors; uptake is interpreted with anatomy and clinical context.

Scanning

Systematic examination of a body region or specimen using imaging, microscopy, or another detection method to locate, characterize, or monitor abnormalities.

Scanning Electron Microscopy

A method that scans a specimen's surface with an

electron beam to produce a highly magnified, three-dimensional-looking image of its shape and surface details.

Scanning Speech

Speech that is unusually slow, broken into separate syllables, and spoken with uneven rhythm or emphasis. It can occur when disease affects the cerebellum or other parts of the nervous system.

Scanning Techniques

Methods used to create images or measurements of the body or a sample. Examples include ultrasound, X-ray, CT, MRI, and nuclear-medicine scans; the method is chosen according to the clinical question.

Scaphoid

A small wrist bone on the thumb side, commonly injured when someone falls onto an outstretched hand. Pain in the hollow just behind the thumb may indicate a fracture, which sometimes heals poorly because part of the bone has limited blood flow.

Scaphoid Abdomen

A scaphoid abdomen is an unusually hollowed abdominal contour, classically seen with severe diaphragmatic hernia in a newborn but also possible with marked wasting.

Scaphoid Bone

The largest proximal-row carpal bone on the thumb side of the wrist; its waist is vulnerable to fracture and avascular necrosis because of its blood supply.

Scaphoid Fractures

Breaks in the small wrist bone near the base of the thumb, often after falling onto an outstretched hand. Pain may be felt in the hollow beside the thumb; some fractures heal poorly because part of the bone has a limited blood supply.

Scapholunate Advanced Collapse

A pattern of wrist arthritis that can develop after a long-standing tear between two wrist bones or an unhealed scaphoid fracture. It causes pain and stiffness that gradually worsen; X-rays show a characteristic pattern of joint wear.

Alternate Names:
SLAC Wrist; Scapholunate Collapse Arthropathy

Scaphycephaly

A long, narrow head shape caused when the major seam running from front to back of the skull closes too early. It is a form of craniosynostosis and may require specialist assessment to protect brain and skull development.

Scapula

The shoulder blade, a flat triangular bone at the back of the chest. It connects the upper arm to the collarbone and provides attachment for muscles that move and stabilize the shoulder.

Scapular Winging

Prominence of the shoulder blade away from the back of the chest, often noticed when pushing against a wall or raising the arm. It may result from weakness of the muscles that stabilize the shoulder blade, including after nerve injury.

Scapulothoracic Joint

The functional gliding connection between the shoulder blade and the back of the chest wall. It is not a true joint but works with nearby joints to position and move the arm.

Scar

An area of fibrous tissue that replaces normal dermal or parenchymal architecture following tissue injury, ulceration, or surgical incision, representing the final endpoint of wound healing. Characterized pathologically by dense collagen deposition (predominantly type I collagen replacing type III collagen) with loss of normal skin appendages (hair follicles and sweat glands) and elastic fibers. Abnormal scarring includes atrophic scars, hypertrophic scars (fibrous tissue confined within original wound borders), and keloids (excessive, nodular fibroblastic proliferation extending beyond initial wound boundaries).

Alternate Names:
Scars; Cicatrix

Scarlatina

Scarlet fever, an illness caused by toxin-producing group A Streptococcus and characterized by sore throat, fever, and a fine rough-textured rash.

Alternate Names:
Scarlet Fever; Second Disease

Scarlet Fever

An illness caused by toxin-producing group A Streptococcus. It usually causes sore throat, fever, and a widespread fine, rough-textured rash; a red tongue and pale skin around the mouth may also occur.

Scar Revision

A procedure that improves the appearance, contour, flexibility, or symptoms of a scar through excision, rearrangement, grafting, laser, injection, or other selected techniques.

Scarring Alopecia

Permanent hair loss caused when inflammation or injury destroys hair follicles and replaces them with scar tissue. Early scalp redness, scaling, itching, pain, or spreading hair loss needs dermatologic assessment because lost follicles cannot regrow hair.

Scarring Bullosa

An older, nonspecific term for blistering disorders that heal with scars. Use the specific diagnosis, such as epidermolysis bullosa acquisita or mucous membrane pemphigoid, when known.

Scars

Plural form; see *Scar*.

Scatter Correction

A medical-imaging method that estimates and reduces errors caused when detected radiation changes direction after passing through tissue. It can improve the accuracy of a nuclear-medicine image or measured activity.

Scatter Events

Radiation particles that change direction after interacting with tissue or another material. In medical imaging they can place signals in the wrong location or reduce contrast, so scanners use design and correction methods to limit their effect.

Scavenger Receptor

A protein on or inside a cell that recognizes and helps remove altered fats, germs, cell debris, or dying cells. It supports early immune defense but can also help fatty material build up in artery walls.

Scavenging System

Equipment that collects and removes waste anesthetic gases from an operating room. It protects staff from repeated exposure and may use a vacuum system or passive venting to carry gases safely away.

Scedosporium

A genus of environmental molds that can cause difficult-to-treat lung, sinus, skin, bone, or disseminated infections, especially in immunocompromised people.

Scedosporium Apiospermum

A mold that can cause localized or disseminated infection, including mycetoma, pneumonia, sinusitis, and brain abscesses; treatment often requires specialist antifungal care.

Schaalia Radingae

A normally slow-growing anaerobic bacterium of the human mouth and skin that can rarely cause abscesses or other invasive infections.

Schaalia Turicensis

A filamentous anaerobic bacterium that may be part of normal flora but can cause actinomycosis-like abscesses and other opportunistic infections.

Schatzki Ring

A thin ring of tissue narrowing the lower esophagus, often near a hiatus hernia. It may cause occasional difficulty swallowing solid food or a piece of food becoming stuck; treatment can widen the narrowed area.

Alternate Names:

Lower Esophageal Mucosal Ring; B Ring

Schereshevkii-Turner Syndrome

Variant spelling of an older name; see *Turner Syndrome*.

Scheuermann Disease

A juvenile osteochondrosis of the spine in which vertebral end plates develop irregularities and anterior wedging during skeletal growth. It commonly produces a rigid thoracic kyphosis, although the thoracolumbar or lumbar spine may also be involved. Symptoms can include back pain, fatigue, limited spinal motion, and postural deformity that becomes more apparent during adolescence. Diagnosis is based on clinical examination and characteristic radiographs; management depends on deformity severity, skeletal maturity, pain, and progression.

Scheuermann's Disease

A growth disorder beginning in adolescence that causes several spinal bones to become wedge-shaped. This can produce a lasting rounded upper back, stiffness, pain, and sometimes breathing or activity limitations.

Schiff Base

A chemical compound formed when a primary amine reacts with an aldehyde or ketone; Schiff bases occur in biochemistry and drug chemistry.

Schiller Test

An examination of the cervix in which iodine solution is applied to highlight areas of abnormal tissue. Areas that do not stain may need further examination or biopsy; the test alone cannot diagnose cancer.

Schilling Test

An older test that measured how well the body absorbed vitamin B12, sometimes used to investigate pernicious anemia or intestinal disease. It is rarely performed now because blood tests and antibody testing have largely replaced it.

Schirmer Test

A test in which standardized filter paper strips measure tear production over a set time, commonly used to evaluate aqueous-deficient dry eye.

Schistocyte Count

Measurement of fragmented red blood cells on a blood smear, supporting evaluation of microangiopathic hemolysis, mechanical valve damage, disseminated intravascular coagulation, or severe burns.

Schistocytes

Broken, irregular, or helmet-shaped red blood cells seen on a blood-smear test. They form when red cells are damaged in abnormal small vessels, by artificial heart valves, or in other illnesses and may signal serious red-cell destruction.

Schistomicide

A medicine that kills parasitic blood flukes responsible for schistosomiasis. Treatment choice depends on the parasite species and the organs affected, and medical advice is needed because infection may cause lasting damage.

Schistosoma

A group of parasitic worms that live in blood vessels. Their young forms can enter through skin exposed to contaminated fresh water and later cause intestinal, urinary, liver, or other disease.

Schistosoma Haematobium

A parasitic blood fluke that can cause urinary schistosomiasis, including hematuria and chronic injury of the urinary tract.

Schistosoma Intercalatum

A parasitic blood fluke that causes intestinal schistosomiasis, mainly in parts of Central and West Africa, after freshwater exposure.

Schistosomiasis

An infection caused by parasitic worms called *Schistosoma*. The worms' eggs hatch in freshwater and infect snails; larvae released by the snails can pene-

trate human skin during contact with contaminated water. Adult worms live in blood vessels, and their eggs can damage the intestine, liver, urinary tract, or other organs. Symptoms may include an itchy rash, fever, abdominal pain, diarrhea, or blood in the stool or urine.

Schistosomiasis (Bilharzia)

Alternate name; see *Schistosomiasis*.

Alternate Names:
Snail Fever

Schizencephaly

A rare brain-development condition in which a cleft lined by abnormal gray matter extends from a brain ventricle to the brain's outer surface. The cleft may be open or closed and can cause seizures, weakness, movement problems, or developmental delay, depending on its size and location.

Schizoaffective Disorder

A psychotic disorder in which schizophrenia symptoms occur during major depressive or manic episodes, while delusions or hallucinations also persist for at least two weeks without a major mood episode. Major mood episodes occupy most of the illness's active and residual course. The disorder has depressive and bipolar types.

Schizogony

A way some single-celled parasites reproduce without mating. One parasite cell grows and divides internally to produce many new cells, which are then released to infect other cells.

Schizoid Personality Disorder

A long-standing pattern of limited interest in close relationships and restricted emotional expression. It differs from schizophrenia because hallucinations and fixed delusions are not central features.

Alternate Names:
Schizoid Disorder; Asocial Personality

Schizophrenia

A serious, long-term mental disorder that can affect a person's thoughts, perceptions, emotions, behavior, and ability to function. Symptoms are often grouped as psychotic, negative, and cognitive. Psychotic symptoms include hallucinations, such as hearing or seeing things that others do not, delusions, which are firmly held beliefs not supported by shared evidence, and disorganized thought or speech. Negative symptoms may include reduced emotional expression, motivation, pleasure, or social interest. Cognitive symptoms may affect attention, memory, planning, and decision-making. Symptoms and their severity vary between people and may come and go or persist over time.

Schizophreniform Disorder

A psychotic disorder with symptoms such as delusions, hallucinations, disorganized speech or behavior, and reduced functioning lasting at least one month but less than six months. The duration distinguishes it from schizophrenia; symptoms are not better explained by a mood disorder, substance, medication, or another medical condition.

Schizotypal Personality Disorder

A long-term pattern of discomfort with close relationships, unusual beliefs or perceptions, unusual speech or behavior, and difficulty interpreting social situations. It is different from schizophrenia because persistent hallucinations and major loss of reality testing are not typical.

Alternate Names:
Schizotypal Disorder; STPD

Schlemm Canal

A circular, endothelium-lined vessel situated in the iridocorneal angle of the anterior chamber, which drains aqueous humor from the trabecular meshwork into the collector channels and episcleral venous system.

Alternate Names:
Canal of Schlemm; Scleral Venous Sinus

Schlemm'S Canal

A circular drainage channel at the edge of the cornea that carries fluid from the front of the eye into blood vessels. Poor drainage can raise pressure inside the

eye and contribute to glaucoma.

Alternate Names:
Canal of Schlemm

Schmorl Node

An intravertebral disc herniation characterized by the protrusion and displacement of nucleus pulposus cartilage through a defect in the cartilaginous vertebral endplate into the trabecular bone marrow of an adjacent vertebral body.

Alternate Names:
Schmorl's Node; Intravertebral Herniation

Schnitzler Syndrome

A rare inflammatory disease causing a long-lasting hives-like rash, repeated fever, bone or joint pain, and raised inflammation tests. It is usually associated with an abnormal IgM blood protein.

School-Age Children Development

School-age development includes advances in growth, coordination, language, learning, independence, social relationships, and emotional regulation, with broad normal variation.

School-Based Rehabilitation

Therapy and other support services provided in a school setting to help a child participate in education and daily school activities.

School Sores

Alternate name; see *Impetigo*.

Schwann Cell

The principal neuroglial cell of the peripheral nervous system (PNS), derived from neural crest cells during embryogenesis. Myelinating Schwann cells wrap repeatedly around a single segment of a large-caliber axon to form a concentric myelin sheath, facilitating rapid saltatory nerve impulse conduction across the nodes of Ranvier. Non-myelinating Schwann cells engulf and mechanically bundle multiple small-caliber unmyelinated axons (Remak bundles). Schwann cells also play a pivotal role in post-traumatic peripheral axon regeneration by guiding sprouting axon growth cones; neoplastic proliferation yields schwannomas and neurofibromas.

Alternate Names:
Schwann Cells; Neurolemmocyte

Schwann Cells

Plural form; see *Schwann Cell*.

Schwannoma

A usually noncancerous, slow-growing tumor arising from cells that support nerves. It may cause a lump, pain, numbness, or weakness; a tumor involving the hearing and balance nerve can cause hearing loss, ringing, or dizziness.

Alternate Names:
Neurilemmoma

Schwannomatosis

A condition in which multiple schwannomas, usually slow-growing tumors of the covering of nerves, develop. The main problem is often long-lasting pain, although numbness, weakness, or other nerve symptoms can occur depending on tumor location.

Alternate Names:
Neurinomatosis

SCI

Alternate name; see *Spinal Cord Injury*.

Sciatica

Pain, tingling, numbness, or weakness that travels from the lower back or buttock down the leg, usually because a nerve root is irritated by a disk problem or narrowing of the spine. Progressive weakness, numbness around the inner thighs or genitals, or new loss of bladder or bowel control may indicate severe nerve compression.

Alternate Names:
Sciatic Neuralgia

Sciatic Nerve

The body's largest nerve, running from the lower spine through the buttock and down the back of the leg. It supplies movement and sensation to much of the leg and foot.

Sciatic Neuritis

Alternate name; see *Sciatica*.

Scimitar Syndrome

A congenital condition in which one or more veins from the right lung drain into the inferior vena cava instead of the left atrium. The right lung may be underdeveloped, and the condition can cause repeated chest infections, breathing problems, high pressure in the lung arteries, or heart failure.

Scintigraphy

Nuclear-medicine imaging in which a small amount of radioactive tracer is given and a camera records where it collects. The pattern can show the function, blood flow, or activity of organs such as bone, thyroid, kidneys, or heart.

Scintillation

A localized flash or emission of light; in nuclear medicine, the flash of luminescence produced in a luminescent crystal (e.g., sodium iodide crystal activated with thallium) when struck by an ionizing photon or particle. In ophthalmology and neurology, scintillation denotes a visual phenomenon of twinkling, flashing, or shimmering zigzag lines of light (scintillating scotoma or teichopsia), classically experienced during the aura phase of a migraine attack.

Alternate Names:
Scintillations; Scintillating Scotoma; Teichopsia

Scintillation Crystal

A material in some medical detectors that changes incoming radiation into tiny flashes of light. The flashes are measured to create images or estimate the amount of radioactive tracer present.

Scintillations

Plural form; see *Scintillation*.

Scirrhus

An older term for a hard cancer containing a large amount of scar-like tissue. It was used especially for some breast or stomach cancers and describes texture rather than a separate cancer type.

Scissors

Instruments with two blades used to cut tissue, sutures, dressings, or other material. Surgical types vary in length, blade shape, and sharpness; examples include Mayo and Metzenbaum scissors.

Sclera

The sclera is the tough white outer coat of the eye that protects the globe and provides attachment for eye muscles.

Scleral Buckling

A retinal-detachment repair procedure in which a silicone band or buckle is placed around the outside of the eye to support the retinal break and reduce traction.

Scleral Icterus

Yellowing of the whites of the eyes, caused by bilirubin building up in the body. It is a visible sign of jaundice, which can result from liver disease, bile-duct blockage, or increased breakdown of red blood cells.

Scleral Inflammation

Alternate name; see *Scleritis*.

Scleredema

A sclerosing skin disorder causing thick, hard, often waxy skin, classically on the neck, upper back, and shoulders. It may follow infection, occur with diabetes or a monoclonal gammopathy, or rarely be associated with other systemic disease.

Scleredema Diabeticorum

Scleredema diabeticorum is thickening and hardening of the skin on the upper back and neck, usually associated with long-standing diabetes and obesity.

Scleritis

Inflammation of the sclera, the tough white outer wall of the eye. It often causes deep eye pain, redness, and tenderness and can threaten vision. It

may be associated with autoimmune disease, infection, trauma, surgery, or medicines. Types include anterior and posterior scleritis; complications can include inflammation of nearby eye structures, scleral thinning, and vision loss.

Alternate Names:
Deep Scleral Inflammation; Scleral Inflammation

Sclerochoroidal Calcification

A rare ocular finding caused by calcium-salt deposits in the posterior sclera, sometimes extending into the choroid. It usually appears as yellow-white plaques in the peripheral fundus and is often asymptomatic; most cases are idiopathic, though some are associated with altered calcium-phosphate metabolism.

Sclerodactyly

Thick, tight skin on the fingers or toes, often making them shiny, tapered, or hard to bend. It commonly occurs in systemic sclerosis and may limit movement.

Scleroderma

A group of conditions that cause skin and sometimes deeper tissues to become hard, thick, or tight. Localized scleroderma, also called morphea, mainly affects the skin and nearby tissues. Systemic sclerosis can affect the skin, blood vessels, and internal organs such as the esophagus, lungs, kidneys, and heart. The cause is not fully known, and symptoms vary by type and organs involved.

Scleroderma Renal Crisis

A sudden, dangerous rise in blood pressure with rapid kidney failure in a person with systemic sclerosis. It may also damage blood cells and platelets. It is a medical emergency and is treated urgently, usually with an ACE-inhibitor medicine.

Alternate Names:
SRC; Systemic Sclerosis Renal Crisis

Scleroma

A long-lasting infection, usually of the nose and upper airway, caused by Klebsiella rhinoscleromatis. It can produce scar tissue, blocked breathing, nasal discharge, voice changes, or facial deformity.

Scleromyxedema

A rare long-term skin disorder in which many small, firm, waxy bumps and thickened skin develop, especially on the face, neck, and hands. It may also affect muscles, joints, swallowing, lungs, or other organs.

Sclerosing Adenosis

A benign breast condition in which scar-like fibrous tissue forms in the milk-producing lobules. It may cause a small lump or breast pain and is associated with a slight increase in breast cancer risk.

Sclerosing Cholangitis

Inflammation and scarring that narrow or block the tubes carrying bile from the liver. It may cause itching, jaundice, abdominal pain, repeated infections, and liver damage; the cause guides treatment and follow-up.

Sclerosing Mesenteritis

A rare inflammatory condition causing thickening and scarring in the tissue that supports the intestines. It may cause abdominal pain, nausea, weight loss, or bowel blockage, although some people have no symptoms.

Sclerosing Peritonitis

Thickening and scarring of the lining inside the abdomen, sometimes after long-term peritoneal dialysis. The scar tissue can restrict the intestines and cause pain, vomiting, poor nutrition, or bowel blockage.

Sclerosing Sialadenitis

Long-term inflammation that makes a salivary gland swollen and hard because scar-like tissue forms inside it. It may be related to an immune disorder and can cause dry mouth, pain, or repeated swelling.

Sclerosis

Abnormal hardening or scarring of tissue, often from excess connective tissue, chronic inflammation, degeneration, or neurologic plaques; the affected organ determines the specific disease.

Sclerosteosis

A rare inherited condition in which bones, especially the skull, become abnormally thick. It may cause a broad or tall build, joined fingers, headaches, hearing loss, facial weakness, or pressure on nerves inside the skull.

Sclerotherapy

A treatment in which an irritating or closing agent is injected into a blood vessel or body cavity to make it scar and seal, commonly used for varicose veins and selected vascular lesions.

Sclerotomy

A sclerotomy is a surgical opening made through the sclera, the white outer layer of the eye, often during vitreoretinal surgery.

Scoliosis

A structural sideways curve of the spine measuring more than 10 degrees by the Cobb method on X-ray, usually with vertebral rotation. It may be idiopathic, congenital, or neuromuscular; some curves cause no symptoms, while larger curves may change body shape and can rarely affect breathing.

Alternate Names:
Spinal Curvature

Scombroid Poisoning

An illness caused by eating fish, such as tuna or mackerel, that was not kept cold enough. Bacteria in the fish produce histamine that is not destroyed by cooking. Symptoms can begin within minutes and include flushing, headache, a peppery taste, rash, palpitations, and stomach cramps.

Alternate Names:
Histamine Fish Poisoning; Scombrotoxism

Scopolamine

Scopolamine is a muscarinic antagonist used mainly to prevent motion sickness and postoperative nausea; dry mouth, blurred vision, urinary retention, confusion, and other anticholinergic effects may occur.

Scopolamine Hydrobromide

The hydrobromide salt of scopolamine, an anticholinergic medicine used mainly to prevent motion sickness and postoperative nausea.

Scopolamine Patch

A skin patch that slowly releases scopolamine, a medicine that blocks a nerve signal involved in nausea. In adults, it is used to prevent nausea and vomiting from motion sickness or after surgery. It can cause dry mouth, blurred vision, confusion, and overheating.

Alternate Names:
Scopolamine Transdermal Patch; Scopolamine Transdermal System

Scopulariopsis

Scopulariopsis is a mold genus that rarely causes opportunistic infection, especially in people with immune suppression or implanted devices.

Scorbutic

Relating to scurvy caused by severe vitamin C deficiency. It can cause easy bruising, bleeding gums, poor wound healing, anemia, bone or joint pain, and weakness; treatment with vitamin C and an adequate diet usually leads to recovery.

Scorpion Fish Sting

A painful injury from the venomous spines of a scorpion fish, causing severe local pain and swelling and sometimes whole-body symptoms. Spines or venom may remain in the injury.

Scorpions

Venomous arachnids whose stings can cause local pain and, depending on the species, sweating, muscle spasms, breathing problems, or other serious symptoms.

Scorpion Sting

A venomous injury from a scorpion, usually causing immediate pain, burning, redness, or tingling. Some species can cause muscle twitching, abnormal eye movements, breathing difficulty, or dangerous

autonomic symptoms.

Alternate Names:
Scorpion Envenomation; Scorpion Bite

Scorpion Stings

Alternate name; see *Scorpion Sting*.

Scotoma

A blind or blurred spot within an otherwise usable field of vision. It may result from retinal disease, optic-nerve damage, migraine, stroke, or another eye or brain disorder.

Scotty Dog Sign

The normal radiological configuration of the posterior vertebral elements on oblique lumbar spine radiographs resembling a Scottish terrier dog; a radiolucent line crossing the neck of the dog indicates a defect or fracture in the pars interarticularis (spondylolysis).

Alternate Names:
Scottish Terrier Sign; Pars Interarticularis Collar Sign

Scrape

A scrape is a superficial abrasion in which friction removes part of the skin surface; cleaning, protection, and monitoring for infection support healing.

Screening

Testing people without symptoms to identify a disease or an increased risk of disease. The appropriate test, age range, interval, and follow-up depend on the condition, individual risk, and current guidance; screening benefits must be balanced against harms.

Screening And Diagnosis For HIV

Testing for human immunodeficiency virus using an antigen-antibody assay or nucleic-acid test, followed by confirmatory testing and assessment of immune status when positive.

Screening Procedure

A test or examination offered to people without symptoms to detect disease or risk early enough for effective prevention or treatment; eligibility and intervals depend on evidence and risk.

Screening Program

An organized public-health service that systematically invites a defined population to undergo testing for an asymptomatic condition, with quality-assured follow-up, diagnosis, treatment, and evaluation of benefits and harms.

Screening Study

A planned investigation of an asymptomatic population to identify early disease, precursor lesions, or risk factors using a validated test and follow-up pathway.

Screening Test

A test applied to people without symptoms or a known diagnosis to identify those at increased risk of a condition. A screening result usually requires a diagnostic or confirmatory evaluation before treatment is initiated.

Screening Tests for Depression

Alternate name; see *Depression Screening*.

Screen Time And Children

Time children spend using televisions, computers, phones, tablets, or game devices; excessive or poorly timed use can affect sleep, activity, learning, mood, and family routines.

Screws

Threaded metal devices used to hold broken bones together or attach plates and other implants securely to bone.

Script

A script is a written set of instructions or a prescription; in healthcare, a prescription specifies the medicine, dose, route, timing, and duration.

Scrivener's Palsy

An older term for task-specific hand dystonia or cramp occurring during writing.

Scrofuloderma

A form of skin tuberculosis caused when infection in a nearby lymph node, bone, or joint spreads directly into the skin. It often begins as a firm lump that softens, breaks open, and forms a draining sore or tunnel; neck lymph nodes are a common source.

Scrotal Calcinosis

Firm, usually painless calcium deposits in the skin of the scrotum that appear as one or more whitish or yellowish lumps. They may become tender, ulcerate, or release a chalky material; removal is considered if they cause symptoms.

Scrotal Infection

Infection of the scrotal skin or underlying structures, which may cause redness, swelling, warmth, pain, or drainage. Rapidly worsening pain, fever, discoloration, or severe swelling is an emergency because serious soft-tissue infection must be excluded.

Scrotal Masses

Lumps or swellings in the scrotum, arising from the skin, fluid around a testicle, veins, infection, hernia, or a testicular tumor. A firm, painless, or rapidly growing lump can occur with a testicular tumor.

Scrotal Pain

Pain in the scrotum caused by infection, trauma, hernia, fluid collections, varicocele, testicular torsion, or other conditions affecting the testes and surrounding structures.

Scrotal Septum

A tissue wall that divides the scrotum into right and left compartments.

Scrotal Swelling

Enlargement of the scrotum caused by fluid, inflammation, infection, hernia, varicocele, hydrocele, tumor, trauma, or testicular torsion; sudden pain is an emergency.

Scrotal Ultrasound

Ultrasound imaging of the scrotum and testes used to evaluate pain, swelling, masses, torsion, infection, trauma, and blood flow.

Scrotum

The scrotum is the external skin-and-muscle sac containing the testes and epididymides; its muscles help regulate testicular temperature, and swelling or pain may indicate infection, torsion, hernia, or tumor.

Scrub In

To scrub in is to perform surgical hand antisepsis and put on sterile clothing and gloves before participating in a sterile procedure.

Scrubs

Scrubs are protective work garments commonly worn by healthcare staff; they reduce clothing contamination but do not replace hand hygiene or other precautions.

Scrub Typhus

An infection spread by tiny mites called chiggers. It can cause high fever, headache, swollen lymph nodes, rash, and sometimes a dark sore at the bite site. Severe illness can affect the lungs, kidneys, heart, or brain; untreated disease can be fatal.

Alternate Names:
Tsutsugamushi Disease; Mite-Borne Typhus

Scrub Up

To scrub up means to clean and antiseptically prepare the hands and forearms before a sterile procedure.

Scurf

Fine flakes or scales shed from the skin, especially the scalp. It may occur with dry skin, dandruff, eczema, psoriasis, infection, or irritation and may be accompanied by itching or redness.

Scurvy

A disease caused by severe vitamin C deficiency. It can cause bleeding or swollen gums, easy bruising, small skin bleeds, poor wound healing, anemia, bone

or joint pain, and fatigue.

Seabather's Eruption

An itchy papular or vesicular eruption caused by contact with stinging larvae in seawater, often beneath swimwear. Symptoms may begin after leaving the water and usually resolve over days; extensive reactions can cause marked inflammation.

Sea-Blue Histiocyte

An immune cell that appears blue-green under a microscope because it contains stored fats or cell-waste pigment. It may be seen in some storage, blood, or metabolic disorders, but the finding alone does not identify a disease.

Seafood Poisoning

Clinical toxic syndromes resulting from the ingestion of seafood containing marine toxins or accumulated bio-toxins, including ciguatera fish poisoning, scombroid (histamine) toxicity, paralytic shellfish poisoning, and tetrodotoxin poisoning.

Alternate Names:
Marine Toxin Poisoning; Shellfish Toxicity; Ichthyosarcotoxism

Sea-Sickness

Motion sickness caused by conflicting signals from the inner ear, eyes, and body during travel on a boat or ship. It may cause nausea, vomiting, dizziness, sweating, headache, and pallor.

Seasonal Affective Disorder

Depression that repeatedly begins during a particular season, most often autumn or winter, and improves at another time of year. Symptoms may include low mood, loss of interest, tiredness, oversleeping, increased appetite, and social withdrawal.

Seasonal Affective Disorder (SAD)

Alternate name; see *Seasonal Affective Disorder*.

Seasonal Affective Disorder Syndrome

Alternate name; see *Seasonal Affective Disorder*.

Seasonal Allergic Rhinitis

Inflammation of the nasal passages causing sneezing, runny nose, and itching due to seasonal pollen exposure. See *Hay Fever*.

Seasonal Allergies

An allergic reaction that occurs at specific times of the year when outdoor plants release tiny pollen grains into the air. In spring, tree pollen (such as oak, birch, and cedar) is the most common trigger; in summer, grass pollen causes symptoms; and in late summer and autumn, weed pollen (especially ragweed) and outdoor mold spores are common culprits. When a sensitized person inhales pollen, the immune system mistakenly identifies it as a threat, causing the release of histamine and other chemicals that inflame the nasal passages, sinuses, and eyes. Common symptoms include frequent sneezing, a congested or runny nose with clear drainage, an itchy throat or roof of the mouth, and red, itchy, watery eyes (allergic conjunctivitis).

Alternate Names:
Hay Fever; Seasonal Allergic Rhinitis; Pollinosis; Seasonal Allergy

Sebaceous Adenoma

A sebaceous adenoma is a usually benign tumor of sebaceous glands that can appear as a yellowish skin nodule and may be associated with Muir-Torre syndrome.

Sebaceous Carcinoma

An uncommon cancer arising from sebaceous, or oil-producing, glands. It often appears as a firm or yellowish eyelid or skin nodule and may require biopsy and specialist treatment.

Sebaceous Cyst

A common but imprecise term for an epidermoid cyst, a keratin-filled cyst beneath the skin.

Sebaceous Epithelioma

A benign sebaceous neoplasm, often presenting as a yellowish papule or nodule. Multiple or unusual lesions may warrant assessment for a DNA mismatch-repair syndrome such as Muir-Torre syndrome.

Sebaceous Gland

A microscopic exocrine holocrine gland located in the dermis of the skin, usually connected to a hair follicle to form a pilosebaceous unit (with specialized free sebaceous glands occurring in the eyelids as Meibomian glands, the areola as Montgomery tubercles, and oral mucosa as Fordyce spots). Composed of lipid-producing sebocytes that rupture to secrete sebum, an oily mixture of triglycerides, squalene, and wax esters that lubricates and waterproofs the skin and hair while exerting mild antimicrobial properties; androgen-driven hyperactivity and follicular hyperkeratinization are central to the pathogenesis of acne vulgaris.

Alternate Names:
Sebaceous Glands

Sebaceous Gland Carcinoma

Sebaceous gland carcinoma is an uncommon skin cancer arising from oil glands, often appearing as a firm yellowish eyelid or skin lump.

Sebaceous Glands

Plural form; see *Sebaceous Gland*.

Sebaceous Hyperplasia

A benign enlargement of sebaceous glands, presenting as small yellowish papules with central umbilication, usually on the face of adults.

Seborrhea

A term used inconsistently for oily skin or scalp with greasy scale. It is often used to refer to seborrheic dermatitis, an inflammatory skin condition that commonly affects the scalp, face, and chest.

Seborrheic Dermatitis

A chronic, relapsing inflammatory skin disorder affecting sebum-rich areas, especially the scalp, face, ears, and chest. It produces erythematous patches with greasy white or yellow scale; dandruff is its mild, scalp-limited form.

Seborrheic Keratoses

Plural form; see *Seborrheic Keratosis*.

Seborrheic Keratosis

A common benign epidermal growth with a sharply defined, waxy or verrucous, "stuck-on" surface. Lesions may be flat or raised and range from skin-colored to brown or black; they become more common with age and are not premalignant.

Alternate Names:
Basal Cell Papilloma; Senile Wart

Seborrhoea

British spelling of seborrhea, meaning excessive sebum production; the term is also used loosely for seborrheic dermatitis.

Seborrhoeic

Relating to increased or altered activity of sebaceous glands or to areas rich in these glands, such as the scalp, face, chest, and upper back.

Seborrhoeic Dermatitis

British spelling; see *Seborrheic Dermatitis*.

Seborrhoeic Keratosis

British spelling; see *Seborrheic Keratosis*.

Sebum

An oily substance made by skin glands that lubricates and protects the skin and hair. Excess production can contribute to oily skin, acne, and dandruff, while changes may accompany some skin disorders.

Seckel Syndrome

A rare inherited condition causing severe growth restriction before and after birth, a very small head, characteristic facial features, and often developmental or intellectual disability. Bone, blood, and other birth differences may also occur.

Secobarbital Overdose

Poisoning from taking too much secobarbital, a sedative medicine. It can cause extreme sleepiness, confusion, slowed breathing, coma, or death.

Secondaries In The Liver

Informal name for cancer that has spread to the liver from another part of the body; see *Liver Metastases*.

Secondary Adrenal Insufficiency

Reduced production of adrenal hormones because the pituitary or brain does not provide enough stimulation, often after long-term steroid treatment is stopped suddenly. It can cause fatigue, weakness, nausea, low blood pressure, and low blood sugar; skin darkening and salt loss are less typical than in primary adrenal failure.

Secondary Amenorrhea

Absence of menstruation for at least three months in someone with previously regular cycles or six months with previously irregular cycles, caused by pregnancy, endocrine, ovarian, uterine, or systemic factors.

Secondary Attack Rate

The proportion of susceptible people who become infected after contact with an initial case during a defined period. It helps estimate how readily an infection spreads in households, schools, healthcare settings, or other close-contact groups.

Secondary Brain Cancer

Alternate name; see *Brain Metastases*.

Secondary Cancer

A cancer that has spread from its original site to another part of the body; the resulting tumor is a metastasis.

Secondary Glaucoma

Glaucoma caused by another eye disease, systemic disease (a condition affecting the body), eye injury, or medicine. The cause may obstruct aqueous outflow or raise intraocular pressure (pressure inside the eye); the drainage angle may be open or closed, and the optic nerve may be damaged.

Secondary Hyperparathyroidism

Overactivity of the parathyroid glands in response to low calcium, abnormal phosphate, vitamin-D deficiency, or kidney disease. It can weaken bones, cause bone pain, and contribute to calcium deposits in blood vessels.

Secondary Hypertension

High blood pressure caused by an identifiable medical condition, medicine, or substance, rather than primary (essential) hypertension. Causes include kidney disease or narrowed kidney arteries, hormone disorders, sleep apnea, pregnancy-related conditions such as preeclampsia, and certain medicines or drugs, including steroids, stimulants, decongestants, and some pain relievers. Treating the cause may improve blood pressure.

Secondary Hypothyroidism

Low thyroid-hormone production because the pituitary or nearby brain area does not provide enough thyroid-stimulating signal. It may cause tiredness, feeling cold, constipation, dry skin, slow heart rate, or menstrual changes.

Secondary Immune Response

A faster and stronger defense when the body meets a germ or foreign substance again. Memory immune cells from the first exposure respond quickly and usually produce antibodies and other defenses more effectively.

Secondary Immunodeficiency

Reduced immune function caused by an acquired condition or exposure rather than a primary genetic disorder. Causes include HIV infection, cancer, malnutrition, medicines, and chronic disease; the manifestations depend on which immune functions are impaired.

Secondary Infections

Infections that develop during or after another disease, injury, or treatment because of tissue damage, altered defenses, or immunosuppression.

Secondary Infertility

Difficulty becoming pregnant or carrying a pregnancy to term after a previous pregnancy. It may

affect either or both partners and can have the same causes as infertility in people who have never been pregnant, or be related to changes in health, age, or reproductive function.

Secondary Lymphoid Organs

Organs where mature lymphocytes meet foreign substances and begin immune responses. They include lymph nodes, the spleen, tonsils, and other lymphoid tissues.

Secondary Osteoporosis

Bone loss caused by another illness, medication, or prolonged immobility.

Secondary Osteosarcoma

An osteogenic sarcoma arising in previously abnormal or treated bone, such as bone affected by Paget disease, prior radiation, or chronic bone lesions; prognosis and treatment depend on stage and resectability.

Secondary Parkinsonism

Secondary parkinsonism is slowed movement, rigidity, tremor, or postural instability caused by another condition, medicine, toxin, vascular injury, or structural brain disease.

Secondary Peritonitis

Diffuse or localized acute bacterial or chemical inflammation of the peritoneal cavity resulting from direct breach of an intra-abdominal hollow viscus, such as a perforated peptic ulcer, ruptured appendix, ischemic bowel perforation, or anastomotic leak.

Alternate Names:
Acute Secondary Peritoneal Inflammation

Secondary Polycythemia

An absolute increase in red blood cell mass driven by elevated circulating erythropoietin levels, either as an appropriate physiological response to chronic systemic hypoxia (chronic cyanotic lung/heart disease, high altitude, smoking) or pathologically from erythropoietin-secreting tumors (renal cell carcinoma, cerebellar hemangioblastoma, hepatocellular carcinoma).

Secondary Postpartum Hemorrhage

Heavy or abnormal bleeding occurring more than 24 hours and up to 12 weeks after childbirth. Causes include retained placental tissue, infection, poor healing where the placenta was attached, or a bleeding disorder. Heavy bleeding, dizziness, fainting, fever, or severe pain may occur.

Alternate Names:
Late Postpartum Hemorrhage; Delayed PPH

Secondary Prevention

Finding and treating a disease early to stop it worsening or causing complications. Examples include screening for some cancers, checking blood pressure, testing for early diabetes, and treating an abnormality before it produces serious symptoms.

Secondary Progressive Multiple Sclerosis

A phase of multiple sclerosis in which disability gradually worsens over time after an earlier relapsing pattern. Relapses may still occur, but progressive walking, strength, vision, bladder, thinking, or other problems can develop even between attacks.

Alternate Names:
SPMS; Secondary-Progressive MS

Secondary Psychosis

Psychotic symptoms caused or contributed to by a medical illness, medicine, substance, or neurologic disorder rather than a primary psychotic disorder. New hallucinations, delusions, or confusion can reflect a reversible underlying cause.

Secondary Sexual Characteristics

Physical changes that develop during puberty and are not directly part of the reproductive organs, such as breast development, facial or body hair, voice changes, and changes in body shape.

Secondary Shock

Circulatory failure occurring as a consequence of another condition, such as infection, trauma, bleeding, heart failure, allergy, or endocrine crisis, with inadequate tissue perfusion.

Secondary Syphilis

The stage of syphilis that occurs weeks or months after the first sore when the bacteria spread through the body. It may cause a widespread rash, including the palms and soles, swollen glands, fever, tiredness, mouth patches, or moist lesions; antibiotic treatment can cure the infection.

Secondary Systemic Amyloidosis

Alternate name; see *AA Amyloidosis*.

Secondary Tumor

A tumor formed when cancer cells spread from the original site to another part of the body.

Second-Degree AV Block

A heart-rhythm problem in which some electrical signals from the upper chambers fail to reach the lower chambers. The heartbeat may be slow or irregular; certain patterns can progress to complete heart block.

Second-Degree Burn

A burn that damages the outer skin and part of the layer beneath it. The area is usually painful, red, moist, and blistered; deeper burns may look pale and heal slowly. Large, deep, or sensitive-area burns can cause serious tissue damage.

Second-Hand Smoke

Smoke inhaled from burning tobacco products or exhaled by a person who is smoking. It contains toxic substances and increases health risks in exposed people.

Second-Look Surgery

Second-look surgery is a planned or follow-up operation performed to inspect healing, remove remaining disease, assess treatment response, or manage complications.

Second Malignancy

A new, separate cancer that develops after an earlier cancer. The risk may be influenced by inherited factors, previous radiation or chemotherapy, age, and other exposures; it is different from recurrence of the first cancer.

Second Messengers

Small molecules inside cells that pass along messages received from hormones, nerve chemicals, or other outside signals. They help control contraction, secretion, metabolism, gene activity, and cell growth.

Second Messenger Systems

Internal signaling systems that carry a message from a hormone, nerve chemical, or growth factor at the cell surface to processes inside the cell. They can change contraction, secretion, metabolism, gene activity, or cell growth.

Second Opinion

An independent medical assessment by another qualified clinician to help confirm or clarify a diagnosis, prognosis, or treatment plan.

Second Stage of Labor

The part of childbirth that begins when the cervix is fully open and ends when the baby is born. It includes descent of the baby and pushing; its length varies with previous births, pain relief, the baby's position, and the health of parent and baby.

Second Trimester

The middle part of pregnancy, from 14 through 27 completed weeks. The fetus grows rapidly, movement is often felt, and ultrasound and blood screening may assess development and certain conditions; the timing and tests vary by pregnancy and local care.

Secretin

A hormone released by the first part of the small intestine when acidic stomach contents enter it. Secretin prompts the pancreas and bile ducts to release alkaline fluid, helping neutralize acid and support digestion.

Secretin Stimulation Test

A test in which secretin is given and changes in blood or digestive fluid are measured. It may assess pancreatic function or investigate a rare tumor that releases excess gastrin and stomach acid.

Secretion

The release of a substance from cells or glands into the blood, a body passage, or outside the body. Examples include saliva, hormones, digestive juices, mucus, and substances removed into urine or bile.

Secretory Diarrhea

Watery diarrhea caused when the intestine releases too much water and salt or absorbs too little. It may continue even without eating and can result from infection, medicines, bile-acid problems, hormone-producing tumors, or inflammation.

Section

A defined part or subdivision of an organ, document, study, or procedure; in anatomy and imaging, the term identifies a specific slice or region examined.

Sedation

The use of medicines to make a person relaxed, drowsy, or less aware during a procedure while maintaining appropriate monitoring and breathing.

Sedation Dentistry

The use of medicine during dental care to reduce fear, discomfort, or awareness. It may involve inhaled gas, tablets, or medicines through a vein; deeper sedation can affect breathing and requires trained staff and continuous monitoring.

Sedation Levels

The depth of medicine-induced drowsiness, ranging from minimal relaxation with normal responses to deep sedation with limited response and possible breathing or airway support. Sedation can deepen unexpectedly, so appropriate monitoring is required.

Sedative

A chemical agent or medication that depresses the central nervous system to reduce excitement, irritability, or anxiety, producing a calming, tranquilizing effect (anxiolysis) at lower doses and drowsiness or sleep induction (hypnosis) at higher doses. Major pharmacologic classes include benzodiazepines, non-benzodiazepine receptor agonists (Z-drugs), barbiturates, and central alpha-2 agonists; risks include cognitive and motor impairment, respiratory depression, physiological tolerance, dependence, and life-threatening withdrawal upon abrupt discontinuation.

Alternate Names:
Sedatives; Sedative-Hypnotic; Sedative-Hypnotics

Sedative-Hypnotic

A medicine or substance that slows brain activity to reduce anxiety or cause sleep. Examples include benzodiazepines, barbiturates, and some sleep medicines. Too much can cause confusion, coma, or dangerously slow breathing, especially with alcohol or opioids.

Sedative, Hypnotic, or Anxiolytic Use Disorder

A pattern of problematic use of sedative, hypnotic, or anxiolytic medicines causing impairment, distress, tolerance, withdrawal, or inability to control use.

Sedative-Hypnotic Toxidrome

A pattern of poisoning caused by substances that slow brain activity. It may cause extreme sleepiness, slurred speech, poor coordination, slow breathing, coma, or loss of airway protection, especially when combined with alcohol or opioids.

Sedatives

Plural form; see *Sedative*.

Sedimentation Rate

The erythrocyte sedimentation rate, a nonspecific blood test measuring how quickly red cells settle in a tube and sometimes supporting assessment of inflammation when interpreted with other findings.

Sed Rate

A blood test measuring how quickly red blood cells

settle, used as a nonspecific marker of inflammation.

Alternate Names:
Erythrocyte Sedimentation Rate; ESR

Segmental Innervation

The organization of nerve supply according to spinal cord segments. Each segment contributes to characteristic dermatomes, myotomes, and reflexes, so changes in sensation, strength, or reflexes can help localize a neurologic lesion.

Segmental Pressures

Blood-pressure readings taken at several points on the arms and legs to compare circulation. A large difference between levels can help locate a narrowed or blocked artery in peripheral artery disease.

Segmentation

Repeated squeezing of short sections of the intestine that mixes food with digestive fluids and brings it against the intestinal lining for absorption. Unlike peristalsis, it mainly mixes contents rather than pushing them forward.

Segmentectomy

Surgery removing one or more defined sections of a lung rather than an entire lobe. It may treat a small, localized lung cancer or another focal problem while preserving more lung tissue; bleeding, air leakage, infection, and reduced breathing capacity are possible.

Alternate Names:
Anatomical Segmentectomy; Pulmonary Segmentectomy

SEID

Alternate name; see *Myalgic Encephalomyelitis/Chronic Fatigue Syndrome*.

Seidel Test

An eye examination using fluorescein dye to look for leaking fluid from a full-thickness injury to the cornea or eye wall. Streaming or dilution of the dye suggests a leak, but a negative test does not rule out a serious eye injury.

Alternate Names:
Seidel's Test; Aqueous Humor Leakage Test

Seizure

A transient episode of signs or symptoms caused by abnormal excessive or synchronous electrical activity in the brain. It may affect movement, sensation, awareness, behavior, or autonomic function; some seizures cause convulsions, while others do not. Seizures may be provoked by illness or injury or occur in epilepsy; one seizure alone does not establish epilepsy.

Alternate Names:
Seizures

Seizure Disorder

A chronic neurologic condition characterized by an enduring predisposition to generate recurrent unprovoked epileptic seizures, encompassing epilepsy and its associated neurobiological, cognitive, and psychosocial consequences. Seizures are classified by onset into focal, generalized, and unknown onset; clinical evaluation involves electroencephalography (EEG) and brain MRI to identify epileptogenic foci, structural lesions, or genetic channelopathies. Management utilizes targeted anti-seizure medications, ketogenic diet, vagus nerve stimulation, or epilepsy resective surgery.

Alternate Names:
Seizure Disorders; Epilepsy

Seizure Disorders

Plural form; see *Seizure Disorder*.

Seizure Disorders in Pregnancy

Epilepsy and new-onset seizures during pregnancy. Causes include pre-existing epilepsy, metabolic problems, medicine effects, and eclampsia; antiseizure medicines can affect fetal development, while uncontrolled seizures can harm the pregnant person and fetus.

Selective Antibody Deficiency With Normal Immunoglobulins

An immune problem in which the total amount of antibodies is normal but the body does not make

enough protective antibodies against some germs after vaccination. Repeated ear, sinus, or chest infections may occur.

Selective Deficiency Of IgA

A usually inherited immune problem in which the antibody IgA is very low or absent while other antibodies are near normal. Some people have repeated sinus, chest, or bowel infections, allergies, or autoimmune disease; others have no symptoms.

Selective Estrogen Receptor Modulator

A class of medications that interact with the body's estrogen receptors in a targeted, tissue-specific manner, behaving like estrogen in some body tissues while blocking estrogen's effects in others. For example, some SERMs block estrogen in breast tissue to help prevent or treat hormone-sensitive breast cancers, while acting like estrogen in bone tissue to help protect bone strength and prevent osteoporosis.

Alternate Names:
Selective Estrogen Receptor Modulators; SERM; SERMs

Selective Estrogen Receptor Modulators

Plural form; see *Selective Estrogen Receptor Modulator*.

Selective IgA Deficiency

An immune condition with very low or absent immunoglobulin A, an antibody protecting mucus-lined surfaces. Some people have repeated respiratory or intestinal infections, allergies, autoimmune disease, or no symptoms.

Selective Mutism

A childhood anxiety disorder in which a person speaks comfortably in some settings but repeatedly cannot speak in others, such as school or unfamiliar social situations. It lasts at least one month and can interfere with learning, relationships, or daily life.

Selective Serotonin Reuptake Inhibitors

Antidepressants that increase serotonin signaling by slowing its reabsorption by nerve cells. They treat depression and several anxiety disorders, but effects take time and may include nausea, sexual problems, sleep changes, or withdrawal symptoms.

Alternate Names:
SSRIs

Selective Serotonin-Reuptake Inhibitors

Antidepressants that increase the availability of serotonin, a chemical used for communication between nerve cells. They treat depression and anxiety disorders; nausea, sleep changes, sexual problems, and withdrawal symptoms can occur.

Selective Serotonin Reuptake Inhibitor (SSRI)

Alternate name; see *Selective Serotonin Reuptake Inhibitors*.

Selective Serotonin Reuptake Inhibitor Toxicity

Harm from taking too much of a selective serotonin reuptake inhibitor or combining it with interacting substances. Effects may include nausea, tremor, drowsiness, or agitation; severe cases can cause serotonin syndrome, seizures, abnormal heart rhythms, or death.

Selective Tubal Occlusion Procedure

Selective tubal occlusion blocks a fallopian tube to prevent sperm and egg from meeting and is a permanent contraceptive procedure.

Selegiline

A medicine that blocks monoamine oxidase B, used for Parkinson disease and sometimes depression; interactions require caution.

Selenium

A mineral needed for antioxidant enzymes, thyroid function, reproduction, and immune activity. Deficiency is uncommon in many regions, while excessive supplements can cause hair or nail changes, stomach upset, nerve problems, or toxicity.

Selenium-75

A radioactive form of selenium used mainly as a calibration or testing source in imaging and measurement equipment. It releases radiation as it decays and has a half-life of about 120 days.

Selenium Deficiency

Low levels of selenium, a trace element needed for antioxidant enzymes and thyroid hormone activity. It is uncommon in most regions and usually subclinical, but severe deficiency contributes to Keshan disease, affecting heart muscle, and Kashin-Beck disease in selenium-poor areas. Assessment and replacement are guided by clinical and laboratory findings.

Selenium In Diet

Selenium is a trace mineral needed for antioxidant enzymes, thyroid hormone metabolism, and reproduction. Excess intake, especially from supplements, can cause toxicity.

Selenium Sulphide

A skin-applied medicine that reduces certain fungi and excess scaling. It is used for dandruff and seborrheic dermatitis and may cause irritation, dryness, discoloration, or an unpleasant smell if misused.

Self-Diagnosing Body Dysmorphic Disorder

Alternate name; see *Body Dysmorphic Disorder*.

Self-Diagnosis

Identification of a health problem by a person without formal clinical assessment. It may be inaccurate because symptoms can have multiple causes.

Self-Efficacy

A person's confidence in their ability to manage a health condition, follow a treatment plan, and handle symptoms. It can influence participation in care and health outcomes.

Self-Harm

Intentional self-injury or self-poisoning, regardless of whether the person intends to die. It includes acts such as cutting, burning, hitting oneself, or taking an overdose; suicidal intent should be described separately when known.

Self Harming

Alternate name; see *Self-Injury/Cutting*.

Self-Help Group

A peer group in which members support one another while changing a harmful behavior or coping with a problem.

Alternate Names:
Support Group; Peer Support Group

Self-Injury/Cutting

Deliberate injury to one's own body, often used to cope with overwhelming emotions and requiring compassionate assessment of safety and mental health.

Alternate Names:
Nonsuicidal Self-Injury; NSSI

Self-Management

Actions a person takes to monitor and manage a health condition, including treatment use, symptom monitoring, and lifestyle measures.

Self-Poisoning

Intentional ingestion or exposure to a potentially harmful substance, which may be associated with suicidal intent and can cause poisoning or injury.

Self-Retaining Retraction

Holding tissue away from an operative field with a retractor that remains in position without continuous manual support.

Alternate Names:
Self-Retaining Retraction; Mechanical Retraction

Self-Testing For COVID-19

Testing a sample collected at home, usually from the nose, to check for COVID-19 infection. A negative result does not always rule out infection, especially early in illness.

Sella Turcica

A saddle-shaped hollow in a bone at the base of the skull that holds the pituitary gland. The pituitary controls many hormones, so changes in this area can affect growth, reproduction, metabolism, and the body's response to stress.

Semaglutide

Semaglutide is a glucagon-like peptide-1 receptor agonist used for selected patients with type 2 diabetes or chronic weight management. It slows gastric emptying and reduces appetite and glucose levels; nausea, gallbladder disease, pancreatitis risk, and contraindications require review.

Semen

The fluid released during ejaculation, containing sperm from the testes mixed with fluids from the seminal vesicles, prostate, and other glands. It carries and supports sperm; changes in amount, color, or the presence of blood or pain may reflect reproductive or urinary conditions.

Semen Analysis

A laboratory examination measuring semen volume and sperm number, movement, shape, and vitality. It is a common first test when assessing fertility; results vary, so an abnormal result is often repeated and interpreted with the couple's history.

Semen DNA Analysis

A test that examines genetic material inside sperm, usually for selected infertility or repeated-pregnancy-loss evaluations. It may detect increased DNA damage, but its usefulness and treatment implications depend on the clinical situation.

Semicircular Canals

Three curved, fluid-filled tubes in each inner ear that sense head rotation and help maintain balance. Problems affecting them can cause spinning dizziness, nausea, or difficulty keeping the eyes steady when the head moves.

Semi-Fowler Position

A bed position in which a person lies on the back with the head of the bed raised, often about 30 to 45 degrees from horizontal. It is less upright than Fowler position. The angle ranges can overlap at about 45 degrees.

Semilunar Cartilages

The two crescent-shaped pads of tough cartilage inside the knee, commonly called the menisci. They cushion the joint, spread weight, and improve stability; a tear can cause pain, swelling, catching, or locking.

Semilunar Valves

The aortic and pulmonary valves, which open during ventricular contraction and close during ventricular relaxation to prevent backflow into the ventricles.

Seminal Fluid Analysis

A laboratory test of semen that measures the amount of fluid and the number, movement, and shape of sperm. It helps assess fertility and may check whether sperm remain after a vasectomy.

Alternate Names:
Semen Analysis; Spermiogram

Seminal Vesicle

One of a pair of convoluted, tubular glands situated posterior to the urinary bladder and lateral to the ampullae of the ductus deferens in males. The seminal vesicles synthesize and secrete a thick, alkaline fluid that constitutes approximately 65–75% of total ejaculate volume, enriched with fructose (serving as an energy source for sperm motility), prostaglandins (stimulating uterine contractions), semenogelin (coagulating seminal fluid), and vitamin C. The excretory duct merges with the vas deferens to form the ejaculatory duct emptying into the prostatic urethra.

Alternate Names:
Seminal Vesicles; Vesicula Seminalis

Seminal Vesicles

Plural form; see *Seminal Vesicle*.

Seminiferous Tubules

Tiny, coiled tubes inside the testes where sperm are made. Supporting cells nourish developing sperm and help create the environment needed for sperm production.

Seminoma

A cancerous tumor arising from sperm-forming cells in the testis. It often grows slowly and is highly treatable with surgery, radiation, chemotherapy, or careful monitoring depending on its stage.

Semont Maneuver

A rapid, side-to-side liberatory repositioning maneuver used in the clinical management of posterior semicircular canal benign paroxysmal positional vertigo (BPPV), designed to dislodge cupulolithiasis or canalithiasis debris into the utricle.

Alternate Names:
Semont Liberatory Maneuver; Liberatory Maneuver for BPPV

Senescence

Changes and gradual loss of function associated with aging. In cells, senescence is a lasting state in which a cell stops dividing but remains active; an accumulation of such cells may contribute to aging and disease.

Alternate Names:
Biological aging

Senile Lentigines

Flat, sharply defined brown or tan spots caused by chronic ultraviolet exposure, commonly appearing on sun-exposed skin with age.

Senile Purpura

Alternate name; see *Actinic Purpura*.

Senna

A plant-derived stimulant laxative containing sennosides, used short term for constipation and sometimes to empty the bowel before a procedure. It increases intestinal activity and may cause abdominal cramps or diarrhea; prolonged or excessive use can cause dependence or fluid and electrolyte disturbances.

Sensate Focus Techniques

Structured, gradual touch exercises used in sex therapy to reduce performance pressure, improve body awareness, and rebuild comfortable intimacy. Partners agree on boundaries and initially avoid goals such as intercourse or orgasm.

Alternate Names:
Sensate Focus; Masters and Johnson Therapy

Sensation

Awareness of changes such as touch, pain, temperature, sound, movement, or body position. Special nerve endings detect these changes and send messages to the brain, where they are experienced and interpreted.

Sense

A sense is a capacity to detect and interpret stimuli such as touch, temperature, pain, sound, light, smell, taste, position, or internal body signals.

Sensitisation

A process in which repeated exposure makes the body's immune, nerve, or behavioral response stronger or easier to trigger. Sensitization can contribute to allergy, chronic pain, and some learned responses.

Sensitivity

In testing, the proportion of people who truly have a condition and receive a positive result. In other settings, it means how strongly a person, cell, or instrument responds to a stimulus.

Sensitivity Analysis

Sensitivity analysis tests how much a study's conclusion changes when assumptions, measurements, or input values are varied.

Sensitized

Having antibodies against human-cell markers called HLA. This can happen after pregnancy, transfusion,

or transplantation and may make it harder to find a suitable organ donor or increase the risk of transplant rejection.

Sensorimotor Polyneuropathy

Damage to many nerves causing both altered sensation and weakness, usually starting in the feet or hands. Numbness, burning pain, poor balance, reduced reflexes, and muscle wasting may occur; diabetes is one possible cause.

Sensorineural Deafness

Sensorineural deafness is hearing loss from dysfunction of the inner ear, auditory nerve, or central pathways rather than blockage of sound conduction.

Sensorineural Hearing Loss

Hearing loss caused by damage to the inner ear or the nerve that carries sound to the brain. It can make speech hard to understand, especially in noisy places, and may result from aging, loud noise, infection, inherited conditions, or medicines.

Sensorium

A person's level of consciousness, awareness, attention, and understanding of surroundings. Changes may include confusion, drowsiness, agitation, disorientation, or reduced responsiveness and can signal illness, medicines, intoxication, or brain injury.

Sensory

Relating to sensation or to nerves and pathways that carry information such as touch, pain, temperature, position, hearing, or vision to the brain.

Sensory Cortex

Areas of the brain that receive and interpret information about touch, pain, temperature, pressure, and body position. Damage can cause numbness, altered sensation, or difficulty recognizing where a body part is.

Sensory Deprivation

A major reduction in normal input from sight, sound, touch, movement, or other senses. Prolonged deprivation can affect mood, thinking, sleep, orientation, and perception, especially in isolated or vulnerable people.

Sensory Level

A clear line on the body below which feeling is reduced or changed. It can suggest a spinal-cord problem, especially when accompanied by weakness, altered reflexes, or bladder and bowel problems.

Sensory Nerves

Nerves that carry information such as touch, pain, temperature, and position from the body to the spinal cord and brain. Damage may cause numbness, tingling, burning pain, or reduced awareness of injury.

Sensory Neuron

A nerve cell that carries information from receptors toward the brain and spinal cord. It helps detect touch, pain, temperature, pressure, body position, sound, light, smell, and taste.

Sensory Processing Disorder

Difficulty noticing, interpreting, or responding to sound, touch, movement, light, or body position. It may affect behavior, learning, coordination, or daily activities and can occur with other developmental conditions; assessment and support are individualized.

Sensory Receptors

Specialized cells or nerve endings that detect stimuli such as touch, temperature, pain, light, sound, or chemical changes.

Sentinel Event

An unexpected healthcare event that causes death or serious physical or psychological harm, or creates a major risk of such harm. It is associated with formal review and system-level safety changes.

Sentinel Injury

An unexpected injury in an infant who cannot yet

move independently, such as bruising, a mouth injury, or a fracture. It may be an early sign of inflicted injury or other serious harm.

Sentinel Loop

A localized, persistently gas-filled, dilated segment of small intestine visible on plain abdominal radiographs, reflecting focal paralytic ileus produced by adjacent acute intraperitoneal inflammation (most commonly acute pancreatitis or acute appendicitis).

Alternate Names:
Sentinel Loop Sign; Localized Adynamic Ileus

Sentinel Lymph Node

The first lymph node or group of nodes most likely to receive fluid draining from a tumor. Removing and examining them can show whether cancer has begun to spread and help determine its stage.

Sentinel Lymph-Node Biopsy

Surgical removal and pathologic examination of the first draining lymph node or nodes from a primary tumor. It is used for selected melanomas, breast cancers, and other tumors to assess regional metastatic risk and guide staging.

Sentinel Lymph Node Biopsy For Melanoma

Sentinel lymph-node biopsy identifies and removes the first draining lymph node or nodes from a melanoma site to detect microscopic spread. The result helps stage disease and guide further treatment; it does not remove all regional nodes routinely.

Sentinel Node

A sentinel node is the first lymph node or group of nodes to which cancer cells are most likely to spread from a primary tumor. A sentinel lymph-node biopsy helps assess spread.

Sentinel Node Biopsy

Alternate name; see *Sentinel Lymph-Node Biopsy*.

Sentinel Surveillance

Ongoing collection of health information from selected clinics, laboratories, or communities to track disease trends. It can provide early warning of outbreaks but does not count every case in the population.

Separated Cranial Sutures

Separated cranial sutures in an infant can reflect normal growth or increased intracranial pressure, hydrocephalus, prematurity, or other illness and require clinical assessment.

Separation Anxiety

Separation anxiety is developmentally excessive fear or distress when apart from an attachment figure, causing avoidance, physical complaints, sleep problems, or impairment. Treatment may include gradual exposure, family-based support, cognitive behavioral therapy, and selected medication.

Separation Anxiety Disorder

Excessive and persistent fear about being apart from a parent, partner, or other attachment figure. It may cause repeated reassurance-seeking, refusal to leave home, nightmares, physical symptoms, or difficulty attending school or work.

Separation Anxiety In Children

Developmentally excessive distress when separated from an attachment figure, with worry, refusal, physical symptoms, nightmares, or school avoidance that impairs daily life.

Separation Of The Iris

A tear that pulls the colored part of the eye away from its normal attachment, usually after a blunt injury. It may cause double vision, glare, an irregular pupil, bleeding, or increased eye pressure and needs eye-specialist assessment.

Sepsis

A life-threatening medical emergency caused by the body's overwhelming and toxic response to an infection. Instead of remaining localized to fight off the invading bacteria, viruses, or fungi, the immune system releases immune chemicals into the bloodstream that trigger widespread inflammation. This

systemic response damages healthy blood vessels and organs, leading to dangerously low blood pressure, poor blood circulation, and progressive failure of vital organs such as the kidneys, lungs, and heart.

Alternate Names:
Systemic Inflammatory Response to Infection; Blood Poisoning

Sepsis Syndrome

An older, nonspecific term for a severe response to infection. Current medical usage favors *sepsis* when infection causes life-threatening organ dysfunction and *septic shock* when circulatory and metabolic abnormalities persist despite fluid treatment.

Septal Defect

An abnormal opening in the septum between the heart's chambers that permits blood to pass between the right and left sides of the heart.

Septal Hematoma

A collection of blood inside the wall dividing the two sides of the nose, usually after an injury. It causes blockage and painful swelling and can destroy cartilage and deform the nose if untreated.

Septate Uterus

A congenital difference in which a band of tissue partly or completely divides the inside of the uterus. Many people have no symptoms, but it can increase miscarriage or some pregnancy risks; imaging confirms it, and selected cases are treated by removing the dividing tissue.

Alternate Names:
Uterine Septum

Septic

Relating to a serious infection or to harmful germs in a normally sterile body site. For example, septic arthritis is an infected joint, while septic shock is life-threatening organ and circulation failure caused by an overwhelming infection.

Septic Abortion

A miscarriage or induced pregnancy loss complicated by infection of the uterus or surrounding tissues. Fever, chills, worsening abdominal pain, foul discharge, fast heartbeat, or faintness may occur; it is an emergency requiring antibiotics, supportive care, and removal of infected retained tissue when necessary.

Alternate Names:
Infected Abortion

Septicaemia

Older term; see *Bacteremia* or *Sepsis*, depending on the clinical findings.

Septic Arthritis

Infection of a joint, usually bacterial, causing acute pain, swelling, restricted movement, and systemic illness.

Alternate Names:
Pyogenic Arthritis; Bacterial Arthritis

Septic Embolism

A piece of infected material travels through the bloodstream and blocks a smaller blood vessel, spreading infection to another organ. It often starts with an infected heart valve and can cause abscesses or tissue damage.

Septicemia

Older term; see *Bacteremia* or *Sepsis*, depending on the clinical findings.

Septic Pulmonary Infarction

Death of part of the lung after infected clots or other infected material block small lung arteries. It may cause fever, chest pain worse with breathing, cough, coughing blood, and lung abscesses.

Septic Shock

The most severe and life-threatening stage of sepsis, occurring when an overwhelming bodily response to infection causes a catastrophic drop in blood pressure that cannot be restored with intravenous fluids alone. The profound failure of the circulatory system deprives vital organs of oxygen and blood flow, resulting in severe tissue damage, multi-organ

failure, and a very high risk of death.

Septic Shock Criteria

Clinical diagnostic criteria defined by consensus Sepsis-3 guidelines: persistent sepsis-induced hypotension requiring vasopressor therapy to maintain a mean arterial pressure of at least 65 mmHg, accompanied by a serum lactate level exceeding 2 mmol/L despite adequate fluid resuscitation.

Septic Thrombophlebitis

Infected thrombosis within a vein, causing local inflammation and possible bloodstream infection or septic emboli. It may complicate intravenous devices, pelvic infection, skin infection, or deep soft-tissue infection.

Septo-Optic Dysplasia

A condition present from birth involving underdevelopment of one or both optic nerves, parts of the brain's midline, and sometimes the pituitary gland. It may cause poor vision, involuntary eye movements, seizures, developmental differences, or hormone deficiencies.

Septoplasty

Septoplasty is surgery to straighten or reshape the nasal septum to improve airflow or address structural obstruction.

Septum

A wall or partition separating two spaces or tissues, such as the nasal septum or the septum between heart chambers.

Severe Sepsis

Older term from pre-2016 definitions for SIRS caused by suspected or documented infection, with organ dysfunction, poor tissue blood flow, or low blood pressure. The current Sepsis-3 definition includes life-threatening infection-related organ dysfunction under *Sepsis*, so it considers "severe sepsis" redundant.

Sequela

A lasting consequence or condition that remains after an earlier disease, injury, infection, or treatment has ended, such as paralysis after stroke or scarring after infection.

Sequelae

Lasting effects or complications that remain after an illness or injury. Examples include weakness after a stroke, breathing problems after severe infection, or pain after an injury; sequelae may be physical, mental, emotional, or social.

Sequential Therapy

Treatment in which different medicines or interventions are given one after another rather than at the same time. The sequence may improve safety, effectiveness, or tolerance.

Sequester

To sequester means to isolate or set apart; in medicine, sequestered tissue or material is separated from its normal circulation or surroundings.

Sequestrum

A piece of dead bone that has separated from healthy bone, usually because of a long-lasting bone infection. It can prevent healing, cause drainage or pain, and may need surgery after infection is treated.

Ser

Ser is the standard abbreviation for serine, an amino acid incorporated into proteins and involved in metabolism and cell signaling.

Serine

Serine is a nonessential amino acid used in protein synthesis, one-carbon metabolism, membrane formation, and signaling.

Serious Adverse Event

An unwanted medical event that results in death, is life-threatening, requires or prolongs hospitalization, causes major disability, or causes a birth defect. It may occur during treatment without being caused

by the treatment.

Serious Health Problems Symptoms

Critical clinical signs and red-flag symptoms signaling potentially life-threatening or emergent medical disorders requiring urgent medical evaluation. Examples include sudden severe (thunderclap) headache, acute unilateral weakness or facial droop, crushing retrosternal chest pain, acute respiratory distress, hemoptysis, hematemesis, high fever accompanied by nuchal rigidity, and sudden loss of consciousness.

Alternate Names:
Red Flag Symptoms; Emergency Warning Signs

SERMs

Selective estrogen receptor modulators that have estrogen-like effects in some tissues and blocking effects in others.

Alternate Names:
Selective Estrogen Receptor Modulators

Seroconversion

Development of detectable antibodies in blood after infection, vaccination, or another immune-triggering event, showing a changed immune status.

Serodiagnostic

Relating to diagnosis using antibodies, antigens, or other markers measured in blood serum. These tests can show infection, immunity, inflammation, or other conditions; results vary with timing and clinical context.

Serologic Test

A blood test that detects antibodies, antigens, or other immune markers to help diagnose infection, assess immunity, or monitor response to treatment.

Serology

The laboratory evaluation of serum for antibodies, antigens, or other immune markers. Results may indicate current infection, previous exposure, vaccination, autoimmune reactivity, or passive antibody transfer and must be interpreted with timing and clinical context.

Serology For Brucellosis

Blood testing for antibodies to Brucella species, interpreted with exposure history and symptoms because cross-reactions and early false-negative results can occur.

Seroma

A pocket of clear body fluid that forms near a surgical incision or injured tissue. It may cause swelling, pressure, or discomfort and often resolves, though large or painful collections may need drainage.

Seronegative Arthritis

Inflammatory arthritis in which common blood tests for rheumatoid factor and anti-CCP antibodies are negative. It includes several diseases with different patterns, such as spine, skin, bowel, or eye involvement, so symptoms and examination guide diagnosis.

Serosanguineous

Containing both serous fluid and a small amount of blood. It often describes thin wound drainage that looks pink or light red, though the color can vary with the amount of blood. It differs from sanguineous drainage, which consists mainly of fresh blood.

Serositis

Inflammation of the smooth lining around the lungs, heart, or abdominal organs. It can cause sharp pain that worsens with breathing or movement and may cause fluid to collect around the affected organ.

Serotonin

A chemical messenger used by nerve cells and other tissues. It helps regulate mood, sleep, appetite, bowel function, and pain; too much activity from medicines can cause serotonin syndrome.

Alternate Names:
5-Hydroxytryptamine; 5-HT

Serotonin Blood Test

A blood test measuring serotonin, used selectively in evaluating suspected serotonin-producing neuroendocrine tumors; many medicines and specimen factors affect results.

Serotonin-Norepinephrine Reuptake Inhibitors

Antidepressants that increase the activity of serotonin and norepinephrine, chemical messengers between nerve cells. They treat depression, some anxiety disorders, and certain nerve or long-lasting pain conditions; nausea, sweating, sleep changes, and withdrawal symptoms can occur.

Serotonin Syndrome

A potentially life-threatening reaction to medicines or drugs that raise serotonin activity. It can occur after combining serotonergic medicines, increasing a dose, or taking too much; it often begins within hours. Symptoms may include restlessness or confusion, sweating, fever, diarrhea, a fast heartbeat, changing blood pressure, tremor, overactive reflexes, or repeated muscle jerks. Severe cases can cause seizures or organ damage.

Serotype

A subgroup within a microorganism species, distinguished by differences in surface antigens detected through antibody-based tests. Different serotypes may differ in their ability to cause disease or in which vaccines protect against them.

Serous

Describes a thin, watery fluid that is usually clear or pale yellow. A small amount normally lubricates the pleural, pericardial, and peritoneal cavities; similar fluid may drain from a wound or collect in a blister.

Serous Borderline Ovarian Tumor

A low-malignant-potential ovarian tumor whose cells show abnormal growth but lack destructive invasion into supporting tissue. It may remain in the ovary or involve nearby surfaces; treatment and follow-up depend on its extent and microscopic features.

Serous Cystadenoma of Pancreas

Alternate name; see *Pancreatic Cysts*.

Serous Fluid Cytology

Examination of cells in fluid collected from around the lungs, heart, or abdominal organs. It can look for cancer cells, infection, or inflammation; additional tests may be needed when the result is unclear.

Serous Membrane

A thin mesothelial membrane that lines the closed internal cavities of the body (the pleural cavities, pericardial cavity, and peritoneal cavity) and reflects over the contained visceral organs. Composed of a single layer of simple squamous mesothelial cells supported by a thin layer of loose connective tissue, it continuously secretes a small amount of lubricative, protein-poor serous fluid that minimizes friction between opposing parietal and visceral surfaces during organ motion (respiration, cardiac contraction, peristalsis).

Alternate Names:
Serous Membranes; Serosa

Serous Membranes

Plural form; see *Serous Membrane*.

Serous Tubal Intraepithelial Carcinoma

An early, noninvasive cancerous change in cells at the end of a fallopian tube near the ovary. It is thought to be the starting point for many high-grade cancers of the ovary, tube, or abdominal lining.

Serpentine Supravenous Hyperpigmentation

A pattern of dark, wavy skin discoloration that follows the paths of surface veins, usually on the upper chest or neck. It can occur with vein inflammation, poor blood flow, some medicines, or cancer.

Serrated Pathway

One route by which some colon cancers develop from flat or saw-toothed polyps. These polyps may be easy to miss during colonoscopy and can acquire

cell changes that increase cancer risk, so removal and follow-up are important.

Serrated Polyposis Syndrome

A disorder characterized by multiple serrated lesions or polyps in the colon and an increased risk of colorectal cancer, requiring colonoscopic surveillance and removal of significant lesions.

Serration

A row of small tooth-like projections or notches along an edge, used to describe anatomy, cells, instruments, or imaging appearances.

Serratus Anterior Muscle

A muscle along the side of the chest that holds the shoulder blade against the ribs and helps raise the arm. Injury to its nerve can make the shoulder blade stick out and weaken pushing or overhead movements.

Sertoli Cell

An elongated, somatic "nurse" cell located within the seminiferous tubules of the testes that provides physical, nutritional, and biochemical support for developing spermatogenic cells throughout spermatogenesis. Regulated by follicle-stimulating hormone (FSH) and testosterone, Sertoli cells form tight junctions with adjacent Sertoli cells to establish the blood-testis barrier (isolating haploid germ cells from systemic immune surveillance), phagocytose residual spermatid cytoplasm, and secrete androgen-binding protein (ABP), inhibin B, and anti-Müllerian hormone (AMH) during male embryogenesis.

Alternate Names:
Sertoli Cells; Sustentacular Cell

Sertoli Cells

Plural form; see *Sertoli Cell*.

Sertoli-Cell Tumor

A tumor arising from Sertoli cells, which support sperm development in the testicle. It is often benign but may produce estrogen or other hormones and cause breast enlargement, infertility, or a testicular mass.

Sertoli-Leydig Cell Tumor

A rare ovarian tumor that may produce male hormones, causing increased facial hair, acne, a deeper voice, or irregular periods. Treatment depends on the tumor's stage and features.

Sertoli-Leydig Tumor

Alternate form; see *Sertoli-Leydig Cell Tumor*.

Serum

The clear liquid left after blood has clotted. It contains water, salts, hormones, antibodies, nutrients, and waste products but lacks fibrinogen and most clotting proteins, making it useful for laboratory tests.

Serum Albumin Test

A blood test that measures albumin, a protein made mainly by the liver. A low result can occur with inflammation, liver disease, kidney or intestinal protein loss, or fluid shifts; it is not a stand-alone measure of nutritional status.

Alternate Names:
Serum Albumin Test; Blood Albumin Test; Albumin Level; Serum Albumin Assay

Serum Chloride Test

A clinical laboratory measurement of chloride (Cl^-) concentration in serum or plasma, essential for calculating the serum anion gap and evaluating acid-base balance, hydration status, and renal tubular function.

Alternate Names:
Serum Chloride; Blood Chloride Test; Serum Electrolytes Chloride

Serum Electrolyte Test

A blood test panel that measures the primary circulating electrolytes—sodium, potassium, chloride, and bicarbonate; see *Electrolyte Panel*.

Serum Concentration

The amount of a substance measured in the liquid

part of clotted blood. Results may reflect when the sample was taken, how the substance is absorbed and removed, and whether the level is expected to help or harm.

Serum Free Hemoglobin Test

A blood test measuring hemoglobin not contained within red cells, used to support evaluation of intravascular hemolysis, transfusion reactions, or mechanical red-cell destruction.

Serum Glutamic Oxaloacetic Transaminase

SGOT, now called AST, is an enzyme released by injured liver, heart, skeletal muscle, or other cells; an elevated level is not specific to liver injury.

Serum Glutamic Pyruvic Transaminase

SGPT, now called ALT, is an enzyme concentrated in liver cells and commonly measured as a marker of hepatocellular injury.

Serum Herpes Simplex Antibodies

A blood test that detects type-specific IgG antibodies to herpes simplex virus types 1 or 2. HSV-1 antibodies do not show whether infection is oral or genital; HSV-2 antibodies usually indicate anogenital infection. IgM testing is not clinically useful, and blood tests do not confirm that a current lesion is caused by herpes.

Serum Iron Test

A blood test measuring circulating iron bound mainly to transferrin; it is interpreted with ferritin, transferrin saturation, and blood counts rather than used alone to diagnose iron deficiency.

Serum Osmolal Gap

The difference between the measured concentration of dissolved particles in blood and the calculated value. A high gap may suggest an unmeasured substance, including a toxic alcohol, but other illnesses and laboratory factors can also affect it.

Serum Osmolality Test

A laboratory test measuring the total concentration of dissolved solute particles per kilogram of blood serum; see *Osmolality Blood Test*.

Serum Phenylalanine Screening

A blood test measuring phenylalanine, used in newborn screening and follow-up of phenylketonuria or other disorders of phenylalanine metabolism.

Serum Progesterone

A blood test measuring progesterone, a hormone made mainly after ovulation and during pregnancy. The result can help assess ovulation, ovarian function, fertility treatment, or early pregnancy, but interpretation depends strongly on timing and pregnancy status.

Serum Protein Electrophoresis

A blood test that separates proteins in serum into groups. It can show abnormal antibody production or low protein levels and is often followed by immunofixation when a plasma-cell disorder is suspected.

Serum Sickness

A delayed immune reaction, usually one to three weeks after exposure to certain medicines, injected proteins, or antiserum. It can cause fever, rash or hives, painful swollen joints, enlarged lymph nodes, and sometimes organ problems.

Serum Therapy

Prevention or treatment using antibody-containing plasma, immunoglobulin, antitoxin, or antivenom. It provides immediate but usually temporary protection against a specific infection or toxin; allergic reactions and other infusion-related problems are possible.

Serum Uric Acid

A blood test measuring uric acid, a purine-breakdown product. The result helps assess gout, kidney stones, kidney function, or effects of some cancer treatments.

Serum Uric Acid Test

A blood test measuring the concentration of uric acid, the final breakdown product of purine metabolism, used in the diagnosis of gout and hyperuricemia; see *Serum Uric Acid*.

Serving Size

Serving size is the standardized amount used to describe the nutrients or calories in food and may differ from the amount a person actually eats.

Sesamoid Bones

Small bones embedded within or beside tendons, where they protect the tendon and improve leverage. Examples include the kneecap and the small bones beneath the big toe.

Sesamoiditis

Painful inflammation of tissues around a sesamoid bone, most often beneath the big toe. Pain usually worsens with walking, running, dancing, or pressure on the front of the foot.

Sesquipedalian

Sesquipedalian means characterized by very long words; clear healthcare communication favors language that patients can understand.

Sessile

Attached directly by a broad base rather than a narrow stalk. A sessile polyp can be harder to remove completely, and its broad shape may conceal abnormal tissue.

Set

In exercise, a group of consecutive repetitions performed before a rest period. In medicine, "set" can also mean a prepared group of instruments, tests, or equipment.

Sever Disease

A painful irritation of the growth area at the back of the heel in growing children, often during sports. Heel pain worsens with running or jumping and usually improves with activity adjustment, heel support, calf stretching, and time.

Severe Acute Respiratory Syndrome

A serious contagious respiratory illness caused by the SARS-associated coronavirus, SARS-CoV. It usually begins with fever and may cause chills, muscle aches, headache, diarrhea, dry cough, and breathing difficulty. Most affected people develop pneumonia, which can progress to low blood oxygen, respiratory failure, and death. The name usually refers to the disease identified in the 2002–2004 outbreak; SARS-CoV-2 causes COVID-19, a different disease.

Severe Brain Injury Coma

Alternate name; see *Coma*.

Severe Combined Immunodeficiency

A group of inherited conditions in which important immune cells do not develop or work properly. Affected babies can develop severe, repeated infections early in life; treatment may include immune-restoring therapies such as stem-cell transplantation or gene therapy.

Severe Combined Immunodeficiency (SCID)

Alternate name; see *Severe Combined Immunodeficiency*.

Severe Dengue

Dengue with severe leakage of fluid from blood vessels causing shock or breathing difficulty, severe bleeding, or serious organ damage such as liver, brain, or heart injury. It can become life-threatening.

Alternate Names:
Severe Dengue Virus Infection; Critical Dengue

Severe Falciparum Malaria

Severe malaria caused by Plasmodium falciparum. It may involve cerebral malaria, severe anemia, hypoglycemia, metabolic acidosis, kidney injury, respiratory distress, shock, or multiple-organ dysfunction.

Severe Hearing Loss

Hearing loss that substantially limits access to speech or environmental sound. It may be conductive, sensorineural, or mixed and may require hearing aids, cochlear implantation, communication support, or treatment of an underlying cause.

Severe Obesity

Obesity with a body mass index (BMI) of 40 kg/m^2 or higher, commonly classified as class 3 obesity. BMI is a screening measure and does not fully describe a person's health.

Alternate Names:
Class III Obesity; Extreme Obesity

Sevoflurane

An inhaled anesthetic gas used to start and maintain general anesthesia. It acts in the brain to produce unconsciousness and reduces awareness of pain; it can lower breathing and blood pressure and may trigger malignant hyperthermia in susceptible people.

Sex Change

An outdated, imprecise term sometimes used for gender-affirming care, which may include social, hormonal, or surgical interventions. Use the specific care or procedure name when known.

Sex Chromosomes

The X and Y chromosomes, which contribute to sex development and carry many other genes.

Sex Cord-Stromal Ovarian Tumor

A group of ovarian tumors arising from sex cord or stromal cells, including granulosa-cell, Sertoli-Leydig cell, and thecoma-fibroma tumors. Some produce hormones; behavior varies by tumor type.

Sex Headaches

Headaches brought on by sexual activity, including a gradually increasing ache or a sudden severe headache at orgasm. A first or thunderclap headache can signal bleeding or another dangerous cause.

Sex Hormones

Hormones involved in sexual development, reproduction, menstrual cycles, pregnancy, and related body functions. Major groups include estrogens, progesterone, and androgens, which also affect bones, muscles, mood, and tissues.

Sex-Linked Dominant

A pattern of inheritance in which a disease-causing gene variant lies on a sex chromosome and one altered copy can cause the condition. The chance of passing it on differs for mothers and fathers and for children of different sexes.

Sex-Linked Inheritance

Inheritance of a trait caused by a gene on a sex chromosome, commonly the X chromosome.

Sex-Linked Recessive

A pattern in which a disease-causing gene variant, usually on the X chromosome, commonly causes disease in males with one altered copy. Females usually need two altered copies, while those with one may be carriers or have milder symptoms.

Sex Therapy

Structured psychological or behavioral therapy for sexual concerns or dysfunction.

Sexual Abuse

Nonconsensual sexual contact, exploitation, or behavior; it is a safeguarding and health emergency when immediate danger or injury exists.

Sexual Addiction

Legacy label; see *Compulsive Sexual Behavior Disorder*.

Sexual Assault

Any sexual contact or sexual act without freely given consent, including unwanted touching, penetration, coercion, or sexual activity when a person cannot consent. It can cause injury, infection, pregnancy, and psychological trauma.

Alternate Names:

Nonconsensual Sexual Contact; Sexual Violence

Sexual Assault Prevention

Sexual-assault prevention includes consent education, recognizing coercion, safer environments, bystander intervention, and access to confidential support; responsibility always lies with the person who commits the assault.

Sexual Dysfunction

A group of conditions involving persistent or recurrent difficulty with sexual desire, arousal, erection, ejaculation, orgasm, or pain that causes clinically significant distress. Causes may be physical, psychological, medication-related, hormonal, or related to life circumstances.

Sexual Dysfunction Disorders

Alternate name; see *Sexual Dysfunction*.

Sexual Health

Sexual health includes physical, emotional, mental, and social well-being related to sexuality. It includes contraception, fertility, consent, relationships, and prevention of sexually transmitted infections.

Sexual Intercourse

Sexual activity involving penetration, most commonly penile-vaginal, but sometimes penile-anal or other forms depending on the people involved. It may be for pleasure, intimacy, or reproduction and requires freely given consent.

Alternate Names:
Copulation; Coition; Sexual Union

Sexually Transmitted Disease

An infection or clinical illness transmitted predominantly through sexual contact (vaginal, anal, or oral sex) or vertical perinatal transmission from mother to infant. Etiologies include bacterial (*Chlamydia trachomatis*, *Neisseria gonorrhoeae*, *Treponema pallidum*), viral (HIV, herpes simplex virus, human papillomavirus, hepatitis B), protozoal (*Trichomonas vaginalis*), and ectoparasitic pathogens. Clinical manifestations include urethral/vaginal discharge, genital ulcers, pelvic inflammatory disease, infertility, or chronic systemic disease; contemporary clinical terminology increasingly prefers the broader term sexually transmitted infection (STI) to encompass asymptomatic infection.

Alternate Names:
Sexually Transmitted Diseases; STD; STDs; Sexually Transmitted Infection; Sexually Transmitted Infections; STI; STIs

Sexually Transmitted Diseases

Plural form; see *Sexually Transmitted Disease*.

Sexually Transmitted Diseases in Pregnancy

Alternate name; see *Sexually Transmitted Disease*.

Sexually Transmitted Diseases in Women

Alternate name; see *Sexually Transmitted Disease*.

Sexually Transmitted Disease (STD)

Alternate name; see *Sexually Transmitted Disease*.

Sexually Transmitted Disease Treatments

Alternate name; see *Sexually Transmitted Disease*.

Sexually Transmitted Infection

Alternate name; see *Sexually Transmitted Disease*.

Sexually Transmitted Infections

Plural form; see *Sexually Transmitted Disease*.

Sexual Masochism Disorder

A mental-health diagnosis involving repeated sexual arousal from being humiliated, beaten, bound, or otherwise made to suffer, when the pattern causes significant distress or disrupts daily life, or involves a person who has not freely consented.

Sexual Obsession

An unwanted, intrusive sexual thought, image, or urge that causes distress, often discussed in obsessive-compulsive disorder. It is distinct from compulsive sexual behavior, which involves difficulty controlling repeated behavior.

Sexual Rehabilitation

Assessment and treatment to help restore or adapt sexual function after illness, injury, surgery, disability, or medicine effects. It may include education, counseling, pelvic-floor therapy, devices, or medicines.

Sexual Sadism

A recurrent sexual interest in another person's physical or psychological suffering or humiliation. The interest alone is not a mental disorder; acts without consent are abuse.

Sexual Sadism Disorder

A mental-health diagnosis involving repeated sexual arousal from another person's physical or emotional suffering, when it causes clinically significant distress or impairment or involves acting with someone who has not freely consented.

Sexual Violence

Sexual violence is any sexual act, attempt, contact, or coercion without freely given consent and can cause physical injury, infection, pregnancy, trauma, and long-term health effects.

Sezary Disease

Alternate name; see *Sezary Syndrome*.

Sezary Syndrome

An uncommon form of cutaneous T-cell lymphoma involving widespread red skin and abnormal lymphocytes in the blood.

Alternate Names:
Sezary Disease; Mycosis Fungoides Variant

Striae Distensae

Linear dermal scars that develop when the skin stretches rapidly due to growth, pregnancy, or rapid weight fluctuations. See *Stretch Mark*.

Stage 3 HIV Infection

Advanced phase of human immunodeficiency virus infection characterized by severe immunosuppression and opportunistic infections. See *AIDS*.

Sphygmothermic Dissociation

Unusual clinical pairing of fever with a slow heart rate (relative bradycardia), seen in yellow fever, typhoid, and legionellosis. See *Faget Sign*.

Spatial Inattention

Neurological impairment where a person fails to attend or respond to sensory stimuli on the side opposite a brain lesion. See *Visual Neglect*.

Short-Sightedness

Common refractive error where close objects appear clearly but distant objects appear blurry. See *Nearsightedness*.

SLR Test

Physical examination maneuver used to detect nerve root irritation or disk herniation in patients with lower back pain. See *Straight Leg Raise Test*.

SéZary Syndrome

An uncommon form of skin lymphoma in which abnormal immune cells are found in the skin and blood. It usually causes widespread red, scaly, itchy skin and enlarged lymph nodes and requires specialist care.

Sgarbossa Criteria

A set of electrocardiogram findings used to look for a heart attack when an existing conduction problem or pacemaker makes the tracing difficult to read. The findings can support, but cannot prove, an acute blocked heart artery.

Shadowing Artifact

An ultrasound artifact in which a strongly attenuating or reflecting structure produces a dark area behind it because little sound reaches the tissues beyond. Stones, bone, and gas commonly cause shadowing.

Shaken Baby Syndrome

Older term; see *Abusive Head Trauma*.

Shaken Impact Syndrome

A nonstandard term sometimes used for abusive head trauma in infants and children. The preferred term is abusive head trauma, which describes injury from inflicted impact, shaking, or both.

Shampoo Ingestion

Accidental swallowing of a small amount of shampoo usually causes mouth or stomach irritation; larger or concentrated exposures may cause vomiting or breathing problems and warrant poison-control advice.

Shared Decision-Making

A collaborative process in which clinicians and patients combine best available evidence with patient values, preferences, goals, and circumstances to choose among reasonable options.

Shark Attack

A shark attack can cause severe lacerations, bleeding, tissue loss, drowning, and shock; emergency rescue, hemorrhage control, and trauma care are critical.

Sharp-Force Defense Wounds

Cuts or other injuries on the hands or forearms that may occur when a person attempts to protect against an attack. The distribution and morphology of defensive injuries may help reconstruct an assault but are not independently proof of a particular event.

Alternate Names:
Defensive Wounds; Defense Injuries

Sharp Force Trauma

An injury caused by a sharp or pointed object, such as a knife, broken glass, or needle. It may produce a cut or a deeper puncture and can damage blood vessels, nerves, organs, or bones; deep wounds can cause severe blood loss or internal injury.

Sharps Container

A strong, leak-resistant container for used needles, lancets, blades, and other sharp medical items. It is designed to reduce needlestick injury and infection and is labeled, puncture-resistant, and closable.

Sharps Injury

A percutaneous or mucocutaneous injury caused by a needle or other sharp instrument that may expose a person to blood or body fluids. Immediate wound care, incident reporting, risk assessment, and pathogen-specific post-exposure management are required.

Shave Biopsy

Removal of a raised or superficial skin lesion by shaving off a thin layer with a sterile blade. The tissue is examined under a microscope; bleeding, infection, scarring, or an inadequate sample can occur.

Sheath

A hollow tube that provides access through the skin and into a blood vessel or body passage for insertion and exchange of catheters or other devices.

Sheehan's Syndrome

Loss of pituitary hormones caused by damage to the pituitary gland after severe bleeding or dangerously low blood pressure during or after childbirth. It may cause inability to breastfeed, extreme tiredness, low blood pressure, menstrual changes, or other hormone deficiencies.

Sheehan Syndrome

Permanent injury to the pituitary gland caused by severe bleeding or very low blood pressure during or after childbirth. Because the gland makes several hormones, symptoms may include inability to breastfeed, low blood pressure, fatigue, and menstrual or fertility problems.

Alternate Names:
Simmonds Disease; Postpartum Hypopituitarism

Shellac Poisoning

Poisoning from swallowing or inhaling shellac, a coating product that may contain alcohol or other solvents. It can cause irritation, vomiting, dizziness, drowsiness, or lung injury if it enters the lungs.

Shellfish Allergy

An immune reaction to proteins in crustaceans or mollusks that can cause hives, digestive or respiratory symptoms, or anaphylaxis.

Alternate Names:
Crustacean Hypersensitivity; Shellfish Hypersensitivity

Shellfish Poisoning

Illness caused by toxins accumulated in contaminated shellfish. Depending on the toxin, symptoms may include vomiting, diarrhea, tingling, weakness, confusion, breathing difficulty, or paralysis; severe cases can be fatal.

Shielding

Material placed between a person and a source of radiation to reduce exposure. The material depends on the radiation: lead or tungsten is used for many X-rays and gamma rays, while plastic or acrylic can be useful for beta radiation.

Shifting Dullness

A change in the sound made when tapping the belly as a person turns onto their side, showing that extra fluid is shifting with gravity inside the stomach cavity.

Shift Work Sleep Disorder

A circadian rhythm sleep-wake disorder caused by a recurring work schedule that overlaps the usual sleep period, producing insomnia and/or excessive sleepiness, reduced sleep, and impaired functioning. Symptoms persist in association with the schedule, typically for at least 3 months.

Alternate Names:
SWSD; Shift-Work Sleep Disorder

Shiga Toxin-Producing Escherichia coli Infection

Infection caused by Shiga toxin-producing strains of Escherichia coli. It commonly causes diarrhea and abdominal cramps and may cause bloody diarrhea. A small number of people, especially children, develop hemolytic uremic syndrome, which can damage the kidneys.

Alternate Names:
STEC; Shiga Toxin-Producing E. coli Infection; Verocytotoxin-Producing E. coli Infection

Shigella

A genus of bacteria causing shigellosis, an acute diarrheal illness that may include fever and bloody stools.

Shigellosis

Shigellosis is intestinal infection caused by Shigella bacteria, producing diarrhea that may be bloody, fever, cramps, and dehydration.

Shilajit

Shilajit is a mineral-rich, resin-like substance used in some traditional medicines. Product purity and safety vary, and contamination with heavy metals is possible.

Shin Bone Fever

An older nonspecific term for painful inflammation or infection involving the shin or nearby tissues.

Shingles

Alternate name; see *Herpes Zoster*.

Shingles And Pregnancy

Shingles is reactivation of varicella-zoster virus and usually causes a painful one-sided blistering rash. It is distinct from primary chickenpox; pregnancy can affect treatment choices and the significance of contact with susceptible people.

Shin Splints

A common term for medial tibial stress syndrome, an overuse injury causing pain and tenderness along the inner border of the shinbone. It is associated with repetitive impact or a sudden increase in activity and involves irritation of tissues around the bone. It is distinct from a stress fracture and acute compartment syndrome, which are separate causes of lower-leg pain.

Alternate Names:
Medial Tibial Stress Syndrome

Shin Spot

A shin spot is a nonspecific mark or lesion on the lower leg; its significance depends on appearance, duration, symptoms, injury, and associated disease.

Shirodkar Cerclage

An operation that places a strong stitch high around the cervix to help prevent it opening too early during pregnancy. It is used in selected people at risk of late miscarriage or premature birth and can cause bleeding, infection, or injury to nearby organs.

Shisha

Shisha is tobacco or another smoking mixture used in a water pipe. The water does not remove the main toxic substances, and smoking shisha can expose users to nicotine, carbon monoxide, and cancer-causing chemicals.

Shivering

Repeated, involuntary muscle contractions that generate heat, usually in response to cold or fever. Severe or unexplained shivering may occur with infection, medicine reactions, or other illness.

Shock

A life-threatening failure of circulation in which organs do not receive enough blood and oxygen. It can result from severe blood or fluid loss, heart failure, overwhelming infection, a severe allergic reaction, or an obstruction to blood flow. Signs may include confusion, faintness, cold or mottled skin, rapid breathing, little urine, or very low blood pressure.

Shock and Pregnancy

Life-threatening inadequate tissue perfusion during pregnancy or after birth, caused by hemorrhage, sepsis, cardiogenic disease, embolism, anaphylaxis, or other processes. Rapid maternal resuscitation, hemorrhage or infection control, and fetal assessment are essential.

Shock Lung

Older term; see *Acute Respiratory Distress Syndrome*.

Shock Wave Lithotripsy

A procedure that focuses repeated sound-pressure waves from outside the body onto a kidney or ureter stone to break it into smaller pieces that can pass in urine. Blood in the urine, pain, blockage, infection, or incomplete stone removal can occur.

Shone Complex

A group of congenital left-sided obstructive heart lesions, classically including supravalvular mitral ring, parachute mitral valve, subaortic stenosis, and coarctation of the aorta. The combination and severity vary and may lead to heart failure or systemic outflow obstruction.

Short Arm Of A Chromosome

The shorter section of a chromosome, labeled p from the French word for “small.” Missing, extra, or rearranged DNA in this section can alter genes and cause disease.

Short Bones

Small, roughly cube-shaped bones that provide stability and limited movement. The wrist and ankle contain most of the body’s short bones.

Short Bowel Syndrome

A condition in which the small intestine is shortened or damaged and cannot absorb enough nutrients from food. It most often occurs after surgery to remove part of the small intestine and may cause diarrhea, weight loss, and nutritional deficiencies.

Short-Chain Fatty Acids

Small fatty substances made when bacteria in the large intestine break down dietary fiber. They help nourish the bowel lining and may influence inflammation and metabolism; their effects vary with diet and the person’s gut bacteria.

Shortness Of Breath

Alternate name; see *Dyspnea*.

Short Philtrum

A short philtrum is reduced distance between the

nose and upper lip and may be an isolated feature or part of a genetic, developmental, or prenatal-exposure syndrome.

Short QT Syndrome

A rare inherited heart-rhythm disorder in which the heart's electrical recovery time is unusually short. It can cause atrial or ventricular arrhythmias, fainting, or sudden cardiac death; diagnosis requires specialist ECG and family-history assessment, and treatment may include an implantable defibrillator.

Alternate Names:
SQTS

Short-Sight

Myopia, a refractive error in which distant objects are focused in front of the retina.

Short Stature

Height substantially below the expected range for age and sex, requiring assessment of growth pattern and cause.

Short-Term Memory

The ability to hold and use a small amount of information for seconds or minutes. It helps with following instructions, doing mental tasks, and remembering a recent conversation before information is stored more permanently or forgotten.

Alternate Names:
Immediate Memory

Shotty

Describes small, firm, discrete lymph nodes, often reactive after infection; persistent, enlarging, hard, or generalized nodes may have causes other than a recent infection.

Shoulder

The area where the upper limb joins the body, including the shoulder blade, collarbone, and upper-arm bone. Its main joint allows a wide range of arm movement but is less stable and can be injured or dislocated.

Shoulder Arthroscopy

A minimally invasive procedure using a camera and instruments through small incisions to diagnose and treat selected disorders of the shoulder joint and surrounding tissues.

Shoulder Bursitis

Inflammation of a fluid-filled sac around the shoulder, often associated with rotator-cuff disease or repetitive overhead activity. Pain with arm elevation and lying on the affected side is common; treatment options include activity modification, therapy, medicines, or injection.

Alternate Names:
Subacromial Bursitis; Subdeltoid Bursitis

Shoulder CT Scan

Computed tomography of the shoulder used to evaluate fractures, bone alignment, arthritis, tumors, infection, and complex bony anatomy.

Shoulder Dislocation

Complete displacement of the upper arm bone from the shoulder socket, usually caused by a fall, collision, or forceful twisting. It causes severe pain, deformity, and inability to move the arm and may injure nearby bones, nerves, or blood vessels.

Shoulder Dystocia

A childbirth emergency in which the baby's head is born but a shoulder becomes stuck behind the birthing parent's pelvic bone. Delivery maneuvers are used to free the shoulder; delay can cause lack of oxygen, fractures, or nerve injury in the baby and heavy bleeding in the parent.

Shoulder Impingement

Older term; see *Subacromial Pain Syndrome*.

Shoulder Impingement Syndrome

Older term; see *Subacromial Pain Syndrome*.

Alternate Names:
Subacromial Impingement Syndrome; Neer Impingement

Shoulder Instability

Excessive or recurrent movement of the shoulder joint caused by injury, laxity, or altered joint anatomy. Associated lesions may include a Bankart tear, Hill-Sachs lesion, or injury to the joint capsule or ligaments.

Shoulder MRI Scan

Magnetic resonance imaging of the shoulder used to evaluate rotator-cuff tendons, labrum, cartilage, ligaments, muscles, bone marrow, and joint fluid.

Shoulder Pain

Pain in or around the shoulder caused by injury, tendon or bursa disorders, arthritis, nerve disease, or referred pain. Sudden weakness, deformity, chest symptoms, fever, or pain after major trauma can indicate a serious cause.

Shoulder Replacement

Surgery replacing damaged surfaces of the shoulder with artificial parts to relieve severe pain and improve movement. The implant may replace the joint in the usual or reverse configuration; infection, stiffness, dislocation, loosening, or nerve injury can occur.

Shulman Syndrome

Alternate name; see *Eosinophilic Fasciitis*.

Shunt

A passage that diverts blood, cerebrospinal fluid, urine, or another fluid from one channel to another.

Shwachman Syndrome

An inherited multisystem disorder usually involving exocrine pancreatic insufficiency, bone-marrow dysfunction, and skeletal abnormalities. Children may have steatorrhea, poor growth, recurrent infections, neutropenia, anemia, or increased risk of myeloid malignancy.

Shy-Drager Syndrome

Alternate name; see *Multiple System Atrophy*.

SIADH

A condition in which the body releases too much antidiuretic hormone, causing it to retain water and dilute the blood sodium level. It may cause nausea, headache, confusion, seizures, or coma and requires treatment of the cause and sodium abnormality.

Sialadenitis

Inflammation or infection of a saliva-making gland, causing painful swelling near the cheek or under the jaw, often worse during meals. Causes include bacteria, viruses, dehydration, or a blocked tube that carries saliva. Pus may mean a pocket of infection has formed.

Sialagogues

Substances or medicines that increase saliva production. They may help some people with dry mouth, but treatment also considers hydration, medicines, oral care, and the cause of reduced saliva.

Sialidosis (Mucolipidosis Type I)

A rare inherited lysosomal storage disorder caused by deficient alpha-neuraminidase, usually because of *NEU1* variants. It may cause coarse facial features, skeletal or eye abnormalities, myoclonus, ataxia, developmental impairment, or vision problems, with severity varying by type.

Sialogram

An imaging study of a salivary gland and its ducts after contrast is introduced through the duct opening, used to assess obstruction, stones, strictures, or chronic inflammation.

Sialography

An imaging procedure that uses contrast material to show salivary glands and their ducts. It can help identify blockage, stones, narrowing, chronic inflammation, or tumors, although newer imaging is often preferred.

Sialolithiasis

A stone in a saliva-making gland or the tube that carries saliva into the mouth, most often in a gland under the jaw. It can cause repeated swelling and

pain during meals and may block saliva or lead to infection.

Sialorrhea

Excess saliva or difficulty controlling and swallowing it, causing drooling. It commonly occurs with neurologic disease, swallowing difficulty, dental problems, or some medicines; treatment addresses the cause and may include swallowing therapy or selected medicines.

Sialorrhoea

Excess saliva that pools in the mouth or dribbles out as drooling. It is often caused by difficulty controlling or swallowing saliva rather than making too much. It may occur with cerebral palsy, Parkinson disease, motor-neuron disease, or other conditions and can cause skin irritation or choking. Swallowing therapy and other treatments may help.

Sialuria

A rare inherited disorder in which cells make and release too much sialic acid, a sugar used on cell surfaces. It may cause developmental delay, enlarged liver and spleen, distinctive facial features, and variable learning difficulties.

Sibling

A person's brother or sister; family history from siblings can inform genetic and disease risk assessment.

SIBO

Alternate name; see *Small Intestinal Bacterial Overgrowth*.

Sicca Syndrome

Persistent dryness of the eyes and mouth caused by reduced tears and saliva. It may result from Sjögren syndrome, medicines, dehydration, radiation, or other illnesses and can lead to eye irritation, mouth sores, tooth decay, or difficulty swallowing.

Sickle Cell

An inherited group of blood disorders caused by abnormal hemoglobin. Red blood cells may become rigid and curved, causing anemia, severe pain, blocked blood flow, and damage to organs.

Sickle-Cell Anaemia

See *Sickle Cell Anemia*.

Sickle Cell Anemia

A form of sickle cell disease, usually caused by inheriting two hemoglobin S genes (HbSS); HbS beta-zero thalassemia is also sometimes grouped with it. Rigid, sickle-shaped red cells break down early and can block small blood vessels, causing anemia, pain, stroke, lung complications, jaundice, and infection risk.

Sickle Cell Crisis

A sudden complication of sickle cell disease. Most often, stiff, sickle-shaped red blood cells block small blood vessels and cause severe pain. Other crises can cause sudden lung problems, a rapid drop in red blood cells, or blood to collect in the spleen.

Sickle Cell Dactylitis

Painful swelling of the hands or feet caused by blockage of small blood vessels during a sickle-cell episode, especially in infants and young children. It may be an early sign of sickle-cell disease and requires appropriate clinical evaluation.

Sickle Cell Disease

A group of autosomal recessive inherited hemoglobin disorders involving hemoglobin S, which can make red blood cells rigid and prone to sickling. Sickling and red-cell breakdown can cause anemia, episodes of blocked blood flow, and damage to organs; forms include hemoglobin SS, hemoglobin SC, and hemoglobin Sbeta-thalassemia.

Sickle Cell Test

A laboratory test detecting hemoglobin S or assessing sickling, used in screening and diagnosis of sickle-cell trait or sickle-cell disease; definitive testing identifies hemoglobin variants.

Sickle Cell Trait

An inherited state in which a person has one gene for hemoglobin S and one usual hemoglobin gene. Most people have no symptoms and do not develop sickle cell disease, but rare problems can occur with severe dehydration, low oxygen, or extreme exertion.

Sick Sinus Syndrome

A problem with the heart's natural pacemaker that causes the heartbeat to become too slow, pause, or alternate between fast and slow. It may cause dizziness, fainting, tiredness, palpitations, or reduced exercise ability.

Alternate Names:
Bradycardia-Tachycardia Syndrome

Side Effect

Any unintended, non-targeted secondary physiological effect produced by a pharmaceutical agent or medical intervention occurring at standard therapeutic doses, which may be beneficial, neutral, or harmful (adverse drug reaction). Commonly arising from off-target binding or predictable extension of primary on-target pharmacology across non-target tissues (e.g., dry mouth from anticholinergics, sedation from first-generation antihistamines).

Alternate Names:
Side Effects; Adverse Effect; Adverse Drug Reaction

Side Effects

Plural form; see *Side Effect*.

Side-Effects

Unintended effects that occur while a medicine or treatment is used. They range from mild symptoms to serious harm; the risk depends on the treatment, dose, duration, other medicines, and the person's health.

Sideroblastic Anemia

Anemia caused by faulty hemoglobin production. Iron builds up inside developing red blood cells instead of being used properly; causes include inherited disorders, alcohol, some medicines or toxins, vitamin B6 deficiency, and bone-marrow disease.

Siderosis

Accumulation of iron in body tissues, or lung disease from breathing iron-containing dust. It may cause no symptoms, but long-term dust exposure can produce cough, breathing difficulty, and permanent lung damage.

SIDS

Abbreviation; see *Sudden Infant Death Syndrome*.

Sievert

A unit used to estimate how much biological harm ionizing radiation could cause. It accounts for the type of radiation and the sensitivity of different tissues and is used when discussing radiation risk.

Alternate Names:
Equivalent Radiation Dose Unit; Sv Unit

Sight

The ability to see, involving the eyes and visual nervous system.

Sigmoid

Sigmoid means S-shaped; the sigmoid colon is the curved section of large intestine between the descending colon and rectum.

Sigmoid Colon

The curved, S-shaped section of the large intestine between the descending colon and rectum. It stores stool before bowel movements and is a common site for diverticular disease, twisting, and colorectal cancer.

Sigmoidoscopy

Endoscopic examination of the rectum and lower colon using a flexible or rigid sigmoidoscope. It can identify inflammation, bleeding, polyps, or tumors and may allow biopsy or treatment.

Sigmoid Volvulus

Twisting of the S-shaped lower colon around the tissue that supports it, blocking the bowel. It can cause severe abdominal swelling, pain, vomiting, and inability to pass stool or gas; prolonged twisting can

cut off the blood supply and cause bowel death.

Sign

An observable or measurable finding that may show disease or a change in health. Examples include a rash, fever, swelling, abnormal heartbeat, or high blood pressure; a sign differs from a symptom, which is felt and reported by the person.

Signal Peptide

A short part of a newly made protein that acts like an address label, directing the protein to the cell membrane, outside the cell, or a particular internal compartment. It is often removed after delivery.

Signal-To-Noise Ratio

A comparison between the useful information in a test or image and the unwanted background variation. A higher ratio usually produces a clearer image or more reliable measurement.

Signal Transduction

The chain of events by which a hormone, nerve chemical, or medicine attaches to a cell and produces a response inside it. The response can change cell activity, movement, growth, survival, or gene use.

Signature

A signature is a person's identifying mark or electronic confirmation of approval, consent, authorship, or verification.

Signature Strengths

Personal character strengths that a person values and naturally uses.

Signet Ring Cell Carcinoma

A cancer whose cells contain mucus that pushes the cell nucleus to one side, giving a ring-like appearance under a microscope. It most often begins in the stomach or colon and may grow widely or aggressively.

Sign Language

Sign language is a complete visual language using hand shape, movement, position, facial expression, and body movement rather than spoken sound.

Sign of Leser-Trelat

The sudden appearance or rapid increase of numerous seborrheic keratoses, sometimes reported as a paraneoplastic sign. Most seborrheic keratoses are harmless and common, so the pattern alone does not establish an underlying cancer.

Signs Of An Asthma Attack

An asthma attack may cause worsening wheeze, cough, chest tightness, breathlessness, rapid breathing, difficulty speaking, or reduced peak flow; severe attacks can cause respiratory failure.

Sildenafil Citrate

The citrate salt of sildenafil, a phosphodiesterase type 5 inhibitor used for erectile dysfunction and pulmonary arterial hypertension. It relaxes vascular smooth muscle through nitric-oxide signaling. Use with organic nitrates or riociguat is contraindicated because the combination can cause severe hypotension.

Silent Heart Attack

A heart attack that causes no recognized pain or typical warning signs. It may be discovered later through an electrocardiogram or imaging and still damages heart muscle and increases future risks.

Alternate Names:
Unrecognized Myocardial Infarction; Silent MI

Silent Ischemia

Reduced blood flow to heart muscle without typical chest pain or other recognized symptoms. It may still damage the heart and is detected through testing rather than symptoms alone.

Alternate Names:
Asymptomatic Myocardial Ischemia

Silent Mutation

A DNA change that usually does not alter the amino acid in the protein made from the gene. It may still affect how the gene is copied, how long its RNA

lasts, or how much protein is produced.

Silent Myocardial Infarction

A heart attack that occurs without recognized typical symptoms and is discovered later from medical records or testing. An electrocardiogram may suggest an old infarction, but abnormal Q waves alone are not specific; cardiac imaging can help confirm prior heart-muscle injury.

Alternate Names:
Unrecognized Myocardial Infarction; Painless MI

Silent Sinus Syndrome

Silent sinus syndrome is painless inward collapse of the maxillary sinus and floor of the orbit, often causing facial asymmetry, enophthalmos, or a sunken eye. Imaging confirms the diagnosis, and endoscopic treatment restores sinus ventilation when indicated.

Silent Thyroiditis

Silent thyroiditis is painless autoimmune inflammation of the thyroid that may briefly release excess hormone before causing temporary hypothyroidism and eventual recovery.

Silicate

A salt or ester containing silicon and oxygen, found in minerals and industrial materials; inhalation of some silicate dusts can irritate the lungs or contribute to pneumoconiosis.

Silicon Dioxide

A mineral found in soil, rock, dust, and industrial materials. Breathing crystalline forms over time can scar the lungs, cause silicosis, and increase the risk of lung cancer.

Silicone

A synthetic polymer composed of repeating siloxane units (silicon and oxygen backbone with attached organic methyl, phenyl, or vinyl groups). Biologically inert, heat-resistant, and flexible, medical-grade silicones are widely used in biomedical implants (e.g., breast implants, intraocular lenses), indwelling catheters, wound dressings, and scar therapy sheets; complications can include fibrous capsular contracture, rupture, or granulomatous foreign body reaction.

Alternate Names:
Silicones; Polysiloxane

Silicone Elastomer

A flexible, rubber-like silicone material used in implants, tubing, dressings, and other devices; complications may include infection, leakage, allergy, or device failure.

Silicone Implants

Medical implants containing silicone gel or elastomer used for breast reconstruction or augmentation; complications may include rupture, capsular contracture, infection, malposition, or need for revision.

Silicone Mastitis

A granulomatous inflammatory reaction to silicone released from a breast implant or injected silicone. It may cause nodules, pain, lymphadenopathy, or imaging findings that mimic malignancy.

Silicone Oil Hyperoleon

A complication after eye surgery in which silicone oil breaks into tiny droplets and moves into the front of the eye. It can raise eye pressure, irritate the eye, damage the cornea, and sometimes requires removal or washing of the oil.

Silicones

Plural form; see *Silicone*.

Silicosis

A permanent lung-scarring disease caused by breathing crystalline silica dust. It can cause cough, breathlessness, reduced lung function, tuberculosis risk, and progressive respiratory disability after workplace or environmental exposure.

Silk

Silk is a protein fiber used in textiles and some medical sutures or biomaterials; reactions and tissue response depend on the product and processing.

Silk Road Disease

Alternate name; see *Behcet Syndrome*.

Siltuximab

A monoclonal antibody that binds interleukin-6 and is used to treat adults with multicentric Castleman disease who are negative for HIV and human herpesvirus 8.

Silver

A metal used in some dressings, creams, and medical devices for antimicrobial activity; excessive exposure can cause permanent blue-gray skin discoloration called argyria.

Silver Diamine Fluoride

A liquid applied to a tooth to slow or stop active tooth decay. It usually turns the treated decayed area black and may be useful when drilling or immediate restorative treatment is difficult.

Silver Nitrate

A caustic antiseptic used topically to cauterize tissue, control minor bleeding, or treat some wounds; it can burn healthy skin and permanently stain tissue.

Silver Poisoning

Silver poisoning, or argyria, follows excessive silver exposure and can cause permanent blue-gray skin discoloration and, rarely, organ or neurologic effects.

Silver-Russell Syndrome

A growth disorder usually present from birth, marked by poor growth before and after birth, a small or asymmetrical body, and characteristic facial features. Most cases are linked to changes in gene activity rather than a change in the gene itself.

Silver Sulfadiazine

A topical antimicrobial cream formerly used widely for burns; it may delay healing in some wounds and is not appropriate for everyone, including some newborns and people with sulfonamide allergy.

Silymarin

A mixture of flavonolignans from milk thistle marketed as a dietary supplement; evidence for treating liver disease is limited and product quality varies.

Simeprevir

An older hepatitis C virus NS3/4A protease inhibitor formerly used with other antivirals; it is no longer a usual first-line treatment because better direct-acting regimens are available.

Simethicone

Simethicone is a non-absorbed antifoaming agent that coalesces gas bubbles in the gastrointestinal tract and is used for symptomatic relief of bloating; it does not treat the underlying cause of pain.

Simian Crease

A simian crease is a single transverse crease across the palm, which may be a normal variant or occur with some chromosomal or developmental conditions.

Simmonds Disease

An older term for severe pituitary-gland failure. It can cause extreme tiredness, weight loss, low blood pressure, loss of menstrual periods or sexual function, and deficiencies of several hormones.

Simmonds Test

A calf-squeeze test for a possible torn Achilles tendon. If squeezing the calf does not make the foot point downward, a tear is suspected, but examination and sometimes imaging are needed.

Alternate Names:
Thompson Test; Thompson-Simmonds Calf Squeeze Test

Simmonds-Thompson Test

Another name for the calf-squeeze test used when an Achilles tendon tear is suspected. A missing downward movement of the foot supports the diagnosis but does not replace a full assessment.

Alternate Names:
Thompson Test; Simmonds Test

Simple Febrile Seizure

A generalized seizure in a febrile child aged 6–60 months, without central nervous system infection, metabolic disturbance, or a history of afebrile seizures. It lasts less than 15 minutes and occurs only once in a 24-hour period.

Alternate Names:
Benign Febrile Seizure; Typical Febrile Seizure

Simple Goiter

A simple goiter is noncancerous enlargement of the thyroid without obvious thyroid-hormone excess or deficiency, caused by iodine imbalance, stimulation, or other factors.

Simple Mastectomy

Simple mastectomy removes the breast tissue and nipple while leaving most chest muscles and usually the underarm lymph nodes.

Simple Prostatectomy

Surgical removal of the enlarged central portion of the prostate to relieve bladder-outlet obstruction from benign prostatic hyperplasia; it does not remove the entire prostate.

Simple Pulmonary Eosinophilia

A usually mild lung reaction in which eosinophils, a type of white blood cell, collect temporarily in the lungs. It may cause cough, fever, or wheezing and can follow medicines, parasites, or other exposures. Symptoms and chest shadows often clear on their own.

Simplexvirus

A genus of herpesviruses that includes herpes simplex virus types 1 and 2, which cause cold sores, genital herpes, and other infections.

Simpson Test

A bedside fatigability test used to assess neuromuscular transmission in suspected ocular myasthenia gravis. The patient is asked to maintain upward gaze for one minute; progressive worsening of ptosis or the development of diplopia constitutes a positive test result.

Alternate Names:
Sustained Upward Gaze Test

Simuliidae

The family of black flies; bites can cause itchy skin reactions, and some species transmit Onchocerca volvulus, the parasite that causes river blindness.

Simultanagnosia

An inability to see more than one object, or the whole visual scene, at the same time even though basic eyesight may be adequate. It usually results from damage to brain areas that combine visual information.

Simvastatin

A statin medicine that lowers LDL, often called bad cholesterol, by reducing cholesterol production in the liver. It helps lower the risk of heart attack and stroke; muscle pain, liver problems, and medicine interactions are possible.

Sincalide

A synthetic form of cholecystokinin used during gallbladder imaging to stimulate contraction and measure bile flow; it may cause abdominal pain, nausea, or flushing.

Sindbis Virus

A mosquito-borne virus that can cause fever, rash, and joint pain. It occurs mainly in parts of Africa, Europe, Asia, and Australia.

Sinding-Larsen-Johansson Syndrome

A painful overuse injury at the lower tip of the kneecap in growing children and adolescents. Pain usually worsens with running or jumping and improves as growth finishes and the irritated area heals.

Sinecatechins

A topical green-tea catechin ointment for external genital and perianal warts caused by human papillomavirus; it can cause local irritation.

Singer's Nodule

A small, usually noncancerous thickening on a vocal fold caused by repeated voice strain. It can cause lasting hoarseness, a rough voice, or reduced vocal range; voice therapy and reducing strain are often helpful.

Singing

Singing is producing musical sounds with the voice. It can support communication and social well-being, while excessive or improper voice use may cause vocal strain.

Single-Dose Toxicity

Harm caused by one exposure to a substance or medicine, assessed according to dose, route, timing, and the exposed person's characteristics.

Single-Fiber Electromyography

A specialized electrical test that records signals from individual muscle fibers. It measures small variations in the timing of nerve-to-muscle communication and can detect disorders such as myasthenia gravis, even when routine nerve tests are normal. A fine needle is used, and the test may be uncomfortable.

Alternate Names:
SFEMG; Single-Fiber EMG

Single Nucleotide Polymorphism

A common inherited difference in one DNA building block. Most have little or no effect, but some are linked with disease risk, ancestry, or how a person responds to a medicine.

Single Palmar Crease

A single transverse palmar crease is one crease crossing the palm instead of the usual two; it can be a normal variant or a feature of genetic syndromes.

Single-Photon Absorptiometry

An older scan that used a small amount of radiation to estimate bone density, usually in an arm or other peripheral bone. More accurate bone-density methods have largely replaced it.

Alternate Names:
SPA

Single Photon Emission Computed Tomography

A nuclear medicine scan that uses a radioactive tracer and a rotating camera to create three-dimensional images of blood flow or organ function. It can assess the heart, bones, brain, kidneys, or other organs.

Single-Photon Emission Computed Tomography

A nuclear-medicine scan that uses a radioactive tracer and a rotating camera to create three-dimensional images of blood flow or organ activity. It can assess the heart, brain, bones, kidneys, and other organs.

Singlet Oxygen

A highly reactive form of oxygen involved in oxidative reactions, immune defenses, photodynamic therapy, and tissue injury from oxidative stress.

Single Ventricle

A group of heart defects present at birth in which one lower chamber does most of the work of pumping blood to both the body and lungs. Babies usually need specialist care and staged operations.

Singultus

Medical term for hiccups; see *Hiccups*.

Sin Nombre Virus Infection

Alternate name; see *Hantavirus Pulmonary Syndrome*.

Sinoatrial Block

A heart-rhythm problem in which an electrical signal from the heart's natural pacemaker is delayed or fails to spread to the upper chambers. It can cause missed beats, pauses, dizziness, or fainting.

Alternate Names:
SA Exit Block

Sinoatrial Node

A group of specialized cells in the right atrium that normally initiates the electrical impulse for each heartbeat; also called the sinus node.

Alternate Names:
SA Node

Sinuatrial Node

The sinoatrial node, a group of specialized cells in the right atrium that normally initiates the heartbeat and sets the cardiac rhythm.

Sinus

An anatomical cavity, channel, or hollow space, referring in medical anatomy to: (1) the paranasal sinuses (air-filled, mucosa-lined extensions of the nasal cavity within the frontal, maxillary, ethmoid, and sphenoid bones); (2) dural venous sinuses (endothelial-lined venous channels between layers of the dura mater); or (3) an abnormal blind-ended tract leading from a deep focus of suppuration to an epithelial or mucosal surface.

Alternate Names:
Sinuses; Paranasal Sinus

Sinus Arrest

A pause in the heartbeat caused when the heart's natural pacemaker briefly fails to produce an electrical signal. It may cause dizziness, fainting, or no symptoms and can result from heart-rhythm disease or medicine effects.

Alternate Names:
Sinus Pause

Sinus Arrhythmia

Sinus arrhythmia is normal variation in sinus-heart rate, commonly speeding during inhalation and slowing during exhalation, especially in young people.

Sinus Bradycardia

Sinus bradycardia is a sinus rhythm slower than the expected rate; it can be normal during sleep or athletic conditioning but may also reflect drugs or disease.

Sinus CT Scan

Computed tomography of the paranasal sinuses used to evaluate chronic or complicated sinusitis, anatomic obstruction, trauma, inflammatory disease, or tumors.

Sinuses

Plural form; see *Sinus*.

Sinus Headache

Pain attributed to a sinus headache is often migraine, but sinus inflammation can cause facial pressure, congestion, reduced smell, and pain that worsens with bending. Fever, purulent discharge, persistent symptoms, or eye or neurologic signs guide evaluation.

Sinus Histiocytosis

An increase in cleanup immune cells within the open spaces of a lymph node. It is often a response to nearby inflammation, infection, a tumor, or tissue breakdown and is interpreted with the rest of the biopsy.

Sinusitis

Inflammation of the lining of one or more paranasal sinuses. It may follow a viral respiratory infection or be associated with allergy, nasal inflammation, or other causes. Common features include nasal obstruction, discharge, facial pressure or pain, headache, and reduced smell. Acute and chronic forms differ in duration and pattern.

Sinusitis And Sinus Problems

Alternate name; see *Sinusitis*.

Sinus Lift

A dental procedure that adds bone beneath the lining of the maxillary sinus in the upper jaw. It may create enough support for a dental implant when the jawbone has become too thin.

Sinus MRI Scan

Magnetic resonance imaging of the paranasal sinuses and surrounding soft tissues used to evaluate tumors,

invasive infection, orbital or intracranial extension, and selected inflammatory disease.

Sinus Node

Alternate name; see *Sinoatrial Node*.

Sinus Node Dysfunction

A disorder in which the heart's natural pacemaker does not generate or conduct impulses normally, causing rhythms that may be too slow, pauses, or alternating slow and fast rhythms.

Alternate Names:
Sinoatrial Node Dysfunction; Sick Sinus Syndrome

Sinusoid

A specialized, highly permeable capillary characterized by a wide, irregular lumen, discontinuous or absent basal lamina, and large fenestrae or intercellular gaps between endothelial cells. Found in the liver, spleen, bone marrow, and lymph nodes, sinusoids facilitate slow blood flow and unrestricted transcellular exchange of macromolecules, plasma proteins, and migrating blood cells between the bloodstream and parenchyma.

Alternate Names:
Sinusoids; Sinusoidal Capillary

Sinusoidal Fetal Heart Rate Pattern

A rare, smooth, regular wave pattern on an unborn baby's heart-rate tracing with little normal variation. It can indicate severe fetal anemia or low oxygen.

Sinusoidal Obstruction Syndrome

Injury and blockage of the small blood vessels in the liver, most often after high-dose chemotherapy given before a stem-cell transplant. It can cause painful liver enlargement, jaundice, fluid buildup, swelling of the abdomen, and rapid weight gain.

Alternate Names:
Hepatic Veno-Occlusive Disease; VOD/SOS

Sinusoids

Plural form; see *Sinusoid*.

Sinus Pain

Pressure or pain around the forehead, cheeks, nose, or eyes caused by sinus inflammation, infection, migraine, or other conditions. Severe headache, eye swelling, vision change, high fever, or neurologic symptoms can indicate a serious complication.

Sinus Rhomboidalis

A diamond-shaped depression forming the floor of the fourth brain ventricle, near structures controlling movement and vital functions.

Sinus Rhythm

A heart rhythm started by electrical impulses from the sinoatrial node, the natural pacemaker. It is usually regular, although sinus rhythm can be too fast, too slow, or affected by illness.

Sinus Tachycardia

A heart rhythm originating in the sinoatrial node with a rate faster than normal, commonly occurring as a physiologic response to exercise, fever, pain, dehydration, or stress.

Sinus X-Ray

Plain radiographic imaging of the paranasal sinuses; it has limited sensitivity and is often replaced by CT when detailed evaluation is needed.

Sipuleucel-T

A personalized cancer immunotherapy made from a patient's immune cells and used for selected advanced prostate cancers. The cells are trained to recognize a prostate-cancer target before being returned to the patient.

Sirenomelia

A rare congenital malformation in which the lower limbs are partially or completely fused. It is usually associated with severe abnormalities of the genitourinary, gastrointestinal, vascular, and spinal systems and is often fatal in the neonatal period.

Sirolimus

Sirolimus is an mTOR inhibitor used for immuno-

suppression after transplantation and selected vascular or lymphatic disorders; mouth ulcers, hyperlipidaemia, cytopenias, infection, impaired wound healing, and pneumonitis can occur.

Sirtuins

A family of enzymes that change other proteins and help regulate how cells use energy, respond to stress, and switch genes on or off. Their possible roles in aging and disease are still being studied.

Sisomicin

An aminoglycoside antibiotic related to gentamicin that has activity against some aerobic gram-negative bacteria; use is limited by kidney and hearing toxicity.

Sister Mary Joseph Nodule

A metastatic tumor deposit in or around the umbilicus, usually from an intra-abdominal or pelvic malignancy.

Sister Mary Joseph's Nodule

A firm, hard nodule in the umbilicus resulting from metastatic malignancy, most commonly from intra-abdominal or pelvic cancers including gastric, ovarian, and colorectal carcinoma. It indicates advanced, disseminated disease with a poor prognosis. Diagnosis is by fine needle aspiration biopsy.

Sitagliptin Phosphate

Sitagliptin phosphate is a DPP-4 inhibitor that prolongs incretin activity and improves glucose-dependent insulin secretion in type 2 diabetes; dose adjustment in kidney disease and rare pancreatitis or severe joint pain are important considerations.

Sitosterolemia

A rare inherited disorder in which the body absorbs and stores too much plant sterol, a substance found in plant foods. The buildup can cause early artery disease, skin lumps, anemia, easy bleeding, or low platelets.

Sitting Position

An upright or semiupright position in which the patient's torso is elevated and the hips and knees are flexed; it is used for selected shoulder and neurosurgical procedures.

Sit-to-Stand Postural Drift

A tendency to lose balance or move away from a stable position while standing up from a chair. It may reflect weakness, poor coordination, dizziness, or impaired balance.

Alternate Names:
Postural Instability on Rising; Chair Rise Imbalance

Situational Syncope

A reflex faint triggered by a specific situation such as coughing, urination, defecation, swallowing, laughter, or prolonged standing, caused by transient reduced cerebral perfusion.

Situs Ambiguus

A birth difference in which internal organs are arranged irregularly rather than in the usual left-right pattern. It is often associated with congenital heart defects and an absent, small, or abnormally functioning spleen.

Situs Inversus

A congenital condition in which the thoracic and abdominal organs are reversed or mirrored from their normal positions. Complete situs inversus (situs inversus totalis) involves all organs.

Situs Inversus Totalis

A congenital condition in which the major visceral organs are mirrored from their normal positions, with the liver on the left, heart on the right, and other viscera similarly reversed.

Sitz Bath

Immersion of the perineal and anal region in warm or prescribed water for symptom relief in conditions such as hemorrhoids, anal fissures, or postpartum discomfort.

SI Units

The International System of Units used for standardized measurements, including meter, kilogram, second, mole, and pascal.

Six Fingers Or Toes

Six fingers or toes is polydactyly, a congenital extra-digit difference that may occur alone or as part of a genetic syndrome.

Six-Minute Walk Test

A simple test measuring how far a person can walk in six minutes on a flat path. Clinicians record distance, symptoms, heart rate, and oxygen level to assess exercise ability and monitor heart or lung disease. Rest breaks are allowed, and the result is interpreted with other findings.

Alternate Names:
6MWT; Six-Minute Walk Distance

Sixth Disease

Alternate name; see *Roseola*.

Sixth Nerve Palsy

Dysfunction of the abducens nerve (cranial nerve VI) producing weakness or paralysis of the ipsilateral lateral rectus muscle, characterized by convergent strabismus (esotropia) and horizontal binocular diplopia worsening on gaze toward the paretic side; frequently caused by microvascular ischemia or elevated intracranial pressure.

Alternate Names:
Abducens Nerve Palsy

Size Perception

The brain's judgment of how large or small an object or body part is. Vision, touch, distance, and context all contribute; eye or brain disorders can make objects appear unusually large or small.

Sjögren Disease

A chronic autoimmune disease in which the body's immune system mistakenly attacks its own moisture-producing glands, primarily the tear glands (lacrimal glands) and salivary glands. This causes the hallmark symptoms of severe dry eyes (which feel gritty, burning, or irritated) and dry mouth (which can cause difficulty chewing, swallowing, and speaking, along with an increased risk of dental cavities). It can occur on its own or alongside other autoimmune conditions such as rheumatoid arthritis or lupus, and may also cause fatigue, joint pain, or dryness in other parts of the body.

Alternate Names:
Sjögren's Syndrome; Sjogren Syndrome; Sicca Syndrome; Autoimmune Exocrinopathy

Sjögren Disease-Associated Arthritis

Joint pain or inflammation associated with Sjögren disease. Joint pain is more common than objective joint inflammation, so symptoms are interpreted alongside examination and other findings.

Sjogren-Larsson Syndrome

A rare autosomal recessive neurocutaneous disorder caused by mutations in the ALDH3A2 gene encoding fatty aldehyde dehydrogenase (FALDH), characterized by the clinical triad of congenital ichthyosis, spastic diplegia or tetraplegia, and severe intellectual disability with retinal glistening white dots.

Alternate Names:
SLS; Fatty Aldehyde Dehydrogenase Deficiency

Sjögrenś Disease

Alternate name; see *Sjögren Disease*.

Sjogren's Syndrome

Alternate name; see *Sjögren Disease*.

SjöGren's Syndrome

Alternate name; see *Sjögren Disease*.

Sjogren Syndrome

Alternate name; see *Sjögren Disease*.

SjöGren Syndrome

Alternate name; see *Sjögren Disease*.

SJS

Alternate name; see *Stevens-Johnson Syndrome*.

Skeletal Development

Skeletal development is formation, growth, remodeling, and maturation of bones and cartilage from embryonic life through adulthood.

Skeletal Dysplasia

An inherited disorder of bone or cartilage development that may cause short or uneven growth, unusually shaped limbs, spine problems, or other differences in the skeleton. Effects vary widely between conditions.

Skeletal Limb Abnormalities

Skeletal limb abnormalities are differences in the formation, length, alignment, or structure of an arm or leg caused by genetic, developmental, vascular, injury, or other factors.

Skeletal Muscle

A type of voluntary, striated muscle tissue anchored to the skeleton via collagenous tendons that contracts to generate joint movement, maintain posture, and produce thermogenic heat. Composed of multinucleated, cylindrical muscle fibers containing highly organized myofibrils divided into repeating sarcomeres (the functional contractile unit, bounded by Z-discs and comprising interdigitating actin thin filaments and myosin thick filaments); contraction is triggered by acetylcholine release at neuromuscular junctions and mediated by calcium-troponin-tropomyosin cross-bridge cycling.

Alternate Names:
Skeletal Muscles; Striated Muscle; Voluntary Muscle

Skeletal Muscles

Plural form; see *Skeletal Muscle*.

Skeletal Muscle Tissue

Voluntary striated muscle attached to bones or other structures, composed of contractile fibers that generate movement, posture, heat, and joint stability.

Skeletal Myocytes

Skeletal myocytes are striated muscle cells responsible for voluntary movement, posture, heat production, and stabilization of joints.

Skeletal Survey

A set of X-rays of most of a child's bones, used especially when multiple injuries or a medical condition affecting bone development is suspected. It can show fractures, bone abnormalities, and signs of healing; imaging alone does not establish their cause.

Skeletal System

The skeletal system consists of bones, cartilage, joints, and supporting ligaments that provide structure, protect organs, enable movement, and store minerals.

Skeletal X-Ray

A skeletal X-ray series uses radiographs of selected bones and joints to evaluate fractures, alignment, bone density patterns, arthritis, infection, tumors, and developmental abnormalities.

Skeleton

The body's framework of bones and cartilage that supports movement and protects organs. It also stores minerals, contains marrow that makes blood cells, and provides attachment points for muscles and ligaments.

Skeletonization

Final stage of postmortem decomposition where soft tissues, organs, and skin have completely decayed or been scavenged, leaving only clean osseous skeletal remains.

Skene Gland Cyst

A fluid-filled sac that forms when a Skene gland, also called a paraurethral gland, becomes blocked. These glands are located beside the opening of the urethra. Small cysts may cause no symptoms. Larger or infected cysts may cause pain, painful urination, difficulty passing urine, pain during sex, recurrent urinary infections, or an abscess. Diagnosis is usually made by pelvic examination. Symptomatic cysts may need surgical removal or marsupialization.

Skilled Nursing Facility

A facility where people receive 24-hour nursing care and rehabilitation after illness, injury, surgery, or a hospital stay. Care may include wound care, medicines, injections, therapy, and help with daily activities until the person can return home or move to another setting.

Skilled Nursing Or Rehabilitation Facilities

Facilities that provide 24-hour nursing care, rehabilitation, medication management, and assistance with daily activities after illness, injury, surgery, or functional decline.

Skin

The body's outer covering, consisting mainly of the epidermis and dermis with appendages such as hair, nails, and glands. It protects against injury, infection, ultraviolet light, and water loss; detects touch, pressure, pain, and temperature; helps regulate body temperature; and contributes to immune defense and vitamin D production.

Skin Abscess

A painful, swollen pocket of pus under the skin, usually caused by a bacterial infection. It may need drainage and antibiotics.

Skin Absorption

Movement of a substance through the skin into underlying tissues or the bloodstream. Absorption depends on the substance, skin condition, contact time, and exposed area.

Skin Aging

Natural aging and long-term sun exposure gradually thin and dry the skin, reduce elasticity, slow healing, and cause wrinkles or dark spots. Limiting ultraviolet exposure, using protective clothing, and applying broad-spectrum sunscreen can reduce further damage.

Skin Aging And Appearance

Skin aging is a complex biological process influenced by both intrinsic factors, such as genetics and natural aging, and extrinsic factors, particularly ultraviolet radiation exposure.

Skin Allergies And Contact Dermatitis

Inflammatory skin reactions triggered by exposure to allergens or irritants that come into direct contact with the skin.

Skin Allergy Testing

Tests in which small amounts of suspected allergens are placed on or just under the skin and the reaction is observed. They can show sensitization to foods, medicines, venoms, or environmental allergens; a positive result does not by itself establish clinical allergy.

Skin And Aging

Skin aging involves intrinsic and extrinsic changes. Intrinsic aging causes thinning, wrinkling, and fragility. Extrinsic (photo)aging causes wrinkles, telangiectasias, lentigines, and actinic keratoses. Collagen loss, elastin degradation, and decreased cell turnover contribute to aging skin.

Skin And Environment

Environmental factors significantly affect skin health. Pollution causes oxidative stress, inflammation, and accelerated aging. Particulate matter penetrates skin, generating free radicals. Blue light from screens causes hyperpigmentation, particularly in darker skin tones. Indoor heating and air conditioning cause dryness.

Skin Appendages

Structures that grow from or lie within the skin, including hair follicles, oil glands, and sweat glands. They help lubricate and cool the body and can be affected by acne, infection, inflammation, or inherited disorders.

Skin Barrier

Alternate term; see *Skin Barrier Function*.

Skin Barrier Function

The outer skin barrier limits water loss and helps

keep out irritants, allergens, and germs. Its tightly packed surface cells and natural oils maintain protection; injury or inflammation can make skin dry, cracked, and more vulnerable.

Skin Biopsy

Removal of a small skin sample for examination under a microscope. It can help diagnose skin cancer, infection, inflammatory disease, blistering disease, or an unexplained rash; the method depends on the lesion.

Skin Biopsy Methods

The sampling method is chosen according to the lesion's appearance and depth. A punch takes a round full-thickness sample, a shave removes a superficial layer, and an excision removes the whole lesion when complete removal is appropriate.

Skin Biopsy Techniques

Skin biopsy is selected according to the suspected diagnosis and lesion depth. Punch biopsy samples full-thickness skin; shave biopsy samples superficial lesions; excisional biopsy removes an entire small lesion; and incisional biopsy samples part of a large lesion.

Skin Blushing/Flushing

Temporary reddening or warming of the skin caused by widening of small blood vessels. It may result from heat, emotion, exercise, fever, medicines, or hormone changes.

Skin Cancer

Cancer that begins in cells of the skin. Common types include basal cell carcinoma, squamous cell carcinoma, and melanoma; less common types arise from other skin structures. Risk is influenced by ultraviolet exposure, immune suppression, genetic susceptibility, and certain preexisting lesions. A skin cancer may appear as a changing, bleeding, growing, scaly, or nonhealing spot.

Alternate Names:
Cutaneous Malignancy

Skin Cancer Epidemiology

Skin cancers are common and include basal-cell carcinoma, squamous-cell carcinoma, and melanoma. Incidence and mortality vary by tumor type, geography, skin phenotype, ultraviolet exposure, immune status, and access to diagnosis and treatment.

Skin Cancer Reconstruction

Reconstructive repair of a defect after removal of skin cancer. Depending on the size, depth, and location, repair may use direct closure, a skin graft, a local or regional flap, or free tissue transfer to restore protection, function, and appearance.

Skin Cancer Screening

Examination of the skin for new or changing spots, especially in people at increased risk. Clinicians may use a full-body examination, a magnifying instrument, or a biopsy; routine screening recommendations vary by individual risk.

Skin Cancer Staging

Determining how far a skin cancer has grown or spread to guide treatment and estimate outlook. For melanoma, staging considers tumor thickness and ulceration, lymph-node involvement, and spread to distant sites; the exact system depends on cancer type.

Skin Cancer Surgery

Surgery to remove skin cancer with a margin of apparently healthy tissue. The method depends on the cancer type, size, location, and spread and may include standard excision or Mohs surgery, which checks the edges during removal.

Skin Carcinoma

Cancer arising from skin cells, most commonly basal-cell or squamous-cell carcinoma. It may appear as a changing sore, lump, scaly patch, or wound that does not heal and needs examination.

Skin Care

Measures that protect and maintain the skin, including gentle cleansing, moisturization, sun protection, wound care, avoidance of irritants, and treatment

of identified disease.

Skin Care And Incontinence

Skin protection for people with urine or stool leakage, including gentle cleansing, thorough drying, absorbent products, barrier creams, regular changing, and treatment of the underlying cause.

Skin Cells

Skin cells form the layers of the skin and include keratinocytes, melanocytes, immune cells, and sensory cells. They provide protection, pigmentation, sensation, and repair.

Skin Color

The visible color of skin, determined mainly by melanin, blood flow, oxygenation, and other pigments.

Skin Culture

Laboratory testing of a swab, scraping, fluid, or tissue sample from the skin to identify bacteria, fungi, or other organisms causing infection.

Skin Cyst

A closed sac under or within the skin, often filled with fluid, keratin, or other material. Many are harmless; pain, infection, or change in size or appearance may occur.

Skin Diseases

Conditions affecting skin, hair, nails, glands, or subcutaneous tissue, including infection, inflammation, neoplasia, and genetic disorders.

Skin Erosion

A shallow loss of the epidermis that leaves a moist or crusted surface but does not extend deeply into the dermis, often caused by friction, scratching, blister rupture, or inflammation.

Skin Examination

Systematic inspection and palpation of the skin, hair, nails, and mucous membranes to assess color, lesions, texture, distribution, vascular signs, infection, and cancer warning features.

Skin Findings In Newborns

Common skin changes in newborns, such as milia, newborn rash, peeling, birthmarks, or bluish hands and feet. Most are harmless; fever, blisters, widespread redness, or an ill appearance can signal infection or another serious condition.

Skin Flaps

Pieces of skin and underlying tissue moved to cover a wound while keeping or reconnecting their blood supply. Flaps may come from nearby tissue or another part of the body and are used after injury, cancer removal, or reconstructive surgery.

Skin Graft

Skin taken from one area of the body and placed over a wound, burn, ulcer, or surgical defect. A graft must obtain blood from the wound surface to survive and may fail, scar, change color, or require further surgery.

Alternate Names:
Skin Grafting

Skin Grafting

Unhyphenated variant; see *Skin-Grafting*.

Skin-Grafting

Surgery that moves skin from a donor area to cover a wound, burn, ulcer, or tissue defect. The graft needs blood supply from the wound bed and may fail, scar, or change color.

Skin Immune System

The cells and protective substances in skin that recognize germs, remove damaged cells, and control inflammation. It works with the skin barrier to prevent infection and support healing after injury.

Skin Induration

Unusual hardness or firmness of the skin or tissue beneath it. Causes include scar formation, inflammation, swelling, infection, an infiltrating disease, or a growth; examination determines the cause.

Skin Infection

Infection of the skin or underlying soft tissue, commonly caused by bacteria, fungi, or viruses. Redness, warmth, swelling, pain, drainage, or fever may occur; rapidly spreading redness, severe pain, blisters, or systemic illness can indicate deep or spreading infection.

Skin Integrity

The condition of skin and underlying tissue when it remains intact and protected from injury. Prolonged pressure, friction, moisture, poor blood flow, and illness can cause breakdown, especially over bony areas.

Skin Irritation

Inflammation or discomfort caused by direct contact with an irritant, often producing redness, burning, itching, dryness, or scaling.

Skin Lesion

An abnormal area of skin that may result from infection, inflammation, injury, allergy, or a benign or malignant growth.

Skin Lesion Aspiration

Removal of fluid or cells from a skin lump with a needle for testing or drainage.

Skin Lesion Biopsy

Removal of part or all of a skin lesion for microscopic examination to diagnose infection, inflammatory disease, benign tumor, or skin cancer.

Skin Lesion KOH Exam

Microscopic examination of skin scrapings treated with potassium hydroxide to detect fungal hyphae or yeast in suspected superficial fungal infection.

Skin Lesion Of Blastomycosis

A blastomycosis skin lesion results from dissemination of Blastomyces fungal infection and may appear as verrucous or ulcerated lesions with raised borders.

Skin Lesion Removal

Removal of an unwanted, suspicious, or diseased area of skin by shaving, cutting, freezing, scraping, or another method. Tissue may be sent for laboratory examination; bleeding, infection, scarring, and incomplete removal are possible.

Skin Lumps

Skin lumps are localized bumps or masses caused by cysts, lipomas, inflamed follicles, infections, benign tumors, or less commonly cancer; persistence or change warrants assessment.

Skin Mastocytoma

A localized collection of mast cells in the skin, usually a yellow-brown or reddish plaque or nodule in a child that may swell, itch, or redden when rubbed.

Skin Microbiome

The community of bacteria, fungi, viruses, and other microorganisms normally living on the skin. They interact with the skin and immune system; changes in this community may contribute to some skin diseases.

Skin Mycosis

A fungal infection of the skin, hair, or nails, also called cutaneous mycosis or dermatomycosis. It may be superficial or extend deeper into the skin and can cause scaling, itching, inflammation, discoloration, or lesions; diagnosis depends on the appearance and, when needed, microscopy or culture.

Skin Necrosis

Death of skin tissue from ischemia, infection, pressure, toxins, trauma, vasculitis, or severe inflammation, producing discoloration, blisters, ulcers, or black eschar.

Skin Neoplasm

A skin neoplasm is an abnormal growth in the skin that may be benign, precancerous, or malignant.

Skin Nodules

Firm, raised lumps in or under the skin. They may

result from inflammation, infection, injury, cysts, or benign or malignant growths.

Skin Of Color

A broad term for people with more deeply pigmented skin. Some conditions may appear differently, and dark marks or raised scars may develop more readily after inflammation or injury; skin cancer can occur in every skin tone.

Skin Or Nail Culture

Laboratory culture of skin, hair, or nail material to identify bacteria or fungi when infection is suspected; results require clinical correlation.

Skin Pigmentation

Skin color is produced mainly by melanin made by pigment-producing cells. Sun exposure, hormones, inflammation, medicines, and illness can make areas darker or lighter; new or changing discoloration may reflect a developing skin condition.

Skin Rash

A visible change in the skin, such as redness, scaling, bumps, blisters, or discoloration. Causes include infection, allergy, inflammation, medicines, heat, and systemic disease; rapid spread, skin pain, blistering, fever, or mucosal involvement can signal serious illness.

Skin Resurfacing

Procedures that improve skin texture, scars, wrinkles, or uneven color by removing or changing surface skin layers. Methods include lasers, chemical peels, and abrasion; risks include infection, pigment changes, and scarring.

Skin Scraping

Removal of a small amount of surface skin scale or material for laboratory examination, commonly to look for fungi, mites, or other causes of a rash.

Skin Self-Exam

A person's own inspection of the skin for new or changing moles, sores, lumps, or patches.

Skin Tag

A benign, pedunculated cutaneous polypoid growth composed of a core of loose fibrovascular tissue covered by normal epidermis. Commonly arising in intertriginous skin folds where friction occurs (such as the neck, axillae, inframammary creases, and groin), skin tags are strongly correlated with advancing age, obesity, insulin resistance, metabolic syndrome, and pregnancy.

Alternate Names:
Skin Tags; Acrochordon; Fibroepithelial Polyp

Skin Tags

Plural form; see *Skin Tag*.

Skin Test

A test that uses the skin's response to help diagnose a condition. Examples include allergy prick or patch tests and the tuberculin skin test for tuberculosis infection; the method and meaning depend on the test.

Skin Turgor

The skin's ability to return to its normal position after being gently pinched. Reduced turgor may occur with dehydration, although it is less reliable in older adults.

Skin Writing

A skin condition in which light scratching or pressure causes temporary raised red lines or welts.

Skipped Heartbeats

Alternate name; see *Palpitation*.

Skull

The bony framework of the head that protects the brain and supports the face, eyes, ears, and jaw.

Skull Fracture

A break in one or more skull bones caused by trauma. It may occur with bleeding inside the skull, brain injury, or leakage of clear fluid from the nose or ear.

Skull X-Ray

A skull X-ray uses low-dose radiation to show skull bones and may help assess selected fractures, foreign bodies, or bone abnormalities.

Slanted Ear

An ear whose upper edge slopes unusually compared with typical ear orientation; it may be isolated or part of a genetic condition.

SLAP Lesion

A tear in the upper rim of the shoulder socket, sometimes where the biceps tendon attaches. It may follow a fall, lifting injury, or repeated overhead activity and can cause pain, clicking, weakness, or instability.

Slapped Cheek Disease

Alternate name; see *Parvovirus Infection*.

Slapped Cheek Syndrome

Erythema infectiosum, a parvovirus B19 infection causing a slapped-cheek rash and sometimes joint or hematologic complications.

SLAP Tears

Tears of the superior glenoid labrum extending from anterior to posterior, sometimes involving the biceps tendon attachment. They may cause pain, clicking, or instability, especially with overhead activity.

SLE

Systemic lupus erythematosus, a chronic autoimmune disease that can affect skin, joints, kidneys, blood, nervous system, and other organs.

Sleep

A naturally recurring state in which awareness and responses to the surroundings decrease while the brain and body follow organized patterns. Sleep supports learning, memory, emotional health, physical recovery, immune function, and metabolism.

Alternate Names:
Slumber

Sleep Apnea

Repeated pauses or reductions in breathing during sleep. It can result from the airway closing, the brain failing to signal breathing, or both, and may cause loud snoring, gasping, poor sleep, daytime sleepiness, and low oxygen.

Sleep Apnoea

Alternate name; see *Sleep Apnea*.

Sleep Architecture

The pattern and order of sleep stages during a night or other sleep period. It includes lighter sleep, deep sleep, and dream-related REM sleep; illness, medicines, age, stress, and sleep disorders can change how much time is spent in each stage.

Sleep Bruxism

Repeated grinding or clenching of the teeth during sleep, which may cause tooth wear, jaw pain, or headaches.

Sleep Debt

The accumulated difference between the amount of sleep a person needs and the amount obtained over time; it may impair alertness, mood, cognition, and performance.

Sleep Diary

A daily record of sleep and wake times, awakenings, naps, medicines, caffeine, and related factors used to assess sleep patterns and treatment response.

Sleep Disorder

A broad medical or psychiatric condition characterized by disturbances in sleep quality, timing, architecture, or duration, or by abnormal physiological events occurring during sleep or sleep-wake transitions. Major classifications include insomnias, sleep-related breathing disorders (obstructive and central sleep apnea), central disorders of hypersomnolence (narcolepsy, idiopathic hypersomnia), circadian rhythm sleep-wake disorders, parasomnias (NREM and REM sleep parasomnias), and sleep-related movement disorders (restless legs syndrome). Diagnosis is supported by polysomnography and

actigraphy.

Alternate Names:
Sleep Disorders; Somnipathy

Sleep Disorders

Plural form; see *Sleep Disorder*.

Sleep Disorders in Children

Children and teens need age-appropriate sleep, and disorders may involve insomnia, circadian delay, sleep apnea, parasomnias, restless legs, or insufficient opportunity. Snoring, pauses in breathing, unusual daytime sleepiness, mood change, or poor school performance warrants evaluation.

Sleep Disorders In Older Adults

Sleep problems in later life, including insomnia, sleep apnea, restless legs, and circadian changes; contributing factors include medicine effects, pain, depression, and medical illness.

Sleep Efficiency

The percentage of time in bed that a person is actually asleep. It is calculated by dividing total sleep time by time in bed; a low value may occur with insomnia, repeated awakenings, or other sleep disorders.

Sleep Epilepsy

Epilepsy in which seizures occur predominantly during sleep or transitions between sleep and wakefulness. Events may be subtle or involve movements, vocalizations, confusion, or injury and require neurologic evaluation.

Sleep Fragmentation

Repeated brief awakenings or partial arousals that interrupt otherwise continuous sleep. It can reduce restorative sleep and occur with sleep apnea, pain, noise, movement disorders, medicines, or illness.

Sleep Hygiene

Habits and surroundings that support regular, restorative sleep. Helpful measures include a consistent schedule, a dark and quiet bedroom, relaxing before bed, and limiting caffeine, alcohol, nicotine, and stimulating screen use near bedtime.

Sleep Terror Disorder

A non-rapid eye movement (NREM) sleep parasomnia characterized by abrupt awakenings with panicky screams, intense autonomic arousal, and motor agitation; see *Night Terrors*.

Sleeping Sickness

Alternate name; see *Human African Trypanosomiasis*.

Sleeplessness

Alternate lay term; see *Insomnia Disorder*.

Sleep Medicine

The medical specialty focused on disorders of sleep and wakefulness. It includes insomnia, sleep-related breathing disorders, narcolepsy and other hypersomnolence disorders, circadian rhythm disorders, parasomnias, and sleep-related movement disorders; evaluation may involve sleep history and physiologic testing.

Sleep Onset Latency

The time required to fall asleep after attempting to sleep; prolonged latency may occur with insomnia, anxiety, circadian misalignment, stimulants, or another sleep disorder.

Sleep Paralysis

Temporary inability to move or speak when falling asleep or waking, while awareness is partly or fully preserved. Episodes usually last seconds to minutes and may include frightening hallucinations. Recurrent episodes can be associated with sleep deprivation, irregular sleep, narcolepsy, or other sleep disorders.

Sleep Related Breathing Disorders

Sleep-related breathing disorders cause abnormal ventilation or oxygenation during sleep, including obstructive and central sleep apnea and sleep-related hypoventilation. Snoring, witnessed pauses, gasp-

ing, morning headache, or daytime sleepiness may prompt sleep testing and treatment.

Alternate Names:
Sleep-Disordered Breathing; SDB

Sleep-Related Hypoventilation

Breathing that is too shallow during sleep to remove enough carbon dioxide or maintain normal oxygen. It can result from obesity, lung or muscle disease, chest-wall problems, brain disorders, or sedating medicines.

Sleep-Related Hypoxemia

Abnormally low blood oxygen during sleep that may occur with sleep-disordered breathing, lung disease, neuromuscular weakness, hypoventilation, or other medical conditions.

Sleep Spindles

Short bursts of regular brain activity that occur mainly during stage 2 non-REM sleep. They are seen on a sleep recording and are thought to help protect sleep and process newly learned information.

Sleep Study

A comprehensive overnight diagnostic sleep recording that monitors brain waves, oxygen saturation, heart rhythm, and respirations; see *Polysomnography*.

Sleep Studies

Overnight tests that record brain activity, eye movements, heart rate, breathing, blood oxygen, body position, and limb movements. They help identify sleep apnea, unusual movements, seizures during sleep, and other sleep disorders.

Alternate Names:
Sleep Diagnostic Study; Nocturnal Somnography

Sleepwalking

Recurrent walking or other complex behavior during sleep, usually with little memory afterward. It is more common in children and may be triggered by sleep deprivation, stress, fever, medicines, or other sleep disorders; injury prevention is important.

Sleepwalking And Children

Sleepwalking in children is usually benign and often resolves with age; regular sleep, hazard prevention, and evaluation of frequent, violent, injurious, or atypical episodes are important.

Sleepwalking Disorder

A sleep disorder involving repeated episodes of walking or other complex behavior during sleep, usually with little memory afterward, that cause injury, distress, sleep disruption, or impaired daytime functioning.

Sleeve Gastrectomy

An operation that removes most of the stomach, leaving a narrow sleeve-shaped section. It limits how much food the stomach can hold and changes appetite hormones; bleeding, leakage, reflux, and nutritional problems can occur.

Sleeve Lobectomy

An operation that removes a lung lobe and the nearby affected part of the main breathing tube, then reconnects the remaining airway. It can remove a centrally located tumor while preserving more healthy lung than removing the whole lung. Possible complications include air leakage, narrowing of the airway, infection, and bleeding.

Alternate Names:
Bronchial Sleeve Resection; Sleeve Resection of the Lung

Sliding Filament

The process by which muscles contract: two protein fibers slide past each other, shortening the muscle's working units. Calcium and energy from ATP allow the fibers to attach, pull, release, and repeat the cycle.

Sliding Hiatal Hernia

A sliding hiatal hernia occurs when the stomach and gastroesophageal junction move upward through the diaphragm, often contributing to reflux.

Sling

A supportive device or surgically placed strip used to support an injured limb or urinary structures.

Slipped Capital Femoral Epiphysis

A hip problem in growing children or teenagers in which the upper end of the thigh bone slips through its growth area. It may cause hip, groin, thigh, or knee pain and a limp; continued slipping can damage the hip joint and its blood supply.

Alternate Names:
SCFE

Slipped Disc

A common lay term for a herniated or prolapsed intervertebral disk, in which disk material extends beyond its normal boundary and may irritate a nearby nerve, causing back or neck pain, numbness, or weakness.

Slipped Disk

A spinal disk whose tough outer layer tears or weakens, allowing its inner material to bulge and irritate nearby nerves. It may cause back or neck pain, numbness, weakness, or sciatica.

Alternate Names:
Herniated Disc; Intervertebral Disc Prolapse

Slipped Vertebra

Forward movement of one spinal bone compared with the bone below it, also called spondylolisthesis. It may cause back pain, stiffness, hamstring tightness, or pressure on a nerve, although some people have no symptoms.

Alternate Names:
Spondylolisthesis

Slipping Rib Syndrome

Pain caused by excessive movement of the lower ribs, usually from loosened cartilage. The pain may be sharp and can sometimes be reproduced by pressing or moving the rib.

Slit Lamp

An eye-examination microscope that uses magnification and a narrow beam of light to inspect the eyelids, cornea, lens, and other eye structures. It helps detect infection, injury, cataract, and glaucoma-related changes.

Alternate Names:
Biomicroscope

Slit-Lamp Biomicroscope

Alternate name; see *Slit Lamp*.

Slit Lamp Biomicroscopy

A detailed eye examination using a bright, narrow beam of light and a microscope to view the front of the eye. Additional lenses can help examine the retina and other structures farther back.

Slit-Lamp Exam

Alternate name; see *Slit Lamp Biomicroscopy*.

Slit Lamp Examination

A fundamental ophthalmological diagnostic procedure utilizing a specialized high-intensity light source focused through a slit aperture paired with a binocular biomicroscope to examine the anterior segment of the eye (cornea, anterior chamber, iris, crystalline lens) and vitreous under high magnification.

Alternate Names:
Biomicroscopy

Slit-Lamp Examination

A diagnostic ophthalmologic procedure utilizing a binocular biomicroscope paired with an adjustable, high-intensity slit-beam light source, allowing detailed optical sectioning and high-magnification stereoscopic examination of the eyelids, cornea, anterior chamber, iris, lens, and anterior vitreous.

Alternate Names:
Slit-Lamp Biomicroscopy; Anterior Segment Biomicroscopy

SLL

Alternate name; see *Small Lymphocytic Lymphoma*.

Slough

Soft, dead, or detached tissue covering or separating from a wound, ulcer, or inflamed surface. It can delay healing and may need gentle removal after blood flow, infection, and the wound's depth are assessed.

Slowed or Arrested Breathing

Pathologic depression of the respiratory rate (bradypnea) or complete cessation of ventilatory airflow (apnea), resulting from central nervous system depression, drug toxicity (such as opioid overdose), traumatic brain injury, upper airway obstruction, or terminal cardiopulmonary arrest requiring emergent airway management and resuscitation.

Alternate Names:
Bradypnea; Apnea; Respiratory Arrest; Hypopnea

Slow Heartbeat

Alternate name; see *Bradycardia*.

Slow Heart Rate

A heart rate slower than expected, often below 60 beats per minute in an adult. It may be normal in some people but can cause dizziness, fainting, tiredness, or shortness of breath when it reduces blood flow.

Slow-Twitch Fiber

A type of muscle fiber suited to steady activity over a long time. It uses oxygen efficiently and resists tiredness, helping with posture, walking, and endurance activities rather than short bursts of maximum force.

Alternate Names:
Type I Muscle Fiber; Red Muscle Fiber

Slow-Wave Sleep

The deepest stage of non-REM sleep, marked by slow brain waves and reduced response to sounds or touch. It supports physical recovery, memory, and hormone release and is often reduced by ageing, illness, alcohol, or sleep disruption.

Alternate Names:
Deep Sleep; Delta Sleep; Stage N3 Sleep

Small Airway Disease

Narrowing, inflammation, or blockage of the smallest breathing tubes in the lungs. It may cause cough, wheezing, breathlessness, or trapped air and can occur with asthma, COPD, infection, or other lung disease.

Small Bowel Adenocarcinoma

A malignant gland-forming epithelial tumor of the small intestine. It is uncommon and may cause occult bleeding, obstruction, abdominal pain, or weight loss; risk is increased in selected inherited and inflammatory disorders.

Small Bowel Bacterial Overgrowth

An abnormal increase in bacteria in the small intestine, where bacterial numbers are normally lower than in the large intestine. It can cause bloating, abdominal discomfort, diarrhea, weight loss, or poor nutrient absorption. Methane-producing archaea are addressed separately as intestinal methanogen overgrowth.

Small Bowel Bleeding

Bleeding from the small intestine. It may cause black or maroon stool, hidden blood loss, or iron-deficiency anemia and may require capsule endoscopy, enteroscopy, imaging, or other tests to find the source.

Small Bowel Follow-Through

A series of X-rays taken after swallowing contrast, usually barium, to follow its movement through the small intestine. It can show narrowing, obstruction, inflammation, or abnormal transit.

Small Bowel Obstruction

A partial or complete blockage that stops food, liquid, or gas from moving through the small intestine. It may result from scar tissue, a hernia, a tumor, or narrowing from inflammation. It can cause belly pain, swelling, vomiting, and inability to pass stool or gas.

Small-Bowel Obstruction

Alternate spelling; see *Small Bowel Obstruction*.

Small Bowel Prolapse

Alternate name; see *Enterocele*.

Small Bowel Resection

Surgical removal of a diseased segment of the small intestine followed by reconnection or stoma formation when needed.

Small Bowel Series

A series of X-ray images of the small intestine after swallowing contrast material, usually barium. It can show narrowing, blockage, abnormal movement, inflammation, tumors, or changes from Crohn disease.

Small Bowel Tissue Smear/Biopsy

Examination of cells or a tissue sample from the small intestine to investigate poor nutrient absorption, celiac disease, inflammation, infection, or a tumor.

Small-Bowel Transplantation

Surgery replacing a severely diseased or nonfunctioning small intestine with donor bowel. It may help people unable to receive enough nutrition through the gut but requires lifelong rejection-preventing medicines and monitoring.

Small-Bowel Volvulus

Twisting of the small intestine that can block its contents and cut off its blood supply. It may cause severe abdominal pain, vomiting, swelling, and inability to pass stool or gas.

Small Calorie

A small calorie is a unit of heat energy; food labels usually use a kilocalorie, written Calorie with a capital C, equal to 1,000 small calories.

Small Cell Carcinoma

A fast-growing cancer made of small cells, most often beginning in the lung and strongly linked to smoking. It may shrink at first with treatment but often returns or spreads early, including to the brain.

Small-Cell Carcinoma

A fast-growing cancer, most often starting in the lung and strongly linked with smoking. It may shrink quickly with chemotherapy or radiation but often returns or spreads early, including to the brain.

Small Cell Lung Cancer

An aggressive lung cancer strongly associated with smoking and early spread. It often responds initially to chemotherapy or radiation, but recurrence is common and treatment depends on the stage and overall health.

Small Cell Lung Carcinoma

An aggressive, high-grade neuroendocrine malignancy of the lung strongly linked to heavy cigarette smoking, characterized histologically by small sheets of cells with scant cytoplasm, granular nuclear chromatin ("salt-and-pepper"), absence of nucleoli, high mitotic rates, and frequent paraneoplastic syndromes (SIADH, Lambert-Eaton).

Alternate Names:
SCLC

Small Eye

An eye that is smaller than usual because it did not develop fully before birth. Vision may be reduced, especially when other eye structures are also affected, and assessment can identify associated conditions.

Small Fiber Neuropathy

Damage to tiny nerves that carry pain, temperature, and automatic body signals. It can cause burning feet, tingling, poor temperature sensation, abnormal sweating, digestive symptoms, or heart-rate changes; diabetes is one possible cause.

Small For Gestational Age

Birth weight or size below the expected range for gestational age, caused by constitutional small size, placental insufficiency, infection, genetic disease, or maternal factors.

Small Incision Lenticule Extraction

Surgery

Small incision lenticule extraction, or SMILE, is a laser eye procedure that removes a small piece of corneal tissue through a tiny incision to correct some cases of nearsightedness and astigmatism.

Small Intestinal Bacterial Overgrowth

An abnormal increase or change in bacteria within the small intestine, often causing bloating, abdominal pain, nausea, diarrhea, fullness, weight loss, or nutrient deficiency. Causes include impaired intestinal movement, structural problems, surgery, and some systemic diseases; these symptoms also occur in other conditions.

Small Intestinal Bacterial Overgrowth (SIBO)

Alternate name; see *Small Intestinal Bacterial Overgrowth*.

Small-Intestinal Cancer

Malignant tumors arising in the small intestine, classified mainly as adenocarcinoma, neuroendocrine tumors, lymphomas, or sarcomas. They are far less common than colorectal cancer and often present late with vague abdominal pain, bleeding, obstruction, or weight loss; risk is increased in some inherited syndromes, celiac disease, and Crohn disease. Diagnosis uses endoscopy, capsule endoscopy, or imaging, and treatment depends on the tumor type and stage.

Small Intestinal Fungal Overgrowth

A proposed condition in which excess fungi are found in the small intestine and may be associated with bloating, nausea, diarrhea, or abdominal discomfort. Symptoms are nonspecific and testing is not standardized, so the condition remains uncertain.

Small Intestinal Ischemia And Infarction

Inadequate blood supply to the small intestine that can progress to irreversible tissue death, perforation, sepsis, and shock.

Small Intestinal Mucosa

The inner lining of the small intestine. Its folds, villi, and microvilli greatly increase the area available for digestion and nutrient absorption.

Small Intestine

The long, coiled part of the digestive tract between the stomach and large intestine. It receives bile and pancreatic juices, completes digestion, and absorbs most nutrients and much of the body's water.

Small Intestine Aspirate And Culture

Collection and culture of fluid aspirated from the small intestine to evaluate suspected bacterial overgrowth or selected infections; the procedure is invasive and results require clinical correlation.

Small Intestine Cancer

A malignant tumor arising in the small intestine. Types include adenocarcinoma, neuroendocrine tumor, lymphoma, and sarcoma; symptoms and treatment depend on the tumor type and extent.

Small Intestine Prolapse

Alternate name; see *Enterocele*.

Small Lymphocytic Lymphoma

A usually slow-growing B-cell non-Hodgkin lymphoma that is closely related to chronic lymphocytic leukemia. It commonly causes enlarged lymph nodes and is diagnosed with tissue examination and immunophenotyping.

Smallpox

A severe contagious disease caused by variola virus, producing fever and rash; global eradication was certified in 1980.

Small Round Blue Cell Tumor

A tumor whose cells look small, round, and blue under a microscope. This appearance occurs in several cancers, especially in children, so additional tissue tests are needed to identify the exact type.

Small Saphenous Vein

A superficial vein running up the back of the calf and usually joining the popliteal vein behind the

knee. It helps return blood from the foot and calf to the heart.

Small Vessel Disease

Disease affecting small blood vessels, which can impair blood flow and contribute to brain, heart, kidney, or other organ problems. The specific term depends on the affected organ and cause.

Small-Vessel Vasculitis

A group of diseases that inflame small blood vessels and can affect the skin or internal organs. Skin involvement may cause raised purple spots, blisters, or ulcers; other symptoms depend on the organs involved. Leukocytoclastic vasculitis is a common biopsy pattern in skin-limited small-vessel vasculitis, but the terms are not interchangeable in every case.

SMART

A way to set goals that are specific, measurable, achievable, relevant, and time-limited. SMART goals state exactly what is wanted, how progress will be checked, and when the goal should be reached.

Alternate Names:
SMART Criteria; Specific Measurable Goals

Smashed Fingers

A finger injury caused by crushing, which may damage skin, nail, bone, tendon, or nerve. Deformity, severe pain, numbness, impaired movement, or blood under the nail can accompany a fracture or significant tissue injury.

Smear Of Duodenal Fluid Aspirate

A smear of duodenal fluid aspirate examines fluid from the first part of the small intestine for selected parasites or other microscopic findings.

Smegma

A buildup of shed skin cells, skin oils, and moisture in genital folds, including beneath the foreskin. It is a normal body material and can be removed with gentle washing.

Smell

The sense of detecting airborne chemicals through receptors in the nasal lining and processing the signals in the brain. Reduced or lost smell can follow infection, nasal disease, head injury, medicines, or neurologic disease.

SMILE

A laser eye operation that corrects short-sightedness and some short-sighted astigmatism. The laser creates a thin piece of tissue inside the cornea, which is removed through a small opening without making a larger corneal flap.

Smile Design

Planning smile based on facial features, gum display, tooth proportions. Digital smile design software available.

Smith Fracture

An extra-articular fracture of the distal radius with volar (palmar) displacement and angulation of the distal fracture fragment ('reverse Colles fracture'), typically caused by a direct fall onto a flexed wrist.

Alternate Names:
Reverse Colles Fracture; Volar Distal Radius Fracture

Smith-Lemli-Opitz Syndrome

A rare inherited disorder affecting cholesterol production before birth. It may cause growth and developmental problems, distinctive facial features, heart or limb abnormalities, feeding difficulty, and genital differences.

Smith-Magenis Syndrome

A genetic neurodevelopmental disorder, usually involving deletion of 17p11.2 or an RAI1 variant. It causes developmental delay, intellectual disability, distinctive facial features, sleep disturbance, behavioral dysregulation, and variable congenital abnormalities.

Smoke Evacuator

A device that captures and filters smoke produced

during surgery by electrical, laser, or ultrasonic instruments. Removing the plume reduces staff and patient exposure to particles, irritating gases, and potentially infectious material.

Smoke Inhalation

Injury from breathing smoke, hot gases, or combustion products, potentially causing airway burns, poisoning, and lung injury.

Smoke Inhalation Injury

Pulmonary injury caused by inhalation of toxic products of combustion.

Smokeless Tobacco

Smokeless tobacco delivers nicotine and causes dependence, oral lesions, gum recession, tooth loss, cardiovascular risk, and cancers of the mouth, throat, and pancreas. Quitting reduces harm, and counseling plus approved medicines improve cessation success.

Alternate Names:
Chewing Tobacco; Snuff; Dip

Smoker Keratosis

Alternate name; see *Leukoplakia*.

Smoker Lung

Alternate name; see *Chronic Obstructive Pulmonary Disease*.

Smoking

Inhalation of smoke from burning tobacco or other substances, associated with addiction, cancer, cardiovascular disease, and lung disease.

Smoking And Asthma

Smoking irritates and inflames airways, worsens asthma control, increases attacks, and reduces treatment response; stopping smoking and avoiding secondhand smoke improve outcomes.

Smoking And COPD

Smoking is the major preventable cause of COPD and accelerates lung-function loss; quitting reduces progression and exacerbations even after COPD is established.

Smoking and Pregnancy

Smoking during pregnancy exposes the fetus to nicotine and other harmful chemicals and increases risks such as poor growth, preterm birth, placental problems, and stillbirth. Stopping at any time is beneficial.

Smoking And Surgery

Smoking before or after an operation increases the risk of breathing problems, wound infection, poor healing, blood clots, heart complications, and failure of repaired tissue. Stopping as early as possible improves recovery, even if surgery is soon.

Smoking Cessation

The process of stopping tobacco or nicotine use. It may involve counseling, behavioral support, medicines, or nicotine replacement.

Smoking Cessation Medications

Medicines that reduce nicotine withdrawal and cravings, including nicotine replacement, bupropion, and varenicline, used with behavioral support and individualized for health risks and preferences.

Smoldering Multiple Myeloma

An asymptomatic plasma-cell disorder with increased clonal plasma cells or monoclonal protein but no myeloma-defining organ damage; it requires risk-based monitoring for progression to active multiple myeloma.

Alternate Names:
Asymptomatic Myeloma; Indolent Myeloma; SMM

Smooth Muscle

Muscle that works automatically in the walls of hollow organs, blood vessels, and airways. It controls processes such as bowel movement, bladder emptying, blood-vessel width, airway narrowing, and childbirth contractions.

Smothering

Mechanical obstruction of the external nose and mouth that prevents effective ventilation. It may be caused by a covering, compression, or an obstructing soft material; findings are often nonspecific and must be interpreted with the scene, history, and complete examination.

Snake Bite

An injury resulting from the penetration of fangs from a venomous or non-venomous snake, which in venomous species introduces complex toxin mixtures into human tissue. Envenomation effects are classified based on venom components into cytotoxins (causing severe tissue necrosis, pain, and compartment syndrome), hemotoxins/coagulotoxins (causing consumption coagulopathy and fatal systemic hemorrhage), and neurotoxins (blocking presynaptic or postsynaptic neuromuscular transmission, causing ptosis, bulbar palsy, and respiratory arrest). Management prioritizes immobilization, monitoring for coagulopathy and compartment syndrome, and prompt administration of species-specific antivenom.

Alternate Names:
Snake Bites; Snake Envenomation

Snake-Bite

A wound from a snake that may cause local injury, envenomation, infection, or systemic toxicity.

Snake Bites

Plural form; see *Snake Bite*.

Snapping Finger

Trigger finger, painful catching or locking of a finger caused by stenosing inflammation around a flexor tendon.

Snapping Hip Syndrome

A clicking or snapping sensation in the hip, sometimes with pain, caused by a tendon moving over bone or by a problem inside the joint. Activity adjustment and exercises often help; persistent pain may need imaging or other treatment.

Sneddon Syndrome

A rare disorder in which small arteries become blocked, causing a net-like purplish skin pattern and repeated strokes or stroke-like events. Headache, high blood pressure, memory problems, or heart-valve changes may also occur.

Sneezing

A forceful reflex expulsion of air through the nose and mouth, often triggered by nasal irritation.

Snellen Chart

A chart of letters or symbols used to measure visual acuity at a specified distance.

Snoring

Noisy breathing during sleep caused by vibration of relaxed or narrowed tissues in the throat. It can be harmless, but loud frequent snoring with pauses in breathing, choking, morning headaches, or daytime sleepiness may indicate sleep apnoea.

Snoring And Sleep Apnea

Snoring is the sound produced by vibrating soft tissues in the upper airway during sleep, often resulting from partial airway obstruction. Sleep apnea is a more serious condition characterized by repeated episodes of complete or partial airway collapse during sleep, leading to intermittent hypoxia, frequent arousal, and fragmented sleep.

Snort

A snort is a forceful nasal or respiratory sound; it may occur with congestion, sleep-disordered breathing, irritation, or inhalation of a substance.

Snot

Alternate informal term; see *Mucus*.

Snow Blindness

A painful temporary burn of the eye's clear front surface caused by intense ultraviolet light, often reflected from snow, ice, water, or sand. Symptoms may include gritty pain, tearing, redness, light sensitivity, and blurred vision.

SNRIs

A class of antidepressants that increase the activity of serotonin and norepinephrine, chemical messengers between nerve cells. They treat depression, some anxiety disorders, and certain nerve or long-lasting pain conditions.

Snuff

Snuff is finely ground tobacco inhaled through the nose or placed in the mouth and can cause nicotine dependence, oral disease, and cardiovascular harm.

Snuffles

A runny or congested nose; in newborns, persistent snuffles can be a sign of congenital syphilis.

Social Anxiety Disorder

Intense, persistent fear of being judged, embarrassed, or rejected in social or performance situations. It can lead to avoidance, physical anxiety symptoms, and difficulty with school, work, relationships, or daily activities.

Social History

Information about a person's living situation, relationships, occupation, education, tobacco or substance use, diet, safety, and other social factors relevant to health and care.

Social Isolation

Limited contact or interaction with other people. Persistent isolation may adversely affect mental and physical health.

Social Media Addiction

Social media addiction is a pattern of difficult-to-control use that causes distress or interferes with sleep, work, school, relationships, or daily activities. It is not a universally defined formal diagnosis.

Social Phobia

Alternate name; see *Social Anxiety Disorder*.

Social Worker

A professional who helps patients and families manage practical, emotional, and social problems related to illness. They may arrange community resources, support discharge planning, assist with benefits, and provide counseling or referrals.

Sociophobia

Older term; see *Social Anxiety Disorder*.

Sodium

A mineral and body salt helping control fluid balance, nerves, muscles, and blood pressure; abnormal levels can be harmful.

Sodium Test

A blood test measuring serum sodium, the predominant extracellular cation governing fluid balance and osmotic pressure; see *Sodium* and *Basic Metabolic Panel*.

Sodium Bicarbonate Therapy

Treatment using sodium bicarbonate to make overly acidic blood less acidic in selected conditions, such as some cases of kidney disease. It can increase sodium and fluid load and alter blood potassium or calcium.

Sodium Bisulfate Poisoning

Poisoning from sodium bisulfate, an acidic chemical used in some cleaners and pool products. It can burn the skin, eyes, mouth, and digestive tract; fumes may irritate breathing passages.

Sodium Blood Test

A blood test measuring serum sodium, a major extracellular electrolyte involved in water balance and nerve and muscle function; results are interpreted with fluid status and other electrolytes.

Sodium Carbonate Poisoning

Poisoning from sodium carbonate, an alkaline chemical found in some cleaning products. It may irritate or burn the eyes, skin, mouth, and digestive tract; vomiting can worsen injury after swallowing it.

Sodium Chloride

The salt sodium chloride; sterile solutions are used for fluid replacement, irrigation, and drug dilution.

Sodium Cromoglycate

A mast-cell stabilizer used in selected allergy and asthma treatments; also called cromolyn.

Sodium Diatrizoate

A water-soluble iodinated contrast agent used for selected radiographic examinations. It can cause allergic-like reactions, kidney stress, or aspiration complications, so its use depends on the procedure and patient risks.

Sodium Hydroxide Poisoning

Severe poisoning from sodium hydroxide, a strong alkali in some drain and oven cleaners. It can rapidly burn the mouth, throat, esophagus, stomach, skin, and eyes; vomiting can cause further tissue injury or aspiration.

Sodium Hypochlorite

The active chemical in many bleach and disinfectant products. It kills many germs when used correctly, but concentrated liquid can burn skin, eyes, and the digestive tract; mixing it with acids or ammonia can release dangerous gas.

Sodium Hypochlorite Poisoning

Poisoning from bleach containing sodium hypochlorite. Swallowing may irritate or burn the mouth and digestive tract; mixing bleach with acids or ammonia can release dangerous gases causing cough, chest pain, or breathing failure.

Sodium In Diet

Dietary sodium helps regulate fluid balance and nerve and muscle function, but excess intake can raise blood pressure; processed foods are a major source.

Sodium Polystyrene Sulfonate

A resin that binds potassium in the intestine and has been used to lower high blood potassium. It can cause constipation and serious intestinal injury.

Sodium-Potassium Pump

A ubiquitous, electrogenic P-type ATPase enzyme complex in eukaryotic plasma membranes that hydrolyzes one molecule of ATP to export three sodium ions from the cell in exchange for importing two potassium ions, maintaining intracellular ion gradients, resting membrane potential, and cellular osmotic volume.

Alternate Names:
Na+/K+-ATPase

Sodium Urine Test

A urine test measuring sodium excretion, used with blood tests and clinical findings to assess volume status, kidney handling of sodium, and causes of hyponatremia or hypertension.

Sodium Valproate

An anticonvulsant and mood stabilizer that carries important pregnancy and reproductive risks, including birth defects and impaired fetal development.

Soft Markers For Aneuploidy

Ultrasound findings during pregnancy that are common in healthy fetuses but occur somewhat more often when there is an extra or missing chromosome. They do not diagnose a chromosome condition and are interpreted with other screening results.

Soft Tissue Augmentation

Restoration or enhancement of volume and contour in skin or underlying soft tissue using fillers, fat transfer, implants, or other reconstructive techniques.

Soft-Tissue Calcinosis

Buildup of calcium deposits in skin, muscles, tendons, or other soft tissues. The deposits may form hard lumps, cause pain or limited movement, break through the skin, or occur because of kidney disease, abnormal calcium levels, inflammation, or tissue damage.

Soft Tissue Injury

Damage to muscles, tendons, ligaments, fascia, skin, or other non-bony tissues, often caused by trauma or overuse.

Soft Tissue Rheumatism

An older broad term for pain or inflammation affecting muscles, tendons, ligaments, or bursae. Modern diagnosis usually names the specific condition, such as tendinitis, bursitis, or a muscle strain.

Soft Tissue Sarcoma

A group of malignant tumors arising in muscle, fat, fibrous tissue, blood vessels, or other connective tissues. Treatment depends on the subtype, location, stage, and relationship to nearby structures.

Alternate Names:
Soft-Tissue Malignancy; Musculoskeletal Sarcoma

Soft Tissue Tumors

Growths arising in muscle, fat, fibrous tissue, blood vessels, nerves, or other supporting tissues. Many are harmless, but some are cancerous; malignant tumors may be deep, enlarging, firm, painful, or persistent.

Soil Contamination

The presence of harmful substances in soil, such as heavy metals, pesticides, fuel, or industrial waste. People may be exposed through food, water, dust, or skin; testing, removal, covering, or treatment of the soil can reduce risk.

Solanine Plant Poisoning

Toxic ingestion of glycoalkaloids (primarily solanine and chaconine) present in high concentrations in green potato tubers, potato sprouts, and green nightshade foliage, causing acute gastrointestinal and neurological symptoms.

Alternate Names:
Potato Glycoalkaloid Toxicity; Green Potato Poisoning; Solanine Intoxication

Solar Elastosis

Solar elastosis is degeneration and thickening of elastic fibers in skin after long-term ultraviolet exposure. It contributes to leathery, wrinkled, yellowish sun-damaged skin.

Solar Keratosis

Alternate name; see *Actinic Keratosis*.

Solar Lentigines

Alternate name; see *Age Spots*.

Solar Plexus

A network of involuntary nerves in the upper abdomen, centered around the celiac plexus. It helps regulate abdominal organs, and irritation or injury may contribute to upper-abdominal pain or altered organ function.

Solar Purpura

Alternate name; see *Actinic Purpura*.

Solar Urticaria

A rare allergic-type reaction to sunlight or other light that causes itchy red raised patches within minutes on exposed skin. The rash usually improves after light exposure ends; widespread reactions can cause systemic symptoms.

Solder Poisoning

Poisoning from swallowing solder or inhaling fumes or dust during heating. Products may contain lead, tin, antimony, or other metals and can cause stomach symptoms, anemia, nerve injury, or kidney damage.

Soleus Muscle

A broad muscle beneath the gastrocnemius at the back of the lower leg. It joins the Achilles tendon and helps point the foot downward at the ankle, especially during standing and walking.

Solid Pseudopapillary Pancreatic Tumor

Alternate name; see *Pancreatic Cysts*.

Solitary Fibrous Tumor

A solitary fibrous tumor is a usually slow-growing

growth of connective tissue that can arise in the pleura, meninges, or other sites and may rarely behave aggressively.

Solitary Kidney

A solitary kidney means a person has one functioning kidney, because the other kidney is absent, removed, or not working. Many people remain healthy but may need blood-pressure and kidney-function monitoring.

Solitary Pulmonary Nodule

A single small spot in the lung surrounded by otherwise normal lung tissue. It may be a scar, infection, harmless growth, or early cancer; its size, appearance, and change over time determine whether follow-up or biopsy is needed.

Solution

A homogeneous mixture in which one or more substances are dissolved in a solvent; medical solutions include saline and antiseptics.

Solvent Abuse

Harmful inhalation or ingestion of volatile solvents, which can cause neurologic, cardiac, liver, kidney, or respiratory injury.

Solvent Exposure

Contact with organic solvents by inhalation, ingestion, or skin absorption. Acute exposure may cause irritation or central nervous system effects; repeated exposure may damage organs.

Somatic

Relating to the body, especially the body wall and musculoskeletal system, or to physical symptoms.

Somatic Mutation

A genetic change acquired by a body cell during life rather than inherited from a parent. It is passed to descendants of that cell and may contribute to cancer, but it usually is not passed to children.

Somatic Nervous System

The part of the peripheral nervous system that carries sensory information from the skin, muscles, and joints to the central nervous system and controls voluntary movement of skeletal muscles. Its functions also include reflexes that may occur without conscious control.

Somatic Symptom And Related Disorders

A group of mental disorders involving distressing physical symptoms, excessive health-related thoughts or behaviors, illness fears, functional neurologic symptoms, or intentionally produced illness. Examples include somatic symptom disorder, illness anxiety disorder, functional neurologic disorder, and factitious disorder. Malingering is separate because it involves intentional symptom production for an external benefit.

Somatic Symptom Disorder

A mental disorder marked by one or more distressing or life-disrupting physical symptoms and excessive or disproportionate thoughts, feelings, or behaviors related to them or associated health concerns. The symptomatic state is persistent, typically longer than six months; symptoms may be associated with a diagnosed medical condition and need not be medically unexplained.

Somatic Variant

A change in DNA acquired by a body cell after conception rather than inherited from a parent. It usually cannot be passed to children but may affect only some tissues or contribute to cancer.

Somatization

The experience or expression of psychological distress through physical symptoms such as pain, fatigue, or stomach problems. The symptoms are real and not intentional and may coexist with physical disease.

Somatostatin

A hormone made in the brain, pancreas, and digestive tract that slows growth hormone, insulin, glucagon, and digestive-hormone release. It also

reduces movement and secretion within parts of the digestive system.

Somatostatin Analog

A medicine that imitates somatostatin, a hormone that slows the release of several hormones and digestive secretions. It is used for selected hormone-producing tumors, acromegaly, severe diarrhea, and some bleeding conditions.

Somatostatinoma

A rare hormone-producing tumor usually arising in the pancreas or small intestine. It may cause diabetes, diarrhea or greasy stools, gallstones, weight loss, or no symptoms; treatment depends on whether it has spread and may include surgery or cancer medicines.

Somatotropic Pituitary Adenoma

A usually noncancerous pituitary tumor that makes too much growth hormone. In adults it causes acromegaly, with enlargement of the hands, feet, jaw, or other tissues; in children it can cause excessive height before growth ends.

Somatotropin

Growth hormone, produced by the pituitary gland. It supports childhood growth and influences protein, fat, and carbohydrate metabolism; excess or deficiency can cause characteristic growth and metabolic disorders.

Somatotype

A descriptive body-build classification; it is not a disease diagnosis.

Somnambulism

Sleepwalking or performing other activities while only partly awake, usually during deep sleep. Episodes are more common in children and may be triggered by lack of sleep, stress, illness, or medicines; safety measures are important, especially if wandering or injury occurs.

Somniloquy

Talking, laughing, or making sounds during sleep without knowing it. It is usually harmless, but frequent or disruptive episodes may occur with sleepwalking, nightmares, breathing problems during sleep, medicines, or other sleep disorders.

Alternate Names:
Nocturnal Vocalization; Sleep Utterance; Parasomnia Vocalization

Somnolence

Unusual sleepiness or a tendency to fall asleep when a person should be awake. It may result from too little sleep, medicines, alcohol or drugs, sleep disorders, metabolic illness, or neurologic disease.

Somnolent

Somnolent means unusually sleepy or drowsy, which may result from sleep deprivation, medicines, intoxication, metabolic illness, or neurologic disease.

Somogyi Effect

A proposed pattern of early-morning high blood glucose following unrecognized overnight hypoglycemia in a person using insulin. Counterregulatory hormones raise glucose after the low; it is distinguished from the dawn phenomenon by documented overnight hypoglycemia.

Alternate Names:
Somogyi Phenomenon; Rebound Hyperglycemia

Somogyi Phenomenon

A proposed pattern of morning hyperglycemia following unrecognized overnight hypoglycemia, with counterregulatory hormone release. Continuous or overnight glucose measurements are needed to distinguish it from the more common dawn phenomenon before changing therapy.

Sonographer

A healthcare professional trained to obtain diagnostic ultrasound images. They position the patient, operate the scanner, record appropriate views and measurements, and document findings for interpretation by a qualified clinician.

Sonohysterography

Sonohysterography is an ultrasound examination in which sterile fluid is placed in the uterus to outline the uterine cavity and assess problems such as polyps or fibroids.

Soporifics

Medicines or substances that cause sleepiness or promote sleep. They may impair alertness, coordination, and breathing, especially when combined with alcohol or other sedatives.

Sorbitol

A sugar alcohol used as a sweetener and in some medicines. Larger amounts draw water into the bowel and act as a laxative, but may cause gas, cramps, diarrhea, or dehydration.

Sore

Painful or tender, or describing an open area on skin or a moist body lining. A sore may result from injury, infection, inflammation, pressure, allergy, or another medical condition.

Sore Throat

Pain, scratchiness, or irritation in the throat. Common causes include viral infections, bacterial infections, allergies, dry air, smoke, voice strain, and acid reflux; drooling, inability to swallow, a muffled voice, neck swelling, or breathing difficulty can signal airway or deep-throat complications.

Sotalol

A beta-blocking, class III antiarrhythmic medicine used for selected cardiac rhythm disorders. It prolongs cardiac repolarization and the QT interval; excessive prolongation can trigger torsades de pointes, a potentially fatal ventricular arrhythmia. Reduced kidney function can increase drug exposure and risk.

Sotos Syndrome

A genetic disorder that causes unusually rapid growth in childhood, a large head, distinctive facial features, and delayed development or learning difficulties. Coordination, behavior, seizures, heart problems, or kidney problems may also occur. Growth usually slows with age. A change in the *NSD1* gene causes most cases.

Alternate Names:
Cerebral Gigantism; NSD1-Related Overgrowth Syndrome

Sound

Mechanical energy transmitted as waves and perceived by hearing; clinical sound assessment includes speech and respiratory or cardiac sounds.

Source Control

A procedure or intervention that eliminates, drains, debrides, or otherwise controls an anatomic focus of infection or contamination. Examples include drainage of an abscess, removal of infected tissue or device, and repair of a perforation.

Soy

Soy is a legume providing protein and isoflavones; it is nutritious for many people but can cause allergy and may interact with some medicines or thyroid treatment timing.

Soya

Soybean and products made from it; soy is a food source and can cause allergy in susceptible people.

Soybeans

Soybeans are legumes that provide protein, fiber, and compounds called isoflavones. They are used in foods such as tofu and soy milk; allergy is possible.

Soy Protein Intolerance

Adverse gastrointestinal reaction to soy proteins, most often seen in infants and young children. It may cause vomiting, diarrhoea, abdominal pain, blood or mucus in the stool, feeding difficulty, or poor growth.

Space Medicine

The medical specialty concerned with human health and performance during aviation and space travel. It addresses altered gravity, radiation, isolation, motion sickness, sleep, emergencies, exercise, and re-

turning safely to Earth.

Spacer

A chamber attached to a metered-dose inhaler that holds the released medicine briefly, making it easier to breathe into the lungs and reducing medicine left in the mouth or throat.

Alternate Names:
Valved Holding Chamber; Aerosol Spacer

Spanish Fly

A historical name for cantharidin-containing blister beetles; ingestion is poisonous and it is not a safe aphrodisiac.

Sparganosis

A rare tissue infection caused by the larval stage of *Spirometra* tapeworms. People may become infected by drinking water containing infected tiny crustaceans, eating raw or undercooked infected animals such as frogs or snakes, or applying infected animal tissue to the skin or eye. The larvae can form lumps under the skin or affect the eye, brain, or other organs.

Spasm

An involuntary, often painful tightening of one muscle or a group of muscles. Spasms may result from fatigue, dehydration, nerve disease, injury, medicines, inflammation, or problems affecting the brain or spinal cord.

Spasmodic Dysphonia

Spasmodic dysphonia is a focal laryngeal dystonia causing involuntary voice-box spasms and strained, breathy, or interrupted speech.

Spasmodic Torticollis

A form of neck dystonia with involuntary muscle contractions causing twisting, tilting, or abnormal neck posture.

Spasmus Nutans

An uncommon early-childhood syndrome of rapid shimmering eye movements, head nodding, and torticollis that usually resolves; similar signs can occur with neurologic or ocular disease.

Spastic

Describes muscles that are unusually tight and resist being stretched, especially when moved quickly. It may cause stiffness, jerking, abnormal posture, and difficulty controlling movement after nervous-system injury.

Spastic Colon

Alternate name; see *Irritable Bowel Syndrome*.

Spastic Diplegia

A clinical subtype of cerebral palsy historically associated with prematurity and periventricular leukomalacia, characterized by symmetrical spastic hypertonia affecting the lower extremities significantly more than the upper extremities, producing a characteristic "scissor gait" with hip adduction and internal rotation.

Spastic Dysphonia

A voice disorder caused by involuntary spasms of the muscles used for speaking, also called spasmodic dysphonia. The voice may sound strained, broken, breathy, or weak; assessment distinguishes it from structural and neurologic causes.

Spastic Gait

An abnormal walking pattern characterized by stiff, dragging legs, internal rotation of the foot, plantar flexion, and a semicircular circumduction movement of the affected lower limb during the swing phase. It is caused by unilateral or bilateral corticospinal tract (upper motor neuron) damage, such as in cerebral palsy, stroke, or multiple sclerosis.

Spasticity

Velocity-dependent increase in muscle tone caused by an upper motor-neuron lesion, producing stiffness, spasms, abnormal reflexes, and restricted movement.

Spatial Resolution

The ability of an imaging system to show two nearby small objects as separate. Better resolution shows finer detail, but the result depends on the scanner, movement, body part, scan settings, and the type of imaging used.

Speaking with a Tracheostomy Tube

Speech with a tracheostomy tube may be supported by cuff deflation, a speaking valve, or other methods when airflow and airway protection are adequate; specialist assessment is required.

Special Care Baby Unit

A ward within a hospital that provides specialist care for newborn babies who need additional support but not intensive care.

Special Stain

A histochemical stain that highlights a particular tissue component, organism, or deposited substance not adequately demonstrated by routine hematoxylin and eosin. Examples include periodic acid-Schiff, Ziehl-Neelsen, Congo red, and Gomori methenamine silver stains.

Specific Absorbed Fraction

The portion of energy released by radiation in one body area that is absorbed by a particular organ or tissue. It helps calculate the radiation dose during nuclear-medicine treatment or testing.

Specific Activity

The amount of radioactivity in a given amount of material. It matters when preparing radioactive medicines because enough activity is needed for imaging or treatment while limiting the amount of substance and unnecessary exposure.

Specific Gravity

A comparison of urine density with water that gives an estimate of how concentrated the urine is. It may rise with dehydration, sugar, or protein in urine and fall when the kidneys cannot concentrate urine or when excess fluid is present.

Specificity

A test's ability to correctly identify people who do not have the condition being tested.

Specific Learning Disorder

A developmental condition causing lasting difficulty learning or using reading, writing, or mathematics skills despite appropriate teaching. The difficulty interferes with school, work, or daily activities and is not explained only by poor instruction, vision, hearing, or intellectual disability.

Specific Phobia

A disorder involving marked, persistent fear or anxiety about a particular object or situation. The fear is excessive relative to the actual danger, leads to avoidance or intense distress, and interferes with daily functioning.

Specific Reading Disability

Alternate name; see *Dyslexia*.

Specimen Adequacy

The degree to which a collected clinical specimen is sufficient in quantity, correctly identified, properly transported, and representative of the site being tested. Inadequacy can cause invalid, misleading, or falsely negative results.

Specimen Container

A clean, suitable container used to collect, identify, protect, and transport a patient sample for laboratory testing. Container type, labeling, closure, and handling depend on the sample and test.

Specimen Transport Medium

A special liquid or gel that keeps germs or cells suitable for testing while a patient sample travels to the laboratory. The medium, temperature, container, and delivery time depend on the sample and suspected infection.

Speckled Lentiginous Nevus (Nevus Spilus)

A flat tan or brown patch containing multiple darker

macules or papules. It is usually benign, although melanoma can rarely arise within a melanocytic nevus, including an atypical component.

SPECT/CT

A combined scan that uses a radioactive tracer to show organ function and CT to show detailed body structure. The two sets of images are matched to help locate abnormal areas.

Alternate Names:
Single-Photon Emission Computed Tomography/Computed Tomography; SPECT-CT

Spectral Analysis

Examination of the different energy levels within radiation or another signal. In medical imaging, it can separate useful information from background scatter and help identify materials or improve image interpretation.

SPECT Scan

A nuclear-medicine scan that uses a small radioactive tracer and a rotating camera to create three-dimensional pictures of blood flow or organ function. It can examine the heart, brain, bones, kidneys, or other organs.

Alternate Names:
SPECT Imaging; Single-Photon Emission Tomography

Speculum

An instrument used to gently separate or hold open the walls of a body passage so that the area can be visualized, examined, sampled, or treated. Common types include vaginal, nasal, ear, and rectal specula; design and size depend on the body site and intended procedure.

Speech

The production of spoken language using breathing, voice, and movements of the tongue, lips, palate, and other structures. Hearing, brain function, teeth, illness, and dental appliances can affect speech.

Speech And Language Delay

Slower-than-expected development of speech sounds, vocabulary, understanding, or use of language in a child. Causes may include hearing loss, developmental disorders, autism, neurologic disease, or other medical and environmental factors.

Speech Audiometry

Hearing testing that measures detection or recognition of speech at different loudness levels. It commonly includes speech reception threshold and word-recognition testing, complementing pure-tone audiometry.

Alternate Names:
Speech Discrimination Testing; Speech Audiometric Evaluation

Speech Delay

Speech or language development that is slower than expected for a child's age. Causes may include hearing loss, developmental differences, autism, neurologic disease, or limited language access; loss of previously learned skills can indicate developmental regression.

Speech Discrimination

A hearing test that measures how well a person understands spoken words at a comfortable loudness. The result helps assess hearing function beyond the ability to detect pure tones.

Speech Disorders

Conditions that affect making speech sounds, speaking smoothly, using the voice, or controlling the movements needed for speech. They may follow hearing loss, developmental differences, brain injury, stroke, nerve disease, or other conditions and can often be assessed by a speech therapist.

Speech Impairment In Adults

Difficulty producing or understanding speech caused by aphasia, dysarthria, apraxia, hearing loss, neurologic disease, structural problems, or cognitive disorder; sudden onset requires stroke assessment.

Speech Sound Disorder

A developmental communication disorder involving persistent difficulty with the motor production, articulation, or phonological representation of speech sounds; see *Articulation Disorder*.

Speech-Language Pathologist

A clinician who evaluates and treats disorders of speech, language, voice, communication, cognition, and swallowing across childhood, adulthood, and older age.

Speech-Language Pathology Assessment

An evaluation of speech, language, voice, communication, swallowing, and sometimes related cognitive skills. It combines interview, clinical observation, and standardized or functional tests to guide therapy.

Speech Therapy

Assessment and treatment to help with speaking, understanding language, voice, communication, or swallowing. A speech and language therapist may use exercises, practice, communication aids, and advice for the person and family.

Sperm

Mature male gametes produced in the testes. Each normally carries 23 chromosomes and has a head containing genetic material, a midpiece that supplies energy, and a tail that helps it move; semen contains sperm plus fluids from reproductive glands.

Spermarche

The onset of sperm production and the first ejaculation, marking an important stage of male puberty.

Spermatic

Relating to sperm or structures that produce, transport, or support sperm. Spermatic structures include the testes, ducts, blood vessels, nerves, and tissues involved in male reproductive function.

Spermatic Cord

A cord-like structure carrying the vas deferens, testicular blood vessels, nerves, lymph vessels, and supporting tissue. It extends through the groin to the testis and may be affected by hernia, twisting, or infection.

Spermatocele

A usually harmless, fluid-filled cyst beside or within the epididymis, the coiled tube behind the testicle. It often causes no symptoms but may feel like a lump or cause discomfort.

Spermatocele (Epididymal Cyst)

A usually benign, fluid-filled cyst arising in the epididymis near the testicle. It may cause a painless scrotal lump or heaviness and is distinguished from tumors, hydrocele, infection, and other causes by examination and ultrasound.

Spermatogenesis

The production and maturation of sperm in the seminiferous tubules of the testes. It depends on germ cells, Sertoli cells, hormones, and suitable testicular temperature.

Spermatogonium

An early male reproductive cell in the testis that divides and develops into primary spermatocytes, beginning sperm production.

Spermatorrhea

Involuntary leakage or discharge of semen, sometimes occurring during sleep or without orgasm. Occasional nocturnal emissions can be normal; persistent discharge, pain, blood, or urinary symptoms may reflect infection or another genital or urinary condition.

Spermatozoa

Mature male reproductive cells, also called sperm. Each normally carries half the usual chromosome number and has a head, middle section, and tail that helps it move toward an egg.

Spermatozoon

A single mature male reproductive cell, or sperm

cell. The singular form of spermatozoa: one mature male reproductive cell capable of carrying genetic material to an egg.

Sperm Cell

Alternate name; see *Sperm*.

Spermicide

A contraceptive substance that kills or immobilizes sperm, often used with condoms or other barrier methods.

Sperm Retrieval

A procedure that obtains sperm from semen, the epididymis, or testicular tissue for fertility treatment or laboratory testing. The method depends on whether sperm are present in the semen and on the cause of infertility.

Alternate Names:
Sperm Extraction; Surgical Sperm Recovery

S Phase

The stage of the cell cycle when a cell copies all of its DNA before dividing. This duplication allows each new cell to receive a complete set of genetic instructions.

Sphenoid

Relating to the sphenoid bone, a central bone at the base of the skull. It helps form the eye sockets and skull base and contains the hollow spaces called the sphenoid sinuses.

Sphenoidal Sinus

A paired air-filled sinus within the sphenoid bone at the base of the skull. It lies near important nerves and blood vessels, so inflammation or surgery in this area can affect vision, sensation, or nearby blood flow.

Sphenoid Bone

A central bone at the base of the skull that helps form the eye sockets and skull base. It contains the sphenoid sinuses and a hollow that holds the pituitary gland.

Sphenoid Sinusitis

Inflammation or infection of the sphenoid sinus, which lies deep behind the nasal cavity. It may cause deep headache, facial pain, or visual symptoms and can rarely spread to nearby nerves or the brain.

Spherocytes

Red blood cells that are unusually round and dense instead of having their normal flattened shape. They may occur when the cell membrane is damaged or removed, especially in hereditary spherocytosis or immune red-cell destruction.

Spherocytic Anemia

Anemia caused by fragile, sphere-shaped red blood cells that are removed early by the spleen. It is often inherited as hereditary spherocytosis and may cause jaundice, gallstones, fatigue, or an enlarged spleen.

Sphincter

A ring-shaped muscle that opens and closes a body passage. Sphincters help control urine, stool, food, bile, and other fluids; examples include the muscles around the anus, bladder outlet, and stomach outlet.

Sphincter Of Oddi

A muscular valve controlling the release of bile and pancreatic juice into the first part of the small intestine. It opens during digestion and abnormal blockage or tightening can cause pain or pancreatitis.

Sphingomyelinase Deficiency

Deficiency of acid sphingomyelinase caused by variants in the *SMPD1* gene. It causes Niemann-Pick disease types A, A/B, or B, with lipid accumulation affecting the spleen, liver, lungs, brain, or other organs.

Sphygmograph

An instrument or sensor that records the shape and timing of the pulse in an artery. The tracing can provide information about circulation and arterial stiffness.

Sphygmomanometer

A device used to measure arterial blood pressure with an inflatable cuff and pressure-measuring system. Manual versions commonly use an aneroid or mercury manometer with a stethoscope, while electronic versions use sensors to analyze pressure oscillations and display the reading.

Alternate Names:
Blood Pressure Gauge

Spider Angioma

Alternate name; see *Spider Naevi*.

Spider Bite

An injury caused by the fangs (chelicerae) of a spider, with the vast majority causing only minor local erythematous reactions. Medically significant bites in North America stem from the black widow (*Latrodectus*), which injects alpha-latrotoxin (causing massive presynaptic acetylcholine and catecholamine release, producing severe abdominal rigidity, muscle cramping, autonomic instability, and latrodectism), and the brown recluse (*Loxosceles*), which injects sphingomyelinase D (causing localized ischemic necrosis, eschar formation, and loxoscelism with occasional severe intravascular hemolysis).

Alternate Names:
Spider Bites; Arachnidism

Spider Bites

Plural form; see *Spider Bite*.

Spider Naevi

Vascular cutaneous lesions characterized by a central, pulsating red arteriole from which fine, radiating telangiectatic capillaries branch outward like spider legs. Digital pressure blanches the lesion, and upon release it refills rapidly from the center outwards; multiple spider naevi in the superior vena cava distribution (face, neck, upper chest) are classic physical signs of hyperestrogenic states in chronic liver disease, cirrhosis, and pregnancy.

Alternate Names:
Spider Angioma; Spider Naevus; Spider Telangiectasia; Nevus Araneus; Vascular Spider

Spider Naevus

Alternate name; see *Spider Naevi*.

Spider Telangiectasia

Alternate name; see *Spider Naevi*.

Spider Veins

Small visible red, blue, or purple superficial veins, usually on the legs or face. They are generally harmless but may occur with venous insufficiency; sudden pain, swelling, skin ulceration, or one-sided change can signal another vascular problem.

Spielmeyer-Vogt-Batten Syndrome

Alternate historical name for juvenile neuronal ceroid lipofuscinosis, commonly called Batten disease. It usually begins in childhood with vision loss followed by seizures, developmental regression, movement problems, and dementia.

Spielmeyer-Vogt Disease

An older name for neuronal ceroid lipofuscinosis, a group of inherited lysosomal disorders causing progressive loss of vision, seizures, movement problems, and cognitive decline.

Spigelian Hernia

A ventral abdominal wall hernia protruding through a defect in the Spigelian aponeurosis along the semilunar line (between the lateral border of the rectus abdominis muscle and the transversus abdominis aponeurosis), most frequently located below the arcuate line.

Alternate Names:
Lateral Ventral Hernia; Spigelian Aponeurosis Hernia

Spina Bifida

A congenital spinal defect in which one or more vertebral arches do not form or close completely. In open forms, the meninges, spinal cord, or both protrude through the defect; spina bifida occulta may involve only a skin-covered vertebral gap. Neurologic effects vary by type and level and may include leg weakness or problems with bladder and bowel

control.

Spina Bifida Meningocele

Alternate name for the spinal form of meningocele; see *Meningocele*.

Spina Bifida Myelomeningocele

Alternate name; see *Myelomeningocele*.

Spina Bifida Occulta

A usually mild congenital defect in which the posterior parts of one or more vertebrae fail to fuse, while the overlying skin remains intact; the spinal cord and meninges do not protrude through the bony gap. Most people have no symptoms, and the finding is often discovered incidentally on imaging. A dimple, patch of hair, or other skin mark may overlie the defect. Rarely, associated tethering or another spinal dysraphism causes pain, weakness, sensory changes, or bladder or bowel problems.

Spinal Analgesia

Pain relief produced by injecting numbing medicine, sometimes with an opioid, into the fluid around the lower spinal nerves. It may cause temporary leg weakness, itching, difficulty urinating, low blood pressure, headache, or slowed breathing.

Spinal And Bulbar Muscular Atrophy

An X-linked disorder caused by a CAG-repeat expansion in the androgen-receptor gene. It usually affects adult men and gradually damages motor neurons, causing muscle weakness and wasting, cramps, twitching, difficulty speaking or swallowing, and sometimes breast enlargement or reduced fertility. Treatment supports movement, swallowing, breathing, and daily activities.

Alternate Names:
X-Linked Spinal and Bulbar Muscular Atrophy; Kennedy Disease; Kennedy's Disease; SBMA

Alternate Names:
Kennedy Disease; SBMA

Spinal And Epidural Anesthesia

Spinal and epidural anesthesia deliver local anesthetic near spinal nerves to numb the lower body; spinal is a single injection, while epidural uses a catheter for adjustable dosing.

Spinal Anesthesia

An injection of numbing medicine into the fluid around the lower spinal nerves to temporarily block pain and movement in the lower body. Possible effects include low blood pressure, difficulty urinating, headache, infection, bleeding, or rarely excessive numbness and breathing problems.

Alternate Names:
Subarachnoid Block; Spinal Block

Spinal Anesthesia For Cesarean Delivery

A regional anesthetic injected into the fluid around the lower spinal nerves to numb the lower body during a cesarean birth. The mother remains awake, while blood pressure, breathing, and the baby's condition are monitored.

Spinal Angiography

X-ray imaging of blood vessels supplying the spinal cord after contrast is injected. It is used to locate vascular malformations, fistulas, aneurysms, or sources of bleeding and may guide treatment.

Spinal Arachnoiditis

Chronic inflammation and scarring of the arachnoid membrane around spinal nerves. It may cause persistent burning pain, tingling, weakness, or bowel and bladder problems after infection, surgery, trauma, bleeding, or chemical irritation.

Spinal Artery

An artery supplying the spinal cord and its coverings, including the anterior spinal artery and paired posterior spinal arteries; blockage can cause characteristic neurologic deficits.

Spinal Block

A spinal block is injection of local anesthetic into cerebrospinal fluid in the lower back, producing temporary numbness and weakness for surgery or pain control.

Spinal Canal

The spinal canal is the bony passage through the vertebral column containing the spinal cord, its coverings, nerve roots, and blood vessels.

Spinal Cavity

The posterior body cavity formed by the vertebral column that contains and protects the spinal cord.

Spinal Chordoma

A malignant notochord-derived tumor arising along the spine, often in the sacrum. It can produce progressive pain, a mass, weakness, numbness, or bowel and bladder dysfunction and requires specialist imaging and treatment.

Spinal Column

The vertebral column, consisting of vertebrae, discs, ligaments, and joints that support and protect the spinal cord.

Spinal Cord

The cylindrical nervous tissue within the vertebral canal that carries signals between brain and body and mediates reflexes.

Spinal Cord Abscess

A rare collection of pus within the spinal cord, usually caused by infection. It can damage or compress nerve tissue and cause back pain, fever, weakness, sensory changes, or bladder problems. An epidural abscess is a separate infection outside the spinal cord.

Spinal Cord and Spine Disorders

Diseases or injuries affecting the spinal bones, discs, ligaments, spinal cord, or nerve roots. They may cause pain, weakness, numbness, balance problems, deformity, or changes in bladder and bowel function.

Spinal Cord Cleft

A cleft-like division or indentation within the spinal cord, described on imaging or during surgery. It may occur as part of a congenital split-cord malformation or as a focal acquired abnormality associated with nearby spinal or dural pathology.

Spinal Cord Compression

Pressure on the spinal cord or its nerve roots, often from a tumor, infection, bleeding, fracture, or slipped disc. It can cause severe back pain, weakness, numbness, walking difficulty, or loss of bladder or bowel control.

Spinal Cord Disease

A disorder affecting the spinal cord, including compression, inflammation, vascular injury, infection, tumor, degeneration, or trauma, and potentially causing weakness, sensory loss, or autonomic dysfunction.

Spinal Cord Hemisection

Damage affecting one side of the spinal cord. Depending on its extent, it can cause weakness and loss of limb-position sense on the same side of the body, and loss of pain and temperature sense on the opposite side. The classic pattern is called Brown-Sequard syndrome.

Spinal Cord Infarction

Injury to the spinal cord caused by interruption of its blood supply, often involving the anterior spinal artery or aortic circulation. It typically produces sudden back or limb pain followed by weakness, sensory loss, and bladder or bowel dysfunction.

Spinal Cord Injuries

Traumatic damage to the spinal cord that can cause temporary or permanent motor, sensory, autonomic, respiratory, or bowel and bladder dysfunction. Severity depends on the level and completeness of injury.

Spinal Cord Injury

Damage to the spinal cord that can cause weakness, paralysis, altered sensation, or loss of bladder and bowel control. Severity is often graded from complete to incomplete using a standardized neurological examination.

Alternate Names:
SCI

Spinal Cord Injury: Treatments And Rehabilitation

Spinal-cord injury can cause temporary or permanent weakness, sensory loss, autonomic dysfunction, and bowel or bladder problems. Acute care protects the spine and treats complications; rehabilitation addresses mobility, skin, breathing, function, equipment, sexuality, and community participation.

Spinal Cord Neoplasms

Tumors arising in the spinal cord, its coverings, or nearby tissues. They may be noncancerous or cancerous and can cause pain, weakness, numbness, walking problems, or bladder and bowel changes by pressing on nerves.

Spinal Cord Stimulation

An implanted treatment that delivers electrical impulses to the epidural space to alter pain signaling, used for selected chronic neuropathic or ischemic pain after careful assessment.

Spinal Cord Trauma

Spinal cord trauma is injury to the cord from force such as fracture, dislocation, or penetrating damage, potentially causing weakness, sensory loss, autonomic dysfunction, or paralysis.

Spinal Curvature

A curve or bend in the spine. The term may refer to normal curves or abnormal curvature, including scoliosis, kyphosis, or lordosis.

Spinal Disease

Any disorder affecting the vertebrae, discs, joints, ligaments, spinal cord, or nerve roots. It may cause back or neck pain, stiffness, weakness, numbness, walking difficulty, or changes in bladder or bowel control.

Spinal Dysraphism

A group of birth defects caused by incomplete development or closure of the spine and spinal cord before birth. Some forms have an open sac on the back, while others are hidden and may later cause weakness, pain, or bladder and bowel problems.

Spinal Epidural Abscess

A collection of pus between the covering of the spinal cord and the surrounding bone, usually caused by infection. Severe back pain, fever, weakness, numbness, difficulty walking, or loss of bladder or bowel control may occur.

Spinal Epidural Hematoma

A collection of blood in the space between the spinal cord's outer covering and the bones of the spine. It can press on the spinal cord or nerves and cause sudden severe pain, weakness, numbness, or loss of bladder or bowel control.

Spinal Arachnoid Cyst

A fluid-filled sac in or near the arachnoid, one of the thin coverings around the spinal cord. Many cause no symptoms. A cyst that presses on the cord or nerve roots can cause back pain, weakness, numbness, or problems with walking or bladder control.

Spinal Astrocytoma

A tumor that begins in astrocytes, support cells in the brain or spinal cord. In the spine, it often grows within the spinal cord and may cause pain, weakness, numbness, or difficulty walking. Its behavior varies by tumor type and grade.

Spinal Ependymoma

A tumor that begins in cells lining the central canal of the spinal cord. It can grow within the cord or along its surface and may cause back pain, weakness, numbness, or changes in walking or bladder function. Its behavior depends on its type and grade.

Spinal Instability

Abnormal movement between spinal bones that reduces the spine's ability to keep its usual alignment and protect nearby nerves. It may result from injury, wear, infection, or surgery and can cause pain or, if nerves are affected, weakness or numbness.

Spinal Meningioma

A usually slow-growing tumor that begins in the thin coverings around the spinal cord. Most spinal

meningiomas are noncancerous, but a growing tumor can press on the cord or nerves and cause pain, weakness, numbness, or difficulty walking. Symptoms depend on the tumor's size and location.

Spinal Osteoarthritis

Wear of the cartilage in the small joints between spinal bones, most often the facet joints. It may cause back or neck pain and stiffness, especially with movement. Bone spurs can form and sometimes narrow the spaces for spinal nerves.

Spinal Osteoporosis

Loss of bone strength in the vertebrae, the bones of the spine. Weakened vertebrae can break or collapse during a minor fall or ordinary activity, causing back pain, loss of height, or a rounded upper back. Bone loss may remain silent until a fracture occurs. See also *Osteoporosis*.

Spinal Schwannoma

A usually noncancerous tumor that grows from Schwann cells, which wrap around nerves. It often begins on a nerve root near the spinal cord and may cause pain, tingling, numbness, or weakness if it presses on the nerve. Most spinal schwannomas grow slowly.

Spinal Tuberculosis (Pott Disease)

Alternate name; see *Pott Disease*.

Spinal Fluid Leak

Alternate name; see *Cerebrospinal Fluid Leak*.

Spinal Fracture

A fracture of one or more vertebrae caused by trauma, osteoporosis, tumor, or other bone-weakening disease.

Spinal Fusion

Surgery that joins two or more spinal bones so they heal into one stable segment. Bone and often screws, rods, or cages are used; the operation may reduce movement and pain from selected conditions but can cause infection, nerve injury, or problems at nearby levels.

Spinal Ganglion

A small group of nerve-cell bodies beside the spinal cord. It contains sensory nerve cells that carry information about touch, pain, temperature, and body position from the skin, muscles, and joints.

Spinal Injury

Damage to the spinal cord, vertebrae, discs, ligaments, or nearby nerves caused by trauma or another disease. It may cause pain, weakness, numbness, paralysis, or bladder and bowel problems and can be life-threatening when severe.

Spinal Meningitis

Inflammation or infection of the membranes surrounding the spinal cord, often occurring with meningitis involving the brain. Fever, severe headache, neck or back stiffness, confusion, rash, or neurologic changes may occur.

Spinal Metastasis

Spread of a cancer to the vertebrae, spinal canal, or nearby epidural tissues. Back pain, weakness, numbness, gait change, or bowel or bladder dysfunction may signal spinal cord or nerve compression.

Spinal Muscular Atrophy

Usually an autosomal recessive inherited disorder causing progressive loss of motor neurons and muscle weakness, often beginning in infancy or childhood but sometimes appearing in adulthood. Severity varies; breathing, swallowing, and mobility may be affected. Early diagnosis allows genetic counseling and disease-modifying care.

Spinal Muscular Atrophy (SMA)

Alternate name; see *Spinal Muscular Atrophy*.

Spinal Neoplasms

Tumors arising in the spinal cord, its coverings, vertebrae, or nearby tissues. They may be noncancerous or cancerous and can cause back pain, weakness, numbness, walking difficulty, or bladder

and bowel changes when they press on nerves.

Spinal Nerve

One of 31 pairs of nerves leaving the spinal cord through openings between the spinal bones. Each carries messages for sensation, movement, and automatic functions between the body and spinal cord.

Spinal Precautions

Measures used after possible spinal injury to limit movement until the spine and spinal cord have been assessed. They may include careful positioning, support of the neck, and safe transfer; the exact approach depends on the injury and examination.

Spinal Reflex

A fast, automatic response that is processed through the spinal cord. It can occur before the brain becomes aware of the stimulus.

Spinal Shock

A temporary loss of reflexes, muscle tone, and automatic functions below a spinal-cord injury. The affected limbs may initially be limp, and blood-pressure, bladder, bowel, or sexual problems can occur while the injury is assessed and treated.

Spinal Stenosis

Narrowing of the passage containing the spinal cord or nerve roots. It may cause back pain, numbness, weakness, or leg pain with walking that improves when sitting or leaning forward.

Alternate Names:
Vertebral Canal Stenosis; Lumbar Spinal Narrowing

Spinal Stenosis Lumbar

Alternate name; see *Lumbar Stenosis*.

Spinal Tap

Alternate name; see *Lumbar Puncture*.

Spinal Tuberculosis

Alternate name; see *Pott's Disease*.

Spinal Tumor

A benign or malignant neoplasm located within or adjacent to the spinal cord, spinal nerve roots, meninges, or vertebral column. Categorized anatomically into extradural tumors (most commonly metastatic carcinoma from breast, lung, prostate, or myeloma), intradural-extramedullary tumors (predominantly meningiomas and schwannomas), and intramedullary tumors (primarily ependymomas and astrocytomas). Manifestations reflect spinal cord compression, radiculopathy, progressive motor and sensory deficits, and autonomic dysfunction; urgent MRI with gadolinium and surgical decompression with radiation/chemotherapy are essential to preserve neurological function.

Alternate Names:
Spinal Tumors; Spinal Neoplasm; Spinal Neoplasms

Spinal Tumors

Plural form; see *Spinal Tumor*.

Spindle-Cell Sarcoma

A group of cancers made of long, narrow cells under the microscope. They can arise from muscle, fibrous tissue, or nerve coverings; their behavior and treatment vary by the exact tumor type and location.

Spindle Pole

One end of the temporary structure formed during cell division. Fibers extending from each pole attach to duplicated chromosomes and pull the copies into the two new cells.

Spindle Pole Body

A structure in fungal cells that organizes the fibers used to separate duplicated chromosomes during cell division. It performs a role similar to the centrosome in animal cells.

Spine

The vertebral column, consisting of stacked vertebrae that support the body and protect the spinal cord.

Spine Disorders

Conditions affecting the bones, disks, joints, ligaments, nerves, or spinal cord. They may cause back or neck pain, stiffness, weakness, numbness, balance problems, or changes in bladder and bowel control.

Spine Injury

Damage to the bones, discs, ligaments, nerves, or spinal cord. It may cause back pain, weakness, numbness, loss of movement, or bladder and bowel problems; spinal-cord damage can cause permanent disability.

Spinocerebellar Ataxia

A heterogeneous group of progressive, autosomal dominant neurodegenerative disorders characterized by progressive cerebellar ataxia, dysmetria, dysarthria, nystagmus, and oculomotor dysfunction, often accompanied by peripheral neuropathy, pyramidal or extrapyramidal signs, or cognitive decline. Many subtypes (e.g., SCA1, SCA2, SCA3/Machado-Joseph disease, SCA6, SCA7) are caused by unstable trinucleotide (CAG) repeat expansions encoding polyglutamine tracts that lead to toxic protein aggregation and Purkinje cell loss in the cerebellum and brainstem.

Alternate Names:
Spinocerebellar Ataxias; SCA

Spinocerebellar Ataxias

Plural form; see *Spinocerebellar Ataxia*.

Spinothalamic Tract

The primary ascending somatic sensory pathway conveying pain, thermal sensation, and crude non-discriminative touch from peripheral free nerve endings through the spinal cord (decussating within 1 to 2 segments in the anterior white commissure) to the ventral posterolateral (VPL) nucleus of the thalamus.

Spinous Process

The backward-pointing bony projection of a vertebra that can be felt along the middle of the back. Muscles and ligaments attach to it and help support and move the spine.

Spiradenocarcinoma

A rare malignant sweat-gland tumor that may arise in a long-standing spiradenoma, presenting as a rapidly enlarging, painful, or ulcerated nodule.

Spiradenoma

A usually benign painful sweat-gland tumor presenting as a dermal nodule; multiple spiradenomas may occur in Brooke-Spiegler syndrome.

Spiral Organ

The organ of Corti, a sensory structure in the cochlea containing hair cells that convert sound vibrations into nerve signals.

Spiramycin

A macrolide antibiotic used for selected bacterial infections and sometimes during pregnancy for toxoplasmosis. Choice depends on the infection, local guidance, pregnancy stage, allergies, resistance, and other treatment needs.

Spirillum Minus

Spirillum minus is a spiral Gram-negative bacterium that causes rat-bite fever, characterized by fever, rash, and migratory joint pain after rodent exposure; culture is difficult and diagnosis may be clinical or molecular.

Spirit

A volatile liquid preparation or alcohol; the meaning depends on the medical, pharmaceutical, or general context.

Spiritual Pain

Distress involving meaning, purpose, beliefs, identity, or connection, often addressed in palliative and supportive care.

Spirochaetaceae

A family of spiral-shaped bacteria that includes medically important spirochetes such as Borrelia, Treponema, and Leptospira.

Spirochaetales Infection

Infection caused by spiral-shaped bacteria in the order Spirochaetales, including syphilis, Lyme disease, relapsing fever, and leptospirosis.

Alternate Names:
Spirochaetal Infections; Spirochetal Infections

Spirochaete

Another spelling of spirochete, a thin, flexible, spiral-shaped bacterium. Important genera include Treponema, Borrelia, and Leptospira.

Spirochete

A thin, spiral-shaped bacterium that moves with a corkscrew-like motion. Important examples cause syphilis, Lyme disease, relapsing fever, and leptospirosis; diagnosis depends on the organism and may use blood tests or other samples.

Spirogram

A graph recording how much air a person breathes and how quickly it moves during a lung-function test. It helps identify patterns suggesting airway narrowing, restricted lung expansion, or poor effort.

Spirometer

An instrument that measures airflow and the volume of air moved during specified breathing maneuvers, especially forced expiration. It does not by itself measure all lung volumes; residual volume and total lung capacity require additional pulmonary-function testing.

Spirometry

A breathing test that measures how much air a person can blow out and how quickly. It helps identify narrowing of the airways, as in asthma or chronic obstructive pulmonary disease, and can monitor treatment. The person must follow instructions and blow forcefully several times; results are interpreted with age, height, and symptoms.

Spironolactone

A medicine that blocks aldosterone, a hormone that makes the kidneys retain salt and water. It helps the body remove extra fluid while keeping potassium. It is used for heart failure, high blood pressure, excess aldosterone, and fluid buildup from some conditions. It can raise blood potassium to dangerous levels, especially with kidney disease or certain medicines, and may cause breast enlargement or menstrual changes.

Spirulina

Spirulina is a type of cyanobacterium sold as a dietary supplement. Products may provide nutrients, but contamination and medication interactions are possible, and it is not a reliable substitute for a balanced diet.

Spit

Saliva or other fluid expelled from the mouth. Increased saliva or repeated spitting may occur with mouth irritation, nausea, reflux, difficulty swallowing, medication effects, or habit.

Spitting

Forceful expulsion of saliva or other material from the mouth. New or excessive spitting may occur with oral disease, reflux, nausea, difficulty swallowing, medication effects, or habit.

Spitz Nevus

A benign melanocytic nevus, often a pink or pigmented papule in children or young adults, that may resemble melanoma clinically or histologically.

Spitz Nevus Pathology

A usually benign melanocytic proliferation composed of epithelioid or spindle cells, often symmetrical and well circumscribed, with maturation, Kamino bodies, and characteristic epidermal changes. Some lesions overlap morphologically with melanoma.

Splanchnic

Relating to internal organs, especially abdominal organs and their blood vessels or nerves. Splanchnic circulation supplies the digestive organs, while splanchnic nerves carry involuntary signals that regulate their function.

Splanchnic Ischemia

Inadequate blood flow to abdominal organs, usually involving the intestines and caused by arterial embolism, thrombosis, vasoconstriction, or severe low-flow states. It may produce abdominal pain, gastrointestinal bleeding, bowel injury, or organ dysfunction.

Splanchnic Nerve

A nerve carrying automatic signals between the spinal cord and internal organs, especially organs in the chest and abdomen. It helps regulate digestion, blood-vessel tone, and other functions that do not require conscious control.

Spleen

A lymphoid organ in the upper-left abdomen. Its red pulp filters blood and removes aged or abnormal blood cells; its white pulp supports immune responses. It also stores platelets and helps clear blood-borne microorganisms.

Spleen Development

The formation and maturation of the spleen before and after birth. The spleen gradually develops its blood-filtering and immune functions, including removal of aged blood cells and responses to germs in the bloodstream.

Spleen Diseases

Disorders affecting splenic structure or function, including splenomegaly, infarction, infection, cysts, abscess, rupture, vascular disease, and hematologic or infiltrative disorders.

Spleen Disorder

A disease affecting the spleen, such as enlargement, infection, infarction, rupture, inflammation, cyst, or tumor, with possible effects on blood cells and immunity.

Spleen Hemangioma

A spleen hemangioma is a usually benign blood-vessel tumor of the spleen, often incidental but occasionally associated with enlargement, anemia, or rupture risk.

Spleen Hilum

The indented area on the inner surface of the spleen where its blood vessels, nerves, and lymph vessels enter or leave. The splenic vein carries blood from the spleen toward the liver through the portal circulation.

Spleen Removal

Surgery to remove the spleen, which may be needed for injury, an enlarged or overactive spleen, blood disease, or a tumor. Without a spleen, the risk of severe infection increases, so vaccination and medical advice about fever are important.

Splenectomy

Surgical removal of the spleen, performed for selected traumatic, hematologic, malignant, vascular, or other disorders. It increases the risk of severe infection with encapsulated bacteria and requires preventive planning.

Splenic Abscess

A localized collection of pus in the spleen, usually from bloodstream infection, trauma, infarction, or spread from nearby disease and potentially causing fever, left-upper-quadrant pain, and sepsis.

Splenic Artery Aneurysm

An abnormal bulge in the artery that supplies the spleen. It often causes no symptoms, but rupture can cause life-threatening internal bleeding; risk is of particular concern during pregnancy.

Splenic Cyst

A fluid-filled lesion within the spleen, classified as true cysts with an epithelial lining, including congenital, epidermoid, and dermoid cysts, or pseudocysts without a lining, typically resulting from trauma, infection, or pancreatitis. Most are asymptomatic and discovered incidentally on imaging.

Splenic Flexure

The bend of the colon where the transverse colon becomes the descending colon, near the spleen.

Splenic Flexure Syndrome

Pain, fullness, or bloating in the upper-left abdomen caused by gas collecting at the bend where the transverse colon meets the descending colon. Symptoms may improve after passing gas or stool.

Splenic Infarction

Death of part of the spleen when its blood supply is blocked. It may cause sudden pain in the upper-left belly, sometimes spreading to the left shoulder, with nausea or fever. Causes include blood clots, sickle cell disease, heart or blood disorders, infections, inflammation of blood vessels, or injury. In some cases, an abscess or rupture can occur.

Splenic Infection

Infection of the spleen, often an abscess caused by bacteria spreading through the bloodstream or from nearby tissue. It may cause fever, chills, left-upper-abdominal pain, sepsis, or other severe illness.

Splenic Neoplasm

An abnormal growth in the spleen. It may be noncancerous, cancerous, or cancer that has spread from another organ; symptoms and treatment depend on its type, size, and effect on nearby tissues or blood cells.

Splenic Rupture

A tear of the spleen, usually after blunt abdominal trauma but sometimes spontaneous in an enlarged or diseased spleen. It can cause life-threatening internal bleeding; diagnosis and treatment depend on hemodynamic stability and imaging, with urgent surgery or embolization sometimes required.

Splenomegaly

Abnormal enlargement of the spleen. It may result from infection, liver disease, blood disorders, cancer, or other conditions and may cause no symptoms. Some people feel fullness or pain in the upper-left abdomen. An enlarged spleen can trap blood cells and is more easily injured or ruptured.

Splenomegaly With Rheumatoid Arthritis

Enlargement of the spleen occurring with rheumatoid arthritis, classically in Felty syndrome and sometimes with low white blood-cell counts. Infection risk and other causes of spleen enlargement may also be present.

Splenosis

Acquired growth of splenic tissue that implants outside the spleen, usually after splenic injury or splenectomy. Implants most often lie on abdominal or pelvic surfaces and can also occur in the chest after injury to the diaphragm. They are often found incidentally and can resemble tumors; unlike a congenital accessory spleen, splenosis results from displaced tissue.

Spliceosome

The spliceosome is a nuclear RNA-protein complex that removes introns from pre-messenger RNA and joins exons to form mature RNA.

Splice-Site Variant

A variant affecting the sequences required for accurate removal of introns and joining of exons during RNA processing. It may cause abnormal transcripts, exon skipping, intron retention, or reduced functional protein.

Splint

A rigid or flexible orthopedic device applied to an injured extremity or joint to provide noncircumferential immobilization, stabilization, and protection. Widely utilized in the acute management of fractures, sprains, dislocations, and deep soft-tissue trauma because unlike circumferential casts, splints permit acute tissue expansion and post-traumatic soft-tissue edema, substantially mitigating the risk of ischemic compartment syndrome and neurovascular compromise.

Alternate Names:
Splints

Splinter

A small piece of wood, glass, metal, or another material embedded in the skin. A deep fragment or

one near an eye or joint can injure nearby structures; retained material may cause inflammation or infection.

Splinter Haemorrhage

Alternate spelling; see *Splinter Hemorrhage*.

Splinter Haemorrhages

Plural form; see *Splinter Hemorrhage*.

Splinter Hemorrhage

A tiny, longitudinal, dark red-to-brown linear streak appearing under the fingernails or toenails in the direction of nail growth, caused by extravasation of blood from damaged microvascular capillaries of the longitudinally oriented nail bed. While commonly produced by local trauma, multiple or proximal splinter hemorrhages are classic peripheral physical signs of infective endocarditis (microembolization or immune-complex vasculitis), antiphospholipid syndrome, and systemic vasculitis.

Alternate Names:
Splinter Hemorrhages; Splinter Haemorrhage; Splinter Haemorrhages

Splinter Hemorrhages

Plural form; see *Splinter Hemorrhage*.

Splinter Removal

Taking a piece of wood, metal, glass, or another material out of the skin. Small superficial splinters may be removed with clean tweezers, while deep, painful, infected, or eye- or nail-area splinters need clinical care.

Splints

Plural form; see *Splint*.

Split Brain

A state after surgical or pathological disruption of the corpus callosum in which information transfer between cerebral hemispheres is reduced, producing characteristic disconnection findings.

Split-Thickness Skin Graft

A surgical skin graft consisting of the entire epidermis and a variable portion of the underlying dermis harvested using a dermatome from a donor site (commonly the anterolateral thigh or buttocks). Categorized as thin, medium, or thick STSG, it is typically meshed to allow drainage and expand coverage area for large traumatic wounds, burns, or surgical defects; vascularization of the graft proceeds via serum imbibition, inosculation, and revascularization.

Alternate Names:
Split-Thickness Skin Grafts; STSG

Split-Thickness Skin Grafts

Plural form; see *Split-Thickness Skin Graft*.

Splitting

A psychological defense pattern in which a person or situation is viewed as entirely good or entirely bad, with difficulty integrating positive and negative qualities. It can occur in several mental-health conditions and is not diagnostic by itself.

Spondee

A two-syllable word with equal emphasis on both parts, used during speech-hearing tests. Examples help measure the quietest loudness at which a person can recognize spoken words accurately.

Spondylarthritis

A family of inflammatory rheumatic diseases affecting the spine, sacroiliac joints, entheses, peripheral joints, skin, eyes, or bowel, including ankylosing spondylitis and psoriatic arthritis.

Spondylitis

Inflammation of one or more vertebrae or parts of the spine. Causes include infection, autoimmune disease, and inflammatory arthritis; pain, stiffness, fever, or neurologic symptoms may occur.

Spondyloarthritis

A group of inflammatory joint diseases that often affect the spine and joints between the spine and

pelvis. They may also cause tendon pain, swollen fingers or toes, eye inflammation, psoriasis, or bowel inflammation.

Spondylolisthesis

Slipping of one spinal bone forward or backward compared with the bone below it. It may cause back pain, stiffness, leg pain, numbness, or weakness, although some people have no symptoms.

Alternate Names:
Lumbosacral Spondylolisthesis

Spondylolysis

A small stress crack or defect in part of a spinal bone, usually in the lower back. It may cause back pain in adolescents or athletes and can sometimes allow one spinal bone to slip on another.

Alternate Names:
Lumbosacral Spondylolysis

Spondylosis

Wear-related changes in the bones, discs, and small joints of the spine. It becomes more common with age and may cause stiffness or pain, but many people have no symptoms; nerve pressure can cause numbness or weakness.

Sponge

A sponge is a porous material used to absorb fluid, clean or dress wounds, or deliver a product; retained surgical sponges are a preventable complication.

Spongiform Encephalopathy

A serious progressive brain disease in which brain tissue develops tiny sponge-like spaces. Prion diseases are important examples and can cause worsening memory, movement, coordination, behavior, and eventually loss of independence.

Spongy Bone

Porous trabecular bone found inside many bones, especially near joints.

Alternate Names:
Cancellous Bone; Trabecular Bone

Spontaneous Abortion

Unintentional loss of a pregnancy before fetal viability. Causes include chromosomal abnormalities, uterine or cervical problems, infection, and maternal medical conditions.

Alternate Names:
Early Pregnancy Loss; Spontaneous Pregnancy Loss

Spontaneous Bacterial Peritonitis

An infection of ascitic fluid without an identifiable abdominal source, usually occurring in people with cirrhosis and ascites. It may cause fever, abdominal pain, tenderness, or worsening illness. Diagnosis is made by testing ascitic fluid, usually showing at least 250 neutrophils per mm^3.

Spontaneous Bacterial Peritonitis Diagnostic Criteria

See *Spontaneous Bacterial Peritonitis*.

Alternate Names:
SBP Diagnostic Criteria; Ascitic Neutrophil Cutoff

Spontaneous Breathing Trial

A monitored period during which a person on a breathing machine does most of the breathing with little or no machine assistance. It helps clinicians judge whether the person may breathe safely after the tube is removed.

Spontaneous Coronary Artery Dissection

A tear within the wall of an artery supplying the heart, which can narrow or block blood flow and cause a heart attack. It often affects women and may be associated with pregnancy, severe stress, or fibromuscular dysplasia. Treatment depends on blood flow and stability; medicines or a stent may be used, and emergency care is needed for chest pain.

Alternate Names:
SCAD

Spontaneous Miscarriage

Pregnancy loss occurring without an intentional medical or surgical procedure.

Spontaneous Perforation

Unexpected rupture of a hollow organ without a clear external injury, allowing contents to escape and potentially causing peritonitis, mediastinitis, sepsis, or hemorrhage.

Spontaneous Pneumothorax

Air leaking into the space around a lung without a direct injury. It may occur in an otherwise healthy person or because of lung disease and can cause sudden chest pain or breathlessness.

Spontaneous Vaginal Delivery

Birth through the vagina without forceps or a vacuum device. It usually occurs during the second stage of labor as contractions and pushing move the baby through the birth canal.

Alternate Names:
SVD

Spoon-Shaped Nails

Alternate name; see *Koilonychia*.

Sporadic

Occurring irregularly or as an isolated case rather than in a predictable pattern or family cluster.

Sporothrix

A genus of environmental fungi that can cause sporotrichosis, usually after inoculation through the skin and sometimes through inhalation or dissemination.

Sporothrix Schenckii

A group of fungi that causes sporotrichosis, a typically nodular skin and lymphatic infection acquired from plants, soil, or animal scratches.

Sporotrichosis

A fungal infection caused by *Sporothrix* species, usually acquired when contaminated plant material or an infected animal inoculates the skin. The common lymphocutaneous form begins as a papule or ulcer and may produce a chain of nodules along lymphatic vessels. Less often, infection affects the lungs, bones, joints, or other organs.

Sporozoa

An older group name for spore-forming protozoan parasites, including Plasmodium.

Sporozoites

Moving, infective forms produced by certain parasites. For example, mosquitoes inject Plasmodium sporozoites into people, after which they travel to the liver and begin the malaria infection cycle.

Sports Cardiology

A subspecialty of cardiology concerned with cardiovascular health in athletes and highly active people. It considers normal heart adaptations to training and cardiovascular disease in relation to exercise, including exercise-related symptoms, performance, and risk during sport.

Sports Cream Overdose

Excessive use or swallowing of a muscle or joint pain cream, often containing menthol, methyl salicylate, or capsaicin. It may cause skin burns, salicylate poisoning, vomiting, ringing ears, confusion, or seizures.

Sportsman's Groin

Long-lasting groin or lower-abdominal pain related to repeated sports activity, especially kicking, sprinting, twisting, or quick changes of direction. It is often called sports hernia, although there may be no true hernia. Examination and sometimes imaging help identify the cause; treatment may include rest, guided exercises, and, in selected persistent cases, surgery.

Alternate Names:
Athletic Pubalgia; Sports Hernia; Gilmore's Groin; Inguinal Disruption; Core Muscle Injury

Sports Medicine

Medical care focused on preventing, diagnosing, and treating exercise- and sports-related injuries and conditions. It also supports safe training, rehabilitation, performance, and return to activity.

Sports Physical

A preparticipation health evaluation that reviews medical history, symptoms, medications, family risks, and examination findings to identify conditions needing evaluation before sports.

Alternate Names:
Sports Physicals

Sports Rehabilitation

Treatment and training that help a person recover safe movement, strength, fitness, and confidence after a sports injury. It may include exercises, hands-on care, education, gradual return to activity, and steps to reduce the chance of another injury.

Spots Before The Eyes

Visual floaters, flashes, or scotomata perceived in the visual field; sudden onset can occur with retinal tear, detachment, or other urgent eye conditions.

Spots In Front Of The Eyes

Floaters or visual spots caused by shadows from vitreous opacities, inflammation, bleeding, retinal tears, migraine, or other eye or neurologic conditions; sudden flashes or a curtain-like loss are urgent.

Spotted Fever

A group of infections usually spread by ticks and caused by Rickettsia bacteria. They can produce fever, headache, rash, muscle aches, and serious illness requiring prompt diagnosis and antibiotic treatment.

Spousal Abuse

Spousal abuse is physical, sexual, emotional, financial, or coercive harm by an intimate partner; immediate safety planning and confidential support may be needed.

Spouse

A spouse is a person's legally or socially recognized partner; involving a spouse in healthcare requires the patient's consent unless law provides otherwise.

Sprain

An acute traumatic stretching, partial tearing, or complete rupture of one or more ligaments (fibrous connective tissue bands stabilizing a joint and connecting bone to bone). Graded from Grade I (mild microtears without joint instability), Grade II (partial tear with moderate laxity and pain), to Grade III (complete ligamentous disruption with gross articular instability). Common sites include the anterior talofibular ligament in the ankle and anterior cruciate ligament in the knee; management follows the PRICE protocol (protection, rest, ice, compression, elevation) and functional physical rehabilitation.

Alternate Names:
Sprains; Ligamentous Sprain

Sprained Ankle

Stretching or tearing of one or more ankle ligaments, usually after rolling the ankle inward. It may cause pain, swelling, bruising, and instability.

Sprains

Plural form; see *Sprain*.

Spray Drying

Spray drying converts a liquid mixture into a dry powder by atomizing it into a heated gas stream, often used in pharmaceutical and food manufacturing.

Sprengel Deformity

A birth difference in which one shoulder blade sits higher than usual because it did not move to its normal position during development. It may cause uneven shoulders, limited arm movement, or neck and back discomfort.

Spring Fever Henoch-Schonlein

Alternate name; see *Henoch-Schonlein Purpura*.

Sprue

A condition causing poor absorption of nutrients from the small intestine. The term may describe celiac disease or tropical sprue, which have different

causes and require appropriate testing and treatment.

Spur Cell

Alternate name; see *Acanthocyte*.

Spur-Cell Hemolytic Anemia

A severe anemia in which abnormal, spiky red blood cells are rapidly removed from the blood, usually because of advanced liver disease. It can cause jaundice, weakness, and worsening anemia.

Spurling Test

A neck examination used when a pinched nerve is suspected. The clinician gently turns and tilts the neck and applies light downward pressure; pain or tingling traveling into the arm may support cervical nerve-root irritation.

Alternate Names:
Spurling's Maneuver; Cervical Foraminal Compression Test

Sputum

Mucus or other material brought up by coughing from the airways or lungs. Its amount, color, smell, and blood content may provide clues, but sputum alone cannot identify the cause; laboratory testing may be needed.

Sputum Culture

A laboratory test that grows germs from mucus coughed up from the lungs or collected by suction. It can help identify bacterial, fungal, or mycobacterial infection and guide treatment, but a poor sample can give misleading results.

Sputum Direct Fluorescent Antibody Test

A laboratory test that uses glowing antibody markers to look for selected germs in mucus from the lungs. It can provide a rapid result, but culture or molecular testing may also be needed.

Sputum Fungal Smear

Examination of coughed-up lung mucus under a microscope to look for fungi. A culture, blood test, or molecular test may be needed to confirm the specific infection.

Sputum Gram Stain

A quick microscope test that colors a sputum sample to show some bacteria and inflammatory cells and to judge whether the sample is suitable for culture.

Sputum Stain For Mycobacteria

A microscope test that looks for tuberculosis-causing and related bacteria in mucus from the lungs. A positive result supports infection, but a negative result does not exclude it; culture or molecular testing may also be needed.

Squamous Cell

A flat, scale-like epithelial cell possessing a thin, polygonal shape with an attenuated central nucleus. Arranged as simple squamous epithelium (lining blood vessels as endothelium and body cavities as mesothelium, facilitating diffusion and filtration) or stratified squamous epithelium (lining the epidermis, oral cavity, esophagus, and cervix, providing a mechanical protective barrier against abrasion, microbial invasion, and water loss); malignant transformation gives rise to squamous cell carcinoma.

Alternate Names:
Squamous Cells

Squamous Cell Carcinoma

A cancer of flat cells that line the skin or certain body passages. On the skin it may appear as a rough, scaly, crusted, wart-like, or nonhealing sore and can invade nearby tissue or spread if untreated.

Squamous Cell Carcinoma in Situ

Squamous cell carcinoma in situ, also called Bowen disease, is an early skin cancer limited to the outer skin layer. It can become invasive if untreated.

Squamous Cell Carcinoma Of The Lung

A type of non-small-cell lung cancer that usually begins in the lining of a larger airway. It is strongly linked to smoking but can occur in nonsmokers. Symptoms may include a persistent cough, coughing

blood, chest pain, breathlessness, or repeated chest infections; treatment depends on stage and tumor features.

Squamous Cell Carcinoma Of The Skin

Alternate name; see *Cutaneous Squamous Cell Carcinoma*.

Squamous Cells

Plural form; see *Squamous Cell*.

Squamous Cell Skin Cancer

Alternate name; see *Cutaneous Squamous Cell Carcinoma*.

Squamous Intraepithelial Lesion

An abnormal growth of squamous cells that remains within the surface lining of an organ. It may be low-grade or high-grade and commonly results from persistent infection with a high-risk human papillomavirus type; significance and progression risk depend on the site and grade.

Alternate Names:
SIL

Square Foot

A square foot is a unit of area equal to a square measuring one foot on each side, used to describe surfaces, rooms, wounds, or treatment areas.

Square Inch

A square inch is a unit of area equal to a square measuring one inch on each side, used for small surfaces or wound measurements.

Squint

Misalignment of the eyes so they do not point in the same direction. It may be constant or intermittent and can cause double vision, poor depth perception, or reduced vision in one eye.

SRT

Stereotactic radiotherapy, a precise form of external radiation treatment that uses three-dimensional imaging and careful positioning to target a small tumor or other abnormal area. It is often given in two to five sessions to limit exposure to nearby tissue.

SSRI

A selective serotonin reuptake inhibitor; a widely prescribed class of medications commonly used to treat depression, anxiety disorders, and related conditions. They work by slowing the reabsorption of serotonin, a chemical messenger in the brain that helps regulate mood, emotion, and sleep. By allowing more serotonin to remain available between nerve cells, SSRIs help improve mood regulation and alleviate anxiety symptoms.

Alternate Names:
SSRIs; Selective Serotonin Reuptake Inhibitor; Selective Serotonin Reuptake Inhibitors

SSRIs

Plural form; see *SSRI*.

Stable Angina

Repeated, predictable chest pressure or discomfort brought on by activity or stress because the heart muscle receives too little blood. It usually improves with rest or prescribed medicine; new, severe, prolonged, or rest pain may indicate unstable angina or a heart attack.

Alternate Names:
Chronic Stable Angina

Stable Coronary Artery Disease

Coronary artery narrowing causing a consistent, predictable pattern of angina.

Alternate Names:
Stable Ischemic Heart Disease

Stable Disease

An oncology response category in which a cancer has neither shrunk enough to meet criteria for partial response nor grown enough to meet criteria for progressive disease. It describes change over a specified assessment interval and does not mean that the cancer is cured or inactive.

Stabs

Brief, sharp pains or penetrating injuries described as stabbing. Causes vary with location and may include nerve irritation, muscle strain, infection, inflammation, injury, or serious disease.

Stab Wound

A deep puncture caused by a pointed or sharp object. The wound may damage blood vessels, nerves, organs, or bone even when the skin opening looks small; heavy bleeding, severe pain, or a chest or abdominal wound can indicate life-threatening internal injury.

Stafne Bone Defect

A Stafne bone defect is a usually harmless, developmental indentation in the lower jaw caused by nearby salivary-gland tissue. It is often found incidentally on imaging.

Stage 4 Prostate Cancer

Alternate name; see *Advanced Prostate Cancer*.

Stage I

A cancer stage that generally indicates limited disease, although the exact definition and prognosis depend on the cancer type and staging system.

Stage II

A cancer stage that usually indicates a larger or more locally advanced tumor than stage I, without distant spread. The exact tumor size, lymph-node findings, prognosis, and treatment vary by cancer type and staging system.

Stage III

A cancer stage that often indicates more extensive local or regional disease, with the precise criteria depending on the cancer type.

Stage IV

A cancer stage that generally indicates spread to distant organs or sites. Prognosis and treatment vary by cancer type and individual factors.

Stages Of Change

A model describing common steps people may pass through when changing a behavior. These include not yet considering change, thinking about it, preparing, taking action, and maintaining the change; people may move backward or forward between stages.

Alternate Names:
Transtheoretical Model; Prochaska Model

Stages of Labor

The three sequential stages of childbirth: the first stage extends from the onset of labor to complete cervical dilation and includes latent and active phases; the second stage extends from complete dilation to birth of the baby; and the third stage extends from birth to delivery of the placenta.

Staghorn Calculi

Large branching kidney stones that fill part or all of the kidney's urine-collecting system. They are often linked with infection, can damage kidney tissue, and usually require specialist treatment to remove them.

Staghorn Calculus

A branching kidney stone that fills part or all of the renal pelvis and calyces, often associated with infection.

Staging

Determining how far a cancer has grown or spread by assessing the original tumor, nearby lymph nodes, and distant organs. The stage helps estimate outlook and choose treatment.

Staining

A laboratory method that uses colored dyes to make cells, tissue structures, or microorganisms easier to see under a microscope. Different stains highlight different features and can help guide diagnosis, although results may need culture or other tests for confirmation.

Stainless Steel

A corrosion-resistant alloy containing iron and

chromium, used for instruments, implants, orthodontic appliances, and some dental crowns. Its suitability depends on the grade, strength, and tissue exposure.

Stammering

Alternate name for stuttering, a speech-fluency difficulty involving repeated sounds or words, prolonged sounds, or blocks that interrupt speaking. It is common in childhood and may continue into adulthood; speech-language therapy can help.

Standard Deviation

A number that shows how widely measurements differ from their average. A small standard deviation means values are close together, while a large one means they are more spread out; it does not by itself show whether results are good or bad.

Standard Eye Exam

A comprehensive eye examination assessing visual acuity, refraction, pupils, eye movements, external structures, anterior eye, intraocular pressure, and ocular fundus as indicated.

Standardized Extract

An herbal extract adjusted to contain a measured amount of selected ingredient, improving consistency but not guaranteeing safety or effectiveness.

Standardized Uptake Value

A number used on a PET scan to estimate how much radioactive tracer a tissue has taken up, adjusted for the injected amount and body size. It can help compare areas or follow change, but it does not by itself prove cancer or another disease.

Standard Of Care

The conduct, skill, diligence, and judgment a reasonably prudent practitioner of the same specialty would exercise under similar circumstances; the benchmark for medical negligence. It is established through guidelines, peer practice, and expert testimony rather than fixed statute.

Standard Precautions

Basic infection-control measures used for every patient, because blood, body fluids, nonintact skin, and mucous membranes may carry germs. They include hand hygiene, appropriate protective equipment, safe injections, sharps safety, and respiratory etiquette.

Stannosis

A usually mild form of pneumoconiosis caused by long-term inhalation of tin oxide dust. It may produce visible lung changes on imaging, often without major breathing impairment.

Stanozolol

A synthetic anabolic androgenic steroid with limited medical use and potential liver, lipid, and cardiovascular toxicity.

Stapedectomy

Surgical removal or replacement of the stapes, usually to treat otosclerosis and conductive hearing loss.

Stapedius

A small middle-ear muscle that helps limit movement of the stapes and may protect the inner ear from loud sounds.

Stapes

The smallest middle-ear bone, passing sound vibrations from the incus to the inner ear for hearing.

Staph Infection

Alternate informal name; see *Staphylococcal Infection*.

Staph Infections In The Hospital

Infections caused by Staphylococcus bacteria that begin during or after healthcare treatment, or require hospital care. They may involve wounds, blood, lungs, bones, or devices and can be difficult to treat when the bacteria resist antibiotics.

Staphylococcal Food Poisoning

An acute foodborne intoxication caused by the ingestion of preformed heat-stable enterotoxins produced by Staphylococcus aureus in improperly refrigerated or handled foods (such as dairy products, pastries, processed meats, and salads). Characterized by an abrupt onset of severe nausea, spasmodic abdominal cramping, and violent vomiting within 1 to 6 hours of consumption, usually resolving spontaneously within 24 to 48 hours.

Alternate Names:
Staphylococcal Enterotoxicosis; Staph Food Poisoning

Staphylococcal Infection

An infection caused by Staphylococcus aureus or another Staphylococcus species. It may affect the skin, bone, joints, lungs, heart valves, blood, or other tissues. Some strains resist multiple antibiotics. Diagnosis and antimicrobial treatment depend on the site, severity, and susceptibility of the organism.

Alternate Names:
Staph Infection; Staphylococcal Disease

Staphylococcal Meningitis

Staphylococcal meningitis is infection and inflammation of the meninges caused by Staphylococcus bacteria, often after surgery, trauma, bloodstream infection, or an invasive device.

Staphylococcal Pneumonia

Pneumonia caused by Staphylococcus bacteria, sometimes after influenza or another viral infection. It may cause fever, cough, chest pain, breathlessness, lung abscesses, or infected fluid around the lung.

Staphylococcal Scalded Skin

Alternate name; see *Staphylococcal Scalded Skin Syndrome*.

Staphylococcal Scalded Skin Syndrome

A toxin-mediated skin disorder caused by Staphylococcus aureus, usually affecting infants or young children. It produces widespread redness, tenderness, fragile superficial blisters, and peeling that can resemble a burn; extensive skin loss can cause fluid loss and infection.

Staphylococcus

A genus of gram-positive cocci that includes S. aureus and common skin colonizers and pathogens.

Staphylococcus Aureus

A bacterium that commonly lives on the skin or in the nose but can cause infections of the skin, blood, lungs, bones, joints, or heart valves. Some strains are resistant to several antibiotics.

Stapling

Closing or joining tissue with metal or absorbable surgical staples. Staples may be used for skin, blood vessels, or parts of the digestive tract; removal timing depends on the site and staple material.

Starch Poisoning

Illness after swallowing a starch product, most often causing choking, blockage, or stomach upset rather than systemic poisoning. Inhaled powder can irritate the airways; breathing difficulty or persistent vomiting can indicate aspiration or blockage.

Stargardt Disease

An inherited eye disorder that gradually damages the macula, the central part of the retina. It usually begins in childhood or young adulthood and causes loss of detailed central vision; side vision is often preserved.

Starling Equation

A mathematical physical equation describing the transcapillary fluid filtration rate (J_v) as a function of the hydraulic conductance and the balance between hydrostatic pressure gradients (capillary minus interstitial) and oncotic pressure gradients (capillary minus interstitial) across microvascular endothelia.

Starling Forces

The balance of pressures that pushes water out of small blood vessels or pulls it back in. Changes can

cause swelling in tissues, dehydration of tissues, or fluid buildup around organs.

Starvation

Severe lack of food or usable energy over time, causing weight and muscle loss, weakness, changes in body chemistry, reduced immunity, and eventually organ failure. Restarting nutrition after prolonged starvation can trigger dangerous shifts in body salts and fluid balance.

Stasis

Slowing or stopping of normal movement of blood, lymph, intestinal contents, or other body fluids.

Stasis Dermatitis

Inflammation of the lower-leg skin caused by chronic venous hypertension and edema. It may cause itching, redness, scaling, brown discoloration, weeping, or ulcers around the ankles. Management focuses on treating venous disease, compression when safe, skin care, and evaluation for infection or arterial insufficiency.

Stasis Dermatitis And Ulcers

Stasis dermatitis and ulcers result from chronic venous hypertension in the lower legs, causing swelling, brown skin change, inflammation, itching, and slow-healing wounds.

Stasis Ulcer

A stasis ulcer is a chronic lower-leg wound caused by venous hypertension and poor return of blood, commonly near the ankle and associated with edema and skin changes.

STAT

A medical instruction meaning immediately or with urgent priority, such as a stat test, medicine, or consultation.

Statin

A widely prescribed class of medications that help lower blood cholesterol levels, particularly low-density lipoprotein (LDL) or "bad" cholesterol. Statins work by blocking a specific liver enzyme that the body uses to make cholesterol, encouraging the liver to remove more existing cholesterol from the bloodstream. By reducing arterial cholesterol plaque buildup, statins help decrease the long-term risk of heart attacks and strokes in individuals with cardiovascular disease or elevated risk factors.

Alternate Names:
Statins; HMG-CoA Reductase Inhibitor; HMG-CoA Reductase Inhibitors

Statin Drugs

Alternate name; see *Statin*.

Statin-Induced Myopathy

Muscle disease attributed to statin therapy, typically involving muscle weakness or injury with elevated creatine kinase. Muscle aches or tenderness with normal creatine kinase are more broadly described as statin-associated muscle symptoms and do not alone establish myopathy; rare severe injury can progress to rhabdomyolysis and kidney damage.

Statins

Plural form; see *Statin*.

Statins In Diabetes

Cholesterol-lowering treatment for people with diabetes who may benefit from reduced risk of heart attack and stroke. The medicine and dose depend on age, cardiovascular risk, kidney function, other medicines, and possible side effects.

Station

A measure of how far the baby's presenting part, usually the head, has descended through the pelvis during labor. It is compared with the mother's pelvic bones and helps clinicians follow progress toward birth.

Status Asthmaticus

A severe asthma attack that does not improve enough with the first treatments. Breathing may become dangerously difficult, with exhaustion, inability to speak normally, or low oxygen, and emergency hospital treatment is required.

Status Epilepticus

A medical and neurological emergency in which an epileptic seizure lasts longer than 5 minutes, or multiple seizures occur in rapid succession without the person regaining normal consciousness in between. Because normal brain mechanisms fail to stop the continuous abnormal electrical discharges, prolonged seizure activity can lead to permanent brain damage, respiratory failure, or life-threatening systemic complications if not halted rapidly.

Alternate Names:
SE; Convulsive Status Epilepticus; Refractory Status Epilepticus

Status Migrainosus

A severe migraine attack that persists for more than 72 hours, often with persistent vomiting, dehydration, or medication overuse.

Stay Away From Asthma Triggers

Avoiding asthma triggers such as smoke, allergens, infections, fumes, and cold air can reduce symptoms and attacks, alongside prescribed controller and reliever treatment.

STDs

Alternate name; see *Sexually Transmitted Disease*.

Steady State

The point during regular medicine use when the amount entering the body over time is about equal to the amount leaving it. Blood levels then become relatively stable; reaching this point usually takes several doses and depends on the medicine's half-life.

Steal Syndrome

Reduced blood flow to a hand, foot, or other area because a bypass graft or dialysis fistula diverts too much blood. It may cause pain, coolness, pale or blue skin, numbness, or weakness and requires vascular assessment.

Steatocystoma Multiplex

A disorder producing multiple sebum-filled cysts arising from the pilosebaceous units, commonly on the trunk, chest, arms, or face. Lesions are usually skin-colored and painless but may become inflamed; treatment depends on symptoms and extent.

Steatoma

A fatty or sebaceous mass; the term may refer to a lipoma or, in the ear, a cholesteatoma depending on context.

Steatorrhea

The passage of excess fat in the stool, causing greasy, pale, foul-smelling, floating stools—a hallmark of fat malabsorption.

Steatorrhoea

Excess fat in stool, causing pale, bulky, greasy, foul-smelling bowel movements. It suggests poor fat digestion or absorption from pancreatic, liver, bile-duct, intestinal, or other digestive disease.

Steatotic Liver Disease (SLD)

A group of liver disorders characterized by excess fat accumulation in liver cells. Causes include metabolic dysfunction, alcohol, medicines, and other conditions; inflammation, fibrosis, cirrhosis, or liver cancer may develop in some people.

Steele-Richardson-Olszewski Syndrome

Alternate name; see *Progressive Supranuclear Palsy*.

Stein-Leventhal Syndrome

Older name; see *Polycystic Ovary Syndrome*.

ST-Elevation Myocardial Infarction

An acute myocardial infarction associated with characteristic ST-segment elevation on an electrocardiogram. The ECG pattern reflects acute myocardial ischemia but does not, by itself, prove complete coronary-artery blockage. Acute coronary occlusion may occur with or without ST elevation; myocardial infarction is established by evidence of acute myocardial injury together with evidence of ischemia.

Stem Cell

An undifferentiated or unspecialized biological cell

possessing two defining properties: self-renewal (the capacity to undergo numerous rounds of cell division while maintaining the undifferentiated state) and potency (the capacity to differentiate into specialized cell types). Hierarchically classified into totipotent cells (capable of generating an entire organism and extraembryonic membranes), pluripotent cells (embryonic stem cells generating all three primary germ layers), and multipotent/unipotent adult somatic stem cells (e.g., hematopoietic stem cells in bone marrow replenishing blood cell lineages, and neural stem cells).

Alternate Names:
Stem Cells

Stem Cell Donation

The collection of healthy blood-forming stem cells from a donor for transplantation into another person. Cells may be collected from the bloodstream by apheresis after medication increases their number in the blood, or directly from bone marrow under anesthesia. Donor and recipient compatibility, especially human leukocyte antigen matching, helps improve transplant success.

Stem Cells

Plural form; see *Stem Cell*.

Stem Cell Transplantation

Hematopoietic stem cell transplantation replaces diseased or ablated bone marrow with healthy donor or autologous stem cells.

STEMI

A type of heart attack caused by sudden blockage of a heart artery, usually producing characteristic changes on an electrocardiogram. It is an emergency because quickly restoring blood flow can limit permanent heart damage.

Alternate Names:
ST-Elevation Myocardial Infarction

Stenosing Tenosynovitis

Alternate name; see *Trigger Finger*.

Stenosis

Abnormal narrowing of a passage, blood vessel, heart valve, spinal canal, or other opening. Narrowing may restrict flow or compress nearby structures.

Stenosis of the LAD

Narrowing of a major artery supplying the front of the heart. Reduced blood flow may cause chest pain during exertion or a heart attack if the narrowing becomes severe or the artery suddenly blocks.

Stenotic

Stenotic means narrowed, as in a stenotic heart valve, blood vessel, airway, intestine, or other passage.

Stenotrophomonas Maltophilia Resistance

The ability of Stenotrophomonas maltophilia bacteria to survive several antibiotics. Treatment depends on the infected body site, illness severity, and laboratory testing that identifies which medicines are likely to work.

Stensen Duct

The main excretory duct of the parotid gland that traverses the masseter muscle and opens into the oral cavity through a small papilla on the buccal mucosa opposite the second maxillary molar.

Alternate Names:
Parotid Duct; Stensen's Duct

Stent

A tube or scaffold placed inside a vessel or other passage to keep it open.

Stent Graft

A fabric-covered stent placed inside a blood vessel to reinforce the vessel wall or exclude an aneurysm from blood flow.

Stenting

Placement of a small mesh tube to keep a narrowed or blocked passage open. Vascular stents restore blood flow, while drug-coated types release medicine

to reduce repeated narrowing.

Stent Placement

Insertion of a mesh tube or other support to keep a narrowed or blocked passage open. Stents may be used in arteries, bile ducts, ureters, airways, or the esophagus; bleeding, blockage, infection, movement, or repeated narrowing can occur.

Stent Restenosis

Re-narrowing of a blood vessel within or adjacent to a previously placed stent, usually caused by tissue growth, recurrent atherosclerosis, or thrombosis.

Stepping Reflex

A newborn reflex in which an infant held upright makes stepping-like movements when the soles touch a firm surface. It usually fades by about 2 months as the nervous system matures; later walking is a separate learned movement.

Stercoral Colitis

Inflammation and injury of the colon caused by hard, impacted stool pressing on the bowel wall, usually after prolonged constipation. The pressure can reduce blood flow and lead to ulcers or, in severe cases, a hole in the bowel.

Stereognosis

The ability to recognize a familiar object by feeling it without looking. It requires intact skin sensation, nerve pathways, and areas of the brain that interpret touch; loss may occur after nerve or brain injury.

Stereotactic

Stereotactic describes a technique using three-dimensional coordinates to target a precise location in the brain or another body structure.

Stereotactic Biopsy

Image-guided biopsy using three-dimensional coordinates to target a lesion that may be difficult to localize by direct palpation. It is used in the breast and, with specialized systems, the brain, lung, and other organs.

Stereotactic Body Radiation Therapy

A focused form of external radiation that delivers a high dose to a small body tumor in a few treatments. It may treat selected lung, liver, kidney, pancreatic, or spinal tumors while limiting exposure to nearby tissue.

Stereotactic Brain Biopsy

A precision, minimally invasive neurosurgical procedure used to safely obtain small tissue samples from deep, delicate, or high-risk areas of the brain for microscopic examination. Using high-resolution pre-operative MRI or CT scans and a specialized three-dimensional stereotactic head frame or frameless optical infrared navigation system, a neurosurgeon maps exact mathematical coordinates to the suspected tumor or infection. Through a tiny circular burr hole (approximately 3 to 5 mm) in the skull, the surgeon gently passes a specialized hollow biopsy needle straight to the target lesion without disrupting surrounding healthy brain tissue. The extracted tissue specimens are examined by a neuropathologist to determine the exact tumor type, grade, genetic markers, or underlying infection, allowing doctors to design targeted chemotherapy, radiation, or medical therapy.

Alternate Names:
Stereotactic Needle Biopsy; Brain Biopsy; Frameless Stereotactic Biopsy

Stereotactic Breast Biopsy

A minimally invasive percutaneous core-needle biopsy procedure utilizing digital mammographic triangulation from angled X-ray views to precisely target and sample nonpalpable microcalcifications or architectural distortions.

Alternate Names:
Stereotactic Breast Biopsy; Stereotactic Core Needle Biopsy; Mammographically Guided Breast Biopsy

Stereotactic Radiosurgery

A highly precise external radiation treatment that uses imaging and stereotactic positioning to aim one or a few high doses at a small target, usually in the brain. Despite its name, it does not involve an incision; focused beams limit radiation to nearby

healthy tissue. It is used for selected brain tumors and other intracranial disorders.

Alternate Names:
Stereotaxic Radiosurgery

Stereotaxis

A technique using a three-dimensional coordinate system to target deep structures, especially in brain procedures.

Stereotypic Movement Disorder

Repeated, apparently purposeless movements such as hand flapping, rocking, or head banging that interfere with activities or cause injury. It is more common in childhood and developmental conditions; similar movements can have other neurologic or medical causes.

Sterile Field

A designated area maintained free of viable microorganisms during an invasive procedure. Only sterile equipment and materials may contact the field or the sterile portions of instruments.

Sterile Site

A body area or sample that normally contains no living microorganisms, such as blood, spinal fluid, joint fluid, or tissue from a closed space. Finding a germ there is usually important, although accidental contamination must be considered.

Sterile Technique

Methods used to prevent introduction of microorganisms into a sterile field, wound, tissue, device, or body site through hand hygiene, barriers, aseptic handling, and appropriate preparation.

Sterilisation

Destruction or removal of all forms of microbial life, or permanent contraception depending on context.

Sterility

Inability to reproduce, or complete absence of living microorganisms from an object or preparation, depending on context. In healthcare, sterile equipment, implants, and medicines must remain free from contamination to prevent infection.

Sterilization

A process that destroys or removes all forms of microbial life, including spores, from equipment, medicines, or other materials. In another context, sterilization means a permanent method intended to prevent pregnancy.

Sternal Angle

The ridge where the manubrium joins the body of the sternum. It marks the level where the second ribs attach and helps locate structures inside the chest.

Sternal Exploration Or Closure

Surgical reopening or repair of the breastbone after median sternotomy, performed to treat infection, bleeding, instability, dehiscence, or other postoperative chest complications.

Sternal Fracture

A break in the breastbone, most often caused by direct chest impact or compression. It may cause localized pain and tenderness and can accompany cardiac, pulmonary, or mediastinal injury.

Sternal Line

An imaginary vertical line along the outer edge of the breastbone. It is used as a surface landmark when describing the location of chest structures or physical findings.

Sternal Tenderness

Pain when the breastbone is pressed. It can result from injury, inflammation, infection, or other chest-wall problems. Tenderness alone cannot rule out heart or lung causes of chest pain.

Sternoclavicular Joint

A saddle-type synovial joint between the clavicle and manubrium of the sternum. It is the only bony connection between the upper limb and axial skeleton and permits movement of the shoulder girdle.

Sternocleidomastoid Muscle

A prominent muscle on each side of the neck that turns and bends the head and helps stabilize the neck. It can also assist forceful breathing; strain or spasm may cause neck pain and limited movement.

Sternocleidomastoid Fibromatosis

A benign, firm thickening in a neck muscle, usually seen in infants during the first weeks of life. It may make the baby's head tilt to one side; the lump and tightness often improve with stretching and growth.

Sternocostal Joint

A joint where a rib or its cartilage meets the breastbone. These joints help form the front of the chest wall.

Sternotomy

Surgical division of the sternum, usually along the midline, to provide access to the heart or mediastinal structures.

Sternum

The breastbone forming the front of the central chest wall.

Sternutation

Sneezing, a reflex forceful expulsion of air through the nose and mouth triggered by irritation of nasal or upper-airway sensory receptors.

Steroid Myopathy

Muscle weakness caused by prolonged exposure to corticosteroid medicines or excessive cortisol. It usually develops gradually and affects the hips, thighs, shoulders, and upper arms, making it hard to rise from a chair or climb stairs. Weakness may improve when the cause is treated; abrupt steroid withdrawal can cause adrenal insufficiency.

Alternate Names:
Corticosteroid-Induced Myopathy; Glucocorticoid Myopathy

Steroids

A broad family of compounds with a characteristic four-ring structure, including body hormones, corticosteroids, and sex hormones. Their effects depend on the type; prolonged corticosteroid use can suppress immunity and weaken bones.

Stertor

A low-pitched snoring, gurgling, or rattling sound caused by partly blocked air passages in the nose or throat. It may occur during sleep or illness; noisy breathing with severe sleepiness, blue lips, or breathing difficulty is an emergency.

Stethoscope

An instrument used for auscultation, the examination of sounds produced within the body. It usually has a chest piece with a diaphragm and sometimes a bell, flexible tubing, and earpieces; electronic models convert sounds into amplified or recorded signals. It is used to examine heart, lung, bowel, and vascular sounds.

Stevens Johnson Syndrome

Alternate spelling; see *Stevens-Johnson Syndrome*.

Stevens-Johnson Syndrome

A rare, severe, and life-threatening reaction that affects the skin and mucous membranes, most commonly triggered by an adverse reaction to certain medications (such as antibiotics, pain relievers, or anti-seizure drugs) or, less frequently, by infections. It typically begins with flu-like symptoms, followed days later by a painful red or purplish rash that spreads and blisters. The top layer of affected skin and the mucous membranes of the mouth, eyes, and genitals die and peel away, leaving raw, painful areas vulnerable to fluid loss and serious infection.

Alternate Names:
SJS; SJS/TEN Spectrum

Stewart-Treves Syndrome

An angiosarcoma arising in long-standing lymphedema, classically after mastectomy but also after congenital lymphedema, radiation, infection, or other lymphatic damage. It may appear as bruised, purple, nodular, or ulcerated areas in chronically swollen skin.

STI

Alternate name; see *Sexually Transmitted Disease*.

Stickler Syndrome

An inherited connective-tissue disorder that may cause severe nearsightedness, retinal detachment, hearing loss, early arthritis, and differences in the jaw or palate. Regular eye and hearing checks are important.

Stiff Baby Syndrome

A nonspecific description of unusual stiffness or increased muscle tone in an infant, not a single diagnosis. Causes include brain, nerve, muscle, genetic, or metabolic disorders; persistent stiffness, poor feeding, seizures, or breathing problems can indicate serious disease.

Stiffness

Difficulty or discomfort when moving a body part. It may result from joint disease, muscle problems, nerve disorders, inflammation, injury, prolonged rest, or aging and can limit everyday activities.

Stiff-Person Syndrome

A rare immune-related nervous-system disorder causing persistent muscle stiffness and sudden painful spasms. Noise, touch, movement, or emotional stress may trigger spasms, leading to falls and difficulty walking. Blood tests may find related antibodies. Treatment can reduce stiffness and immune activity, but symptoms often require long-term care.

Alternate Names:
SPS; Stiff-Man Syndrome; Moersch-Woltman Syndrome

Stigma

A mark, characteristic, or social discrediting label; in medicine it may refer to a sign or to harmful social attitudes.

Stilboestrol

Historical name; see *Diethylstilbestrol*.

Stilet

A thin, pointed instrument placed inside a cannula or tube to guide insertion, clear a blockage, or provide firmness. It can injure tissue or blood vessels if advanced beyond the device tip.

Stillbirth

The death of a fetus before or during delivery after the gestational-age or birth-weight threshold used by a country or health system. In the United States, it usually refers to loss at or after 20 weeks of pregnancy; the World Health Organization commonly uses 28 weeks for international comparisons. Causes may include problems with the placenta, fetal growth, infection, genetic or developmental conditions, or maternal illness, but some stillbirths remain unexplained.

Still Disease

An inflammatory disease that can affect the whole body. In children it is called systemic juvenile idiopathic arthritis; in adults it is called adult-onset Still disease. It can cause fever, joint pain or swelling, and a rash.

Alternate Names:
Systemic Juvenile Idiopathic Arthritis; Adult-Onset Still Disease; AOSD

Still Disease-Associated Arthritis

Joint inflammation occurring in Still disease. In children, the related diagnosis is systemic juvenile idiopathic arthritis; in adults it is adult-onset Still disease.

Still's Disease

An inflammatory illness that can affect children or adults. It commonly causes repeated high fevers, a fleeting rash, joint pain or swelling, and marked inflammation; it can affect other organs and usually requires specialist treatment.

Still's Murmur

A common harmless heart murmur in children, usually heard between ages 2 and 7. It has a soft, musical sound, becomes louder with fever or exercise, and usually disappears as the child grows; the

heart is otherwise normal.

Alternate Names:
Innocent Vibratory Murmur; Normal Pediatric Murmur; Twanging-String Murmur

Stimulant

A psychoactive substance that temporarily accelerates cognitive, physical, or behavioral activity by increasing sympathetic neurotransmission and central dopaminergic and noradrenergic activity. Pharmacologic stimulants (e.g., methylphenidate, amphetamine salts, modafinil) are used therapeutically for attention-deficit/hyperactivity disorder (ADHD) and narcolepsy; adverse effects and toxicity include tachycardia, hypertension, diaphoresis, insomnia, anorexia, psychomotor agitation, paranoia, and potential for dependence.

Alternate Names:
Stimulants; Psychostimulant; Central Nervous System Stimulant

Stimulants

Plural form; see *Stimulant*.

Stimulant Use Disorder

A pattern of using stimulant drugs that causes significant problems or loss of control despite harm. Stimulants include cocaine and amphetamine-type drugs; stopping may cause tiredness, low mood, increased appetite, or excessive sleep.

Stimulus

A stimulus is a physical, chemical, sensory, or social change that evokes a response from a cell, tissue, organism, or person.

Stingray

A sea-animal injury caused by a stingray spine, usually producing severe pain, swelling, and a puncture wound. Medical care may be needed to clean the wound, remove retained spines, and treat whole-body reactions.

Stings

Injuries caused when an insect, animal, or plant injects venom or irritating material. They may cause pain, swelling, itching, allergic reactions, tissue damage, or serious poisoning depending on the source.

Stippling

Small marks around a firearm entrance wound caused by gunpowder striking the skin. The pattern may help estimate firing distance, but it varies with the weapon and ammunition and cannot establish distance by itself.

Alternate Names:
Gunpowder Stippling; Powder Tattooing

Stitch

A suture used to close tissue, or a sharp transient pain, often in the side during exercise.

St John's Wort

A herbal product made from Hypericum perforatum and sometimes used for depressive symptoms. It can cause side effects and reduce the effectiveness of many medicines, including some contraceptives, anticoagulants, transplant medicines, and HIV treatments.

Stochastic Effects

Possible effects of radiation, especially cancer or inherited genetic changes, whose chance increases with dose. The severity cannot be predicted from the dose, and even low exposure may carry some risk.

Stoddard Solvent Poisoning

Poisoning from Stoddard solvent, a petroleum-based cleaning solvent. Inhalation or swallowing can cause headache, dizziness, drowsiness, skin irritation, or aspiration-related lung injury; vomiting after ingestion can increase aspiration risk.

Stokes-Adams Disease

A syndrome of sudden fainting or near-fainting caused by transient severe slowing or interruption of the heartbeat, often associated with advanced atrioventricular block.

Stokes-Adams Syndrome

Sudden fainting caused by a temporary dangerous slowing or stopping of the heartbeat, often from heart block or another abnormal rhythm. It can cause injury or progress to cardiac arrest.

Stoma

A natural opening or a surgically created opening connecting an organ to the skin or another organ.

Stomach

The hollow, muscular organ between the oesophagus and small intestine. It stores and mixes food with acid and enzymes, begins protein digestion, and meters the resulting chyme into the duodenum, the first part of the small intestine. Gastric acid kills many ingested microbes and helps make dietary iron and some minerals available for absorption.

Stomach Cancer

Cancer that begins in the stomach, most often in gland-forming cells lining the stomach. Risk factors include Helicobacter pylori infection, smoking, chronic inflammation, certain foods, and inherited conditions; symptoms and treatment depend on type and stage.

Alternate Names:
Gastric Carcinoma

Stomach Cramps

Intermittent gripping or spasmodic upper-abdominal pain caused by gas, infection, indigestion, ulcer disease, gallbladder or pancreatic disease, obstruction, or other causes.

Stomach Diseases

Disorders affecting the stomach, including inflammation, ulcers, movement problems, blockage, bleeding, and tumors. Symptoms may include pain, nausea, vomiting, early fullness, weight loss, indigestion, or blood in vomit or stool.

Stomach Flu

A common informal term for viral gastroenteritis, an infection of the stomach and intestines caused by viruses rather than influenza viruses. It may cause watery diarrhea, vomiting, abdominal cramps, fever, and dehydration; some infections cause few or no symptoms.

Stomach Pain

Discomfort in the upper abdomen. Causes range from indigestion and infection to ulcers, gallbladder disease, or pancreatitis; severe or persistent pain can occur with serious disease.

Stomach Paralysis

Stomach paralysis, or gastroparesis, is delayed emptying of stomach contents without obstruction, causing early fullness, nausea, vomiting, and bloating.

Stomach Tube

A tube passed through the mouth or nose into the stomach for drainage, feeding, sampling, or treatment.

Stomach Ulcer

See *Gastric Ulcer*.

Stomach Washout

A procedure that rinses and removes stomach contents through a tube. It is rarely used for selected serious poisonings because it can cause choking, lung injury, bleeding, or other complications.

Stoma Complications

Problems involving an opening made from the intestine or urinary tract to the skin. They include skin irritation, bleeding, retraction, prolapse, narrowing, blockage, high output, infection, and a parastomal hernia; sudden severe pain, color change, or no output can signal ischemia or blockage.

Stomatitis

Inflammation, soreness, redness, or ulcers of the lining of the mouth. Causes include infection, irritation, nutritional deficiency, medicines, and cancer treatment; severe cases can cause dehydration or difficulty eating and drinking.

Stomatodynia

Alternate name; see *Burning Mouth Syndrome*.

Stomatology

The field concerned with diseases of the mouth and oral cavity, including the oral mucosa and related structures. The term is used variably across health systems and may overlap with oral medicine.

Stone

A hard lump formed inside an organ or tube, commonly from mineral salts or other body substances. Stones may block flow, cause pain or infection, and occur in kidneys, gallbladder, or ducts.

Stonefish Sting

A puncture injury from the venomous spines of a stonefish, causing severe pain, swelling, bleeding, and sometimes weakness, breathing problems, or shock. Hot-water immersion may reduce pain, but severe poisoning can affect breathing and circulation.

Stool

The solid or semi-solid waste matter discharged from the gastrointestinal tract through the anus during defecation (feces). Composed of undigested dietary fiber and residue, water, sloughed intestinal mucosal epithelial cells, unabsorbed minerals, bile pigments (stercobilin giving the characteristic brown coloration), and a massive biomass of commensal bacteria. Clinical macroscopic and microscopic evaluation (such as the Bristol Stool Form Scale, fecal occult blood testing, and stool culture) provides diagnostic insight into gastrointestinal motility, malabsorption, and infection.

Alternate Names:
Stools; Feces; Excrement

Stool C Difficile Toxin

A stool test for harmful substances made by Clostridioides difficile bacteria. A positive result supports active infection when a person has compatible diarrhea, but bacteria can be present without causing illness.

Stool Culture

Laboratory growth and identification of bacteria from a stool specimen to investigate infectious diarrhea or intestinal infection. Results may include antimicrobial-susceptibility testing; some organisms can be present through colonization rather than causing symptoms.

Stool Examination

Laboratory analysis of a stool sample for blood, infection, parasites, inflammation, malabsorption, or other digestive abnormalities.

Stool Gram Stain

Microscopic examination of a stool specimen after Gram staining; it may provide limited information about bacterial flora or inflammatory cells but is not a general test for infectious diarrhea.

Stool Guaiac Test

A chemical fecal occult blood test that detects the peroxidase activity of heme in stool. Dietary factors, medicines, and specimen collection can affect results. It is a screening or detection test rather than a diagnosis; a positive result requires clinical follow-up and usually evaluation for a gastrointestinal source.

Stool Holding

Alternate name; see *Encopresis*.

Stool Occult Blood Test

Alternate name; see *Fecal Occult Blood Test*.

Stool Ova And Parasites Exam

Microscopic examination of stool for parasite eggs, cysts, larvae, or other forms, sometimes requiring multiple specimens to improve detection.

Stools

Plural form; see *Stool*.

Stools – Floating

Feces that remain on the water surface, often from trapped gas or diet but sometimes from excess fat in malabsorption; persistent greasy, pale, foul-smelling

stool can indicate impaired fat absorption.

STOPP/START

A checklist used to review medicines in older adults. STOPP identifies medicines that may be inappropriate or harmful, while START identifies useful treatments that may have been missed; clinical judgment is still required.

Storage Diseases

A group of inherited metabolic disorders characterized by accumulation of substrates within cells due to specific enzyme deficiencies. Lysosomal storage diseases result from defects in lysosomal hydrolytic enzymes, leading to accumulation of undigested macromolecules within lysosomes.

Stork Bite

A stork bite is a common harmless pink birthmark, usually a nevus simplex on the forehead, eyelids, nose, or neck, that often fades during childhood.

Strabismus

A condition in which the eyes are not aligned and do not point in the same direction. One eye may turn inward, outward, upward, or downward. It may be constant or come and go. Strabismus can cause double vision in adults and may lead to amblyopia, or reduced vision in one eye, when it begins during childhood. Common types include esotropia, exotropia, hypertropia, and hypotropia.

Strabismus Surgery

Surgery that changes the position or tension of one or more extraocular muscles to improve eye alignment. It is also called eye-muscle surgery.

Alternate Names:
Squint Surgery; Eye Muscle Surgery; Extraocular Muscle Surgery

Straddle Injury

A direct blunt compressive trauma to the perineum occurring when a patient falls astride a hard, rigid object (such as a bicycle crossbar, fence, or beam), frequently causing crushing rupture of the anterior bulbous urethra beneath the pubic symphysis.

Straight Leg Raise Test

A provocative physical examination test for lumbosacral nerve root irritation (L4-S1, typically due to herniated intervertebral disc), in which the patient lies supine and the examiner passively elevates the extended lower extremity; reproduction of electric shooting radicular pain down the leg between 30 and 70 degrees indicates a positive result.

Alternate Names:
Lasegue Sign; SLR Test

Strain

In musculoskeletal medicine, an acute injury to a muscle or its attaching tendon resulting from excessive stretching, violent eccentric contraction, or tensile overload. Graded from Grade I (mild stretching with microscopic tearing), Grade II (partial structural disruption with weakness), to Grade III (complete muscle or tendon rupture). In microbiology, a strain denotes a specific genetic or phenotypically distinct lineage or isolate within a single biological species.

Alternate Names:
Strains; Muscle Strain

Strain Imaging

Ultrasound or magnetic-resonance imaging that measures how much tissue deforms during movement, especially how heart muscle shortens or thickens with each heartbeat. It can reveal early weakness even when the total amount of blood pumped appears normal.

Strains

Plural form; see *Strain*.

Strangulated Hernia

A hernia in which the blood supply to the trapped tissue is cut off, causing ischaemia and possible tissue death; it is a surgical emergency.

Strangulation

Compression of a body structure, especially the neck or a hernia, that compromises blood flow or airway.

Strangury

Painful, urgent, or difficult urination in which only small amounts of urine are passed. It may result from inflammation or irritation of the bladder or urethra, infection, stones, or obstruction.

Strapping

Application of adhesive tape or bandage to support, protect, or restrict movement of a body part.

Stratum Corneum

The outermost skin layer, made mainly of flattened dead cells filled with keratin. It forms a protective barrier that limits water loss and helps block chemicals, germs, and physical injury.

Strawberry Hemangioma

Alternate name; see *Hemangioma*.

Strawberry Tongue

A tongue that looks bright red and bumpy like a strawberry, often seen in childhood illnesses like scarlet fever or Kawasaki disease.

Strength

The ability of a muscle or group of muscles to produce force. Healthcare professionals may test strength by comparing movements against resistance; reduced strength can result from pain, poor effort, muscle disease, nerve problems, or brain injury.

Strength Testing

Assessment of how much force a muscle or muscle group can produce, using examination or equipment. It helps identify weakness and monitor recovery, progression, or response to treatment.

Strength Training

Exercise against resistance to improve muscle force, endurance, power, bone health, and function. Training programs vary in resistance, repetitions, frequency, and progression.

Alternate Names:
Resistance Training; Weight Training

Strep Throat

A bacterial infection of the throat and tonsils caused by group A Streptococcus, also called Streptococcus pyogenes. It commonly causes a sudden sore throat, pain when swallowing, fever, and swollen or red tonsils, sometimes with white patches.

Streptococcal Cellulitis With Lymphangitis

A streptococcal skin infection with inflammation spreading along nearby lymphatic vessels. Redness, warmth, pain, swelling, fever, and red streaks may occur; infection can spread to the blood.

Streptococcal Infection

An infection caused by gram-positive, catalase-negative cocci of the genus *Streptococcus*, classified by hemolytic pattern (alpha, beta, or gamma) and Lancefield cell-wall carbohydrate antigens. Group A Streptococcus (*S. pyogenes*, GAS) causes pharyngitis, impetigo, erysipelas, cellulitis, necrotizing fasciitis, and toxic shock syndrome, with immune-mediated nonsuppurative sequelae including acute rheumatic fever and poststreptococcal glomerulonephritis; Group B Streptococcus (*S. agalactiae*, GBS) causes neonatal sepsis and meningitis; *Streptococcus pneumoniae* is a leading cause of otitis media, community-acquired pneumonia, and bacterial meningitis.

Alternate Names:
Streptococcal Infections; Strep Infection

Streptococcal Infections

Plural form; see *Streptococcal Infection*.

Streptococcal Pharyngitis

Alternate name; see *Strep Throat*.

Streptococcal Screen

A streptococcal screen looks for group A Streptococcus, usually from a throat swab, to help diagnose strep throat.

Streptococcal Toxic Shock Syndrome

A fulminant, life-threatening invasive infection

caused by Streptococcus pyogenes (group A Streptococcus) producing streptococcal pyrogenic exotoxins that act as superantigens. It is characterized by the sudden onset of hypotension, shock, and multiorgan failure, frequently in association with severe invasive soft-tissue infections such as necrotizing fasciitis; it carries an exceptionally high mortality rate.

Alternate Names:
STSS; Streptococcal TSS; Toxic Shock-Like Syndrome

Streptococcus

A group of round bacteria that can cause throat infections, pneumonia, skin infections, heart-valve infection, or serious bloodstream illness. Different species spread and respond to antibiotics differently, so testing may guide treatment.

Streptococcus Agalactiae

Group B Streptococcus, a bacterium that can live in the bowel or genital tract without causing symptoms. It can pass to a baby during birth and cause serious newborn infection, so pregnancy screening and preventive antibiotics are used when indicated.

Streptococcus pneumoniae

Streptococcus pneumoniae is a bacterium that can cause pneumonia, meningitis, ear infection, sinusitis, and bloodstream infection. Vaccination helps prevent serious disease.

Streptococcus Pyogenes

Group A Streptococcus, a bacterium that causes strep throat, scarlet fever, impetigo, cellulitis, and sometimes severe invasive infection. Untreated infection can occasionally lead to rheumatic fever or kidney inflammation.

Streptokinase

A thrombolytic protein that activates plasminogen and dissolves clots; use is limited by bleeding risk and alternatives.

Streptomycin

An injectable aminoglycoside antibiotic used for selected tuberculosis and other bacterial infections. It can damage vestibular function and hearing, sometimes irreversibly, and may injure the kidneys. Toxicity risk is greater with impaired kidney function, high exposure, or prolonged treatment.

Stress

A physical and emotional response to perceived demands or threats. It can change heart rate, breathing, muscle tension, attention, sleep, and digestion; persistent or overwhelming stress may affect health.

Stress Cardiomyopathy

A temporary weakening of the heart muscle that often follows severe emotional or physical stress. It can cause chest pain, breathlessness, or fainting and may resemble a heart attack, even when no heart artery is blocked.

Stress Echocardiography

An ultrasound scan of the heart performed while the heart works harder through exercise or medicine. It looks for changes in heart-muscle movement that may suggest reduced blood flow.

Stress Fracture

An incomplete, microscopic fracture of bone resulting from repeated, subthreshold cyclic mechanical microtrauma and load that exceeds the normal repair and remodeling capacity of bone tissue (fatigue fracture in healthy bone, common in military recruits and runners affecting metatarsals, tibia, or fibula; or insufficiency fracture in abnormally demineralized osteoporotic bone). Presents with localized, insidious pain exacerbated by weight-bearing; initial plain radiographs may be normal, with MRI or nuclear bone scintigraphy offering high sensitivity for early diagnosis.

Alternate Names:
Stress Fractures; Fatigue Fracture

Stress Fractures

Plural form; see *Stress Fracture*.

Stress Incontinence

Involuntary leakage of urine during activities that increase intra-abdominal pressure, such as coughing,

sneezing, lifting, or exercise.

Stress Injuries

Tissue injuries caused by repeated loading or overuse without sufficient recovery. Examples include stress fractures, tendinopathy, and muscle strain.

Stressors

Events, conditions, or circumstances that trigger a physical or emotional stress response. Examples include illness, pain, sleep loss, trauma, work demands, and relationship difficulties.

Stress Related

Describes symptoms or health problems that are triggered or worsened by physical or emotional stress. Stress can affect sleep, pain, digestion, mood, heart rate, and blood pressure; similar symptoms can also have other causes.

Stress Response

Body changes that prepare a person to respond to a perceived threat or challenge. Hormones and nerve signals alter heart rate, breathing, blood flow, attention, digestion, immunity, and energy use.

Alternate Names:
Fight-or-Flight Response

Stress Shielding

Loss or weakening of bone next to an implant because the implant carries more force than the bone normally would. Over time, this can reduce bone density and affect how securely the implant stays in place.

Stress Tests

Diagnostic tests that assess organ function under controlled physical, pharmacologic, or physiologic stress, commonly evaluating the heart for inducible ischemia or abnormal rhythm.

Stress Ulcer Prophylaxis

Measures used to reduce the risk of stomach or duodenal bleeding in selected critically ill people. The need for treatment depends on bleeding risk, other medicines, and the person's overall condition.

Stress Urinary Incontinence

Leakage of urine when coughing, sneezing, laughing, lifting, exercising, or otherwise increasing pressure inside the abdomen. It commonly results from weakness of the pelvic-floor muscles or the bladder outlet and can often be treated.

Stretch Mark

A linear cutaneous atrophic scar resulting from excessive dermal stretching and mechanical tension combined with hormonal influences (glucocorticoids) that rupture elastic fibers and collagen bundles in the reticular dermis. Initially presenting as erythematous, violaceous linear bands (striae rubrae) perpendicular to the direction of skin tension, they gradually mature over months into permanent, hypopigmented, depressed, atrophic lines (striae albae). Commonly associated with rapid pubertal growth spurts, pregnancy (striae gravidarum), obesity, and Cushing syndrome.

Alternate Names:
Stretch Marks; Striae; Striae Distensae

Stretch Marks

Plural form; see *Stretch Mark*.

Stretch Reflex

An automatic tightening of a muscle when it is suddenly stretched, such as the lower-leg movement after tapping the knee tendon. It helps maintain posture and provides information about nerve and spinal-cord function.

Stria

1. A line, stripe, ridge, or thin band that differs from the surrounding tissue; the plural is striae. 2. A stretch mark, a linear mark caused by changes in deeper skin layers, often during rapid growth or stretching.

Alternate Names:
Striae; Stretch Lines

Striae

Linear bands or streaks in the skin, commonly called stretch marks. They develop when deeper skin layers stretch or change rapidly during growth, pregnancy, weight change, muscle gain, or hormone treatment.

Striae Atrophicae

Thin, linear, slightly sunken bands of skin caused by changes in the deeper skin layer; commonly called stretch marks. They may be red or purple at first and later become pale.

Alternate Names:
Stretch Marks; Striae Distensae

Striae Distensae (Stretch Marks)

Linear bands caused by stretching and structural change in the dermis during growth, pregnancy, rapid weight change, muscle gain, or corticosteroid exposure. They may begin red or purple and later become pale and atrophic.

Striae Gravidarum

Linear stretch marks caused by changes in the deeper skin layer during pregnancy. They often appear on the abdomen, breasts, thighs, or buttocks. They may start pink, red, or purple and later become pale.

Striate

Marked with fine lines, bands, or grooves.

Stricture

An abnormal narrowing of a passage in the body, such as the esophagus, intestine, bile duct, or urethra. Scarring, inflammation, injury, surgery, or cancer may cause blockage and symptoms related to the affected organ.

Stridor

A harsh, high-pitched breathing sound caused by air squeezing through a narrowed windpipe or voice box. It is heard loudest over the neck and usually happens while breathing in. This makes it different from wheezing, which comes from inside the lungs when breathing out. In babies and young children, common causes include croup, an object stuck in the throat, or floppy airway cartilage. In adults, causes include severe allergic swelling, vocal-cord problems, infections, or growths in the neck. Doctors find the cause by checking oxygen levels, taking neck X-rays, or looking into the throat with a tiny camera.

String Sign

A very narrow, thread-like passage seen on an imaging test of the digestive tract. It may occur with narrowing from Crohn disease or with narrowing at the stomach outlet in an infant, but it is not specific to one condition.

String Test For Intestinal Parasites

A string test collects a sample from the upper digestive tract on a swallowed capsule and string to look for selected intestinal parasites.

Stripping of Membranes

A procedure in which a clinician sweeps a finger around the cervix to separate the membranes from the lower uterus. This may help start labor by encouraging the body to release natural labor-promoting substances; cramping or light bleeding can occur.

Alternate Names:
Membrane Sweeping; Cervical Sweep

Stroke

A life-threatening medical emergency that occurs when blood flow to a part of the brain is suddenly cut off or reduced, depriving brain cells of oxygen and nutrients. This can happen either because a blood clot blocks an artery supplying blood to the brain (ischemic stroke, the most common type) or because a weakened blood vessel bursts and bleeds into brain tissue (hemorrhagic stroke). Without oxygen, affected brain cells begin to die within minutes, causing sudden symptoms such as facial drooping, arm or leg weakness on one side of the body, difficulty speaking or understanding speech, vision loss, or balance problems.

Alternate Names:
CVA; Cerebrovascular Accident; Brain Attack

Stroke Index

A measure of the amount of blood pumped by the heart with each beat, adjusted for body-surface area. It helps assess heart function and is interpreted with other examination, imaging, and hemodynamic findings.

Stroke Rehabilitation

Rehabilitation after a stroke helps improve movement, speech, swallowing, thinking, mood, and daily activities while reducing complications and preventing another stroke.

Stroke Risk Factors

Stroke risk factors include high blood pressure, smoking, diabetes, high cholesterol, atrial fibrillation, prior stroke, and certain blood or vascular disorders.

Stroke Volume

The volume of blood ejected by the left ventricle with each heartbeat, normally 60-100 mL. It is determined by three factors: preload, afterload, and myocardial contractility. Stroke volume equals end-diastolic volume minus end-systolic volume. Reduced stroke volume occurs in heart failure, hypovolemia, and cardiogenic shock.

Stroma

The supporting tissue of an organ that surrounds and holds its working cells. It may contain connective tissue, blood vessels, nerves, and immune cells; the exact structure and role vary between organs.

Strongyloides Stercoralis

A soil-transmitted roundworm that can enter through skin and live in the human intestine. Infection may cause rash, abdominal symptoms, or no symptoms, but severe hyperinfection can occur when immunity is weakened.

Strongyloidiasis

An intestinal worm infection that can spread throughout the body and become life-threatening when immunity is weakened.

Structured Reporting

Reporting that uses a standard format, headings, and required fields to organize findings. It can improve completeness, consistency, and communication in imaging, pathology, and other clinical reports, but does not replace professional judgment.

Struma Ovarii

A specialized mature ovarian teratoma composed predominantly of thyroid tissue; it may be hormonally active or develop malignant thyroid-type transformation.

Struvite Stones

Kidney or urinary-tract stones formed during infection with certain bacteria. They can grow into large branching stones that fill the kidney and may damage it or block urine flow.

Strychnine

A poison causing severe painful muscle spasms and convulsions while awareness may remain; emergency treatment is required.

ST Segment

The part of an electrocardiogram between the electrical activation and recovery signals of the heart's lower chambers. Abnormal elevation or depression can occur with a heart attack, inflammation, or other conditions and is not specific to one cause.

ST-Segment Elevation

Elevation of the ECG ST segment above the isoelectric baseline, reflecting abnormal ventricular repolarization. It may indicate acute coronary occlusion but can also occur in pericarditis, early repolarization, ventricular aneurysm, or other conditions; interpretation requires clinical context and serial testing.

Stucco Keratosis

Multiple small, rough, whitish or gray-brown keratotic papules, usually on the lower legs and sometimes the arms or trunk of older adults. They are benign and may be treated for cosmetic or symptomatic reasons.

Student's Elbow

Olecranon bursitis, an inflammation of the bursa over the point of the elbow, often related to repeated pressure or trauma.

Stuffy Nose

Blocked or difficult nasal breathing caused by swollen tissue, mucus, allergy, infection, irritants, or structural narrowing.

Stuffy Or Runny Nose – Adult

A stuffy or runny nose in an adult commonly results from viral infection, allergy, irritants, or sinus disease; persistent, severe, bloody, or one-sided symptoms need review.

Stump Pain

Alternate name; see *Residual Limb Pain*.

Stunted Growth

Height substantially below expected levels for age, often due to long-term undernutrition, chronic illness, infection, or other factors.

Stupor

A state of reduced consciousness in which the patient is unresponsive to most environmental stimuli but can be temporarily aroused by vigorous, repeated stimulation (painful stimuli, loud shouting).

Sturge-Weber Syndrome

A condition present from birth involving abnormal blood vessels in the skin and sometimes on the surface of the brain. It may cause a port-wine birthmark, seizures, weakness, headaches, developmental problems, or glaucoma, depending on which areas are affected.

Stutter

Stuttering is a speech-fluency disorder involving repetitions, prolongations, or blocks in speech. Speech-language therapy can improve communication and confidence.

Stuttering

A speech-flow problem involving repeated sounds or words, stretched sounds, pauses, or blocks when speaking. It is not caused by low intelligence; support may include speech therapy, communication strategies, and help with anxiety or teasing.

St Vitus's Dance

An older name for Sydenham chorea, involuntary movements following group A streptococcal infection.

Sty

Alternate name; see *Stye*.

Stye

A tender, localized infection or inflammation of an eyelid gland, usually producing a painful red lump near the eyelid margin.

Alternate Names:
Hordeolum

Styptics

Substances that help stop minor surface bleeding by tightening tissue, narrowing small blood vessels, or supporting clot formation. They are used for limited bleeding and do not replace emergency care for severe blood loss.

Subacromial Pain Syndrome

A clinical term for non-traumatic pain around the subacromial region of the shoulder, usually worse when raising the arm. It may involve rotator-cuff tendinopathy, bursitis, or related disorders; no single examination finding establishes the cause.

Subacute

Describes a disease or process that develops or lasts longer than an acute one but is not chronic. It has no fixed time range; the duration meant should be specified for the condition being described.

Subacute Bacterial Endocarditis

Older term for subacute infective endocarditis, a slowly developing infection of the heart's inner lin-

ing, usually involving a valve. It is most often caused by bacteria, but other organisms can also cause it. Symptoms may include fever, tiredness, weight loss, a new murmur, or complications from infected material travelling in the blood; see *Infective Endocarditis*.

Subacute Combined Degeneration

Damage to parts of the spinal cord, usually from vitamin B12 deficiency. It can cause numbness, weakness, poor balance, and difficulty walking.

Subacute Combined Degeneration Of The Cord

Damage to the spinal cord, usually caused by vitamin B12 deficiency, affecting nerve pathways for vibration, position sense, and movement. It may cause tingling, weakness, poor balance, or difficulty walking and can become permanent without treatment.

Subacute Cutaneous Lupus Erythematosus (SCLE)

A photosensitive form of cutaneous lupus causing annular or papulosquamous red scaly lesions on sun-exposed skin. It may be associated with anti-Ro/SSA antibodies, medicines, or systemic lupus features and needs sun protection and medical evaluation.

Subacute Rehabilitation

Rehabilitation provided after the early phase of illness or injury for people who still need nursing care and therapy but no longer need intensive hospital treatment. It may occur in a specialized facility or outpatient setting.

Subacute Sclerosing Panencephalitis

A rare, progressive brain disease caused by measles virus remaining in the brain years after the original infection. It can cause behavior or learning changes, jerking movements, seizures, loss of coordination, and severe disability; prevention depends on measles vaccination.

Subacute Thyroiditis

Temporary inflammation of the thyroid, often after a viral illness, causing painful neck swelling, fever, and tiredness. Thyroid hormone levels may first be high and later low before returning to normal; treatment relieves pain and other symptoms.

Subaortic Stenosis

Narrowing just below the aortic valve that obstructs blood leaving the heart. It may cause a heart murmur, chest pain, fainting, breathlessness, or damage to the aortic valve and sometimes requires surgery.

Subarachnoid

Situated beneath the arachnoid, one of the thin coverings around the brain and spinal cord. The subarachnoid area contains protective fluid and blood vessels; bleeding there can cause a sudden severe headache and is an emergency.

Subarachnoid Cisterns

Anatomical enlargements and pools of the subarachnoid space formed where the arachnoid membrane bridges over deep depressions between the brain and skull, filled with cerebrospinal fluid, including the cisterna magna, interpeduncular cistern, ambient cistern, and chiasmatic cistern.

Subarachnoid Haemorrhage

Bleeding into the space around the brain containing cerebrospinal fluid, often causing sudden severe headache.

Subarachnoid Hemorrhage

A life-threatening type of stroke characterized by sudden bleeding into the subarachnoid space—the fluid-filled area surrounding the brain between the brain's protective inner membranes. It is most frequently caused by the sudden rupture of a brain aneurysm (a weakened, bulging spot in a cerebral artery) or by severe head trauma. It classically causes a sudden, excruciating headache, often described as the "worst headache of one's life" (thunderclap headache), rapidly accompanied by neck stiffness, nausea, light sensitivity, and loss of consciousness.

Alternate Names:
SAH; Aneurysmal Subarachnoid Hemorrhage

Subarachnoid Space

The space between two thin coverings of the brain and spinal cord, called the arachnoid and pia mater. It contains cerebrospinal fluid and blood vessels and helps cushion the nervous system.

Subareolar Abscess

A pus-filled infection beneath the areola, often associated with periductal inflammation and smoking, causing a painful lump, redness, drainage, or recurrent fistula.

Subchorionic Hemorrhage

Bleeding between the chorion and the uterine wall caused by partial separation of the gestational sac membranes. It may produce vaginal bleeding in early or mid-pregnancy and is assessed according to bleeding, gestational age, and ultrasound findings.

Subclavian

Relating to structures beneath the clavicle, especially the subclavian arteries and veins that supply or drain the upper limbs.

Subclavian Arteries

Paired arteries arising near the base of the neck that supply the upper limbs and give branches to the neck, chest wall, and brain circulation.

Subclavian Artery

A major artery beneath the collarbone that supplies the arm and contributes blood flow to the neck, chest, and brain. Narrowing or blockage can cause arm pain, weakness, or symptoms from reduced blood flow to the brain.

Subclavian Steal Syndrome

A condition in which narrowing of an artery supplying the arm redirects blood away from the back of the brain, especially during arm exercise. It may cause arm pain or weakness, dizziness, fainting, blurred vision, or imbalance. Treatment controls vascular risk factors and may restore blood flow when symptoms are significant.

Subclavian Vein

The continuation of the axillary vein beyond the lateral border of the first rib. It joins the internal jugular vein behind the sternoclavicular joint to form the brachiocephalic vein.

Subclavian Vein Thrombosis

A blood clot in the large vein beneath the collarbone. It may be related to a central venous catheter or pacemaker lead, or to repeated strenuous arm activity and compression at the thoracic outlet (Paget-Schroetter syndrome). It can cause arm or neck swelling, pain, bluish discoloration, and pulmonary embolism.

Subclinical

Present without clear symptoms or signs that a person or clinician can notice. A subclinical problem may be found through a blood test, scan, screening examination, or other test and may or may not later cause symptoms.

Subclinical Disease

Disease that produces no obvious symptoms or signs but can be detected by screening, examination, or laboratory testing. It may remain mild or later become clinically apparent, depending on the condition.

Subclinical Hypothyroidism

A laboratory pattern in which thyroid-stimulating hormone (TSH) is higher than normal while free thyroxine (T4) remains within its reference range. Many people have no symptoms; some develop overt hypothyroidism, especially when thyroid antibodies are present. Follow-up or treatment depends on the TSH level, age, symptoms, pregnancy status, and other health factors.

Alternate Names:
Mild Thyroid Failure Subclinical Thyroid Failure Compensated Hypothyroidism

Subclinical Infection

An infection that produces no noticeable symptoms or signs but may still be detectable by testing and may sometimes be transmissible.

Subconjunctival Hemorrhage

A small blood vessel broken beneath the clear surface of the eye, causing a sharply demarcated red patch that usually resolves without treatment.

Alternate Names:
Hyposphagma; Eye Capillary Bleed

Subconscious

Mental processes outside immediate awareness; it is a psychological term rather than a specific diagnosis.

Subcorneal Pustular Dermatosis

A rare recurring skin disorder causing shallow, non-infectious pus-filled blisters just beneath the outer skin layer, usually on the trunk or skin folds. It may resemble psoriasis and can be associated with blood or immune disorders.

Subcortical Dementia

Cognitive decline associated predominantly with disease of structures beneath the cerebral cortex, often causing slowed thinking, executive dysfunction, mood change, gait problems, and impaired attention. Causes include small-vessel disease and some neurodegenerative disorders.

Subcortical Ischemic Vascular Disease

Chronic small-vessel disease causing reduced blood flow and tissue injury in deep brain structures. It may contribute to slowed thinking, gait difficulty, mood symptoms, urinary problems, and vascular dementia.

Subcu

Subcu is an abbreviation for subcutaneous, meaning beneath the skin; clear clinical instructions should spell out the route.

Subculture

The transfer of microorganisms from one culture to fresh culture medium, used to maintain pure cultures, isolate colonies, increase viability, prepare standardized inocula, and perform identification/susceptibility testing. On solid media, subculture aims to obtain isolated single colonies from a mixed or stock culture.

Subcutaneous

Subcutaneous means beneath the skin; injections by this route deliver medicine into the fatty tissue between skin and muscle.

Subcutaneous Dirofilariasis

A rare zoonotic infection caused by mosquito-transmitted *Dirofilaria* roundworms, most often *D. repens*. It usually forms a localized nodule or slowly migrating swelling beneath the skin. Humans are accidental hosts, and the worms usually do not reproduce in them; diagnosis is generally made by identifying the parasite in a tissue sample.

Subcutaneous Emphysema

Air trapped beneath the skin, often after chest injury, surgery, a punctured lung, or a breathing procedure. It may cause swelling and a crackling feeling; rapid spread or breathing difficulty can indicate a serious underlying air leak.

Subcutaneous Implantable Cardioverter-Defibrillator

A device placed under the skin that detects and treats dangerous fast heart rhythms with an electrical shock. Its wires run outside the heart and blood vessels; infection, inappropriate shocks, movement, or device failure are possible.

Subcutaneous Injections

Administration of a medicine into the fatty tissue beneath the skin, commonly used for insulin, anticoagulants, and selected biologic medicines.

Subcutaneous Layer

The tissue layer beneath the dermis, made mainly of fat and connective tissue. It cushions deeper structures, insulates the body, stores energy, and contains larger blood vessels and nerves.

Subcutaneous Tissue

The layer beneath the skin that connects it to deeper structures. It contains fat, connective tissue, larger blood vessels, and nerves and provides insulation, cushioning, and energy storage.

Subdural

Located beneath the dura, one of the protective coverings around the brain and spinal cord. A subdural hematoma is bleeding in this space, often after head injury, and may cause headache, vomiting, confusion, weakness, seizures, or loss of consciousness.

Subdural Effusion

Accumulation of usually clear fluid in the subdural space, often after trauma, surgery, infection, or cerebrospinal-fluid disturbance and sometimes causing headache or pressure effects.

Subdural Haematoma

A collection of blood between protective coverings of the brain, usually after small veins tear during a head injury. It may develop suddenly or gradually and cause headache, confusion, drowsiness, weakness, seizures, or loss of consciousness.

Subdural Hematoma

A collection of blood between two protective coverings of the brain, usually after small veins tear during a head injury. It can cause headache, confusion, weakness, seizures, sleepiness, or death.

Subdural Hemorrhage

Bleeding between two protective coverings of the brain, usually after tearing of small veins during a head injury. It may cause sudden or gradually worsening headache, confusion, drowsiness, weakness, seizures, or loss of consciousness and is diagnosed with brain imaging.

Subendocardial Myocytes

Heart-muscle cells in the inner layer of the myocardium, which are especially vulnerable to reduced blood flow.

Subendocardial Sclerosis

Fibrous thickening of the inner lining of the heart, often involving the ventricles or valves. Its significance depends on the cause and may include effects on filling, conduction, or cardiac function.

Subependymal Giant Cell Astrocytoma

A usually slow-growing brain tumor that develops near a passage where fluid leaves the brain's cavities. It is strongly associated with tuberous sclerosis and can block fluid flow, causing headache, vomiting, or enlarged brain cavities.

Subependymoma

A rare, usually benign slow-growing ependymal tumor, commonly arising in the ventricular system of adults. Symptoms result from obstruction of cerebrospinal-fluid pathways or incidental detection.

Subfertility

Alternate name; see *Infertility*.

Subgaleal Hematoma

A dangerous collection of blood within the loose areolar connective tissue space between the epicranial aponeurosis (galea aponeurotica) and the cranial periosteum, capable of crossing suture lines and expanding massively across the entire cranial vault, causing hypovolemic shock in neonates following vacuum-assisted delivery.

Subgaleal Hemorrhage

A potentially life-threatening accumulation of blood in the space beneath the scalp's epicranial aponeurosis. It can expand rapidly in a newborn, particularly after vacuum-assisted delivery, and requires urgent recognition and treatment.

Subinvolution

Slower-than-expected return of an organ to its usual size, especially the uterus after childbirth. It may cause prolonged or heavy bleeding, pelvic pain, or an enlarged tender uterus and can result from retained tissue, infection, or other causes.

Subjacent

An anatomical term describing a structure, tissue, or lesion located beneath another structure. It indicates relative position and does not necessarily mean that the two structures are touching; the relationship may be described on physical examination, imaging, or during surgery.

Subjective

Based on a person's own experience or report rather than a directly measured finding. Pain, nausea, fatigue, dizziness, and mood are subjective symptoms, while temperature and blood pressure are objective measurements.

Sublimation

A psychological defense process in which unacceptable impulses are redirected into socially acceptable activity; in chemistry it is solid-to-gas transition.

Sublingual

Sublingual means beneath the tongue; medicines given this way can be absorbed through oral mucosa and may bypass much first-pass liver metabolism.

Sublingual Epidermoid Cyst

A benign cyst lined by stratified squamous epithelium beneath the tongue mucosa, presenting as a slow-growing midline swelling that may require surgical excision if symptomatic.

Sublingual Gland

One of the paired major salivary glands, located beneath the tongue. It produces mainly mucous saliva that enters the mouth through several small ducts and helps lubricate the oral cavity.

Subluxation

Partial displacement of a joint in which some contact between the joint surfaces remains. It may cause pain, swelling, instability, limited movement, nerve injury, or repeated episodes after injury or disease.

Submandibular Gland

One of the major salivary glands, located beneath the lower jaw. It makes much of the saliva present when a person is not eating and releases it into the floor of the mouth through a small duct.

Submucosa

The supportive layer beneath the moist lining of organs such as the intestine, airway, and bladder. It contains blood vessels, nerves, glands, and connective tissue and helps nourish and anchor the lining.

Subphrenic Abscess

A collection of pus beneath the diaphragm, usually caused by infection after abdominal surgery, a burst abdominal organ, or spread from nearby tissue. It may cause fever, upper-abdominal or shoulder pain, breathing discomfort, and sepsis and usually needs drainage and antibiotics.

Subq

Subq is an abbreviation for subcutaneous, referring to tissue beneath the skin and the route used for some injections.

Subscapular Artery

A branch of the axillary artery that supplies the shoulder blade region, chest wall, and nearby muscles. It contributes to the network of vessels supporting the shoulder and upper limb.

Substance

A substance is a material with defined or variable chemical composition; medical effects depend on identity, dose, route, duration, and host factors.

Substance Abuse

Legacy, nonspecific label; see *Substance Use Disorder*.

Substance Abuse Disorder

Legacy label; see *Substance Use Disorder*.

Substance Abuse Psychiatry

An older term for the clinical specialty concerned with substance use disorders and co-occurring

mental-health conditions. Current terminology generally uses *Addiction Psychiatry* or *Addiction Medicine*.

Substance Dependence

A state in which repeated substance use produces physiologic adaptation, so that reducing or stopping the substance may cause withdrawal. It is distinct from, but may occur with, substance-use disorder.

Substance Intoxication

A temporary change in thinking, behavior, or body function caused by recent use of alcohol, a drug, or another substance. Effects depend on the substance, amount, timing, combinations, and the person's health.

Substance Use

The consumption of alcohol, tobacco or nicotine, cannabis, prescription or nonprescription drugs, inhalants, or other psychoactive substances. Use may be occasional, prescribed, nonmedical, or associated with a substance use disorder; the term alone does not imply harmful use.

Substance Use Disorder

A clinically significant pattern of alcohol, tobacco or nicotine, cannabis, prescription or nonprescription drug, inhalant, or other psychoactive-substance use that causes impaired control, social or occupational impairment, risky use, or clinically significant distress. Features may include craving, unsuccessful efforts to reduce or stop use, substantial time spent obtaining or using the substance, failure to meet major responsibilities, continued use despite harm, tolerance, or withdrawal; tolerance and withdrawal are not required.

Alternate Names:
Drug Addiction; Chemical Dependency; Substance Abuse Disorder

Substance Use In Pregnancy

Use of alcohol, tobacco or nicotine, cannabis, opioids, cocaine, or other substances during pregnancy. Effects depend on the substance, dose, timing, route, and other factors and may include maternal complications, impaired fetal growth, preterm birth, or neonatal withdrawal.

Substance Withdrawal

Physical or mental symptoms that occur after reducing or stopping heavy or prolonged substance use. Symptoms range from anxiety and nausea to seizures, severe confusion, dangerous blood-pressure changes, or breathing problems, depending on the substance.

Substance-Induced Psychotic Disorder

Psychotic symptoms—prominently hallucinations or delusions—directly caused by the toxic effects of substance intoxication, substance withdrawal, or medication exposure, persisting beyond typical intoxication.

Substantia Nigra

A group of nerve cells in the middle of the brain involved in movement. Some cells make dopamine and gradually die in Parkinson disease, contributing to stiffness, slowed movement, and tremor.

Substernal Goiter

An enlarged thyroid gland that extends from the neck into the upper chest. It may press on the windpipe or esophagus, causing shortness of breath, cough, or difficulty swallowing. Imaging helps assess its size and position.

Substrate

A substance on which an enzyme acts or a material used by a biochemical pathway.

Subtalar Joint

The joint between the talus and heel bone beneath the ankle. It helps the foot tilt inward and outward.

Subungual Exostosis

A benign osteocartilaginous outgrowth arising beneath the nail, usually of a toe or finger. It causes a painful firm subungual mass and nail deformity and is treated by excision when symptomatic.

Subungual Hematoma

A collection of blood between the nail plate and nail bed, usually after a crush or blunt injury. It may appear red, purple, or black and can cause pressure and throbbing pain. As the nail grows, the discoloration usually moves toward the tip.

Subungual Melanoma

Alternate name; see *Nail Unit Melanoma*.

Subungual Verruca (Wart)

A common wart growing beneath or at the edge of a nail, usually caused by human papillomavirus. It may distort or lift the nail and can be tender. It can resemble other nail growths, including some cancers.

Succenturial Lobe

An accessory lobe of the placenta, connected to the main placenta by blood vessels that traverse the membranes. If undetected after delivery, the succenturial lobe may be retained in the uterus, causing postpartum hemorrhage or infection. Diagnosis: careful inspection of the placenta and membranes after delivery.

Succenturiate Placenta

A succenturiate placenta has one or more accessory lobes separate from the main placenta, which can increase risk of retained tissue or fetal-vessel injury.

Succinate Dehydrogenase

An enzyme inside mitochondria that helps cells make energy. It changes one small molecule into another while passing electrons through the energy-producing system; inherited or tumor-related changes can have clinical importance.

Succinylcholine

A very fast, short-acting medicine that temporarily paralyzes skeletal muscles to help place a breathing tube or perform emergency procedures. It can dangerously raise potassium, stop breathing longer than expected, or trigger malignant hyperthermia in susceptible people.

Succumb

To succumb means to die from or be overcome by a disease, injury, exposure, or other serious process.

Succussion Splash

A splashing sound auscultated over the epigastrium or thorax while gently shaking the patient's torso. In the abdomen, a splash heard more than three to four hours after a meal indicates delayed gastric emptying or gastric outlet obstruction; in the chest, it indicates hydropneumothorax.

Alternate Names:
Hippocratic Succussion Splash

Sucking Blister

A blister or worn area of skin in a newborn, usually on a hand, finger, forearm, or lip, caused by repeated sucking before or during feeding. It is usually harmless and heals on its own.

Sucking Reflex

A primitive reflex present from birth, elicited by placing an object in the infant's mouth. The infant rhythmically sucks on the object. Coordinated sucking and swallowing typically develop by 34-36 weeks gestational age. Premature infants may lack coordinated suck-swallow, requiring gavage feeding.

Sucrose

Common table sugar, a disaccharide made of glucose and fructose. Digestive enzymes split it into these simpler sugars for absorption.

Sucrose Intolerance

Inability to digest or absorb sucrose adequately, often because of congenital or acquired sucrase-isomaltase deficiency. Eating sucrose may cause bloating, cramps, gas, and diarrhea; uncertain diagnosis can lead to unnecessary dietary restriction.

Sucrose Lysis Test

An older blood test once used to look for paroxysmal nocturnal hemoglobinuria, a disorder in which red blood cells are unusually vulnerable to destruction. Flow-cytometry testing has largely replaced it

because it is more specific and reliable.

Suction

Removal of fluid, secretions, blood, or other material using negative pressure. It may be used in airway care, surgery, wound care, or drainage.

Suction Device

Equipment that creates negative pressure to remove fluid, blood, mucus, or other material. It usually includes a pump, tubing, collection container, and suction catheter or tip and is used in airway care, surgery, or wound drainage.

Suction Tip

The end attachment of a suction device used to remove blood, fluid, secretions, or debris. Common types include the Yankauer tip for oropharyngeal suction and surgical suction tips such as the Frink tip.

Sudden Cardiac Death

Unexpected death caused by a heart problem, often a dangerous heart rhythm or heart attack. It usually happens soon after symptoms begin or without warning.

Alternate Names:
SCD; Massive Fatal Arrhythmia

Sudden Death

Unexpected death occurring rapidly after the onset of symptoms or without recognized warning, often caused by cardiac arrest, dangerous arrhythmia, vascular catastrophe, or another acute condition.

Sudden Infant Death Syndrome

A sudden death of a baby under 1 year old that remains unexplained after a full investigation, including review of the baby's health history, examination of the death scene, and an autopsy (examination of the body after death). It is one kind of sudden unexpected infant death (SUID), a broader term that includes deaths from known or unknown causes.

Sudden Infant Death Syndrome (SIDS)

Alternate name; see *Sudden Infant Death Syndrome*.

Alternate Names:
SIDS

Sudden Natural Death Pathology

Postmortem evaluation of an unexpected death from natural disease, commonly involving coronary artery disease, myocardial infarction, cardiomyopathy, myocarditis, pulmonary embolism, epilepsy, or intracranial disease. The cause may remain indeterminate despite complete examination.

Sudden Sensorineural Hearing Loss

A rapid loss of hearing caused by a problem in the inner ear or hearing nerve, often noticed on waking or over a few days. It may be accompanied by ringing or dizziness; recovery is more likely when treatment begins early.

Sudden Unexpected Death in Epilepsy

An unexpected death in a person with epilepsy that is not caused by drowning, injury, prolonged seizure, or another known condition. It is uncommon; controlling seizures, taking prescribed treatment, and discussing nighttime safety may reduce risk.

Sudden Unexpected Death In Infancy

The sudden, unexpected death of an infant that requires investigation of the medical history, circumstances, death scene, and sometimes autopsy. The cause may be identified, or the death may meet the definition of sudden infant death syndrome.

Sudden Unexpected Infant Death

The sudden and unexpected death of an infant younger than 1 year, whether or not the cause is known before investigation. Sudden infant death syndrome is the unexplained subtype after complete scene, history, and autopsy evaluation.

Sudden Visual Loss

Rapid loss or marked reduction of vision in one or both eyes caused by retinal, optic-nerve, vascular, inflammatory, traumatic, or neurologic disease; it

may be permanent if the underlying cause is not reversed promptly.

Sudeck Atrophy

An acute post-traumatic or post-surgical manifestation of complex regional pain syndrome type I (CRPS-I) characterized by severe burning neuropathic pain, autonomic vasomotor and sudomotor dysfunction, localized edema, and rapid patchy radiographic osteopenia of the affected limb.

Alternate Names:
Sudeck's Dystrophy; Post-Traumatic Osteoporosis

Sudek's Atrophy

An older name for complex regional pain syndrome with pain, swelling, autonomic change, and regional bone loss.

Sudorifics

Medicines or other treatments that increase sweating. They have limited specific medical uses; excessive sweating caused by a treatment can lead to dehydration, overheating, or abnormal body salts.

Suffocation

Inability to breathe enough because the airway is blocked, oxygen is unavailable, the chest is compressed, or another problem prevents normal breathing. It quickly causes unconsciousness and death without immediate rescue.

Sugammadex

A medicine used during anesthesia to quickly reverse muscle paralysis caused by selected muscle-relaxing medicines. It binds those medicines so the body can remove them; allergic reactions and changes in heart rate are possible.

Sugar Substitutes

Sugar substitutes provide sweetness with little or no sugar; types differ in energy, digestion, aftertaste, and effects on glucose and gastrointestinal symptoms.

Sugar-Water Hemolysis Test

An older laboratory test assessing red-cell resistance to hypotonic sugar solution, historically used in evaluating paroxysmal nocturnal hemoglobinuria and now largely replaced by flow-cytometric testing.

Suicidal Behavior

Actions, preparations, or explicit self-injurious attempts undertaken with the intent to end one's life; see *Suicide And Suicidal Behavior* and *Suicidal Ideation*.

Suicidal Ideation

Thoughts about dying or ending one's life, with or without intent, a plan, or preparatory actions. They may be passive, such as wishing to be dead, or active, involving thoughts of taking one's life. Suicidal ideation is distinct from a suicide attempt.

Suicidal Intent

The degree to which a person expects or wants to die as a result of suicidal thoughts or behavior. It is assessed with the person's own account, planning, preparation, access to means, and other clinical information.

Suicidality

The presence or risk of suicidal thoughts, intent, plans, or behavior. The term describes a clinical domain rather than a diagnosis; risk is influenced by immediacy, access to means, past behavior, and protective factors.

Suicidal Plan

A stated or considered method, timing, place, or other preparation for ending one's own life. A plan, especially with access to means or intent, indicates high and potentially immediate risk.

Suicide

Death caused by an intentional action to end one's life. Suicidal thoughts, plans, or behavior indicate potentially immediate risk and may precede an attempt.

Suicide And Suicidal Behavior

Thoughts, plans, attempts, or acts intended to cause one's own death. Current intent, a plan, access to means, or inability to stay safe indicates immediate risk.

Suicide Attempt

An act in which a person intentionally tries to end their own life but does not die. It can cause serious injury even when the person did not expect to die and is associated with increased risk of later suicide.

Suicide Risk Assessment

A clinical evaluation of suicidal thoughts, intent, plan, access to means, past attempts, self-harm, psychiatric and medical illness, substance use, protective factors, and immediate safety. It informs but does not replace ongoing clinical judgment and safety planning.

Sulcus

A groove or shallow furrow on an organ or body surface, especially the brain or heart. Brain sulci separate raised areas and increase the cerebral cortex's folded surface area.

Sulfa Drugs

A group of medicines, especially sulfonamide antibiotics, that block a chemical pathway bacteria need to grow. They treat selected infections but can cause allergic reactions and other side effects; the term may also refer to nonantibiotic sulfonamides.

Sulfamethoxazole

A sulfonamide antibiotic used commonly with trimethoprim in selected infections.

Sulfasalazine

An anti-inflammatory medicine used for inflammatory bowel disease and rheumatoid or other inflammatory arthritis. It changes immune activity and can cause nausea, rash, low blood counts, liver problems, or kidney problems.

Sulfatide

A fatty substance containing sulfate found mainly in myelin, the insulating covering of nerve fibers. Abnormal buildup or deficiency can disrupt nerve function and occurs in some inherited metabolic disorders.

Sulfite Oxidase Deficiency

A rare inherited metabolic disorder in which sulfite cannot be adequately converted to sulfate. Toxic sulfite and related compounds can cause neonatal seizures, feeding difficulty, abnormal muscle tone, developmental impairment, and progressive brain injury.

Sulfite Sensitivity

Sulfite sensitivity is an adverse reaction to sulfite preservatives, sometimes causing wheeze, flushing, headache, or other symptoms, especially in people with asthma.

Sulfonamide

A synthetic bacteriostatic antimicrobial agent containing a sulfonamide ($-SO_2NH_2$) functional group that acts as a competitive structural analogue of para-aminobenzoic acid (PABA), selectively inhibiting the bacterial enzyme dihydropteroate synthase (DHPS) in the folic acid biosynthetic pathway. Commonly combined with trimethoprim (TMP-SMX, cotrimoxazole) for sequential synergistic inhibition of tetrahydrofolate synthesis, treating urinary tract infections, *Pneumocystis jirovecii* pneumonia, and community-acquired MRSA. Adverse reactions include hypersensitivity rashes, Stevens-Johnson syndrome, hemolytic anemia in G6PD deficiency, and kernicterus in neonates.

Alternate Names:
Sulfonamides; Sulfa Drug; Sulfa Drugs

Sulfonamides

Plural form; see *Sulfonamide*.

Sulfonylurea

A class of oral antidiabetic secretagogues utilized in the management of type 2 diabetes mellitus that stimulate insulin release from pancreatic beta

cells. Sulfonylureas bind specifically to the SUR1 subunit of ATP-sensitive potassium (K_{ATP}) channels in the beta-cell membrane, inducing channel closure, membrane depolarization, calcium influx via voltage-gated calcium channels, and exocytosis of preformed insulin granules. Divided into first-generation (e.g., chlorpropamide, tolbutamide) and second-generation agents (glipizide, glyburide, glimepiride); major risks comprise hypoglycemia and weight gain.

Alternate Names:
Sulfonylureas

Sulfonylureas

Plural form; see *Sulfonylurea*.

Sulfur Colloid Scan

A nuclear-medicine scan in which a small radioactive tracer is used to show activity in the liver, spleen, bone marrow, or lymph nodes. It can help assess how these organs work or identify abnormal tissue distribution.

Sulfuric Acid Poisoning

Severe poisoning from sulfuric acid, a highly corrosive chemical. It can cause deep burns of the skin, eyes, mouth, throat, and digestive tract; fumes can injure the airways, and vomiting can cause further tissue damage or aspiration.

Sulindac Overdose

Exposure to an excessive amount of sulindac, a nonsteroidal anti-inflammatory drug, may cause nausea, vomiting, stomach bleeding, drowsiness, kidney injury, liver injury, seizures, or metabolic acidosis.

Sulphonamides

A group of medicines, including some antibiotics, that block a chemical pathway bacteria need to grow. They are used for selected infections and other conditions; allergic reactions, interactions, and blood or kidney problems can occur.

Sulphonylureas

Alternate name; see *Sulfonylurea*.

Sumatriptan

A migraine medicine that narrows certain blood vessels and changes nerve signaling to stop acute migraine or cluster headaches.

Summer Diarrhoea

An older term for seasonal diarrheal illness, often referring to infectious diarrhea in children.

Sunburn

An acute inflammatory skin reaction to excessive ultraviolet radiation, usually from sunlight. It causes tender, warm erythema and swelling in exposed areas; more severe injury can blister, followed by peeling as damaged epidermal cells are shed.

Sundowning

Late-day or evening worsening of confusion, agitation, wandering, or behavioral symptoms in some people with dementia or delirium, influenced by fatigue, light, routines, and unmet needs.

Sunflower Syndrome

A rare epilepsy in which a person repeatedly turns toward bright light and waves a hand near the eyes, often triggering absence seizures. It usually begins in childhood and requires neurologic assessment and seizure treatment.

Sunken Chest

Alternate name; see *Pectus Excavatum*.

Sunken Fontanelle

An apparent inward depression of the soft area between an infant's skull bones. It can occur with dehydration or reduced tissue volume but is not specific to either condition. The finding describes an appearance rather than establishing a diagnosis.

Alternate Names:
Depressed Fontanelle; Sunken Soft Spot

Sun Protection

Measures that reduce exposure to ultraviolet radiation, including shade, protective clothing, sunglasses, and broad-spectrum sunscreen. They help

prevent sunburn, premature skin aging, eye damage, and ultraviolet-related skin cancers.

Alternate Names:
UV Protection; Solar Defense

Sunscreens

Topical products that absorb, scatter, or reflect ultraviolet radiation to reduce sunburn and cumulative ultraviolet skin damage. They may be chemical, mineral, or combined formulations and are commonly described by their broad-spectrum protection and sun-protection factor (SPF).

Sunstroke

A life-threatening form of heat illness in which body temperature rises dangerously high and the nervous system is impaired.

Superantigen

A substance made by some bacteria that activates many immune cells at once. This can cause an excessive release of inflammatory chemicals and contribute to illnesses such as toxic shock syndrome or some forms of scarlet fever.

Superficial

Near the surface of the body or an organ, rather than deep inside it. The term may describe tissues, veins, burns, wounds, or infections that mainly affect the skin and tissue just beneath it.

Superficial Fascia

The soft connective tissue layer just beneath the skin. It contains fat, small blood vessels, nerves, and connective tissue and helps insulate the body and allow the skin to move. In some regions it has distinct named layers, such as Camper and Scarpa fascia in the lower abdomen.

Superficial Siderosis

Hemosiderin deposition along the surface of the brain, spinal cord, or cranial nerves, usually caused by repeated or persistent bleeding into the subarachnoid space. It can damage neural tissue and may cause progressive sensorineural hearing loss, cerebellar ataxia, or myelopathy.

Alternate Names:
Superficial Hemosiderosis of the Central Nervous System; Superficial Siderosis of the CNS

Superficial Spreading Melanoma

The most common cutaneous melanoma subtype, characterized initially by radial growth across the epidermis and an irregularly pigmented patch or plaque before invasion develops.

Superficial Thrombophlebitis

Inflammation and a blood clot in a vein just beneath the skin, causing a tender, firm, red cord. It often improves, but the clot can extend into the deep veins or occur with deep-vein thrombosis.

Superimposed Preeclampsia

Preeclampsia developing in a person who already has chronic hypertension. It may present with new or worsening proteinuria, thrombocytopenia, abnormal liver or kidney tests, neurologic symptoms, or other features of maternal organ dysfunction.

Superinfection

A new infection that develops during or after treatment of a previous infection, often involving an antimicrobial-resistant organism or an organism not susceptible to the original therapy, such as Clostridioides difficile after antibiotic exposure.

Superior

Above or toward the head in the body, or higher than another structure. For example, the neck is superior to the chest. The opposite direction is inferior, meaning below or toward the feet.

Superior Mediastinum

The upper part of the mediastinum, above the level of the sternal angle. It contains the thymus, major blood vessels, trachea, esophagus, nerves, and lymph nodes.

Superior Mesenteric Artery

A major artery branching from the abdominal aorta. It supplies blood to much of the small intestine and

to parts of the large intestine, including the right colon and nearby transverse colon.

Superior Mesenteric Artery Syndrome

Pressure on part of the small intestine where it passes between two major arteries, causing blockage. It may follow major weight loss and cause fullness, upper-abdominal pain, nausea, and vomiting; treatment restores nutrition and relieves the obstruction.

Superior Semicircular Canal Dehiscence

A gap or very thin area in the bone covering one balance canal in the inner ear. Loud sounds or pressure may cause dizziness, imbalance, hearing changes, or make a person hear their own voice unusually loudly.

Superior Vena Cava

A large vein in the chest that carries oxygen-poor blood from the head, neck, arms, and upper chest to the right side of the heart.

Superior Vena Caval Obstruction

Narrowing or blockage of the superior vena cava, the large vein that returns blood from the head, neck, arms, and upper chest to the heart. Causes include a chest tumor, a blood clot, or pressure from a nearby structure. It may cause superior vena cava syndrome if blood return is sufficiently impaired.

Alternate Names:
SVCO; Superior Vena Cava Obstruction

Superior Vena Cava Syndrome

A group of symptoms and signs caused by impaired blood flow through the superior vena cava, usually because it is compressed or blocked. It may cause swelling of the face, neck, or arms, visible neck veins, cough, or shortness of breath; severe obstruction can impair breathing or blood flow from the brain.

Supernumerary Digit

An extra finger or toe present from birth, ranging from a small skin tag to a well-formed digit with bone and joints. It may occur alone or with a genetic syndrome and is evaluated for function, circulation, and associated anomalies.

Supernumerary Nipple

A common congenital anatomical anomaly characterized by the presence of an extra, ectopic nipple occurring along the embryological milk line (mammary ridge) extending bilaterally from the axilla through the normal breast to the groin. Arising from incomplete involution of the embryonic ectodermal mammary ridge, it may range from a subtle pigmented macule (often mistaken for a melanocytic nevus) to a fully developed nipple-areola complex with underlying glandular breast tissue (polymastia).

Alternate Names:
Supernumerary Nipples; Polythelia; Third Nipple

Supernumerary Nipples

Plural form; see *Supernumerary Nipple*.

Supernumerary Rib

An extra rib beyond the typical twelve pairs, most commonly a cervical rib above the first thoracic rib, which may compress the brachial plexus or subclavian vessel causing thoracic outlet syndrome.

Supernumerary Teeth

Teeth that develop in addition to the usual number. They may remain hidden or appear in the mouth and can crowd, displace, or prevent nearby teeth from erupting; a common type develops between the upper front teeth.

Supervised Exercise Therapy

A structured, monitored exercise program used to improve walking ability and reduce claudication symptoms in people with peripheral artery disease. The exercise plan is adjusted to the person's symptoms and functional capacity.

Supination

Rotation of the forearm so that the palm faces anteriorly in anatomical position, or upward when the elbow is flexed. The radius and ulna become parallel.

Supine

Position in which a person lies on the back with the front of the body facing upward. The term describes body orientation, so the person can remain supine on a tilted surface or with the head or upper body raised.

Supine Hypotensive Syndrome

A drop in blood pressure that can occur when a pregnant person lies flat on the back, because the enlarged uterus reduces blood return to the heart. Dizziness, nausea, sweating, or faintness may improve by turning onto the side.

Supine Position

Lying on the back with the face and front of the body upward. It is commonly used for examination, imaging, and surgery, but prolonged use can cause pressure injury and late pregnancy may reduce blood return to the heart.

Supplemental Oxygen Therapy

Administration of oxygen at a concentration above that of room air to treat or prevent clinically important hypoxemia. Delivery method and oxygen target depend on the illness, baseline oxygenation, risk of carbon-dioxide retention, and monitoring results; excessive oxygen can also cause harm.

Supplementation

Use of a vitamin, mineral, protein, fiber, or other nutrient preparation to correct a deficiency or meet a clinically identified increased requirement. Effects and risks depend on the nutrient, dose, interactions, and product quality.

Supplements

Products containing substances such as vitamins, minerals, herbs, or amino acids, taken to add to the diet. They can have side effects, interact with medicines, or vary in product quality.

Supportive Care

Treatment that maintains essential body functions, relieves symptoms, prevents complications, and supports recovery while the underlying cause is treated.

Suppository

A solid preparation inserted into the rectum, vagina, or urethra where it dissolves or melts.

Suppression

Reduction or inhibition of a function, response, symptom, or process.

Suppuration

The formation or discharge of pus, a thick fluid made from immune cells, germs, and damaged tissue. It usually occurs with infection and may form an abscess that needs drainage and treatment.

Suppurative

Producing or containing pus, usually as part of an infection or inflammation.

Suppurative Arthritis

A joint infection producing pus and inflammation, usually caused by bacteria. It can rapidly destroy cartilage and cause fever, severe joint pain, swelling, and limited movement, requiring urgent drainage and antimicrobial treatment.

Supracervical Hysterectomy

Hysterectomy in which the uterine body is removed while the cervix is left in place; the fallopian tubes and ovaries may be removed separately.

Alternate Names:
Subtotal Hysterectomy

Supracondylar Humerus Fracture

A break in the upper part of the elbow end of the arm bone, common in children after a fall on an outstretched hand. Swelling, pain, deformity, or inability to move the elbow may occur; severe fractures can damage nearby nerves or arteries and may require surgery.

Alternate Names:
Gartland Supracondylar Fracture; Pediatric Elbow Fracture

Supraglottic Airway Device

A breathing device placed above the vocal cords to

help deliver oxygen and ventilation during anesthesia or emergencies. It can be inserted more quickly than a breathing tube but does not protect against aspiration as reliably.

Supranuclear Ophthalmoplegia

Weakness or loss of control of eye movements caused by damage to brain pathways above the eye-movement nerves. It may make it difficult to look in certain directions.

Supranuclear Palsy

Alternate name; see *Progressive Supranuclear Palsy*.

Suprapubic

Located above the pubic bone in the lower abdomen. The term may describe pain or examination in this area, or a procedure such as inserting a catheter through the lower abdominal wall directly into the bladder when a tube cannot be passed through the urethra.

Suprapubic Catheter

A tube placed through the lower abdominal wall directly into the bladder to drain urine. It may be used when urine cannot drain safely through the urethra or when longer-term bladder drainage is needed.

Suprapubic Catheter Care

Care of a drainage tube that enters the bladder through the lower abdomen, including cleaning the site, keeping the tube unobstructed, securing it, and monitoring urine. Fever, increasing pain, leakage, bleeding, or no urine flow can indicate infection or blockage.

Suprarenal Glands

Two small glands above the kidneys. Their outer layer makes hormones that regulate salt, blood pressure, stress, and metabolism; their inner layer makes adrenaline and related hormones.

Suprascapular Nerve

A nerve from the brachial plexus supplying shoulder muscles that help lift the arm and rotate it outward.

Suprascapular Neuropathy

Dysfunction of the suprascapular nerve from compression, traction, trauma, or an adjacent lesion. It may cause deep shoulder pain, weakness of abduction or external rotation, and wasting of the supraspinatus or infraspinatus muscles.

Supraspinatus Muscle

One of the four rotator-cuff muscles. It helps lift the arm away from the body and stabilize the shoulder joint; its tendon passes beneath the top of the shoulder and is often injured.

Suprasternal Notch

The shallow dip at the upper border of the manubrium, between the inner ends of the collarbones.

Supraventricular Tachycardia

A fast heart rhythm beginning above the ventricles, often starting and stopping suddenly, causing palpitations, dizziness, or weakness.

Alternate Names:
SVT

Sural Nerve

A sensory nerve formed mainly from branches of the tibial and common fibular nerves. It supplies sensation to the posterolateral lower leg and lateral border of the foot.

Suramin

An antiparasitic medicine used mainly for selected early forms of African trypanosomiasis. It requires specialist use because it can cause serious kidney, nerve, allergic, and other adverse effects.

Surface Anatomy

The study of external body landmarks and visible or palpable structures used to locate deeper anatomical structures and guide physical examination or procedures.

Surfactant

A substance that lowers surface tension. In the lungs, it coats the tiny air sacs and helps keep them open when a person breathes out; premature babies may have too little, contributing to respiratory distress syndrome.

Surgeon

A physician trained to perform operations and invasive procedures, and to evaluate and care for patients before and after surgery.

Surgery

Treatment in which a clinician operates on tissues or organs to diagnose, remove, repair, replace, or improve a body structure. Risks and recovery depend on the procedure and the patient's health.

Surgery For Pancreatic Cancer

An operation to remove a pancreatic tumor and sometimes nearby organs or lymph nodes when the cancer can be safely removed. It is major surgery and may cause bleeding, infection, digestive problems, diabetes, or delayed stomach emptying.

Surgery For Pilonidal Cyst

An operation to drain or remove a recurrent or complicated tunnel or cyst near the cleft of the buttocks. Wound care and keeping the area clean are important; infection, slow healing, and recurrence can occur.

Surgical Abortion

A procedure that removes a pregnancy from the uterus to end a pregnancy or treat an early pregnancy loss. Common methods include vacuum aspiration and dilation and evacuation; the method depends on how far the pregnancy has progressed.

Alternate Names:
Vacuum Aspiration; Suction Curettage; Induced Abortion

Surgical Drain

A tube or device placed during or after surgery to remove blood, pus, bile, urine, or other fluid. The amount and appearance of drainage are monitored; infection, bleeding, blockage, and tissue injury are possible.

Surgical Drill

A powered instrument used to cut, shape, or make holes in bone during surgery. Friction and heat during use can injure bone or nearby tissues and contribute to infection or bone weakening.

Surgical Excision

Cutting out a lesion, tumor, organ, or other unwanted tissue using an operation. The removed material may be examined under a microscope; bleeding, infection, scarring, damage to nearby structures, and incomplete removal are possible.

Surgical Fixation

Stabilization of a bone, joint, or other structure with devices such as plates, screws, rods, wires, or external frames.

Surgical Forceps

Handheld instruments used during surgery to hold, grasp, move, or manipulate tissue, sutures, dressings, or other materials. Their shape and pressure are selected to limit tissue injury.

Alternate Names:
Surgical Grasping Forceps; Tissue Forceps

Surgical Hemostasis

Control of bleeding during an operation using pressure, ligation, sutures, clips, electrosurgery, topical agents, vessel sealing, or other techniques. Effective hemostasis requires identification of the bleeding source and correction of coagulopathy when present.

Surgical Hemostat

A clamping surgical instrument used to control bleeding by compressing a blood vessel or tissue.

Alternate Names:
Surgical Hemostatic Forceps; Mosquito Clamp

Surgical Instruments

Tools used during operations, including scalpels,

scissors, forceps, clamps, retractors, needle holders, and devices controlling bleeding. Each instrument is designed for a specific task and must be cleaned, sterilized, and handled safely.

Surgical Margin

The outer edge of tissue removed during an operation. A laboratory examination checks whether disease reaches that edge: a clear margin suggests no disease was seen there, while an involved margin may mean more treatment is needed.

Surgical Repair

An operation that restores or rebuilds damaged tissue, an organ, or a body function. It may close wounds, reconnect structures, stabilize bones, repair blood vessels, or correct defects present from birth.

Surgical Retractor

A surgical instrument used to hold tissues apart, giving doctors a clearer and safer view of the operating area.

Alternate Names:
Tissue Retractor; Wound Retractor

Surgical Risk Stratification

Estimation of the likelihood of perioperative complications using patient factors, urgency, procedure risk, functional capacity, and disease-specific assessment. It informs optimization, monitoring level, shared decisions, and postoperative planning but cannot eliminate uncertainty.

Surgical Safety Checklist

A structured checklist used at defined points before anesthesia, before incision, and before leaving the operating room to verify patient identity, procedure, site, consent, equipment, specimens, and team communication.

Surgical Scissors

Surgical instruments designed to cut tissue, sutures, dressings, or other materials. Different shapes and blade types are selected for delicate, deep, curved, or heavy-duty work.

Alternate Names:
Surgical Scissors; Operating Shears

Surgical Tracheostomy

The operative creation of an opening in the anterior neck into the trachea to secure an airway; see *Tracheostomy*.

Surgical Site Infection

Infection involving the incision, organ, or operative space within the surveillance period after surgery. It may be superficial incisional, deep incisional, or organ-space and requires appropriate culture, antimicrobial therapy, drainage, debridement, or reoperation when indicated.

Surgical Stapler

A device that places metal or absorbable staples to close skin, join tissue, or seal a hollow organ during an operation. Incorrect placement can cause bleeding, leakage, narrowing, or injury.

Surgical Time-Out

A deliberate team pause immediately before incision to verify patient identity, procedure, site, consent, allergies, antibiotics, imaging, implants, equipment, and anticipated critical events. It is a core surgical-safety intervention.

Surgical Wound Classification

Categorization of an operative wound as clean, clean-contaminated, contaminated, or dirty/infected according to the degree of microbial exposure and existing infection. The class helps estimate surgical-site infection risk and guide prophylaxis.

Surgical Wound Infection Treatment

Management of infection in or around a surgical wound, including assessment of depth and severity, drainage or debridement when needed, wound care, and targeted antimicrobial therapy when indicated.

Surrogacy

Surrogacy is an arrangement in which a person carries a pregnancy for intended parent or parents;

medical, legal, ethical, and psychosocial requirements vary by jurisdiction.

Surrogate

A substitute or proxy. In medical research, a surrogate outcome is a measurable change, such as a blood-test result, used to estimate a patient-important outcome such as fewer symptoms or longer survival.

Surrogate Decision-Maker

A person authorized to make healthcare decisions for someone who lacks decision-making capacity, guided by the person's known values and preferences.

Surveillance

The planned collection and review of health information to detect changes in disease, follow a known condition, or identify problems early. It may involve routine reports, active case finding, selected monitoring sites, or regular follow-up of an individual.

Surveillance Imaging

Planned repeat imaging used to monitor disease, treatment response, or possible recurrence. The timing and type of scan depend on the condition, previous treatment, symptoms, risks, and expected usefulness of results.

Survival Rate

The percentage of people alive after a specified time from diagnosis or treatment, commonly measured at five years.

Survivorship

The period of living during and after cancer treatment, together with the care provided during that time. It may include checking for return of cancer, treating late effects, supporting emotional health, improving quality of life, and managing other illnesses.

Survivorship Care Plan

A written summary of cancer treatment, recommended follow-up, possible late effects, screening, medicines, and contacts for ongoing care. It helps the person and healthcare team coordinate care after treatment.

Susac Syndrome

A rare disease in which inflammation and blockage of tiny blood vessels can affect the brain, eyes, and inner ears. It may cause confusion or headache, vision loss, and hearing loss; all features may not appear at once.

Susceptibility

The likelihood of being affected by a disease, exposure, medicine, or microorganism. Susceptibility can reflect genetics, age, immunity, health conditions, previous exposure, dose, or the organism's drug resistance.

Susceptibility Testing

Laboratory testing that shows which antibiotics are likely to stop a person's bacterial infection. The result helps clinicians choose treatment, especially when resistance is possible.

Susceptibility-Weighted Imaging

An MRI technique that is especially sensitive to small veins, blood products, iron, and some calcium deposits in tissue, particularly in the brain.

Suspected Cause

A condition, exposure, or factor believed to explain a symptom or disease but not yet proven. Further history, examination, testing, or observation may support or reject the suspected cause.

Suspension

A liquid medicine in which fine drug particles are spread through the liquid rather than dissolved. The container may need shaking so each dose contains the intended amount; settling, inaccurate measuring, and contamination can cause problems.

Sustained Virologic Response

No detectable hepatitis C virus in the blood 12 or more weeks after antiviral treatment. This is

considered a cure of that infection, but it does not protect against catching hepatitis C again.

Suture

A stitch or material used to close or join tissue.

Suture Anchor

A small implant that secures a tendon, ligament, or other soft tissue to bone. It may be made from metal, polymer, or bioabsorbable material and can fail through pullout, breakage, migration, or inflammatory reaction.

SUV

Standardized uptake value, a number estimating how much radioactive tracer is concentrated in tissue during a PET scan. Clinicians compare it with surrounding tissue and clinical findings to assess tumors or inflammation.

SVC Obstruction

Blockage or compression of the superior vena cava, the large vein returning blood from the head, neck, arms, and upper chest to the heart. It may cause facial or arm swelling, prominent neck veins, cough, headache, or breathing difficulty.

SVC Syndrome

Blockage or compression of the superior vena cava, the large vein returning blood from the upper body to the heart. It may cause swelling of the face, neck, or arms, visible neck veins, cough, or breathing difficulty.

SVT

Alternate name; see *Supraventricular Tachycardia*.

Swab

A small absorbent stick used to collect a sample from the skin, throat, nose, wound, or another body site. The sample can be tested for infection or other conditions, and correct collection affects the result.

Swallowing

The movement of food, liquid, or saliva from the mouth through the throat and esophagus into the stomach. Problems may cause coughing, choking, food sticking, or material entering the airway.

Alternate Names:
Deglutition; Ingestion

Swallowing Assessment

An evaluation of how safely and effectively a person moves food, liquid, or saliva from the mouth to the stomach. It may include observation, X-ray or camera testing, and recommendations about exercises, posture, or food and drink textures.

Swallowing Chalk

Ingestion of chalk, which is usually low in toxicity in small amounts but can cause choking, constipation, or gastrointestinal upset; repeated eating may indicate pica.

Swallowing Difficulty

Dysphagia, or impaired movement of food or liquid from the mouth to the stomach, caused by oropharyngeal, esophageal, neuromuscular, structural, or functional disorders.

Swallowing Problems

Difficulty moving food, liquid, or saliva safely from the mouth to the stomach; dysphagia can cause choking, aspiration, weight loss, or dehydration.

Swallowing Soap

Ingestion of soap, which commonly causes mouth or stomach irritation, nausea, or diarrhea; concentrated or large exposures can injure tissue or affect breathing.

Swallowing Sunscreen

Ingestion of sunscreen, usually causing mild gastrointestinal upset but potentially causing choking or aspiration depending on the amount and product; breathing difficulty or persistent vomiting can signal serious exposure.

Swallowing Syncope

Fainting triggered by swallowing, usually through an

abnormal reflex that slows the heart or lowers blood pressure; it can be associated with heart-rhythm or structural heart disease.

Swallowing Therapy

Assessment and treatment to make swallowing safer and more effective. A speech-language therapist may teach exercises, positioning, food-texture changes, and strategies to reduce aspiration into the airway.

Swallow Study

An X-ray test that records a person swallowing food or liquid mixed with barium. It shows how the mouth and throat work, whether material enters the airway, and whether changes could make swallowing safer.

Swan-Ganz Catheter

A thin tube passed through the right side of the heart into a lung artery to measure pressures and estimate how much blood the heart pumps. It is used selectively in seriously ill patients because complications are possible.

Swan-Ganz Catheterization

A procedure in which a thin catheter is passed through the right side of the heart into a lung artery to measure heart pressures and blood flow. It is used selectively in critically ill patients because bleeding, infection, rhythm problems, or vessel injury can occur.

Swan Neck Deformity

A characteristic joint deformity of the hand in which there is hyperextension of the proximal interphalangeal (PIP) joint accompanied by compensatory flexion of the distal interphalangeal (DIP) joint. It is classically seen in advanced rheumatoid arthritis, systemic lupus erythematosus, and chronic tendon imbalance.

Swan-Neck Deformity

A finger shape problem where the middle joint bends backward and the fingertip curls down, commonly caused by rheumatoid arthritis.

Sweat

Fluid produced by sweat glands, mainly to cool the body as it evaporates. Sweating can also increase with exercise, fever, stress, hormones, or some medicines.

Sweat Chloride Test

A test that measures salt levels in sweat to help diagnose cystic fibrosis. A high result supports the diagnosis, but it is interpreted with symptoms and may be repeated or followed by genetic testing because other factors can affect results.

Sweat Electrolytes Test

A sweat electrolytes test measures salts, especially chloride, in sweat and is commonly used to help diagnose cystic fibrosis.

Sweat Gland

A microscopic tubular exocrine skin gland that secretes sweat for thermoregulation and excretion, categorized into eccrine and apocrine glands. Eccrine sweat glands are distributed widely across the entire skin surface (highest density on the palms, soles, and forehead) and secrete a hypotonic watery electrolyte solution directly onto the epidermal surface under sympathetic cholinergic control to facilitate evaporative cooling. Apocrine sweat glands are restricted to axillary, perineal, and areolar regions, opening into hair follicles to secrete a viscous, lipid- and protein-rich fluid under adrenergic control that undergoes bacterial decomposition to produce characteristic body odor.

Alternate Names:
Sweat Glands; Sudoriferous Gland

Sweat Glands

Plural form; see *Sweat Gland*.

Sweat Gland Tumor

A growth arising from cells of a sweat gland. Most are benign skin lumps, but some are cancerous and may grow, ulcerate, bleed, or spread. Examination and biopsy determine the type; complete removal is often used, with wider treatment and follow-up for cancerous tumors.

Sweating

Production of sweat by eccrine and apocrine glands for heat regulation and other responses; excessive, absent, or asymmetric sweating can indicate medication, autonomic, endocrine, or neurologic disease.

Sweating And Body Odor

Excess perspiration or noticeable odor produced when skin bacteria break down sweat; it may be influenced by hygiene, diet, medicines, hormones, or disease.

Alternate Names:
Diaphoresis and Bromhidrosis; Perspiration and Osmidrosis

Sweetened Beverages

Sweetened beverages contain added sugars and can increase calorie intake, dental caries, obesity, and diabetes risk when consumed frequently.

Sweet's Syndrome

Alternate name; see *Acute Febrile Neutrophilic Dermatosis*.

Sweet Syndrome

Alternate name; see *Acute Febrile Neutrophilic Dermatosis*.

Swelling

Abnormal enlargement caused by fluid accumulation, inflammation, bleeding, infection, tumor, or tissue injury; location, onset, pain, and associated symptoms identify the likely cause.

Swimmer's Ear

Swimmer's ear, also called otitis externa, is inflammation or infection of the skin lining the outer ear canal. It often develops when moisture remains in the canal, allowing bacteria or fungi to grow. Scratching, cotton swabs, or other irritation can also damage the canal's protective skin. Symptoms include ear pain, itching, redness, swelling, drainage, and pain when the outer ear is touched.

Alternate Names:
Otitis Externa; Tropical Ear

Swimmer's Itch

An itchy rash caused by an allergic reaction to microscopic parasites released by infected snails in freshwater or saltwater.

Alternate Names:
Cercarial Dermatitis; Schistosome Dermatitis; Bather's Itch

Swimming Pool Granuloma

A slowly developing skin infection caused by a water-dwelling bacterium after exposure to an aquarium, swimming pool, or natural water. It can cause persistent bumps or sores, often spreading along the arm or hand, and needs specific antibiotic treatment.

Swine Flu

Alternate informal term; see *Influenza A Virus*.

Swollen Ankles And Swollen Feet

Enlargement of the ankles or feet caused by injury, venous insufficiency, lymphatic disease, medication, pregnancy, or systemic fluid retention from heart, kidney, or liver disease. Sudden one-sided swelling with pain, redness, warmth, or breathlessness may indicate thrombosis or infection.

Alternate Names:
Peripheral Dependent Edema; Pedal Edema

Swollen Glands

Lymph nodes that are larger than usual, often because the immune system is responding to infection or inflammation. They may be tender; hard, fixed, enlarging, or unexplained nodes can have causes other than infection.

Alternate Names:
Lymphadenomegaly; Adenopathy

Swollen Gums

Pathologic enlargement, edema, or hypertrophy of the gingival tissue. Etiologies include plaque-induced gingivitis, periodontal disease, acute oral infections, hormonal fluctuations during pregnancy, nutritional deficiencies (such as scurvy), leukemia, or drug-induced gingival hyperplasia from medications like calcium channel blockers, phenytoin, and

cyclosporine.

Alternate Names:
Gingival Swelling Gingival Hyperplasia Gingival Enlargement Enlarged Gums

Swollen Legs

Alternate name; see *Leg Swelling*.

Swollen Lymph Glands

Enlarged lymph nodes, usually caused by infection or inflammation and less often by cancer. They commonly occur in the neck, armpits, or groin; persistent, hard, fixed, or unexplained swelling may have a serious cause.

Alternate Names:
Lymphadenopathy; Lymph Node Enlargement

Swollen Lymph Nodes

Enlarged immune glands, commonly from infection but sometimes from inflammation, medication, or cancer; persistent, hard, or generalized nodes may reflect a more serious cause.

Alternate Names:
Lymphadenopathy; Adenopathy; Bubo

Swollen Lymph Nodes Entry

Alternate name; see *Swollen Lymph Nodes*.

Swollen Tongue

Enlargement of the tongue caused by injury, infection, allergy, inflammation, bleeding, or another condition; sudden breathing difficulty is an emergency.

Swyer Syndrome

A form of pure 46,XY gonadal dysgenesis resulting from mutations in the *SRY* gene or related sex-determining pathways, presenting as a phenotypic female with normal external female genitalia, streak gonads, absent puberty, and primary amenorrhea, carrying a high risk of gonadoblastoma in the streak gonads.

Alternate Names:
46,XY Pure Gonadal Dysgenesis

Sycosis Barbae

Long-lasting inflammation or infection of hair follicles in the beard area, usually involving bacteria and ingrown hairs. It can cause painful bumps, pus, crusting, scarring, and hair loss and needs appropriate treatment.

Sydenham Chorea

A delayed neurologic complication of group A streptococcal infection causing involuntary jerky movements, hypotonia, emotional lability, and coordination problems, usually in children.

Sydenham's Chorea

A delayed immune complication of group A streptococcal infection, usually in children. It causes involuntary, irregular movements and may cause clumsiness, muscle weakness, emotional changes, or difficulty with speech and daily tasks.

Symblepharon

Scar tissue that joins the inside of the eyelid to the eye's surface, usually after a severe burn, inflammation, or eye disease. It can restrict eye movement, cause dryness or pain, and may need specialist treatment.

Symmastia

An abnormal connection or loss of the normal separation between the breasts across the midline of the chest, sometimes occurring after breast surgery or reconstruction. Management depends on symptoms, anatomy, and cause.

Sympathectomy

Surgical interruption or destruction of sympathetic nerves to reduce abnormal vasoconstriction, sweating, or pain in selected conditions.

Sympathetic

Relating to the part of the autonomic nervous system that prepares the body for activity or stress by changing heart rate, blood-vessel tone, sweating, breathing, and digestion. In everyday language, it can also mean showing concern for another person.

Sympathetic Ganglion

A small group of nerve cells outside the brain and spinal cord that relays automatic signals to blood vessels, sweat glands, and internal organs. These signals help control heart rate, blood pressure, digestion, and body responses to stress.

Sympathetic Nervous System

The autonomic division that prepares the body for activity or stress by increasing heart rate and altering vascular, airway, and digestive function.

Sympatholytic

A medicine or treatment that reduces adrenaline-like nerve activity. It may lower blood pressure, slow the heart, or reduce excessive sweating, but the effects and risks depend on the specific medicine and require appropriate prescribing.

Sympathomimetic Drugs

Medicines that imitate the body's adrenaline-like nerve activity, often by stimulating alpha or beta receptors. They may open airways, raise blood pressure, or reduce congestion but can cause fast heartbeat, anxiety, or dangerous effects.

Sympathomimetic Syndrome

Alternate name; see *Sympathomimetic Toxidrome*.

Sympathomimetic Toxicity

Excess catecholamine activity causing agitation, mydriasis, diaphoresis, tachycardia, hypertension, hyperthermia, chest pain, seizures, stroke, or rhabdomyolysis. Unlike anticholinergic toxicity, sweating is usually prominent; benzodiazepines, active cooling, ECG monitoring, and treatment of ischemia, hypertension, and complications are central.

Sympathomimetic Toxidrome

A poisoning pattern caused by excessive adrenergic stimulation, producing agitation, sweating, dilated pupils, rapid heart rate, high blood pressure, elevated temperature, tremor, or seizures.

Symphysis

A joint where two bones are joined by a pad of tough cartilage. The pubic symphysis connects the front pelvic bones and normally allows slight movement, especially during pregnancy and childbirth.

Symphysis-Fundal Height

The distance from the top of the pubic bone to the top of the uterus, measured through the abdomen during pregnancy. From about 24 to 36 weeks, the measurement often roughly matches the number of weeks of pregnancy. A larger or smaller result may lead to an ultrasound to check fetal growth, fluid, or the pregnancy dates.

Alternate Names:
Fundal Height Measurement; SFH

Symphysis Pubis

The fibrocartilaginous joint connecting the left and right pubic bones at the front of the pelvis.

Symptom

A change or problem felt or reported by a patient that may suggest illness, such as pain, nausea, or breathlessness.

Symptomatic

Having symptoms caused by a disease or condition; symptomatic treatment relieves those symptoms without necessarily treating the underlying cause.

Symptomatic Disease

A stage or presentation of an illness in which an individual experiences recognizable physical or mental symptoms, such as pain, fever, cough, fatigue, or nausea. It contrasts with asymptomatic or subclinical disease, in which pathological changes or infections exist without causing noticeable symptoms.

Alternate Names:
Clinical Disease; Manifest Disease; Overt Disease

Symptomatic Porphyria

Porphyria causing clinical attacks or ongoing symptoms from abnormal heme production. Manifesta-

tions may include severe abdominal pain, neurologic or psychiatric symptoms, blistering or sun-sensitive skin, or liver complications depending on the type.

Symptomatic Treatment

Care aimed at relieving symptoms such as pain, fever, nausea, itching, or cough without directly removing the underlying cause. It may be used alone or alongside treatment for the disease itself.

Synaesthesia

Synaesthesia is a neurological trait in which stimulation of one sense or mental process automatically produces an additional sensory experience, such as seeing colors when hearing sounds.

Synapse

A connection where one nerve cell communicates with another nerve cell, muscle, or gland. Signals cross the small gap using chemicals or electrical changes to control movement, sensation, thought, and body functions.

Synapse Assembly

The developmental process by which neurons form organized connections with other neurons or target cells, using cell-adhesion molecules and signaling proteins.

Synapsins

A family of neuronal proteins that help organize synaptic vesicles and regulate the release of neurotransmitters.

Synaptic Cleft

The very small gap between a presynaptic neuron and its target cell across which neurotransmitters travel.

Synaptic Membrane

The specialized membrane at a neuronal junction, including the neurotransmitter-releasing presynaptic membrane and receptor-containing postsynaptic membrane.

Synaptic Plasticity

The ability of connections between nerve cells to become stronger, weaker, or structurally different in response to activity. It supports learning, memory, adaptation, and some changes in chronic pain.

Synaptic Transmission

Communication between nerve cells or between a nerve cell and another target across a synapse. Electrical signals trigger release of chemical messengers, which bind receptors and change the receiving cell's activity.

Synaptic Vesicle

A small membrane-bound sac in a nerve ending that stores neurotransmitters and releases them into the synaptic cleft when the neuron is activated.

Synaptonemal Complex

A temporary protein structure that pairs matching chromosomes during egg or sperm formation. It helps chromosomes exchange genetic material accurately before cells divide and is important for normal reproductive development.

Synaptosome

A sealed nerve-terminal structure produced when brain tissue is mechanically disrupted; it is used to study neurotransmitter release and synaptic function.

Synaptotagmin

A calcium-sensing protein on nerve-cell storage sacs that helps trigger rapid release of chemical nerve signals. It is essential for communication between nerve cells and between nerves and muscles.

Synarthrosis

A joint with little or no movement, such as a skull suture or tooth anchored in its socket, in which bones are joined by fibrous tissue or cartilage.

Synchondroses

Cartilage-based joints in which bones are joined by hyaline cartilage and allow little or no movement.

Growth plates and the joint between the first rib and the breastbone are examples.

Synchronized Cardioversion

Delivery of an electrical shock timed with the heart's electrical cycle to restore a more organized rhythm. It treats selected fast rhythms; sedation, clot prevention, monitoring, and energy settings depend on the rhythm and patient.

Alternate Names:
Direct Current Cardioversion; Electrical Cardioversion; R-Wave Synchronized Shock

Syncope

A brief loss of consciousness and muscle control caused by a temporary reduction in blood flow to the brain, followed by spontaneous recovery. Common causes include reflex fainting, a sudden blood-pressure drop, dehydration, and heart disease; prolonged confusion may suggest another cause.

Alternate Names:
Passing Out; Temporary Loss of Consciousness; Swoon

Syndactyly

Congenital joining or webbing of two or more fingers or toes. It may occur alone or with a genetic syndrome and sometimes requires reconstructive surgery.

Syndecan

A group of proteins on the cell surface that help cells attach to their surroundings and receive signals. They contribute to tissue development, healing, and responses to injury.

Syndesmophyte

A thin, bony growth that forms along the edges of the vertebrae, often in ankylosing spondylitis, and may bridge adjacent vertebrae.

Syndesmoses

Fibrous joints in which two bones are held together by strong ligaments or a sheet of connective tissue. They allow little movement; the joint between the lower leg bones near the ankle is one example.

Syndrome

A group of symptoms, signs, or test findings that commonly occur together. A syndrome may have several possible causes and does not always name one specific disease.

Syndrome Of Inappropriate ADH Secretion

Excessive antidiuretic hormone activity causing water retention and low blood sodium despite no major swelling or dehydration. It may result from lung disease, medicines, cancer, or brain disorders and can cause confusion or seizures.

Syndrome of Inappropriate Antidiuresis (SIAD)

Excessive vasopressin activity causes retention of free water, inappropriately concentrated urine, and usually low serum sodium despite no appropriate physiologic stimulus. Causes include medicines, lung or brain disease, cancer, and postoperative stress; severe hyponatremia can cause seizures or coma.

Syndrome Of Inappropriate Antidiuretic Hormone

Excessive release or effect of antidiuretic hormone causing impaired free-water excretion, low serum sodium, and inappropriately concentrated urine in the absence of an appropriate physiologic stimulus.

Syndrome Of Inappropriate Antidiuretic Hormone Secretion

Excessive activity of the water-retaining hormone vasopressin causes the body to retain water and lowers the blood sodium level. Causes include medicines, lung disease, cancer, and brain disorders; severe cases can cause confusion or seizures.

Alternate Names:
SIADH; Schwartz-Bartter Syndrome

Syndrome X

Alternate name; see *Metabolic Syndrome*.

Synechia

An abnormal band of scar-like tissue joining surfaces that should remain separate. In the eye, it may attach the iris to the lens or cornea and interfere with fluid drainage or vision.

Synechiae

Abnormal bands of scar-like tissue joining surfaces that should remain separate. They may occur in the eye, uterus, nose, or other sites and can restrict movement, block passages, or impair function.

Synergist

A muscle, drug, or factor that works together with another to produce or enhance an effect.

Synergistic Necrotizing Fasciitis

A rapidly progressive necrotizing soft-tissue infection caused by mixed aerobic and anaerobic organisms acting together. Severe pain, swelling, skin discoloration, fever, and systemic toxicity may occur; the infection can rapidly cause sepsis and death.

Synesthesia

Synesthesia is a stable perceptual phenomenon in which stimulation of one sensory pathway automatically produces an experience in another, such as seeing colors with sounds.

Synostoses

Fusions between two bones in which bone tissue joins them together. They may be present from birth or develop later and can limit growth or movement depending on their location.

Synostosis

Fusion of two bones by bone tissue, present from birth or developing later. It may be harmless, but fusion in the skull, forearm, or other important area can restrict growth or movement.

Synovectomy

An operation to remove part or all of an inflamed lining inside a joint. It may reduce pain and swelling in selected cases of arthritis or repeated joint inflammation and can be done through small cuts or open surgery.

Synovial Biopsy

A synovial biopsy removes a small sample of the joint lining to investigate infection, inflammatory arthritis, crystal disease, or an unusual joint lesion.

Synovial Bursa

A small, fluid-filled sac near a joint that reduces rubbing between moving tissues such as tendons, muscles, skin, and bone. Irritation or inflammation of a bursa causes bursitis, pain, and swelling.

Synovial Chondromatosis

A usually noncancerous condition in which the joint lining forms many small cartilage nodules that may break loose. It can cause pain, swelling, catching, and limited movement, often in the knee, hip, or elbow.

Synovial Cyst

A fluid-filled sac near a joint or tendon sheath, sometimes connected to the joint and sometimes containing material similar to that in a ganglion cyst. It may press on nearby nerves and cause pain, numbness, or weakness.

Synovial Fluid

A slippery fluid inside a freely movable joint that reduces friction and helps nourish cartilage. Changes in its amount or contents can occur with injury, infection, bleeding, crystals, or arthritis.

Alternate Names:
Synovia

Synovial Fluid Analysis

Testing fluid removed from a swollen or painful joint. The laboratory examines its appearance, cells, crystals, and germs to help distinguish injury, arthritis, gout, bleeding, and joint infection; a very hot, painful joint can indicate infection.

Synovial Joint

The most common and freely movable (diarthrodial)

classification of joint in the human body, characterized by a fluid-filled joint cavity enclosed by an outer fibrous joint capsule and an inner vascular synovial membrane. Opposing articular bone surfaces are lined by smooth, avascular hyaline articular cartilage that minimizes friction and absorbs compressive shock. The synovial membrane secretes viscous synovial fluid (rich in hyaluronic acid and lubricin) that nourishes articular chondrocytes and lubricates joint movement.

Alternate Names:
Synovial Joints; Diarthrosis

Synovial Joints

Plural form; see *Synovial Joint*.

Synovial Membrane

The thin lining inside a freely moving joint. It makes synovial fluid, which reduces rubbing and helps nourish the smooth joint surfaces; inflammation of this lining causes swelling and pain.

Synovial Reaction To Implanted Prostheses

Inflammation or tissue change around an artificial joint caused by wear particles, loosening, corrosion, infection, or an immune reaction. It may cause pain, swelling, or reduced function after joint replacement.

Synovial Sarcoma

A cancer of soft tissue that often develops near a joint in an arm or leg, especially in adolescents and young adults. Diagnosis requires tissue testing; treatment may include surgery, radiation, or chemotherapy.

Synoviocytes

Synoviocytes are cells lining the joint synovium that produce lubricating fluid and inflammatory mediators and help maintain or damage joint tissue.

Synovitis

Inflammation of the lining inside a joint, causing swelling, warmth, pain, or reduced movement. It may follow injury or occur with arthritis, gout, autoimmune disease, or infection; a hot, very painful joint can indicate infection.

Synovium

Tissue lining a joint or tendon sheath that makes lubricating fluid and helps support smooth movement.

Synovography

An imaging test in which contrast is placed inside a joint to outline its capsule, lining, or possible tear. It is used selectively; MRI, ultrasound, or other scans are often preferred for joint problems.

Synthetic Androgen

A synthetic androgen is a manufactured compound that activates androgen receptors and may mimic testosterone; therapeutic and anabolic use can suppress gonadal function and cause acne, mood effects, infertility, liver injury, or cardiovascular harm.

Synthetic Biology

Synthetic biology combines biology and engineering to design or modify biological systems. It has potential medical uses but also requires careful safety and ethical oversight.

Syphilis

A sexually transmitted infection caused by Treponema pallidum that progresses through primary, secondary, latent, and tertiary stages and can affect the nervous system, eyes, heart, or fetus.

Syphilis Serology

Blood tests used to screen for syphilis and monitor response to treatment. A reactive result usually needs confirmation with a different test and interpretation alongside symptoms, examination, and treatment history.

Syphilitic Alopecia

Non-scarring hair loss occurring as a manifestation of secondary syphilis, presenting with diffuse thinning or patchy, moth-eaten alopecia of the scalp, eyebrows, or beard. It is thought to result from direct spirochaetal invasion of hair follicles during

the spirochaetaemic phase.

Syphilitic Aseptic Meningitis

Syphilitic aseptic meningitis is inflammation of the meninges caused by Treponema pallidum, producing headache, neck stiffness, cranial-nerve symptoms, or other neurologic findings.

Syphilitic Gumma

A destructive lump or area of inflammation caused by long-standing untreated syphilis. It can affect the skin, bones, liver, brain, or other organs and may form a firm mass or ulcer; appropriate antibiotic treatment can prevent further damage.

Syringe

A medical device with a hollow barrel, movable plunger, and tip that may connect to a needle, catheter, or other fitting. It is used to draw up, measure, inject, or remove fluids. Common types include disposable, oral, insulin, tuberculin, and safety syringes.

Alternate Names:
Medical Syringe

Syringe Drivers

Small pumps that push medicine from a syringe continuously or at programmed times. They provide controlled delivery when precise dosing is needed, including pain relief, symptom control, or medicines given under the skin.

Syringocystadenoma Papilliferum

A usually harmless sweat-gland skin growth, often appearing as a small bump or plaque on the scalp or face. It may develop within a birthmark and can resemble other lesions, so diagnosis may require examination or biopsy.

Syringoma

A syringoma is a benign tumor of sweat-duct cells, usually appearing as small skin-colored or yellowish papules around the eyelids or elsewhere.

Syringomyelia

A fluid-filled cavity that develops inside the spinal cord. It can slowly damage the cord and cause pain, weakness, loss of pain or temperature sensation, stiffness, or problems with bladder, bowel, or sexual function.

Syrinx

A fluid-filled cavity within the spinal cord, usually related to disturbed movement of the fluid around the brain and spinal cord. It can damage nerve tissue and cause pain, weakness, stiffness, or loss of sensation; a syrinx in the cord is called syringomyelia.

Syrup

A syrup is a viscous liquid preparation, often sweetened, used as a medicine vehicle or oral dosage form; concentration and ingredients determine safe dosing.

Systematic Desensitization

A behavioral therapy technique that pairs gradual, planned exposure to a feared situation with relaxation or other coping skills. It is used mainly for phobias and anxiety and is adapted to the person's response.

Systemic

Affecting the whole body or relating to an entire system rather than a localized site.

Systemic Aleukemic Reticuloendotheliosis

A historical name for a leukemic reticuloendothelial disorder, most often referring to the aleukemic form of hairy-cell leukemia. It may cause low blood counts, an enlarged spleen, infections, fatigue, or bleeding and is diagnosed by blood, marrow, and immunophenotypic studies.

Systemic Anatomy

The study of the structures of the body organized by organ system, such as the skeletal, muscular, nervous, cardiovascular, or digestive system.

Systemic Antifungals

Antifungal medicines taken orally or given intra-

venously for infections that are extensive, invasive, refractory, or unsuitable for topical treatment. Choice and duration depend on the organism, site, severity, drug interactions, organ function, and local resistance patterns.

Systemic Chemotherapy

Systemic chemotherapy uses medicines that travel through the bloodstream to kill or slow cancer cells throughout the body.

Systemic Circuit

The circulation that carries oxygenated blood from the left ventricle through the body and returns deoxygenated blood to the right atrium.

Systemic Dermatoses

Skin manifestations that arise as secondary signs of internal medical diseases, such as endocrine disorders, autoimmune conditions, internal malignancies, or nutritional deficiencies.

Alternate Names:
Cutaneous Manifestations of Systemic Disease; Systemic Skin Signs

Systemic Disease

A disease that affects the whole body or several organs rather than one local area. Examples include autoimmune disease, widespread infection, hormonal disorders, and some cancers.

Systemic Effects

Effects involving the whole body rather than one local area. A medicine, infection, toxin, or disease may produce systemic cardiac, neurologic, kidney, liver, blood, or other effects.

Systemic Exertional Intolerance Disease

Alternate name; see *Myalgic Encephalomyelitis/Chronic Fatigue Syndrome*.

Systemic Inflammatory Response Syndrome

A body-wide inflammatory response to infection or noninfectious problems such as injury, burns, pancreatitis, or surgery. The classic adult definition requires at least two of four findings: temperature >38°C or <36°C; heart rate >90 beats/min; breathing rate >20/min or arterial $PaCO_2$ <32 mmHg (4.3 kPa); or white blood-cell count $> 12 \times 10^9$/L or $< 4 \times 10^9$/L, or >10% immature neutrophils. SIRS can occur without infection and is not the same as sepsis.

Systemic Juvenile Idiopathic Arthritis

A childhood inflammatory disease causing repeated high fevers, a temporary pink rash, and swollen or painful joints. It can also enlarge lymph nodes, liver, or spleen and may affect other organs, requiring specialist monitoring and treatment.

Systemic Lupus

Systemic lupus erythematosus is an autoimmune disease that can affect skin, joints, kidneys, blood, nervous system, lungs, and heart. Symptoms fluctuate, and treatment is tailored to organ involvement with sun protection, monitoring, and immunomodulatory medicines.

Alternate Names:
Systemic Lupus Erythematosus; SLE

Systemic Lupus Erythematosus

A chronic autoimmune disease in which the immune system mistakenly attacks healthy tissues and organs throughout the body, triggering widespread inflammation. Because it can affect almost any body system, symptoms vary widely from person to person and often come in unpredictable flares followed by periods of remission. Common signs include extreme fatigue, joint pain and swelling, low-grade fevers, sun sensitivity, and a characteristic butterfly-shaped rash across the cheeks and bridge of the nose, with potential complications involving the kidneys, heart, lungs, and brain.

Alternate Names:
SLE; Lupus; Lupus Erythematosus

Systemic Lupus Erythematosus (SLE) and Pregnancy

SLE can affect fertility, kidneys, blood counts, blood vessels, placenta, and fetal growth, while pregnancy

can trigger disease activity. Preconception planning, compatible medicines, antibody testing, blood-pressure and kidney monitoring, and maternal-fetal surveillance are important.

Systemic Mastocytosis

A rare disorder in which abnormal mast cells build up in the bone marrow or other organs. When activated, these immune cells release chemicals that can cause flushing, itching, abdominal cramps, faintness, or severe allergic reactions. In some forms, mast-cell buildup can damage organs.

Systemic Scleroderma

Alternate name; see *Systemic Sclerosis*.

Systemic Sclerosis

A chronic autoimmune connective-tissue disease marked by small-vessel abnormalities and excess collagen deposition (fibrosis) in the skin or internal organs. Skin thickening and Raynaud phenomenon are characteristic; the digestive tract, lungs, heart, and kidneys may also be affected.

Systemic Sclerosis-Associated Arthritis

Joint pain or inflammation occurring in systemic sclerosis. Stiffness, swelling, or reduced movement may occur, and symptoms can overlap with other connective-tissue diseases.

Systemic Therapy

Treatment that travels through the bloodstream or otherwise affects the whole body. Examples include chemotherapy, hormone treatment, targeted treatment, and immunotherapy; it differs from local treatment such as surgery or focused radiation.

Systemic Vascular Resistance

The aggregate resistance to blood flow through the systemic circulation, regulated mainly by the tone of small arteries and arterioles. It contributes to mean arterial pressure and the resistance the left ventricle pumps against.

Systemic Vasculitis

A group of disorders involving inflammation and damage of blood-vessel walls. It can affect vessels of different sizes, narrowing or weakening them and impairing blood flow; manifestations vary with the vessels and organs involved.

Alternate Names:
Generalized Vasculitis

Systemic Venous

Systemic venous refers to veins returning deoxygenated blood from the body to the right side of the heart, excluding the pulmonary circulation.

Systole

The part of each heartbeat when a heart chamber contracts and pushes blood forward. Ventricular systole sends blood to the lungs and body, while arterial pressure rises and the heart's valves coordinate flow.

Systolic

Systolic means relating to contraction of the heart, especially the pressure in arteries when the ventricles eject blood.

Systolic Anterior Motion

Movement of the mitral valve toward the path where blood leaves the heart during each heartbeat. It can partly block blood flow and cause the valve to leak, especially in hypertrophic cardiomyopathy. Symptoms may include breathlessness, chest pain, dizziness, or fainting; treatment depends on the cause and severity.

Alternate Names:
SAM; SAM of the Mitral Valve

Systolic Murmur

An abnormal auscultatory heart sound heard during cardiac ventricular systole (between the first heart sound, S_1, and second heart sound, S_2), produced by turbulent blood flow. Subdivided into midsystolic (ejection) murmurs (typically crescendo-decrescendo, caused by aortic stenosis, pulmonary stenosis, or benign physiologic flow) and holosystolic (pansystolic) murmurs (plateau-shaped, beginning

at S_1 and continuing through S_2, caused by mitral regurgitation, tricuspid regurgitation, or ventricular septal defect).

Alternate Names:
Systolic Murmurs

Systolic Murmurs

Plural form; see *Systolic Murmur*.

Systolic Pressure

The maximum arterial pressure during ventricular contraction, recorded as the upper number of a blood-pressure reading.

T

T1 Mapping

A quantitative cardiac MRI technique that measures longitudinal relaxation times in heart muscle. Native (pre-contrast) and post-contrast measurements help characterize tissue changes such as edema, fibrosis, or infiltration; values depend on the scanner and sequence used.

T2 Mapping

A quantitative cardiac MRI technique that measures the transverse relaxation time of heart tissue. Prolonged myocardial T2 often reflects increased tissue water, such as edema or inflammation.

T3

Triiodothyronine, the more active of the main thyroid hormones. It helps control how quickly the body uses energy and supports normal growth, development, heart activity, and body temperature.

T3RU Test

A legacy thyroid-function blood test that estimates unoccupied thyroid-hormone binding sites on serum proteins, especially thyroxine-binding globulin. It does not measure serum T3. Historically, the result was combined with total T4 to calculate the free thyroxine index; direct free-T4 and TSH assays have largely replaced this use.

T3 Test

A blood test measuring triiodothyronine, used with thyroid-stimulating hormone and thyroxine to evaluate thyroid function, particularly suspected hyperthyroidism.

T4

Thyroxine, the main hormone released by the thyroid gland. Much of it is changed into the more active T3 in body tissues. T4 helps control energy use, growth, development, and body temperature.

Tabes Dorsalis

A late nervous-system complication of untreated syphilis that damages sensory nerves and parts of the spinal cord. It can cause severe brief pains, numbness, poor balance, loss of reflexes, and bladder or sexual problems.

Tablet

A solid medicine made to be swallowed, chewed, dissolved in the mouth, or used in another specified way. Some tablets release medicine immediately, while others are coated or designed to release it slowly.

Tablet Splitting

Dividing a tablet into smaller parts. Extended-release, enteric-coated, and some specialized tablets may release medicine incorrectly or become unsafe when split.

TAB Vaccine

An older vaccine against typhoid fever and paratyphoid A and B. It has largely been replaced by newer typhoid vaccines and does not protect against every cause of fever or every type of paratyphoid infection.

Tacalcitol

A vitamin-D-like medicine applied to skin affected

by psoriasis or selected scaling disorders. It helps regulate skin-cell growth and inflammation but can irritate skin or raise calcium if overused.

Tache Noire

A dark scab or area of dead tissue at the site of a tick bite. It can occur with some spotted-fever infections and is interpreted with fever, rash, travel, and exposure history.

Tachyarrhythmia

An abnormally fast heart rhythm, which may arise from the atria, ventricles, or the heart's conduction system. Symptoms can include palpitations, dizziness, chest discomfort, shortness of breath, or fainting; severe cases can impair circulation or cause cardiac arrest.

Tachycardia

A heart rate faster than expected for a person's age and situation. It may be a normal response to exercise, stress, fever, or dehydration, or may result from a heart or other medical problem.

Alternate Names:
Rapid Heartbeat; Fast Heart Rate

Tachycardia-Bradycardia Syndrome

A variant manifestation of sick sinus syndrome characterized by alternating paroxysmal supraventricular tachyarrhythmias (commonly atrial fibrillation or atrial flutter) and periods of severe sinus bradycardia or prolonged sinus pauses upon arrhythmia termination.

Alternate Names:
Tachy-Brady Syndrome

Tachycardia-Induced Cardiomyopathy

Weakening and dilation of the heart muscle caused by a persistent or frequently recurring rapid heart rhythm, often improving when the arrhythmia is controlled.

Tachykinin

A family of small signaling proteins, including substance P, that help regulate pain, inflammation, smooth-muscle activity, and communication between nerve cells.

Tachyphrenia

Tachyphrenia is rapid flow of thoughts or accelerated mental activity, often described in association with mania, stimulants, or other psychiatric states.

Tachyphylaxis

A rapid loss of a medicine's effect after repeated doses over a short time. It differs from tolerance, which usually develops more slowly; the effect may return after the medicine-free interval is lengthened.

Tachypnea

Abnormally rapid breathing. It may occur with exercise or anxiety, but can also signal fever, low oxygen, pneumonia, blood clot in the lung, heart failure, severe infection, pain, or acid buildup.

Tachypnoea

Breathing faster than expected for a person's age and situation. It may result from exercise, fever, pain, anxiety, lung disease, low oxygen, heart failure, severe infection, or acid buildup; its significance depends on the cause and other findings.

Tachysystole

More than five uterine contractions in 10 minutes, averaged over 30 minutes, during labor. It can reduce the baby's oxygen supply, especially when the fetal heart rate is abnormal, and may follow medicines used to start or strengthen labor.

Alternate Names:
Uterine Tachysystole; Excessive Uterine Activity

TACO

Transfusion-associated circulatory overload is acute or worsening breathing difficulty caused by a rise in hydrostatic pressure after transfusion, usually with pulmonary edema. It typically begins during or within 12 hours after transfusion and may include high blood pressure and fluid overload; heart or kidney disease increases risk.

TAC Regimen

A chemotherapy combination of docetaxel, doxorubicin, and cyclophosphamide, used for selected breast cancers; it can cause infection risk, nausea, hair loss, heart effects, and other toxicities.

Tacrolimus

A medicine that suppresses immune activity. It is used to prevent rejection after an organ transplant and, in different preparations, to treat eczema and some other inflammatory skin conditions; infection risk and other side effects require monitoring.

Tactile

Relating to the sense of touch, including feeling pressure, texture, vibration, temperature, or pain. Touch signals travel through nerves to the brain; reduced or abnormal touch sensation may result from nerve, spinal-cord, brain, or skin disease.

Tactile Agnosia

Inability to recognize a familiar object by touch even though basic sensation is intact. It usually results from a problem in areas of the brain that interpret sensory information.

Tactile Fremitus

Vibrations felt on the chest when a person speaks. Changes in these vibrations can help clinicians identify lung problems such as pneumonia, fluid around the lung, a collapsed lung, or reduced air movement.

Tactile Sense

The ability to perceive touch, pressure, vibration, texture, and related mechanical stimuli through receptors in the skin and deeper tissues.

Tadalafil

Tadalafil is a phosphodiesterase-5 inhibitor used for erectile dysfunction, benign prostatic hyperplasia, and pulmonary hypertension; headache, flushing, hypotension, priapism, and dangerous nitrate interactions are important risks.

Taenia

A group of tapeworms that includes Taenia solium, the pork tapeworm, and Taenia saginata, the beef tapeworm. Adult worms can live in the intestine; T. solium eggs can also cause cysts in body tissues.

Taenia Saginata

Taenia saginata is the beef tapeworm acquired from undercooked infected beef; intestinal infection may cause abdominal symptoms or passage of motile segments but does not usually cause human cysticercosis.

Taeniasis

Intestinal infection caused by adult *Taenia* tapeworms. It is usually acquired by eating undercooked beef or pork containing larval cysts. It may cause abdominal discomfort, nausea, diarrhea, or passage of worm segments. Swallowing *Taenia solium* eggs causes cysticercosis in tissues, which is a different infection.

Taenia Solium

A pork tapeworm that infects people who eat undercooked pork or swallow its eggs. Adult worms live in the intestine, while eggs can cause cysticercosis, including dangerous infection of the brain.

Tailbone Trauma

Injury to the coccyx, the small bone at the bottom of the spine, usually after a fall or prolonged pressure. It causes pain when sitting, standing, or passing stool. Most injuries are bruises and improve over time; persistent or severe pain may indicate a fracture or another problem.

Tail Of The Epididymis

The lower part of the epididymis where mature sperm are stored before entering the vas deferens.

Takayasu Arteritis

An immune-mediated large-vessel vasculitis affecting the aorta and its major branches. Inflammation can narrow, block, or weaken these arteries, causing limb pain with use, weak or unequal pulses, blood-pressure differences, bruits, fever, fatigue, vision or

neurological symptoms, or organ ischemia.

Takayasu Disease

A large-vessel vasculitis that primarily affects the aorta and its major branches. It may cause limb claudication, weak or unequal pulses, blood-pressure differences, bruits, fever, fatigue, or arterial narrowing and aneurysms. Imaging and inflammatory assessment guide immunosuppressive and vascular treatment.

Takayasu'S Arteritis

Inflammation of the aorta and its major branches that can narrow or weaken the arteries. It may cause weak pulses, unequal blood pressure, arm or leg pain with use, fever, fatigue, or high blood pressure.

Takotsubo Cardiomyopathy

A temporary heart condition often triggered by severe emotional distress or intense physical stress, earning it the common name "broken heart syndrome." A sudden flood of stress hormones causes the main pumping chamber of the heart (the left ventricle) to temporarily enlarge and weaken, taking on a ballooned shape that resembles a traditional Japanese octopus trap (takotsubo). It closely mimics the symptoms of a heart attack—causing sudden chest pain, shortness of breath, and abnormal heart rhythms—even though coronary arteries are not blocked by blood clots.

Alternate Names:
Broken Heart Syndrome; Stress-Induced Cardiomyopathy; Apical Ballooning Syndrome

Takotsubo Syndrome

A temporary weakening of the heart muscle often triggered by intense emotional or physical stress. It can resemble an acute heart attack with chest pain, breathlessness, and ECG changes. Coronary artery disease can coexist, but an acute blockage does not explain the heart-muscle changes; complications can include heart failure, arrhythmia, or shock.

Alternate Names:
Stress Cardiomyopathy; Broken-Heart Syndrome

Talactoferrin Alfa

Talactoferrin alfa is a recombinant lactoferrin-related immunomodulatory protein studied as a treatment or adjunct in cancer and infectious disease.

Talaporfin Sodium

Talaporfin sodium is a photosensitizer used or studied in photodynamic therapy, where light activation produces local cytotoxic effects.

Talar Dome Lesion

An injury or defect involving the cartilage and underlying bone at the top of the talus. It may follow an ankle injury or develop through repeated loading and can cause persistent ankle pain, swelling, or catching.

Alternate Names:
Osteochondral Lesion of the Talus; Osteochondral Defect of the Talus

Talar Tilt Test

An examination that gently tilts the ankle inward or outward to assess ligament support, especially the calcaneofibular ligament. Excessive tilt or a clear difference from the other ankle may suggest ligament injury; the result is interpreted with the history and other examination findings.

Alternate Names:
Inversion Stress Test of Ankle; CFL Integrity Test

Talc

A soft mineral; inhalation of talc dust can cause talcosis, and contaminated injected talc can injure vessels and lungs.

Talcosis

Lung damage caused by breathing talc dust or, rarely, injecting talc-containing crushed medicines. It can cause scarring, cough, and shortness of breath; severity depends on the amount and type of exposure.

Talcum Powder Poisoning

Harmful effects from swallowing or inhaling talcum

powder. Swallowing usually causes mild stomach upset, but inhaling it can injure the lungs and make breathing difficult.

Talipes

A deformity of the foot and ankle present at birth or acquired later. It may affect position, flexibility, walking, and shoe fit, and treatment depends on severity, cause, age, and function.

Talipes Calcaneovalgus

A foot deformity in which the heel is turned outward and the ankle is dorsiflexed so the foot points upward; flexible newborn cases often improve, while rigid cases may reflect a structural abnormality.

Talipes Equinovarus

A congenital foot deformity with ankle plantar flexion (equinus), heel inversion (varus), and inward deviation of the forefoot (adduction), often with a high arch. It is the common rigid form of clubfoot and may affect one or both feet.

Tall Stature

Tall stature means height substantially above the expected range for age and sex and may be familial, endocrine, genetic, or associated with another condition.

Talofibular Ligament Injury

Sprain or tear of one or more ligaments connecting the fibula to the talus, especially the anterior talofibular ligament on the outer ankle. It commonly follows an inversion injury and may cause pain, swelling, bruising, or instability.

Talus

The ankle bone between the shinbones and the heel and foot bones. It transfers body weight through the ankle and has a limited blood supply, so some fractures can damage the bone and cause delayed healing or bone death.

Tamoxifen

A medicine that blocks or changes oestrogen effects in breast tissue. It treats and helps prevent some breast cancers, but can increase the risk of blood clots and, rarely, cancer of the uterine lining.

Tamoxifen Citrate

The citrate salt of tamoxifen, a selective estrogen-receptor modulator used to treat or prevent some breast cancers; blood clots and endometrial cancer are important uncommon risks.

Tamoxifen Toxicity

Adverse pharmacological effects of the selective estrogen receptor modulator tamoxifen used in breast cancer treatment, including hot flashes, increased risk of deep vein thrombosis and pulmonary embolism, and endometrial hyperplasia/carcinoma via agonistic estrogenic effects on the uterus.

Tampon

A material inserted into the vagina to absorb menstrual blood; prolonged use can rarely lead to toxic shock syndrome.

Tamponade

Pressure on an organ caused by accumulated fluid, blood, or gas. Cardiac tamponade occurs when fluid or blood around the heart prevents it from filling and pumping properly.

Tamsulosin Hydrochloride

The hydrochloride salt of tamsulosin, an alpha-1 blocker that relaxes prostate and bladder-neck muscle to improve urinary symptoms from benign prostatic enlargement.

Tangier Disease

A rare inherited disorder causing extremely low HDL cholesterol and buildup of cholesterol in tissues. It may cause enlarged yellow-orange tonsils, enlarged liver or spleen, nerve symptoms, or clouding of the cornea; cardiovascular risk varies and specialist testing is needed.

Tanner Staging

A five-stage scale describing physical changes during

puberty, including breast or genital development and pubic hair. It helps clinicians assess whether development is absent, typical, early, delayed, or progressing unevenly.

Tantalum

A corrosion-resistant metal used in some surgical implants and medical devices; exposure risk depends on the form, dose, and route.

Tapentadol

A prescription pain medicine with opioid-like and nerve-signal effects, used for selected moderate or severe pain. It can cause sleepiness, constipation, dependence, seizures, and dangerously slow breathing, especially with alcohol or other sedatives.

Tapeworm

A parasitic flatworm with a segmented body that may live in the intestine or form larval cysts in tissues. People acquire different species by eating infected meat or fish or by ingesting eggs from contaminated sources. Symptoms and complications depend on the species and site.

Tapeworm Infection

Infection caused by parasitic tapeworms. Taenia species may live as adult worms in the intestine, while some tapeworm larvae can form cysts in tissues.

Tapotement

A massage technique using rhythmic tapping, patting, or percussion. It can worsen injury or bleeding in some situations.

Tapping

Repeated light striking or percussion used during an examination, treatment, or test. It may help assess reflexes, pain, body sounds, or fluid and can also be used in chest physiotherapy or other treatments.

TAPSE

Alternate name; see *Tricuspid Annular Plane Systolic Excursion*.

TAPVR

Alternate name; see *Total Anomalous Pulmonary Venous Return*.

Tarantula Spider Bite

A bite from a tarantula that usually causes local pain, redness, and swelling. Some species also release irritating hairs that can affect the skin or eyes.

Tardieu Spots

Small pinpoint hemorrhages, classically seen beneath the lung or heart coverings in some deaths involving increased venous pressure. They are nonspecific and cannot by themselves establish the cause or timing of death.

Alternate Names:
Subpleural Ecchymoses; Petechial Hemorrhages

Tardive Dyskinesia

A delayed-onset movement disorder associated with prolonged use of dopamine-blocking medicines, especially antipsychotics. It causes involuntary, repetitive movements, often of the tongue, face, or jaw, and sometimes the limbs or trunk; these may persist or worsen after the medicine is stopped.

Tardive Dystonia

A persistent or recurrent movement disorder caused by prolonged exposure to dopamine-receptor-blocking medicines. Sustained twisting postures or repetitive muscle contractions may affect the neck, trunk, face, or limbs.

Tardive Oral Dyskinesia

Involuntary repetitive movements of the mouth, tongue, jaw, or face that develop after prolonged exposure to dopamine-blocking medicines. It may persist after the medicine is stopped or even after dose reduction.

Target Cell

An abnormal morphologic erythrocyte (codocyte) characterized by a disproportionate excess of cell membrane relative to intracellular hemoglobin content, producing a distinctive microscopic “bull’s-eye”

appearance with a central area of hemoglobin surrounded by a clear ring and an outer hemoglobinized rim. Characteristically observed on peripheral blood smear in hemoglobinopathies (thalassemia syndromes, hemoglobin C disease, sickle cell disease), severe iron deficiency anemia, obstructive liver disease (due to increased membrane cholesterol), and post-splenectomy states.

Alternate Names:
Target Cells; Codocyte; Codocytes

Target Cells

Plural form; see *Target Cell*.

Target-Controlled Infusion

A computer-controlled pump that adjusts the rate of an intravenous medicine to reach and maintain a planned concentration in the blood or at its site of action. It is used mainly during anesthesia and requires close monitoring.

Targeted Radiation Therapy

Radiation directed precisely at a tumor or other abnormal tissue to damage its DNA while limiting exposure to nearby healthy tissue. It may be delivered from outside the body or through an implanted source.

Targeted Temperature Management

Careful control of body temperature after cardiac arrest or another critical illness, usually in an unconscious patient. It aims to limit further brain injury and requires continuous monitoring while the person is cooled or kept from developing fever.

Targeted Therapies For Cancer

Cancer medicines designed to act on specific features of cancer cells or their surroundings. They may be more selective than traditional chemotherapy, but can still cause important side effects.

Targeted Therapy

Treatment that acts on a specific change or feature helping cancer cells grow, survive, or spread. Testing the tumor may identify a target and predict benefit. These treatments can be more selective than traditional chemotherapy but may still cause serious side effects and resistance.

Target Organ

An organ especially affected by a disease, hormone, toxin, medicine, or other exposure. Effects may occur because the organ has specific receptors, receives the substance, or is especially vulnerable to damage.

Target Sign

A classic cross-sectional ultrasonographic and CT finding of intussusception characterized by concentric alternating hyperechoic and hypoechoic rings formed by the invaginating bowel (intussuscipiens and intussusceptum) with mesenteric fat and fluid ('donut sign').

Alternate Names:
Donut Sign of Intussusception; Bullseye Sign

Target Tissue

Tissue that responds to a hormone, medicine, toxin, or other signal because its cells have the appropriate receptor or molecular target. The response may change growth, activity, metabolism, or survival.

Tarlov Cyst

A cerebrospinal fluid-filled perineural dilational sac arising between the perineurium and endoneurium of posterior spinal nerve roots, most frequently occurring at the S2 and S3 sacral levels. Arising from arachnoid proliferation or venous hydrostatic hypertension, the cyst cavity characteristically contains neural elements (nerve root fibers) within its wall or lumen. While frequently incidental on sacral MRI, enlarging cysts can produce symptomatic sacral radiculopathy, low back pain, perineal numbness (saddle anesthesia), sciatica, and neurogenic bladder or bowel dysfunction.

Alternate Names:
Tarlov Cysts; Perineural Cyst; Sacral Nerve Root Cyst

Tarlov Cysts

Plural form; see *Tarlov Cyst*.

Tar Remover Poisoning

Poisoning from swallowing, inhaling, or skin contact with tar-removing chemicals. Effects vary by product and may include irritation, dizziness, vomiting, or breathing problems.

Tars

A thick black substance from organic material; tobacco tar contains chemicals that can damage lungs and cause cancer.

Tarsal

Relating to the tarsus, the group of bones forming the ankle and hindfoot. Tarsal bones help support body weight and allow foot movement.

Tarsal Bones

The seven bones of the hindfoot and midfoot that connect the ankle to the metatarsals and form the arches and load-bearing framework of the foot.

Alternate Names:
Tarsus

Tarsal Coalition

An abnormal connection between two foot bones, usually present from birth. It can make the foot stiff or flat and cause pain, repeated ankle sprains, or difficulty walking, often becoming noticeable during adolescence.

Tarsal Cyst

A fluid-filled or other cystic lesion in the ankle or foot region, which may cause a lump, pain, pressure, or nerve symptoms. Examination and imaging determine whether it is a ganglion, synovial cyst, or another lesion.

Tarsal Joints

The articulations among the tarsal bones and between the tarsals and metatarsals, providing stability and controlled movement for walking and adapting the foot to surfaces.

Tarsal Tunnel Syndrome

Pressure on the tibial nerve as it passes through a narrow space near the inner ankle. It can cause burning pain, tingling, or numbness in the sole and may result from injury, swelling, diabetes, or a mass. Treatment depends on the cause.

Tarsorrhaphy

A procedure that partially or completely closes the eyelids to protect the cornea or reduce exposure in conditions such as severe dry eye or facial nerve palsy.

Tar Staining

A yellowish-brown discoloration observed on the fingers, fingernails, or facial hair caused by prolonged cutaneous deposition of tar and nicotine particulates from cigarette smoking. It serves as an objective physical sign of chronic heavy tobacco consumption.

Tarsus

The group of seven bones forming the ankle and the back and middle parts of the foot. These bones connect the lower-leg bones to the metatarsals and help support body weight, absorb forces, and adapt the foot during walking.

TAR Syndrome

Thrombocytopenia-absent-radius syndrome, an inherited condition causing low platelet counts and absent or severely shortened radius bones in the forearms. It may also cause limb differences, heart defects, kidney problems, or milk intolerance.

Tartar

A hard deposit of mineralized dental plaque, also called calculus.

Tarui Disease

A rare inherited muscle-energy disorder caused by deficiency of an enzyme needed to break down sugar for energy. Exercise can trigger early fatigue, cramps, muscle breakdown, and dark urine; some people also have chronic anemia or high uric acid.

Alternate Names:
Glycogen Storage Disease Type VII (GSD VII); Muscle Phosphofructokinase Deficiency

Tassinari Syndrome

An older term for a childhood epilepsy disorder with frequent abnormal brain activity during sleep, seizures, and possible effects on learning or development. Modern clinicians usually use a more specific diagnosis based on the child's seizures and sleep recording.

Taste

The sensation produced by the interaction of chemical substances with taste receptor cells (TRCs) on the tongue, palate, pharynx, epiglottis, and upper esophagus. Taste is one of the five primary senses (gustation).

Taste Bud

A taste bud is a cluster of specialized sensory cells in papillae of the tongue and some oral tissues that detects sweet, sour, salty, bitter, and umami stimuli and transmits signals through cranial nerves.

Taste Disorder

Abnormal reduction, loss, distortion, or unpleasant alteration of taste, caused by infection, medications, oral disease, nerve injury, neurologic disease, or other factors.

Taste Receptor

A sensor on taste-bud cells that detects chemicals in food and helps produce the sensations of sweet, salty, sour, bitter, and savory (umami). Signals then travel through nerves to the brain.

Tattoos

Tattoos are permanent designs made by placing pigment into the skin. Risks include infection, allergic reactions, scarring, and difficulty removing the pigment.

Taurine

Taurine is a sulfur-containing compound involved in normal cell, nerve, muscle, and bile-acid function. It is present in foods and added to some energy drinks; high caffeine intake in such drinks can be harmful.

Taurodontism

A tooth-development difference with an enlarged pulp chamber and shortened roots, usually affecting molars. It may occur alone or with genetic conditions and can complicate dental treatment or root-canal procedures.

Taussig-Bing Anomaly

A rare birth defect in which both major arteries leave the right lower heart chamber and a hole lies between the lower chambers below the pulmonary artery. It can cause severe low oxygen and heart failure in infancy and usually requires early specialist surgery.

Alternate Names:
Taussig-Bing Syndrome; DORV with Subpulmonic VSD

TAVR

Alternate name; see *Transcatheter Aortic Valve Replacement*.

Taxanes

Chemotherapy medicines, including paclitaxel and docetaxel, that disrupt cell division by stabilizing tiny internal structures. They treat several cancers but may cause low blood counts, nerve symptoms, hair loss, allergic reactions, or fluid retention.

Tay-Sachs Disease

A rare autosomal recessive lysosomal storage disorder usually caused by disease-causing variants in the *HEXA* gene. Reduced or absent beta-hexosaminidase A activity prevents normal breakdown of GM2 ganglioside, which accumulates mainly in neurons. The infantile form causes progressive loss of previously acquired skills, weakness, an exaggerated startle response, seizures, and vision changes; juvenile and late-onset forms may progress more slowly and have variable movement, speech, psychiatric, or cognitive features.

Alternate Names:
GM2 Gangliosidosis Type 1 Hexosaminidase A Deficiency HEXA Deficiency

Tazarotene

A topical retinoid used for acne, plaque psoriasis, and some sun-damaged skin. It can irritate skin and increases sun sensitivity; pregnancy precautions are important.

TB

Alternate name; see *Tuberculosis*.

TBG Blood Test

A blood test measuring thyroxine-binding globulin, the principal thyroid-hormone transport protein; it helps interpret abnormal total thyroid-hormone levels when binding-protein changes are suspected.

TBI

Alternate name; see *Traumatic Brain Injury*.

TBM

Abbreviation; see *Tuberculous Meningitis*.

TB Test

A tuberculosis test looks for infection with Mycobacterium tuberculosis using a skin test, blood test, or examination of respiratory specimens.

TB (Tuberculosis)

Alternate name; see *Tuberculosis*.

TCA Cycle

A series of chemical reactions inside cells that breaks down products of carbohydrates, fats, and proteins. It produces carbon dioxide and energy-carrying molecules used to make the cell's energy supply.

T Cell

A type of white blood cell that matures in the thymus and helps protect the body from infections and abnormal cells. Some T cells kill infected cells, while others coordinate or limit immune responses.

T-Cell

A thymus-derived lymphocyte that constitutes the primary effector of cell-mediated adaptive immunity. Characterized by surface expression of the antigen-specific T-cell receptor (TCR) complex coupled to CD3 signaling chains, T cells undergo positive and negative selection in the thymic cortex and medulla. Subsets include CD4+ T helper cells (Th1, Th2, Th17, and T-regulatory cells producing distinct cytokine profiles), CD8+ cytotoxic T lymphocytes (mediating targeted apoptosis of virally infected and neoplastic cells via perforin and granzymes), and memory T cells providing long-term immunologic memory.

Alternate Names:
T-Cells; T Lymphocyte; T Lymphocytes

T-Cell Count

A laboratory measurement of T lymphocytes in blood, often including CD4 cells, used to assess immune function and monitor conditions such as HIV infection or immunosuppression.

T-Cell Lymphoma

A type of blood cancer that develops from abnormal T lymphocytes, specialized white blood cells that normally help the immune system fight infections. In T-cell lymphoma, these cells grow and divide uncontrollably, accumulating in lymph nodes, skin, bone marrow, or other organs. It can present either as a skin-based lymphoma causing persistent itchy patches, plaques, or tumors, or as a systemic lymphoma causing swollen lymph nodes, fever, drenching night sweats, and weight loss.

Alternate Names:
T-Cell Lymphomas; Peripheral T-Cell Lymphoma; PTCL

T-Cell Lymphomas

Plural form; see *T-Cell Lymphoma*.

T-Cell Receptor

A protein on a T cell that recognizes a particular piece of a germ or abnormal cell when another cell displays it. This recognition helps start or direct a targeted immune response.

T-Cells

Plural form; see *T-Cell*.

TCOF1

A gene in which disease-causing variants can produce Treacher Collins syndrome, a craniofacial developmental disorder. Genetic counseling and assessment of breathing, hearing, vision, feeding, and speech may be needed.

TCS

Abbreviation; see *Treacher Collins Syndrome*.

Td

Td is a vaccine protecting against tetanus and diphtheria, generally used as a booster in adolescents and adults according to local schedules.

Tdap Vaccination In Pregnancy

Administration of tetanus, diphtheria, and acellular pertussis (Tdap) vaccine during each pregnancy, optimally at 27-36 weeks. The goal: boost maternal antibodies to protect the newborn from pertussis (whooping cough) before the infant can be vaccinated at 2 months.

Td Immunization

Vaccination against tetanus and reduced-dose diphtheria, used for routine boosters, catch-up immunization, and wound-related protection according to age and vaccination history.

Tear

A split or rupture in tissue, such as a muscle, tendon, ligament, meniscus, skin, or organ, caused by trauma, overuse, degeneration, or pressure.

Teardrop Cells

Red blood cells shaped like teardrops on a blood smear. They may occur when the bone marrow is scarred or crowded by another disease, but they are not specific to one condition.

Alternate Names:
Dacrocytes; Tear-Drop Poikilocytes

Tear Duct Reconstruction

Surgery to repair or rebuild part of the lacrimal drainage system to restore tear flow, often after injury or blockage. Depending on the site, it may repair a drainage channel or create a new route from the tear sac into the nose.

Tear Film Break-Up Time

A quantitative clinical ophthalmologic test measuring tear film stability and evaporative dry eye; after instilling topical fluorescein, the interval between a complete blink and the appearance of the first dry black spot in the pre-corneal tear film under cobalt blue light is timed (normal greater than 10 seconds; less than 10 seconds indicates tear film instability).

Alternate Names:
TBUT; Tear Breakup Assay

Tearing

Excessive production or inadequate drainage of tears, commonly caused by irritation, allergy, dry-eye reflex tearing, infection, eyelid malposition, or lacrimal-duct obstruction.

Tears

Fluid made mainly by the lacrimal glands that lubricates, nourishes, cleans, and protects the eye's surface. Tears contain water, salts, oils, mucus, and immune substances that help maintain clear, comfortable vision.

Technetium-99

A radioactive form of technetium that changes slowly by radioactive decay and is related to technetium-99m, the more widely used imaging isotope. Technetium isotopes are used in nuclear medicine and research.

Technetium-99M

A short-lived radioactive form of technetium used in many nuclear-medicine scans. It is attached to different substances so doctors can examine bones, the heart, kidneys, brain, or other organs; the radiation is detected by a special camera.

Technique

The method, equipment, and sequence of steps used for a medical examination, procedure, or imaging study. Correct technique improves safety, accuracy,

and consistency of results.

Tectum

The dorsal roof plate of the midbrain located posterior to the cerebral aqueduct, composed of the paired superior colliculi (mediating visual orientation reflexes and saccades) and inferior colliculi (relaying auditory pathways).

Alternate Names:
Tectum Mesencephali; Quadrigeminal Plate

TEE

TEE, or transesophageal echocardiography, uses an ultrasound probe in the esophagus to obtain detailed images of heart valves, chambers, clots, and nearby vessels.

Teenage Pregnancy

Pregnancy in a person aged 19 years or younger. Compared with adult pregnancy, it may carry higher risks of anemia, high blood pressure, preterm birth, and low birth weight, although outcomes improve with timely prenatal care and support.

Teenagers And Drugs

Psychoactive substance use during adolescence is associated with risks to brain development, mental health, safety, education, and social functioning. The effects vary with the substance, frequency and duration of use, age at exposure, and individual vulnerability; substance-use disorders may also develop.

Teenagers And Sleep

Teenagers commonly need about eight to ten hours of sleep, but schedules, screens, caffeine, mood, school demands, and sleep disorders can reduce sleep quality.

Teen Depression

Depression in an adolescent, causing persistent sadness, irritability, loss of interest, low energy, sleep or appetite changes, hopelessness, or thoughts of death. Symptoms persist long enough to impair school, relationships, or daily life.

Alternate Names:
Adolescent Depression

TEER

Alternate name; see *Transcatheter Edge-To-Edge Repair*.

Teeth

Hard, mineralized structures in the mouth used for cutting, tearing, and grinding food. They are held in the jaw by surrounding bone and gums and can be affected by decay, infection, injury, or wear.

Teeth Grinding

Alternate name; see *Bruxism*.

Teeth-Grinding

Alternate name; see *Bruxism*.

Teething

Teething is eruption of an infant's primary teeth through the gums and may cause gum discomfort, drooling, and chewing; high fever or severe illness suggests another cause.

Teichopsia

A visual disturbance involving shimmering zigzags, flashing patterns, or fortress-like shapes. It commonly occurs as a migraine aura but can have other causes, especially when new, persistent, or associated with vision loss.

Teicoplanin

A glycopeptide antibiotic used for selected serious infections caused by susceptible Gram-positive bacteria, including some resistant staphylococci. Kidney function and blood levels may need monitoring.

Telangiectasia

A visible, permanently dilated small blood vessel near the skin or mucosal surface, occurring alone or with conditions such as rosacea, liver disease, or inherited vascular syndromes.

Telangiectasis

Widening of small blood vessels near the skin or a moist body lining, producing visible red or purple lines or patches. Causes include sun exposure, rosacea, hormones, liver disease, and inherited conditions.

Teledermatology

Teledermatology is the use of video, photographs, or other digital communication to assess and manage skin conditions remotely. Some problems still require an in-person examination or biopsy.

Telegraphic Speech

A style of verbal expression in which speech consists predominantly of content words (nouns and verbs) with omission of grammatical morphemes, prepositions, conjunctions, and auxiliary verbs, resembling a telegram. It is characteristic of expressive (Broca) non-fluent aphasia.

Telehealth

Delivery of healthcare through secure electronic communication or remote monitoring, including video visits, telephone care, messaging, and transmission of clinical data.

Telemedicine

Delivery of medical care at a distance using information and communication technology. It may include video or telephone consultations, secure messages, remote diagnosis, treatment, and review of clinical information.

Teleradiology

The remote review of medical images, such as X-rays, CT scans, or MRI scans, by a qualified radiologist who is not at the imaging site. It can provide urgent or specialist interpretation when local expertise is unavailable and must protect patient information.

Tele-Rehabilitation

Rehabilitation provided remotely through video visits, phone calls, apps, or monitoring devices. It may include assessment, home exercises, education, and progress checks when in-person care is difficult to access.

Telogen and Anagen Effluvium

Diffuse, usually nonscarring hair shedding caused by premature entry of follicles into the resting telogen phase or abrupt injury to actively growing anagen follicles. Telogen shedding commonly follows illness or stress after a delay, whereas anagen shedding can begin within days to weeks of chemotherapy, radiation, or toxin exposure.

Telogen Effluvium

A common, non-scarring form of diffuse hair shedding that occurs when more hairs than usual enter the resting (telogen) phase. Shedding often begins 2–4 months after illness, fever, surgery, childbirth, major stress, rapid weight loss, nutritional deficiency, or certain medicines. It is usually temporary, with regrowth after the trigger is corrected, although recovery may take several months.

Telomere

A protective DNA region at the end of each chromosome. It helps keep genetic material stable during cell division and usually becomes shorter as cells divide and age.

Temazepam

A sedative medicine sometimes used for short-term insomnia. It can cause drowsiness, poor coordination, memory problems, dependence, and dangerously slow breathing, especially when combined with alcohol, opioids, or other sedatives.

Temperature

A measurement of body heat. The result varies with the measurement site, time, activity, age, and illness.

Temperature Measurement

Measurement of body or environmental temperature using a thermometer or sensor at a specified site, interpreted with method, age, timing, and clinical context.

Temple

The region of the skull at the side of the head between the forehead and ear.

Temple Syndrome

A genomic-imprinting disorder involving chromosome 14q32 that causes prenatal and postnatal growth restriction, hypotonia, developmental delay, feeding difficulty, short stature, and abnormal pubertal development.

Temporal

Relating either to time or to the temple area on the side of the skull, including the temporal lobe.

Temporal Arteritis

Inflammation of arteries, especially those at the temples, usually in adults over 50. It may cause a new headache, scalp tenderness, jaw pain while chewing, fever, or vision problems and can threaten sight.

Temporal Arteritis Pathology

Granulomatous inflammation of medium and large arteries, often with disruption of the internal elastic lamina, intimal hyperplasia, medial inflammation, and giant cells. Biopsy findings may be segmental and can persist after treatment.

Temporal Artery

An artery running along the side of the scalp, supplying nearby tissues; inflammation can cause temporal arteritis.

Temporal Bones

The two skull bones on the sides and base of the head. They contain the ear structures and passages for important nerves and blood vessels and help protect the brain.

Temporalis

A broad muscle on each side of the head, over the temple. It helps close the jaw for chewing; its back fibers also pull the lower jaw backward.

Alternate Names:

Temporal Muscle

Temporal Lobe

One of the main areas on each side of the brain, near the ears. It helps process sounds, understand language, form memories, and process emotions.

Temporal Lobe Epilepsy

Epilepsy in which seizures begin in the part of the brain near the ears that helps process memory, emotion, and sound. Episodes may cause unusual feelings, déjà vu, staring, loss of awareness, or repetitive movements.

Temporal Lobe Seizure

A seizure that begins in the temporal lobe of the brain and may cause altered awareness, unusual sensations, or repetitive movements.

Temporary Blindness

A transient loss of vision in one or both eyes. It can result from retinal or brain ischemia, migraine, seizures, changes in blood pressure, eye disease, or other causes; sudden loss can signal a vascular or neurologic emergency.

Temporary Loss Of Consciousness

A brief period of unresponsiveness with loss of posture, followed by recovery. Fainting is common, but seizures, abnormal heart rhythms, low blood sugar, and other illnesses can also cause it; recurrent episodes may reflect an underlying disorder.

Temporary Unconsciousness

A brief episode of loss of awareness and responsiveness, often caused by syncope but also possible with seizure, concussion, hypoglycemia, or other conditions requiring assessment.

Temporomandibular Disorders

Alternate name; see *TMJ Disorder*.

Temporomandibular Joint

The jaw joint in front of each ear, where the lower jaw meets the skull. It allows the mouth to open,

close, and move side to side; problems can cause pain, clicking, stiffness, or limited movement.

Temporomandibular Joint Disorder

Alternate name; see *TMJ Disorder*.

Temporomandibular Joint Dysfunction

A musculoskeletal disorder affecting the temporomandibular joint, articular disc, and masticatory muscles, characterized by preauricular facial pain, clicking or crepitus on jaw movement, and restricted mandibular opening.

Alternate Names:
TMD; TMJ Syndrome

Temporomandibular Joint Replacement

Surgery that removes a severely damaged jaw joint and replaces it with an artificial joint. It may be considered for ankylosis, advanced joint destruction, or persistent severe symptoms after other treatments have failed.

Temporomandibular Joint Syndrome

Pain or dysfunction involving the jaw joint and chewing muscles, often causing jaw pain, clicking, restricted opening, headache, or tooth-related symptoms. Causes include clenching, trauma, arthritis, and stress-related muscle tension. Persistent locking, severe pain, or inability to eat can occur in more serious jaw or dental conditions.

TEN

Alternate name; see *Toxic Epidermal Necrolysis*.

Tenascin

A group of proteins in the tissue surrounding cells that help organize tissue structure and influence growth, healing, and inflammation. Levels may change in wounds, developing tissues, and some tumors.

Tender

Painful or sensitive when touched or pressed, a finding that may indicate inflammation, infection, trauma, ischemia, or another underlying process.

Tenderness

Pain or discomfort caused by pressing or touching a body part. It may indicate inflammation, injury, infection, or another local or systemic problem.

Tendinitis

Inflammation of a tendon, often associated with overuse or injury. It can cause localized tenderness, stiffness, swelling, or pain with movement. Tendinopathy is a broader term for tendon disease and does not always involve active inflammation.

Alternate Names:
Tendonitis

Tendinopathy

Pain and abnormal structure or function of a tendon, often related to repeated loading, aging, or injury. It can cause localized tenderness, stiffness, weakness, or pain with movement and does not necessarily involve active inflammation.

Tendinosis

Long-lasting wear and disorganization of tendon tissue, usually from repeated loading or an injury rather than sudden inflammation. It can cause pain and reduced strength.

Tendinous Xanthoma

Firm nodular lipid deposit inside tendons, most commonly on the Achilles tendon, indicative of familial hypercholesterolemia. See *Tendon Xanthoma*.

Tendon

A strong band of tissue that connects a muscle to a bone and transfers the muscle's pull to move a joint. Tendons have a limited blood supply, so some injuries heal slowly.

Tendon Injury

Damage to a tendon ranging from microscopic overuse injury to partial or complete rupture, causing localized pain, weakness, swelling, or loss of function.

Tendonitis

Alternate spelling; see *Tendinitis*.

Tendon Repair

Surgery to reconnect a torn tendon to itself or to bone so that movement can be restored. It is followed by protected movement and rehabilitation; re-tearing, stiffness, weakness, infection, and nerve or vessel injury can occur.

Tendon Rupture

A partial or complete tear of a tendon, usually caused by sudden force, chronic tendon disease, or injury. It can cause sudden pain, swelling, weakness, and loss of the movement normally produced by that tendon.

Tendon Sheath

A thin lubricated covering around some tendons that reduces friction as the tendon moves; inflammation is called tenosynovitis.

Tendon Transfer

Surgical relocation of a functioning tendon to restore movement or balance when the original muscle-tendon unit is absent, paralyzed, or irreparable. Successful transfer requires an adequate donor, appropriate excursion, and a stable recipient joint.

Tendon Xanthoma

Firm, often painless cholesterol deposits in tendons, especially the Achilles tendons and tendons of the fingers. They can occur with inherited high cholesterol and other lipid disorders.

Alternate Names:
Tendinous Xanthoma; Achilles Tendon Xanthoma

Tenecteplase

A clot-dissolving medicine that helps restore blood flow during selected ischemic strokes and heart attacks. It is given through a vein, usually as one dose, but can cause serious bleeding, including bleeding in the brain.

Tenericutes

A former classification group for bacteria that lack a rigid cell wall, including Mycoplasma. The name is mainly used in older biological classifications; it is not a diagnosis or a routine clinical test result.

Tenesmus

A distressing sensation of needing to empty the bowel or bladder despite little output, commonly caused by rectal inflammation, infection, tumor, constipation, or urinary irritation.

Teniposide

Teniposide is a podophyllotoxin-derived antineoplastic drug that inhibits topoisomerase II and is used in selected leukemia or lymphoma regimens.

Tennis Elbow

Alternate name; see *Lateral Epicondylitis*.

Tennis Elbow Surgery

An operation to remove or repair damaged tendon tissue at the outer elbow when persistent tennis-elbow pain has not improved with nonsurgical care. Recovery requires rehabilitation, and pain, stiffness, nerve injury, or continued symptoms are possible.

Tenodesis

Surgical fixation of a tendon to bone or another tendon to restore function, stabilize a joint, or treat tendon imbalance.

Tenofovir

An antiviral medicine used with other drugs to treat HIV and, in some forms, to treat or prevent hepatitis B. It stops viruses copying their genetic material; kidney and bone effects require appropriate monitoring.

Tenosynovitis

Tenosynovitis is inflammation of the sheath surrounding a tendon, producing pain, swelling, and restricted gliding, commonly in the hand or wrist.

Tenotomy

Surgery that cuts or releases a tendon to reduce tightness, correct a deformity, relieve pressure, or change movement. It may be performed through a small opening or a larger incision; weakness, bleeding, infection, nerve injury, or recurrence can occur.

Tenovaginitis

Inflammation of a tendon and its surrounding sheath, also called tenosynovitis.

TENS

Abbreviation; see *Transcutaneous Electrical Nerve Stimulation*.

Tensile Strength

The ability of a tissue or material to resist being pulled apart; it is important in wound healing and the integrity of sutures, tendons, and other connective tissues.

Tension

A pulling force or state of being stretched; in medicine it may describe tissue tension, blood-vessel wall tension, muscle tightness, or psychological strain depending on context.

Tension Headache

A common headache causing mild or moderate pressure or tightness, often on both sides or like a band around the head. It usually lacks vomiting and may be linked with stress, poor sleep, muscle tension, or prolonged screen or neck strain.

Tension Pneumothorax

A life-threatening medical emergency that occurs when air enters the pleural space between the lung and the chest wall and cannot escape, acting like a one-way valve. With each breath, rising air pressure collapses the affected lung and shifts the heart, windpipe, and major blood vessels toward the opposite side of the chest. This pressure kinks the large veins returning blood to the heart, causing sudden, severe breathing distress, a drastic drop in blood pressure, and cardiovascular collapse.

Tension-Type Headache

A common headache that usually causes mild or moderate pressure or tightness on both sides of the head. Routine activities usually do not make it worse, and nausea or vomiting are usually absent. Stress or poor sleep may contribute but do not define the headache type.

Tentorium

A strong fold of the brain's protective covering separating the cerebellum from the back parts of the cerebrum. It supports brain structures and contains an opening through which the brainstem passes.

Tentorium Cerebelli

A broad, crescent-shaped dural fold that arches over the posterior cranial fossa, physically separating the overlying occipital lobes of the cerebral hemispheres from the underlying cerebellum; its anterior free edge forms the tentorial notch (incisura).

Teprotumumab

A monoclonal antibody targeting the insulin-like growth factor 1 receptor and used to treat thyroid eye disease in selected patients.

Teratocarcinoma

An older term for a malignant mixed germ-cell tumor containing teratoma and embryonal carcinoma components. It most often arises in the testis; current pathology reports usually name the specific tumor components.

Teratogen

A medicine, chemical, infection, radiation exposure, or other influence that can harm an embryo or fetus and cause birth defects, growth problems, abnormal development, or pregnancy loss. Risk depends on the exposure, amount, timing, and individual factors.

Teratogenesis

The development of a birth defect, impaired growth, abnormal function, or pregnancy loss after harmful exposure during pregnancy. Risk depends on the substance or infection, amount, timing, route, and

genetic factors; exposure does not automatically mean that harm will occur.

Teratogenic

Capable of causing congenital malformations, growth impairment, functional deficits, or pregnancy loss when an embryo or fetus is exposed during a vulnerable developmental period.

Teratogenic Drugs

Medicines that can harm an embryo or fetus and cause birth defects, poor growth, abnormal development, or pregnancy loss. The risk depends on the medicine, dose, timing, and stage of pregnancy.

Teratogenicity

The ability of a medicine, chemical, infection, or other exposure to harm an embryo or fetus. Risk depends on the substance, amount, timing, and individual factors; exposure does not guarantee harm.

Teratology and Drug Use During Pregnancy

Teratology is the study of how genetic, environmental, infectious, and medicine exposures can affect embryonic or fetal development. Risk depends on the substance, dose, timing, route, and maternal factors; abrupt medicine changes can also carry risks.

Teratoma

A tumor made of several types of tissue, such as skin, muscle, bone, or nerve tissue, because it develops from cells capable of forming different body tissues. It may be noncancerous or cancerous and can occur in the ovary, testicle, or other sites.

Teratozoospermia

Teratozoospermia is a high proportion of abnormally shaped sperm and may contribute to reduced fertility, though semen results must be interpreted as a whole.

Terazosin Hydrochloride

The hydrochloride salt of terazosin, an alpha-1 blocker used for urinary symptoms from benign prostatic enlargement and sometimes for hypertension; dizziness and first-dose fainting can occur.

Terbinafine

An antifungal medicine that damages the outer covering of fungi, stopping their growth or killing them. It is used on the skin or taken by mouth for selected fungal infections; liver problems and taste changes are possible.

Terbufos

Terbufos is a highly toxic organophosphate pesticide that inhibits acetylcholinesterase and can cause severe cholinergic poisoning.

Terbutaline

A beta-2 agonist used as a bronchodilator; it has limited and specialist use as a tocolytic.

Teres Major Muscle

A thick muscle of the posterior shoulder originating from the dorsal inferior angle of the scapula and inserting onto the medial lip of the intertubercular sulcus of the humerus; innervated by the lower subscapular nerve, it acts to adduct, medially rotate, and extend the arm.

Terfenadine

An older antihistamine withdrawn or restricted in many places because interactions and excessive blood levels can cause dangerous heart-rhythm abnormalities.

Teriparatide For Osteoporosis

An injectable medicine related to parathyroid hormone that stimulates new bone formation. It is used for selected people with severe osteoporosis or high fracture risk, usually for a limited period, and is followed by treatment that helps maintain the bone gained.

Terlipressin

A medicine similar to vasopressin that tightens certain blood vessels. It is used in selected hospital

treatments for life-threatening bleeding from enlarged esophageal veins or kidney failure related to advanced liver disease; reduced blood flow and breathing problems are important risks.

Term

Relating to pregnancy from 37 weeks and 0 days through 41 weeks and 6 days. This period includes early term (37 weeks 0 days to 38 weeks 6 days), full term (39 weeks 0 days to 40 weeks 6 days), and late term (41 weeks 0 days to 41 weeks 6 days); 42 weeks and later is post-term.

Term Birth

Birth from 37 weeks and 0 days through 41 weeks and 6 days of pregnancy. Early term is 37 weeks 0 days to 38 weeks 6 days, full term is 39 weeks 0 days to 40 weeks 6 days, and late term is 41 weeks 0 days to 41 weeks 6 days; birth at 42 weeks or later is post-term.

Terminal Care

Care focused on comfort, symptom relief, dignity, and support for a person with an advanced illness who is approaching the end of life.

Terminal Delirium

Delirium occurring near the end of life, often caused by advanced organ failure, medication effects, metabolic disturbance, infection, or reduced cerebral perfusion. Management prioritizes comfort, reversible contributors when consistent with goals, and support for the patient and family.

Terminal Dribbling

A prolonged final part of urination in which the stream slows to a trickle or dribble. It is a voiding symptom, distinct from post-micturition dribbling, which is leakage after urination has finished; it may occur alongside weak stream or hesitancy.

Terminal Duct Lobular Unit

The smallest working unit of the breast, made of a small duct and the lobules connected to it. Many common breast changes and cancers begin in this area.

Terminal Ileitis

Inflammation of the distal ileum, commonly associated with Crohn disease but also caused by infection, ischemia, medication, or other inflammatory conditions and producing pain, diarrhea, or bleeding.

Terminal Illness

An advanced disease that is expected to lead to death, although the timing is uncertain and treatment may sometimes slow it. Care may focus on comfort, symptom relief, personal goals, and support for the patient and family.

Terminal Insomnia

Waking too early and being unable to return to sleep, a pattern that can occur in depression, circadian-rhythm disorders, aging, or other insomnia conditions.

Terry's Lines

Alternate name; see *Terry's Nails*.

Terry's Nails

An abnormal nail appearance in which the proximal eighty percent or more of the nail bed is opaque and chalky-white (apparent leukonychia) with obscuration of the lunula, bordered by a narrow distal band of pink or reddish-brown vascular nail bed. It is classically associated with liver cirrhosis, chronic congestive heart failure, type 2 diabetes mellitus, and systemic sclerosis, as well as normal aging.

Alternate Names:
Terry Nails; Terry's Lines; Terry Lines

Terson Syndrome

The occurrence of intraocular hemorrhage (subhyaloid, preretinal, or vitreous hemorrhage) in association with acute aneurysmal subarachnoid hemorrhage or severe traumatic brain injury, caused by sudden severe intracranial pressure elevation transmitted through the optic nerve sheath.

Alternate Names:
Terson's Syndrome; Subarachnoid Intraocular Hemorrhage

Tertian Fever

A fever that returns about every 48 hours. This pattern can occur with some malaria infections, especially those caused by *Plasmodium vivax* or *P. falciparum*; the pattern alone does not confirm malaria.

Tertiary Hyperparathyroidism

Persistent overproduction of parathyroid hormone after long-standing kidney disease or another cause of parathyroid overactivity. It can raise the blood calcium level and damage bones or kidneys.

Tertiary Prevention

Care that reduces complications, disability, or suffering from an established disease. Examples include rehabilitation, long-term disease management, preventing relapses, controlling symptoms, restoring function, and providing palliative care.

Testes

The paired male reproductive organs in the scrotum. They produce sperm and testosterone and may be affected by infection, injury, torsion, tumors, or disorders of development.

Testicle

The male primary reproductive gonad, suspended within the scrotum by the spermatic cord. Each testis is enclosed in a dense fibrous capsule (the tunica albuginea) and divided into lobules containing seminiferous tubules lined by Sertoli cells and developing germ cells (mediating spermatogenesis) and interstitial Leydig cells (synthesizing and secreting testosterone under luteinizing hormone [LH] stimulation). Normal scrotal position provides the sub-core temperature essential for optimal spermatogenesis; common pathologies encompass cryptorchidism, testicular torsion, epididymo-orchitis, varicocele, and testicular germ cell tumors.

Alternate Names:
Testicles; Testis; Testes

Testicle Lump

Alternate wording; see *Testicular Mass*.

Testicle Pain

Alternate name; see *Testicular Pain*.

Testicles

Plural form; see *Testicle*.

Testicular Appendage Torsion

Twisting of a small, nonessential remnant attached to the testicle or epididymis. It commonly causes localized scrotal pain and swelling in children and may produce a small tender blue spot under the scrotal skin.

Testicular Artery

An artery that supplies blood to a testis and travels in the spermatic cord.

Testicular Atrophy

Shrinkage of a testicle with loss of some functioning tissue. Causes include an undescended testicle, infection, twisting, injury, varicocele, hormone problems, aging, or other damage; it may reduce sperm or testosterone production.

Testicular Biopsy

Removal of a small sample of testicular tissue for microscopic examination, used selectively to evaluate infertility, atypical lesions, or suspected testicular disease.

Testicular Cancer

Cancer arising in a testicle, most often in younger adult men. It commonly appears as a painless lump, enlargement, heaviness, or ache. Ultrasound and blood tests help assess a suspected tumor; treatment is highly effective for many people, especially when found early.

Testicular Cancer In Children

Cancer arising in a child's testicle. It may appear as a painless lump, swelling, or enlargement; the tumor types and behavior differ with age.

Alternate Names:
Pediatric Testicular Neoplasm; Pediatric Testicular Tumor

Testicular Choriocarcinoma

A rare, highly aggressive nonseminomatous germ-cell tumor containing trophoblastic cells. It often produces markedly elevated hCG and may spread early through the bloodstream, including to the lungs or brain.

Testicular Descent

The movement of the testes from the abdomen into the scrotum before or soon after birth.

Testicular Diseases

Conditions affecting the testis, including twisting, infection, injury, tumors, blood-vessel problems, and abnormal development. Symptoms may include pain, swelling, a lump, fertility problems, or changes in hormone production.

Testicular Disorders

Conditions affecting the testes or surrounding structures, including torsion, infection, inflammation, trauma, tumors, and hormonal disorders. Symptoms may include pain, swelling, a mass, infertility, or changes in sexual development and require appropriate evaluation.

Alternate Names:
Testicular Pathology

Testicular Failure

Testicular failure occurs when the testes do not produce enough testosterone, sperm, or both. Causes include genetic conditions, injury, infection, medicines, and damage from chemotherapy or radiation.

Testicular Feminization

Outdated term for complete androgen insensitivity syndrome; see *Androgen Insensitivity Syndrome*.

Testicular Function

The two main jobs of the testes: making sperm and producing the sex hormone testosterone.

Testicular Gonadoblastoma

A rare tumor made from developing reproductive cells and supporting cells in an abnormally developed or undescended testicle. It is often associated with Y-chromosome material and may increase the risk of another germ-cell cancer.

Testicular Hydrocele

A buildup of clear fluid around a testicle, causing painless swelling of the scrotum. It may be present from birth or develop after injury, infection, inflammation, or another condition; examination helps exclude other causes of swelling.

Testicular Infection

Infection involving the testis, most often occurring with inflammation of the epididymis (epididymo-orchitis); isolated orchitis can also occur. It may cause scrotal pain, swelling, and fever and must be distinguished from testicular torsion.

Testicular Interstitium

The tissue between the seminiferous tubules. It contains Leydig cells, blood vessels, lymph vessels, and connective tissue.

Testicular Lobule

One of the small sections inside a testis that contains seminiferous tubules.

Testicular Mass

A lump or enlargement within or around a testicle caused by tumor, infection, inflammation, cyst, hematoma, or torsion. A solid mass within the testicle can be linked to cancer or another serious condition.

Testicular Microlithiasis

Multiple tiny calcifications within the testicular tissue seen on ultrasound. The finding alone does not establish cancer, and follow-up depends on other risk factors and clinical findings.

Testicular Pain

Pain in one or both testes, caused by torsion, infection, trauma, inflammation, hernia, tumor, or referred pain from nearby structures. Sudden, severe

pain may indicate testicular torsion, which interrupts blood flow and can cause permanent testicular injury or loss without prompt treatment.

Testicular Self-Exam

A person's own examination of the testes for lumps, swelling, or changes in size or shape.

Testicular Seminoma

A malignant germ-cell tumor of the testis, usually affecting younger adults. It commonly presents as a painless testicular enlargement or mass; diagnosis uses ultrasound, orchiectomy pathology, tumor markers, and staging imaging.

Testicular Torsion

Twisting of the spermatic cord that cuts off blood flow to a testicle. It usually causes sudden, severe one-sided scrotal pain and swelling, sometimes with nausea or vomiting. It is a surgical emergency; prolonged loss of blood flow can cause permanent testicular injury or loss.

Alternate Names:
Torsion of Spermatic Cord; Testis Twisting

Testicular Torsion Emergency

Alternate name; see *Testicular Torsion*.

Testicular Torsion Overview

Alternate name; see *Testicular Torsion*.

Testicular Torsion Repair

Urgent surgery to untwist a spermatic cord and restore testicular blood flow, followed by fixation of the affected and usually opposite testis to prevent recurrence.

Testicular Trauma

Injury to a testicle caused by a blow, crush injury, penetrating wound, or other force. It may cause pain, swelling, bruising, bleeding, or rupture of the tough covering around the testicle.

Testicular Tumor

Alternate name; see *Testicular Cancer*.

Testicular Vein

A vein that drains blood from a testis through the spermatic cord. The right and left sides drain into different larger veins.

Testis

One of the two male reproductive glands in the scrotum. It produces sperm and testosterone and is surrounded by protective tissue. Sudden pain, swelling, or a new lump can indicate torsion, infection, or a tumor.

Alternate Names:
Male Gonad; Orchis

Testis Disorder

A condition affecting a testicle, including torsion, infection, tumor, trauma, infertility-related damage, hormonal dysfunction, or abnormal development.

Testis Neoplasm

A tumor arising in testicular tissue, most commonly a germ-cell tumor in younger adults; painless enlargement, heaviness, or a solid mass may occur and is commonly investigated with ultrasound.

Test Meal

A meal with known ingredients and amounts given before measuring a body response, such as stomach emptying, acid production, blood sugar, or hormone release. The person follows specific preparation and timing instructions.

Testosterone

A steroid sex hormone produced mainly by the testes and, in smaller amounts, by the ovaries and adrenal glands. It supports reproductive development, muscle and bone maintenance, red-blood-cell production, libido, and other physiologic functions; levels vary with age, sex, time of day, illness, and medicines.

Testosterone Deficiency

Alternate name; see *Male Hypogonadism*.

Testosterone Propionate

A short-acting injectable testosterone ester used in selected hormone-replacement or androgen-deficiency settings; risks include erythrocytosis, infertility, acne, mood effects, and prostate-related monitoring needs.

Tests For H Pylori

Tests for Helicobacter pylori infection, including urea breath testing, stool antigen testing, biopsy-based testing, or selected blood tests; choice depends on treatment and clinical context.

Test Strips

Narrow strips containing chemicals that react with a sample to measure or detect a substance. Common examples test urine for blood or infection, or test blood for glucose or ketones. Results can be affected by storage, timing, contamination, and incorrect use.

Tetanus

A serious and potentially fatal bacterial infection caused by a potent nerve toxin produced by *Clostridium tetani*, a bacterium commonly found in soil, dust, and animal manure that can enter the body through puncture wounds, cuts, or animal bites. The toxin travels along nerves to the spinal cord and brainstem, where it blocks normal inhibitory nerve signals. This leads to continuous, agonizing muscle spasms, starting with the jaw and neck (lockjaw), causing difficulty swallowing, rigid arching of the spine, and potentially fatal breathing muscle paralysis.

Alternate Names:
Lockjaw; Clostridium tetani Infection

Tetanus Toxin

A toxin made by the bacterium Clostridium tetani. It blocks calming signals in the nervous system, causing painful muscle stiffness and spasms, including lockjaw. Vaccination and proper wound care reduce the risk of tetanus.

Tetany

Muscle cramps, spasms, or twitching caused by increased nerve and muscle excitability, most often from low calcium or magnesium. Tingling around the mouth or in the hands may occur; severe spasms or breathing difficulty may occur in serious cases.

Tethered Cord Syndrome

A condition in which the spinal cord is abnormally attached and stretched inside the spinal canal. It may cause back or leg pain, weakness, numbness, foot changes, or bladder and bowel problems, sometimes worsening during growth.

Tetrabenazine

A medicine that reduces storage and release of certain brain chemicals involved in movement. It treats selected involuntary movement disorders but may cause sleepiness, depression, restlessness, stiffness, swallowing problems, or abnormal movements.

Tetracaine

Tetracaine is a potent ester local anaesthetic used topically or for spinal anaesthesia; excessive dose can cause seizures, cardiovascular toxicity, and methemoglobinaemia.

Tetrachloroethylene

Tetrachloroethylene, or perchloroethylene, is an industrial solvent used in dry cleaning; substantial exposure can affect the nervous system, liver, and kidneys.

Tetrachlorvinphos

An organophosphate insecticide that can block acetylcholinesterase. Significant exposure may cause sweating, vomiting, pinpoint pupils, muscle twitching, slow breathing, seizures, or coma.

Tetracycline

A class of broad-spectrum antibiotics used to treat a wide range of bacterial infections, including respiratory tract infections, skin conditions such as severe acne, and tick-borne illnesses. They work by interfering with the ability of bacteria to produce the proteins necessary for growth and multiplication. Because they bind to calcium, they can cause permanent tooth discoloration and affect bone growth,

and are therefore avoided in young children and during pregnancy.

Alternate Names:
Tetracyclines

Tetracyclines

Plural form; see *Tetracycline*.

Tetracycline Stain

Gray, yellow, or brown tooth discolouration caused by tetracycline-family antibiotics taken while teeth are developing. The colour is within the tooth and may require professional whitening, veneers, or crowns for cosmetic improvement.

Tetrahydrozoline Poisoning

Poisoning from swallowing eye drops or nasal drops containing tetrahydrozoline. It can cause extreme sleepiness, slow heart rate, low blood pressure, and breathing problems, especially in children.

Tetralogy Of Fallot

A congenital heart defect comprising a ventricular septal defect, obstruction of the right ventricular outflow tract (usually pulmonary stenosis), an overriding aorta that receives blood from both ventricles, and right ventricular hypertrophy. The obstruction can reduce blood flow to the lungs and lower blood oxygen levels.

Tetraplegia

Paralysis or severe weakness affecting both arms and both legs, usually because the spinal cord in the neck has been injured or damaged by disease. Trunk movement, sensation, breathing, and bladder or bowel control may also be affected.

Tet Spell

A sudden episode of severe bluish coloring and low oxygen in a child with unrepaired tetralogy of Fallot. Crying, feeding, or exertion may trigger it; the child may breathe rapidly, become limp, or faint. It is an emergency requiring calming, positioning, oxygen, and urgent specialist care.

Alternate Names:
Hypercyanotic Spell; Paroxysmal Dyspneic Attack; Blue Spell

TGA

Alternate name; see *Transient Global Amnesia*.

Th1/Th2/Th17/Tfh/Treg Balance

A description of how several types of helper immune cells work together. They help fight infections, support antibody production, promote inflammation, or limit excessive immune activity; disruption may contribute to allergy or autoimmune disease.

Thalamic Pain Syndrome

A central neuropathic pain syndrome developing weeks to months after a cerebrovascular infarct involving the ventral posterolateral (VPL) nucleus of the thalamus (posterior cerebral artery occlusion), characterized by burning, allodynic, and severe intractable contralateral hemibody pain.

Alternate Names:
Dejerine-Roussy Syndrome

Thalamus

A pair of structures deep within the brain that relay most sensory information, such as touch, vision, and hearing, to the outer brain. They also help regulate movement, alertness, and memory.

Thalassaemia

Alternate spelling; see *Thalassemia*.

Thalassemia

A group of inherited blood disorders in which the body makes too little of one part of hemoglobin, the oxygen-carrying protein in red blood cells. This causes anemia, ranging from mild to severe, and may require regular treatment.

Thalassemia Major

A severe inherited blood disorder in which the body makes too little hemoglobin. It causes serious anemia beginning in childhood and may require regular blood transfusions, with monitoring for iron buildup and organ damage.

Thalidomide

A medicine that changes immune activity and is used for selected cancers and inflammatory conditions. It can cause severe birth defects, nerve damage, blood clots, sleepiness, and other harms, requiring strict safety controls.

Thallium

Thallium is a toxic heavy metal that can cause gastrointestinal illness followed by painful nerve damage, hair loss, skin changes, kidney or liver injury, seizures, and heart or brain problems.

Alternate Names:
Thallium Toxicity; Thallotoxicosis

Thallium-201

A radioactive substance sometimes used in heart-blood-flow scans. Heart muscle takes it up in relation to its blood supply, and a special camera shows areas receiving less blood.

Thallium-201 Stress Test

A nuclear cardiac-perfusion test in which thallium-201 or a comparable tracer is used with stress imaging to identify areas of reduced blood flow or nonviable heart muscle.

Thallium Poisoning

Alternate name; see *Thallium*.

Thallium Scan

A nuclear-medicine test using thallium-201 to show blood flow to heart muscle or selected tumors. It is now less common because other tracers are often preferred, but may still have specific uses.

Thallium Toxicity

Heavy-metal poisoning that may begin with gastrointestinal symptoms and progress to painful sensorimotor neuropathy, encephalopathy, alopecia, and nail changes such as Mees lines. Blood or urine testing supports diagnosis; treatment may include Prussian blue and supportive care.

Thanatophoric Dysplasia

A severe inherited disorder of bone growth causing extremely short limbs, a narrow chest, a large head, and abnormal skull and spine development. The small chest can prevent adequate breathing after birth and is often life-threatening.

Theca

A connective-tissue sheath, especially the theca surrounding an ovarian follicle.

Theca Lutein Cyst

A usually temporary ovarian cyst caused by strong stimulation from pregnancy-related hormones or fertility treatment. It is often present in both ovaries and may cause abdominal pressure or pain; it commonly shrinks when hormone levels return to normal.

Thecoma

A usually benign ovarian sex-cord stromal tumor composed of theca-like cells, often producing estrogen and presenting with abnormal uterine bleeding or an incidental adnexal mass.

Thelarche

The onset of breast development, usually the first visible sign of female puberty. It commonly begins between ages 8 and 13, with substantial normal variation.

Thelaziasis

Infection of the eye by nematode worms of the genus *Thelazia*, usually transmitted by flies that feed on tears. The worms live in the conjunctival sac, the pocket between the eyelid and eyeball, and may cause a foreign-body sensation, tearing, or conjunctivitis. Human infection is uncommon; these parasites mainly infect animals.

Thenar Eminence
