Knowledge for Better Health

A COMPACT REFERENCE
FOR STUDENTS, PROFESSIONALS
AND HEALTH-CONSCIOUS READERS

CHAMAN SINGH VERMA

Preface

This dictionary is a concise reference to medical terms, diseases, investigations, treatments, anatomy, physiology, and related clinical concepts. It is intended to help students, healthcare professionals, educators, and general readers understand unfamiliar medical language.

The entries are arranged alphabetically from A to Z, with each letter presented in its own chapter. This arrangement allows a reader to locate a known term quickly while maintaining a consistent structure throughout the book. Related terms, recognized common names, and alternative names are included when they improve clarity or aid searching.

Definitions are written in simple, formal language and are intended to be clear, accurate, and useful for reference. Medical terminology changes as scientific knowledge and clinical guidance develop; therefore, important information should be checked against current textbooks, primary research, professional guidance, and local clinical protocols.

This book is an educational reference, not a substitute for professional medical advice, diagnosis, or treatment. Readers should seek advice from a qualified healthcare professional when making decisions about health.

Chaman Singh Verma

Medical Disclaimer

Educational and Reference Purpose Only: This publication, *The Modern Medical Pocket Dictionary*, is prepared and compiled strictly for educational, academic, historical, and reference purposes. It is intended for medical students, healthcare professionals, educators, and researchers.

No Medical Advice: The information contained herein does not constitute professional medical advice, clinical diagnosis, treatment protocols, or formal therapeutic recommendations. It should not be used as a substitute for the professional judgment of qualified physicians, surgeons, or certified healthcare providers.

Clinical Practice Guidelines: Healthcare practitioners must always consult primary evidence-based medical literature, institutional protocols, manufacturer prescribing information, and national clinical guidelines (such as WHO, CDC, NICE, or national medical councils) when making diagnostic or therapeutic decisions for individual patients.

Limitation of Liability: Neither the author nor the publishers accept any legal responsibility or liability for any errors, omissions, or clinical outcomes resulting from the use or application of any information presented in this work.

A

A1AT Deficiency

Abbreviation for alpha-1 antitrypsin deficiency; see *Alpha-1 Antitrypsin Deficiency*.

A1C

Alternate name for the hemoglobin A1c test; see *Hemoglobin A1c*.

AA Amyloidosis

A systemic disease in which amyloid deposits form from serum amyloid A protein, usually after prolonged inflammation or infection. Deposits most often affect the kidneys but may involve other organs.

Alternate Names:
Amyloid A Amyloidosis; Secondary Amyloidosis; Secondary Systemic Amyloidosis

Aagenaes Syndrome

A rare inherited disorder that causes reduced flow of bile from the liver beginning in infancy and long-lasting swelling from lymph-fluid buildup, usually in the legs. Liver problems may come and go with age, but some people develop vitamin deficiency, poor growth, or liver scarring.

Aarskog-Scott Syndrome

A rare inherited developmental disorder, often related to FGD1 variants, characterized by distinctive facial features, short stature, skeletal differences, and genital anomalies.

Alternate Names:
Aarskog Syndrome

Aarskog Syndrome

Alternate name; see *Aarskog-Scott Syndrome*.

Aase-Smith Syndrome I

A rare congenital syndrome characterized by hydrocephalus, often associated with Dandy-Walker malformation, cleft palate, and severe joint contractures. Other reported features include thin fingers with absent or reduced knuckle creases, ear abnormalities, clubfoot, and heart defects. Its cause is not established.

Aase-Smith Syndrome II

A rare inherited disorder that causes reduced production of red blood cells and thumbs with three bones instead of the usual two.

Aase Syndrome

Alternate name; see *Aase-Smith Syndrome II*.

AAT

Abbreviation for alpha-1 antitrypsin, a protein made mainly in the liver that helps protect lung tissue from enzyme-related damage. Blood testing can measure its amount and type.

AAT Deficiency

Abbreviation for alpha-1 antitrypsin deficiency; see *Alpha-1 Antitrypsin Deficiency*.

Abadie Sign

Reduced pain sensation when firm pressure is applied to the Achilles tendon, classically described in tabes dorsalis.

Abandoned Lead

A wire from a pacemaker or defibrillator that is no longer connected to the device but remains in the body. It may be left in place when removal poses greater risk, because scar tissue can attach it to a vein or the heart. Retained leads can complicate later device procedures, blood-vessel access, or management of infection.

Alternate Names:
Abandoned Pacemaker Lead; Abandoned ICD Lead

Abasia

Inability to walk because of impaired coordination of walking, despite enough leg strength to move the legs in other positions. Causes may be neurologic or functional.

Abate

To become less intense or to reduce in severity, frequency, or amount; symptoms, inflammation, pain, or fever may abate.

Abatement

A reduction in the severity, intensity, frequency, or amount of a symptom, disease process, exposure, or other condition.

ABCDE Assessment

A systematic emergency assessment of airway, breathing, circulation, disability, and exposure. It prioritizes recognition of life-threatening abnormalities and repeated reassessment.

ABCDE Rule For Melanoma

A screening mnemonic for pigmented lesions: asymmetry, border irregularity, color variation, diameter greater than about 6 mm, and evolution. It does not diagnose melanoma.

Abdomen

The body region between the diaphragm and pelvis. It contains most digestive organs, the kidneys, spleen, pancreas, and major blood vessels and is described clinically by four quadrants or nine regions.

Abdominal

Relating to the abdomen, the body region between the chest and pelvis that contains organs of the digestive, urinary, and reproductive systems.

Abdominal Abscess

A localized collection of pus within the abdomen, usually caused by bacterial infection, inflammation, surgery, or organ perforation. It may cause fever and abdominal pain.

Abdominal Adhesion

Alternate index label; see *Abdominal Adhesions*.

Abdominal Adhesions

Bands of scar-like tissue that form inside the abdomen and make two or more organs stick to each other or to the abdominal wall. They most often develop after surgery but may also follow infection, inflammation, endometriosis, or radiation; some are present from birth. They often cause no symptoms, but may cause long-lasting abdominal pain, infertility when they affect pelvic reproductive organs, or a partial or complete intestinal blockage. A blockage may cause pain, bloating, constipation, vomiting, or inability to pass gas.

Abdominal Angina

Pain in the abdomen after eating, caused by reduced blood flow through the arteries supplying the intestines. It is usually due to hardening and narrowing of these arteries.

Abdominal Aorta

The portion of the aorta below the diaphragm that extends to its bifurcation into the common iliac arteries. It supplies the abdominal organs, pelvic organs, and lower limbs through its branches.

Abdominal Aortic Aneurysm

A balloon-like bulge or enlargement in the wall of the abdominal aorta (the main blood vessel carrying blood from the heart through the abdomen). It develops when the vessel wall weakens over time, typically defined as reaching a diameter of 3 centimeters or greater. While often causing no symptoms

initially, a severe or enlarging aneurysm can tear or rupture, causing sudden severe abdominal, back, or flank pain, dizziness, and life-threatening internal bleeding.

Alternate Names:
AAA; Abdominal Aneurysm

Abdominal Aortic Aneurysm Repair

Treatment of an abdominal aortic aneurysm to prevent rupture or control a rupture. Repair may be performed by open surgery, which replaces the weakened aortic segment with a graft, or by endovascular repair (EVAR), which places a stent graft inside the aorta.

Alternate Names:
AAA Repair

Abdominal Aortic Aneurysm Screening

Use of ultrasonography in people without symptoms to detect an abdominal aortic aneurysm. Screening eligibility depends on risk factors and applicable guidelines. If an aneurysm is found, subsequent imaging is surveillance, with intervals based largely on aneurysm size. See also: *Abdominal Aortic Ultrasound*.

Abdominal Aortic Ultrasound

An imaging test that uses sound waves to visualize the abdominal aorta and detect or measure an aneurysm. It may be used for screening, diagnostic evaluation, or surveillance and does not use ionizing radiation. See also: *Abdominal Aortic Aneurysm Screening*.

Abdominal Aponeurosis

A broad, flat sheet of tough connective tissue that attaches abdominal muscles to nearby muscles, bones, or fascia and helps form and strengthen the abdominal wall. The aponeuroses of the external oblique, internal oblique, and transversus abdominis contribute to the abdominal sheath and midline linea alba.

Abdominal Binder

A wide wrap worn around the abdomen to support the abdominal wall and apply gentle compression, often after surgery or injury.

Abdominal Bloating

A feeling of fullness, pressure, or tightness in the abdomen. It may occur with or without visible enlargement and is commonly caused by intestinal gas, constipation, food intolerance, or functional gastrointestinal disorders.

Abdominal Bruit

An abnormal blowing or whooshing sound heard over the abdomen with a stethoscope, usually caused by turbulent blood flow through a narrowed or enlarged artery. It may occur with renal-artery stenosis or an abdominal aortic aneurysm. Further assessment depends on symptoms and vascular risk factors.

Abdominal Cavity

The cavity between the diaphragm and pelvis containing the stomach, liver, gallbladder, spleen, pancreas, kidneys, and intestines.

Abdominal Circumference

The distance around the abdomen. In pregnancy, fetal abdominal circumference is measured by ultrasound at a standardized level that includes the stomach, portal sinus, and spine; it is used with other measurements to estimate fetal size and assess growth.

Abdominal Colic

Cramping abdominal pain caused by contractions or obstruction of a hollow organ, such as the intestine, ureter, or bile duct. Pain often comes in waves and may be accompanied by nausea, vomiting, sweating, or altered bowel or urinary function. Severe or persistent pain can reflect obstruction or another acute disorder.

Abdominal Compartment Syndrome

A syndrome of sustained intra-abdominal pressure greater than 20 mm Hg associated with new organ dysfunction or failure. It can impair kidney, lung, cardiovascular, and intestinal function. Causes include abdominal injury or disease, bleeding, severe

inflammation, intestinal edema, and major fluid resuscitation.

Abdominal CT

Computed tomography of the abdomen used to evaluate selected causes of abdominal pain, trauma, bowel obstruction, inflammation, bleeding, and masses. The protocol and use of contrast depend on the suspected condition and the patient's clinical status.

Abdominal CT Scan

Alternate name; see *Abdominal CT*.

Abdominal Distension

Visible or measured enlargement of the abdomen, often with a feeling of fullness or tightness. Causes include gas, constipation, fluid, pregnancy, enlarged organs, bowel obstruction, or bleeding; severe pain, vomiting, fever, or inability to pass stool or gas may occur with obstruction or bleeding.

Alternate Names:
Abdominal Swelling; Swollen Abdomen; Abdominal Distention

Abdominal Distention

Alternate name; see *Abdominal Distension*.

Abdominal Epilepsy

A rare and debated term for focal seizures in which abdominal sensations or symptoms are prominent. Similar symptoms have many more common causes, so the diagnosis requires evidence that the episodes are epileptic.

Alternate Names:
Autonomic Epilepsy; Gastrointestinal Epilepsy

Abdominal Exploration

Surgical examination of the abdominal cavity to locate, and sometimes treat, a suspected cause of symptoms or an abnormal finding. It may be done through an abdominal incision or with a laparoscope.

Abdominal Fat

Adipose tissue stored beneath the skin or around abdominal organs; excess visceral fat is metabolically active and associated with insulin resistance, fatty liver, and cardiovascular risk.

Abdominal Fibromatosis

Alternate name for an abdominal desmoid tumor, a fibrous growth that can invade nearby tissues but does not spread to distant organs; see *Desmoid Tumor*.

Abdominal Fluid

Fluid in the peritoneal cavity, the space around the abdominal organs. A small amount normally lubricates the organs; excess fluid is called ascites.

Alternate Names:
Peritoneal Fluid

Abdominal Girth

The distance around the abdomen, measured at a specified level. It may be used to monitor abdominal distention, fetal growth, obesity, ascites, or changes in intra-abdominal volume.

Abdominal Guarding

Tensing of the abdominal wall during examination, either voluntarily to limit pain or involuntarily in response to irritation of the peritoneum. Involuntary guarding may occur with peritonitis or other acute abdominal disease.

Abdominal Hernia

Protrusion of an organ or tissue through a weakness or opening in the abdominal wall. Common types include incisional, umbilical, epigastric, and ventral hernias.

Abdominal Hysterectomy

Surgical removal of the uterus through an incision in the abdominal wall; the cervix, ovaries, and fallopian tubes may or may not also be removed.

Abdominal Mass

A lump or enlargement in the abdomen that can

be felt on examination or seen on imaging. It may arise from an enlarged organ, hernia, cyst, abscess, or benign or cancerous tumor; the term describes a finding, not a diagnosis.

Abdominal Migraine

A recurrent disorder seen mainly in children, causing moderate to severe midline, periumbilical, or diffuse abdominal pain. Attacks last 2–72 hours, may include pallor, loss of appetite, nausea, or vomiting, and are separated by symptom-free intervals. Headache is absent during the abdominal attacks.

Abdominal MRI Scan

A magnetic resonance imaging study that produces detailed images of the abdomen using magnetic fields and radiofrequency energy.

Abdominal Muscles

The muscles forming the front and sides of the abdominal wall. They support the trunk, help with posture and breathing, and increase intra-abdominal pressure during coughing, lifting, and defecation.

Alternate Names:
Abdominal Wall Muscles

Abdominal Muscle Strain

A stretch or tear in the muscle fibers of the abdominal wall, such as the rectus abdominis or obliques, usually caused by sudden twisting, heavy lifting, or intense athletic exertion. Symptoms include localized abdominal soreness, swelling, and pain aggravated by coughing or bending.

Alternate Names:
Pulled Abdominal Muscle; Abdominal Wall Strain

Abdominal Neoplasm

An abnormal growth in an organ or tissue of the abdomen. It may be noncancerous or cancerous and can cause pain, swelling, bleeding, changes in bowel function, or no symptoms.

Alternate Names:
Abdominal Tumor

Abdominal Neoplasms

Alternate index label; see *Abdominal Neoplasm*.

Abdominal Pain

Pain or discomfort in the area between the chest and pelvis. It may arise from the abdominal wall or organs, or be referred from another body region. Sudden severe pain, involuntary rigidity, fainting, persistent vomiting, fever, or blood in stool can occur with serious abdominal disease; abdominal pain in pregnancy may occur with ectopic pregnancy.

Abdominal Palpation

Part of a physical examination in which a clinician feels the abdomen with the hands to assess tenderness, muscle guarding, masses, or enlarged organs. Findings can guide further evaluation but do not identify a cause on their own.

Alternate Names:
Palpation of the Abdomen

Abdominal Point Tenderness

Pain felt in one specific area when the abdomen is pressed. It may occur with appendicitis, gallbladder inflammation, or other local disease; it does not identify the cause by itself.

Alternate Names:
Focal Abdominal Tenderness; Point Pain in Abdomen

Abdominal Pregnancy

An ectopic pregnancy in which the gestation implants in the peritoneal cavity, outside the uterus, fallopian tubes, and ovaries. It is rare and may implant on the peritoneum or abdominal organs; placental attachment can cause severe hemorrhage. Ultrasound is used for diagnosis, with MRI sometimes helping to clarify the implantation site.

Abdominal Quadrant

One of four topographical divisions of the abdomen made by the midline and a transverse plane through the umbilicus. The right upper, left upper, right lower, and left lower quadrants provide a standard way to record the location of pain, tenderness, or a mass.

Abdominal Radiography

A regular X-ray of the abdomen. It may be taken while a person is lying down, standing, or lying on their side.

Abdominal Reflex

Contraction of the abdominal muscles after stimulation of the abdominal skin. An absent or asymmetric reflex may indicate neurologic disease, although it can be absent normally in some people.

Abdominal Regions

The nine named areas used to describe locations on the abdominal wall: the right and left hypochondriac, epigastric, right and left lumbar, umbilical, right and left iliac, and hypogastric regions.

Abdominal Respiration

Breathing in which movement of the diaphragm produces prominent movement of the abdominal wall, especially during relaxed breathing. The pattern may be assessed when evaluating respiratory effort, breathing mechanics, or neuromuscular weakness.

Alternate Names:
Diaphragmatic Breathing

Abdominal Retractor

A surgical instrument used to hold back the abdominal wall or organs to improve access and visibility during an operation.

Alternate Names:
Abdominal Wall Retractor

Abdominal Rigidity

Involuntary tensing of the abdominal wall, usually caused by irritation of the peritoneum. It may occur with peritonitis, perforation, severe infection, or intra-abdominal bleeding.

Abdominal Sounds

Sounds produced by movement of gas and fluid through the intestines; changes in frequency or character may support, but do not establish, a diagnosis.

Abdominal Swelling

Alternate name; see *Abdominal Distension*.

Abdominal Tap

Alternate name; see *Abdominocentesis*.

Abdominal Thrusts

A first-aid maneuver used for severe choking in a responsive person. Current American Heart Association guidance alternates five back blows with five abdominal thrusts for adults and children; for infants, it alternates five back blows with five chest thrusts.

Abdominal Trauma

An injury to the abdomen caused by a blow, crash, or fall, or by an object that pierces the body. It may damage the abdominal wall, organs, or blood vessels and cause internal bleeding. Abdominal trauma is described as blunt or penetrating, depending on how the injury occurred.

Abdominal Ultrasound

An ultrasound examination that uses sound waves to produce images of the abdomen and assess its structure and blood flow when applicable.

Abdominal Wall

The layered muscular, fascial, and skin-covered boundary surrounding the abdominal cavity. It supports and protects abdominal organs and helps with posture, breathing, coughing, and straining. Weakness or defects may produce abdominal or incisional hernias; trauma, infection, and tumors may also affect the wall.

Abdominal Wall Fat Pad Biopsy

Removal of a small sample of abdominal fat to look for amyloid, usually with a special Congo-red stain. It is less invasive than biopsy of an affected organ, but a negative result does not rule out amyloidosis.

Abdominal Wall Hernia

Alternate name; see *Abdominal Hernia*.

Abdominal Wall Surgery

Surgery to repair a defect or disease of the abdominal wall, often a hernia. It may be open or laparoscopic, and mesh may or may not be used depending on the defect, location, and patient factors.

Abdominal X-Ray

Alternate name; see *Abdominal Radiography*.

Abdominocentesis

Inserting a needle through the abdominal wall into the space around the abdominal organs to remove or test extra fluid, called ascites.

Alternate Names:
Paracentesis

Abdominopelvic Cavity

The connected body space below the diaphragm containing abdominal and pelvic organs, including digestive, urinary, and reproductive structures, protected by surrounding muscles, bones, and lining tissues.

Abdominoperineal Resection

An operation that removes the anus, rectum, and usually part of the sigmoid colon. Because the normal anal outlet is removed, the surgeon creates a permanent colostomy, bringing the colon through the abdominal wall to drain stool into a bag. It may be used for selected low rectal or anal cancers.

Alternate Names:
APR

Abdominoplasty

A surgical procedure that removes excess abdominal skin and may tighten the abdominal wall.

Alternate Names:
Tummy Tuck

Abducens Nerve

The sixth cranial nerve. It controls the muscle that moves the eye outward. Damage to this nerve can prevent outward eye movement and cause double vision.

Abducens Nerve Diseases

Disorders affecting the sixth cranial nerve, which moves the eye outward. Injury or disease can weaken this movement and cause horizontal double vision; causes include diabetes-related nerve injury, raised pressure inside the skull, infection, inflammation, stroke, or trauma.

Abducens Nerve Palsy

Dysfunction of the sixth cranial nerve resulting in paralysis or paresis of the lateral rectus muscle. Clinically characterized by horizontal diplopia that worsens on gaze toward the affected side and convergent strabismus (esotropia) in primary gaze. Common etiologies include microvascular ischemia (diabetes mellitus, hypertension), elevated intracranial pressure (false localizing sign), trauma, and cavernous sinus lesions.

Alternate Names:
Sixth Nerve Palsy; CN VI Palsy

Abducent

Describing a muscle that moves a body part away from the midline. The term also appears in the older name “abducent nerve” for the abducens nerve (cranial nerve VI).

Abducent Nerve

Older alternate name; see *Abducens Nerve*.

Abduct

To move an arm, leg, finger, or other body part away from the center line of the body.

Abduction

Movement of a limb or other body part away from the median plane of the body. In ocular motility, it is movement of an eye outward, away from the nose.

Abductor Muscle

A muscle that moves a body part away from the midline or, for a digit, away from the axis of the hand or foot.

Abercrombie Syndrome

An older name for systemic amyloidosis, in which abnormal amyloid proteins accumulate in organs and impair their function.

Aberrant Conduction

Transient abnormal intraventricular conduction of a supraventricular electrical impulse through the ventricular conduction system, typically occurring when an impulse reaches bundle branch tissue during its relative refractory period. Most commonly presents as a wide QRS complex with right bundle branch block morphology following a sudden change in cycle length (Ashman phenomenon).

Alternate Names:
Aberrancy; Ventricular Aberration

Aberrant Right Subclavian Artery

A congenital vascular anomaly in which the right subclavian artery arises from the aortic arch distal to the left subclavian artery rather than from the brachiocephalic trunk. It travels behind the esophagus to reach the right arm and may occasionally compress the esophagus or trachea.

Alternate Names:
Arteria Lusoria

Aberration

A deviation from normal structure, function, or appearance; in optics, it is an imperfection that prevents light from forming a sharply focused image.

Abetalipoproteinemia

A rare inherited disorder in which the body cannot make normal particles that carry fat and cholesterol in the blood. It causes poor absorption of dietary fat, deficiencies of vitamins carried with fat, abnormal red blood cells, and possible nerve or eye disease.

Abfraction

A proposed explanation for some noncarious loss of tooth tissue near the gum line, in which repeated biting forces are thought to contribute. This mechanism remains debated and has not been established as the sole cause. Such defects are more neutrally called noncarious cervical lesions, which may involve acid exposure, toothbrushing abrasion, and mechanical stress.

Abiotrophy

Progressive loss of function in a tissue or organ as its cells degenerate. The term describes this process but does not specify which tissue is affected or what causes the degeneration.

Ablate

To remove or destroy tissue using surgery, heat, cold, chemicals, or another energy source. Ablation may treat abnormal heart rhythms, tumors, pain pathways, or other selected conditions.

Ablation

A procedure that removes or destroys tissue or stops an unwanted body function using surgery, heat, cold, electricity, medicines, or other methods.

Ablative Surgery

Surgery that destroys or removes abnormal tissue, often using excision, heat, cold, electrical energy, or other tissue-destructive methods.

Ablepharon

A rare congenital condition in which one or both eyelids are absent or severely underdeveloped. It can leave the eye exposed and may require protective treatment and reconstructive surgery.

Abnormal

Outside the expected range or appearance for a particular body structure, function, or test. An abnormal result may reflect disease, a temporary change, or normal variation; the term alone does not identify its cause or clinical importance.

Abnormal Color

A change in the usual color of the skin, the lining of the mouth or eyes, or a body fluid. Examples include pallor, bluish discoloration (cyanosis), yellowing (jaundice), and redness (erythema). These findings can reflect changes in blood flow, oxygenation, bilirubin, or inflammation; their meaning dif-

fers by site.

Alternate Names:
Discoloration

Abnormal (Dysfunctional) Uterine Bleeding

Dysfunctional uterine bleeding is a deprecated term formerly used for abnormal uterine bleeding without an identified structural cause. Current terminology describes the bleeding as abnormal uterine bleeding and classifies possible causes using FIGO PALM-COEIN. See *Abnormal Uterine Bleeding*.

Abnormal Fissure

An unusual crack or cleft in tissue, either because it occurs where no fissure is normally present or because it is unusually deep or wide. It may result from a developmental difference, injury, or inflammation; the finding alone does not identify its cause.

Abnormal Hemoglobins Testing

Blood testing that looks for unusual forms of hemoglobin, the oxygen-carrying protein in red blood cells. It helps diagnose inherited disorders such as sickle-cell disease and thalassemia; results may require specialized laboratory analysis.

Abnormality

A finding that differs from the expected structure, function, development, or test result. It may be harmless, temporary, or caused by disease; the word alone does not identify its cause or seriousness.

Abnormal Labor

Labor that is unusually slow, prolonged, arrested, or associated with abnormal contractions, fetal position, or signs that the fetus is not tolerating labor. The term includes several patterns of abnormal labor progress and is not a single diagnosis.

Abnormal Liver Function Tests

Abnormal blood-test results suggesting injury, inflammation, impaired bile flow, or reduced synthetic function of the liver. Commonly measured analytes include aminotransferases, alkaline phosphatase, bilirubin, albumin, and prothrombin time; patterns are interpreted with symptoms, medications, imaging, and other tests.

Abnormally Dark Or Light Skin

Skin that has become darker or lighter than a person's usual skin tone. Darkening is called hyperpigmentation and lightening is called hypopigmentation. Causes include inflammation or injury, sun exposure, medicines, infections, hormonal disorders, and genetic conditions.

Abnormally Excessive Sweating

See *Hyperhidrosis*.

Abnormal Pap Test

A cervical screening result showing abnormal cells or evidence of human papillomavirus. It does not by itself mean cancer; the findings range from minor cellular changes to abnormalities associated with a higher risk of cervical precancer.

Abnormal Posturing

An abnormal, sustained position of the body or limbs caused by severe dysfunction of the brain, brainstem, spinal cord, or muscles. Decorticate, decerebrate, and opisthotonic postures can occur with life-threatening neurologic injury.

Abnormal Reflex

A reflex response that is absent, reduced, unusually brisk, or unequal between sides on examination. It can point to dysfunction in the sensory or motor nerves, spinal cord, brain, or muscles; its meaning depends on which reflex is tested and the other examination findings.

Abnormal Tooth Shape

Abnormal tooth shape may result from developmental defects, genetic conditions, trauma, wear, or tumors and can affect function, appearance, and eruption.

Abnormal Uterine Bleeding

Bleeding from the uterus that differs from the usual pattern in amount, duration, frequency, or regularity

in a person who is not pregnant. Causes include changes in ovulation or hormones, fibroids, polyps, medicines, infection, and cancer. Bleeding after sex may come from the cervix or vagina rather than the uterus; bleeding during pregnancy is assessed separately.

Abnormal Uterine Bleeding (AUB)

Alternate name; see *Abnormal Uterine Bleeding*.

Abnormal Vaginal Bleeding

Alternate symptom label; see *Abnormal Uterine Bleeding*.

Abnormal Virilization

Development of masculinizing physical features in a person whose expected sex development does not include them, often from excess androgens.

Alternate Names:
Virilization

ABO Blood Group System

The major blood-group system defined by A and B antigens on red blood cells and usually by naturally occurring anti-A or anti-B antibodies in plasma. The four principal groups are A, B, AB, and O. Correct ABO matching is essential because incompatible transfusion can cause rapid, severe red-cell destruction.

Alternate Names:
ABO Blood Group ABO Blood Groups ABO Blood Types ABO System

ABO Blood Typing

Alternate name; see *ABO/Rh Typing*.

ABO Incompatibility

A mismatch between ABO blood groups that can cause red-cell destruction. In transfusion, recipient antibodies may trigger an acute hemolytic reaction; maternal IgG antibodies can cross the placenta and cause hemolysis and jaundice in a newborn, usually less severely than Rh-mediated disease.

ABO/Rh Typing

A laboratory test that determines a person's ABO and Rh blood groups. It is performed before transfusion, transplantation, and some obstetric procedures.

Abortion

The ending of a pregnancy, either spontaneously or by induction. An induced abortion is initiated with medicines or a medical procedure; spontaneous abortion, commonly called miscarriage, occurs without intentional intervention. The terms distinguish pregnancy loss from intentional termination.

Abortion Complications

Possible physical complications of pregnancy loss or induced abortion include heavy bleeding, retained pregnancy tissue, and infection; risks vary with the method, gestational age, and access to appropriate care. Emotional responses also vary and are not themselves a medical complication.

Abortive

Incomplete, unsuccessful, or stopped before full development; an abortive infection produces limited disease without the usual complete clinical course.

Abortive Polio

A mild, nonparalytic poliovirus infection causing nonspecific fever, sore throat, headache, nausea, or malaise without the neurologic findings of paralytic polio.

Above The Knee Amputation

Amputation of the lower limb through the thigh above the knee joint, usually performed for severe vascular disease, infection, trauma, or cancer.

Abrade

To wear away tissue by friction or erosion; an abrasion is the resulting scrape or superficial loss of skin.

Abrasion

A superficial injury in which the skin is scraped

or rubbed away, usually by friction. In dentistry, abrasion means mechanical wearing away of tooth structure by an external force.

Abrin

A highly toxic protein found in rosary pea seeds that blocks protein synthesis and kills cells. Poisoning after ingestion or inhalation can cause severe gastrointestinal illness, breathing problems, organ failure, and death.

ABR Test

Auditory brainstem response testing records electrical activity from the auditory nerve and brainstem through scalp electrodes to assess hearing and auditory-pathway function, especially in infants or people unable to provide reliable behavioral responses.

Abruptio Placenta

Alternate name; see *Abruptio Placentae*.

Abruptio Placentae

Premature separation of the placenta from the uterine wall before delivery. It can cause vaginal bleeding, abdominal pain, uterine tenderness, fetal distress, and maternal shock.

Abs

An informal name for the muscles at the front and sides of the abdomen. They help bend and rotate the trunk, support the spine, protect abdominal organs, and increase pressure for coughing, lifting, breathing, or bowel movements.

Abscess

A localized collection of pus within tissue or an organ, usually caused by infection and surrounded by inflamed tissue. It may cause pain, swelling, warmth, or fever, although symptoms vary with its size and location. Abscesses can occur in skin, deeper tissues, organs, or body spaces.

Abscessed Tooth

A collection of pus caused by bacterial infection of the tooth or surrounding tissues, usually arising from untreated dental decay, a cracked tooth, or periodontal disease. Pain, facial swelling, fever, and sensitivity may occur. Spread into deep facial spaces can obstruct the airway or cause systemic infection.

Abscission

Separation or removal of tissue. In surgical use, it means cutting away tissue; in biology, it can mean the natural shedding of a body part, such as a leaf.

Absence Epilepsy

A generalized epilepsy with brief seizures that cause a sudden pause in activity and impaired awareness, often with staring or small repetitive movements. Awareness usually returns quickly without confusion; the seizures may occur many times a day.

Alternate Names:
Pyknolepsy; Petit Mal Epilepsy (historical term)

Absence Of Sweating

Anhidrosis is diminished or absent sweating, which may be focal or generalized. It impairs thermoregulation and can result from autonomic dysfunction, peripheral neuropathy, skin disease, medications, or congenital conditions. Severe generalized anhidrosis can cause heat intolerance and exertional hyperthermia.

Absence Of The Breast

Congenital absence of breast development, called amastia; it may affect one or both sides and can occur with other developmental anomalies.

Absence Seizure

A brief seizure causing sudden staring and reduced awareness, usually lasting only seconds with rapid recovery. The person may stop speaking or responding and may make small repetitive movements; an EEG helps confirm the diagnosis.

Alternate Names:
Petit Mal Seizure (historical term)

Absent Breath Sounds

Lack of audible air movement over part or all of

a lung. Causes include pneumothorax, pleural effusion, or airway obstruction; sudden onset may indicate an acute airway or lung disorder.

Absent Eye

Anophthalmia, a congenital absence or severe underdevelopment of the eye globe and ocular tissue; it may affect one or both eyes and may occur with other birth defects.

Absent Menstrual Periods

Alternate index label; see *Amenorrhea*.

Absent Pulmonary Valve

A birth defect in which the valve between the heart and the lung arteries is missing or severely underdeveloped. It can enlarge those arteries and cause breathing problems, poor blood flow to the lungs, or other heart defects.

Absent Reflex

Failure of an expected automatic movement to occur when a tendon or other body area is stimulated. It may suggest a problem in a nerve, nerve root, spinal cord, or muscle, although reflexes can normally differ between people and sides.

Absent Thirst

Reduced or absent desire to drink despite a potential need for fluids, which can occur with hypothalamic disease, aging, altered consciousness, medications, or severe illness.

Absolute Eosinophil Count

A laboratory blood test measuring the exact number of eosinophils per microliter of blood to evaluate allergic disorders, asthma, parasitic infections, drug reactions, or hypereosinophilic syndromes.

Alternate Names:
AEC; Absolute Eosinophils; Blood Eosinophil Count

Absolute Neutrophil Count

The actual number of circulating neutrophils (including both mature segmented neutrophils and immature bands) per microliter of blood, calculated as WBC$\times$(%segmented neutrophils+%bands)/100. A normal ANC is typically 1,500 to 8,000/μL. Neutropenia is defined as an ANC $< 1,500/\mu$L, with severe neutropenia defined as an ANC $< 500/\mu$L, which confers a markedly increased risk of invasive and life-threatening infections.

Alternate Names:
ANC

Absorb

To take in a substance, such as through the skin or intestine, or to reduce the intensity of radiation or light by taking up its energy.

Absorption

The passage of a substance across a body surface into body fluids or the bloodstream. In pharmacology, it is the movement of a drug from its administration site into systemic circulation. Intravenous administration places a drug directly in the bloodstream and therefore bypasses this process.

Abstinence

Deliberate avoidance of a substance or behavior, such as alcohol, tobacco, or sexual activity. In a person with physical dependence, stopping a substance may cause withdrawal. Withdrawal after prolonged heavy alcohol or sedative use can be medically dangerous; abstinence does not itself imply dependence or withdrawal.

Abulia

Marked reduction in motivation, initiative, and spontaneous activity, usually caused by dysfunction of frontal-subcortical brain circuits or related neurologic disease.

Abusive Head Trauma

Injury to an infant or young child caused by inflicted blunt impact, violent shaking, or both. Findings may include subdural hemorrhage, retinal hemorrhage, encephalopathy, fractures, or other injuries; diagnosis requires careful multidisciplinary assessment because no single finding is diagnostic.

Alternate Names:
Shaken Baby Syndrome (older term)

Abutment

A natural tooth, dental implant, or component that supports a dental prosthesis. Abutments may hold a bridge, denture, or implant crown in position and transfer chewing forces to the supporting tooth, implant, or bone.

Acalculia

Loss of the ability to do or understand numbers and calculations that a person could previously manage. It may result from injury or disease affecting areas of the brain involved in calculation.

Acalculous Cholecystitis

Inflammation of the gallbladder without gallstones. It usually occurs suddenly in people who are critically ill, injured, recovering from surgery, unable to eat, or in shock. Reduced bile flow and poor blood supply can contribute, and severe cases may cause tissue death or a hole in the gallbladder. Fever and pain in the upper-right abdomen may occur; ultrasound is commonly used for evaluation.

Acalculous Cholecystopathy

A term sometimes used for functional gallbladder disorder, which causes biliary-type pain without gallstones or another structural cause. Gallbladder dysmotility and a low ejection fraction on cholescintigraphy may support the diagnosis; terminology and diagnostic criteria vary.

Alternate Names:
Biliary Dyskinesia; Chronic Acalculous Gallbladder Disease

Acanthamoeba

A free-living amoeba found in soil and water that can cause corneal infection, skin or sinus infection, or rarely granulomatous amoebic encephalitis. Contact-lens exposure to contaminated water increases keratitis risk, while invasive disease is more likely with impaired immunity.

Acanthamoeba Keratitis

A rare corneal infection caused by the free-living amoeba *Acanthamoeba*. It is associated with contact lenses exposed to contaminated water and may cause severe eye pain, redness, light sensitivity, blurred vision, and a ring-shaped corneal infiltrate. The infection can damage the cornea and threaten sight.

Acanthocyte

An abnormal red blood cell with irregular, thorny or spike-like projections of varying length and width on its outer membrane. They are seen on a blood smear in advanced liver disease (such as cirrhosis), lipid metabolism disorders, abetalipoproteinemia, or neuroacanthocytosis.

Acanthocytosis

The presence of acanthocytes—red blood cells with irregular, thorn-like projections—in a blood sample. It can occur in inherited lipid disorders, advanced liver disease, and some neurological disorders; the cause depends on the clinical context.

Acantholysis

Loss of adhesion between keratinocytes, the main cells of the epidermis (outer skin layer). The cells separate, sometimes forming blisters or surface erosions. Acantholysis is a microscopic finding seen in disorders such as pemphigus and some inherited or infectious skin diseases; it is not a disease by itself.

Acanthoma

A nonspecific term for a proliferation or thickening of epidermal keratinocytes. It appears in the names of several distinct lesions; many are benign, but behavior depends on the specific subtype, and the term alone does not identify one diagnosis.

Acanthosis Nigricans

Dark, thickened, velvety skin, usually in folds such as the neck, armpits, or groin. It is often associated with insulin resistance, obesity, type 2 diabetes, hormonal disorders, or medicines; rarely, sudden extensive disease can signal an underlying cancer.

Acapnia

A marked deficiency or absence of carbon dioxide in the blood. The more commonly used term for a low arterial carbon-dioxide level is hypocapnia, often caused by breathing too quickly or deeply.

Acardia

A severe fetal anomaly in a monochorionic twin pregnancy in which one twin lacks a functional heart and depends on blood flow supplied by the co-twin through placental vascular connections. It occurs in twin reversed arterial perfusion sequence.

Acariasis

Illness or skin infestation caused by mites or ticks. It may cause itching, a rash, burrows, skin nodules, or deeper tissue inflammation; some mites and ticks can also transmit infection.

Acaricide

A pesticide used to kill mites and related arachnids such as ticks. It may be used on animals, plants, or environments; exposure can irritate skin and may cause poisoning if misused.

Acatalasemia

A rare inherited condition in which catalase, an enzyme that breaks down hydrogen peroxide, is absent or greatly reduced. Many people have no symptoms, but some develop mouth ulcers, tissue damage, or increased sensitivity to oxidative stress.

Alternate Names:
Acatalasia; Catalase Deficiency

Acatalasia

Alternate name; see *Acatalasemia*.

ACC

Abbreviation that may refer to: (1) adenoid cystic carcinoma (see *Adenoid Cystic Carcinoma*); (2) agenesis of the corpus callosum (see *Agenesis Of The Corpus Callosum*); or (3) aplasia cutis congenita (see *Aplasia Cutis Congenita*).

Accelerated Growth

An increase in a child's growth velocity above the expected rate for age and developmental stage, determined from serial height or length measurements. It may occur during normal puberty or catch-up growth; abnormal acceleration, especially with early pubertal signs or advanced bone age, may suggest precocious puberty or another endocrine disorder.

Accelerated Idioventricular Rhythm

A rhythm of wide electrical beats arising in the heart's lower chambers, often seen as blood flow returns after a heart attack. It is usually self-limited, but symptoms, the underlying cause, and other heart problems affect its significance.

Alternate Names:
AIVR

Accelerated-Phase Chronic Myeloid Leukemia

A term used in some classification systems for chronic myeloid leukemia showing features of progression. Criteria vary; the International Consensus Classification includes 10% to 19% blasts, while the 2022 World Health Organization classification no longer recognizes a separate accelerated phase.

Accelerometry

Measurement of movement or acceleration using a sensor. It can assess physical activity, walking, tremor, falls, sleep, or rehabilitation progress, depending on the device and the recording method.

Acceptable Daily Intake

The estimated amount of a substance that a person can consume every day throughout life without a meaningful health risk, based on available evidence and safety margins. It is usually expressed per kilogram of body weight.

Alternate Names:
ADI

Acceptance-Based Therapies

Psychotherapeutic approaches that help a person notice and accept thoughts, feelings, or bodily sensations while reducing unhelpful attempts to control or avoid them.

Alternate Names:
Acceptance-Based Psychotherapy; Acceptance-Focused Therapy

Access Needle

A hollow needle used to enter a blood vessel, body cavity, organ, or fluid collection. It may be used to take a sample, drain fluid, give treatment, or help place a catheter.

Alternate Names:
Introducer Needle; Percutaneous Access Needle; Vascular Access Needle

Accessory

Additional or supplementary; in anatomy, an accessory structure is an extra part or a structure that assists the usual organ or system.

Accessory Digestive Organ

An organ that supports digestion but is not part of the alimentary canal, such as the liver, pancreas, gallbladder, or salivary glands.

Accessory Muscles

Muscles recruited to assist the primary muscles of respiration or another movement when the normal workload is increased; use of respiratory accessory muscles may indicate respiratory distress.

Accessory Nerve

The eleventh cranial nerve (CN XI), a primarily motor nerve whose spinal component supplies the sternocleidomastoid and trapezius muscles. It enables head rotation and shoulder elevation; injury may cause weak head rotation, impaired shoulder shrug, and shoulder droop.

Alternate Names:
Cranial Nerve XI; Spinal Accessory Nerve

Accessory Pathway

An abnormal electrical connection between the atria and ventricles that can bypass the atrioventricular node and cause pre-excitation or tachyarrhythmias, including atrioventricular reentrant tachycardia.

Accessory Placenta

An extra placental lobe separate from the main placenta but connected to it by fetal blood vessels; it can increase the risk of retained placental tissue or vessel injury during delivery.

Accessory Spleen

A congenital nodule of normal splenic tissue separate from the main spleen, usually near the splenic hilum or tail of the pancreas. It is often found incidentally and should be distinguished from splenosis, which develops when splenic tissue implants elsewhere after injury or surgery.

Alternate Names:
Accessory Spleens; Splenule; Splenunculus; Supernumerary Spleen

Accidental Death

Death caused by an unintentional injury or event rather than disease, suicide, or homicide. The cause is determined through medical, scene, and sometimes legal investigation.

Alternate Names:
Unintentional Death

Accidental Fall

An unintentional movement to the ground or a lower level. Falls can cause bruises, fractures, head injury, or internal bleeding, especially in older adults; loss of consciousness, severe pain, or confusion may indicate serious injury.

Alternate Names:
Fall Injury

Accident And Emergency Medicine

Accident and emergency medicine is the specialty concerned with immediate evaluation and treatment of acute illness, injury, poisoning, and life-threatening emergencies.

Acclimation

Physiological adjustment to a changed environmental condition, such as temperature, oxygen availability, or altitude. Some technical usage distinguishes acclimation, which occurs under controlled or simulated conditions, from acclimatization in natural conditions. The terms are also used interchangeably, including in descriptions of high-altitude adaptation.

Accommodation

The ability of the eye to change the shape of its lens so that near objects can be focused clearly.

Accommodation Reflex

The coordinated adjustment of the lens, ciliary muscle, and pupils that shifts the eye from distance to near focus; it includes lens thickening, convergence, and pupillary constriction.

Accommodative Insufficiency

Inability of the eye to increase lens power adequately for near focusing, causing eyestrain, blurred near vision, headache, or difficulty reading.

Accouchement

Accouchement is the process of childbirth, including labor, delivery of the infant, and expulsion of the placenta.

Accretion

Gradual buildup or growth of material that makes an object or body tissue larger. Examples include crystals forming in fluid, extra bone developing after injury, or plaque collecting on teeth.

ACE Blood Test

A blood test measuring angiotensin-converting enzyme. It may support evaluation of sarcoidosis and some other inflammatory or liver disorders, but an abnormal result is not specific and cannot diagnose a disease by itself.

Acebutolol

Acebutolol is a beta-adrenergic blocker with intrinsic sympathomimetic activity used in some settings for hypertension and cardiac rhythm disorders; it can slow heart rate and conduction.

ACE Inhibitors

Medicines that reduce formation of angiotensin II, lowering blood pressure and pressure within the kidney's filtering units. They are used for hypertension, heart failure, and selected kidney or cardiovascular conditions. Risks include cough, high potassium, kidney-function changes, and rare facial or airway swelling; exposure during pregnancy can injure fetal kidneys.

Acellular

Without cells. An acellular material may consist of fluid, minerals, or the supporting material around cells and may be natural, diseased, or used in a medical product.

Acentric Chromosome

A chromosome fragment that lacks a centromere and therefore usually cannot attach normally to the spindle during cell division.

Acephalostomia

An extremely rare and severe birth defect involving absence or major failure of development of the head and mouth. It is usually incompatible with survival and is identified during prenatal or newborn examination.

Acetabular Fractures

Breaks or cracks in the acetabulum, the curved cup-like socket of the pelvis that forms the hip joint with the head of the femur. They often follow high-energy trauma but can occur after low-energy falls in older adults with fragile bones, causing groin pain and difficulty bearing weight.

Alternate Names:
Acetabulum Fracture; Pelvic Socket Fracture

Acetabular Fracture

Alternate name; see *Acetabular Fractures*.

Acetabular Labrum

A fibrocartilaginous rim attached to the margin of the acetabulum that deepens the hip socket, helps maintain a fluid seal, and contributes to hip-joint stability.

Acetabular Notch

The indentation in the inferior margin of the acetabulum, bridged by the transverse ligament of the acetabulum and forming a passage for structures

entering the hip joint.

Acetabuloplasty

A surgical procedure that reshapes or augments the acetabular rim or socket to improve coverage of the femoral head in selected structural hip disorders.

Acetabulum

The cup-shaped socket of the hip formed by the fused ilium, ischium, and pubis. It articulates with the femoral head and is deepened by the acetabular labrum.

Acetaldehyde

A chemical produced when the body metabolizes alcohol. Accumulation may contribute to flushing, nausea, and vomiting.

Acetaminophen

A medicine that relieves pain and reduces fever but has little anti-inflammatory effect. Excessive doses, including combined use of multiple acetaminophen-containing products, can cause severe liver injury. Heavy alcohol use can increase the risk of liver damage.

Alternate Names:
Paracetamol; APAP

Acetaminophen And Codeine Overdose

A medical emergency caused by ingesting toxic amounts of a combination pain medicine. It produces dual life-threatening effects: codeine suppresses the central nervous system, causing extreme drowsiness, slowed or stopped breathing, and coma, while acetaminophen depletes protective liver antioxidants, leading to progressive liver failure.

Alternate Names:
Co-Codamol Overdose; Tylenol with Codeine Overdose

Acetaminophen Overdose

Taking more acetaminophen than the body can safely process, causing serious liver damage. Early symptoms may be mild or absent; nausea, abdominal pain, jaundice, and liver failure can develop later. N-acetylcysteine is an antidote and is most effective when started early, but may still help later.

Alternate Names:
Acetaminophen Toxicity; Acetaminophen Poisoning; Paracetamol Toxicity; Paracetamol Overdose; APAP Overdose

Acetaminophen Poisoning

Alternate name; see *Acetaminophen Overdose*.

Acetaminophen Toxicity

Alternate name; see *Acetaminophen Overdose*.

Acetate

A form of acetic acid and a small molecule used by cells in energy and building processes. The body can convert acetate into acetyl-CoA, which helps make or break down fats and other substances.

Acetazolamide

A medicine that changes salt and fluid handling in the kidneys. It is used for glaucoma, prevention or treatment of altitude illness, and selected fluid, metabolic, or neurologic conditions.

Acetone

A volatile ketone body produced during increased fat metabolism. It may contribute to the characteristic breath odor of ketosis and ketoacidosis.

Acetone Body

A ketone produced when the body breaks down fat for energy. Acetone is one of three main ketones and can contribute to the distinctive breath odor of prolonged fasting or diabetic ketoacidosis.

Acetone Breath

A distinctive sweet, fruity odor on the breath caused by the exhalation of volatile acetone, a ketone body produced during accelerated lipolysis and ketogenesis. It is a characteristic physical examination finding in diabetic ketoacidosis (DKA), as well as in severe starvation, prolonged fasting, and ketogenic metabolic states.

Alternate Names:

Fruity Breath; Ketotic Breath; Diabetic Breath Odor

Acetone Poisoning

Harm from swallowing or breathing a large amount of acetone, a solvent found in some products. It may cause irritation, dizziness, vomiting, drowsiness, low blood pressure, or breathing problems; severe exposure can be life-threatening.

Acetonuria

The presence of acetone or other ketone bodies in the urine, which may occur with fasting, vomiting, uncontrolled diabetes, or other states of increased fat metabolism.

Acetylation

A chemical change that adds a small acetyl group to a protein, medicine, or DNA-related molecule. This can alter how the molecule works, how long it lasts, how it is moved, or how strongly a gene is active.

Acetylcholine

A chemical messenger used by nerve cells in the brain and body. It carries signals between nerves at autonomic ganglia, from parasympathetic nerves to organs, and from motor nerves to skeletal muscles. In the brain, it plays roles in attention, learning, and memory. It is made from choline and acetyl-CoA.

Acetylcholine Receptor Antibody

Acetylcholine receptor antibody testing detects antibodies associated with autoimmune myasthenia gravis and is interpreted with the neurologic examination and other studies.

Acetylcholinesterase

An enzyme that quickly breaks down acetylcholine, a chemical messenger, into choline and acetate at nerve connections, including the junction between a nerve and a muscle. This helps stop the acetylcholine signal. Some medicines and toxic chemicals act by blocking this enzyme.

Alternate Names:
AChE; Acetylcholine Acetylhydrolase

Acetylcholinesterase Inhibitors

Medicines that slow the breakdown of acetylcholine, increasing its activity at nerve connections. They are used in conditions such as Alzheimer disease and myasthenia gravis; some agents also reverse nondepolarizing neuromuscular blockade after anesthesia.

Acetyl-CoA Carboxylase

An enzyme that begins the process of making fatty acids by changing acetyl-CoA into malonyl-CoA. Its activity responds to the cell's energy supply and to hormones, helping balance fat production with energy needs.

Acetyl-Coenzyme A

A substance used in many energy and building processes inside cells. It helps release energy from food and provides material for making fatty acids, cholesterol, and ketones.

Acetylcysteine

A medicine that loosens thick mucus so it is easier to clear. It is also the main antidote for acetaminophen overdose because it restores glutathione, a substance the liver uses to neutralize the overdose's toxic breakdown product.

Acetylsalicylic Acid

Alternate index label; see *Aspirin*.

ACH

Abbreviation commonly used for achondroplasia, a genetic skeletal disorder causing disproportionate short stature and characteristic changes in the skull, spine, and long bones.

ACh (Acetylcholine)

Alternate name; see *Acetylcholine*.

Achalasia

A disorder in which the muscle ring between the esophagus and stomach does not relax properly, and the esophagus cannot move food normally into the stomach. It causes difficulty swallowing and regurgitation.

Alternate Names:
Cardiospasm; Esophageal Achalasia

Achalasia Of The Cardia

A disorder in which the valve between the esophagus and stomach does not relax properly and the esophagus loses its normal squeezing movement. Food and liquid can collect in the esophagus, causing progressive difficulty swallowing, regurgitation, chest discomfort, and weight loss.

AChE (Acetylcholinesterase)

Alternate name; see *Acetylcholinesterase*.

Achenbach's Syndrome

A benign condition of recurrent, painful, spontaneous hematoma formation in the pulp of a finger or thumb, typically affecting middle-aged women. It presents with sudden onset of throbbing pain and blue-black discoloration of the fingertip, resolving spontaneously over one to two weeks without treatment.

Achenbach Syndrome

A benign, self-limiting disorder characterized by the sudden onset of acute pain, swelling, and bluish discoloration or hematoma on the palmar surface of one or more fingers, occurring without identifiable significant trauma.

Alternate Names:
Paroxysmal Finger Hematoma; Acute Blue Finger Syndrome

Achilles Paratenonitis

Inflammation of the paratenon, the loose protective sheath of tissue surrounding the Achilles tendon. It causes swelling, localized warmth, tenderness, and a characteristic crepitus or friction sensation during movement of the ankle.

Alternate Names:
Achilles Peritendinitis

Achilles Tendinitis

Painful irritation or degeneration of the tendon joining the calf muscles to the heel. It usually follows repeated loading and can cause stiffness, swelling, tenderness, and pain during walking or exercise.

Alternate Names:
Achilles Tendinopathy; Calcaneal Tendinitis

Achilles Tendinopathy

Pain and structural changes in the Achilles tendon, usually associated with repeated loading. It commonly causes pain and stiffness at the back of the heel, especially after rest or during walking, running, and jumping. The term describes a tendon disorder and does not necessarily imply active inflammation.

Achilles Tendon

The tendon connecting the calf muscles, gastrocnemius and soleus, to the calcaneus, or heel bone. It transmits muscle force to the foot and contributes to plantarflexion, the movement that points the foot downward. This action helps propel the body during walking, running, and jumping.

Alternate Names:
Calcaneal Tendon; Tendo Calcaneus; Achilles' Tendon

Achilles Tendonitis

A commonly used term for pain and inflammation or degeneration of the Achilles tendon. It may affect the tendon at its heel insertion or its mid-portion and is often related to repetitive loading.

Achilles Tendon Problems

Disorders affecting the Achilles tendon, including tendinitis, tendinopathy, bursitis, partial tear, and rupture. They can cause pain, stiffness, swelling, or sudden loss of push-off strength.

Achilles Tendon Repair

Surgery that reconnects a completely or severely torn Achilles tendon. The ankle is protected in a cast or brace afterward, followed by gradual exercises to restore movement and strength; recovery takes several months.

Achilles Tendon Rupture

A partial or complete tear of the Achilles tendon,

usually caused by sudden force. It causes posterior ankle pain, weakness in plantar flexion, and difficulty walking or standing on tiptoe.

Achillobursitis

Inflammation of a bursa near the Achilles tendon, causing pain, tenderness, swelling, or friction-related discomfort at the back of the heel.

Achlorhydria

A condition in which the stomach produces no hydrochloric acid; reduced but not absent acid is called hypochlorhydria. It can occur with autoimmune gastritis or loss of acid-producing stomach cells and may impair absorption of iron or vitamin B12. Acid-suppressing medicines usually reduce acid rather than cause complete achlorhydria.

Achondrogenesis

A group of severe inherited disorders in which cartilage and bone development is profoundly impaired. Affected fetuses have very short limbs and poorly formed bones, and most cases are fatal before or shortly after birth.

Achondroplasia

An autosomal dominant bone-growth disorder caused by a disease-causing change in the *FGFR3* gene. It causes short arms and legs, short stature, a larger head, and a prominent forehead. One altered gene copy usually causes the condition; two copies cause a severe, often fatal form.

Alternate Names:
Chondrodystrophy; Achondroplastic Dwarfism

Achoo Syndrome

The photic sneeze reflex: repeated sneezing triggered by sudden exposure to bright light, especially after entering sunlight from darkness.

Achromatopsia

Absent or severely reduced color vision. The term usually refers to an inherited retinal disorder, which also causes light sensitivity and reduced visual acuity; it can also refer to acquired loss of color perception after damage to color-processing areas of the brain (cerebral achromatopsia).

Alternate Names:
Complete Color Blindness

Achromia

Achromia is loss or marked reduction of pigment in skin, hair, eye, or another tissue; causes include genetic disorders, autoimmune depigmentation, injury, and chemical exposure.

Aciclovir

Alternate spelling; see *Acyclovir*.

Acid

A substance that donates hydrogen ions (protons) in solution or accepts an electron pair in a chemical reaction. In water, acids increase hydrogen-ion activity. Strong acids can damage tissue, while acids also participate in normal digestion, metabolism, and body-fluid regulation.

Acid-Base Analysis

Evaluation of blood pH, bicarbonate, and carbon dioxide to identify metabolic or respiratory disturbances, including those caused by poisoning.

Acid Base Balance

The body's control of acids and bases in its fluids, especially the blood. The lungs remove carbon dioxide and the kidneys adjust acids and bicarbonate to keep blood pH within a narrow safe range.

Acid-Base Disorder

A problem that makes the blood too acidic or too alkaline. It may result from changes in breathing, kidney function, metabolism, or severe illness. Blood tests help identify the cause and whether the body is compensating.

Acid-Base Imbalance

Alternate name; see *Acid-Base Disorder*.

Acidemia

An abnormally low arterial blood pH (below 7.35), indicating an increased hydrogen ion concentration

in circulating blood. It is the measurable laboratory state resulting from an underlying respiratory or metabolic acidosis.

Acid-Fast Bacilli

Bacteria that retain the primary stain after an acid-alcohol wash during acid-fast staining. Most are mycobacteria, including the bacteria that cause tuberculosis and leprosy; *Nocardia* and some related bacteria may be weakly acid-fast. A positive smear does not identify the species.

Alternate Names:
AFB; Acid-Fast Bacteria

Acid-Fast Bacillus Smear

Microscopic examination of a specimen, often sputum, for acid-fast organisms using a special stain. A positive result supports mycobacterial infection but does not by itself identify the species or establish drug susceptibility; culture or molecular testing is also required.

Acid-Fast Stain

A special dye test used to find mycobacteria and a few related organisms in samples such as sputum. A positive result does not identify the species or show which medicines will work.

Acid Indigestion

A nonspecific term for upper-abdominal discomfort, often with burning, fullness, belching, or nausea. It does not necessarily mean excess stomach acid and may occur with reflux, dyspepsia, gastritis, ulcer disease, or other conditions.

Acid Loading Test

A specialized test of how well the kidneys remove acid from the body. After a carefully controlled acid dose, urine is measured for acidity and other substances to investigate suspected kidney-tubule problems.

Acid Mucopolysaccharides

An older name for long sugar chains found in supporting tissues such as cartilage, skin, and joint fluid. Abnormal breakdown or storage of these substances causes a group of inherited storage disorders.

Acidophil

A cell or tissue part that absorbs acidic laboratory dyes strongly, especially the pink dye eosin. The pattern helps pathologists recognize certain cells in tissue samples, including some pituitary cells.

Acidophilus

Lactobacillus acidophilus, a lactic-acid-producing bacterium found in the intestinal and genital microbiota and used in some fermented foods and probiotic products.

Acidosis

An abnormal bodily state in which body fluids become overly acidic, lowering the blood's normal pH balance. It is divided into two main types: **respiratory acidosis**, which occurs when the lungs cannot breathe out enough carbon dioxide; and **metabolic acidosis**, which occurs when the kidneys cannot remove enough acid, when excess acids build up (such as from diabetes or severe infection), or when the body loses too much bicarbonate.

Acid Phosphatase

An enzyme that works best in acidic conditions and is found in several tissues, including prostate and blood cells.

Alternate Names:
ACP

Acid Reflux

Backward flow of acidic stomach contents into the esophagus, causing heartburn, sour regurgitation, cough, or throat irritation. Frequent reflux may be gastroesophageal reflux disease and can injure the esophagus.

Acid Reflux Disease

Digestive condition where stomach acid repeatedly flows backward into the esophagus, causing heartburn. See *Gastroesophageal Reflux Disease*.

Acid Soldering Flux Poisoning

Injury from swallowing or inhaling acidic chemicals used in soldering. It may burn the mouth, throat, skin, or eyes and can cause vomiting, breathing difficulty, or dangerous changes in body chemistry.

Acid Sphingomyelinase Deficiency

An inherited lysosomal storage disorder caused by deficient acid sphingomyelinase, usually because of disease-causing variants in the *SMPD1* gene. Sphingomyelin accumulates in cells and may cause enlarged liver or spleen, lung disease, bone changes, or neurologic impairment; the condition was historically classified as Niemann–Pick disease types A and B.

Aciduria

Aciduria means an abnormally acidic urine or the presence of excess organic acids in urine; it may reflect diet, dehydration, medication, or an inherited metabolic disorder.

Acinar Cell

A cell in a small cluster that makes and releases a fluid or substance. In the pancreas, acinar cells release digestive enzymes into small ducts.

Acinar Cell Carcinoma

A rare cancer of cells that resemble enzyme-secreting acinar cells, most often arising in the pancreas. It can form a mass and cause nonspecific abdominal symptoms.

Acinetobacter Baumannii Resistance

Resistance means that Acinetobacter baumannii is not killed by one or more antibiotics. It can cause difficult hospital infections, especially in intensive-care units, so culture and susceptibility testing guide treatment.

Acinus

A small working unit of a gland made of cells that release their product into a duct. Examples include the secretory units of the pancreas and salivary glands.

AC Joint

The acromioclavicular joint, a gliding joint between the acromion of the scapula and the clavicle at the top of the shoulder.

ACL Injury

A sprain or tear of the strong ligament inside the knee that helps prevent the shinbone from sliding too far forward. It commonly follows twisting or sudden stopping and may cause a pop, swelling, pain, or a feeling that the knee gives way.

ACL Reconstruction

Surgery that replaces a torn anterior cruciate ligament inside the knee with a tendon graft. It may restore stability after injury, especially when the knee gives way or the person plans activities requiring pivoting; rehabilitation is required afterward.

ACL Tear

Alternate name; see *Anterior Cruciate Ligament Tear*.

Acne

A common inflammatory disorder of the pilosebaceous units, which consist of hair follicles and their attached oil glands. Follicular blockage can form open comedones (blackheads) or closed comedones (whiteheads); inflammation may produce papules, pustules, or nodules and can lead to scarring or dark marks.

Alternate Names:
Acne Vulgaris; Pimples

Acne Conglobata

A rare, severe nodulocystic form of acne with groups of inflammatory nodules, cysts, interconnected abscesses, and draining sinuses, usually on the trunk, buttocks, or limbs. It can be persistent, recur, and leave atrophic or hypertrophic scars.

Acne Fulminans

A sudden, severe ulcerating form of acne associated with fever, painful joints, malaise, and sometimes weight loss or abnormal blood counts. It is a

systemic inflammatory emergency, and isotretinoin exposure can precipitate or worsen the eruption.

Acneiform Eruptions

Monomorphic follicular papules and pustules that resemble acne but usually lack comedones. They may be caused by medicines, occupational or chemical exposures, infections, or other disorders; timing, distribution, and trigger help distinguish them from acne vulgaris.

Acne Inversa

See *Hidradenitis Suppurativa*.

Acne Keloid

A chronic inflammatory condition causing firm scar-like bumps around hair follicles, usually on the back of the neck.

Alternate Names:
Acne Keloidalis Nuchae

Acne Keloidalis Nuchae (AKN)

Alternate name; see *Acne Keloid*.

Acne Papules

Small, solid, raised bumps caused by inflammation around hair follicles, often as part of acne. Unlike pustules, papules contain no visible pus.

Alternate Names:
Inflammatory Acne Bumps

Acne Rosacea

Alternate name; see *Rosacea*.

Acne Scars

Permanent textural changes and indentations or raised fibrous tissue that develop in the skin after severe or untreated inflammatory acne lesions heal with abnormal collagen formation.

Alternate Names:
Post-Acne Scarring; Cicatricial Acne

Acne Vulgaris

A common disorder of hair follicles involving follicular plugging, increased oil production, and inflammation in which Cutibacterium acnes may contribute. It causes blackheads or whiteheads and may also cause inflamed papules, pustules, or deep nodules on the face, chest, back, and upper arms; deeper disease can scar.

Acoustic

Relating to sound or hearing. In medicine, the term describes sound waves and hearing-related phenomena, including their production, transmission, and reception. It appears in terms for auditory tests, reflexes, and structures associated with hearing.

Acoustic Nerve

The acoustic nerve, properly called the vestibulocochlear nerve, carries signals for hearing and balance from the inner ear to the brain. It is the eighth cranial nerve.

Acoustic Neuroma

Alternate name; see *Vestibular Schwannoma*.

Alternate Names:
Vestibular Schwannoma; Acoustic Neurinoma; Acoustic Neurilemmoma

Acoustic Reflex

An automatic tightening of a small middle-ear muscle in response to a loud sound. Testing it helps assess the middle ear, hearing pathways, and facial nerve.

Alternate Names:
Stapedial Reflex; Stapedius Reflex; Middle-Ear Muscle Reflex

Acoustic Shock

Auditory and other symptoms after exposure to a sudden or intense sound, potentially including ear pain, tinnitus, hyperacusis, dizziness, or temporary hearing change.

Acoustic Trauma

Acute damage to the auditory system from a brief, intense sound such as an explosion or firearm. It may cause tinnitus, temporary or permanent sensorineural hearing loss, and tympanic or ossicular

injury. Sudden hearing loss may occur.

ACPA

Autoantibody marker frequently measured in blood to help diagnose and evaluate rheumatoid arthritis. See *Anti-Cyclic Citrullinated Peptide Antibody*.

Acquired

Developed after birth rather than being present at birth or inherited; an acquired condition may result from infection, exposure, injury, aging, or another later event.

Acquired C1-Inhibitor Deficiency Angioedema

A bradykinin-mediated disorder caused by acquired deficiency or dysfunction of C1 inhibitor, often associated with lymphoproliferative or autoimmune disease. Recurrent swelling of the skin, bowel wall, or upper airway usually occurs without hives or itching; low C1q and C1-inhibitor testing help distinguish it from hereditary or histamine-mediated angioedema.

Acquired Cystic Kidney Disease

Development of multiple fluid-filled cysts in kidneys with long-standing chronic kidney disease, especially kidney failure. It may cause blood in the urine, pain, or infection and is associated with an increased risk of renal cell carcinoma. Many cysts cause no symptoms.

Acquired Feminization

Development of typically female secondary sexual characteristics after birth in a person not expected to develop them, often from hormonal change.

Acquired Heart Disease

Heart disease that develops after birth, commonly from coronary artery disease, hypertension, infection, inflammation, valve disease, or other acquired conditions.

Acquired Immunity

Specific immune protection gained after birth through the body's response to infection or vaccination (active immunity), or through transferred antibodies (passive immunity).

Acquired Immunodeficiency Syndrome

The advanced stage of disease caused by infection with the human immunodeficiency virus (HIV), characterized by profound destruction of CD4+ T helper lymphocytes (typically defined by a CD4+ T-cell count $< 200/\mu$L or a CD4+ percentage $< 14\%$) leading to severe opportunistic infections, secondary neoplasms (such as Kaposi sarcoma and non-Hodgkin lymphoma), and systemic wasting. See also: *AIDS*.

Alternate Names:
AIDS; Stage 3 HIV Infection

Acquired Lipodystrophy

A group of disorders in which body fat is lost after birth rather than because of an inherited condition. Fat loss may be widespread or limited to certain body regions. Causes include autoimmune disease, inflammation of fat tissue, infection, and some medicines; metabolic effects vary with the amount and pattern of fat loss.

Acquired Methemoglobinemia

A disorder in which an oxidizing medicine or chemical changes the iron in hemoglobin so it cannot carry oxygen normally. It may cause bluish skin, headache, or breathlessness. Causes include dapsone, benzocaine, and nitrites; diagnosis is confirmed by measuring methemoglobin in blood.

Alternate Names:
Toxic Methemoglobinemia; Drug-Induced Methemoglobinemia; Chemically Induced Methemoglobinemia

Acquired Nasolacrimal Duct Obstruction

Blockage of the tear-drainage system that develops after birth. It may cause excessive tearing, discharge, or repeated inflammation of the lacrimal sac and can result from aging, infection, injury, inflammation, scarring, or a mass.

Acquired Platelet Function Defect

Impaired platelet adhesion or aggregation that de-

velops after birth. Causes include antiplatelet medicines, kidney failure, hematologic disease, and other systemic disorders; platelet counts may remain normal, but mucocutaneous bleeding can occur.

Acquired Tracheomalacia

Acquired tracheomalacia is weakening of the tracheal wall after injury, inflammation, compression, or prolonged ventilation, causing airway collapse and breathing symptoms.

Acquisition

The process by which new information or a skill is learned and initially encoded, especially in discussions of memory and learning.

Alternate Names:
Learning Acquisition; Memory Acquisition

Acquisition Duration

The time required to collect a measurement, image, or body signal. Longer acquisition may improve detail or accuracy but can increase motion problems, discomfort, radiation exposure, or equipment time.

Acquisition Time

The time during which a medical imaging system collects data. The required time depends on the imaging method, body region, protocol, and patient movement.

Acral Lentiginous Melanoma

A subtype of melanoma arising on acral skin (palms, soles, or under nails), appearing as a dark, irregularly pigmented patch or plaque. It is more common in people with darker skin tones and often presents at a later stage due to less frequent surveillance of these sites. Prognosis depends on thickness and stage at diagnosis.

Acroangiodermatitis

Alternate name; see *Pseudo-Kaposi Sarcoma (Acroangiodermatitis)*.

Acrocallosal Syndrome

A rare congenital developmental syndrome, usually inherited in an autosomal recessive pattern, characterized by partial or complete absence of the corpus callosum, distinctive craniofacial features, and extra digits. Developmental delay or intellectual disability is common, while brain, skeletal, and other abnormalities vary. Some cases are associated with biallelic variants in the *KIF7* gene.

Acrocentric Chromosome

A chromosome whose central joining point lies close to one end, giving it a very short section and a longer section. In humans, chromosomes 13, 14, 15, 21, and 22 have this shape.

Acrochordon

Alternate name; see *Skin Tag*.

Acrocyanosis

Persistent bluish or purplish discoloration and coolness of the hands, feet, nose, or ears, usually without pain, caused by narrowing of small skin blood vessels. It is often worse in cold conditions and may be primary or due to another disorder.

Acrodermatitis

Inflammation affecting skin on the hands, feet, or other body extremities. Causes vary and include infections, nutritional deficiency, inherited disorders, medicines, and immune reactions; appearance and treatment depend on cause.

Acrodermatitis Chronica Atrophicans

A late cutaneous manifestation of Lyme borreliosis, usually caused by persistent *Borrelia afzelii* infection in Europe. It begins with unilateral reddish-violet swelling on an extremity and can progress over months or years to thin, atrophic, fibrotic skin; diagnosis uses clinical findings, serology, and sometimes biopsy.

Acrodermatitis Enteropathica

A zinc-deficiency disorder classically causing perioral and acral dermatitis, diarrhea, and alopecia. The primary inherited form results from impaired intestinal zinc absorption; acquired deficiency may follow malnutrition, malabsorption, or other illness,

and untreated disease can impair growth, healing, and immunity.

Acrodynia

A painful condition with red, swollen, sweaty hands and feet, classically associated with mercury poisoning and historically called pink disease in children.

Acrodysostosis

A rare inherited disorder of bone development causing short, broad fingers and toes, a small nose and middle face, and short stature. Some people have learning difficulties or reduced response to parathyroid and other hormones.

Acrokeratosis Paraneoplastica

A rare skin condition causing thick, wart-like growths on the hands and feet, often around the nails, as a reaction to an internal cancer. It is most often linked with cancers of the digestive or respiratory tract.

Acromegaly

A rare hormonal disorder that occurs in adults when the pituitary gland at the base of the brain produces too much growth hormone, usually due to a non-cancerous tumor. Because the bones can no longer grow longer in adulthood, the excess hormone causes gradual enlargement of the bones and soft tissues of the hands, feet, face, and jaw, as well as joint pain, high blood pressure, and metabolic changes.

Alternate Names:
Pituitary Gigantism (pediatric counterpart before epiphyseal closure); Somatotropinoma

Acrometastasis

Metastatic spread of cancer to a distal part of a limb, especially the bones of the hands or feet and less often nearby soft tissues. Acrometastases are rare and often occur in advanced cancer; the lung is a common primary site.

Alternate Names:
Acrometastases

Acromioclavicular Joint

The small joint at the top of the shoulder where the collarbone meets the shoulder blade. It allows limited gliding as the arm moves and is held stable mainly by two groups of strong ligaments.

Acromioclavicular Joint Injuries

Sprains or dislocations of the joint between the acromion and clavicle, usually caused by a fall or direct shoulder impact. Severity ranges from ligament sprain to complete displacement and is assessed clinically and with imaging.

Alternate Names:
Acromioclavicular Joint Injury

Acromion

A bony projection from the shoulder blade that forms the highest point of the shoulder. It joins the collarbone and forms a roof over the shoulder joint, with a tendon and lubricating sac passing beneath it.

Acro-Osteolysis

Resorption or destruction of the terminal bones of the fingers or toes. It can occur with inherited disorders, autoimmune disease, severe vascular disease, trauma, or repeated occupational exposure and may cause shortened, painful, or deformed digits.

Acroparaesthesia

Acroparaesthesia is tingling, pins-and-needles, burning, or altered sensation in the hands or feet, commonly related to nerve compression, neuropathy, vascular disease, or metabolic causes.

Acrophobia

An excessive, persistent fear of heights that causes marked anxiety, avoidance, or impairment beyond the ordinary caution associated with high places.

Acropustulosis of Infancy

A recurrent itchy eruption of tiny vesicles and pustules, mainly on the palms and soles of infants and young children. Crops become less frequent and usually resolve by early childhood; scabies may precede

or mimic it.

Acrosin

An enzyme released from the cap-like structure at a sperm's tip. It helps sperm pass through the egg's surrounding layers during fertilization, although successful fertilization requires many additional steps.

Acrosome

A cap-like structure on the head of a sperm cell containing enzymes that help it attach to and enter the egg during fertilization.

Acrosome Reaction

The release of enzymes from the cap at the front of a sperm cell after it contacts an egg. These enzymes help the sperm pass through the egg's outer coating; other steps are also needed for fertilization.

ACTH Blood Test

A blood test that measures the level of ACTH, a hormone made by the pituitary gland. It is usually checked with a cortisol test to help find problems of the adrenal or pituitary glands.

ACTH-Secreting Pituitary Adenoma

A usually noncancerous corticotroph tumor of the pituitary gland that produces excess adrenocorticotropic hormone (ACTH), causing Cushing disease. It may lead to weight gain around the trunk, high blood pressure, high blood sugar, muscle weakness, easy bruising, and other effects of prolonged cortisol excess.

ACTH Stimulation Test

A test that shows whether the adrenal glands can make cortisol. A synthetic form of ACTH is given, and cortisol levels are measured before and after it is given. A small rise may suggest adrenal insufficiency.

Actigraphy

Recording movement over days or weeks with a small wearable sensor, usually worn on the wrist. The pattern of movement helps estimate when a person is asleep or awake and how active they are, but it does not measure sleep directly and cannot by itself diagnose every sleep problem.

Alternate Names:
Actigraphic Monitoring

Actin

A protein that helps cells keep their shape and move. In muscle, actin works with myosin to produce contraction; in other cells, it supports movement, internal transport, and changes in cell structure.

Alternate Names:
Actin Filament; Microfilament Protein

Actin-Binding Protein

A protein that attaches to actin filaments and helps build, organize, move, or anchor the cell's internal framework. Examples include myosin, gelsolin, and alpha-actinin.

Acting Out

Expressing emotional conflict or distress through behavior rather than words.

Actinic

Relating to ultraviolet radiation from sunlight or UV lamps; chronic actinic exposure can cause sunburn, photoaging, and actinic keratoses.

Actinic Cheilitis

A precancerous sun-damage condition of the lips, usually the lower lip, caused by long-term ultraviolet exposure. It may cause persistent dryness, scaling, whitening, thickening, or blurring of the lip border and can progress to squamous cell carcinoma.

Actinic Granuloma

A usually harmless inflammatory skin condition that occurs on sun-damaged skin. It causes ring-shaped patches with a thinner center and a raised red border, most often on the neck, arms, or backs of the hands.

Actinic Keratosis

A rough, scaly, sandpaper-like lesion caused by cu-

mulative ultraviolet damage, usually on sun-exposed skin such as the face, scalp, ears, neck, forearms, or hands. It is a keratinocytic precancer that may progress to cutaneous squamous-cell carcinoma.

Alternate Names:
Solar Keratosis; AK; Senile Keratosis

Actinic Keratosis Pathology

Atypical keratinocytes with disordered maturation in the lower epidermis, often with parakeratosis, alternating orthokeratosis, and solar elastosis. It is a premalignant squamous lesion that can progress to cutaneous squamous cell carcinoma.

Actinic Purpura

Bruising caused by fragile, sun-damaged skin and connective tissue, usually on the backs of the hands and forearms in older adults. The purple patches may appear after minor trauma and are generally harmless, although medicines such as anticoagulants can worsen them.

Actin Myofilament

A thin muscle fiber made mainly of actin that interacts with myosin, allowing muscle cells to shorten and produce force during contraction and movement.

Alternate Names:
Thin Filament

Actinomycetoma

A slowly worsening bacterial infection of the skin and deeper tissue, usually affecting the foot after soil contamination. It causes swelling, firm lumps, draining channels, and grains in the discharge; untreated disease can damage bone.

Actinomycin D

Actinomycin D, or dactinomycin, is an antineoplastic antibiotic that blocks DNA-dependent RNA synthesis and is used for selected cancers; myelosuppression and tissue injury are important risks.

Actinomycosis

A chronic infection caused by Actinomyces bacteria, which normally live in the mouth and digestive and genital tracts. After entering deeper tissue, they can cause firm inflammatory masses and draining sinuses containing small yellow granules. The infection most often affects the face and neck, chest, or abdomen and pelvis and can resemble cancer.

Action Potential

A brief electrical signal that travels along a nerve or muscle cell. It begins when the cell's electrical charge changes enough to trigger the signal and allows nerves to communicate and muscles to contract.

Action Tremor

An involuntary rhythmic oscillation of a body part occurring during active voluntary muscle contraction. Subtypes include postural tremors (maintaining a position against gravity), kinetic tremors (moving through an arc), and intention tremors (worsening near the target).

Activated Charcoal

A porous form of carbon that adsorbs some substances in the gastrointestinal tract and can reduce their absorption after selected poisonings. It is not effective for every toxin and can cause aspiration or other complications.

Activated Partial Thromboplastin Time

A blood test that measures clotting through the intrinsic and common coagulation pathways. It may be prolonged by unfractionated heparin, clotting-factor deficiencies, inhibitors, or some liver and systemic disorders.

Activated Protein C Resistance

An inherited thrombophilic disorder characterized by an impaired anticoagulant response of plasma to activated protein C (APC). Approximately 90 to 95 percent of cases are caused by the factor V Leiden mutation (G1691A), which alters the APC cleavage site on factor V, predisposing affected individuals to recurrent deep venous thrombosis and pulmonary embolism.

Alternate Names:

APC Resistance

Active Caries

Tooth decay that is continuing to progress. The affected surface is often soft, rough, or chalky.

Active Management Of Third Stage

A set of measures used after birth to reduce postpartum hemorrhage, usually including a uterotonic medicine, controlled cord traction when appropriate, and assessment of uterine tone and bleeding.

Active Phase Of Labor

The part of the first stage of labor in which the cervix dilates progressively, generally beginning at about 6 cm and continuing to full dilation. Progress varies between individuals.

Active Site

The part of an enzyme where a target molecule attaches and a chemical reaction takes place. Its shape and chemical properties help the enzyme recognize particular molecules and change them into products.

Active Surveillance

Close, structured monitoring of a cancer or precancerous condition without immediate treatment. It includes scheduled examinations, laboratory tests, imaging, or biopsies, with treatment started if evidence of progression develops.

Active Transport

The movement of a substance across a cell membrane using cellular energy. It often moves the substance against a concentration or electrical gradient and helps cells control salts, nutrients, waste products, and other substances.

Activities Of Daily Living

Routine tasks required for personal care and independent living, including basic activities and more complex instrumental activities. Performance is assessed to describe functional status and support care planning.

Acupressure

A complementary treatment in which firm pressure is applied to selected points on the body, often with the fingers. It may provide short-term relief of symptoms such as nausea or pain, but evidence of benefit varies by condition.

Acupuncture

A treatment originating in traditional Chinese medicine in which thin needles are inserted into the skin and sometimes moved or electrically stimulated. It may help some pain conditions or treatment-related nausea, but benefits vary.

Acute

Describing symptoms or a condition that begins or worsens quickly and usually lasts a limited time. It is commonly contrasted with chronic, which develops or continues over a longer period.

Acute Abdomen

Sudden or severe abdominal pain with clinical features suggesting a potentially serious intra-abdominal disorder.

Acute Acalculous Cholecystitis

Acute gallbladder inflammation without gallstones, usually occurring in critically ill, injured, postoperative, or fasting patients. Ischaemia, bile stasis, and infection may contribute; it can progress rapidly to necrosis or perforation.

Acute Adrenal Crisis

A sudden, life-threatening shortage of adrenal hormones, especially cortisol, in a person with adrenal insufficiency. Infection, injury, surgery, or abrupt interruption of long-term glucocorticoids can precipitate it; manifestations include vomiting, abdominal pain, confusion, low blood pressure, and shock.

Acute Agitation

A state of heightened motor activity, emotional tension, irritability, and impaired behavioral control. It can occur with delirium, intoxication or withdrawal, medical illness, or psychiatric disorders.

Acute Alcohol Intoxication

Neurobehavioral and physiologic impairment caused by recent ethanol exposure. Severity varies with concentration, tolerance, co-ingestants, and comorbidity; dangerous effects include respiratory depression, aspiration, hypoglycemia, hypothermia, trauma, and coma.

Acute Angle-Closure Glaucoma

An ophthalmic emergency in which sudden closure of the anterior-chamber angle causes a rapid rise in intraocular pressure. Severe eye pain, blurred vision, halos, headache, nausea, vomiting, and a red eye may occur; rapid pressure elevation can damage the optic nerve and threaten vision.

Acute Aortic Syndrome

A term for a group of sudden, life-threatening emergencies involving the wall of the aorta, the body's main artery. It includes a tear between the wall's layers (aortic dissection), bleeding within the wall without an open tear (intramural hematoma), or a deep ulcer penetrating the wall lining. These conditions typically cause sudden, severe, tearing chest or back pain and require urgent medical evaluation.

Alternate Names:
AAS

Acute Bacterial Prostatitis

A sudden bacterial infection of the prostate causing fever, chills, pain between the scrotum and anus or in the lower back, painful urination, and sometimes inability to pass urine. Prostate manipulation can trigger bacteremia, and severe infection may cause sepsis.

Acute Bacterial Rhinosinusitis

Bacterial infection of the paranasal sinuses suspected when symptoms persist without improvement for at least 10 days, worsen after initial improvement, or are severe, with fever of at least 39 °C and purulent nasal discharge or facial pain for 3–4 days. Viral infection is more common; duration and symptom pattern help distinguish the two.

Acute Basophilic Leukemia

A rare, aggressive acute myeloid leukemia in which immature basophil-lineage cells accumulate in the bone marrow and sometimes the blood. It can cause anemia, infections, bleeding, fever, bone pain, or other effects of marrow failure; diagnosis requires blood and marrow examination with immunophenotyping and genetic studies.

Acute Bilirubin Encephalopathy

Brain dysfunction in a newborn caused by very high bilirubin levels. Poor feeding, sleepiness, weak muscle tone, irritability, a high-pitched cry, unusual movements, seizures, or coma may develop; severe cases can cause permanent brain injury.

Alternate Names:
Bilirubin Neurotoxicity

Acute Blood Loss

Rapid loss of blood that reduces circulating blood volume. It can cause weakness, a fast heart rate, low blood pressure, confusion, organ injury, or shock; the effects depend on the amount and rate of bleeding and the person's health.

Acute Bronchitis

Short-term inflammation of the large airways in the lungs, usually caused by a virus such as a cold or flu. It causes a cough that may bring up clear, yellow, or green mucus and may cause chest soreness, mild fever, tiredness, or wheezing. The cough often lasts 1 to 3 weeks; viruses cause most cases.

Alternate Names:
Chest Cold; Tracheobronchitis

Acute Bursitis

Sudden, acute inflammation of a synovial bursa, typically triggered by direct trauma, acute crystal deposition (gout/pseudogout), bacterial infection (most commonly *Staphylococcus aureus*), or unaccustomed repetitive strain. It presents with rapid-onset localized swelling, erythema, warmth, exquisite focal tenderness, and restricted active joint motion.

Alternate Names:
Acute Bursal Synovitis

Acute Caries

Tooth decay that progresses rapidly, often producing a soft lesion or cavity. Risk is increased by factors such as frequent sugar exposure, reduced saliva, or poor oral hygiene.

Acute Cerebellar Ataxia

Sudden or rapidly developing incoordination caused by cerebellar dysfunction. In children it may follow an infection; other causes include stroke, intoxication, inflammation, and tumor.

Acute Chest Syndrome

A potentially life-threatening pulmonary complication of sickle cell disease characterized by a new lung infiltrate plus fever or respiratory symptoms such as chest pain, cough, hypoxemia, or breathing difficulty.

Acute Cholangitis

Alternate name; see *Ascending Cholangitis*.

Acute Cholecystitis

Acute inflammation of the gallbladder, most often caused by persistent cystic-duct obstruction by a gallstone. It commonly causes sustained right-upper-quadrant pain, fever, nausea, vomiting, and a positive Murphy sign; diagnosis combines clinical, laboratory, and imaging findings, usually including ultrasound. Early laparoscopic cholecystectomy is generally preferred when appropriate, with drainage considered when surgery is unsafe.

Acute Colonic Pseudo-Obstruction

Severe widening of the large intestine without a physical blockage, usually in people who are seriously ill, injured, or recovering from surgery. It can cause pain, swelling, nausea, and vomiting. If it is not treated, the bowel may lose its blood supply or tear.

Alternate Names:
Ogilvie Syndrome; Colonic Pseudo-Obstruction

Acute Compartment Syndrome

A rapid rise in pressure inside a closed muscle compartment that reduces blood flow and can permanently damage muscles and nerves. It usually follows a fracture, crush injury, or severe swelling and can cause lasting loss of limb function.

Alternate Names:
ACS (acute compartment syndrome)

Acute Coronary Syndrome

A clinical spectrum of acute myocardial ischemia caused most often by coronary plaque disruption and thrombosis. It includes unstable angina, non-ST-elevation myocardial infarction (NSTEMI), and ST-elevation myocardial infarction (STEMI); ECG findings and serial cardiac troponin help distinguish these presentations.

Acute Coronary Syndromes

Another name for *Acute Coronary Syndrome*.

Acute Cough

A cough lasting less than three weeks. Common causes include viral respiratory infection, acute bronchitis, and pneumonia.

Acute Cutaneous Lupus Erythematosus (ACLE)

A lupus-specific inflammatory skin eruption that commonly presents as a transient malar or generalized erythematous rash, often triggered by sunlight and associated with systemic lupus activity. The malar rash usually spares the nasolabial folds; systemic manifestations may coexist.

Acute Cystitis

Acute bacterial infection and inflammation confined to the lower urinary tract and bladder mucosa, typically caused by uropathogenic *Escherichia coli* and presenting with acute dysuria, urinary frequency, urgency, suprapubic pain, and hematuria.

Alternate Names:
Acute Bacterial Cystitis; Bladder Infection

Acute Dacryocystitis

Acute infection and inflammation of the lacrimal sac, most commonly caused by obstruction of the

nasolacrimal duct leading to stasis and secondary bacterial infection. It presents with painful swelling, redness, and tenderness at the medial canthus with purulent discharge.

Acute Decompensated Heart Failure

A sudden worsening of symptoms in someone with heart failure, occurring when the heart can no longer pump blood effectively enough to meet the body's needs. Fluid backs up into the lungs and other tissues, causing severe shortness of breath (especially when lying flat), rapid weight gain, swelling in the legs, and extreme fatigue.

Alternate Names:
ADHF; Acute Congestive Heart Failure

Acute Diarrhea

Passage of loose or watery stools, usually three or more times daily, lasting less than two weeks. Infection, food-related illness, medicines, and other intestinal disorders can cause it. Blood in stool, severe dehydration, persistent vomiting, or severe pain may accompany a more serious illness.

Acute Disease

An illness that begins suddenly or develops over a short period. It often lasts a limited time, although it can be mild, severe, or life-threatening and may sometimes lead to a longer-term condition.

Acute Disseminated Encephalomyelitis

A rare inflammatory condition of the brain and spinal cord that damages the protective myelin coating around nerve fibers. It typically develops one to three weeks after a viral or bacterial infection, or rarely after a vaccination, as an abnormal immune response. Symptoms usually come on quickly and include headache, fever, confusion, weakness, vision changes, or difficulty walking.

Alternate Names:
ADEM; Postinfectious Encephalomyelitis

Acute Ear Infection

A sudden, rapid-onset bacterial or viral infection of the middle ear space behind the eardrum, characterized by earache, fever, hearing muffled sounds, and bulging of the tympanic membrane.

Alternate Names:
Acute Otitis Media; AOM; Middle Ear Infection

Acute Endometritis

Acute inflammation of the endometrium, usually caused by ascending infection or retained tissue after pregnancy-related events or uterine instrumentation; fever, pelvic pain, and abnormal bleeding may occur.

Acute Epididymitis

Sudden inflammation of the epididymis, usually caused by infection and sometimes involving the testis. It causes unilateral scrotal pain and swelling; testicular torsion can cause similar symptoms.

Acute Epiglottitis

Alternate name; see *Epiglottitis*.

Acute Erythroid Leukemia

A rare, aggressive acute myeloid leukemia characterized by predominant neoplastic proliferation of immature erythroid cells with maturation arrest. In the 2022 WHO classification, it largely corresponds to what was previously called pure erythroid leukemia and is typically defined by erythroid predominance in the bone marrow, usually with at least 80% erythroid precursors and at least 30% proerythroblasts. The 2022 International Consensus Classification places comparable cases within the broader category of AML with mutated *TP53*; classification requires integrated morphologic, immunophenotypic, cytogenetic, and molecular assessment.

Alternate Names:
Pure Erythroid Leukemia (historical term)

Acute Esophageal Necrosis

A rare, severe condition in which the lining of the esophagus undergoes tissue death and appears black during endoscopy, usually in the lower third and ending abruptly where the esophagus meets the stomach. It often causes bleeding from the upper digestive tract. It is thought to result from a combination of reduced blood flow, injury from refluxed stomach contents, and weakened defenses of the

lining.

Alternate Names:
Black Esophagus; Acute Necrotizing Esophagitis

Acute Exacerbation

A sustained, rapid worsening of a chronic disease beyond its usual day-to-day fluctuations. In chronic lung disease, it commonly causes increased breathlessness, cough, or sputum; respiratory infections and air pollution are common triggers, though other causes such as aspiration or pulmonary embolism may need consideration.

Acute Exacerbation Of Asthma

A progressive increase in dyspnea, cough, wheezing, or chest tightness with reduced expiratory airflow compared with the patient's baseline. Severe attacks may cause exhaustion, silent chest, hypercapnia, and respiratory failure.

Acute Exacerbation Of COPD

A sudden worsening of chronic obstructive pulmonary disease, with more breathlessness, cough, or sputum than usual. It is often triggered by a respiratory infection, air pollution, or another stress on the lungs.

Acute Fatty Liver Of Pregnancy

A rare, potentially life-threatening liver disorder that usually develops late in pregnancy. Fat builds up in liver cells and may cause nausea, abdominal pain, jaundice, low blood sugar, abnormal bleeding, kidney failure, or other organ failure.

Acute Febrile Illness

A recent-onset illness with fever, often accompanied by chills, headache, muscle aches, or fatigue. Infection is a common cause; inflammatory diseases and reactions to medicines can also cause fever. The term describes a presentation, not a specific diagnosis.

Acute Febrile Neutrophilic Dermatosis

An inflammatory skin disease causing an abrupt eruption of tender, often edematous red or violaceous papules, plaques, or nodules. Fever and elevated blood neutrophils are common; associations include infection, inflammatory disease, pregnancy, certain medicines, and malignancy. A skin biopsy typically shows a dense neutrophil infiltrate without vasculitis.

Alternate Names:
Sweet Syndrome

Acute Fever in Adults

A recent-onset rise in body temperature in an adult, usually caused by infection and sometimes by inflammatory disease or a medicine reaction. Fever is a regulated increase in the body's temperature set point; overheating from heat exposure is hyperthermia, not fever.

Acute Flaccid Myelitis

A rare serious illness, usually in children, causing sudden weakness and limpness of one or more arms or legs. Facial weakness, swallowing difficulty, or breathing failure may occur.

Acute Gastritis

Sudden inflammation of the stomach lining. It may cause upper-abdominal pain, nausea, vomiting, or bleeding and can result from infection, medicines, alcohol, or severe illness. Some stomach injury from medicines or severe illness is gastropathy, in which there is little inflammation.

Alternate Names:
Acute Erosive Gastritis

Acute Generalized Exanthematous Pustulosis

A sudden skin reaction, usually to a medicine, that causes many small pus-filled bumps on widespread red skin. Fever may occur. It often starts within days of exposure and improves after the triggering medicine is stopped.

Acute Glomerulonephritis

Acute immune or infectious inflammation of the glomeruli producing a nephritic syndrome: hematuria with dysmorphic red cells or red-cell casts, variable proteinuria, edema, hypertension, and reduced kidney function. Causes include postinfec-

tious disease, IgA nephropathy, vasculitis, and lupus; complement, serology, and sometimes kidney biopsy help identify the cause.

Acute Granulocytic Leukemia

Older term for acute myeloid leukemia; see *Acute Myeloid Leukemia*.

Acute Heart Failure

Rapid onset or worsening of heart-failure symptoms and signs, caused by pulmonary or systemic congestion, reduced cardiac output, or both. It may be a first episode or a sudden decompensation of chronic heart failure and can range from worsening breathlessness or edema to pulmonary edema or cardiogenic shock.

Alternate Names:
Acute Decompensated Heart Failure; ADHF

Acute Hemorrhagic Edema of Infancy

A usually self-limited cutaneous small-vessel vasculitis of infants, characterized by fever, edema, and large bruise-like or targetoid purpuric lesions on the face and extremities. Internal-organ involvement is uncommon, and most cases resolve within one to three weeks.

Acute Hemorrhagic Leukoencephalitis

A rare, fulminant inflammatory demyelinating disease of the brain, considered a severe form of acute disseminated encephalomyelitis. It can cause rapidly worsening headache, fever, confusion, seizures, weakness, coma, and brain swelling.

Acute Hepatic Porphyria

A group of rare genetic metabolic disorders caused by enzymatic defects in the heme biosynthesis pathway in the liver. They are characterized by acute, life-threatening attacks of severe neurovisceral symptoms, including intense abdominal pain, autonomic instability, neuropathy, and psychiatric disturbances.

Alternate Names:
AHP

Acute Hepatitis

Sudden inflammation and injury of the liver, developing over days to months. It may cause tiredness, nausea, pain under the right ribs, dark urine, jaundice, or no symptoms. Causes include viruses, alcohol, medicines, toxins, and autoimmune disease.

Acute HIV Syndrome

A flu-like illness that may occur about 2–6 weeks after HIV infection, when the virus is multiplying rapidly. Fever, sore throat, swollen glands, rash, muscle aches, headache, nausea, diarrhea, or mouth ulcers may occur, but some people have no symptoms.

Acute Hypercapnic Respiratory Failure

A sudden inability to breathe out enough carbon dioxide, causing it to build up in the blood. Severe lung disease, asthma, weak breathing muscles, sedative medicines, or chest problems can cause confusion, sleepiness, or dangerous breathing failure.

Acute Hypoxemic Respiratory Failure

A sudden inability of the lungs to put enough oxygen into the blood. Pneumonia, fluid in the lungs, severe inflammatory lung injury, collapsed lung tissue, or a blood clot in the lungs may cause severe breathlessness, bluish skin, confusion, or organ injury.

Acute Idiopathic Polyneuritis

Guillain–Barré syndrome, an acute immune-mediated disorder of peripheral nerves that usually causes progressive symmetric weakness and reduced reflexes and may impair breathing.

Acute Illness

Alternate name; see *Acute Disease*.

Acute Inflammation

A rapid immune response to injury or infection that usually lasts hours to days. It can cause redness, warmth, swelling, pain, and reduced function as extra blood, fluid, and immune cells enter the affected area.

Acute Inflammatory Demyelinating Polyneuropathy

See *Guillain-Barre Syndrome*.

Acute Inflammatory Demyelinating Polyradiculoneuropathy

The most common form of Guillain–Barré syndrome. The immune system damages the protective covering of nerves, causing progressive weakness, tingling, and reduced reflexes that may spread to the breathing muscles.

Acute Intermittent Porphyria

An inherited disorder of haem production caused by reduced hydroxymethylbilane synthase activity. Attacks may cause severe abdominal pain, nausea, constipation, dark urine, nerve symptoms, confusion, or seizures; medicines, hormonal changes, fasting, and illness can trigger them.

Acute Interstitial Nephritis

Sudden inflammation of the tissue between the kidney's filtering structures, most often caused by a reaction to a medicine. Infections and autoimmune disease can also cause it, leading to blood or protein in urine and a sudden decline in kidney function.

Acute Ischemic Stroke

Sudden loss of brain, spinal-cord, or retinal function because a blood vessel is blocked and the tissue does not receive enough oxygen. Brain imaging distinguishes ischemia from bleeding.

Acute Keratitis

Sudden inflammation of the cornea, the clear front layer of the eye. It may result from infection, injury, contact-lens wear, or other causes. Symptoms may include eye pain, redness, tearing, sensitivity to light, or blurred vision. Severe cases may cause a corneal ulcer.

Acute Kidney Injury

An abrupt decline in kidney function, defined by a serum-creatinine rise of at least 0.3 mg/dL within 48 hours, a rise to at least 1.5 times baseline within 7 days, or urine output below 0.5 mL/kg/hour for 6 hours. Causes are commonly prerenal hypoperfusion, intrinsic kidney injury, or postrenal obstruction; complications include azotemia, fluid and electrolyte disorders, and acidosis.

Alternate Names:
AKI; Acute Kidney Failure; Acute Renal Failure

Acute Kidney Injury Staging

The KDIGO classification grades acute kidney injury as stage 1, 2, or 3 using changes in serum creatinine or urine output; the more severe criterion determines the stage. Stage 1 includes a creatinine rise of at least 0.3 mg/dL within 48 hours or 1.5–1.9 times baseline within 7 days, or urine output below 0.5 mL/kg/h for 6–12 hours. Stage 2 includes creatinine 2.0–2.9 times baseline or urine output below 0.5 mL/kg/h for at least 12 hours. Stage 3 includes creatinine at least 3 times baseline, a level of at least 4.0 mg/dL, initiation of kidney replacement therapy, estimated glomerular filtration rate below 35 mL/min/1.73 m^2 in a person under 18, urine output below 0.3 mL/kg/h for at least 24 hours, or no urine output for at least 12 hours.

Acute Leukemia

A fast-growing blood cancer in which immature abnormal blood cells crowd the bone marrow and interfere with normal blood-cell production. It can cause anemia, infections, and bleeding.

Acute Limb Ischemia

Sudden reduction in arterial blood flow to a limb that threatens tissue viability, usually caused by embolism, thrombosis, or graft occlusion. The six classic findings are pain, pallor, pulselessness, paresthesia, paralysis, and poikilothermia; prolonged ischemia can result in tissue loss.

Acute Limb Ischemia Six Ps

Six findings of suddenly reduced artery blood flow to a limb: pain, paleness, absent pulse, tingling or numbness, weakness or paralysis, and a cold limb.

Acute Liver Failure

A rapid loss of liver function, developing within 26 weeks in someone without known cirrhosis or long-

term liver disease. It causes poor blood clotting and changes in thinking or alertness (hepatic encephalopathy). Causes include some medicines or poisons, viral hepatitis, autoimmune hepatitis, and Wilson disease.

Alternate Names:
Fulminant Hepatic Failure (older term)

Acute Low Back Pain

Pain in the lower back lasting less than 6 weeks. Most cases are nonspecific, without a clearly identifiable structural cause; some are associated with muscle or ligament strain, disc disease, or other spinal conditions.

Alternate Names:
Acute Lumbago

Acute Lymphangitis

Acute inflammation of lymphatic vessels, typically caused by streptococcal or staphylococcal infection spreading from a wound. It causes red, tender streaks extending from the infection site toward nearby lymph nodes and may occur with fever or malaise.

Acute Lymphoblastic Leukemia

A rapidly progressive cancer of immature B- or T-lymphoid cells (lymphoblasts) that accumulate in the bone marrow and may circulate in blood or involve lymph nodes, spleen, liver, or central nervous system. Marrow failure can cause anemia, infection, or bleeding.

Alternate Names:
ALL; Acute Lymphocytic Leukemia; Acute Lymphoid Leukemia

Acute Lymphocytic Leukemia

Alternate name; see *Acute Lymphoblastic Leukemia*.

Acute Lymphoid Leukemia

Alternate name; see *Acute Lymphoblastic Leukemia*.

Acute Megakaryoblastic Leukemia

A subtype of acute myeloid leukemia characterized by at least 20differentiation, identified by platelet-lineage markers such as CD41, CD42b, or CD61. It occurs in children and adults; childhood cases are strongly associated with Down syndrome.

Acute Mesenteric Ischemia

A sudden reduction in blood flow to the intestine that threatens bowel viability. Causes include arterial embolism or thrombosis, mesenteric venous thrombosis, and nonocclusive low-flow states. Severe abdominal pain may initially be disproportionate to examination findings; untreated ischemia can progress to bowel infarction, peritonitis, and shock.

Alternate Names:
AMI (acute mesenteric ischemia)

Acute Mitral Regurgitation

Sudden backward flow of blood from the left ventricle into the left atrium during systole, caused by acute leaflet, chordal, papillary-muscle, or ventricular injury. It can rapidly produce pulmonary edema, low cardiac output, or shock.

Acute Monocytic Leukemia

An older FAB classification term (AML-M5) for acute myeloid leukemia with monocytic differentiation. It involves abnormal immature monocytic cells in the bone marrow and blood and may cause anemia, infection, bleeding, or tissue infiltration such as gingival enlargement.

Alternate Names:
AML-M5

Acute Mountain Sickness

A high-altitude illness caused by inadequate acclimatization, usually after ascent above about 2,500 m (8,200 ft). It is characterized by headache plus symptoms such as nausea, loss of appetite, dizziness, fatigue, or disturbed sleep. Worsening symptoms, confusion, inability to walk normally, or breathlessness at rest indicate progression to life-threatening high-altitude cerebral or pulmonary edema.

Acute Myeloblastic Leukemia

See *Acute Myeloid Leukemia*.

Acute Myelogenous Leukemia

Older alternate name; see *Acute Myeloid Leukemia*.

Acute Myeloid Leukemia

A clonal hematopoietic neoplasm characterized by the rapid proliferation and accumulation of abnormal, poorly differentiated myeloid progenitor cells (blasts) in the bone marrow and peripheral blood. This suppresses normal hematopoiesis, leading to progressive cytopenias manifested as fatigue from anemia, recurrent or opportunistic infections from neutropenia, and petechiae, ecchymoses, or mucosal bleeding from thrombocytopenia.

Alternate Names:
AML; Acute Myelogenous Leukemia

Acute Myocardial Infarction

Death of heart muscle from acute ischemia. Diagnosis requires a rise or fall in cardiac troponin, with at least one value above the sex-specific 99th-percentile upper reference limit, together with clinical, electrocardiographic, imaging, or pathologic evidence of acute myocardial ischemia. Coronary atherothrombosis is a common cause, but infarction can also result from oxygen supply-demand imbalance or other coronary mechanisms.

Alternate Names:
AMI

Acute Myocardial Infarction Pathology

Histopathologic evolution of myocardial infarction, from early ischemic injury and coagulative necrosis through inflammation, granulation tissue, and scar formation. The findings depend on the interval between infarction and examination.

Acute Necrotizing Ulcerative Gingivitis

A painful, rapidly developing infection of the gums characterized by punched-out gingival papillae, ulceration, spontaneous bleeding, gray necrotic tissue, and foul breath. It is associated with anaerobic oral bacteria and risk factors such as poor oral hygiene, smoking, stress, malnutrition, or immunosuppression.

Alternate Names:
ANUG; Trench Mouth; Vincent Stomatitis

Acute Nephritic Syndrome

A clinical syndrome of glomerular inflammation marked by hematuria, variable proteinuria, edema, hypertension, and reduced kidney function.

Acute Nonlymphocytic Leukemia

Older term for acute myeloid leukemia; see *Acute Myeloid Leukemia*.

Acute Obstructive Uropathy

Sudden impairment of urinary flow caused by obstruction of the urinary tract, potentially producing hydronephrosis, pain, infection, and acute kidney injury.

Acute-On-Chronic Liver Failure

Sudden severe worsening of advanced chronic liver disease, causing liver failure and failure or dysfunction in one or more other organs. A 2026 global consensus defines liver failure using a bilirubin level of at least 5 mg/dL and a blood-clotting test (INR) of at least 1.5. It carries high short-term risk of death.

Acute Onset Pain

Pain that begins suddenly, often over seconds, minutes, or hours.

Alternate Names:
Sudden-Onset Pain

Acute Otitis Media

A sudden infection or inflammation in the space behind the eardrum, often after a cold. It can cause ear pain, fever, irritability, or temporary hearing loss; the eardrum may bulge because fluid or pus has built up behind it.

Acute Pain

Pain that begins suddenly and usually lasts for a limited period, often because of injury, illness, or a procedure.

Acute Pancreatitis

Sudden inflammation of the pancreas, most often caused by gallstones or alcohol. It usually causes

severe upper-abdominal pain that may reach the back, with nausea or vomiting; complications can include fluid loss, infection, organ failure, or pancreatic collections.

Acute Pericarditis

Rapid-onset inflammation of the sac around the heart, often idiopathic or viral and sometimes related to autoimmune disease, heart injury, kidney disease, cancer, or medicines. It typically causes sharp chest pain that worsens with breathing or lying down and improves when sitting up and leaning forward; a friction rub, diffuse ST-segment elevation with PR-segment depression, or a pericardial effusion may occur.

Acute-Phase Reactants

A group of plasma proteins whose circulating concentrations increase or decrease by at least 25 percent during inflammatory states, tissue injury, or infection. Positive reactants include C-reactive protein, ferritin, fibrinogen, and hepcidin; negative reactants include albumin and transferrin.

Alternate Names:
Acute-Phase Proteins

Acute Poisoning

Harmful effects that develop after a short-term exposure to a toxic substance by swallowing, inhaling, injection, skin contact, or another route. Effects depend on the substance, amount, route, and time of exposure.

Acute Proctitis

Sudden inflammation of the rectal mucosa causing rectal pain, urgency, tenesmus, bleeding, mucus, or discharge. Infectious, inflammatory, ischemic, traumatic, and radiation-related causes are possible.

Acute Promyelocytic Leukemia

A subtype of acute myeloid leukemia usually defined by a PML::RARA fusion, most often from the t(15;17) chromosome translocation. It can rapidly cause life-threatening bleeding and clotting abnormalities from disseminated intravascular coagulation and fibrinolysis.

Acute Pulmonary Edema

Acute or rapidly worsening accumulation of fluid in the lungs; see *Pulmonary Edema*.

Acute Pulmonary Histoplasmosis

An acute lower respiratory tract infection caused by inhaling microconidia of the dimorphic fungus *Histoplasma capsulatum*, commonly found in soil enriched with bird or bat guano. Manifestations range from mild flu-like symptoms to severe pneumonia with mediastinal lymphadenopathy.

Alternate Names:
Primary Pulmonary Histoplasmosis; Acute Histoplasmosis Pneumonia

Acute Pyelonephritis

A sudden bacterial infection of the kidney, usually spreading upward from the bladder. It can cause fever, chills, pain in the side or back, nausea, and painful or frequent urination. In some cases it spreads to the bloodstream or impairs kidney function.

Acute Radiation Sickness

Illness caused by receiving a high dose of penetrating radiation over a short time, potentially damaging bone marrow, intestines, skin, and other organs.

Acute Radiation Syndrome

See *Radiation Sickness*.

Acute Rehabilitation

Multidisciplinary rehabilitation provided during or soon after hospitalization for conditions such as stroke, spinal-cord injury, traumatic brain injury, or major trauma. Its goals address functional impairment.

Acute Rejection

An immune injury to a transplanted organ or tissue caused by recipient T cells, donor-specific antibodies, or both. It may arise at various times after transplantation, so timing alone does not define it. The form of tissue damage and effects on graft function vary by organ.

Acute Renal Artery Occlusion

Sudden obstruction of blood flow through one or both main renal arteries or their primary branches, most commonly caused by thromboembolism, in situ thrombosis, or trauma. It presents with severe flank or abdominal pain, hematuria, refractory hypertension, and rapid deterioration of kidney function.

Acute Renal Failure

See *Acute Kidney Injury*.

Acute Respiratory Disease

A broad term for a recent-onset illness affecting the upper or lower respiratory tract. Examples include a respiratory infection, an asthma attack, or lung injury from inhaled substances; the term alone does not name a specific diagnosis or cause.

Acute Respiratory Distress Syndrome

A severe, life-threatening form of lung injury in which widespread inflammation causes fluid to leak into the lungs' microscopic air sacs (alveoli). This prevents the lungs from filling with air and stops sufficient oxygen from reaching the bloodstream. It develops rapidly—usually within a week of a major illness or injury such as severe pneumonia, sepsis, or physical trauma—causing intense shortness of breath and low blood oxygen levels.

Alternate Names:
ARDS; Noncardiogenic Pulmonary Edema

Acute Respiratory Failure

A sudden inability of the respiratory system to maintain adequate oxygenation, carbon-dioxide removal, or both. It may result from lung disease, airway obstruction, neuromuscular weakness, or impaired respiratory drive.

Acute Retinal Necrosis

A rapidly progressive necrotizing viral retinitis, usually caused by herpes viruses, with vitreous inflammation, peripheral retinal necrosis, occlusive vasculitis, and risk of retinal detachment.

Acute Retroviral Syndrome

The acute illness that may occur shortly after HIV infection, commonly involving fever, rash, sore throat, lymph-node enlargement, muscle aches, or headache.

Acute Rhinitis

Sudden inflammation of the nasal lining, commonly caused by a viral infection or an irritant, producing congestion, nasal discharge, and sneezing.

Acute Rhinosinusitis

See *Acute Sinusitis*.

Acute Sinusitis

Acute inflammation of the mucosa of one or more paranasal sinuses, usually following a viral upper-respiratory infection. It causes nasal obstruction, purulent or discoloured discharge, facial pressure or pain, and reduced smell; persistent, severe, or worsening symptoms may indicate acute bacterial rhinosinusitis or a complication.

Alternate Names:
Acute Rhinosinusitis; Paranasal Sinus Infection

Acute Stress Disorder

A trauma-related mental-health condition beginning after exposure to actual or threatened death, serious injury, or sexual violence and lasting from three days to one month. Symptoms may include intrusive memories, avoidance, negative mood, dissociation, and increased arousal.

Acute Symptomatic Hyponatremia

A recently developing low blood sodium concentration accompanied by symptoms, particularly neurologic symptoms such as headache, confusion, seizures, or reduced consciousness. Clinical significance depends on the sodium level, rate of change, underlying cause, and associated illness.

Acute Transverse Myelitis

Inflammation across a segment of the spinal cord that can cause rapidly developing weakness, sensory changes, and bladder or bowel dysfunction.

Acute Tubular Necrosis

A kidney disorder caused by damage to the cells lining the tiny filtering tubules of the kidneys. It is the most common cause of sudden kidney failure in hospitalized patients, typically triggered by a severe lack of blood flow and oxygen to the kidneys (such as during severe low blood pressure or shock) or by toxic exposure to certain medications or imaging contrast dyes. As damaged cells slough off and block the tubules, kidney function drops, leading to decreased urine production and buildup of waste products in the blood.

Alternate Names:
ATN; Acute Tubular Injury (ATI)

Acute Urinary Retention

Sudden inability to pass urine despite a full bladder, often causing severe lower-abdominal pain and swelling. Causes include blockage, medicines, nerve problems, or impaired bladder contraction.

Acute Viral Hepatitis

A short-term infection that inflames the liver, caused by a hepatitis virus. Hepatitis A and E usually cause acute infection; hepatitis B, C, and D can also become chronic, and hepatitis D occurs only with hepatitis B. Symptoms may include tiredness, nausea, right-upper-abdominal discomfort, dark urine, or jaundice, but some people have none.

Acute Viral Illness

A short-duration illness caused by a virus. Symptoms depend on the affected organ system and may include fever, fatigue, cough, vomiting, diarrhea, or rash.

Acute Vision Loss

Sudden reduction or loss of vision in one or both eyes caused by retinal vascular occlusion, retinal detachment, optic-nerve disease, stroke, acute glaucoma, inflammation, or trauma.

Acute Weeping Dermatitis

A form of acute dermatitis with inflamed, often blistered skin that releases clear or yellowish fluid and may form crusts. It is a descriptive pattern that can occur with contact dermatitis, eczema, infection, or other inflammatory skin disorders.

Acyanotic

Describes a person or congenital heart defect without visible cyanosis, the bluish discoloration caused by low blood oxygen. Acyanotic heart defects often involve left-to-right blood flow or an obstruction to blood leaving the heart. This label describes oxygenation or presentation, not the severity of the defect. Some defects that are acyanotic early in life can later reduce oxygen levels or cause cyanosis as circulation changes or the disease progresses.

Acyanotic Heart Disease

A broad category of congenital heart defects that do not usually cause visible cyanosis because systemic blood oxygenation is relatively preserved. It includes many left-to-right shunts, such as atrial or ventricular septal defects and patent ductus arteriosus, as well as obstructive lesions. These defects can still strain the heart or cause complications, including heart failure or pulmonary hypertension. The term groups different structural conditions and does not name one specific diagnosis.

Acyclovir

An antiviral drug that inhibits herpesvirus DNA polymerase and is used for infections caused by herpes simplex virus and varicella-zoster virus.

Alternate Names:
Aciclovir

Adactyly

Absence of one or more fingers or toes from birth.

ADA Deficiency

A rare inherited disorder in which cells lack enough adenosine deaminase, an enzyme needed to break down certain cell chemicals. Toxic substances then build up and damage immune cells, often causing severe infections from early infancy.

Adamantine

Very hard or resembling diamond; in dentistry, relating to tooth enamel or enamel-like tissue. The term

may describe an unusually hard structure or the appearance of a lesion containing enamel-forming tissue.

Adamantinoma

A rare, low-grade malignant primary bone neoplasm with epithelial cells in an osteofibrous stroma. It usually arises in the anterior cortex of the tibial shaft and occasionally involves the fibula. It most often affects young adults and presents as a slow-growing painful swelling or pathological fracture. Radiographs show eccentric, multilocular, radiolucent cortical lesions with surrounding sclerosis. The tumor is resistant to chemotherapy and radiotherapy.

Alternate Names:
Adamantinoma of Long Bones; Tibial Adamantinoma; Malignant Angioblastoma of Bone

Adam's Apple

The common name for the laryngeal prominence, the visible projection at the front of the neck formed by the angle where the two laminae of the thyroid cartilage meet.

Adams-Stokes Syndrome

A clinical syndrome characterized by sudden, transient episodes of syncope or loss of consciousness caused by abrupt bradyarrhythmias, high-grade or complete atrioventricular block, or ventricular asystole leading to acute cerebral hypoperfusion.

Alternate Names:
Stokes-Adams Syndrome; Adams-Stokes Attack

Adaptation

Adaptation is the adjustment of a cell, organism, or person to a changing internal or external condition; in medicine it may involve physiologic compensation, behavior, or rehabilitation.

Adaptive Design

A clinical-study design allowing planned changes based on accumulating data while preserving scientific validity. Changes may involve sample size, treatment groups, or enrollment and must follow a prespecified plan.

Adaptive Equipment

Tools or devices modified to help a person perform daily activities safely despite disability, weakness, pain, or sensory loss. Examples include bathroom rails, reachers, adapted utensils, wheelchairs, and communication aids.

Adaptive Immunity

The part of the immune system that learns to recognize specific germs or abnormal cells. B cells make targeted antibodies, T cells coordinate or destroy affected cells, and memory cells help produce a faster response to a later exposure.

ADD/ADHD

Attention-deficit/hyperactivity disorder, a neurodevelopmental condition involving persistent inattention, hyperactivity, impulsivity, or combinations of these symptoms that impair functioning.

Addiction

A commonly used, non-diagnostic term for compulsive substance use or recurrent behavior despite harm, with impaired control, craving, or difficulty stopping. In clinical practice, the specific diagnosis is usually named as a substance-use disorder or a recognized disorder due to addictive behavior; physical dependence alone does not establish addiction.

Addison Anemia

An older name for pernicious anemia, a vitamin B12-deficiency megaloblastic anemia caused by inadequate intrinsic factor and impaired B12 absorption.

Alternate Names:
Addisonian Anemia; Addison's Anemia

Addison Disease

Primary adrenal insufficiency caused by failure or destruction of the adrenal cortex, leading to low cortisol and sometimes low aldosterone. Findings may include fatigue, weight loss, low blood pressure, salt craving, and darkened skin; severe cortisol deficiency can cause adrenal crisis.

Alternate Names:
Primary Adrenal Insufficiency; Primary Adrenocor-

tical Insufficiency; Addison's Disease

Addisonian Anemia

Alternate name; see *Addison Anemia*.

Addisonian Crisis

Life-threatening emergency resulting from acute cortisol deficiency in patients with adrenal insufficiency. Precipitated by infection, trauma, surgery, or abrupt discontinuation of chronic glucocorticoid therapy.

Additive Genetic Effects

The contributions of individual alleles that combine approximately additively to influence a measurable trait, without requiring interaction between those alleles.

Adduct

To move an arm, leg, finger, toe, or other body part toward the center line of the body.

Adduction

Movement of a body part toward the body's midline or, for a finger or toe, toward the hand or foot's central axis. For example, bringing an arm back toward the side is shoulder adduction.

Adductor Muscle

A muscle that moves a body part toward the body's midline or, for a digit, toward the axis of the hand or foot.

Adductor Muscles

The medial compartment muscle group of the thigh (comprising adductor longus, adductor brevis, adductor magnus, gracilis, and pectineus) that draws the lower extremity toward the midline and stabilizes the pelvis; strain of these muscles is a frequent cause of athletic groin pain. See also: *Adductor Muscle*.

Adductor Muscle Strain

An overstretch or small tear in an inner-thigh muscle that draws the leg toward the body's midline. It often causes groin or inner-thigh pain, especially during running, kicking, or changing direction.

Adenine

A purine nitrogenous nucleobase that forms complementary base pairs with thymine in DNA (via two hydrogen bonds) and with uracil in RNA. It also forms essential components of adenosine, cellular energy carriers (ATP, ADP, AMP), second messengers (cAMP), and key metabolic cofactors (NAD+, FAD).

Alternate Names:
6-Aminopurine; Ade

Adenitis

Inflammation of a gland or lymph node, usually caused by infection or an immune-mediated disease. It may cause localized swelling, tenderness, redness, or fever. The affected structure and underlying cause shape the clinical features. Adenitis may be acute or chronic, depending on its duration.

Adenocarcinoma

A cancer made of cells that form glands or have gland-like features. It can start in many organs, including the bowel, breast, lung, pancreas, prostate, stomach, or uterus.

Adenocarcinoma Cancers

Alternate name; see *Adenocarcinoma*.

Alternate Names:
Glandular Cancers; Adenocarcinomas

Adenocarcinoma In Situ Of Cervix

A noninvasive glandular precursor lesion of the cervix, usually associated with high-risk human papillomavirus; abnormal glandular cells remain confined to the epithelium but may progress to invasive adenocarcinoma.

Adenocarcinoma Of The Colon

A malignant gland-forming epithelial tumor of the colon, commonly presenting with altered bowel habits, occult bleeding, anemia, or an obstructing mass.

Adenocarcinoma Of The Lung

The most common type of non-small-cell lung cancer. It begins in gland-forming cells, often toward the outer lung, and can occur in smokers or nonsmokers. Some tumors have gene changes, such as EGFR, ALK, or KRAS, that guide treatment choices.

Alternate Names:
Pulmonary Adenocarcinoma; Bronchial Adenocarcinoma

Adenohypophysis

The front part of the pituitary gland, a small hormone-producing organ at the base of the brain. It releases hormones that regulate growth, thyroid activity, adrenal function, reproduction, milk production, and other body processes.

Adenoid Basal Carcinoma

A rare, usually indolent cervical carcinoma composed of small basaloid nests, often associated with squamous intraepithelial lesions and requiring distinction from more aggressive tumors.

Adenoid Cystic Carcinoma

A rare malignant cancer that arises in secretory glands, most commonly the major and minor salivary glands of the head and neck, as well as the breast, skin, and airways. It tends to grow slowly but is notable for tracking along nerve pathways (perineural invasion), causing pain or numbness, and recurring or spreading to the lungs years after initial treatment.

Alternate Names:
Cylindroma

Adenoid Cystic Carcinoma Of The Vulva

A rare malignant tumor of vulvar Bartholin-type glands, often causing pain because of perineural invasion. It is usually slow-growing but may recur locally or metastasize after long intervals.

Adenoidectomy

Surgical removal of the adenoids, a patch of lymphatic tissue behind the nose. In children, it may be used for persistent nasal obstruction, obstructive sleep apnea, or selected cases of recurrent middle-ear disease or chronic rhinosinusitis.

Alternate Names:
Adenoid Excision; Adenoid Removal

Adenoid Hyperplasia

Alternate name; see *Adenoid Hypertrophy*.

Adenoid Hypertrophy

Enlargement of the adenoids, a patch of tissue behind the nose at the top of the throat. It is common in children and may happen during or after an infection. Enlarged adenoids can block nasal breathing and cause mouth breathing, snoring, disturbed sleep, pauses in breathing during sleep, or fluid behind the eardrum and repeated ear infections.

Alternate Names:
Enlarged Adenoids; Adenoidal Hyperplasia; Adenoid Hyperplasia

Adenoiditis

Acute or chronic inflammation and infection of the adenoid tissue behind the nose. It causes persistent nasal congestion, purulent nasal discharge, mouth breathing, snoring, sore throat, and muffled speech.

Adenoid Removal

Alternate name; see *Adenoidectomy*.

Adenoids

A collection of lymphatic tissue located in the upper airway at the back of the nasopharynx, forming part of Waldeyer's ring. In infants and young children, they help sample and trap inhaled germs to build immunity, but typically shrink in size during late childhood and adolescence.

Alternate Names:
Pharyngeal Tonsil; Nasopharyngeal Tonsil

Adenolipoma

A benign tumor composed of glandular cells and mature fat cells. It may occur in the skin, breast, thyroid, parathyroid, or salivary glands.

Adenolymphoma

A benign salivary-gland tumor, also called Warthin

tumor, composed of oncocytic epithelium and lymphoid stroma and occurring most often in the parotid gland.

Alternate Names:
Warthin Tumor; Papillary Cystadenoma Lymphomatosum

Adenoma

A usually noncancerous gland-forming tumor arising from epithelial tissue. Some adenomas produce hormones or other secretions, and some—especially certain colon and rectal adenomas—contain precancerous changes and may later become cancerous.

Adenoma-Carcinoma Sequence

The usual step-by-step pattern in which some colon polyps develop genetic changes, become increasingly abnormal, and eventually turn into colon cancer over several years. Removing suitable polyps can interrupt this progression.

Adenoma Malignum

An older name for minimal-deviation adenocarcinoma, a rare, well-differentiated, invasive, mucus-producing cancer of the cervix. Its cells may look nearly normal under the microscope, making diagnosis difficult.

Adenomatosis

A condition in which multiple gland-forming tumors called adenomas develop in one organ or tissue. The tumors are often benign, but their number and location may affect cancer risk.

Adenomatous Polyp

A benign gland-forming polyp, most commonly in the colon, that may contain dysplasia and can progress through the adenoma–carcinoma sequence. Tubular, villous, and tubulovillous types are recognized.

Adenomatous Polyposis

Alternate name; see *Familial Adenomatous Polyposis*.

Adenomyoepithelioma Of The Breast

A rare biphasic breast tumor composed of proliferating epithelial and myoepithelial cells. Most are benign, but local recurrence can occur, and a small proportion develop malignant features or metastasize.

Adenomyoma

A benign uterine lesion composed of endometrial glands and stroma within a proliferation of smooth muscle; it may cause abnormal uterine bleeding or mimic other uterine tumors.

Adenomyosis

A condition in which tissue like the lining of the uterus grows into its muscular wall. It may make the uterus larger and cause heavy periods, strong cramps, or ongoing pelvic pain. Some people have no symptoms.

Adenopathy

Disease or enlargement of a gland, most often used for lymph-node enlargement or abnormal lymph-node involvement.

Adenosarcoma

A malignant mixed tumor containing benign gland-forming epithelial tissue and a malignant connective-tissue component. The term most often refers to Müllerian adenosarcoma of the uterus, but similar tumors can arise in other organs. It may recur locally, while spread to distant sites is less common.

Adenosine

A purine nucleoside made of adenine linked to ribose that participates in energy transfer and cell signaling. Given rapidly by injection, it can briefly slow conduction through the atrioventricular node and is used for selected supraventricular tachycardias.

Adenosine Deaminase Deficiency

A rare inherited genetic disorder caused by a lack of the adenosine deaminase enzyme, which is needed to break down metabolic waste in cells. Without this enzyme, toxic byproducts build up and destroy developing white blood cells (lymphocytes), leading

to a severely weakened immune system. It is one of the primary causes of severe combined immunodeficiency (SCID), leaving affected infants highly vulnerable to frequent and life-threatening infections.

Alternate Names:
ADA Deficiency; ADA-SCID

Adenosine Deaminase Severe Combined Immunodeficiency (ADA-SCID)

A severe combined immune deficiency caused by inherited adenosine deaminase deficiency. Toxic purine metabolites prevent normal development and function of T and B lymphocytes, leaving affected infants highly vulnerable to severe or recurrent infections.

Adenosine Diphosphate

A nucleotide formed when ATP loses one phosphate group. ADP can be converted back to ATP to support cellular energy use, and released ADP also activates nearby platelets and promotes platelet aggregation during clot formation.

Alternate Names:
ADP

Adenosine Monophosphate

A small molecule made of adenine, ribose, and one phosphate group. It is formed when cells break down or recycle energy-carrying molecules and helps regulate energy use and cell signaling.

Alternate Names:
AMP; Adenylic Acid

Adenosine Triphosphate

The main short-term energy source inside cells. Cells make it from nutrients and use it to power muscle contraction, movement of substances across cell membranes, chemical reactions, and many other essential processes.

Alternate Names:
ATP

Adenosis

An abnormal change involving a gland or glandular tissue, often an increase in the number or size of its glandular units. In the breast, adenosis refers to enlarged or increased milk-producing lobules and is benign; in other organs, the specific meaning depends on the named tissue and subtype.

Adenosis Of The Breast

A benign breast change in which the milk-producing lobules are larger or more numerous than usual. Sclerosing adenosis is a distinct pattern in which scar-like tissue forms in the lobules.

Adenovirus

A group of DNA viruses that commonly cause respiratory illness, including cold-like symptoms, sore throat, fever, bronchitis, croup, or pneumonia. Depending on the type, adenoviruses can also cause conjunctivitis, gastroenteritis, cystitis, or rarely neurologic disease. They spread through respiratory secretions, close contact, contaminated surfaces, and fecal–oral exposure. Most infections are mild, but severe disease is more likely in infants, people with heart or lung disease, and people with weakened immune systems.

Adenovirus DNA PCR (Feces)

A stool test that uses polymerase chain reaction (PCR) to detect adenovirus genetic material. It can help identify adenovirus in someone with a compatible illness; a positive result is interpreted with symptoms because viral DNA may sometimes be detected without illness.

Alternate Names:
Stool Adenovirus PCR; Adenovirus PCR, Stool

Adenovirus Infection

Illness caused by an adenovirus, commonly with sore throat, cough, fever, pink eye, diarrhea, or vomiting, especially in children. The virus spreads through droplets, close contact, contaminated surfaces, or infected stool. One pattern, pharyngoconjunctival fever, brings sore throat, red eyes, and fever together and spreads easily in daycare or swimming-pool settings. Most infections clear on their own, but severe breathing or widespread disease can occur in infants, older adults, people with heart or lung

disease, and people with weak immune systems.

Adenylate Cyclase

An enzyme that changes ATP into cyclic AMP, a chemical messenger inside cells. It is often activated by signals received at the cell surface and helps control many cell functions.

Alternate Names:
Adenylyl Cyclase

Adequate Intake

A formal nutritional reference standard within the Dietary Reference Intakes (DRI) system. It represents the recommended average daily nutrient intake level based on observed or experimentally determined approximations in healthy populations, used when scientific evidence is insufficient to calculate an Estimated Average Requirement (EAR) and Recommended Dietary Allowance (RDA) (such as for vitamin K, potassium, or infant nutrition).

Alternate Names:
AI

ADHD in Children

Attention-deficit/hyperactivity disorder in childhood, characterized by developmentally inappropriate inattention, hyperactivity, or impulsivity across settings. Diagnosis requires persistent impairment and information from caregivers, teachers, and clinical assessment.

ADHD in Women

Attention-deficit/hyperactivity disorder manifesting in females, who frequently present with predominantly inattentive symptoms, internal restlessness, disorganization, and emotional dysregulation rather than prominent physical hyperactivity.

Alternate Names:
Female ADHD; ADHD in Adult Women

Adherence

The extent to which a person's behavior corresponds with agreed healthcare recommendations, including taking medications, following diets, or executing lifestyle changes. Non-adherence may stem from adverse effects, regimen complexity, cognitive impairment, financial constraints, or lack of support.

Alternate Names:
Compliance; Treatment Adherence; Medication Adherence

Adherens Junction

A connection that helps neighboring cells stick together. It links proteins on one cell to the internal support fibers of another, helping tissues keep their shape, strength, and protective barrier.

Adhesiolysis

A procedure that cuts or removes bands of scar tissue that abnormally join organs or body surfaces. It may relieve pain or release a blocked intestine, but the bands can form again after surgery.

Adhesion

A band of scar-like tissue that abnormally joins internal surfaces or organs, often after surgery, infection, inflammation, or injury, sometimes causing pain or blockage.

Adhesion Molecules

Proteins on cells that help cells attach to one another or to the material supporting them. They help organize tissues, guide immune cells to inflamed areas, and can influence how cancer spreads.

Adhesive Capsulitis

Alternate name; see *Frozen Shoulder*.

Adhesive Capsulitis Of The Hip

A rare condition in which the capsule around the hip joint becomes thick and tight, causing pain and reduced movement. The term is less established for the hip than for the shoulder, so other causes of hip stiffness must be considered.

Adhesive Tape

A material used to secure dressings, devices, or tubing to the skin. It is available in paper, cloth, plastic, and other forms.

ADHF

Sudden worsening of heart failure symptoms, causing severe breathlessness and fluid retention. See *Acute Decompensated Heart Failure*.

Adie Syndrome

A neurological condition characterized by a tonically dilated pupil (Adie pupil) that reacts sluggishly to light but constricts more completely to near focus, accompanied by diminished or absent deep tendon reflexes, typically at the Achilles and patellar tendons.

Alternate Names:
Holmes-Adie Syndrome; Adie Pupil Syndrome

Adie Tonic Pupil

A pupil that is unusually large and reacts slowly to light but constricts better when focusing on a near object. It usually affects one eye and results from injury to nerves controlling the pupil; the cause may be unknown or related to another disorder.

Adipocere

A grayish-white, waxy, soap-like substance formed in decomposing bodies exposed to moisture and lack of oxygen (such as damp soil or submerged water). It is produced by the bacterial hydrolysis and hydrogenation of body fats into fatty acids (saponification). This process retards putrefaction and can preserve body contours, facial features, and traumatic injuries for months or years, assisting forensic identification.

Alternate Names:
Grave Wax; Saponification Wax; Mortuary Wax

Adipocyte

A fat cell that stores energy and releases hormones and other signals affecting appetite, blood sugar, inflammation, and metabolism. White fat mainly stores energy, while brown and beige fat can produce heat; enlarged or excessive fat cells can contribute to insulin resistance.

Adipocytes

Plural form; see *Adipocyte*.

Adipogenesis

The process by which immature cells develop into fat cells. It helps form and maintain body-fat tissue, which stores energy and produces hormones; abnormal increases in the number or size of fat cells can contribute to obesity and metabolic disease.

Adipokine

A chemical messenger released by body fat. Adipokines help control appetite, blood sugar, fat use, inflammation, blood pressure, and immune activity; abnormal levels may contribute to obesity, diabetes, and heart or blood-vessel disease.

Adiponectin

A hormone produced mainly by fat cells that helps regulate fatty-acid use, glucose metabolism, insulin sensitivity, and inflammation. Levels are often lower with obesity and insulin resistance, but a blood level is not diagnostic by itself.

Adipose

Relating to body fat or composed of adipose tissue, which stores energy and also functions as an endocrine and immune-active organ.

Adipose Tissue

A specialized connective tissue composed mainly of adipocytes that store energy as triglycerides. It provides thermal insulation, cushioning for organs, and endocrine regulation through hormones and signaling molecules such as leptin and adiponectin.

Adiposis Dolorosa

Adiposis dolorosa, or Dercum disease, is a rare disorder characterized by painful fatty deposits, often with obesity, fatigue, and other systemic symptoms.

Adiposity

The amount and location of body fat. Too much body fat, especially around the abdomen, can increase the risk of diabetes, heart disease, high blood pressure, and joint or movement problems.

Adipsia

Little or no feeling of thirst despite the body needing fluid. It can lead to dehydration and dangerously high blood sodium, especially when caused by illness affecting the brain, medicines, aging, or severe illness.

Adjacent

Next to, close to, or sharing a boundary with another structure, tissue, organ, or lesion. The term helps describe location, spread of disease, or relationships seen on imaging or examination.

Adjustment Disorder

Emotional or behavioral symptoms in response to an identifiable stressor, beginning within three months of the stressor. The symptoms cause significant distress or impairment and do not meet criteria for another mental disorder. They generally do not persist for more than six months after the stressor or its consequences have ended.

Adjustment Disorders

Alternate index label; see *Adjustment Disorder*.

Adjustment Disorder With Anxiety

An emotional or behavioral response to an identifiable stressor, with prominent anxiety symptoms such as worry, nervousness, or separation anxiety. Symptoms begin within three months of the stressor, cause distress out of proportion to the stressor or significant functional impairment, and do not meet criteria for another mental disorder; they generally resolve within six months after the stressor or its consequences end.

Adjuvant

An added treatment or substance that enhances the effect of a primary treatment; in vaccines, an adjuvant strengthens the immune response to an antigen.

Adjuvant Chemotherapy

Systemic antineoplastic drug therapy administered following definitive primary treatment, such as complete surgical tumor resection, designed to eradicate occult micrometastatic disease and reduce the risk of cancer recurrence.

Adjuvant Therapy

Additional treatment given after the main treatment to reduce the chance of disease returning. Examples include chemotherapy, radiation, hormone treatment, or immune treatment after surgery for selected cancers.

Adlerian Theory

A psychological theory developed by Alfred Adler, also called individual psychology. It emphasizes feelings of inferiority, goal-directed striving, a person's style of life, and social interest—the capacity to belong to and contribute to the community. Early family experiences and relationships are considered important influences on development.

Alternate Names:
Individual Psychology

Ad Lib

A prescription or clinical instruction meaning as desired or as tolerated, from the Latin ad libitum.

ADME

The four processes that describe what the body does to a medicine: absorption into the bloodstream, distribution through tissues, chemical breakdown, and excretion from the body. These processes influence a medicine's dose, timing, and effects.

Administered Activity

The measured amount of radioactive material given to a patient for a scan or treatment. The amount is recorded with the radioactive substance, method, date, and time so the exposure and treatment can be checked safely.

Administration Procedure

A method used to give a medicine, fluid, vaccine, nutrition, or other treatment, such as by mouth, injection, inhalation, skin application, or infusion. The method affects speed, dose, and risks.

Adnexa

Structures next to an organ. In gynecology, the uterine adnexa are the ovaries, fallopian tubes, and supporting ligaments and tissues around the uterus.

Adnexal Dysplasia

Abnormal development or organization of skin appendages, such as hair follicles or oil and sweat glands. The term describes a tissue finding; its significance depends on the affected structure and microscopic pattern and does not by itself establish cancer.

Adnexal Mass

A growth or enlargement involving structures beside the uterus, such as an ovary or fallopian tube.

Adnexal Torsion

Twisting of an ovary, fallopian tube, or both around their supporting tissues. The twist can reduce or stop blood flow. It usually causes sudden one-sided pelvic pain, often with nausea or vomiting; prolonged torsion can damage ovarian tissue.

Adnexal Tumors

Tumors arising in structures beside the uterus, especially the ovaries, fallopian tubes, or supporting tissues. They may be benign, borderline, or malignant and are evaluated with examination, imaging, laboratory tests, and sometimes surgery or biopsy.

Adnexal Tumors And Masses

Abnormal growths or masses involving the ovary, fallopian tube, or nearby supporting tissues; they may be benign or malignant.

Adnexitis

Inflammation of one or more uterine adnexa, usually the fallopian tubes and sometimes the ovaries. It commonly occurs as part of pelvic inflammatory disease and may cause lower abdominal pain, fever, abnormal discharge, or pain during sex; untreated infection can lead to an abscess, infertility, or ectopic pregnancy.

Alternate Names:

Salpingo-Oophoritis

Adolescence

The developmental period between childhood and adulthood, involving physical maturation, puberty, and major psychological and social changes.

Adolescent Development

The physical, cognitive, emotional, and social changes that occur as a person develops from childhood into adulthood, including puberty and the development of greater independence.

Adolescent Health

The health and wellbeing of young people (10-19 years), addressing the physical, psychological, and social transitions of puberty and adolescence.

Adolescent Medicine

The medical specialty focused on health and development during adolescence and young adulthood. It addresses physical, mental, behavioral, reproductive, and social health, including growth, chronic disease, sexuality, nutrition, and substance use. Care is developmentally appropriate and may support transition to adult services.

Adolescent Obesity

Alternate index label; see *Pediatric Obesity*.

Adolescent Schizophrenia

Schizophrenia diagnosed with onset during adolescence. It is uncommon and may disrupt thinking, perception, emotions, and functioning at school or with peers; diagnosis requires a persistent pattern and exclusion of mood, substance-related, neurologic, and other causes of psychosis.

Adolescent Substance Use

Harmful or risky use of alcohol, nicotine, or other drugs during adolescence, including nonmedical use of prescription medicines. It can affect development, health, school performance, and relationships and may be associated with a substance use disorder.

Adoptive Cell Therapy

A personalized cellular immunotherapy in which a patient's own lymphocytes are expanded or engineered ex vivo and reinfused to attack the tumor; examples include tumor-infiltrating lymphocyte (TIL) therapy and chimeric antigen receptor (CAR) T-cell therapy.

Adoptive Immunotherapy

Treatment in which immune cells are collected, activated or genetically modified, and returned to the patient to attack disease, especially cancer. Fever, inflammation, and other immune reactions may occur.

ADP-Ribosylation

A chemical change in which a small molecule is attached to a protein or other cell molecule. This can switch the molecule's activity on or off and is used by normal cell processes and by some bacterial toxins.

Adrenal Adenoma

A benign, noncancerous tumor arising from the cortex of the adrenal gland. While many are nonfunctioning and cause no symptoms, some oversecrete adrenal hormones such as aldosterone (causing Conn syndrome) or cortisol (causing Cushing syndrome).

Alternate Names:
Adrenocortical Adenoma

Adrenal Cancer

A rare cancer that begins in one of the adrenal glands above the kidneys. Some tumors start in the outer cortex and others in the inner medulla; some produce excess hormones, while others cause pain or other symptoms as they grow.

Adrenal Carcinoma

A rare malignant tumor arising from the adrenal cortex. It may produce excess cortisol, aldosterone, androgens, or estrogens, or present as an incidental mass or pressure symptom; hormonal evaluation and imaging help guide diagnosis and staging.

Adrenal Cortex

The outer part of each adrenal gland that produces steroid hormones, including cortisol, aldosterone, and adrenal androgens. These hormones help regulate stress responses, blood pressure, salt balance, and metabolism.

Adrenal Cortex Physiology

The outer layer of each adrenal gland makes hormones that control salt and blood pressure, stress responses, metabolism, and some sexual development. Its activity is regulated by the kidneys, blood potassium, and the brain's hormone-control system.

Adrenal Cortical Carcinoma

Alternate name; see *Adrenocortical Carcinoma*.

Adrenal Crisis

A sudden, life-threatening shortage of adrenal hormones, especially cortisol. It may occur with severe adrenal disease or after abruptly stopping long-term steroid treatment, particularly during infection, injury, or surgery. Symptoms can include severe weakness, vomiting, abdominal pain, confusion, low blood pressure, and collapse.

Adrenalectomy

Surgery to remove one or both adrenal glands, usually for a tumor or severe hormone overproduction. Removing one gland may leave enough hormone production; removal of both causes lifelong adrenal hormone deficiency requiring replacement.

Adrenal Failure

Alternate name; see *Adrenal Insufficiency*.

Adrenal Gland

One of two hormone-producing glands above the kidneys. The outer cortex makes aldosterone, cortisol, and adrenal androgens; the inner medulla makes adrenaline and noradrenaline. Adrenal hormones help regulate blood pressure, metabolism, stress responses, and salt balance.

Adrenal Gland Cancer

Alternate name; see *Adrenal Cancer*.

Adrenal Gland Disorders

A broad spectrum of conditions affecting the hormone production or structural integrity of the adrenal glands, leading to either deficient hormone output (such as Addison disease) or hormone excess (such as Cushing syndrome, primary aldosteronism, or pheochromocytoma).

Alternate Names:
Adrenal Diseases; Adrenocortical Disorders

Adrenal Gland Removal

Alternate name; see *Adrenalectomy*.

Adrenal Glands

Plural form; see *Adrenal Gland*.

Adrenal Gland Tumor

A growth in one of the adrenal glands above the kidneys. It may be noncancerous or cancerous and may or may not produce hormones; a pheochromocytoma is one possible type.

Adrenal Hemorrhage

Bleeding into an adrenal gland, often associated with severe infection, serious illness, a bleeding disorder, blood-thinning medicines, or injury. Bleeding into both glands can cause sudden loss of adrenal hormones, very low blood pressure, and shock.

Adrenal Hyperplasia

Growth of extra cells in one or both adrenal glands, making them larger. When the outer layer (adrenal cortex) is affected, hormone production may change. Effects depend on which hormones are affected and may include early puberty, excess body hair, high blood pressure, or changes in body salts.

Alternate Names:
Adrenocortical Hyperplasia; Adrenal Cortical Hyperplasia

Adrenal Incidentaloma

An unexpected mass found in an adrenal gland during imaging for another reason. It may be benign or cancerous and may or may not produce hormones, so evaluation usually includes imaging review and selected hormone tests.

Adrenaline

Alternate name; see *Epinephrine*.

Adrenal Insufficiency

A condition in which the adrenal glands do not make enough cortisol and sometimes not enough aldosterone. It can result from a problem in the adrenal glands or in the pituitary or hypothalamus, which help control them. It may cause tiredness, weakness, weight loss, low blood pressure, or changes in the body's salt balance. A severe shortage can cause an adrenal crisis.

Alternate Names:
Adrenocortical Hypofunction; Adrenal Cortical Hypofunction; Hypoadrenalism

Adrenal Mass

An abnormal growth or enlargement in or near an adrenal gland. It may be benign or cancerous and may or may not produce hormones; evaluation usually involves imaging and, when appropriate, hormone tests and specialist review.

Adrenal Medulla

The inner part of each adrenal gland, which sits above a kidney. It releases adrenaline and noradrenaline during stress, helping increase heart rate, blood pressure, alertness, and blood flow to muscles.

Adrenal Medulla Physiology

The inner part of each adrenal gland releases adrenaline and noradrenaline when the body's stress-response nerves are activated. These hormones quickly increase alertness, heart activity, blood pressure, and blood flow to muscles.

Adrenal Myelolipoma

A usually benign adrenal tumor composed of mature fat and blood-forming tissue. It is often found incidentally on imaging and causes no symptoms, but larger lesions may produce mass effect or bleeding.

Management depends on size, symptoms, growth, and diagnostic certainty.

Adrenal Nodule

A localized lump in an adrenal gland. It may be a harmless nonfunctioning growth, a hormone-producing tumor, or rarely cancer; assessment depends on its size, imaging features, growth, and hormone production.

Adrenal Tumors

Growths arising in the adrenal cortex or medulla. They may be benign or malignant and may or may not produce hormones. Some are discovered incidentally; others cause symptoms through hormone excess or pressure on nearby structures. Their effects vary with tumor type, hormone activity, size, and location.

Adrenal Venous Sampling

A catheter-based test that measures hormones in blood from each adrenal gland. It helps determine whether one gland is producing too much aldosterone, which can guide treatment for difficult-to-control high blood pressure.

Adrenarche

An early stage of sexual development, typically occurring around age six to eight, marked by increased production and secretion of weak adrenal androgens (such as dehydroepiandrosterone) by the zona reticularis of the adrenal cortex. It contributes to early pubic hair growth, axillary odor, and oily skin.

Adrenergic Agent

A medicine or substance that stimulates or blocks receptors responding to adrenaline (epinephrine) and noradrenaline (norepinephrine). These agents can change heart rate, blood pressure, airway size, and pupil size.

Adrenergic Agonist

A medicine or substance that copies the effects of adrenaline or noradrenaline by activating specific cell receptors. Depending on the receptor, it may raise blood pressure, speed the heart, open the airways, or improve heart pumping.

Alternate Names:
Sympathomimetic

Adrenergic Antagonists

Medicines or other substances that block adrenaline-like signaling at alpha or beta adrenergic receptors. They can lower blood pressure, slow the heart, reduce cardiac workload, or relax smooth muscle; effects and risks depend on the receptor targeted and the medicine used.

Alternate Names:
Adrenergic Blockers

Adrenergic Bronchodilator Overdose

Excess exposure to a medicine that opens the airways by stimulating the body's stress-response system. It may cause shaking, agitation, headache, fast heartbeat, low potassium, chest pain, or abnormal rhythms.

Adrenergic Receptor

A cell-surface receptor activated by adrenaline (epinephrine), noradrenaline (norepinephrine), or related medicines. Alpha and beta receptors help control heart rate, blood pressure, airway size, pupil size, and other body responses.

Adrenergic Receptors

Plural form; see *Adrenergic Receptor*.

Adrenocortical Carcinoma

A rare cancer that begins in the outer layer, or cortex, of an adrenal gland, one of the glands above the kidneys. Some tumors are functioning and make too much of hormones such as cortisol, aldosterone, or adrenal androgens; others are nonfunctioning and make no excess hormones. Hormone-producing tumors may cause weight gain, high blood pressure, muscle weakness, unusual hair growth, or other changes in sexual development. A nonfunctioning tumor may cause no early symptoms, but a growing or spreading tumor may cause an abdominal lump, abdominal or back pain, or a feeling of fullness.

Adrenocorticotropic Hormone

A hormone made by the pituitary gland that tells the adrenal glands to make cortisol. Cortisol helps the body respond to stress and helps control blood pressure, blood sugar, and inflammation.

Alternate Names:
Adrenocorticotrophic Hormone (ACTH); ACTH; Corticotropin

Adrenogenital Syndrome

A group of disorders, usually caused by congenital adrenal hyperplasia, in which excess adrenal androgens cause atypical genital development or early puberty.

Adrenoleukodystrophy

A group of inherited disorders, most often X-linked, in which very-long-chain fatty acids accumulate and damage myelin, the adrenal glands, or both. Childhood cerebral disease can cause behavior and learning changes, seizures, and loss of neurologic function; adrenal insufficiency may also occur.

Alternate Names:
ALD

Adrenomedullin

A hormone-like substance made by many tissues that widens blood vessels and helps regulate blood pressure, circulation, fluid balance, kidney activity, and responses to injury.

Adrenomyeloneuropathy

An adult-onset form of X-linked adrenoleukodystrophy that mainly affects the spinal cord and peripheral nerves. It may cause leg stiffness, weakness, walking difficulty, bladder or bowel problems, and sometimes adrenal insufficiency.

Adson Test

A physical examination manoeuvre sometimes used when assessing possible thoracic outlet syndrome. A change in the radial pulse or symptoms during the manoeuvre is not specific and cannot diagnose the condition by itself.

Alternate Names:
Adson Manoeuvre; Adson's Test

Adsorption

The sticking of molecules to the outside surface of a solid or liquid rather than entering its substance. Activated charcoal works partly by adsorbing some poisons in the digestive tract.

Adult Congenital Heart Disease

Structural cardiac abnormalities present from birth that persist into or are first identified during adult life, including repaired, palliated, or unrepaired defects such as bicuspid aortic valve, atrial or ventricular septal defects, and coarctation of the aorta.

Alternate Names:
ACHD; Congenital Heart Disease in Adults

Adult Day Services

Community-based daytime programs providing supervision, social activities, health-related support, or assistance with daily activities for adults who cannot safely remain alone throughout the day.

Alternate Names:
Adult Day Care; Adult Day Program

Adult Hypertension

Blood pressure that stays above the diagnostic threshold used by a clinical guideline. Thresholds vary between guidelines and measurement settings. Persistent high blood pressure increases the risk of heart, brain, and kidney disease.

Alternate Names:
Systemic Hypertension

Adult Immunisation

Vaccination of adults to prevent infectious diseases, maintain protection from earlier vaccines, or protect people at increased risk. Vaccine schedules vary by country, age, health conditions, occupation, pregnancy, and previous vaccination history.

Alternate Names:
Adult Immunization; Adult Vaccination; Preventive Adult Vaccines

Adult Informed Consent

A process in which an adult with decision-making capacity receives understandable information about a proposed medical intervention, including its purpose, benefits, important risks, and alternatives, and makes a voluntary choice.

Alternate Names:
Informed Medical Consent; Surgical Consent; Patient Autonomous Decision-Making

Adult Nutritional Support in Illness

Dietary strategies providing increased caloric and protein intake during acute or chronic illness, convalescence, or hypermetabolic states to prevent involuntary weight loss and muscle wasting.

Alternate Names:
High-Calorie Diet in Illness; Nutritional Therapy in Recovery

Adult Obstructive Sleep Apnea

Repeated narrowing or closure of the upper airway during sleep in an adult, causing pauses or reductions in breathing and sometimes drops in blood oxygen. It can fragment sleep, cause daytime sleepiness, and increase cardiovascular risk.

Alternate Names:
Adult OSA; Obstructive Sleep Apnea Syndrome

Adult-Onset Asthma

Asthma that begins in adulthood, with variable airway inflammation and narrowing that can cause episodic wheezing, cough, chest tightness, or shortness of breath. Diagnosis uses the symptom pattern and lung-function testing.

Alternate Names:
Late-Onset Asthma; Adult-Onset Reactive Airway Disease

Adult-Onset Still Disease

A rare inflammatory disease that causes recurring high fevers, joint pain or swelling, a salmon-colored rash, and sore throat. It may also inflame the liver, heart, lungs, or other organs.

Adult-Onset Still's Disease

Alternate name; see *Adult-Onset Still Disease*.

Alternate Names:
AOSD; Still's Disease in Adults

Adult Primary Brain Tumor

A tumour that begins in the brain, its coverings, or related structures in an adult rather than spreading there from another site. Types include gliomas, meningiomas, vestibular schwannomas, and primary central nervous system lymphomas.

Alternate Names:
Primary Intracranial Neoplasm

Adult Spinal Deformity

Abnormal curvature or alignment of the spine in an adult, including scoliosis, kyphosis, or loss of normal sagittal balance. It may cause back pain, nerve compression, difficulty walking, or functional disability.

Adult T-Cell Leukemia

A rare and aggressive peripheral T-cell neoplasm caused by infection with the human T-lymphotropic virus type 1 (HTLV-1). Characterized by generalized lymphadenopathy, hepatosplenomegaly, osteolytic bone lesions, severe hypercalcemia, skin infiltration, and atypical multi-lobed circulating lymphocytes known as flower cells.

Alternate Names:
Adult T-Cell Leukemia-Lymphoma; ATLL

Advance Care Planning

A process for discussing and preparing for future health-care decisions, especially if illness may later limit a person's ability to decide or communicate. It may involve the person, loved ones, and clinicians and can result in written instructions or appointment of a health-care proxy. It is broader than an advance directive, which is a legal document recording some preferences.

Advanced Cancer

Cancer that has grown beyond its original site. It may be locally advanced when it has invaded nearby

tissues or metastatic when it has spread to distant organs.

Advanced Cardiovascular Life Support

A standardized set of advanced resuscitation measures for cardiac arrest and other life-threatening cardiovascular emergencies. It includes high-quality CPR, defibrillation when indicated, airway management, medicines, and treatment of reversible causes.

Alternate Names:
ACLS

Advanced Glycation End-Products

Compounds formed when sugar attaches to proteins or fats without the usual enzyme-controlled process. They increase with aging and persistently high blood sugar and may promote inflammation and damage to blood vessels, nerves, kidneys, and other tissues.

Advance Directive

A document recording a person's wishes about future medical care and, in some cases, naming a health-care proxy to make decisions if the person cannot decide or communicate. Its legal form and requirements vary by jurisdiction.

Alternate Names:
Advance Health-Care Directive; Advance Medical Directive

Advanced Maternal Age

A clinical obstetric term for pregnancy in a person who will be 35 years or older at the estimated date of delivery. The chance of some chromosomal conditions and obstetric complications rises with age, but individual risk varies and age alone does not determine pregnancy outcome.

Alternate Names:
AMA Pregnancy

Advanced Prostate Cancer

Prostate cancer that has grown beyond the prostate or spread to distant parts of the body. It may involve nearby tissues, lymph nodes, bones, or other organs.

Advanced Sleep-Wake Phase Disorder

A body-clock disorder in which a person becomes sleepy much earlier than desired and wakes unusually early. The person may sleep normally on this early schedule but cannot stay asleep until a more convenient time.

Advance Statements

Statements, spoken or written, describing a person's preferences for future health care. Their legal status and scope vary by jurisdiction; some are part of an advance directive.

Adventitia

The outer layer of connective tissue around a blood vessel or hollow organ. It supports and anchors the structure and contains small nerves and blood vessels that nourish the wall.

Alternate Names:
Tunica Adventitia

Adventitial Cystic Disease

A rare, non-atherosclerotic vascular condition characterized by the formation of mucin-filled cysts within the adventitial layer of an artery, most frequently the popliteal artery, resulting in extrinsic arterial compression and intermittent claudication.

Alternate Names:
Cystic Adventitial Disease

Adventitious

Abnormal, unexpected, or arising from an unusual location or process; adventitious lung sounds include crackles, wheezes, and other added breath sounds.

Adverse Effect

An unintended and harmful or bothersome effect of a medicine or other treatment given at normal doses or for an intended purpose.

Adverse Event

Any new or worsening health problem that happens during or after a medicine, procedure, or other treatment, whether or not the treatment caused it. Clinicians record its timing, severity, and likely

cause separately.

Adverse Reaction

An unintended and harmful response to a medicine, treatment, or other exposure. It may be predictable from the medicine's effects, such as bleeding with an anticoagulant, or unpredictable, such as an allergic reaction. Severity ranges from mild nausea or rash to serious organ injury, breathing difficulty, or shock.

Alternate Names:
Adverse Drug Reaction

Aedes

Genus of mosquito responsible for transmitting viral infections such as dengue fever, yellow fever, chikungunya, and Zika. See *Dengue Fever*.

Aedes Aegypti

Aedes aegypti is a mosquito that can transmit dengue, yellow fever, chikungunya, Zika, and other viruses.

Aegophony

An altered voice sound heard through a stethoscope when a person says "E" but it sounds like "A." It can occur over lung tissue made denser by infection or fluid, but it does not identify the cause by itself.

A & E Medicine

Accident and emergency (A&E) medicine provides rapid assessment, stabilization, diagnosis, and initial treatment for sudden illness and injury.

Aerobe

An organism that uses oxygen in its metabolism. Obligate aerobes require oxygen for growth, while facultative anaerobes can grow with or without it; these categories describe different oxygen requirements.

Aerobic

Requiring or using oxygen. In microbiology, an aerobic organism grows with oxygen; in the body, aerobic energy production uses oxygen to release energy from nutrients for muscles and other cells.

Aerobic Bacteria

Bacteria that grow using oxygen in their metabolism. Obligate aerobes require oxygen, whereas facultative anaerobes can also grow without it; laboratory classification depends on the species' oxygen requirements.

Aerobic Bacterium

Singular form; see *Aerobic Bacteria*.

Aerobic Exercise

Physical activity using large muscles continuously while the body produces energy with oxygen. Walking, cycling, swimming, and dancing can improve heart, lung, blood-vessel, muscle, mood, and endurance health.

Alternate Names:
Cardio Exercise

Aerobiosis

Life or biological activity that occurs when oxygen is available. Many human cells use oxygen to release energy from food, and some microorganisms need oxygen to grow.

Aerophagia

Excessive swallowing of air, which may cause frequent belching, abdominal bloating, discomfort, or increased intestinal gas. It can occur with rapid eating, chewing gum, anxiety, or swallowing disorders.

Aerophagy

Alternate spelling; see *Aerophagia*.

Aerophobia

An excessive fear of flying or air travel that causes marked anxiety, avoidance, or interference with daily life. It is a specific phobia.

Aerosol

Very small solid particles or liquid drops floating in a gas such as air. Aerosols can carry inhaled medicines, pollutants, or infectious particles and may remain in the air or settle on surfaces.

Aerospace Medicine

The medical field that protects the health, safety, and performance of people involved in aviation and spaceflight, including crews and passengers. It combines clinical, preventive, occupational, and environmental medicine with flight physiology, addressing stresses such as hypoxia, pressure change, acceleration, microgravity, radiation, isolation, and motion sickness.

Aerotitis

Ear pain or middle-ear injury caused by failure to equalize pressure during rapid changes in altitude, such as during aircraft ascent or descent.

Aesthetic Dentistry

Dental care intended to improve the appearance of the teeth, gums, or smile. Procedures may include tooth-colored restorations, veneers, whitening, or selected crowns.

Aesthetic Medicine

Medical care intended to improve appearance or reduce visible signs of aging through procedures, devices, medicines, or skin care; appropriate assessment includes risks, contraindications, and realistic expectations.

Alternate Names:
Cosmetic Medicine

Aetiology

The cause or causes of a disease or condition; also, the study of those causes. Causes may include genetic, environmental, infectious, or immune factors.

Alternate Names:
Etiology

Affect

The observable expression of a person's emotional state, including facial expression, voice, posture, and emotional responsiveness.

Affective Disorder

Another name for a mood disorder, a group of mental health conditions involving lasting changes in mood. These include depression, bipolar disorder, and related conditions. Older medical systems called the group "mood [affective] disorders"; ICD-11 calls it "mood disorders."

Alternate Names:
Mood Disorder

Affective Flattening

Markedly reduced outward expression of emotion, including limited facial expression, voice modulation, and gestures. It may occur in schizophrenia and other psychiatric or neurologic conditions.

Afferent

Carrying signals toward a central organ or structure; afferent nerves transmit sensory information from the body toward the brain and spinal cord.

Afferent Arteriole

A small branch of the renal arterial circulation that conveys blood directly into the glomerular capillary tuft of an individual nephron, playing a pivotal role in regulating glomerular filtration pressure and renal blood flow through autoregulatory and tubuloglomerular mechanisms.

Afferent Loop Syndrome

A blockage or poor emptying in a section of small intestine made during some stomach operations. Digestive juices build up behind the blockage, causing upper-abdominal pain, nausea, vomiting, or poor absorption of nutrients.

Afferent Lymphatic Vessel

A lymphatic vessel that carries lymph into a lymph node.

Afferent Neuron

A sensory nerve cell carrying signals from receptors in the body toward the spinal cord and brain, where information is processed and appropriate responses begin.

Afferent Pathway

A sensory nerve route carrying information from the

skin, muscles, organs, or other tissues toward the spinal cord or brain, where the signals are processed and responses can begin.

Alternate Names:
Sensory Pathway

Afferent Pupillary Defect

An asymmetry in pupillary light reactivity caused by a unilateral or asymmetric lesion in the anterior visual afferent pathway (optic nerve or retina). Identified during the swinging-flashlight test when swinging the light beam from the unaffected eye to the affected eye results in paradoxical bilateral pupillary dilation rather than constriction.

Alternate Names:
Relative Afferent Pupillary Defect; RAPD

Affinity

The strength of attraction or binding between two molecules, such as an antibody and antigen, receptor and ligand, or enzyme and substrate.

Affinity Chromatography

A laboratory method for separating and purifying a substance by allowing it to stick to a partner designed to recognize it. Other substances are washed away, and the desired substance is then released.

A Fib

Alternate name; see *Atrial Fibrillation*.

AFib

Alternate name; see *Atrial Fibrillation*.

Afibrinogenaemia

Alternate spelling; see *Afibrinogenemia*.

Afibrinogenemia

A rare congenital or severe acquired coagulation disorder characterized by the complete or near-complete absence of circulating fibrinogen (factor I, <0.1 g/L). Inherited in an autosomal recessive pattern (mutations in *FGA*, *FGB*, or *FGG*), it manifests with umbilical cord bleeding in neonates, spontaneous mucosal and intracranial hemorrhages, hemarthroses, and prolonged bleeding times.

Alternate Names:
Congenital Afibrinogenemia; Fibrinogen Deficiency; Afibrinogenaemia

Aflatoxin

A toxin made by certain molds that can contaminate foods such as grains, nuts, and spices. Long-term exposure can damage the liver and increase the risk of liver cancer.

African Sleeping Sickness

Alternate name; see *Human African Trypanosomiasis*.

African Trypanosomiasis

Alternate name; see *Human African Trypanosomiasis*.

Afterbirth

The placenta and the membranes that surrounded the baby, which leave the womb after childbirth. If any part remains inside, it can cause heavy bleeding or infection.

After-Cataract

Clouding of the thin membrane behind the artificial lens after cataract surgery. It can develop months or years later and cause blurred or hazy vision, glare around lights, or reduced sharpness of vision.

Alternate Names:
Posterior Capsule Opacification; Secondary Cataract

Afterdepolarization

An abnormal electrical oscillation occurring during or immediately following myocardial action potential repolarization, capable of reaching threshold and triggering cardiac arrhythmias. Early afterdepolarizations occur during plateau or repolarization phases, while delayed afterdepolarizations occur after repolarization is complete.

Afterload

The pressure or resistance the heart must overcome

to push blood out of its ventricles. Higher blood pressure or narrowing of blood vessels increases the heart's workload and can make pumping less efficient.

Afterpains

Cramp-like pains in the lower abdomen during the first few days after childbirth, caused by the womb tightening and shrinking. They may become stronger during breastfeeding and help reduce bleeding.

Aftershave Poisoning

Harm from swallowing aftershave, which may contain alcohol, fragrance, or other chemicals. It can cause vomiting, drowsiness, low blood sugar, breathing problems, or coma.

Against-the-rule Astigmatism

A type of astigmatism in which the steepest curve is close to horizontal rather than vertical. This uneven curve makes light focus unevenly on the retina, which can blur or distort vision. It is the opposite of with-the-rule astigmatism.

Agammaglobulinaemia

Alternate spelling; see *Agammaglobulinemia*.

Agammaglobulinemia

A serious immune deficiency with very low or absent immunoglobulins, usually caused by impaired development of antibody-producing B cells. It leads to recurrent bacterial infections, especially of the ears, sinuses, lungs, or bloodstream.

Aganglionic Megacolon

Congenital absence of nerve cells in part of the large intestine, causing Hirschsprung disease. The affected segment cannot relax normally, leading to intestinal obstruction, abdominal swelling, and delayed passage of stool.

Agar

A jelly-like substance made from red seaweed. Laboratories add it to nutrient mixtures to grow and identify bacteria and fungi on solid surfaces, such as culture plates. It is also used in some bulk laxatives.

Agatston Score

A number calculated from a special CT scan that measures calcium in the heart's arteries. A higher score usually means more coronary plaque and higher heart-disease risk, but it does not directly show blockage. Doctors interpret it with age, sex, blood pressure, cholesterol, diabetes, smoking, family history, and other health conditions.

Alternate Names:
Coronary Artery Calcium (CAC) Score; Agatston Calcium Score

Ageing

Ageing is the natural, lifelong process of physical and biological change. Over time, body reserves may decrease and the risk of some diseases may increase, but the effects vary between people.

Alternate Names:
Aging

Agenesis

Failure of an organ or body structure to form before birth, so it is absent. Agenesis may affect one organ, such as a kidney, or a specific body structure, such as the corpus callosum.

Agenesis of Commissura Magna Cerebri

An older anatomic name for agenesis of the corpus callosum, in which the major commissural fiber tract connecting the cerebral hemispheres is absent or underdeveloped.

Agenesis Of The Corpus Callosum

A birth condition in which the band of nerve fibres connecting the brain's two halves is partly or completely absent. Effects vary widely and may include seizures, developmental delay, learning difficulties, or no noticeable symptoms.

Age Regression

A mental state or behavior involving a temporary return to thoughts, feelings, behaviors, or mannerisms

associated with an earlier stage of life. It may occur in dissociative disorders, hypnosis, trauma-related states, or some therapeutic contexts and is not itself a diagnosis.

Age-Related Cataract

Clouding of the eye's natural lens that develops with aging as lens proteins and structure change. It is the most common type of cataract and often progresses gradually, causing blurred or faded vision, glare, reduced contrast, or difficulty seeing at night.

Age-Related Hearing Loss

Alternate name; see *Presbycusis*.

Age-Related Macular Degeneration

A degenerative disease of the macula associated with aging that can impair detailed central vision. Dry (atrophic) disease involves gradual loss of retinal cells; wet (neovascular) disease involves abnormal blood vessels that leak or bleed beneath or within the retina and may cause faster vision loss.

Alternate Names:
AMD

Age Spots

Flat tan, brown, or black spots on chronically sun-exposed skin, especially the face and backs of the hands. Also called solar lentigines, they result from localized accumulation of melanin and are benign; they are unrelated to liver disease.

Alternate Names:
Liver Spots; Solar Lentigines; Senile Lentigines; Sun Spots

Age-Standardized Rate

A disease or death rate recalculated as if different populations had the same age distribution. This makes comparisons fairer when one population has more older or younger people than another.

Ageusia

Complete loss of the ability to taste. It may result from infections, mouth or nose problems, medicines, chemotherapy, head injury, nerve damage, nutritional deficiency, or neurological disease. Loss of smell can also make food seem tasteless.

Agger Nasi

The most anterior and superior ethmoidal air cell, located immediately anterior to the attachment of the middle nasal turbinate and serving as an important anatomical landmark in functional endoscopic sinus surgery.

Agglutination

Visible clumping that occurs when antibodies or other binding substances join cells or particles together. Laboratory workers use this reaction to help identify blood groups, infections, and other substances in patient samples.

Agglutination Test

A laboratory test that mixes a patient sample with a known antibody or antigen. Visible clumping suggests that the matching substance is present and may help identify blood groups or infections.

Agglutinin

An antibody or other substance that causes cells or particles to stick together in visible clumps. Agglutinins are used in laboratory tests, including blood-group testing and some infection tests.

Agglutinogen

An antigen on a cell or particle that can react with a matching antibody and cause visible clumping. Agglutinogens are especially important in identifying blood groups.

Aggression

Words or actions intended to threaten, harm, or intimidate another person or damage property. Aggression may result from emotional distress, pain, mental illness, brain disorders, medicines, or substance use.

Aggressive

Describes behavior that is forceful or hostile, or a disease that progresses rapidly, invades nearby

tissue, or spreads. When used for a disease, the word is a general description and does not by itself specify its growth rate or prognosis.

Aggressive Angiomyxoma

A rare, usually slow-growing soft-tissue tumor that most often develops in the vulva, perineum, or pelvis of women of reproductive age. It can grow into nearby tissue and often returns after treatment, but rarely spreads to distant organs.

Aggressive Cancer

A cancer that is likely to grow, invade nearby tissue, or spread quickly. Doctors assess its aggressiveness using the cancer type, cell appearance, genetic features, stage, growth rate, and response to treatment.

Agility

The ability to move, stop, or change direction quickly while staying balanced and controlled. Doctors and therapists may assess agility when evaluating movement, coordination, recovery from injury, or physical function.

Agitation

An uncomfortable state of inner tension, restlessness, or increased activity. It may cause pacing, irritability, or inability to remain calm and can result from medical illness, pain, medicines, substance use, or mental health conditions.

Agnathia

A rare birth condition in which the lower jaw is partly or completely absent. It may cause major facial abnormalities and serious problems with breathing, swallowing, and feeding.

Agnogenic Myeloid Metaplasia (AMM)

An older name for primary myelofibrosis, a chronic bone-marrow disorder in which abnormal scar tissue and blood-cell production outside the marrow cause anemia, enlarged spleen, constitutional symptoms, and abnormal blood counts.

Agnosia

An inability to recognize familiar objects, people, sounds, or other sensations even though the related sense works normally. It usually results from damage to areas of the brain that interpret sensory information.

Agonist

A drug or other ligand that binds to a receptor and activates it, producing a biological response. A full agonist can produce the maximum response in a given system, whereas a partial agonist produces a submaximal response even when occupying receptors.

Agonist Muscle

The main muscle responsible for producing a particular movement.

Alternate Names:
Prime Mover

Agoraphobia

An anxiety disorder involving persistent, intense fear of places or situations where escape may be difficult, help may be unavailable, or panic-like symptoms may feel embarrassing. People may avoid crowds, public transportation, shops, or leaving home alone; the fear and avoidance cause significant distress or interfere with daily functioning.

Agostini's Reaction

A historical chemical test for glucose in urine. It used a gold-chloride reagent and an alkali; when heated with glucose, the mixture turned red. It is not a routine test in modern clinical practice.

Alternate Names:
Agostini's Test

Agranulocytes

A group of white blood cells that do not have prominent granules when viewed under a microscope. The group mainly includes lymphocytes and monocytes, which help defend the body against infection.

Agranulocytosis

A serious condition with a profoundly low number of granulocytes, especially neutrophils; it is often defined by an absolute neutrophil count below 500 cells per microliter, although thresholds vary. It increases the risk of severe infection and may result from medicines, chemotherapy, infection, autoimmune disease, or bone-marrow disorders.

Agraphesthesia

An inability to recognize a number or letter traced on the skin with the eyes closed, despite normal basic touch sensation. It may indicate damage to the opposite parietal lobe of the brain.

Agraphia

Loss of a previously learned ability to write because of brain damage or disease. It may follow a stroke, head injury, brain tumour, or neurodegenerative disease and may occur with problems speaking or reading.

Aicardi-Goutieres Syndrome

A rare inherited disorder in which abnormal immune activity causes inflammation and damage mainly in the brain, skin, and immune system. It may begin in infancy with developmental regression, seizures, brain changes, and painful skin lesions.

Aicardi Syndrome

A rare neurodevelopmental disorder affecting mainly girls, classically involving infantile spasms, partial or complete absence of the corpus callosum, and distinctive chorioretinal lacunae. Other brain, eye, and skeletal abnormalities may occur, and severity varies.

Aichmophobia

An intense, irrational, and persistent fear of sharp or pointed objects, such as needles, knives, scissors, or pens, producing acute situational anxiety or avoidance behavior.

Alternate Names:
Fear of Sharp Objects

AIDS

The most advanced stage of HIV infection. In the United States, AIDS is diagnosed when a person with HIV has a CD4 count below 200 cells/mm^3 or develops an AIDS-defining condition.

Alternate Names:
Acquired Immunodeficiency Syndrome; Stage 3 HIV Infection

AIDS-Associated Nephropathy

Kidney disease caused by HIV, usually in untreated or poorly controlled infection. It often causes large amounts of protein in the urine and may rapidly worsen kidney function, leading to kidney failure.

Alternate Names:
HIV-Associated Nephropathy

AIDS-Defining Illnesses

Infections and cancers classified as AIDS-defining conditions in a person with HIV. Their presence can meet the clinical criteria for AIDS, even when a current CD4 count is unavailable. Examples include Pneumocystis pneumonia, Kaposi sarcoma, cytomegalovirus retinitis, and esophageal candidiasis.

Alternate Names:
AIDS-Defining Conditions; AIDS-Defining Opportunistic Infections

AIDS Dementia

A severe form of HIV-associated brain disease occurring mainly in advanced HIV infection. It may cause worsening memory and thinking, slowed movement, difficulty walking, and changes in behaviour.

Ailurophobia

An excessive, irrational fear of cats, leading to significant distress, anxiety symptoms, or behavioral avoidance of domestic felines.

Alternate Names:
Gatophobia; Fear of Cats

Ainhum

A rare disorder in which a painful fibrous band slowly tightens around a toe, usually the little toe.

The band can damage bone and blood supply and may eventually cause loss of the affected part.

Alternate Names:
Dactylolysis Spontanea

Air Abrasion

A dental technique that uses compressed air to spray fine abrasive particles onto a tooth. It can remove limited decay, stains, or old filling material and prepare the tooth for a restoration.

Air Bag

An inflatable vehicle safety device that rapidly expands during a crash to cushion impact and reduce serious injury. It works with, but does not replace, a properly worn seat belt.

Airborne Disease

An infection that can spread when a person breathes in tiny particles containing germs that remain in the air. The risk depends on the germ, ventilation, distance, and length of exposure.

Airborne Precautions

Infection-control measures for pathogens that can spread through infectious particles suspended in air. They include placement in an airborne infection isolation room with negative pressure and appropriate ventilation, limiting transport, and use of a fit-tested respirator such as an N95. They are used for infections such as tuberculosis, measles, and chickenpox.

Air Bronchogram

A branching pattern of air-filled airways seen within an area of lung that has lost its normal air, usually because the air sacs contain fluid, pus, blood, or cells. It is a sign on a chest X-ray or CT scan.

Air-Conditioner Lung

A form of hypersensitivity pneumonitis caused by inhaling microbial antigens from contaminated air-conditioning or humidifying systems. It can cause recurrent fever, cough, shortness of breath, and diffuse lung inflammation; prolonged or repeated exposure may lead to chronic lung damage.

Air Contaminants

Harmful substances in indoor or outdoor air, including smoke, dust, gases, chemicals, allergens, and germs. Health effects depend on the substance, amount breathed, duration of exposure, and a person's health.

Air Embolism

A blockage of blood flow caused by an air or gas bubble entering the bloodstream. Air can enter the circulation during surgical or medical procedures, chest trauma, or rapid pressure changes (such as ascending too quickly during scuba diving). Depending on where the bubble travels, it can block blood flow to the lungs, heart, or brain, potentially causing severe shortness of breath, chest pain, stroke-like symptoms, or loss of consciousness.

Alternate Names:
Gas Embolism; Vascular Air Embolism

Air Passages

The connected tubes that carry air from the nose and mouth to the lungs. They include the throat, voice box, windpipe, and branching airways; swelling, mucus, or an object can narrow or block them.

Airplane Ear

Ear pain, fullness, popping, or temporary hearing loss caused by unequal air pressure on the two sides of the eardrum during takeoff or landing. It is more likely with a blocked nose or ear infection.

Alternate Names:
Barotitis Media

Air Polishing

A dental procedure that directs air, water, and a fine powder onto teeth to remove plaque and surface stains. Common powders include glycine, erythritol, and sodium bicarbonate.

Air Pollution

Air contaminated with harmful gases, particles, smoke, chemicals, or germs. Breathing polluted air can irritate the eyes and lungs and increase the risk of asthma attacks, infections, heart disease,

stroke, and other health problems.

Air Quality

A measure of how clean or polluted the air is, based on the amounts of harmful substances it contains. Poor air quality can affect breathing and heart health, especially in people with existing medical conditions.

Air Sac

A thin-walled structure that contains air. In human lungs, individual air sacs are alveoli, where oxygen enters the blood and carbon dioxide leaves it. Birds have larger air sacs that help move air through their lungs, but those sacs do not themselves carry out gas exchange.

Air-Sickness

Motion sickness caused by the movement of an aircraft. Mismatched signals from the eyes and inner ear can cause nausea, dizziness, sweating, headache, and sometimes vomiting.

Airsickness

Alternate spelling; see *Air-Sickness*.

Air Trapping

A condition in which extra air remains in the lungs after breathing out because narrowed or damaged airways prevent complete exhalation. It commonly occurs in asthma, chronic obstructive pulmonary disease, and bronchiolitis.

Airway

Any passage that carries air between the outside of the body and the lungs, including the nose, mouth, throat, voice box, windpipe, and branching tubes. Swelling, mucus, or an object can narrow or block an airway and restrict breathing.

Airway Clearance Techniques

Methods used to loosen and remove mucus from the breathing tubes. They include controlled coughing, breathing exercises, drainage positions, devices that create resistance during exhalation, and vibrating vests. The choice depends on the illness and the person's strength and ability.

Airway Management

The methods and equipment used to keep a person's airway open and support breathing when airflow is threatened. They may include positioning, suction, airway devices, or a breathing tube connected to a ventilator.

Airway Obstruction

A blockage that partly or fully stops air from moving through the breathing passages. It may be caused by food or another object entering the airway, swelling, mucus, injury, a tumor, or relaxed airway muscles. It can cause noisy breathing, wheezing, low blood oxygen, or breathing to stop.

Airway Resistance

The difficulty air encounters while moving through the breathing tubes. Narrowing from muscle tightening, swelling, mucus, or loss of support increases resistance and makes the breathing muscles work harder.

Akathisia

A movement disorder causing an uncomfortable inner restlessness and a strong urge to move, often with pacing, rocking, or repeated shifting of the legs. It is commonly a side effect of antipsychotic or other medicines.

Akinesia

An inability to initiate or perform voluntary movement, or a marked lack of spontaneous movement. It may occur in Parkinson disease and related disorders, severe depression, or other conditions affecting the brain's movement-control systems.

Akinetic

Describing a person or condition with little or no voluntary movement. It may result from a neurological disease, medicine effect, severe illness, or damage to the brain's movement-control systems.

Akinetic Mutism

A state in which a person is awake but makes little or no voluntary movement or speech. It usually results from severe damage or dysfunction in brain areas that control motivation, attention, and movement.

Akinetopsia

A rare neuropsychological visual deficit characterized by an inability to perceive visual motion, resulting in moving objects appearing as a succession of static freeze-frames. It typically results from bilateral cortical lesions in the middle temporal visual area (area MT/V5).

Alternate Names:
Motion Blindness; Visual Motion Agnosia

Alagille Syndrome

A genetic disorder in which too few or abnormal bile ducts can cause liver disease and jaundice. It may also affect the heart, kidneys, eyes, blood vessels, bones, and facial features. Most cases involve changes in the JAG1 gene.

AL Amyloidosis

A disorder in which clonal plasma cells produce immunoglobulin light chains that misfold and form extracellular amyloid fibrils in tissues. Deposits can impair the heart, kidneys, peripheral nerves, liver, or digestive tract. It is distinct from transthyretin and serum amyloid A amyloidosis.

Alternate Names:
Light Chain Amyloidosis

Alanine

An amino acid, or protein-building molecule, made by the body and obtained from food. Cells use it to make proteins and to help move nitrogen and produce glucose for energy.

Alanine Aminotransferase

An enzyme found mainly inside liver cells. When liver cells are injured, alanine aminotransferase can leak into the blood, causing a raised test result. The result helps assess liver injury but does not identify its cause by itself.

Alternate Names:
ALT

Alanine Aminotransferase Test

A blood test that measures the level of alanine aminotransferase, an enzyme concentrated in liver cells; elevated levels typically indicate acute or chronic liver inflammation or injury. See *Alanine Aminotransferase* and *Liver Function Tests*.

Alanine Transaminase Blood Test

A blood test that measures alanine aminotransferase, an enzyme released when liver cells are damaged. A high result may occur with hepatitis, medicine-related injury, fatty liver disease, or other conditions; its significance varies with clinical context.

ALARA Principle

A foundational radiation safety standard mandating that occupational and medical ionizing radiation exposures be kept as low as reasonably achievable, utilizing dose optimization, exposure time reduction, increased distance, and protective shielding.

Alternate Names:
As Low As Reasonably Achievable

Alarmin

A signal released by injured or severely stressed cells that alerts the immune system. It helps start inflammation and attract protective cells to damaged tissue, even before the body identifies whether infection is present.

Albendazole

An antiparasitic medicine that damages the internal structures parasites need to absorb nutrients and survive. It treats several worm infections, including some intestinal and tissue infections, when prescribed for the appropriate parasite.

Albers-SchöNberg Disease

A usually inherited form of osteopetrosis in which bones become unusually dense because old bone is not removed normally. The bones can still break easily and may cause pain or pressure on nerves, especially in the skull.

Alternate Names:
Autosomal Dominant Osteopetrosis Type II (ADO II); Marble Bone Disease

Albinism

A group of inherited genetic conditions in which the body produces little or no melanin, the pigment responsible for skin, hair, and eye coloration. Characterized by pale skin, white or light blond hair, and light-colored irises, it frequently causes visual impairments—including reduced visual sharpness, rapid involuntary eye movements (nystagmus), extreme sensitivity to bright light (photophobia), and abnormal optic nerve development. People with albinism have an elevated risk of severe sunburn and skin cancer, requiring strict sun protection.

Alternate Names:
Congenital Achromia

Albinismus

Alternate Latin term; see *Albinism*.

Albino

An older noun for a person or animal with albinism, an inherited condition involving reduced melanin. For people, "person with albinism" is usually preferred because it describes the condition without defining the person by it.

Albright Hereditary Osteodystrophy

A genetic condition that may cause short stature, a round face, obesity, dental problems, extra bone under the skin, and shortening of some finger bones. It is linked to changes in the *GNAS* gene and may occur with hormone-resistance disorders.

Alternate Names:
AHO

Albright's Hereditary Osteodystrophy

A group of inherited features that may include short stature, a round face, shortened fingers or toes, extra bone under the skin, and obesity. Some people also have resistance to parathyroid hormone or other hormones.

Albumen

The white part of an egg, made mostly of water and proteins. Albumen is a food substance and is different from albumin, the main protein in blood plasma.

Albumin

The main protein in blood plasma, made by the liver. It helps keep fluid inside blood vessels and carries substances such as hormones, fatty acids, and some medicines through the bloodstream.

Alternate Names:
Serum Albumin

Albumin Clearance

A measure of how quickly the blood protein albumin leaves the bloodstream or another body space. It is used mainly in specialized kidney, liver, or research tests to study leakage, transport, or removal of the protein.

Albuminocytologic Dissociation

A characteristic cerebrospinal fluid finding marked by an elevated protein concentration in the absence of a commensurate increase in white blood cell count. Classically seen in Guillain-Barr'e syndrome after the first week of illness, as well as in chronic inflammatory demyelinating polyneuropathy and spinal cord tumors.

Alternate Names:
Albumino-Cytological Dissociation; Protein-Cell Dissociation

Albumin Test

A blood or urine test measuring the concentration of albumin, the predominant circulating protein produced by the liver, used to assess nutritional status, liver synthetic function, and kidney disease; see *Albumin*.

Albumin-To-Creatinine Ratio

A urine test that estimates how much albumin, a blood protein, is leaking through the kidneys by comparing it with creatinine in the same sample. A persistent result above 30 mg/g may indicate kidney damage; results above 300 mg/g indicate

severe leakage.

Albuminuria

An abnormally high amount of albumin in the urine, showing that the kidneys are allowing this blood protein to pass through. It may be temporary or persistent; ongoing albuminuria can indicate kidney damage and increased cardiovascular risk.

ALCAPA Syndrome

A rare congenital cardiovascular anomaly in which the left coronary artery arises abnormally from the pulmonary artery instead of the aorta. Because the pulmonary artery carries desaturated blood at low pressure, myocardial perfusion is compromised, leading to retrograde coronary flow (coronary steal), infantile heart failure, myocardial infarction, and mitral regurgitation if uncorrected.

Alternate Names:
ALCAPA; Bland-White-Garland Syndrome; Anomalous Left Coronary Artery from the Pulmonary Artery

Alcohol

Ethanol, a substance in beer, wine, and spirits that affects the central nervous system. Excessive consumption impairs motor coordination and cognitive judgment, produces acute intoxication, and can lead to physical dependence, metabolic toxicity, and chronic organ damage.

Alcohol-Associated Liver Disease

Liver injury associated with alcohol use. It ranges from steatosis and inflammation to fibrosis, cirrhosis, liver failure, or liver cancer; severity depends on alcohol exposure, genetics, nutrition, and other health factors.

Alcohol Dehydrogenase

An enzyme found mainly in the liver that begins breaking down alcohol. It changes alcohol into acetaldehyde, a harmful intermediate that is then processed into less toxic substances.

Alternate Names:
ADH; Ethanol Dehydrogenase

Alcoholic Cardiomyopathy

Alternate name; see *Alcohol-Induced Cardiomyopathy*.

Alcoholic Foetor

An alcohol-like odor on the breath after recent alcohol consumption. Breath odor alone cannot determine the amount consumed or establish intoxication.

Alternate Names:
Alcoholic Fetor; Alcohol Breath; Fetor Alcoholicus

Alcoholic Hepatitis

An acute inflammation and injury of the liver caused by heavy alcohol use. It commonly causes jaundice, fatigue, fever, nausea, and abdominal pain and can become severe enough to cause liver failure.

Alternate Names:
Alcohol-Associated Hepatitis; Alcohol-Induced Hepatitis

Alcoholic Ketoacidosis

A dangerous buildup of acids in the blood that can occur after prolonged heavy alcohol use, poor food intake, and repeated vomiting. It may cause abdominal pain, nausea, dehydration, rapid breathing, and a normal or low blood-sugar level.

Alcoholic Liver Disease

Alternate name; see *Alcohol-Associated Liver Disease*.

Alcoholic Myopathy

Muscle damage caused by heavy alcohol use. It may cause muscle pain, tenderness, weakness, or wasting; severe acute injury can destroy muscle tissue and damage the kidneys.

Alternate Names:
Alcohol-Induced Myopathy; Ethanol-Induced Myopathy

Alcoholic Neuropathy

Peripheral nerve damage associated with long-term heavy alcohol use and sometimes nutritional deficiency. It commonly causes burning pain, numbness, tingling, or weakness, especially in the feet and lower

legs.

Alcohol-Induced Cardiomyopathy

A disease of the heart muscle caused by long-term heavy alcohol use. The heart may enlarge and weaken, so it pumps blood less effectively. This can lead to heart failure or abnormal heart rhythms.

Alcohol Intolerance

An unpleasant reaction after drinking alcohol, often caused by inherited difficulty breaking down alcohol or sensitivity to an ingredient in the drink. Symptoms may include flushing, headache, nausea, rapid heartbeat, or worsening asthma.

Alcohol Intoxication

Temporary impairment caused by drinking alcohol. It can cause poor judgment, confusion, slurred speech, loss of coordination, vomiting, reduced consciousness, slowed breathing, or coma.

Alternate Names:
Alcoholic Intoxication

Alcoholism

Alternate name; see *Alcohol Use Disorder*.

Alcohol Poisoning

A life-threatening overdose of alcohol that severely depresses brain function and can cause vomiting, inability to wake, seizures, slow or irregular breathing, low body temperature, coma, or death.

Alcohol-Related Dementia

A cognitive disorder associated with long-term heavy alcohol use. Brain injury may reflect direct alcohol toxicity, thiamine deficiency, liver disease, vascular injury, or a combination; memory, planning, attention, and other abilities may be affected.

Alternate Names:
Alcoholic Dementia; Alcohol-Induced Major Neurocognitive Disorder

Alcohol-Related Neuropathy

Damage to the peripheral sensory and motor nerves caused by chronic, long-term alcohol abuse and associated nutritional deficiencies, typically presenting with symmetric numbness, paresthesias, burning pain, and muscle weakness beginning in the lower extremities.

Alternate Names:
Alcoholic Neuropathy; Alcoholic Polyneuropathy

Alcohol-Related Psychosis

Hallucinations, delusions, or other psychotic symptoms associated with alcohol use, intoxication, withdrawal, or a coexisting alcohol-related disorder. Similar symptoms can occur in other medical and psychiatric conditions.

Alcohol Swab

A single-use pad moistened with alcohol, usually used to clean intact skin before an injection or other procedure. The skin is allowed to dry before the procedure.

Alcohol Use Disorder

A pattern of alcohol use causing clinically significant distress or impairment, with difficulty controlling use, craving, risky use, or continued use despite harm. Diagnosis requires at least two of 11 symptoms within a 12-month period; severity is mild with 2–3 symptoms, moderate with 4–5, and severe with 6 or more.

Alternate Names:
Alcoholism (older term); Alcohol Dependence (older diagnostic term)

Alcohol Withdrawal

Symptoms that can occur after a person who drinks heavily for a long time suddenly stops or greatly reduces alcohol. Symptoms include shaking, sweating, anxiety, nausea, hallucinations, seizures, and delirium; severe withdrawal can be life-threatening.

Alternate Names:
Alcohol Withdrawal Syndrome

Alcuronium

An older, rarely used nondepolarizing neuromuscular-blocking medicine that temporarily paralyzes skeletal muscles during anesthesia. It can also paralyze the muscles needed for breathing,

so it is used only with controlled ventilation and monitoring.

ALD

Abbreviation commonly referring to adrenoleukodystrophy, an inherited disorder of fatty-acid metabolism that can damage the nervous system and adrenal glands.

Aldolase Blood Test

A blood test that measures aldolase, an enzyme found mainly in muscle and liver. A high result may occur with muscle injury or disease, but it is not specific and is interpreted with symptoms and other tests.

Aldosterone

A hormone made by the adrenal glands that helps the kidneys retain sodium and water and remove potassium. It helps control blood volume and blood pressure.

Aldosterone Blood Test

A blood test that measures the hormone aldosterone. It helps investigate high or low blood pressure and abnormal potassium levels and is usually interpreted together with a renin test.

Aldosterone Escape

A physiological phenomenon in primary hyperaldosteronism where persistent mineralocorticoid excess causes initial sodium and water retention, but subsequent increased atrial natriuretic peptide secretion and pressure natriuresis prevent progressive hypervolemia and severe edema.

Aldosterone-to-Renin Ratio

A clinical screening blood test used in the evaluation of secondary hypertension to detect primary aldosteronism (Conn syndrome). A significantly elevated ratio of plasma aldosterone concentration to plasma renin activity prompts confirmatory testing.

Alternate Names:
ARR

Aldosteronism With Normal Blood Pressure

A form of primary aldosteronism in which excess aldosterone is present without obvious hypertension. It may still cause low potassium, metabolic alkalosis, or cardiovascular and kidney risk.

Alektorophobia

An intense and irrational fear of chickens or other fowl, causing marked anxiety or panic upon exposure to the birds, their feathers, or eggs.

Alternate Names:
Fear of Chickens

Aleukemic Leukemia

A presentation of acute or chronic leukemia in which malignant blasts or abnormal leukocytes are absent or present in extremely low numbers in the peripheral blood smear, despite extensive malignant infiltration of the bone marrow.

Alexander Disease

A rare genetic disorder in which abnormal GFAP protein damages the brain's supporting cells and white matter. It may begin in infancy, childhood, or adulthood and can cause enlarged head size, developmental problems, movement difficulty, seizures, or progressive weakness.

Alternate Names:
Fibrinoid Leukodystrophy; GFAP Leukodystrophy

Alexia

Loss of the ability to understand written words despite adequate eyesight, usually because of brain damage from a stroke, injury, tumour, or degenerative disease. It may occur with other language or reading problems.

Alexia Without Agraphia

A classical neurological disconnection syndrome in which a patient can write spontaneously and to dictation but is completely unable to read printed or handwritten text (including their own writing). Caused by an infarction of the left posterior cerebral artery affecting the left visual cortex and the splenium of the corpus callosum, isolating the intact

right visual cortex from the language centers of the left hemisphere.

Alternate Names:
Pure Alexia; Dejerine Syndrome; Pure Word Blindness

Alexithymia

Difficulty recognizing, understanding, or describing one's own emotions. It is a trait or symptom rather than a diagnosis and may occur with autism, depression, trauma, stress, or other conditions.

Alezzandrini Syndrome

An exceptionally rare acquired disorder of unilateral melanocyte destruction involving ipsilateral facial vitiligo and poliosis with retinal or visual abnormalities and sometimes hearing loss. The cause is uncertain, and vision or hearing may progressively worsen.

Alfacalcidol

A medicine related to vitamin D that the liver changes into an active form. It increases absorption of calcium and phosphate and is used for selected disorders of bones, kidneys, or mineral balance.

Algia

A word ending that means pain. It appears in terms such as neuralgia for nerve pain, myalgia for muscle pain, and arthralgia for joint pain; it does not identify the cause.

Alglucerase

An older enzyme-replacement medicine for Gaucher disease, a disorder in which fatty substances build up in cells. It replaces an enzyme the body lacks; newer enzyme preparations are used more often.

Algodystrophy

Older term; see *Complex Regional Pain Syndrome*.

Algoneurodystrophy

Older term; see *Complex Regional Pain Syndrome*.

Algophobia

An abnormal, persistent, and exaggerated fear of experiencing physical pain, often leading to hypervigilance, anticipatory panic, and avoidance of medical procedures or physical activity.

Alternate Names:
Fear of Pain

Algor Mortis

The gradual cooling of the body after death toward the surrounding temperature. The amount of cooling can help estimate the time since death, but it is affected by the environment and other conditions.

Aliasing Artifact

An ultrasound error in which blood flow moving faster than the selected display range appears to change direction or speed. It reflects a limitation of the image display, not necessarily abnormal blood flow.

Alice in Wonderland Syndrome

A rare neurological and perceptual condition characterized by transient distortions of visual perception and body image, in which objects or one's own body parts appear abnormally large (macropsia) or small (micropsia), frequently associated with migraines or Epstein–Barr virus infection.

Alternate Names:
Todd Syndrome; Dysmetropsia

Alien Hand Syndrome

A neurological condition in which an upper limb performs autonomous, purposeful-appearing actions without conscious voluntary control, often accompanied by the patient's sensation that the limb is foreign or acting independently. It is associated with lesions of the corpus callosum, supplementary motor area, or medial frontal cortex.

Alternate Names:
Alien Limb Phenomenon; Anarchic Hand

Alimentary

Relating to eating, digestion, or the movement of food through the body. In medical language, it

usually refers to the digestive tract and the organs that help break down and absorb food.

Alimentary Canal

The continuous muscular tube through which food passes from the mouth to the anus. It includes the throat, oesophagus, stomach, small intestine, and large intestine.

Alkalemia

An abnormally elevated arterial blood pH (greater than 7.45), indicating a decreased hydrogen ion concentration in circulating blood. It represents the net systemic state caused by underlying metabolic or respiratory alkalosis.

Alkali

A basic substance that can neutralize acids. Strong alkalis, such as some cleaning chemicals, can burn the skin, eyes, and digestive tract, while weaker alkalis have food, laboratory, or medical uses.

Alkaline Diet

A diet based mainly on foods claimed to make the body more alkaline. The lungs and kidneys tightly control blood acidity, so food does not make the blood alkaline, although many such diets include nutritious foods.

Alkaline Phosphatase

An enzyme found mainly in the liver, bile ducts, bones, intestine, and placenta. A high blood level may reflect liver or bile-duct disease, increased bone activity, pregnancy, or another condition; its source is clarified by other clinical and laboratory findings.

Alkaline Phosphatase Test

A quantitative serum laboratory assay measuring alkaline phosphatase activity to evaluate suspected cholestatic liver disease, biliary obstruction, or increased bone turnover such as Paget disease or bone metastases.

Alternate Names:
ALP Blood Test; Serum ALP; Alkaline Phosphatase Level

Alkaloid

A naturally occurring chemical containing nitrogen, often made by plants, that can strongly affect the body. Examples include morphine, quinine, nicotine, and atropine.

Alternate Names:
Plant Alkaloid; Basic Nitrogenous Organic Compound

Alkalosis

An abnormal bodily state in which body fluids become too alkaline, raising the blood's pH balance above normal. It is divided into two main types: **respiratory alkalosis**, which happens when rapid or deep breathing (hyperventilation) expels too much carbon dioxide; and **metabolic alkalosis**, which happens when the body loses too much acid (such as from prolonged vomiting or diuretic use) or accumulates too much bicarbonate. Symptoms may include muscle twitches, cramps, numbness, tingling in the fingers or around the mouth, and confusion.

Alkaptonuria

A rare inherited metabolic disorder usually caused by disease-causing variants in both copies of the *HGD* gene, which reduce activity of the enzyme homogentisate 1,2-dioxygenase. Homogentisic acid then builds up; urine may turn dark after standing, and pigment can collect in connective tissues in a process called ochronosis. Over time, this can cause arthritis, especially in the spine and large joints, and sometimes kidney or prostate stones or heart-valve disease.

Alkylating Agents

Drugs or chemicals that damage DNA by attaching chemical groups to it. Some are used to treat cancer by stopping cells from multiplying, but they can also injure healthy cells and cause side effects.

Allantoin

A compound used in some skin products to soften, moisturize, and protect irritated or rough skin. Its effect and safety depend on the product and how it is used.

Allantois

A temporary structure in the early embryo that helps with blood-vessel development and contributes to the umbilical cord and part of the urinary system.

Allele

One of two or more versions of a gene. A person usually inherits one allele from each parent; different alleles can influence traits or the risk of inherited disease.

Allelic

Relating to an allele, one of the different versions of a gene inherited from a parent.

Allen Test

A bedside test that checks whether blood can reach the hand through both of its main arteries. It may be done before taking blood from or placing a catheter in the radial artery.

Allergen

A substance that can provoke an allergic immune response in a person who reacts to it. Allergens include proteins in foods, pollen, animal material, and natural rubber, as well as some medicines and insect venoms. Sensitization to an allergen does not always cause symptoms on exposure.

Allergen Immunotherapy

Treatment that gives gradually increasing amounts of a known allergen by injections or under the tongue. Over time, it can reduce allergic symptoms for selected allergies, but it can rarely cause a serious reaction.

Allergic and Environmental Asthma

Asthma triggered or worsened by allergens or environmental exposures such as dust mites, molds, pollens, animals, smoke, air pollution, or workplace agents. It may be associated with allergic sensitization or workplace exposures.

Allergic Asthma

A common asthma phenotype triggered by environmental allergens such as pollen, animal dander, dust mites, or mold. The immune response often involves immunoglobulin E (IgE) and can cause airway inflammation, wheezing, and breathlessness.

Alternate Names:
Atopic Asthma; Extrinsic Asthma

Allergic Bronchopulmonary Aspergillosis

An allergic reaction to the fungus Aspergillus in the airways, occurring mainly in people with asthma or cystic fibrosis. It can cause worsening breathing symptoms, mucus plugs, airway widening, and high levels of allergy-related cells or antibodies.

Allergic Cascade

The chain of immune events that follows exposure to an allergen. Immune cells release substances such as histamine, which can cause itching, swelling, mucus, wheezing, hives, or anaphylaxis.

Allergic Conjunctivitis

Alternate name; see *Eye Allergies*.

Allergic Contact Dermatitis

A delayed type-IV hypersensitivity reaction after skin contact with an allergen to which the immune system has been sensitized. It causes itching, redness, swelling, blisters, scaling, or chronic fissuring, often extending beyond the contact area; patch testing can help identify the trigger.

Allergic Dermatitis

Skin inflammation caused by an immune reaction to an allergen. It commonly causes itching, redness, swelling, blisters, or scaling and may occur after contact with a triggering substance.

Allergic Diseases

Conditions in which the immune system reacts abnormally to a usually harmless substance called an allergen, such as pollen, dust mites, mold, food proteins, medicines, insect venom, or animal proteins. Some reactions involve immunoglobulin E (IgE) antibodies, while others do not. Allergic diseases may affect the nose, eyes, skin, lungs, or digestive system and can cause sneezing, itching, hives, swelling, vom-

iting, wheezing, or anaphylaxis. Examples include allergic rhinitis, food allergy, drug allergy, allergic conjunctivitis, atopic dermatitis, urticaria, and allergic asthma. Food intolerance is different because it does not involve an immune reaction.

Allergic Proctocolitis

A benign, non-IgE-mediated food protein-induced inflammatory disorder of the distal colon and rectum, seen predominantly in young infants exposed to cow's milk or soy protein in formula or breast milk, classically causing blood- and mucus-streaked stools in an otherwise thriving baby.

Alternate Names:
Food Protein-Induced Allergic Proctocolitis; FPIP

Allergic Reaction

An immune response to a usually harmless substance. It may cause sneezing, itching, hives, swelling, vomiting, or breathing difficulty and can sometimes become life-threatening anaphylaxis.

Alternate Names:
Allergic Reactions

Allergic Rhinitis

Inflammation inside the nose caused by an allergic reaction to inhaled substances such as pollen, dust mites, mold, or animal proteins. It causes sneezing, itching, a blocked or runny nose, and sometimes itchy, watery eyes.

Alternate Names:
Allergic Rhinoconjunctivitis

Allergic Shiners

Dark, symmetrical, bluish-purple circles or discolorations beneath the lower eyelids caused by venous congestion in the peri-orbital plexus, secondary to chronic nasal congestion and mucosal swelling from allergic rhinitis.

Alternate Names:
Periorbital Venous Congestion

Allergic Urticaria

Hives caused by an allergic reaction, often involving immunoglobulin E (IgE). Itchy raised welts appear and usually fade within 24 hours, though new ones may develop. Many cases of hives are not caused by allergy.

Alternate Names:
Allergic Hives

Allergies

Exaggerated, hypersensitive immune reactions to foreign substances (allergens) that are typically harmless to most individuals. Common allergens include foods, pollen, animal proteins, insect venoms, and medications, triggering symptoms from mild rhinitis and urticaria to severe anaphylaxis.

Alternate Names:
Allergic Reactions

Allergies: Shellfish

An immunoglobulin E-mediated food allergy to proteins found in crustaceans (such as shrimp, crab, and lobster) or mollusks (such as clams, oysters, and squid). Manifestations range from hives, lip swelling, and abdominal cramps to life-threatening systemic anaphylaxis.

Alternate Names:
Shellfish Allergy

Allergies to Insect Stings

Allergic reactions to venom from bees, wasps, hornets, or fire ants. Severe reactions can cause hives, throat swelling, wheezing, low blood pressure, or collapse.

Allergist

A physician specializing in allergic and immunologic disorders, including asthma, allergic rhinitis, food allergy, and immune deficiencies. Allergists assess symptoms and test findings to distinguish allergy from other immune or respiratory conditions.

Allergy

An immune response to a usually harmless substance such as pollen, food, medicine, insect venom, or animal proteins. Symptoms range from sneezing, itching, and hives to swelling, breathing difficulty, or life-threatening anaphylaxis.

Alternate Names:
Allergic Hypersensitivity

Allergy Shots

Injections used for allergen immunotherapy. They contain gradually increasing amounts of a specific allergen to reduce sensitivity over time and are given in a setting where a serious allergic reaction can be recognized and treated.

Allergy Skin Test

An in vivo diagnostic procedure in which small amounts of suspected allergens are introduced into or onto the skin via prick, puncture, scratch, or intradermal injection to assess immediate IgE-mediated hypersensitivity through localized wheal-and-flare reactions.

Alternate Names:
Skin Prick Test; Allergy Skin Testing

Allergy Test

A skin or blood test used to look for sensitivity to a suspected allergen. A positive result shows sensitization but does not always establish that exposure causes symptoms; clinical relevance depends on the exposure history.

Alternate Names:
Allergy Testing

Allergy to Natural Rubber (Latex)

An immune reaction to natural rubber latex that may cause contact dermatitis, hives, wheezing, or anaphylaxis. Reactions range from localized skin symptoms to systemic hypersensitivity.

Allis Clamp

A surgical instrument with small teeth used to hold firm tissue during an operation. It provides a strong grip but can injure delicate tissue if applied with too much pressure.

Allocheiria

A neurological sign in which a person feels or identifies a touch on the opposite side of the body from where it was applied. It reflects impaired localization of sensation and may occur with disorders affecting the parietal lobe.

Alternate Names:
Allochiria

Allodynia

Pain caused by something that normally should not hurt, such as light touch, clothing, or gentle pressure. It can occur with nerve injury, migraine, shingles, fibromyalgia, or other pain conditions.

Allogeneic

Coming from another person of the same species who is genetically different, as in an allogeneic blood, tissue, stem-cell, or organ transplant.

Allograft

An organ, tissue, or group of cells transplanted from one genetically different individual to another individual of the same species. The recipient's immune system may reject it, so immunosuppressive medicines may be needed.

Allosteric Regulation

Control of a protein or enzyme when another molecule attaches away from its main working site. The attachment changes the protein's shape and can increase or decrease how well it works.

AloBar Holoprosencephaly

Alobar holoprosencephaly is the most severe form of holoprosencephaly, in which the developing forebrain fails to divide into two cerebral hemispheres. It is usually associated with major brain and facial abnormalities and profound developmental impairment.

Aloe

A plant used in some skin products, medicines, and supplements. Aloe gel applied to skin may soothe minor irritation, while products containing aloe latex taken by mouth can cause cramps, diarrhoea, and dangerous fluid or salt loss.

Aloe Vera

A common name for Aloe species whose inner-leaf gel is used in some skin products and supplements. Oral aloe latex and some whole-leaf products can cause diarrhea, fluid or salt loss, medicine interactions, or toxicity.

Alogia

Markedly reduced speech or speech that conveys little information. It may occur as a negative symptom of schizophrenia and can also be associated with depression, brain disease, or other conditions.

Alongshan Virus

A segmented RNA virus detected in ticks and associated with human febrile illness, first identified in northeastern China. Reported symptoms include fever, headache, fatigue, muscle aches, and sometimes neurologic findings; its clinical significance and geographic distribution remain under study.

Alopecia

Hair loss from the scalp or another part of the body. It may be nonscarring, in which the hair follicles remain and hair may regrow, or scarring, in which inflammation or injury destroys the follicles and can cause permanent hair loss. Causes include inherited pattern hair loss, autoimmune disease, hormonal changes, illness, medicines, nutritional problems, infection, repeated pulling, or other injury. The amount, pattern, and speed of hair loss vary with the cause.

Alopecia Areata

An autoimmune, usually nonscarring hair-loss disorder in which immune cells attack anagen hair follicles. It often causes sharply demarcated smooth patches with exclamation-mark hairs and may involve the scalp, beard, eyebrows, or nails; regrowth is possible but relapses and extensive forms can occur.

Alternate Names:
AA; Patchy Hair Loss; Autoimmune Alopecia

Alopecia Celsi

An older name for alopecia areata, an autoimmune disorder causing sharply defined patches of nonscarring hair loss.

Alopecia Cicatrisata

Older term; see *Scarring Alopecia*.

Alopecia Circumscripta

An older name for alopecia areata, characterized by one or more circumscribed patches of nonscarring hair loss.

Alopecia Mucinosa (Follicular Mucinosis)

A skin disorder in which mucin accumulates within hair follicles and sebaceous glands, causing itchy follicular papules or plaques with hair loss. It may be a primary self-limited condition or a cutaneous sign of lymphoma, especially mycosis fungoides; persistent or widespread forms are more often associated with lymphoma.

Alopecia Totalis

A form of alopecia areata causing complete loss of hair from the scalp. Hair may regrow, remain absent, or fall out again; other autoimmune conditions may coexist.

Alopecia Universalis

Complete or near-complete loss of hair from the scalp and body, usually caused by extensive alopecia areata. Hair may regrow or recur unpredictably.

ALP Blood Test

Alternate index label; see *Alkaline Phosphatase Test*.

Alpers Disease

A rare, progressive autosomal recessive neurodegenerative disorder of early childhood caused by mutations in the nuclear gene *POLG*, characterized by the clinical triad of intractable seizures, psychomotor regression, and progressive liver failure.

Alternate Names:
Alpers-Huttenlocher Syndrome; Progressive Infantile Poliodystrophy

Alpha-1

An abbreviation that may refer to alpha-1 antitrypsin, its deficiency, or a test for the protein; its meaning depends on context.

Alpha-1 Adrenergic Antagonist

A medicine or other substance that blocks alpha-1 adrenergic receptors. This reduces selected effects of noradrenaline on vascular smooth muscle and other tissues; the precise effects depend on the receptor distribution and the substance used.

Alternate Names:
Alpha-1 Adrenergic Blocker

Alpha1-Antitrypsin (AAT) Deficiency

Alternate name; see *Alpha-1 Antitrypsin Deficiency*.

Alpha-1 Antitrypsin Blood Test

A blood test that measures alpha-1 antitrypsin, a protein made by the liver that helps protect lung tissue. A low level may suggest inherited alpha-1 antitrypsin deficiency, which can affect the lungs and liver.

Alpha-1 Antitrypsin Deficiency

An autosomal codominant genetic disorder caused by variants in the *SERPINA1* gene that lead to deficient or dysfunctional alpha-1 antitrypsin (AAT). The deficiency permits uninhibited neutrophil elastase destruction of pulmonary elastin, resulting in early-onset panacinar emphysema (markedly accelerated by smoking). Hepatocyte retention of polymerized mutant protein (most commonly the Pi*ZZ genotype) causes neonatal cholestasis, cirrhosis, and hepatocellular carcinoma. Panniculitis and ANCA-associated vasculitis may also occur.

Alternate Names:
AATD; A1AT Deficiency; AAT Deficiency; Alpha-1 Deficiency

Alpha-Agonists

Medicines that activate alpha receptors on cells. Depending on the medicine and tissue, they can narrow blood vessels, raise blood pressure, reduce eye fluid, or affect the nervous system.

Alpha Blockers

Medicines that relax certain blood vessels and smooth muscles by blocking alpha receptors. They may lower blood pressure or improve urine flow in an enlarged prostate, but can cause dizziness or fainting.

Alpha Cells

Cells in the pancreas that make glucagon. Glucagon raises blood glucose when it falls too low or when the body needs energy between meals.

Alternate Names:
Pancreatic Alpha Cells; Glucagon-Secreting Cells

Alpha-Fetoprotein

A protein made mainly by a developing fetus. Measuring it in maternal blood can help screen for some fetal conditions, while measuring it in adults can help assess selected liver or germ-cell tumours. An abnormal result does not establish a diagnosis.

Alpha-Fetoprotein Test

A blood test measuring alpha-fetoprotein, a fetal plasma protein utilized as a tumor marker for hepatocellular carcinoma and germ cell tumors, or in prenatal screening for neural tube defects; see *Alpha-Fetoprotein*.

Alpha-Gal Syndrome

An allergy to a sugar found in most mammals but not humans or other primates. It can cause delayed hives, stomach symptoms, or anaphylaxis after eating mammalian meat or using some animal-derived products.

Alternate Names:
Alpha-Gal Allergy

Alpha-Globulin

One of several groups of proteins in the liquid part of blood. These proteins carry substances and help with inflammation, clotting, and immune defence; their levels may change with liver disease, inflammation, or other conditions.

Alpha-Glucosidase Inhibitors

Diabetes medicines that slow the digestion and absorption of carbohydrates in the small intestine. They mainly reduce the rise in blood glucose after meals and may cause gas, bloating, or diarrhoea.

Alpha Hydroxy Acids

A group of acids used in skin products to loosen the outer layer of skin and improve roughness, fine lines, or uneven colour. Common examples are glycolic acid and lactic acid; they can irritate skin and increase sun sensitivity.

Alternate Names:
AHAs; Fruit Acids

Alpha-Ketoglutarate

A substance made during the breakdown of nutrients for energy. It also helps the body process amino acids and supports several chemical reactions inside cells.

Alpha-Mannosidosis

An autosomal recessive lysosomal storage disorder caused by deficient lysosomal alpha-mannosidase, usually due to biallelic variants in *MAN2B1*. Mannose-rich oligosaccharides accumulate in cells and damage multiple tissues. Manifestations vary in onset and severity and can include developmental impairment, hearing loss, recurrent infections, skeletal abnormalities, ataxia, and enlargement of the liver and spleen.

Alternate Names:
Alpha-D-Mannosidosis; Alpha-Mannosidase Deficiency

Alpha-Synuclein

A protein found mainly in nerve cells that helps regulate nerve-cell functions. Abnormal forms can collect into clumps in Parkinson disease, Lewy-body dementia, and related disorders, although the clumps are not the only cause of these diseases.

Alpha-Thalassemia

An inherited blood disorder, usually autosomal recessive, in which the body makes too little alpha-globin, a part of hemoglobin that carries oxygen. The condition may cause no symptoms, mild anemia, or severe anemia before or shortly after birth, depending on the number of affected alpha-globin genes.

Alternate Names:
Alpha Thalassaemia

Alpha Waves

A regular pattern of electrical activity in the brain, usually eight to thirteen cycles per second. It is strongest when a relaxed, awake person has closed eyes and decreases with attention or eye opening.

Alternate Names:
Alpha Rhythm; Posterior Dominant Rhythm

ALP Isoenzyme Test

A blood test that helps identify whether a high alkaline phosphatase level comes mainly from the liver, bones, intestine, or placenta. It can help distinguish liver or bile-duct disease from increased bone activity.

Alport Syndrome

An inherited disorder of collagen that can cause progressive kidney disease, hearing loss, and changes in the eyes. It may be caused by changes in the *COL4A3*, *COL4A4*, or *COL4A5* genes and may follow X-linked, autosomal dominant, or autosomal recessive inheritance.

Alprazolam

A benzodiazepine medicine used for anxiety and panic disorder. It calms brain activity but can cause sleepiness, impaired coordination, dependence, and dangerous slowing of breathing, especially with opioids or alcohol.

Alstrom Syndrome

A rare inherited disorder caused by changes in the ALMS1 gene. It may cause progressive vision and hearing loss, obesity, diabetes or insulin resistance, heart disease, and kidney or liver problems.

Alternate Names:
Alström Syndrome

Altered Mental Status

A broad clinical term denoting any disruption in baseline cognitive function, alertness, or awareness, encompassing states ranging from acute delirium, confusion, and agitation to lethargy, stupor, and coma. Common etiologies include metabolic derangements, infections, toxins, and intracranial events.

Alternate Names:
AMS; Altered Sensorium

Alternating Hemiplegia Of Childhood

A rare neurological disorder beginning in infancy or early childhood, causing recurrent episodes of temporary paralysis that may affect either side of the body. Episodes may also involve abnormal movements, eye-movement problems, breathing difficulty, seizures, and developmental impairment; symptoms typically disappear during sleep.

Altitude Headache

Headache related to ascent to high altitude, often as part of acute mountain sickness. It may occur with nausea, dizziness, fatigue, or sleep disturbance and can signal more serious altitude illness when severe or accompanied by neurologic or breathing symptoms.

Altitude Illness

Illness caused by rapid ascent to high altitude without enough time to adjust. It includes acute mountain sickness, high-altitude brain swelling, and high-altitude lung swelling; severe forms can be fatal.

Alternate Names:
Altitude Sickness

Aluminum Phosphide

A highly poisonous pesticide that releases phosphine gas when it contacts moisture or stomach acid. Poisoning can rapidly damage the heart, lungs, digestive system, and other organs.

Aluminum Toxicity

Toxicity from excessive aluminum exposure or accumulation, especially in advanced kidney disease or with contaminated dialysis products. Chronic exposure can cause encephalopathy, speech or movement changes, microcytic anemia, and bone pain or osteomalacia; evaluation includes exposure review, kidney function, and specialist-directed aluminum testing.

Alvarado Score

A clinical score used to estimate the likelihood of acute appendicitis from symptoms, examination findings, and blood-test results. It supports assessment but does not by itself confirm or exclude appendicitis.

Alveolar

Relating to an alveolus, especially one of the tiny air sacs in the lungs where oxygen enters the blood and carbon dioxide leaves it.

Alveolar Abnormalities

Changes in the lung air sacs that can interfere with oxygen and carbon-dioxide exchange. They may occur with infection, fluid buildup, emphysema, scarring, or a developmental condition.

Alveolar Adenoma

A rare, benign, well-circumscribed epithelial neoplasm of the lung, composed of cystic spaces lined by alveolar epithelial cells with a supporting stromal component. It generally appears as a solitary pulmonary nodule and may be found incidentally. It is distinct from malignant lung tumours, although imaging alone may not establish its histology.

Alveolar-Arterial Oxygen Gradient

The difference between oxygen pressure in the lung air sacs and oxygen pressure in arterial blood. It is calculated as PAO2 minus PaO2. A high value may indicate a problem with oxygen transfer, blood flow through the lungs, or lung tissue. A normal value with low blood oxygen may suggest slow breathing or low oxygen in the surrounding air.

Alternate Names:
A-a Gradient; A-a Oxygen Difference

Alveolar Bone

The part of the jawbone that surrounds and sup-

ports the roots of the teeth. It can shrink after tooth loss and may need rebuilding before some dental implants.

Alveolar Bone Loss

Loss of the bone that supports the teeth, most often caused by periodontitis. It can make teeth loose and may lead to tooth loss; dental treatment can slow further loss.

Alveolar-Capillary Barrier

The delicate biological membrane formed by the alveolar type I pneumocyte, capillary endothelial cell, and their intervening fused basement membranes, through which oxygen and carbon dioxide diffuse between alveolar air and capillary blood.

Alternate Names:
Alveolar-Capillary Membrane; Blood-Air Barrier

Alveolar-Capillary Membrane

Thin anatomical barrier separating air in the pulmonary alveoli from blood in the alveolar capillaries. See *Blood-Air Barrier*.

Alveolar Dead Space

The volume of inhaled air that reaches alveoli that are adequately ventilated but lack sufficient pulmonary capillary blood perfusion, preventing gas exchange from taking place.

Alveolar Echinococcosis

A rare, serious infection caused by the young form of the Echinococcus multilocularis tapeworm, usually after swallowing contaminated food or water. It creates slowly growing, tumor-like areas in the liver that can invade nearby tissue or spread.

Alternate Names:
Alveolar Hydatid Disease

Alveolar Gas Equation

A formula used to estimate the oxygen level in the lung air sacs from the inhaled oxygen level and carbon-dioxide level. Comparing this estimate with arterial blood oxygen helps assess how well the lungs exchange gases.

Alveolar Hypoventilation

Deficient ventilation of the pulmonary alveoli resulting in reduced carbon dioxide elimination, leading to arterial hypercapnia and respiratory acidosis.

Alveolar Macrophage

An immune cell that lives in the lung air sacs and removes inhaled dust, microbes, and damaged cells. It also helps regulate inflammation in the lungs.

Alternate Names:
Dust Cell

Alveolar Osteitis

Painful inflammation of a tooth socket after extraction, usually caused by loss or breakdown of the blood clot that normally protects the socket.

Alternate Names:
Dry Socket; Fibrinolytic Alveolitis

Alveolar Proteinosis

Alternate form; see *Pulmonary Alveolar Proteinosis*.

Alveolar Rhabdomyosarcoma

A cancer of immature muscle-forming cells, usually affecting children or adolescents. It may arise in the limbs, trunk, head, or neck and can spread early to lymph nodes, lungs, bones, or other tissues.

Alveolar Ventilation

The amount of fresh air reaching the lung air sacs each minute and available for oxygen and carbon-dioxide exchange. It depends on breathing rate, breath size, and the amount of air remaining in the breathing passages.

Alveolar Ventilation Equation

A relationship showing how breathing affects blood carbon-dioxide levels. When the amount of fresh air reaching the lung air sacs falls, carbon dioxide rises; when effective breathing increases, carbon dioxide falls, if production stays constant.

Alveolitis

Inflammation of the lung air sacs, usually causing cough and shortness of breath, or inflammation of

a tooth socket after extraction, called dry socket. The body site identifies the meaning.

Alveolus

One of the microscopic air sacs at the ends of the lung airways. Oxygen passes from an alveolus into the blood and carbon dioxide passes from the blood into it.

Alzheimer Disease

A progressive brain disease and the most common cause of dementia. It slowly damages nerve cells and the connections between them. Early symptoms often include trouble remembering recent events, finding words, or planning tasks. As the disease advances, it can affect language, judgment, orientation, behavior, and daily activities. Beta-amyloid protein can collect in plaques between nerve cells, and tau protein can form tangles inside them; these changes are linked to brain damage. Alzheimer disease is not a normal part of aging, although risk increases with age.

Alternate Names:
Alzheimer's Disease; Alzheimer's

Alzheimer's

Alternate name; see *Alzheimer Disease*.

Amalgam

A dental filling material made by combining mercury with metals such as silver, tin, and copper. It is strong and durable but has a metallic appearance and may not be suitable for every person or tooth.

Amastia

A birth condition in which one or both breasts do not develop. The nipple, chest muscle, or other nearby structures may also be absent or underdeveloped.

Amaurosis

Partial or complete loss of vision, which may be temporary or permanent and may result from disease of the eye, retina, optic nerve, or visual pathways in the brain.

Amaurosis Fugax

Sudden, temporary loss of vision in one eye, usually caused by brief retinal ischemia, often from an embolus. It is a form of retinal transient ischemia that can signal vascular disease and increased stroke risk.

Amaxophobia

An intense, disproportionate fear of riding in or driving a vehicle, such as an automobile, producing pronounced anxiety or avoidance behavior.

Alternate Names:
Motophobia; Fear of Driving

Ambidextrous

Able to use the left and right hands with similar skill. It describes a pattern of handedness, not a disease.

Ambient

Surrounding or present in the immediate environment, such as ambient temperature, light, noise, or air.

Ambiguous Genitalia

External genital anatomy that does not have typical male or female features. It usually reflects a difference in sex development, which may involve chromosomes, hormones, or the formation of reproductive organs.

Amblyopia

Reduced vision in one or, rarely, both eyes because the visual system did not develop normally during childhood. It can result from misaligned eyes, unequal focusing between the eyes, or something that blocks clear vision. The eye may look normal, although a cause such as a cataract or drooping eyelid may be visible. Earlier onset and longer duration are associated with greater effects on visual development.

Alternate Names:
Lazy Eye; Functional Amblyopia; Visual Suppression Amblyopia

Ambu Bag

A self-inflating manual resuscitator, commonly called a bag-valve mask, used with a face mask or airway device to provide positive-pressure ventilation when breathing is inadequate. Ambu is a brand name often used generically.

Ambulatory Blood Pressure Monitoring

Measurement of blood pressure at regular intervals, usually for twenty-four hours, with a portable cuff worn during normal activities and sleep. It can identify blood-pressure patterns that may not appear during a clinic visit.

Amebiasis

An infection caused by the parasite Entamoeba histolytica, usually spread by swallowing contaminated food, water, or material from contaminated hands. It may cause no symptoms, diarrhea, abdominal pain, or bloody diarrhea. In some cases, the infection can spread from the intestine to the liver.

Alternate Names:
Entamoeba Histolytica Infection

Amebic Colitis

Inflammation of the large intestine caused by Entamoeba histolytica. It may cause abdominal pain, diarrhoea, bloody stools, or fever.

Alternate Names:
Amoebic Colitis

Amebic Dysentery

An acute, invasive intestinal infection caused by the protozoan parasite Entamoeba histolytica, characterized by extensive ulceration of the colonic mucosa ("flask-shaped" ulcers). Patients typically present with severe lower abdominal cramping, tenesmus, and frequent passage of bloody, mucoid stools, with potential complications including fulminant necrotizing colitis, toxic megacolon, bowel perforation, and secondary amebic liver abscess.

Alternate Names:
Amoebic Dysentery

Amebic Liver Abscess

A collection of infected or damaged tissue in the liver caused by the parasite *Entamoeba histolytica*. It often affects the right side of the liver and may cause fever, pain under the right ribs, and an enlarged or tender liver. Imaging and blood tests can support the diagnosis.

Alternate Names:
Amoebic Liver Abscess; Hepatic Amebiasis; Entamoeba Liver Abscess

Amebic Meningoencephalitis

A rare, rapidly progressing, and severe infection of the brain and its surrounding membranes caused by the free-living amoeba Naegleria fowleri. It typically occurs when warm freshwater containing the amoeba enters the nasal cavity during swimming, diving, or nasal rinsing, allowing the organism to travel along the nerves to the brain. Symptoms include intense frontal headache, high fever, stiff neck, nausea, vomiting, confusion, seizures, and coma.

Alternate Names:
Primary Amebic Meningoencephalitis; PAM; Primary Amoebic Meningoencephalitis

Ameboma

A chronic, localized inflammatory granulomatous pseudotumor of the bowel wall that develops in a minority of patients with untreated or inadequately treated Entamoeba histolytica infection, most commonly affecting the cecum or ascending colon. It presents as a palpable, tender right-lower-quadrant abdominal mass associated with intermittent bloody diarrhea, obstruction, or weight loss, frequently mimicking colonic adenocarcinoma on colonoscopy and cross-sectional imaging.

Alternate Names:
Amoeboma; Amebic Granuloma

Amelanotic Melanoma

A melanoma that produces little or no dark pigment and may appear pink, red, or skin-coloured instead of black or brown. Its appearance can delay recognition; diagnosis requires examination of a tissue sample.

Amelia

A rare birth condition in which one or more arms or legs are completely absent. It may occur alone or with other developmental differences.

Amelioration

Improvement or reduction in the severity, frequency, or effect of a symptom, disease, impairment, or other harmful condition.

Ameloblastoma

A usually slow-growing tumour that begins in cells involved in tooth development, most often in the lower jaw. It can grow into nearby bone, deform the jaw, and return after treatment.

Amelogenesis

The process by which developing teeth form and harden enamel, the tough outer covering of each tooth. Problems with this process can make enamel thin, weak, discoloured, or easily damaged.

Amelogenesis Imperfecta

A group of inherited conditions in which tooth enamel does not form normally. The enamel may be thin, soft, rough, discoloured, or easily worn on most or all teeth.

Amenorrhea

Absence of menstrual periods. Primary amenorrhea means menstruation has not started by the expected age; secondary amenorrhea means periods stop after they have begun. It may be normal during pregnancy, breastfeeding, or menopause, or may result from hormonal, reproductive, medical, nutritional, or exercise-related conditions.

Amenorrhea (Absence of Menstruation)

Alternate name; see *Amenorrhea*.

American Trypanosomiasis

Alternate name; see *Chagas Disease*.

Ametropia

A focusing problem in which the eye does not bring incoming light to a sharp focus on the retina. Nearsightedness, farsightedness, and astigmatism are common forms and can cause blurred vision.

Amino Acid

A small molecule used to build proteins. Amino acids also support energy production and other chemical processes in the body.

Amino Acid Catabolism

The body's breakdown of amino acids after proteins are digested. Their nitrogen part is removed and safely processed, while the remaining part is used to make energy, glucose, ketones, or other substances.

Amino Acid Symbols

The standard one-letter and three-letter abbreviations used to identify the 20 amino acids most commonly used to build proteins. They make genetic, laboratory, and biochemical information shorter and easier to compare.

Aminoaciduria

Abnormally large amounts of amino acids in the urine, usually because the kidney tubules cannot reabsorb them properly or because of an inherited metabolic disorder.

Aminoglycoside Nephrotoxicity

Kidney injury caused by aminoglycoside antibiotics, which can build up in kidney cells. Risk increases with high doses, prolonged treatment, existing kidney disease, or other kidney-toxic medicines.

Aminoglycoside Ototoxicity

Inner-ear damage caused by aminoglycoside antibiotics, which may lead to hearing loss, ringing in the ears, dizziness, or balance problems. Risk increases with high or prolonged exposure.

Aminoglycosides

A group of antibiotics that kill certain bacteria by stopping them from making essential proteins. Examples include gentamicin, tobramycin, amikacin, and streptomycin; they can damage the kidneys and

inner ear.

Aminophylline Overdose

Poisoning caused by too much aminophylline, a medicine that opens narrowed airways. It can cause vomiting, tremor, rapid or irregular heartbeat, low blood pressure, seizures, or dangerous changes in blood chemistry.

Aminotransferase

An enzyme that helps cells process amino acids, the building blocks of proteins. Blood levels of ALT and AST may rise when liver, muscle, or other cells are injured, but the result does not identify the cause alone.

Amiodarone

An antiarrhythmic medicine used to treat selected abnormal heart rhythms, including atrial fibrillation and ventricular tachycardia. It can affect the lungs, liver, thyroid, eyes, skin, nerves, and heart rhythm.

Amiodarone-Induced Skin Discoloration

A blue-grey or slate-grey darkening of sun-exposed skin caused by long-term amiodarone treatment. It is more likely with higher doses and may fade partly after the medicine is stopped.

Amiodarone-Induced Thyroid Dysfunction

An overactive or underactive thyroid caused by amiodarone. The medicine contains iodine and can either increase thyroid-hormone production or inflame and damage the thyroid.

Amiodarone-Induced Vortex Keratopathy

Whorl-shaped deposits in the surface layer of the cornea caused by amiodarone. They usually cause no symptoms but may produce halos around lights and generally improve after the medicine is stopped.

Amiodarone Pulmonary Toxicity

Lung injury caused by amiodarone, most often presenting as interstitial pneumonitis but also as organizing pneumonia, diffuse alveolar damage, or pulmonary fibrosis. Symptoms may include progressive breathlessness and cough. Foamy alveolar macrophages can occur but are not specific for toxicity.

Alternate Names:
Amiodarone Lung; Amiodarone-Induced Pneumonitis

Amitriptyline

A tricyclic antidepressant that changes serotonin and noradrenaline signalling in the brain. It is also used for some nerve pain and migraine prevention; common effects include sleepiness, dry mouth, and constipation.

Amitriptyline And Perphenazine Overdose

Poisoning caused by taking too much amitriptyline and perphenazine. It can cause severe sleepiness, confusion, seizures, low blood pressure, abnormal heart rhythms, coma, or breathing problems.

Amitriptyline Hydrochloride Overdose

Poisoning caused by taking too much amitriptyline. It can cause severe sleepiness, confusion, seizures, low blood pressure, abnormal heart rhythms, coma, or breathing problems.

Ammonia

A nitrogen-containing waste product made when the body processes proteins. The liver normally changes it into urea for removal; high blood levels can affect brain function, especially in severe liver disease.

Ammonia Blood Test

A blood test that measures ammonia, a waste product normally cleared by the liver. A high result may occur with severe liver disease, inherited metabolic conditions, some medicines, or other illnesses; the level does not always match the severity of symptoms.

Ammonia Poisoning

Injury caused by breathing, swallowing, or getting concentrated ammonia on the skin or eyes. It can

burn tissues and cause coughing, breathing difficulty, chest pain, or serious lung damage.

Ammonia Toxicity

Injury caused by inhaling or swallowing ammonia, or by contact with the skin or eyes. Concentrated exposure can cause tissue burns, cough, bronchospasm, laryngeal injury, or pulmonary edema.

Ammonium Hydroxide Poisoning

Injury caused by exposure to ammonium hydroxide, a corrosive chemical found in some cleaners and industrial products. It can burn the skin, eyes, mouth, throat, lungs, and digestive tract.

Amnesia

Loss or impairment of memory beyond ordinary forgetfulness. It may prevent a person from forming new memories, recalling past events, or doing both, and may result from brain injury, illness, medicines, or emotional trauma.

Amnestic Syndrome

A pattern of memory impairment that significantly affects learning, storing, or recalling information. It may occur with brain injury, stroke, dementia, epilepsy, substance use, or other neurological conditions.

Amniocentesis

A procedure in which a thin needle removes a small sample of fluid from around the developing baby. The sample can be tested for genetic, chromosomal, or infection-related conditions.

Amnioinfusion

A procedure that adds sterile fluid to the sac around the developing baby, usually during labour, to reduce pressure on the umbilical cord or dilute thick meconium.

Amnion

The thin inner membrane forming the fluid-filled sac around the developing baby. It holds the amniotic fluid and helps protect the fetus during pregnancy.

Amnion Nodosum

Small deposits of fetal skin material or other debris attached to the inner membrane of the pregnancy sac. They are usually linked with too little amniotic fluid, often because the developing baby is making less urine.

Amnioscope

An instrument formerly inserted through the cervix to examine the amniotic fluid and membranes. It is now rarely used and has largely been superseded by ultrasound.

Amniotic Band

A strand of amniotic membrane that can wrap around a developing body part, restricting growth or blood flow and causing a deformity or loss of tissue.

Amniotic Band Sequence

A group of birth differences caused when strands of the amniotic membrane wrap around or attach to developing fetal parts. Effects may include constriction rings, missing digits, limb defects, or facial and body-wall abnormalities.

Alternate Names:
Amniotic Constriction Band Sequence; ADAM Complex; Streeter Dysplasia

Amniotic Band Syndrome

Alternate name; see *Amniotic Band Sequence*.

Amniotic Fluid

The liquid surrounding the developing baby inside the amniotic sac. It cushions the baby, allows movement and growth, and helps maintain a stable environment during pregnancy. It is continually produced, swallowed, and replaced.

Amniotic Fluid Embolism

A rare, life-threatening syndrome that usually begins during labour or soon after birth with sudden breathing or heart failure and often severe bleeding. Its exact cause is not fully understood; it is associated with fetal material entering the pregnant

person's circulation.

Amniotic Fluid Index

An ultrasound estimate of the amount of fluid around the developing baby. It adds the deepest fluid measurements from four areas of the uterus and helps identify unusually low or high fluid levels.

Alternate Names:
AFI; Amniotic Fluid Volume Assessment

Amniotic Sac

The thin, fluid-filled membrane around the developing baby in the uterus. It contains amniotic fluid, cushions the fetus, and usually breaks near or during labour when the waters break.

Amok

An old, culture-related term for a sudden episode of uncontrolled, often violent behaviour followed by exhaustion or memory loss. Modern assessment considers medical, neurological, psychiatric, substance-related, and cultural factors.

AMP-Activated Protein Kinase

A master cellular energy-sensing serine/threonine kinase activated during metabolic stress when intracellular AMP-to-ATP or ADP-to-ATP ratios rise (such as during exercise, hypoxia, or fasting). Once activated, it restores energy homeostasis by promoting ATP-generating catabolic processes (such as glucose uptake via GLUT4, fatty acid oxidation, glycolysis, and autophagy) while suppressing ATP-consuming anabolic pathways (such as lipid synthesis, protein synthesis via mTOR inhibition, and gluconeogenesis). It is a primary molecular target of the antidiabetic drug metformin.

Alternate Names:
AMPK; 5'-AMP-Activated Protein Kinase

Amphetamine

A stimulant medicine that increases certain chemical signals in the brain. It is used for selected attention, activity, or sleep disorders; misuse can cause dependence, high blood pressure, abnormal heart rhythms, or psychosis.

Amphetamine-Related Psychiatric Disorders

Psychiatric syndromes associated with amphetamine exposure, including intoxication, withdrawal, substance-induced psychosis, mood symptoms, anxiety, or a stimulant use disorder.

Amphetamine Substance Use

Use of amphetamine-type stimulants, which can be associated with insomnia, anxiety, psychosis, high blood pressure, arrhythmias, overheating, dependence, and overdose.

Amphetamine Toxicity

A sympathomimetic syndrome caused by amphetamine or related stimulants. Features can include agitation, dilated pupils, sweating, rapid heart rate, high blood pressure, hyperthermia, chest pain, seizures, or psychosis; severe cases may involve stroke, rhabdomyolysis, or cardiac ischemia.

Amplified Musculoskeletal Pain Syndrome

A condition, often affecting children or teenagers, in which the nervous system increases normal pain signals. Pain may be severe or widespread and can occur with sensitivity, fatigue, swelling, or difficulty using the affected area.

Ampulla

A widened part of a tube-shaped body structure. Examples include the ampulla where the bile and pancreatic ducts join the intestine and the ampulla of a fallopian tube.

Ampulla of Vater

An anatomical dilation located within the medial wall of the descending duodenum, formed by the union of the common bile duct and the main pancreatic duct, draining into the duodenal lumen via the major duodenal papilla.

Alternate Names:
Hepatopancreatic Ampulla

Ampullary Carcinoma

A malignant epithelial tumor arising in or around the ampulla of Vater, where the bile duct and pancreatic duct enter the duodenum. It can block bile flow and cause jaundice, abnormal liver tests, pancreatitis, or gastrointestinal bleeding.

Alternate Names:
Ampullary Cancer

Ampullary Tubal Ectopic Pregnancy

A tubal ectopic pregnancy implanted in the ampulla, the widened middle portion of a fallopian tube between the isthmus and infundibulum. The ampulla is a common site of ectopic implantation. The pregnancy may cause pelvic pain or vaginal bleeding; rupture can lead to internal hemorrhage.

Amputation

Surgical removal of all or part of a limb, finger, toe, or other body part, often because of severe injury, infection, poor blood flow, or cancer. Traumatic amputation is tissue loss caused by an injury. The level removed depends on healthy tissue, blood supply, healing, and expected function.

Alternate Names:
Surgical Amputation; Limb Removal

Amputation Stump

The part of a limb left after amputation. It may develop wound problems, infection, poor circulation, nerve pain, phantom-limb pain, or skin irritation from a prosthesis.

Amsler Grid

A small square chart used to check central vision. Wavy, missing, or distorted lines may indicate a problem in the macula and are evaluated with a complete eye examination.

Amusia

Difficulty recognizing, understanding, or producing music despite adequate hearing. It may be present from birth or develop after brain injury, stroke, or another neurological condition.

Amygdala

A group of nerve cells deep in each side of the brain that helps process emotions, especially fear, and contributes to learning, memory, and responses to important or threatening events.

Alternate Names:
Amygdaloid Nucleus

Amylase

An enzyme that begins breaking down starch. It is made mainly by the salivary glands and pancreas and can be measured in blood or urine when pancreatic or salivary-gland disease is suspected.

Amylase And Lipase

Blood tests for digestive enzymes used when pancreatic disease is suspected. Lipase is generally more specific for pancreatic injury, but neither test alone confirms acute pancreatitis.

Amylase Test

A blood or urine test that measures the amount of amylase, an enzyme made mainly by the salivary glands and pancreas. It may help assess pancreatitis and other problems affecting the pancreas or salivary glands.

Alternate Names:
Serum Amylase; Blood Amylase Test; Amylase Blood Test

Amylin Analogues

Medicines that imitate amylin, a hormone released by the pancreas with insulin. They slow stomach emptying, reduce the rise in blood glucose after meals, and reduce glucagon release.

Amyloid

A protein-rich fibrillar material with a characteristic cross-beta-sheet structure. Pathologic amyloid deposits can accumulate in tissues, disrupt organ function, and cause amyloidosis.

Alternate Names:
Amyloid Protein

Amyloid Nephropathy

Renal involvement occurring in systemic amyloidosis, characterized by extracellular accumulation of insoluble amyloid fibrils in glomerular, vascular, and interstitial compartments, typically leading to heavy proteinuria, nephrotic syndrome, and progressive kidney failure.

Amyloid Neuropathy

Nerve damage caused by amyloid deposits in or around peripheral nerves. It may cause numbness, tingling, burning pain, weakness, or problems with automatic body functions such as blood-pressure control.

Amyloidosis

A group of diseases in which proteins fold abnormally, clump together, and form deposits called amyloid in tissues or organs. Amyloidosis may be localized to one site or systemic, affecting several organs such as the kidneys, heart, liver, nerves, or digestive tract. Major forms include light-chain (AL), serum amyloid A (AA), and transthyretin (ATTR) amyloidosis; effects vary with the amyloid protein and organs involved.

Alternate Names:
Amyloid Disease; Amyloid Infiltration

Amyloid PET

A brain scan using a small radioactive tracer that attaches to amyloid deposits. It can help assess selected cognitive disorders, but a positive scan does not by itself establish a specific dementia diagnosis.

Amyloid Plaque

A deposit of amyloid-beta protein outside nerve cells in the brain. Plaques are associated with Alzheimer disease, but their presence alone does not explain every person's memory or thinking problem.

Amyloid Precursor Protein

A normal protein found in nerve-cell membranes. Enzymes can cut it into smaller pieces, including amyloid-beta; abnormal accumulation of amyloid-beta in the brain is associated with Alzheimer disease.

Alternate Names:
APP; Amyloid-Beta Precursor Protein

Amyloid Purpura

Purple or bruise-like spots, often around the eyes, caused by amyloid deposits weakening small blood vessels. It may occur with systemic amyloidosis and can be accompanied by easy bruising elsewhere.

Amyoplasia

The most common form of arthrogryposis multiplex congenita, characterized by the congenital absence or marked underdevelopment of skeletal muscle tissue, resulting in symmetric multiple joint contractures and replacement of muscle tissue with fibrous and fatty material.

Alternate Names:
Classic Arthrogryposis; Amyoplasia Congenita

Amyotrophic Lateral Sclerosis

A progressive disease that damages nerve cells in the brain and spinal cord that control voluntary muscle movement and breathing. It causes increasing muscle weakness, muscle wasting, twitching, and stiffness, which can make walking, speaking, swallowing, and breathing difficult. Sensation usually remains normal, though some people have changes in thinking or behavior. Most cases occur without a known family cause; some are inherited.

Alternate Names:
Lou Gehrig's Disease ALS

Anabolic Steroid Induced Hypogonadism

Reduced testicular hormone production and fertility caused by misuse of anabolic steroids. Extra steroid hormones suppress the body's normal hormone signals and may lead to testicular shrinkage, low sex drive, erectile problems, infertility, or depression.

Alternate Names:
ASIH; Anabolic-Androgenic Steroid-Induced Hypogonadism

Anabolic Steroids

Synthetic medicines related to testosterone that promote muscle and bone growth. They have limited medical uses but are sometimes misused for appear-

ance or performance; misuse can harm the heart, liver, fertility, mood, and hormone system.

Anabolic Steroid Use and Abuse

Use of anabolic-androgenic steroids without a medical indication or at excessive doses. It can suppress natural hormone production and affect fertility, mood, blood pressure, cholesterol, liver function, heart structure, and growth in adolescents.

Anabolism

The set of body processes that use energy to build larger molecules from smaller ones, such as making proteins from amino acids or storing glucose as glycogen.

Anaemia

A condition in which the blood has too few red blood cells or too little haemoglobin. This reduces the blood's ability to carry oxygen and may cause tiredness, weakness, breathlessness, or dizziness.

Anaerobe

A microorganism that can grow without oxygen. Some anaerobes are harmed or killed by oxygen, while others tolerate oxygen but do not use it to produce energy.

Anaerobic

Able to live, grow, or function without oxygen. Anaerobic bacteria can cause infections in deep wounds, abscesses, the mouth, abdomen, or pelvis.

Anaerobic Bacteria

Bacteria that can grow without oxygen. Obligate anaerobes cannot use oxygen and may be harmed by it, while facultative anaerobes can grow with or without oxygen. Anaerobic bacteria normally live in places such as the mouth, intestine, and vagina. They can cause infections in deep wounds, abscesses, the abdomen, pelvis, or other tissues with low oxygen.

Anaerobic Glycolysis

The metabolic breakdown of glucose into lactate in the absence or insufficiency of cellular oxygen, producing a net yield of two molecules of adenosine triphosphate per glucose molecule and regenerating oxidized nicotinamide adenine dinucleotide (NAD+) to maintain energy generation.

Anagen

The active growth phase of the hair cycle, when cells in the hair root make the hair shaft. Scalp hairs usually remain in this phase for several years before entering a resting or shedding phase.

Anagen Effluvium

An abrupt, extensive shedding of hair during the active growth (anagen) phase, caused by acute toxic disruption of mitotic activity in the follicular matrix cells. It typically begins within days to weeks of exposure to cytotoxic chemotherapy, ionizing radiation, or acute heavy metal poisoning.

Anal Abscess

A collection of pus near or within the anus, usually caused by an infected anal gland. It can cause throbbing pain, swelling, fever, and difficulty sitting.

Anal Canal

The final part of the digestive tract, extending from the rectum to the anus. It contains muscles that control the passage of stool and has different nerve and blood supplies along its length.

Anal Cancer

A malignant tumor arising in the anal canal or perianal skin. Most are squamous cell carcinomas, usually associated with oncogenic human papillomavirus (HPV) infection. Symptoms may include anal bleeding, pain, a lump, itching, discharge, or a change in bowel habits; diagnosis is confirmed by examination and biopsy.

Anal Carcinoma

Alternate term; see *Anal Cancer*.

Anal Condyloma

A wart-like growth on or around the anus, usually

caused by low-risk types of human papillomavirus. It is usually not cancerous, but multiple or recurring warts may occur with other abnormal anal cells.

Anal Dysplasia

Abnormal, precancerous cellular alterations within the squamous epithelium lining the anal canal, most commonly induced by persistent infection with high-risk oncogenic human papillomaviruses (HPV).

Alternate Names:
Anal Intraepithelial Neoplasia; AIN

Anal Fissure

A linear tear in the lining of the anal canal, often following passage of hard stool or repeated diarrhea. It typically causes sharp pain during defecation that may persist afterward, sometimes with a small amount of bright-red blood on wiping.

Anal Fistula

An epithelialized tract connecting the anal canal with the perianal skin, most often developing after infection of an anal gland or an abscess. It may cause persistent or intermittent drainage, discomfort, or recurrent abscesses. Crohn disease is another important cause.

Analgesia

Relief or absence of pain without necessarily causing unconsciousness. It may result from medicines, a nerve block, or another treatment; touch, pressure, or movement may still be felt.

Analgesics

Medicines that reduce or relieve pain. Non-opioid analgesics reduce pain and fever. Nonsteroidal anti-inflammatory drugs (NSAIDs) reduce pain, fever, and inflammation by lowering the production of substances involved in these responses. Opioid analgesics reduce the brain's and spinal cord's response to pain but may cause sleepiness, constipation, slowed breathing, tolerance, and dependence. Adjuvant analgesics are medicines mainly used for other conditions that can help with certain types of pain, such as nerve pain. The choice depends on the type and severity of pain, the person's health, and possible risks.

Alternate Names:
Painkillers; Pain-Relieving Medicines

Anal Herpes

A viral infection of the perianal skin and anal canal caused by herpes simplex virus (usually HSV-2 or HSV-1), characterized by painful, grouped fluid-filled vesicles that rupture into shallow ulcerations accompanied by local pain, itching, and tenesmus.

Alternate Names:
Perianal Herpes; Anorectal Herpes

Anal Intercourse

Sexual activity involving insertion into the anus. Because the anal lining can tear and does not provide natural lubrication, it can transmit infections and cause injury if precautions are not used.

Anal Intraepithelial Neoplasia

Abnormal cells in the lining of the anus, usually associated with persistent high-risk human papillomavirus infection. Low-grade changes may resolve, while high-grade changes can progress to anal cancer.

Anal Itching

Itching of the skin around the anus (pruritus ani), which may have no identified cause or result from moisture or stool seepage, irritation, dermatitis, hemorrhoids, fissures, or infection. Pinworms are a possible cause, particularly in children.

Alternate Names:
Perianal Itching; Rectal Itching

Anal Mucositis

Inflammation and open sores of the anal lining, often caused by radiation or chemotherapy. It can cause pain, burning, bleeding, discharge, and difficulty passing stool.

Anal Necrosis

Death of tissue around the anus, anal canal, or nearby skin. It may result from severe infection, poor blood flow, injury, or radiation and can cause

severe pain, skin discolouration, blisters, fever, or rapid worsening.

Analog

A substance, structure, or process that resembles another and has a similar function but is not identical in chemical makeup or structure.

Analogous

Similar in function or purpose to another structure or process, even though its origin or physical structure is different.

Anal Pain

Pain around the anus or nearby skin. Common causes include a fissure, abscess, thrombosed haemorrhoid, muscle spasm, infection, or inflammation.

Alternate Names:
Proctalgia

Anal Papilla

A small, usually normal projection of the anal lining near the junction between the upper and lower types of lining in the anal canal.

Anal Sphincter

A muscular structure that controls passage of stool and gas from the anal canal. It includes the involuntary internal anal sphincter and the voluntary external anal sphincter.

Anal Stenosis

Abnormal narrowing of the anal canal that impedes the normal passage of stool, usually resulting from scarring following surgical procedures such as haemorrhoidectomy, or from chronic inflammatory bowel disease, trauma, or radiation therapy.

Alternate Names:
Anal Stricture

Anal Warts

Benign fleshy growths or lesions occurring on the perianal skin or within the anal canal, caused by localized infection with low-risk strains of the human papillomavirus, particularly types 6 and 11.

Alternate Names:
Condylomata Acuminata of Anus; Perianal Warts

Anal Yeast Infection

A localized superficial fungal infection of the perianal skin caused by overgrowth of *Candida* species, primarily *Candida albicans*, causing intense pruritus, redness, maceration, and burning around the anus.

Alternate Names:
Perianal Candidiasis; Anal Thrush

Analysis

A careful examination of information, samples, measurements, symptoms, or clinical problems to identify patterns, understand causes, or support a medical decision.

Analysis Of Urine

Laboratory examination of urine for blood, cells, protein, glucose, germs, and other substances. Results can help assess urinary infection, kidney disease, diabetes, bleeding, dehydration, and other conditions.

Analytic Sensitivity

The smallest amount of a substance that a laboratory method can reliably detect. It describes the test's measurement ability and is different from clinical sensitivity, which describes how well a test detects disease.

Anaphia

Complete loss of touch sensation in a body area. It may result from nerve injury, neurological disease, reduced blood flow, or anaesthetic treatment and can allow burns, wounds, or pressure injuries to go unnoticed.

Alternate Names:
Anaptic

Anaphylactic Shock

A severe form of anaphylaxis in which a sudden allergic reaction causes dangerously low blood pressure and poor blood flow to organs. It may occur

with airway swelling, breathing difficulty, collapse, or cardiac arrest.

Anaphylactoid Reaction

An older term for a reaction resembling anaphylaxis that is not caused by an IgE-mediated allergy. Current terminology generally uses non-IgE-mediated or nonimmune anaphylaxis, depending on the mechanism.

Alternate Names:
Non-Allergic Anaphylaxis; Pseudoallergic Reaction

Anaphylatoxin

A small peptide fragment (predominantly C3a, C4a, and C5a) generated during activation of the complement cascade. Anaphylatoxins induce mast cell degranulation, smooth muscle contraction, increased vascular permeability, and chemotaxis of phagocytic leukocytes.

Anaphylaxis

A rapidly developing, potentially life-threatening systemic hypersensitivity reaction characterized by compromise of the airway, breathing, or circulation, often accompanied by mucosal or skin manifestations (such as urticaria, angioedema, or flushing) and gastrointestinal symptoms. Prompt administration of intramuscular epinephrine (adrenaline) into the anterolateral thigh is the definitive first-line emergency treatment. Anaphylaxis may occur without circulatory shock, and skin signs may occasionally be absent.

Anaphylaxis During Anesthesia

A severe allergic reaction occurring during or soon after anaesthesia. It may cause sudden low blood pressure, airway narrowing, breathing difficulty, collapse, or skin flushing; triggers can include medicines, antiseptics, or latex.

Anaplasia

Loss of the normal mature features and specialized function of cells. Anaplastic cells may vary greatly in size and shape, have abnormal nuclei, and divide rapidly or unusually. Anaplasia is most often seen in high-grade cancers and usually suggests more aggressive behavior. It is different from metaplasia, in which one mature cell type changes into another cell type.

Anaplasmosis

A tick-borne infection caused by the bacterium *Anaplasma phagocytophilum*. It may cause fever, headache, muscle aches, low platelet and white-cell counts, and raised liver enzymes. PCR or paired blood-antibody tests can help confirm it. Morulae seen in white blood cells can support the diagnosis but are not always present and do not confirm it alone.

Alternate Names:
Human Granulocytic Anaplasmosis; HGA

Anaplastic

Describing cells or a tumor that has lost many features of its normal mature form. Anaplastic tumors often grow quickly, invade nearby tissue, or spread, although the outlook depends on the specific cancer and its treatment.

Anaplastic Astrocytoma

An older term for a high-grade tumour arising from star-shaped supporting cells in the brain. Modern classification relies on its genetic features as well as its appearance; symptoms depend on its location.

Anaplastic Ependymoma

A high-grade tumour arising from cells lining the brain's fluid-filled spaces or the spinal canal. It can grow quickly and may obstruct the flow of cerebrospinal fluid.

Anaplastic Large Cell Lymphoma

A rare type of non-Hodgkin lymphoma arising from abnormal T cells. The cells are usually large and carry the CD30 marker; the disease may affect the skin, lymph nodes, or other organs.

Alternate Names:
ALCL

Anaplastic Large-cell Lymphoma

Alternate spelling; see *Anaplastic Large Cell Lym-*

phoma.

Anaplastic Thyroid Cancer

Alternate name; see *Anaplastic Thyroid Carcinoma*.

Anaplastic Thyroid Carcinoma

An extremely aggressive, undifferentiated malignancy of the thyroid follicular epithelium characterized by rapid local invasion into adjacent cervical structures and early distant metastasis. Presenting symptoms include a rapidly enlarging hard neck mass, hoarseness, dysphagia, and dyspnea, carrying a very poor median survival despite multimodality therapy.

Alternate Names:
Undifferentiated Thyroid Carcinoma; ATC

Anarithmetia

A primary neuropsychological impairment in basic arithmetic reasoning, computational ability, and understanding of numerical concepts, distinguishing it from secondary calculation deficits caused by spatial or linguistic impairments. It is typically associated with lesions of the dominant inferior parietal lobule (angular gyrus).

Anasarca

Severe, widespread swelling caused by excess fluid under the skin and sometimes around organs. It can occur with serious heart, kidney, or liver disease or very low blood protein and may cause rapid weight gain or breathing difficulty.

Anastomosis

A surgical, traumatic, or pathological connection created between two hollow organs, tubular structures, or blood vessels (such as an arterial anastomosis, arterio-venous fistula, or bowel resection re-connection), establishing communication and allowing continuous fluid or luminal flow.

Anastomotic Leak

Leakage from a connection made during surgery, often where two sections of intestine or another hollow organ were joined. An incomplete seal can allow contents into nearby tissue and cause pain, fever, infection, or life-threatening illness.

Anastrozole

A medicine that lowers the body's production of oestrogen. It is used mainly for hormone-sensitive breast cancer, especially after menopause.

Anatomical Axis

An imaginary line around which a body part rotates or moves. Anatomical axes help describe movements such as rotation of the shoulder, hip, spine, or other joints.

Anatomical Conduit

A natural or surgically created passage that carries air, fluid, tissue, or another structure between body regions, such as an airway, blood vessel, or surgical channel.

Anatomical Orifice

A natural opening into or out of the body or through a body structure, such as the mouth, nostril, anus, urethra, or an opening of a blood vessel.

Alternate Names:
Body Opening

Anatomical Planes

Imaginary flat surfaces used to divide the body into sections for describing anatomy and interpreting medical scans. Common planes are sagittal, coronal, and transverse.

Anatomical Position

The standard reference posture for describing the body: standing upright, facing forward, arms at the sides, hands turned forward, and feet directed forward.

Anatomical Snuffbox

A triangular hollow on the thumb side of the back of the wrist that appears when the thumb is extended. It overlies the scaphoid bone and radial artery; tenderness there after a fall may indicate a scaphoid fracture.

Alternate Names:

Anatomic Snuffbox

Anatomic Orientation Terms

Standard words used to describe the position of one body structure relative to another, including above, below, front, back, near, far, inside, and outside.

Anatomist

A scientist or health professional who studies the structure of the human or animal body, including its organs, tissues, blood vessels, nerves, and their relationships.

Anatomy

The study of body structure and how its parts relate to one another. It includes visible structures, tissues and cells seen with magnification, and how the body develops.

ANCA-Associated Vasculitis

A group of rare diseases in which the immune system attacks small blood vessels. It can affect the kidneys, lungs, nerves, skin, eyes, and other organs. A blood test for antineutrophil cytoplasmic antibodies (ANCA) can help with diagnosis but cannot confirm the disease on its own.

Ancillary Pathology Studies

Supplementary diagnostic modalities—including immunohistochemistry, special histochemical stains, flow cytometry, in situ hybridization, and molecular genetic assays—performed in conjunction with standard light microscopy to achieve precise pathological classification.

Ancylostomiasis

A parasitic nematode infection caused by species of the genus *Ancylostoma* (such as *Ancylostoma duodenale*), acquired through transcutaneous penetration of infective larvae from contaminated soil, characteristically leading to chronic intestinal blood loss, iron deficiency anemia, and hypoproteinemia.

Alternate Names:
Hookworm Infection

Andersen-Tawil Syndrome

A rare inherited disorder with a variable combination of episodic flaccid muscle weakness (periodic paralysis), ventricular arrhythmias, and distinctive facial or skeletal features. Cardiac findings may include prominent U waves and prolonged QT or QU intervals; not every affected person has the full triad.

Alternate Names:
ATS; Periodic Paralysis Type 3; Andersen Syndrome

Anderson Disease

A rare inherited disorder in which abnormal glycogen builds up in cells because of changes in the *GBE1* gene. It usually begins in infancy with poor growth and an enlarged liver and may progress to scarring, high blood pressure in the liver, and liver failure.

Alternate Names:
Glycogen Storage Disease Type IV (GSD IV); Amylopectinosis

Androgen

A hormone such as testosterone that helps regulate sexual development, fertility, muscle, bone, and hair growth in people of all sexes.

Androgen Deficiency

Too little production or effect of androgen hormones, especially testosterone. In males, it may cause reduced sexual desire, erectile difficulty, infertility, loss of muscle or bone, low energy, or reduced facial and body hair.

Androgenetic Alopecia

A common, inherited form of gradual hair loss caused by sensitivity of hair follicles to androgen hormones. It usually produces a receding hairline or crown thinning in males and diffuse thinning over the crown in females.

Androgen Excess

Abnormally high levels or effects of androgen hormones. It may cause acne, increased facial or body hair, scalp hair loss, irregular periods, infertility, or a deeper voice, especially in females.

Alternate Names:
Hyperandrogenism

Androgenic

Relating to androgen hormones, such as testosterone, or producing their effects. These effects may include facial or body hair, oily skin, a deeper voice, muscle growth, and development of male reproductive features.

Androgen Insensitivity Syndrome

An inherited condition in which cells cannot respond fully to testosterone and related hormones. A person with XY chromosomes may therefore have female-appearing external genitals, incomplete male development, undescended testes, and no uterus.

Androgen Insufficiency

A level or effect of androgen hormones that is too low for normal body function. Symptoms may include reduced sexual desire, erectile difficulty, infertility, low energy, reduced muscle mass, or weaker bones.

Alternate Names:
Androgen Deficiency

Androgen Receptor

A protein in cells that binds testosterone and related hormones. This allows the hormones to influence sexual development, reproduction, muscle, bones, hair, and some cancers.

Androgen Suppression

Lowering the production of androgen hormones or blocking their action in the body. It is used mainly for some hormone-sensitive cancers, especially prostate cancer, and can cause hot flushes, sexual problems, bone loss, weight change, and metabolic effects.

Alternate Names:
Androgen Deprivation

Android Pelvis

A relatively narrow, heart-shaped or funnel-shaped female pelvis with reduced space in the middle. During childbirth, this shape may make passage of the baby more difficult than some other pelvic shapes.

Andropause

Alternate informal term; see *Male Hypogonadism*.

Androphobia

An irrational and overwhelming fear of men, leading to high levels of anxiety, psychological distress, and deliberate avoidance of male individuals.

Alternate Names:
Fear of Men

Anejaculation

Inability to release semen during orgasm or sexual activity. It may result from nerve or spinal disease, pelvic surgery, medicines, diabetes, hormonal problems, or psychological factors and may cause infertility.

Anembryonic Pregnancy

An early pregnancy loss in which a gestational sac and trophoblastic tissue implant and grow within the uterus, but an embryo fails to develop; medically termed a blighted ovum.

Anemia

A lower-than-normal haemoglobin concentration in the blood. It may reduce oxygen delivery to tissues and cause tiredness, weakness, shortness of breath, or dizziness, though mild anemia may cause no symptoms. Causes include blood loss, reduced red-cell production, or increased red-cell breakdown.

Alternate Names:
Anaemia

Anemia and Thrombocytopenia in Pregnancy

Low red-cell or platelet counts during pregnancy. Causes include iron deficiency, normal blood-volume changes, other nutritional deficiencies, immune or hypertensive disorders, bleeding, infection, and bone-marrow disease.

Anemia in Newborns

A reduction in red blood cell volume or hemoglobin

concentration in an infant during the first 28 days of life, arising from blood loss (such as fetomaternal hemorrhage), hemolysis (such as ABO or Rh incompatibility), or decreased red-cell production.

Alternate Names:
Neonatal Anemia

Anemia In Pregnancy

Anemia during pregnancy, commonly caused by iron deficiency, folate deficiency, vitamin B12 deficiency, blood loss, or the normal increase in the liquid part of blood. It can cause tiredness, weakness, breathlessness, or dizziness.

Alternate Names:
Gestational Anemia; Pregnancy-Associated Anemia

Anemia Of Chronic Disease

Anemia associated with long-term inflammation, infection, cancer, kidney disease, or another chronic illness. Inflammation limits the use of stored iron and reduces red-cell production; mild cases may cause no symptoms.

Anemia Of Inflammation

Anemia caused by long-lasting infection, inflammatory disease, cancer, or another condition that activates the immune system. Inflammation traps iron in storage and slows red-cell production.

Anemia of Malignancy

A multifactorial normocytic or microcytic anemia developing in patients with neoplastic disease, resulting from cytokine-mediated blunting of erythropoiesis, impaired iron utilization, marrow infiltration, hemorrhage, or myelosuppressive antineoplastic therapies.

Alternate Names:
Cancer-Related Anemia; Anemia of Cancer

Anemic

Having anemia, meaning that the blood carries less oxygen than the body needs because it has too few red blood cells or too little haemoglobin.

Anencephalic

Relating to or affected by anencephaly, a neural tube defect in which major portions of the brain and skull fail to develop. The adjective is usually applied to an embryo, fetus, or newborn with this condition. Anencephaly arises when the upper neural tube fails to close during early embryonic development.

Anencephaly

A severe neural tube defect in which the cranial end of the neural tube fails to close during early embryonic development, preventing normal formation of much of the brain and skull. The forebrain and cerebrum are absent or severely underdeveloped, although some lower brain structures may remain. Many affected pregnancies end in stillbirth; infants born alive usually die within hours or days. The condition is often identified before birth.

Anergy

A state in which an immune cell does not respond to a substance that would normally activate it. The cell remains present but is functionally quiet; this can help prevent attacks against the body's own tissues.

Anesthesia

A medically controlled loss of feeling caused by medicines during a procedure. Anesthetic medicines mainly block nerve signals, especially pain signals, from reaching the brain. Local anesthesia numbs a small area while the person remains awake. Regional anesthesia blocks nerves supplying a larger part of the body and may be used while the person remains awake. General anesthesia also changes brain activity to cause controlled unconsciousness. Before modern anesthesia, surgery was extremely painful and had to be very quick; anesthesia made longer and more complex operations possible. Breathing, blood pressure, heart rate, and oxygen levels are monitored.

Alternate Names:
Anaesthesia

Anesthesia Gas Analyzers

Devices that measure the amounts of oxygen, carbon

dioxide, and inhaled anesthetic gases delivered to and breathed out by a patient during anesthesia. They help detect problems with breathing or gas delivery.

Anesthesia Informatics

The use of electronic records, monitoring data, and computer systems to support anesthesia care. It can improve documentation, identify medicine interactions or dosing errors, and help evaluate outcomes.

Anesthesia Machine

Equipment that supplies controlled mixtures of oxygen, air, and anesthetic gases, and supports breathing during anesthesia. It includes systems that remove carbon dioxide and safety devices that warn of delivery problems.

Anesthesia Monitoring

Continuous assessment of vital functions during anesthesia, including oxygen levels, breathing, blood pressure, heart rate, temperature, and level of unconsciousness as appropriate for the procedure.

Anesthesia Pharmacogenomics

The study of how inherited genetic differences affect responses to anesthetic and pain medicines. Examples include prolonged muscle paralysis from pseudocholinesterase deficiency and inherited susceptibility to malignant hyperthermia.

Anesthesiologist

A doctor trained to provide anesthesia and manage pain, breathing, blood pressure, and other vital functions during procedures. Anesthesiologists also assess patients before surgery and may treat critical illness or severe pain.

Anesthesiology

The medical specialty concerned with anesthesia and perioperative care. Anesthesiologists assess and support patients before, during, and after procedures, managing consciousness, pain, and vital functions such as breathing and circulation. The field also includes critical care and pain medicine.

Alternate Names:
Anaesthesiology

Anetoderma

A rare disorder caused by loss or weakening of elastic fibers in the dermis, producing soft, wrinkled, depressed, or pouch-like macules and plaques with a characteristic button-hole feel. It may be primary or follow infection, inflammation, autoimmune disease, or another skin lesion; biopsy and selected systemic evaluation may be needed.

Aneuploidy

An abnormal number of whole chromosomes in a cell, caused by an error during cell division. A cell may have an extra or missing chromosome, as in trisomy 21, and this can affect development or pregnancy.

Aneurin

Alternative chemical name for thiamine, an essential water-soluble vitamin required for energy metabolism. See *Vitamin B1*.

Aneurysm

An abnormal bulge or widening in an artery caused by weakness in its wall. Many aneurysms cause no symptoms. Depending on their location and size, they may enlarge, press on nearby structures, or rupture and cause serious bleeding.

Alternate Names:
Aneurysms

Aneurysmal Bone Cyst

A benign but locally aggressive osteolytic bone lesion composed of multiple blood-filled, communicating fibrous cavities that expand and thin the surrounding cortical bone, most commonly developing in the metaphysis of long bones or the posterior spine in children and adolescents.

Alternate Names:
ABC

Aneurysm Clip

A small surgical device placed across the opening of a brain aneurysm to stop blood from entering

it. It is usually placed during open brain surgery; rarely, it may move, block a nearby vessel, or allow bleeding to recur.

Aneurysm Clipping

Brain surgery to place a small clip across the opening of a brain aneurysm, a weak bulge in a brain artery. The clip stops blood from entering the bulge and lowers the risk of bleeding, but the procedure has its own risks and cannot guarantee that a stroke or future bleeding will not occur.

Alternate Names:
Surgical Clipping; Cerebral Aneurysm Clipping; Microvascular Clipping

Aneurysm Coils

Soft metal coils placed inside an aneurysm through a catheter. The coils promote clotting within the bulge and reduce blood flow into it, lowering the chance of rupture.

Aneurysm Repair

A procedure that reinforces, closes, or replaces a weakened section of a blood vessel to prevent rupture or other complications. It may be performed through open surgery or through a catheter inside the vessel.

Angelman Syndrome

A genetic disorder affecting brain development and function, usually because the maternal copy of the *UBE3A* gene is missing or inactive. It causes severe developmental delay, very limited speech, movement and balance problems, seizures, and a characteristic happy or excitable manner.

Anger

An emotional response to frustration, unfairness, danger, or a perceived threat. It may range from irritation to intense rage; persistent or uncontrollable anger can affect relationships, safety, and health.

Angiitis

Inflammation of blood-vessel walls, also called vasculitis. Depending on the vessel and disease type, inflammation may narrow or block the vessel, reduce blood flow, weaken its wall, or cause bleeding. Necrosis may occur in some forms but is not required for the term.

Alternate Names:
Vasculitis; Blood Vessel Inflammation; Arteritis

Angina

Chest discomfort that occurs when the heart muscle does not get enough oxygen-rich blood, usually because of coronary artery disease, but sometimes because of spasm or problems in the heart's small blood vessels. It may feel like pressure, squeezing, tightness, burning, or indigestion and may spread to the arm, jaw, neck, shoulder, or back. Breathlessness, nausea, sweating, or unusual tiredness may occur, sometimes without chest pain. Stable angina usually follows a predictable pattern, often with activity, and may improve with rest. New, worsening, prolonged, or rest symptoms can indicate unstable angina or a heart attack.

Alternate Names:
Angina Pectoris

Angina Bullosa Hemorrhagica

A usually benign, sudden blood-filled blister of the oral mucosa, most often the soft palate. It may follow minor trauma, inhaled or topical steroids, or occur with diabetes; blisters usually rupture and heal spontaneously. Recurrent or atypical lesions can resemble autoimmune blistering disease.

Angina Pectoris

Chest discomfort or pressure resulting from temporarily reduced blood flow to the heart muscle. See *Angina*.

Angina Symptoms

Symptoms of reduced blood flow to the heart may include pressure, squeezing, burning, or tightness in the chest, with discomfort spreading to the arm, jaw, back, or shoulder. Breathlessness, sweating, nausea, or unusual tiredness may also occur.

Alternate Names:
Ischemic Chest Pain; Anginal Chest Pain; Anginal Discomfort

Anginophobia

An extreme, irrational fear of experiencing angina pectoris, heart attacks, or sudden chest pain, causing chronic anxiety and frequent emergency-department visits.

Alternate Names:
Fear of Chest Pain

Angioblastoma

A usually slow-growing, highly vascular tumour of the central nervous system, most often found in the cerebellum or spinal cord. It may cause headache, balance problems, weakness, or other symptoms from pressure on nearby tissue.

Angiocardiography

Imaging of the heart and major blood vessels, usually after contrast material is given. X-ray, CT, or MRI can show the heart chambers, valves, narrowed vessels, leaks, abnormal connections, or other structural problems.

Angiodysplasia

A common acquired vascular malformation characterized by fragile, dilated, tortuous submucosal blood vessels in the gastrointestinal tract, most frequently found in the cecum and right colon of adults over age 60. It is a major cause of recurrent, painless lower gastrointestinal bleeding and unexplained iron-deficiency anemia. It is strongly associated with aortic valve stenosis (Heyde's syndrome, due to acquired von Willebrand factor deficiency) and chronic renal failure. Diagnosis is established on colonoscopy, where lesions appear as small, bright-red, spider-like mucosal patches; active or high-risk bleeding is treated endoscopically using argon plasma coagulation (APC) or electrocautery.

Alternate Names:
Colonic Angiodysplasia; Arteriovenous Malformation of the Colon; Vascular Ectasia of the Colon

Angiodysplasia of Gastrointestinal Tract

A common vascular anomaly of the gastrointestinal mucosa characterized by dilated, tortuous, and fragile submucosal capillaries and venules, most commonly located in the cecum and ascending colon, and representing a frequent cause of lower gastrointestinal bleeding in older adults.

Alternate Names:
GI Angiodysplasia

Angiodysplasia Of The Colon

Alternate name; see *Angiodysplasia*.

Angioedema

Sudden swelling in the deeper layers of the skin or in moist tissues inside the body. It often affects the lips, eyelids, tongue, throat, hands, feet, or gut. Some types occur with itchy hives, while others usually do not. Swelling of the tongue or throat can block breathing.

Angioedema And Hives

Alternate name; see *Urticaria And Angioedema*.

Angiofibroma

A usually noncancerous growth made of blood vessels and fibrous tissue. It commonly appears as a small facial papule in adolescents or, in a different form, as a vascular tumour in the back of the nose that may cause blockage or nosebleeds.

Angiofollicular Lymph Node Hyperplasia

An uncommon disorder in which lymph nodes contain excess small blood vessels and abnormal immune-cell growth. Castleman disease may affect one lymph-node region or many parts of the body.

Alternate Names:
Castleman Disease

Angiogenesis

The formation of new blood vessels from existing vessels. It is normal during growth, menstruation, and wound healing, but abnormal angiogenesis can help cancers grow and can damage vision in some eye diseases.

Angiogenesis Inhibition

Preventing or slowing the growth of new blood vessels. This can limit a tumor's blood supply or reduce harmful vessel growth in some eye diseases. Treat-

ment may increase the risk of high blood pressure, bleeding, or delayed wound healing.

Alternate Names:
Antiangiogenic Therapy

Angiogenesis Inhibitor

A therapeutic agent that inhibits the formation of new blood vessels, predominantly by antagonizing vascular endothelial growth factor (VEGF) or its receptors, used in oncology to restrict tumor blood supply and in ophthalmology to treat neovascular macular degeneration.

Alternate Names:
Antiangiogenic Agent

Angiogram

An image of blood vessels, usually made after contrast material is given. It can show narrowing, blockage, aneurysm, tearing, abnormal connections, or bleeding and may be produced by catheter X-ray, computed tomography, or magnetic resonance imaging.

Angiography

Imaging of blood vessels to show their shape and blood flow. It may use X-rays with injected contrast material, computed tomography (CT), magnetic resonance imaging (MRI), or a catheter placed inside a blood vessel. Angiography can show narrowing, blockage, aneurysms, abnormal connections, bleeding, or other vascular abnormalities; catheter angiography may also allow treatment during the same procedure.

Angioid Streak

Irregular dark lines caused by breaks in a tough layer beneath the retina. They may bleed or allow abnormal blood vessels to grow, reducing vision, and can be associated with some inherited disorders.

Angioimmunoblastic T-Cell Lymphoma

An aggressive subtype of peripheral mature T-cell lymphoma characterized by generalized lymphadenopathy, constitutional symptoms (fever, night sweats, weight loss), hepatosplenomegaly, skin rashes, and polyclonal hypergammaglobulinemia.

Alternate Names:
AITL

Angiokeratoma

A benign cutaneous vascular lesion characterized by ectatic, dilated blood vessels in the upper dermis associated with overlying epidermal hyperkeratosis, presenting as dark red, blue, or purple scaly papules.

Alternate Names:
Cutaneous Angiokeratoma

Angiokeratoma of the Scrotum

A benign vascular papule caused by superficial capillary dilation and overlying thickened skin, usually appearing as multiple dark-red, blue, or purple papules on the scrotum. Lesions may bleed after friction and can be mistaken for melanoma or other lesions; examination establishes the diagnosis.

Angiolipoma

A common benign subcutaneous tumor composed of mature adipose tissue interspersed with a network of proliferating capillary blood vessels, typically presenting as multiple tender, mobile nodules on the forearms of young adults.

Alternate Names:
Vascular Lipoma

Angiolymphoid Hyperplasia With Eosinophilia

An uncommon benign vascular and inflammatory lesion, also called epithelioid hemangioma, that produces solitary or grouped red-brown papules or nodules, usually on the head and neck near the ears or scalp. Eosinophilia may occur; biopsy distinguishes it from Kimura disease and other vascular or neoplastic lesions.

Alternate Names:
Epithelioid Hemangioma

Angiomatoid Fibrous Histiocytoma

A rare soft-tissue neoplasm of intermediate biological potential, primarily affecting children and young adults, characterized microscopically by sheets of histiocyte-like cells surrounding pseudo-vascular, blood-filled cystic spaces and a fibrous pseudocap-

sule.

Alternate Names:
AFH

Angiomyofibroblastoma

A usually noncancerous, slow-growing tumour of blood-vessel and connective-tissue cells, most often occurring as a small, well-defined, painless mass in the vulva or vagina.

Angiomyolipoma

A usually noncancerous kidney tumour made of blood vessels, muscle, and fat. It may occur alone or with tuberous sclerosis and can bleed, especially when large.

Angio-Oedema

British spelling; see *Angioedema*.

Angiopathy

Any disease or abnormal change in blood vessels. Causes include diabetes, inflammation, fatty deposits, injury, infection, and inherited disorders; effects depend on the vessels and organs involved.

Angioplasty

A catheter procedure used to widen a narrowed or blocked blood vessel, most often an artery. A catheter with a small, deflated balloon is guided to the narrowed area, usually with imaging. The balloon is inflated to widen the vessel, then deflated and removed. A stent may be placed to help keep the vessel open. Angioplasty is used in coronary and other arteries and, in some cases, veins.

Alternate Names:
Balloon Angioplasty; Percutaneous Transluminal Angioplasty

Angioplasty Balloon

An inflatable cylindrical balloon catheter designed to dilate stenotic vascular segments, fracture atheromatous plaques, or deploy and seat endovascular stents.

Alternate Names:
Balloon Catheter; Dilatation Balloon; Angioplasty Catheter

Angiosarcoma

A rare, fast-growing cancer that begins in cells lining blood or lymph vessels. It may occur in the skin, breast, liver, or bone and can spread to other organs.

Angiosarcoma Of The Breast

A rare cancer arising from cells that line blood vessels in the breast. It may arise there as a primary tumor or develop secondarily after radiation therapy or chronic lymphedema.

Angiosarcoma Of The Heart

A rare, aggressive cancer arising from blood-vessel cells in the heart, most often in the right upper chamber. It may obstruct blood flow, cause fluid around the heart or abnormal rhythms, and spread to other organs.

Angiotensin

A group of hormones that help regulate blood pressure and the body's salt and water balance. Angiotensin II narrows blood vessels and signals the kidneys and adrenal glands to retain salt and water.

Angiotensin Converting Enzyme

An enzyme that changes angiotensin I into angiotensin II, which raises blood pressure by narrowing blood vessels. The enzyme also breaks down bradykinin, a substance that can widen vessels.

Angiotensin-Converting Enzyme 2

A cell-surface zinc metalloprotease that cleaves angiotensin II into the vasodilatory and cardioprotective peptide angiotensin-(1-7), acting as an essential counter-regulatory enzyme within the renin-angiotensin-aldosterone system; also serves as the host cell receptor for the SARS-CoV-2 spike protein.

Alternate Names:
ACE2

Angiotensin I

A mostly inactive hormone made from angiotensinogen. Angiotensin-converting enzyme changes it into

angiotensin II, which narrows blood vessels and promotes salt and water retention.

Angiotensin II

A hormone that narrows blood vessels and causes the body to retain salt and water. These effects increase blood pressure and help maintain blood flow when circulating volume is low.

Angiotensin Receptor Blockers

Medicines that prevent angiotensin II from activating its main receptor. They relax blood vessels and reduce salt and water retention, lowering blood pressure and reducing strain on the heart and kidneys.

Angle-Closure Glaucoma

A type of glaucoma in which the outer edge of the iris blocks the eye's drainage angle. Fluid then builds up, causing eye pressure to rise and potentially damaging the optic nerve and vision. It may develop suddenly with severe eye pain, blurred vision, halos, headache, nausea, or vomiting, or develop slowly without symptoms.

Angular Cheilitis

Soreness and cracking at one or both corners of the mouth. Moisture, yeast or bacterial infection, dentures, irritation, or low iron or vitamin levels can contribute.

Angular Stomatitis

Alternate name; see *Angular Cheilitis*.

Anhedonia

Reduced or absent ability to feel pleasure or interest in activities that were previously enjoyable. It can occur with depression, schizophrenia, substance use, and other conditions.

Anhidrosis

Failure to sweat when the body needs to cool itself. It may result from nerve or sweat-gland damage, skin disease, dehydration, medicines, or an inherited condition. Without enough sweat, the body can overheat.

Anhidrotic Asthenia

Older name for anhidrotic heat exhaustion, a rare heat-related illness linked to widespread miliaria (heat rash) and reduced sweating; see *Anhidrotic Heat Exhaustion*.

Anhidrotic Heat Exhaustion

A rare heat-related illness described after prolonged exposure to hot, humid conditions. Widespread miliaria (heat rash) blocks sweat ducts, reducing sweating and making it harder for the body to cool. It can cause heat intolerance, severe tiredness, headache, or breathing difficulty.

Alternate Names:
Tropical Anhidrotic Asthenia (older term); Sweat-Retention Syndrome (older term); Thermogenic Anhidrosis (older term)

Animal-Assisted Therapy

A planned healthcare intervention in which a trained animal is used with a qualified professional to support goals such as improving mood, communication, movement, or participation. Infection exposure and animal allergy are relevant considerations.

Animal Bites

Injuries caused by the teeth of animals such as dogs, cats, or wild animals, which can produce puncture wounds, lacerations, crush injuries, and significant bacterial inoculation, such as with *Pasteurella multocida* or rabies virus.

Alternate Names:
Animal Bite Injuries

Anion

A particle with a negative electrical charge. Important anions in body fluids include chloride, bicarbonate, and phosphate, which help maintain fluid balance, electrical activity, and the blood's acid level.

Anion Gap

A calculated diagnostic parameter derived from serum electrolyte concentrations to detect unmeasured anions in the blood, calculated as $[Na^+] - ([Cl^-] + [HCO_3^-])$. The normal range is typically

8–12 mEq/L (varying with laboratory analyzers; decreases by roughly 2.5 mEq/L for every 1 g/dL decline in serum albumin). An elevated anion gap indicates high-anion-gap metabolic acidosis caused by accumulation of unmeasured organic acids (e.g., lactic acidosis, diabetic or alcoholic ketoacidosis, uremia, or toxic ingestions such as methanol, ethylene glycol, and salicylates).

Anion Gap Metabolic Acidosis

Metabolic acidosis with an increased anion gap, which suggests extra acids or other unmeasured substances in the blood. Causes include lactic acidosis, ketoacidosis, kidney failure, and some poisonings. The reference range varies by laboratory and albumin level.

Alternate Names:
AGMA; High Anion Gap Metabolic Acidosis

Aniridia

A congenital, bilateral, complete or partial absence of the iris, typically caused by mutations in the PAX6 gene. It is accompanied by photophobia, nystagmus, reduced visual acuity, foveal hypoplasia, and an increased risk of early-onset glaucoma and cataracts, and may occur as part of the WAGR syndrome.

Anisakiasis

A parasitic infection caused by larvae of anisakid nematodes, especially *Anisakis* and *Pseudoterranova*, acquired by eating raw or undercooked marine fish or squid. Larvae may invade the stomach or intestine, causing acute abdominal pain, nausea, or vomiting; intestinal infection can produce eosinophilic granulomatous inflammation. Allergic reactions to parasite antigens may also occur.

Aniseikonia

An ocular condition in which there is a significant perceived difference in the size or shape of the retinal images between the right and left eyes, often resulting from high anisometropia or refractive surgery, leading to difficulty with binocular fusion and depth perception.

Alternate Names:
Unequal Retinal Image Size

Anismus

Inappropriate, paradoxical contraction or failure of relaxation of the puborectalis muscle and external anal sphincter during attempted defecation, causing pelvic floor dysfunction and chronic functional constipation.

Alternate Names:
Pelvic Floor Dyssynergia; Paradoxical Puborectalis Contraction

Anisocoria

An unequal size of the pupils, the black centers of the eyes. In about 20% of healthy people, a slight difference is natural and harmless. When abnormal, it is caused by eye injury, certain eye drops, or nerve disorders that prevent a pupil from widening or shrinking normally. Doctors test how the pupils react in bright light and darkness to identify the underlying cause.

Anisocytosis

Greater-than-usual variation in the size of red blood cells. It is a laboratory finding rather than a disease and may occur with iron deficiency, vitamin deficiency, or other types of anemia.

Anisometropia

A difference in the focusing power of the two eyes. It can cause unequal image size, blurred vision, eyestrain, or reduced development of vision in one eye during childhood.

Anisopoikilocytosis

Variation in both the size and shape of red blood cells, identified on examination of a blood smear. It is a morphological finding rather than a diagnosis and may occur in several anaemias and other blood disorders, including iron-deficiency or megaloblastic anaemia and haemoglobin disorders. The pattern of cell changes and accompanying laboratory findings help determine its significance.

Ankle

The joint connecting the lower leg and foot. It is

formed mainly by the tibia, fibula, and talus and allows the foot to move up and down while ligaments provide stability.

Ankle Arthroplasty

Surgical replacement of the ankle joint with an artificial joint, usually for severe painful arthritis. It aims to reduce pain while preserving movement; suitability depends on bone, alignment, activity, and surrounding-joint condition.

Ankle Arthroscopy

A procedure using a small camera and instruments inserted through small cuts around the ankle to diagnose or treat problems such as loose bone or cartilage, inflamed lining, or tissue impingement.

Ankle Bone

Any of the bones forming the ankle joint, chiefly the lower ends of the tibia and fibula and the upper part of the talus.

Ankle-Brachial Index

A comparison of blood pressure measured at the ankle with blood pressure measured at the arm. A low result may indicate narrowed leg arteries; a very high result may mean the arteries are too stiff to measure reliably.

Ankle Dislocation

Complete displacement of the ankle bones from their normal joint position, usually after a severe injury. It often occurs with a fracture or ligament injury and can damage blood vessels or nerves.

Alternate Names:
Dislocated Ankle; Talotibial Dislocation

Ankle-Foot Orthosis

A brace that supports the ankle and foot and controls alignment or movement during standing and walking. It may improve walking or prevent foot drop caused by weakness, spasticity, instability, or deformity.

Ankle Fracture

A break in one or more bones forming the ankle, usually the tibia, fibula, or talus. It may cause pain, swelling, bruising, and inability to bear weight; displaced or unstable fractures may damage nearby tissues.

Ankle Fractures

Plural form; see *Ankle Fracture*.

Ankle Joint

The hinge-like joint between the lower ends of the tibia and fibula and the talus. It mainly moves the foot upward and downward and is supported by surrounding ligaments.

Ankle Pain

Pain in or around the ankle, commonly caused by a sprain, fracture, tendon problem, arthritis, bursitis, or infection. Associated findings may include deformity, marked swelling, fever, numbness, or inability to bear weight.

Ankle Replacement

Surgery that replaces the damaged surfaces of the ankle joint with an artificial joint, usually for severe arthritis causing persistent pain and disability. It aims to reduce pain and preserve ankle movement.

Ankle Sprain

An injury in which one or more ankle ligaments are stretched or torn, most often on the outer side after the foot twists inward. Pain, swelling, bruising, and a feeling of instability may occur.

Ankle Swelling

Enlargement around the ankle caused by injury, inflammation, infection, vein or lymph problems, or general fluid retention. Sudden one-sided swelling with pain, warmth, fever, or breathlessness can occur with vascular or infectious disease.

Ankyloblepharon

Abnormal sticking or joining of the upper and lower eyelid edges. It may be present at birth or follow

inflammation, burns, injury, or surgery and can partly block vision when severe.

Ankyloglossia

Alternate name; see *Tongue-Tie*.

Ankylose

To become stiff or unable to move at a joint, sometimes because scar tissue or bone joins the joint surfaces.

Ankylosing

Causing or involving progressive stiffness or loss of movement in a joint, sometimes because scar tissue or bone joins the joint surfaces.

Ankylosing Spondylitis

A long-term inflammatory disease that mainly affects the spine and the joints linking the lower spine to the pelvis. It often causes back or buttock pain and stiffness that is worse after rest and eases with movement. In severe cases, bones in the spine may grow together and limit movement. The eyes and other joints can also be affected.

Alternate Names:
Bekhterev Disease; Radiographic Axial Spondyloarthritis; Marie-Strümpell Disease

Ankylosis

Abnormal reduction or complete loss of movement in a joint. It may result from fibrous scar tissue, bone fusion, injury, infection, chronic inflammation, or surgery. Fibrous ankylosis involves scar tissue, while bony ankylosis involves fusion of neighboring bones. In dentistry, ankylosis may describe fusion of a tooth root to the surrounding jawbone.

Ankyrin

A protein that connects selected cell-surface proteins to the cell's internal support framework. It helps red blood cells keep their shape; inherited changes can make the cells fragile and cause anemia.

Annihilation

The conversion of a particle and its opposite partner into energy when they collide. In PET scanning, a positron meets an electron and produces two gamma rays that travel in opposite directions to create the image.

Annular Pancreas

A birth defect in which pancreatic tissue forms a ring around part of the duodenum, the first section of the small intestine. The ring may narrow the intestine and cause vomiting, abdominal swelling, or feeding problems.

Annulus

A ring-shaped structure or band in the body. Examples include the tough outer ring of an intervertebral disc and the fibrous rings surrounding the heart valves.

Annulus Fibrosus

The tough, outer fibrocartilaginous ring of an intervertebral disc composed of concentric lamellae of collagen fibers, which encircles and restrains the central gel-like nucleus pulposus and absorbs rotational and compressive mechanical loads.

Alternate Names:
Anulus Fibrosus

ANOCA

Chest pain or other angina symptoms when the major heart arteries do not have a severe blockage. The symptoms may result from poor function of the heart's small vessels or temporary spasm of a coronary artery.

Anodontia

Complete absence of teeth from birth, caused by failure of tooth development. It is rare and may occur with inherited conditions affecting the skin, hair, nails, and teeth.

Anogenital Tract

The connected region containing the anus, tissues around the anus, genital organs, and nearby skin and moist linings.

Anomalous Anatomy

A difference from the usual structure, number, position, origin, or pathway of an organ, blood vessel, duct, or other body part. It may cause no symptoms or may affect health, diagnosis, or surgery.

Anomalous Coronary Artery

A birth defect in which one of the heart's arteries has an unusual starting point or path. Some arteries pass between the aorta and the pulmonary artery and may be squeezed during hard exercise. This can reduce blood flow to the heart and may cause chest pain, fainting, abnormal heart rhythms, or rarely sudden cardiac death.

Alternate Names:
AAOCA; Anomalous Aortic Origin of a Coronary Artery; Congenital Coronary Artery Anomaly; ACAOS

Anomaly

Alternate name; see *Abnormality*.

Anomaly Scan

A detailed ultrasound examination usually performed around 18–22 weeks of pregnancy to assess fetal growth and organs, the placenta, and amniotic fluid, and to screen for major structural birth defects.

Alternate Names:
Mid-Pregnancy Ultrasound; 20-Week Scan; Fetal Anomaly Scan

Anomia

Difficulty finding or saying a familiar word, especially the name of an object or person, even though its meaning is known. It can occur after a stroke or with other brain or language disorders.

Anomic Aphasia

A mild, fluent form of expressive aphasia characterized by persistent difficulty naming objects, people, or words during speech and writing, while comprehension, repetition, and grammatical structure remain relatively preserved.

Alternate Names:
Nominal Aphasia; Dysnomia

Anophthalmia

A birth defect in which one or both eyes fail to develop. It may occur with other birth defects and can affect growth of the eye socket and face.

Anorchia

Complete absence of testicular tissue, usually congenital but sometimes occurring after loss of testes that formed. Bilateral absence prevents testicular production of testosterone and sperm and can affect pubertal development and fertility. It is distinct from cryptorchidism, in which testes are present but have not descended into the scrotum.

Anorectal Abscess

A collection of pus in tissues around the anus or rectum, usually caused by an infected anal gland. It may cause severe pain, swelling, fever, or difficulty sitting.

Anorectal Fistula

An abnormal tunnel between the anus or rectum and nearby skin or another organ. It often develops after an abscess or infection and may cause persistent drainage, pain, or repeated abscesses.

Anorectal Infection

Infection of the anus, rectum, or nearby tissues. It may cause pain, swelling, discharge, fever, or difficulty passing stool and can lead to an abscess.

Anorectal Malformation

A birth defect in which the anus or rectum does not form normally or does not connect correctly to the skin. The opening may be absent, misplaced, or abnormally connected to another organ.

Anorectal Manometry

A test that measures pressure and sensation in the rectum and anal canal. A thin pressure-sensitive tube assesses how well the muscles relax and tighten and may help investigate constipation or loss of bowel control.

Anorexia

Loss or reduction of appetite. It can result from illness, pain, medicines, emotional distress, or other causes and is different from anorexia nervosa, an eating disorder.

Anorexia Nervosa

A serious eating disorder involving persistent restriction of energy intake that leads to significantly low body weight, intense fear of gaining weight or persistent behaviour that prevents weight gain, and disturbance in how body weight or shape is experienced. It can cause malnutrition, slow heart rate, low blood pressure, and organ damage.

Anorgasmia

Persistent or repeated difficulty reaching orgasm or inability to reach orgasm despite adequate sexual stimulation. It may result from medicines, illness, hormonal changes, pain, stress, trauma, or relationship factors.

Anorgasmy

Another spelling of anorgasmia: persistent or repeated inability to reach orgasm despite adequate sexual stimulation. Possible causes include medicines, illness, hormonal changes, stress, trauma, or relationship factors.

Anoscopy

Examination of the anal canal using a short, lighted tube called an anoscope. It helps investigate rectal bleeding, haemorrhoids, fissures, fistulas, pain, and other problems near the anus.

Anoscopy And High-Resolution Anoscopy

Examination of the anal canal and lower rectum with a short viewing tube. High-resolution anoscopy adds magnification and special lighting to identify and assess abnormal tissue, including changes related to HPV.

Anosmia

Complete loss of the sense of smell. It may follow a viral infection, blocked or inflamed nasal passages, head injury, medicines, toxic exposure, or a neurological or inherited disorder.

Anosodiaphoria

A neurological state of apparent emotional indifference or unconcern toward severe physical disability, such as hemiplegia, despite intellectual awareness and verbal acknowledgement of the deficit. It is most commonly associated with non-dominant (right) hemisphere parietal lobe lesions.

Anosognosia

Lack of awareness of, or inability to recognize, one's own illness or neurological impairment. It can occur after certain brain injuries or strokes and is not simply deliberate denial.

Anotia

A birth defect in which the outer ear is completely absent. The ear canal and middle-ear structures may also be abnormal, causing reduced hearing on the affected side.

Anovulation

Failure to release an egg from an ovary during a menstrual cycle. It can cause irregular or absent periods, abnormal bleeding, or infertility and may result from hormonal disorders, low body weight, stress, excessive exercise, or polycystic ovary syndrome.

Anoxia

Complete lack of oxygen reaching body tissues. It can quickly damage or kill cells, especially in the brain, heart, and kidneys, and may result from blocked blood flow, breathing failure, or severe poisoning.

Anrep Effect

An intrinsic physiological autoregulation mechanism of the myocardium whereby an abrupt increase in ventricular afterload causes an initial stretch followed by a sustained, positive inotropic increase in ventricular contractility over the ensuing several minutes.

Anserine Bursa

A synovial fluid-filled sac situated on the proximal medial aspect of the tibia, interposed between the tibial collateral ligament and the conjoined tendons of the sartorius, gracilis, and semitendinosus muscles; inflammation causes pes anserine bursitis.

Alternate Names:
Pes Anserinus Bursa

Antacids

Medicines that neutralise stomach acid and provide short-term relief from heartburn, indigestion, and acid reflux. Different products contain different minerals and may interact with other medicines or alter bowel movements.

Antagonist

A drug or other substance that reduces or blocks the effect of another substance. A receptor antagonist binds to a receptor without activating it and reduces the response to an agonist, often by preventing the agonist from binding or signaling.

Antagonist Muscle

A muscle that produces the opposite movement to the main working muscle and helps control or reverse that movement.

Antalgic Gait

A pain-avoiding walking pattern in which the person spends less time bearing weight on the painful limb, producing a limp. The affected side has a shortened stance phase, and the opposite step is often shortened. It is a gait feature rather than a diagnosis and may result from joint, bone, muscle, or spinal pain.

Alternate Names:
Pain-Relieving Gait; Limping Gait; Antalgic Walk

Ant Bites

Puncture injuries and venomous stings inflicted by ants, particularly fire ants, which produce immediate burning pain followed by the development of pruritic sterile pustules, wheals, or rarely systemic allergic reactions.

Antebrachium

The anatomical region of the upper limb situated between the elbow and the wrist, consisting of the radius and ulna surrounded by anterior and posterior muscular compartments.

Alternate Names:
Forearm

Antecubital Fossa

The shallow hollow at the front of the elbow. It contains the biceps tendon, a major artery, and a major nerve and is commonly used to draw blood or measure blood pressure.

Antegrade

Moving or occurring in the normal forward direction, such as blood flowing away from the heart or an electrical signal travelling through its usual pathway.

Antemortem Injury

An injury that occurred before death. It may show bleeding into living tissue, clot formation, inflammation, swelling, or early healing, which can distinguish it from damage occurring after death.

Antenatal

Relating to the period before birth or to care during pregnancy. Antenatal care monitors the pregnant person and fetus, screens for complications, and provides health advice and support.

Alternate Names:
Prenatal; Antepartum

Antepartum Fetal Surveillance

Tests used before birth to check fetal well-being, especially in higher-risk pregnancies. They may include monitoring fetal movements, the fetal heart rate, ultrasound assessment, and blood-flow measurements.

Antepartum Hemorrhage

Bleeding from the vagina during the second half of pregnancy and before birth. Causes include placenta previa, placental abruption, and problems with the cervix or vagina; severe bleeding can cause maternal

or fetal compromise.

Antepartum Testing

Alternate name; see *Antepartum Fetal Surveillance*.

Anterior

Relating to the front of the body or positioned nearer the front than another structure. The term is used to describe body parts, scan findings, injuries, and disease locations.

Anterior Cerebral Artery Syndrome

A stroke syndrome resulting from occlusion or ischemia of the anterior cerebral artery, classically causing contralateral motor weakness and sensory loss predominantly affecting the lower extremity more than the upper extremity and face. Additional findings may include abulia, urinary incontinence, and frontal release signs due to medial frontal lobe involvement.

Alternate Names:
ACA Syndrome; ACA Infarction

Anterior Chamber

The fluid-filled space between the cornea and iris at the front of the eye. It contains aqueous fluid, which nourishes the cornea and lens and helps maintain eye pressure; impaired drainage can contribute to glaucoma.

Anterior Chamber Angle

The area where the cornea and iris meet at the front of the eye. It contains the main drainage tissue for aqueous fluid; blockage here can raise eye pressure and cause glaucoma.

Anterior Commissure

A transverse bundle of myelinated nerve fibers crossing the midline anterior to the columns of the fornix and above the lamina terminalis, interconnecting the olfactory bulbs, amygdalae, and middle and inferior temporal gyri across the cerebral hemispheres.

Anterior Cord Syndrome

Damage to the front part of the spinal cord, often from injury or reduced blood flow. It can cause weakness or paralysis and loss of pain and temperature sensation below the damage, while the ability to feel vibration and limb position is often preserved.

Anterior Cruciate Ligament

A strong band of tissue inside the knee that connects the thigh bone to the shin bone. It helps prevent the shin bone from sliding too far forward and controls knee rotation.

Anterior Cruciate Ligament Injury

Damage or tearing of the main stabilizing ligament inside the knee, often after sudden turning, stopping, landing, or overextension. It may cause a popping sensation, rapid swelling, pain, and a feeling that the knee gives way.

Anterior Cruciate Ligament Tear

A partial or complete tear of the ligament inside the knee that limits forward sliding and rotation of the shin bone. It commonly causes a pop, rapid swelling, pain, and knee instability after a sudden twist or landing.

Anterior Drawer Sign

Excessive forward movement of the shin relative to the thigh when the knee is bent. This finding suggests looseness or injury of the anterior cruciate ligament.

Anterior Drawer Test

A physical examination maneuver used to check the anterior cruciate ligament in the knee or the anterior talofibular ligament in the ankle. The examiner gently pulls the shin or foot forward; unusual movement may suggest ligament injury.

Anterior Interosseous Nerve

A pure motor branch of the median nerve arising in the proximal forearm that courses deeply along the anterior surface of the interosseous membrane to innervate the flexor pollicis longus, the lateral half of flexor digitorum profundus, and the pronator quadratus; damage produces the classic inability to make the "OK" sign.

Alternate Names:
AIN

Anterior Interosseous Nerve Syndrome

A pure motor neuropathy of the forearm resulting from compression or neuritis of the anterior interosseous nerve (a motor branch of the median nerve). Causes weakness of the flexor pollicis longus, pronator quadratus, and the radial half of the flexor digitorum profundus, classically producing an inability to form the ÖKšign (pinching index finger and thumb pulp-to-pulp instead of tip-to-tip).

Alternate Names:
Kiloh-Nevin Syndrome; AIN Neuropathy

Anterior Knee Pain

Pain at the front of or behind the kneecap, often worse with stairs, squatting, running, or prolonged sitting. Common causes include irritation around the kneecap, tendon problems, arthritis, and injury.

Anterior Mediastinum

The front part of the lower mediastinum, located behind the sternum and in front of the heart sac. It contains fat, connective tissue, lymph nodes, and part of the thymus.

Anterior Midline

The imaginary vertical line running down the center of the front of the body, separating the right and left sides.

Anterior Myocardial Infarction

A heart attack affecting the front wall of the main pumping chamber, usually because the left anterior descending coronary artery is blocked. It can seriously weaken the heart and cause heart failure or shock.

Alternate Names:
Anterior Heart Attack; Anterior MI

Anterior Pituitary

The front part of the pituitary gland. It releases hormones that control the adrenal and thyroid glands, growth, milk production, egg or sperm production, and reproductive function.

Anterior Placenta

An anatomical variation in pregnancy where the placenta implants and develops along the front wall of the uterus, closest to the maternal abdominal wall. It is generally a normal placental position but may cushion and reduce early perception of fetal movements.

Alternate Names:
Anterior Uterine Placental Implantation

Anterior/Posterior Drawer Test

A physical examination of knee stability. Pulling the shin bone forward tests the anterior cruciate ligament; pushing it backward tests the posterior cruciate ligament.

Anterior Segment Surgery

Eye surgery involving structures in the front portion of the eye, including the cornea, anterior chamber, iris, and lens. Procedures may address cataracts, corneal disease, glaucoma, or other disorders affecting these structures; the specific operation depends on the tissue and condition involved.

Anterior Talofibular Ligament

A short, flat ligament on the lateral aspect of the ankle that spans from the anterior margin of the lateral malleolus of the fibula to the neck of the talus. It is the primary stabilizer against anterior talar displacement and excessive inversion, and represents the most frequently torn ligament in lateral ankle sprains.

Alternate Names:
ATFL

Anterior Tibial Artery

An artery that carries blood down the front of the leg and continues onto the top of the foot as the dorsalis pedis artery. Its pulse can usually be felt near the front of the ankle.

Anterior Uveitis

Inflammation in the front part of the eye, usually

involving the iris and sometimes nearby tissue. It can cause eye pain, redness, light sensitivity, blurred vision, and floating spots.

Alternate Names:
Iritis; Iridocyclitis

Anterior Vaginal Prolapse

Bulging of the anterior vaginal wall into the vaginal vault, commonly resulting from herniation of the urinary bladder (cystocele) due to attenuation or tearing of the pubocervical fascia and pelvic floor musculature. Symptoms may include a palpable vaginal bulge, pelvic heaviness, urinary frequency, urgency, incomplete emptying, or stress incontinence.

Alternate Names:
Cystocele; Bladder Prolapse; Prolapsed Bladder; Anterior Wall Prolapse

Anterior Vaginal Wall Repair

Surgery to strengthen the front wall of the vagina when the bladder bulges into it. The procedure restores support using the person's own tissues; the approach and risks depend on the prolapse and overall health.

Anterograde Amnesia

Difficulty forming new memories after the onset of brain injury or illness, while some memories from before the event may remain. Causes include brain injury, stroke, encephalitis, or alcohol-related thiamine deficiency.

Alternate Names:
Anterograde Memory Loss

Anterolateral Thoracotomy

A surgical opening into the chest through an incision between the ribs on the front and side of the chest. It gives access to the lungs, heart, and other structures in the chest. A left-sided approach is commonly used for rapid access during emergency trauma surgery and is usually made through the fourth or fifth intercostal space; it may be extended across the chest as a clamshell thoracotomy.

Anterolisthesis

Forward slipping of one spinal bone relative to the bone below it. It may result from wear, a stress fracture, injury, or a problem present from birth and may cause back pain or nerve symptoms.

Anteroposterior

Directed from the front of the body toward the back. In an anteroposterior X-ray view, the beam enters through the front and leaves through the back.

Anteverted Uterus

A position in which the uterus tilts forward relative to the vagina, toward the bladder. It is a common, normal variation. Anteversion describes the angle of the uterus as a whole, whereas anteflexion describes a forward bend between the body of the uterus and the cervix.

Alternate Names:
Anteriorly Tilted Uterus

Anthocyanin

A natural plant pigment that gives many fruits, vegetables, and flowers red, purple, or blue colours. It has antioxidant effects in laboratory studies and is found in foods such as berries, grapes, and red cabbage.

Anthophobia

An abnormal, persistent fear of flowers, flower petals, or floral arrangements, causing distress or avoidance upon exposure.

Alternate Names:
Fear of Flowers

Anthracosis

A benign, non-fibrotic form of pneumoconiosis characterized by the asymptomatic accumulation of inhaled carbon and soot pigment in the lung parenchyma, alveolar macrophages, and draining hilar lymph nodes, commonly seen in urban dwellers and cigarette smokers.

Alternate Names:
Black Lung Pigmentation; Carbon Pigmentation

Anthrax

A serious infection caused by the bacterium *Bacil-*

lus anthracis. People can become infected through contact with infected animals or animal products, breathing in spores, or eating contaminated food; skin, lung, or intestinal disease may result.

Anthrax Blood Test

A laboratory test that looks for the anthrax bacterium or the body's immune response to it in blood or another sample. It helps confirm suspected anthrax, which can affect the skin, lungs, or digestive tract.

Anthropometry

The measurement of body size and proportions, such as height, weight, waist size, limb length, and skinfold thickness. These measurements help assess growth, nutrition, and body composition.

Anthropophobia

An intense fear of people or social interaction that can cause marked anxiety, avoidance, or difficulty functioning. It is a descriptive term and is not a distinct formal diagnosis in current diagnostic systems.

Alternate Names:
Fear of People

Antiandrogen

A medicine or substance that lowers the production or blocks the effects of androgen hormones such as testosterone. It is used for selected prostate conditions, androgen-related disorders, and some gender-affirming treatments.

Antianginal

A medicine used to prevent or relieve angina, the chest discomfort caused by reduced blood flow to heart muscle. Different medicines lower the heart's workload, widen blood vessels, or improve coronary blood flow.

Anti-Anxiety Agents

Medicines used to reduce excessive anxiety or panic. Different medicines work in different ways and may cause sleepiness, dependence, or other side effects; the choice depends on the person and the condition.

Alternate Names:
Anxiolytics

Antiarrhythmic

A medicine used to prevent or treat certain abnormal heart rhythms. Some medicines aim to restore or maintain a normal rhythm, while others control the heart rate without restoring normal rhythm. The choice depends on the rhythm, heart condition, and risks, because these medicines can also cause abnormal rhythms.

Alternate Names:
Antiarrhythmics; Antiarrhythmic Medicines

Antibacterial

Able to kill bacteria or stop them from growing. The term may describe a medicine, disinfectant, surface treatment, or part of the body's immune defence.

Antibiogram

A report showing which antibiotics are likely to work against bacteria grown from patient samples in a laboratory. It helps clinicians choose treatment and monitor local patterns of antibiotic resistance.

Antibiotic

A medicine that kills bacteria or inhibits their growth. Antibiotics act on bacterial structures or processes, such as cell-wall synthesis or protein production, and are used against susceptible bacterial infections. They do not treat viral infections. Their use can cause adverse effects and select for antimicrobial resistance.

Alternate Names:
Antibiotics

Antibiotic Misuse in Viral URIs

The inappropriate prescription or self-administration of antibacterial agents for acute viral upper respiratory tract infections (such as the common cold or influenza), which confers no therapeutic benefit and drives antimicrobial resistance and adverse drug events.

Alternate Names:
Antibiotic Stewardship in URI; Inappropriate Antibiotic Use in Colds; Antibiotic Overuse in Flu

Antibiotic-Resistant Bacterial Infection

An infection caused by bacteria that are not adequately stopped by one or more antibiotics normally active against them. Resistance may be intrinsic or acquired and can limit effective treatment options.

Antibody

A Y-shaped protective glycoprotein produced by plasma cells (differentiated B lymphocytes) that specifically binds to a complementary antigen to neutralize toxins and pathogens or mark them for destruction. See also: *Immunoglobulin*.

Alternate Names:
Immunoglobulin

Antibodies

Plural form; see *Antibody*.

Antibody-Dependent Cell-Mediated Cytotoxicity

An immune process in which antibodies bind to antigens on the surface of an infected or abnormal cell, marking it for destruction by cytotoxic effector cells (such as natural killer cells).

Alternate Names:
ADCC

Antibody-Drug Conjugate

A treatment in which an antibody carrying a linked medicine binds to a target on a cell and delivers the medicine near or inside that cell. It is used for selected cancers and can still damage healthy tissues or cause medicine-specific toxicities.

Antibody Engineering

Designing or changing antibodies so they bind more accurately, last longer, cause fewer unwanted immune reactions, or work better as medicines. Researchers may alter their target, size, immune effects, or attachment to another medicine.

Antibody Therapy

Treatment using laboratory-made or purified antibodies to block, activate, or target a particular molecule or cell. It is used for selected cancers, immune disorders, infections, and other conditions.

Antibody Titer Blood Test

A blood test that estimates the amount of a specific antibody by repeatedly diluting the sample until the antibody can no longer be detected. Results may help show previous exposure, immunity, or a recent infection, depending on the antibody tested.

Anti-CCP

Abbreviation for cyclic citrullinated peptide antibody; see *Anti-CCP Antibody*.

Anti-CCP Antibody

An autoantibody directed against cyclic citrullinated peptides (CCP) measured in serum to assist in diagnosing rheumatoid arthritis. It demonstrates high specificity ($> 95\%$) for rheumatoid arthritis and serves as a predictor of erosive joint disease.

Alternate Names:
Anti-Cyclic Citrullinated Peptide; ACPA

Anticholinergic

Blocking the action of acetylcholine, a chemical messenger used by nerves. These medicines can reduce secretions and muscle spasms but may cause dry mouth, blurred vision, constipation, difficulty urinating, fast heartbeat, or confusion.

Anticholinergic Burden

The combined anticholinergic effect of one or more medicines. A high burden can cause dry mouth, constipation, blurred vision, difficulty urinating, confusion, or delirium, especially in older adults.

Anticholinergic Toxicity

Excess blockade of muscarinic acetylcholine receptors, producing flushed, dry skin, fast heartbeat, dilated pupils, delirium, urinary retention, and reduced bowel sounds.

Anticholinergic Toxidrome

A pattern of poisoning caused by excessive blockage of acetylcholine signals. It may cause dry skin and mouth, large pupils, fast heartbeat, inability to uri-

nate, reduced bowel activity, overheating, agitation, or delirium.

Anti-Citrullinated Peptide Antibody

Alternate index label; see *Anti-Cyclic Citrullinated Peptide Antibody*.

Anticoagulant

A medicine that reduces blood clot formation by interfering with one or more steps in coagulation. It is used to prevent or treat thromboembolic disease. Unlike antiplatelet medicines, anticoagulants primarily affect the coagulation system rather than platelet activation; bleeding is an important adverse effect.

Anticoagulants and Thrombolytics in Pregnancy

Medicines that prevent clot formation or dissolve selected clots during pregnancy or after delivery. Their effects on clotting, bleeding, and fetal exposure vary by medicine and pregnancy stage.

Anticoagulation

Treatment that reduces the formation or growth of blood clots by slowing the clotting process. It is used for conditions such as clots in veins, irregular heart rhythm, and selected heart or blood-vessel disorders.

Anticodon

A group of three RNA building blocks on a transfer-RNA molecule. It pairs with a matching sequence on messenger RNA so the cell adds the correct amino acid while making a protein.

Anticonvulsants

Medicines, also called antiseizure medicines, used to prevent or control seizures. Some are also used for nerve pain, migraine, or mood disorders; their effects, interactions, and side effects differ between medicines.

Alternate Names:
Antiseizure Medicines; Antiseizure Drugs; Anticonvulsant Drugs

Anti-Cyclic Citrullinated Peptide

Highly specific blood test used to detect rheumatoid arthritis early in its disease course. See *Anti-Cyclic Citrullinated Peptide Antibody*.

Anti-Cyclic Citrullinated Peptide Antibody

An autoantibody measured in blood that recognizes citrullinated proteins. A positive result can support a diagnosis of rheumatoid arthritis, especially when symptoms and examination findings fit, but it does not establish the diagnosis by itself.

Alternate Names:
Anti-CCP Antibody; ACPA; Anti-Citrullinated Peptide Antibody; Anti-Cyclic Citrullinated Peptide; Cyclic Citrullinated Peptide Antibody

Anti-D

An injection containing antibodies given to an RhD-negative pregnant person after certain pregnancy events, or around birth, to prevent the person's immune system making antibodies against RhD-positive fetal blood. This helps protect a current or future pregnancy from fetal red-cell destruction.

Antideformity Position

A planned position for a limb or joint that helps prevent or limit shortening, stiffness, or deformity after injury, surgery, burns, nerve damage, or prolonged immobility.

Antidepressant Discontinuation Syndrome

A constellation of transient physiological symptoms that occurs following the abrupt cessation, dose reduction, or missed doses of an antidepressant medication, particularly selective serotonin reuptake inhibitors (SSRIs) or serotonin-norepinephrine reuptake inhibitors (SNRIs). Symptoms include flu-like discomfort, insomnia, nausea, hyperarousal, and sensory disturbances (such as electric shock-like sensations).

Alternate Names:
Antidepressant Withdrawal; SSRI Discontinuation Syndrome

Antidepressants

Medicines used mainly to treat depression. Different types change the activity of chemical messengers in the brain and may also treat anxiety, nerve pain, obsessive thoughts, or other conditions.

Antidiabetic

Relating to a medicine or treatment used to control diabetes or lower blood glucose; see *Antidiabetic Drugs*.

Antidiabetic Drugs

Medicines used to manage diabetes by replacing insulin, increasing insulin release or action, reducing glucose production or absorption, or helping the kidneys remove glucose. The appropriate medicine depends on the type of diabetes, blood glucose, other health conditions, and treatment goals.

Antidiuretic Hormone

A hormone made in the brain and released by the pituitary gland that helps the kidneys conserve water. It also narrows blood vessels when blood volume or blood pressure is low.

Alternate Names:
Vasopressin

Antidiuretic Hormone Blood Test

A blood test that measures vasopressin, the hormone that helps the kidneys conserve water. It may help investigate excessive thirst, very dilute urine, inappropriate water retention, or other disorders of water balance.

Antidiuretic Hormone Physiology

Vasopressin is made in the hypothalamus and released from the posterior pituitary when the blood becomes too concentrated or blood volume falls. It makes kidney tubules retain water and can narrow blood vessels.

Antidiuretic Hormone Resistance

Failure of the kidneys to respond properly to vasopressin. It causes production of large amounts of dilute urine and intense thirst and may result from medicines, mineral imbalance, kidney disease, or inherited changes.

Anti-DNase B Blood Test

A blood test that measures the body's antibodies against a protein made by group A streptococcal bacteria. It can support evidence of a recent strep infection when doctors investigate rheumatic fever, kidney inflammation, or another complication.

Antidote

A substance that counteracts or limits the harmful effects of a poison. Antidotes act in different ways, including binding a toxin, blocking its effects, or restoring a chemical process disrupted by it.

Anti-Double-Stranded DNA Antibody

An autoantibody measured in blood that recognizes double-stranded DNA. It can support a diagnosis of systemic lupus erythematosus; levels may track disease activity, especially kidney involvement, in some people.

Alternate Names:
Anti-dsDNA Antibody; dsDNA Antibody; Anti-Double-Stranded DNA; Double-Stranded DNA Antibody

Antiemetics

Medicines used to prevent or relieve nausea and vomiting. Different types act on chemical signals in the brain or digestive tract, and the choice depends on the cause, age, pregnancy, other medicines, and risk of side effects.

Antiepileptic Drugs

Medicines used to prevent or control seizures by reducing excessive electrical activity in the brain. The best choice depends on the seizure type, age, other conditions, medicines, and possible side effects.

Antifreeze Poisoning

Poisoning after swallowing or otherwise being exposed to antifreeze, especially products containing ethylene glycol. It may first cause intoxication and vomiting, then severe acid buildup, kidney failure, brain injury, or death.

Antifungal Prophylaxis

Use of an antifungal medicine to prevent a serious fungal infection in someone at high risk, such as a person with prolonged low white-cell counts, a stem-cell transplant, or severe immune suppression.

Antifungal Resistance

The ability of a fungus to survive a medicine that would normally stop its growth or kill it. Resistance may be present naturally or develop after genetic changes or repeated exposure to antifungal medicines.

Anti-GBM Disease

An autoimmune disease in which antibodies attack supporting layers in the kidneys and sometimes the lungs. It can rapidly cause kidney failure, coughing up blood, or bleeding into the lungs.

Antigen

A substance or part of a substance that the immune system can recognize. It may come from a germ, toxin, transplanted tissue, or abnormal cell and can trigger antibodies or other immune responses.

Antigen Detection Test

A test that looks for a protein or other marker from a specific germ in a patient sample. It is often rapid, but it may miss an infection when the amount of germ material is small.

Antigenic Drift

The gradual change in a virus's surface proteins as it multiplies. These small changes can help viruses, especially influenza viruses, partly evade existing immunity and contribute to repeated seasonal outbreaks.

Antigenic Shift

A sudden major change in a virus's surface proteins, usually when two different influenza A viruses exchange genetic material inside the same cell. It can produce a virus to which many people have little immunity.

Antigenic Variation

Changes in a germ's surface markers that help it avoid recognition by the immune system. Variation may happen gradually through mutations or suddenly when genetic material is exchanged between different strains.

Antigen Presentation

The process by which an immune or other cell displays small pieces of proteins on its surface for T cells to inspect. This helps the immune system recognize infections, abnormal cells, transplanted tissue, and sometimes the body's own tissues.

Antigen-Presenting Cell

An immune cell that breaks proteins into small pieces and displays them on its surface so T cells can recognize them. Important antigen-presenting cells include dendritic cells, macrophages, and B cells.

Alternate Names:
APC

Antigen Receptor

A protein on an immune cell that recognizes a particular substance or protein fragment. B-cell receptors can bind whole substances, while T-cell receptors recognize fragments displayed by other cells.

Anti-Glomerular Basement Membrane Blood Test

A blood test that detects antibodies attacking the kidney's filtering membranes and sometimes the lungs' supporting membranes. A positive result supports anti-GBM disease when symptoms and other test results are consistent.

Anti-Glomerular Basement Membrane Disease

An autoimmune disease in which antibodies damage the kidney's filtering membranes and sometimes the lungs. It may cause rapidly worsening kidney function, blood in the urine, coughing up blood, or lung bleeding.

Antigout

A medicine used to prevent or treat gout. Some lower uric-acid levels over time, while others reduce the inflammation and pain of an acute gout attack.

Antihistamines

Medicines that block histamine, a chemical involved in allergy symptoms. They can relieve itching, sneezing, runny nose, watery eyes, or hives. Older types may cause drowsiness; medicines that reduce stomach acid by blocking H2 receptors are a separate group.

Antihistamines For Allergies

Medicines that block histamine and relieve allergy symptoms such as itching, sneezing, runny nose, watery eyes, or hives. Some cause drowsiness and interactions or side effects vary between medicines.

Anti-HMGCR Myopathy

A rare autoimmune muscle disease in which antibodies attack a muscle enzyme. It causes ongoing weakness and muscle injury, especially around the hips, thighs, shoulders, and upper arms, and may begin after treatment with a statin medicine.

Alternate Names:
Statin-Induced Immune-Mediated Necrotizing Myopathy; Anti-HMG-CoA Reductase Myopathy

Antihypertensives In Pregnancy

Medicines used to lower high blood pressure during pregnancy. Drug effects and risks vary by medicine and stage of pregnancy; some agents can impair fetal kidney development.

Anti-IgE Therapy

Treatment using an antibody that binds free immunoglobulin E, an allergy-related immune protein. This reduces activation of allergy cells and may lessen symptoms and attacks in selected allergic asthma and other allergic conditions.

Anti-IL4 Receptor Therapy

Treatment that blocks a cell receptor used by interleukin-4 and interleukin-13, immune signals that promote allergic inflammation. It can reduce airway inflammation in selected asthma and other allergic diseases.

Anti-IL5 Therapy

Treatment that blocks interleukin-5 or its receptor, reducing the production or survival of eosinophils, a type of white blood cell. It is used for selected eosinophilic diseases, including some severe asthma.

Anti-Inflammatory

Pertaining to any drug, substance, or therapeutic intervention that reduces, counteracts, or suppresses inflammation, vascular permeability, tissue edema, and associated pain. Major therapeutic classes include nonsteroidal anti-inflammatory drugs and glucocorticoids.

Anti-Insulin Antibody Test

A blood test that detects antibodies against insulin. These antibodies can bind insulin and release it unpredictably, causing low blood sugar; the test helps investigate unexplained hypoglycaemia and insulin autoimmune syndrome.

Antileukotriene

A medicine that blocks leukotrienes, chemical signals that can cause airway narrowing and inflammation. It is used in selected asthma and allergy-related conditions, often as part of a broader treatment plan.

Alternate Names:
Leukotriene Modifier; Leukotriene Pathway Inhibitor

Anti-MDA5 Dermatomyositis

A form of dermatomyositis associated with antibodies against a protein called MDA5. It often causes distinctive skin changes with little muscle weakness but carries a high risk of rapidly worsening inflammation and scarring in the lungs.

Antimetabolite

A substance that resembles a chemical needed by cells and interferes with the cell's normal chemical reactions or DNA production. Some are used

to treat cancer or suppress an overactive immune system.

Antimicrobial

A substance that kills or limits the growth of microscopic organisms, including bacteria, viruses, fungi, or parasites. Antibiotics are antimicrobials, but they act only against bacteria.

Antimicrobial Adverse Effects

Unwanted effects caused by medicines that treat infections. Depending on the medicine, they may include allergy, diarrhoea, liver or kidney injury, hearing problems, tendon injury, or harmful effects on heart rhythm.

Antimicrobial Agent

A substance that kills microorganisms or stops them from growing. Antimicrobial agents include antibacterial, antiviral, antifungal, and antiparasitic medicines.

Antimicrobial Desensitization

A carefully supervised process of giving gradually increasing doses of an infection-fighting medicine to temporarily reduce an immediate allergy response. It is considered only when the medicine is essential and suitable alternatives are unavailable.

Antimicrobial Dosing Optimization

Choosing the infection medicine, dose, timing, route, and duration so enough medicine reaches the infection without unnecessary harm. Kidney function, liver function, body size, infection severity, and resistance are considered.

Antimicrobial Hypersensitivity Reactions

Immune reactions to an infection-fighting medicine, ranging from an itchy rash to life-threatening anaphylaxis. The timing and symptoms vary with the medicine and type of immune response.

Antimicrobial Pharmacodynamics

How an infection-fighting medicine affects a microorganism, including how much medicine and how much exposure are needed to stop or kill it. This information helps select an effective dose and schedule.

Antimicrobial Pharmacokinetics

How the body absorbs, spreads, changes, and removes an infection-fighting medicine. Kidney or liver disease, age, body size, and other medicines can change how much medicine is needed and how often it is given.

Antimicrobial Resistance

The ability of a microorganism to survive or grow despite a medicine that would normally kill it or stop its growth. Resistance can affect bacteria, viruses, fungi, or parasites and can spread between organisms.

Alternate Names:
AMR; Drug Resistance

Antimicrobial Resistance Mechanisms

Ways microorganisms avoid being killed by infection medicines. They may destroy or change the medicine, alter its target, prevent it entering, or actively pump it out of the cell.

Antimicrobial Resistance Surveillance

Ongoing collection and analysis of resistance results from patient samples. It shows how resistance changes over time and helps hospitals and public-health services choose effective treatment and limit spread.

Antimicrobial Sensitivity Test

A laboratory test that shows which infection-fighting medicines can stop or kill a microorganism grown from a patient sample. It helps guide treatment for a confirmed infection.

Antimicrobial Stewardship

Coordinated efforts to use infection-fighting medicines only when needed and to choose the right medicine, dose, route, and duration. This improves outcomes and limits resistance and side effects.

Antimicrobial Susceptibility Testing

Laboratory testing that estimates whether a microorganism is likely to respond to particular infection-fighting medicines. Methods include measuring growth around medicine-containing discs or in liquid; results help select treatment.

Antimicrobial Therapy

Use of antibacterial, antiviral, antifungal, or antiparasitic medicines to prevent or treat an infection. The choice depends on the microorganism, infection site, severity, resistance, and the person's health.

Antimitochondrial Antibody

An antibody that reacts with structures inside mitochondria, the parts of cells that produce energy. It is strongly associated with primary biliary cholangitis, an autoimmune bile-duct disease; its significance depends on symptoms and liver tests.

Antimony

A metallic chemical element whose compounds can be poisonous. Some antimony compounds have been used to treat leishmaniasis; exposure can affect the heart, liver, kidneys, or nervous system.

Anti-Mullerian Hormone

A hormone made by developing ovarian follicles and by cells in the testes before birth. Its blood level can help estimate ovarian follicle number or assess some reproductive and developmental conditions, but it does not measure fertility by itself.

Antineoplastic

See *Antineoplastic Drugs*.

Alternate Names:
Anticancer Agent; Antitumor Agent

Antineoplastic Drugs

Medicines used to treat cancer, including chemotherapy, targeted medicines, immunotherapies, and hormone therapies, which act in different ways and have drug-specific benefits and adverse effects.

Alternate Names:
Antineoplastic Agents; Anticancer Drugs; Anticancer Medicines; Antitumor Drugs

Anti-NMDA Receptor Encephalitis

A serious immune attack on the brain involving a receptor important for communication between nerve cells. It may cause sudden behavior or psychiatric changes, memory loss, seizures, abnormal movements, reduced consciousness, and unstable heart rate or blood pressure.

Alternate Names:
Anti-N-Methyl-D-Aspartate Receptor Encephalitis; NMDA Receptor Encephalitis

Antinuclear Antibody

A diverse family of autoantibodies directed against nucleic acids, histones, ribonucleoproteins, and other nuclear and cytoplasmic components, evaluated via indirect immunofluorescence as a primary serological screen for systemic lupus erythematosus, systemic sclerosis, mixed connective tissue disease, and Sjogren syndrome.

Alternate Names:
ANA; Antinuclear Antibodies; Antinuclear Autoantibodies; FANA

Antinuclear Antibody Panel

A comprehensive laboratory panel of specific autoantibody assays (such as anti-dsDNA, anti-Smith, anti-Ro/SSA, anti-La/SSB, and anti-RNP) utilized to characterize specific autoimmune rheumatic diseases following a positive antinuclear antibody screen.

Antinuclear Antibody Test

A blood test that screens for autoantibodies directed against cellular nuclei, commonly ordered during evaluation for systemic lupus erythematosus and other autoimmune conditions; see *Antinuclear Antibody*.

Antioxidant

A substance that limits reactions involving reactive molecules, including free radicals and some reactive oxygen or nitrogen species. The body produces antioxidant enzymes and also obtains antioxidant substances from food; these systems help protect cells from oxidative damage.

Antiparietal Cell Antibody Test

A blood test that detects antibodies against cells in the stomach lining that make acid and help absorb vitamin B12. A positive result may support autoimmune gastritis or pernicious anemia but does not prove either condition alone.

Antiparkinson

Relating to medicines used to reduce symptoms of Parkinson disease. These medicines may increase or imitate dopamine activity or change other brain signals that influence movement.

Antiphospholipid Antibodies

Autoantibodies that attach to proteins linked with cell membranes. Persistent antibodies may increase the risk of blood clots and pregnancy complications, but they can also appear temporarily after an infection or with some medicines.

Antiphospholipid Antibody

An antibody directed against proteins that bind to cell-membrane fats. Persistent antibodies may be associated with blood clots or pregnancy complications, especially when clinical features of antiphospholipid syndrome are present.

Alternate Names:
APA; aPL Antibody

Antiphospholipid Antibody Syndrome

Alternate name; see *Antiphospholipid Syndrome*.

Antiphospholipid Syndrome

An autoimmune condition in which persistent antiphospholipid antibodies occur together with blood clots or certain pregnancy complications. Assessment uses the person's medical history and blood tests; antibody positivity alone does not establish the syndrome, and positive tests generally need confirmation at least 12 weeks later.

Alternate Names:
APS; Antiphospholipid Antibody Syndrome; Hughes Syndrome; aPL Syndrome

Antiphospholipid Syndrome and Pregnancy

An autoimmune clotting disorder associated with recurrent pregnancy loss, placental insufficiency, fetal growth restriction, preeclampsia, thrombosis, or other pregnancy morbidity. Diagnosis requires compatible clinical events and persistent antiphospholipid antibodies on tests at least 12 weeks apart.

Antiplatelet

A medicine that reduces platelet activation or aggregation and lowers the formation of arterial blood clots; see *Antiplatelet Agents*.

Antiplatelet Agents

Medicines that reduce the ability of platelets to stick together and form clots. They are used in selected people to lower the risk of clots in arteries, including after some heart or blood-vessel events.

Alternate Names:
Antiplatelet Drugs; Antiplatelet Medicines

Antiplatelet Therapy

Treatment with medicines that make platelets less likely to stick together. It is used in selected people to reduce clots in arteries, including after some heart attacks, strokes, or stent procedures.

Antiprotozoal

A medicine or substance that kills protozoa or stops them growing. Protozoa are microscopic parasites that can cause infections such as malaria, giardiasis, or amoebiasis.

Antipsychotic Medicine

A medication used to treat psychosis, bipolar disorder, and severe agitation by altering neurotransmitter pathways (primarily dopamine and serotonin); see *Antipsychotic*.

Alternate Names:
Antipsychotics; Neuroleptics

Antipyretic

A medicine that lowers fever and may ease related discomfort. Acetaminophen and ibuprofen are common examples. Aspirin exposure during viral illness

in children has been associated with Reye syndrome.

Alternate Names:
Antipyretics; Fever-Reducing Medicines

Anti-Reflux Surgery

An operation to reduce the backward flow of stomach contents into the oesophagus by strengthening or reshaping the valve between the oesophagus and stomach. It may be considered for selected people with severe reflux or a hiatus hernia.

Antiretroviral

A medicine that acts against retroviruses, including HIV. Different antiretroviral medicines block different steps by which HIV enters cells, copies its genetic material, or makes new virus particles.

Antiretroviral Therapy

Treatment of HIV infection with a combination of medicines that block several steps in HIV reproduction. It lowers the amount of virus, protects immune function, reduces illness, and greatly lowers the chance of sexual transmission when the virus remains undetectable.

Anti-Rust Product Poisoning

Illness caused by swallowing, breathing, or skin exposure to a product used to remove or prevent rust. It may burn the mouth and digestive tract or damage the lungs and other organs.

Antisepsis

Use of a chemical product on living skin or tissue to reduce harmful microorganisms and lower infection risk. It does not make tissue completely sterile; some antiseptics can injure tissue if applied improperly.

Antiseptic

A substance used on skin or other living tissue to kill or slow harmful microorganisms. Antiseptics can help reduce infection risk but may damage tissue if used incorrectly.

Antiserum

Blood serum containing antibodies against a specific germ, toxin, or other substance. It can provide temporary immune protection or help neutralize a toxin.

Anti-Smooth Muscle Antibody

An antibody that reacts with proteins in smooth muscle cells. A blood test may support autoimmune hepatitis, but low levels can also occur with other autoimmune diseases or infections and are not diagnostic alone.

Antisocial Personality

A long-term pattern of disregarding other people's rights, safety, rules, and responsibilities, often including deceit, impulsive behaviour, aggression, or lack of remorse.

Alternate Names:
Antisocial Personality Disorder

Antisocial Personality Disorder

A mental-health disorder involving a persistent pattern of violating other people's rights and social rules, deceitfulness, impulsivity, aggression, irresponsibility, or lack of remorse. The pattern begins by adolescence and continues into adult life.

Alternate Names:
ASPD; Dissocial Personality Disorder; Sociopathy

Antispasmodic Drugs

Medicines that relax involuntary muscle and reduce cramping or spasms, most often in the digestive tract. Some are also used for bladder or bile-duct spasms; side effects depend on the medicine.

Alternate Names:
Antispasmodics; Spasmolytics

Anti-SRP Myopathy

A rare autoimmune muscle disease caused by antibodies against a protein involved in making new proteins. It causes rapidly progressive weakness, especially around the hips, shoulders, and neck, and may cause difficulty swallowing.

Alternate Names:
Anti-Signal Recognition Particle Myopathy; SRP-Associated Necrotizing Myopathy

Antistreptolysin O Titer

A blood test that measures antibodies against a toxin made by group A streptococcal bacteria. A raised or rising result may show a recent strep infection when investigating rheumatic fever or kidney inflammation, but does not prove an active infection.

Antisynthetase Syndrome

An autoimmune disease in which the immune system attacks proteins needed to make other proteins. It may cause muscle inflammation and weakness, arthritis, fever, colour changes in the fingers, rough cracked skin on the hands, or lung inflammation and scarring.

Antithrombin

A natural blood protein that slows clotting by blocking thrombin and other clotting proteins, especially factor Xa. Too little antithrombin, whether inherited or acquired, increases the risk of clots in veins.

Antithrombin Deficiency

A condition in which the blood has too little or too little active antithrombin, a natural anti-clotting protein. It may be inherited or acquired and increases the risk of clots, especially in the veins.

Antithrombin III Blood Test

A blood test that measures the amount or activity of antithrombin, a protein that limits clotting. A low result may indicate inherited deficiency or may occur with liver disease, kidney protein loss, severe illness, or some treatments.

Antithrombin III Deficiency

Reduced amount or activity of antithrombin, causing increased risk of blood clots in veins. It may be inherited or result from liver disease, kidney disease, severe illness, or other causes.

Antithymocyte Globulin

A preparation of antibodies that removes or suppresses T cells, immune cells involved in transplant rejection and some autoimmune reactions. It is used in selected transplants and blood-cell disorders and can cause allergic reactions, low blood counts, and infections.

Antithyroglobulin Antibody Test

A blood test that detects antibodies against thyroglobulin, a protein used to make thyroid hormones. Raised levels may support Hashimoto thyroiditis or other autoimmune thyroid disease but do not determine thyroid function by themselves.

Anti-Thyroid Peroxidase Antibody

An autoantibody directed against thyroid peroxidase, the key enzyme required for thyroid hormone synthesis. Elevated titers are the hallmark laboratory finding in Hashimoto thyroiditis and are also present in Graves disease.

Alternate Names:
Anti-TPO Antibody; Thyroid Peroxidase Antibody

Antitoxin

An antibody or antibody preparation that binds to and neutralizes a toxin. It can provide temporary protection or treatment for selected poisonings and infections that produce toxins.

Antitubercular Agents

Medicines used to treat tuberculosis, an infection caused by *Mycobacterium tuberculosis*. Treatment commonly uses combinations of these medicines; adverse effects can involve the liver, nerves, eyes, and other organs.

Antitussive

A medicine that reduces coughing. Some act on cough-control areas in the brain, while others reduce irritation in the airways. Opioid antitussives can cause sleepiness and slow breathing.

Alternate Names:
Cough Suppressant

Anti-VEGF Injections

Injections, usually given into the eye, that block vascular endothelial growth factor, a signal that promotes abnormal blood-vessel growth and leakage. They can improve or preserve vision in several

retinal diseases.

Antiviral Agent

A medicine that inhibits viral replication or another step in a virus's life cycle. Antiviral agents act against particular viruses or virus groups and are used to prevent or treat selected viral infections. They do not act against bacteria; unlike antibiotics, their targets are viral processes or virus-infected cells.

Alternate Names:
Antiviral Medicine

Anton Syndrome

A rare neurological condition characterized by cortical blindness accompanied by visual anosognosia (complete denial of blindness) and visual confabulation. Patients genuinely behave and report as if they can see, despite profound vision loss, classically caused by bilateral occipital lobe infarctions.

Alternate Names:
Anton-Babinski Syndrome; Visual Anosognosia

Antral Follicle Count

The number of small developing egg-containing sacs seen in both ovaries, usually measured by vaginal ultrasound early in the menstrual cycle. It helps estimate ovarian reserve and response to fertility medicines but does not by itself predict natural fertility.

Alternate Names:
AFC; Basal Antral Follicle Count

Antral Web

A thin, circumferential mucosal diaphragm in the gastric antrum, usually located one to two centimetres proximal to the pylorus. It can be congenital or acquired and may cause gastric outlet obstruction, nausea, postprandial vomiting, and early satiety.

Alternate Names:
Gastric Antral Diaphragm; Antral Septum

Antrochoanal Polyp

A usually noncancerous growth that starts in the lining of a cheek sinus and extends into the back of the nose. It is more common in children and young adults and may cause blockage or drainage on one side.

Antrum

A cavity or chamber within an organ. The term commonly refers to the lower part of the stomach near its outlet or the air-filled sinus in the cheek.

Anuria

Almost complete absence of urine production, often defined in an adult as less than about 100 millilitres in 24 hours. It can signal severe kidney failure, blockage, shock, or another emergency.

Anus

The opening at the end of the digestive tract through which stool leaves the body. Two ring-shaped muscles help control when stool and gas are released.

Anxiety

A feeling of worry, fear, or unease that can be a normal response to danger or stress. It becomes a disorder when it is excessive, persistent, difficult to control, or interferes with daily life.

Anxiety Disorder

Alternate index label; see *Anxiety Disorders*.

Anxiety Disorders

A group of mental-health conditions involving excessive fear, worry, or anxiety that persists, is difficult to control, or causes significant distress or impairment. Major types include generalized anxiety disorder, panic disorder, social anxiety disorder, specific phobia, agoraphobia, separation anxiety disorder, and selective mutism. Physical symptoms may include a racing heart, sweating, muscle tension, poor sleep, or stomach upset.

Anxiety in Children

Developmentally inappropriate and persistent worry, fear, or dread in pediatric populations, manifesting through behavioral changes, somatic complaints (such as stomachaches or headaches), separation

distress, school refusal, or sleep disturbances.

Alternate Names:
Pediatric Anxiety; Childhood Anxiety Disorders

Anxiety & Panic

Anxiety disorders involve excessive fear, worry, or physiological arousal; panic attacks are sudden episodes of intense fear with symptoms such as palpitations, breathlessness, chest discomfort, trembling, or fear of dying.

Aorta

The body's largest artery, carrying oxygen-rich blood from the left side of the heart to the rest of the body. It passes through the chest and abdomen and divides into the arteries supplying the pelvis and legs.

Aortal

Relating to the aorta, the large artery that carries blood from the heart to the body.

Aortic

Relating to the aorta, the main artery carrying blood from the heart to the body.

Aortic Aneurysm

An abnormal widening of the aorta, the large artery that carries blood from the heart to the body, caused by weakness in its wall. It may occur in the chest or abdomen and often causes no symptoms. An aneurysm can rupture; aortic dissection is a related but distinct condition in which blood separates the wall's layers.

Aortic Aneurysm Rupture

A break through the wall of an aortic aneurysm that causes severe internal bleeding. It may produce sudden chest, back, or abdominal pain, collapse, and shock and is a life-threatening emergency.

Aortic Aneurysm Screening

Testing people at increased risk for an aortic aneurysm before symptoms appear. Abdominal ultrasound is commonly used; eligibility depends on age, sex, smoking history, and family history.

Aortic Angiography

Imaging of the aorta after contrast material is given, usually with X-ray, computed tomography, or magnetic resonance imaging. It can show narrowing, blockage, aneurysm, tearing, or abnormal blood flow.

Aortic Arch

The curved part of the aorta between its upward and downward sections. Three major arteries branch from it to supply the head, neck, and arms; disease here can affect blood flow or press on nearby structures.

Aortic Arch Syndrome

A group of signs caused by narrowing or blockage of arteries branching from the aortic arch, reducing blood flow to the arms, head, or brain. Causes include large-vessel vasculitis, such as Takayasu arteritis, and atherosclerosis; findings may include unequal pulses or blood pressure, arm fatigue, dizziness, or neurological symptoms.

Aortic Balloon Pump

A temporary heart-support device. A catheter with a balloon is placed in the main artery in the chest; the balloon inflates and deflates with each heartbeat to improve blood flow to the heart and reduce the heart's workload.

Alternate Names:
Intra-Aortic Balloon Pump; IABP

Aortic Body

A small group of sensory cells near the aortic arch that detects changes in blood oxygen, carbon dioxide, and acidity. It sends signals to the brain to help adjust breathing and circulation.

Aortic Coarctation

Alternate name; see *Coarctation of the Aorta*.

Aortic Disease

Any disorder affecting the aorta, the body's main

artery, including aneurysm, dissection, narrowing, inflammation, or fatty deposits. Some cases cause no symptoms; sudden severe chest, back, or abdominal pain can occur with acute aortic disease.

Aortic Dissection

A life-threatening condition in which a tear occurs in the inner layer of the aorta (the body's largest artery). High-pressure blood surges through the tear, causing the inner and middle layers of the aortic wall to separate or split apart and creating a second channel for blood flow. This weakens the aorta, risks sudden rupture, and can block blood flow to vital organs such as the heart, brain, kidneys, or limbs. It classically presents with sudden, severe, ripping or tearing pain in the chest or upper back.

Alternate Names:
Dissecting Aortic Aneurysm (historical); Dissecting Aneurysm (historical)

Aortic Embolism

Blockage of a downstream artery by material, often cholesterol debris or a blood clot, that has broken away from the aorta. It can suddenly reduce blood flow to a limb or organ.

Aortic Graft Infection

Infection involving an artificial graft used to repair or replace part of the aorta. It can cause fever, bloodstream infection, bleeding, or a new abnormal connection with the intestine.

Aortic Injury

Damage to the aorta, often caused by severe chest trauma or a medical procedure. A tear can cause internal bleeding, reduced blood flow, shock, and a life-threatening emergency.

Aortic Insufficiency

Leakage through the aortic valve that allows blood to flow backward into the heart's main pumping chamber. It can make the heart work harder and may eventually cause heart failure.

Aortic Intramural Hematoma

Bleeding within the middle layer of the aortic wall, usually without a visible tear through the inner lining or blood flow in a false channel as occurs in aortic dissection. It may result from rupture of tiny vessels within the wall or from a small tear not visible on imaging, and it can progress to dissection or aortic rupture.

Aortic Regurgitation

Leakage through an aortic valve that does not close completely, allowing blood to flow from the aorta back into the left ventricle during diastole. Acute regurgitation can cause sudden pulmonary edema or shock; chronic regurgitation may enlarge and weaken the left ventricle and cause breathlessness, chest discomfort, palpitations, or heart failure. Echocardiography assesses the cause and severity.

Aortic Regurgitation Murmur

A blowing sound heard during the part of the heartbeat when the heart relaxes, caused by blood leaking backward through the aortic valve. It is often loudest along the left side of the breastbone.

Aortic Rupture

A life-threatening break through the wall of the aorta, often following an aneurysm or dissection. It can cause sudden severe chest, back, or abdominal pain, internal bleeding, collapse, and shock.

Aortic Sclerosis

Calcification, fibrosis, and thickening of the aortic valve leaflets without significant hemodynamic obstruction or restriction of valve opening. It is a common echocardiographic finding in older adults and is associated with increased cardiovascular risk.

Aortic Stenosis

Narrowing of the aortic valve that obstructs blood leaving the left ventricle. Common causes include age-related calcification, a bicuspid valve, and rheumatic disease; severe disease can cause exertional breathlessness, chest pain, fainting, left-ventricular thickening, or heart failure. Echocardiography assesses severity.

Aortic Stenosis Grading

Assessment of how severely the aortic valve is narrowed using ultrasound measurements of valve area and blood-flow speed or pressure difference. Results are generally described as mild, moderate, or severe and help guide monitoring and treatment.

Aortic Valve

A valve between the heart's left pumping chamber and the aorta. It opens to let blood leave the heart and closes to stop blood flowing backward.

Aortic Valve Disease

Narrowing, leakage, or another abnormality of the valve between the heart's left pumping chamber and the aorta. It may cause breathlessness, chest pain, tiredness, fainting, or no symptoms at first.

Aortic Valve Insufficiency

Leakage of the aortic valve that allows blood to flow backward into the left pumping chamber between heartbeats. The extra workload can enlarge or weaken the heart over time.

Aortic Valve Regurgitation

Backward leakage of blood through an aortic valve that does not close completely. The heart must pump harder, and severe or long-standing leakage can cause enlargement or heart failure.

Alternate Names:
Aortic Regurgitation; Aortic Insufficiency; Aortic Incompetence

Aortic Valve Replacement

A procedure to replace a diseased aortic valve with a mechanical or tissue valve. It may be performed through open-heart surgery or, in selected people, by a catheter-based procedure.

Alternate Names:
AVR

Aortic Valve Stenosis

Alternate index label; see *Aortic Stenosis*.

Aortitis

Inflammation of the aorta, the body's largest artery. It may result from an autoimmune disease or infection and can weaken the artery or cause narrowing, aneurysm, dissection, or leakage of the aortic valve.

Aortocaval Compression Syndrome

Dizziness, nausea, weakness, or low blood pressure that can occur when the pregnant uterus compresses major abdominal blood vessels while a person lies flat, especially later in pregnancy. The main effect is reduced blood return to the heart; symptoms often improve when the person changes position.

Alternate Names:
Supine Hypotensive Syndrome of Pregnancy

Aortoenteric Fistula

A life-threatening direct communication between the aorta and the gastrointestinal tract, most frequently involving the third or fourth portion of the duodenum. It may occur primarily from an eroding abdominal aortic aneurysm or secondarily following prosthetic aortic reconstruction, classically presenting with minor herald gastrointestinal bleeding followed by catastrophic exsanguination.

Aortography

Imaging of the aorta after contrast material is injected, often through a catheter. It can show aneurysms, tears, narrowing, blockages, or abnormal blood-vessel connections; computed tomography or magnetic resonance imaging is often used instead.

Aortoiliac Occlusive Disease

Narrowing or blockage, usually from atherosclerosis, in the lower abdominal aorta or the arteries branching toward the pelvis and legs. It may cause buttock or thigh pain during walking, weak femoral pulses, or erectile dysfunction. The classic combination of these findings is called Leriche syndrome.

Alternate Names:
Leriche Syndrome (classic presentation)

Aortopathy

Any pathological condition or disease process affect-

ing the structure or wall of the aorta, frequently involving dilation, aneurysm formation, or cystic medial degeneration, as seen in genetic disorders such as Marfan syndrome, Loeys-Dietz syndrome, and bicuspid aortic valve disease.

Alternate Names:
Aortic Wall Disease

Aortopulmonary Window

A rare birth defect in which an opening connects the aorta and pulmonary artery. Too much blood may flow to the lungs, causing breathing problems, poor growth, or heart failure in infancy.

AOSD

Rare systemic inflammatory disorder characterized by daily spiking fevers, salmon-pink rash, and joint pain. See *Adult-Onset Still's Disease*.

APACHE II Score

A hospital scoring system that combines vital signs, laboratory results, age, and serious long-term illnesses to estimate the severity of critical illness. A higher score generally indicates greater risk, but it does not predict an individual outcome with certainty.

Apathy

Reduced motivation, interest, or emotional response. It can occur with depression, dementia, Parkinson disease, brain injury, other neurological illness, or medicines and is different from ordinary tiredness or sadness.

APC Tumor Suppressor

A protein made from the APC gene that helps control cell growth and the removal of damaged cells. Harmful changes in this gene can allow excess intestinal polyps to form and increase colorectal-cancer risk.

Apert Syndrome

A rare inherited condition in which some skull bones join too early. It causes an unusually shaped head and face and often joined fingers or toes; breathing, vision, hearing, or development may also be affected.

Apex

The tip or pointed end of a body structure. Examples include the lower pointed end of the heart, formed mainly by the left ventricle, and the upper tip of a lung.

Apex Beat

The outermost and lowest point on the precordium at which the cardiac impulse can be palpated or inspected during ventricular systole, typically located in the left fifth intercostal space along the midclavicular line.

Alternate Names:
Apical Impulse

Apgar Score

A standardized rapid evaluation of a newborn infant's clinical status, typically performed at 1 and 5 minutes after birth (and at 5-minute intervals up to 20 minutes if depressed). Five physiological signs are evaluated and scored 0, 1, or 2: Appearance (skin color), Pulse (heart rate), Grimace (reflex irritability), Activity (muscle tone), and Respiration, yielding a total score from 0 to 10. A score of 7 to 10 is considered reassuring; 4 to 6 indicates moderate depression requiring intervention; and 0 to 3 signifies severe depression requiring immediate active resuscitation.

Alternate Names:
Apgar Assessment; Newborn Apgar Score

Aphagia

Complete inability to swallow. It may result from a blockage, neurological disease, severe pain, or loss of normal swallowing-muscle function and can lead to choking, dehydration, or aspiration.

Aphakia

Absence of the eye's natural lens, usually after cataract surgery, injury, or a birth difference. It causes major focusing problems and is usually corrected with an intraocular lens, contact lens, or strong glasses.

Aphallia

A very rare birth condition in which the penis is

absent because it did not develop. The urethral opening may be in an unusual place, and other urinary or genital differences may occur.

Alternate Names:
Penile Agenesis

Aphantasia

Markedly reduced or absent ability to voluntarily form mental visual images. It is a cognitive phenomenon rather than, by itself, a disease and may occur with otherwise normal vision, memory, and imagination.

Aphasia

A brain-related disorder that impairs speaking, understanding, reading, or writing language. It most often follows a stroke but can also result from head injury, brain tumour, infection, or degeneration.

Apheresis

A procedure in which blood passes through a machine that removes a selected component, such as plasma, platelets, red cells, or abnormal cells, and returns the remaining blood to the person.

Apheresis Donation

A blood donation in which a machine collects one component, such as platelets or plasma, and returns the other blood components to the donor. The process may allow more of the needed component to be collected than whole-blood donation.

Aphonia

Complete loss of the ability to produce a normal voice, although whispering may remain possible. Causes include inflammation, vocal-cord paralysis, injury, growths, nerve disease, or psychological factors.

Aphrasia

Loss or impairment of the ability to speak. The term is older and less precise than aphasia, which can affect speaking, understanding, reading, or writing.

Aphthous Stomatitis

Repeated painful ulcers on the moist lining of the mouth, commonly called canker sores. They are usually shallow, heal without scarring, and are not contagious.

Aphthous Ulcer

A painful, noncontagious ulcer of the moist lining of the mouth, commonly called a canker sore. Most heal within one to two weeks, although larger ulcers may last longer.

Apical

Relating to or located at the tip of a body structure, such as the tip of a lung, heart, or tooth.

Apical Ballooning Syndrome

A temporary weakening and ballooning of the main pumping chamber of the heart, often after severe emotional or physical stress. It can resemble a heart attack but usually occurs without a blocked coronary artery.

Apical Periodontitis

Inflammation or infection around the tip of a tooth root, usually caused by infected or dead pulp. It may cause pain when biting, swelling, or no symptoms and is assessed with dental examination and imaging.

Apical Pulse

The heartbeat counted by listening over the tip of the heart, usually on the left side of the chest. It may be used when the pulse at the wrist is difficult to feel or when an accurate heart rate is needed.

Apicoectomy

Dental surgery that removes the tip of a tooth root and nearby infected tissue, usually when infection persists after root-canal treatment. The end of the root is then sealed.

Aplasia

Failure of an organ, tissue, or group of cells to develop, causing it to be absent or severely under-

developed. It may be present from birth or result from inherited disease, injury, infection, or severe damage to the cells that produce it.

Aplasia Cutis Congenita

A birth defect in which a localized area of skin, most often on the scalp, is absent or incompletely formed. It may heal as a scar or hairless patch and can coexist with an underlying skull or vascular abnormality, especially when the lesion is large or atypical.

Aplastic

Describing a tissue that has failed to develop or produce its normal cells. The term is often used for bone-marrow failure, in which too few red cells, white cells, and platelets are made.

Aplastic Anemia

A rare, serious bone-marrow failure disorder in which the marrow cannot make enough blood cells, usually because blood-forming stem cells are damaged. It lowers red cells, white cells, and platelets—not just red cells—so it can cause tiredness, infections, and easy bruising or bleeding. Causes include immune attack, some medicines, toxic chemicals, radiation, infections, and inherited conditions; sometimes no cause is found.

Aplastic Crisis

A sudden, temporary stop in red-cell production that causes a rapid worsening of anemia. It most often follows parvovirus B19 infection in people whose red cells already have a shortened lifespan, such as those with sickle-cell disease.

Apley Compression Test

A physical examination manoeuvre used to evaluate for meniscal tears of the knee joint. With the patient prone and the knee flexed to ninety degrees, the examiner applies downward axial force to the heel while rotating the tibia internally and externally; pain or joint line clicking indicates meniscal pathology.

Alternate Names:
Apley Grinding Test; Apley's Compression Test

Apley Distraction Test

A clinical examination technique used to differentiate collateral ligament injuries from meniscal tears. With the patient prone and the knee flexed to ninety degrees, the examiner stabilizes the posterior thigh and applies upward traction to the lower leg with internal and external rotation; localized pain suggests ligamentous sprain rather than meniscal damage.

Alternate Names:
Apley's Distraction Test

Apley Grind Test

A physical examination maneuver used in orthopedics to evaluate meniscus tears of the knee. With the patient prone and the knee flexed to 90 degrees, the examiner stabilizes the thigh, applies downward axial compressive force onto the heel while externally and internally rotating the tibia; pain or mechanical clicking indicates a torn meniscus.

Alternate Names:
Apley Compression Test; Apley Meniscal Test

Apley Scratch Test

A shoulder examination in which a person reaches behind the head and then behind the back. It gives a quick estimate of shoulder movement; limited or painful reach can have several causes and does not identify a specific injury by itself.

Alternate Names:
Apley Scratch Maneuver; Apley Shoulder Test

APLS

Abbreviation for antiphospholipid syndrome, an autoimmune disorder associated with venous or arterial thrombosis and pregnancy complications, with persistent antiphospholipid antibodies.

Apnea

Temporary cessation of breathing, with no airflow into or out of the lungs. It may result from airway obstruction or reduced brain signals driving respiration; effects depend on its cause and duration. Prolonged apnea can lower blood oxygen, raise carbon dioxide, impair consciousness, and progress to cardiac arrest or death.

Apnea-Hypopnea Index

The average number of complete or partial breathing interruptions during each hour of sleep, measured in a sleep study. It helps describe sleep-apnea severity, but symptoms, oxygen levels, and other findings also matter.

Apnea of Infancy

Repeated pauses in breathing in an infant. Causes and significance vary with age and clinical context; apnea of prematurity is a distinct diagnosis in preterm infants.

Apnea Of Prematurity

Repeated pauses in breathing in a premature infant because breathing control is not fully developed. Episodes may lower oxygen or slow the heartbeat and require monitoring and, when necessary, breathing support.

Apneic

Relating to a period when breathing has stopped temporarily. Apneic episodes may occur during sleep, illness, poisoning, seizures, or severe airway blockage and can quickly lower oxygen.

Apneustic Breathing

An abnormal pattern with an unusually long pause after breathing in. It usually indicates serious injury to the brainstem and may occur with other signs of severe neurological damage.

Apnoea

Alternate British spelling; see *Apnea*.

Apocrine

Relating to a secretion mechanism in which the apical part of a secretory cell buds off with its contents. The term also names certain glands, such as apocrine sweat glands, whose secretion in humans occurs mainly by merocrine exocytosis without loss of cell material.

Apocrine Hidrocystoma

A benign cyst of an apocrine sweat gland, commonly presenting as a translucent or bluish, dome-shaped papule near the eyelid or elsewhere on the skin. It may enlarge with heat or sweating and is usually diagnosed clinically.

Apoenzyme

The protein part of an enzyme before its required helper substance has attached. It is usually inactive or less active until the helper, called a cofactor, binds to it.

Apolipoprotein B100

A protein on cholesterol-carrying particles such as low-density and very-low-density lipoproteins. Its blood level estimates the number of particles that can contribute to fatty buildup in artery walls.

Apolipoprotein CII

A protein on fat-carrying particles in the blood that activates an enzyme needed to break down triglycerides. Too little or faulty apolipoprotein CII can cause triglycerides to rise to very high levels.

Apolipoproteins

Proteins attached to fats in the blood that help transport and process cholesterol and triglycerides. Different apolipoproteins are found on different fat-carrying particles and have different effects.

Aponeurosis

A broad, flat sheet of tough connective tissue that attaches a muscle to bone, another muscle, or other tissues and helps transmit the muscle's force.

Apophenia

Seeing meaningful patterns or connections in unrelated or random events. Mild experiences can occur normally, while marked or distressing experiences may occur with some psychiatric or neurological conditions.

Apophyses

Bony projections that grow from or arise near a bone and usually provide attachment for muscles or ligaments. Unlike the main growth plate of a long

bone, an apophysis does not normally increase the bone's length.

Apoptosis

A controlled process of cell death in which a cell dismantles itself and is removed with little inflammation. It helps shape developing organs and remove old, damaged, or abnormal cells; failure of this process can contribute to cancer.

Apoptosis Extrinsic Pathway

A controlled cell-death process that begins when an outside signal attaches to a death receptor on a cell's surface. Internal enzymes then take the cell apart in an orderly way, usually without causing the swelling and inflammation of an injury.

Apoptosis Intrinsic Pathway

A controlled cell-death process that begins with severe stress inside a cell, such as DNA damage, lack of growth signals, or lack of oxygen. The cell's energy-producing structures then release signals that activate enzymes to dismantle it.

Apoptotic Body

A small membrane-bound piece of a cell that has begun controlled cell death. Immune or neighbouring cells can recognize and remove these pieces without causing much inflammation.

Appalachian Type Amyloidosis

A rare hereditary transthyretin amyloidosis variant associated with abnormal amyloid deposition, often causing neuropathy, autonomic symptoms, or heart involvement. Diagnosis requires genetic and tissue or specialized laboratory evaluation.

Apparent Mineralocorticoid Excess

A rare inherited disorder in which cortisol acts too strongly on the kidneys because it is not changed into an inactive form normally. It can cause severe high blood pressure, low potassium, and unusually low levels of renin and aldosterone.

Appendageal

Relating to structures that develop from the skin, including hair follicles, sweat glands, and oil-producing glands.

Appendectomy

Surgery to remove the appendix, usually to treat appendicitis. It may be performed laparoscopically through small incisions using a camera or through a larger open incision; the approach depends on the condition and clinical needs.

Alternate Names:
Appendicectomy; Appendix Removal

Appendiceal

Relating to the appendix, a narrow, finger-shaped pouch attached to the beginning of the large intestine.

Appendiceal Adenocarcinoma

A cancer arising from gland-forming cells in the appendix. It may be found after appendicitis or unexpectedly and can spread through the abdominal lining; outlook depends on its type, size, and spread.

Appendiceal Cancer

Cancer arising in the appendix. Types include neuroendocrine tumours, mucin-producing tumours, and adenocarcinoma; some can rupture and spread tumour cells or mucus through the abdomen.

Appendiceal Rupture

A tear or hole in an inflamed appendix that allows infected material into the abdomen. It can cause peritonitis, an abscess, sepsis, or severe abdominal pain.

Appendiceal Tumors

Tumours arising in the appendix, including neuroendocrine tumours, mucin-producing tumours, and adenocarcinoma. Some cause no symptoms, while others cause appendicitis, pain, blockage, or abdominal swelling.

Appendicitis

Inflammation of the appendix, often after its opening becomes blocked by hardened stool, mucus, or swollen tissue. It commonly causes pain that moves to the lower right abdomen, nausea, loss of appetite, and fever and can lead to rupture.

Alternate Names:
Epityphlitis; Acute Appendicitis

Appendicitis in Children

Acute inflammation of the appendix, a common surgical emergency in childhood. Symptoms may include abdominal pain that shifts from around the navel to the lower right abdomen, fever, or vomiting; atypical presentations are common, especially in young children. Perforation is more frequent at diagnosis in children than in adults.

Alternate Names:
Pediatric Appendicitis

Appendicolith

A small, often calcified deposit inside the appendix. It can block the appendix and is linked to appendicitis, but it may also be found in people who do not have appendicitis.

Alternate Names:
Appendiceal Calculus

Appendicular Skeleton

The bones of the arms and legs and the shoulder and pelvic girdles that attach them to the central skeleton.

Appendix

A small, finger-shaped pouch attached to the beginning of the large intestine. It contains immune tissue and may help support healthy gut bacteria, although its exact function is not fully understood and it is not essential for digestion. Inflammation of the appendix is called appendicitis.

Appendix Cancer

A group of malignancies arising in the appendix, including adenocarcinoma, goblet cell adenocarcinoma, and neuroendocrine neoplasms. Appendiceal mucinous tumors require specific classification: low- and high-grade appendiceal mucinous neoplasms are distinct from invasive mucinous adenocarcinoma. Older labels such as "goblet cell carcinoid" are no longer preferred.

Appendix Testis

A small remnant of tissue near the upper part of the testis, left over from early development. It is usually harmless but can sometimes twist and cause pain in boys.

Appetite

The psychological desire to eat food, distinct from physiological hunger, modulated by central nervous system pathways, neuroendocrine signaling, sensory stimuli, emotional states, and metabolic demands.

Appetite Regulation

The control of hunger and fullness by the brain, digestive tract, hormones, emotions, habits, sleep, and surroundings. Signals such as ghrelin promote hunger, while leptin and other signals help promote fullness.

Applied Behavior Analysis

A structured approach that observes behaviour and uses learning principles, practice, and reinforcement to build useful skills or reduce behaviour that interferes with daily life. Goals are individualized and respectful of the person.

Apposition

Placement of two structures next to or against each other. In wound care, good apposition means that the edges of a cut are accurately aligned so they can heal.

Apprehension Test

A provocative orthopedic examination maneuver designed to detect joint instability, most commonly applied to the shoulder (glenohumeral joint) or knee (patellofemoral joint). In the anterior shoulder apprehension test, the examiner places the arm in 90 degrees of abduction and maximal external rotation; a positive test occurs when the patient exhibits vis-

ible fear, alarm, or resistance due to a feeling of impending anterior subluxation or dislocation. In the patellar apprehension test (Fairbank's sign), lateral displacement of the patella elicits anxiety and quadriceps contraction.

Alternate Names:
Anterior Apprehension Test; Crank Test; Fairbank's Apprehension Test

Appropriate For Gestational Age

Describing a fetus or newborn whose estimated size or weight is within the expected range for the number of weeks of pregnancy, commonly between the 10th and 90th percentiles.

Apraxia

Difficulty performing a learned, purposeful movement even though strength, sensation, coordination, and understanding are sufficient. It results from a problem in the brain's planning of movement rather than simple weakness.

Apraxia of Speech

A neurogenic motor speech disorder characterized by an impaired ability to plan, sequence, and program the sensorimotor commands necessary for phonetically normal speech production in the absence of significant neuromuscular weakness or paralysis. Marked by inconsistent articulatory errors, effortful groping, and disrupted prosody.

Alternate Names:
Verbal Apraxia; Speech Apraxia

Apraxic Gait

A higher-level neurological gait disorder characterized by the loss of the ability to coordinate voluntary stepping and leg movements in the absence of primary sensory loss, weakness, or cerebellar ataxia. Patients exhibit hesitation in initiating walking, a wide-based stance, short shuffling steps, and a tendency for the feet to appear glued to the floor (m̈agnetic gaiẗ), commonly seen in normal pressure hydrocephalus, bilateral frontal lobe lesions, and advanced subcortical vascular encephalopathy.

Alternate Names:
Gait Apraxia; Frontal Gait Disorder; Magnetic Gait; Bruns Apraxia

Aprosodia

A neurological speech and language disorder characterized by an inability to express or comprehend the emotional tone, rhythm, pitch, and melody (prosody) of verbal communication. It is classically associated with lesions of the non-dominant (right) cerebral hemisphere in areas homologous to Broca and Wernicke expressive and receptive language regions.

Alternate Names:
Dysprosody; Affective Agnosia of Speech

APS

Abbreviation for antiphospholipid syndrome, though it can refer to other terms in different contexts.

AP X-Ray

An X-ray view in which the beam enters through the front of the body and exits through the back. It is called an anteroposterior view.

Aquagenic Keratoderma

Temporary painful whitening, thickening, and wrinkling of the palms or soles after contact with water. It may cause prickling or burning, is often associated with cystic fibrosis, and usually settles after the skin dries.

Aquagenic Pruritus

A condition characterized by severe, intense, prickling or stinging itching of the skin that develops rapidly after contact with water of any temperature, occurring without visible skin changes or hives. It may be idiopathic or secondary to polycythemia vera.

Alternate Names:
Water-Induced Itching

Aquaphobia

An excessive, irrational fear of water, leading to intense anxiety when in or near bodies of water such as swimming pools, rivers, lakes, or oceans.

Alternate Names:
Hydrophobia (Psychological); Fear of Water

Aquaporin

A channel in a cell membrane that lets water pass through. Aquaporin-2 in kidney tubules responds to vasopressin and helps the kidneys return water to the blood instead of losing it in urine.

Aquatic Therapy

Exercise or rehabilitation performed in water. Water buoyancy reduces load on joints while water resistance strengthens muscles and supports balance, movement, and conditioning.

Aqueous Flare

A hazy beam seen in the clear fluid at the front of the eye during slit-lamp examination. It means inflammation has allowed proteins to leak into the eye and may occur with uveitis, infection, injury, or surgery.

Aqueous Humor

The clear fluid in the front part of the eye. It nourishes the cornea and lens, removes waste, and helps maintain pressure and the shape of the eye.

Arachidonic Acid Pathway

A major cellular lipid metabolic cascade in which arachidonic acid, released from cell membrane phospholipids by phospholipase A2, is converted into bioactive eicosanoids (prostaglandins, prostacyclin, thromboxane A2, and leukotrienes) via cyclooxygenase and lipoxygenase enzymes.

Arachnitis

An older spelling of arachnoiditis, chronic inflammation and scarring of the arachnoid membrane around spinal or cranial nerves that can cause persistent pain, sensory symptoms, weakness, or bladder and bowel dysfunction.

Arachnodactyly

Abnormally long, thin fingers or toes. It may occur alone or as a feature of inherited connective-tissue disorders such as Marfan syndrome.

Arachnoidal Fibroblastoma

A rare benign or low-grade tumor arising from fibroblastic cells of the arachnoid coverings. Symptoms depend on location and may result from compression of the brain, spinal cord, or nerves.

Arachnoid Cyst

A usually noncancerous, fluid-filled sac between layers of the membrane covering the brain or spinal cord. Many cause no symptoms, but a large cyst may cause headache, seizures, weakness, or pressure on nearby tissue.

Arachnoid Cysts

Plural form; see *Arachnoid Cyst*.

Arachnoid Granulations

Macroscopic tufted outgrowths of the arachnoid membrane that project through the dura mater into the dural venous sinuses, predominantly the superior sagittal sinus, serving as the primary structural pathway for the passive reabsorption of cerebrospinal fluid into venous blood.

Alternate Names:
Pacchionian Bodies; Arachnoid Villi

Arachnoiditis

Inflammation of the arachnoid, one of the membranes covering the brain and spinal cord, most often in the spine. Inflammation may cause thickening, scarring, and bands that make nerve roots stick together or interfere with the normal flow of cerebrospinal fluid. Possible causes include infection, bleeding around the spinal cord, spinal injury, chronic nerve compression, surgery or another spinal procedure, and chemical irritation. Symptoms may include severe or burning back and limb pain, numbness, tingling, weakness, abnormal reflexes, or problems with bladder or bowel function. The course may remain stable or worsen over time.

Arachnoid Mater

The middle of three thin membranes covering the brain and spinal cord. The space beneath it con-

tains the fluid that cushions the nervous system and carries important blood vessels.

Arachnophobia

An intense, irrational, and debilitating fear of spiders and other arachnids, representing one of the most prevalent specific animal phobias.

Alternate Names:
Fear of Spiders

Arbovirus

A virus spread by a biting insect or tick, such as a mosquito, tick, or sandfly. Arboviruses can cause fever, rash, joint pain, bleeding, or inflammation of the brain, depending on the virus.

Arbovirus A Chikungunya Type

An older classification term for chikungunya virus, a mosquito-borne alphavirus that causes fever and often severe inflammatory joint pain, rash, headache, and muscle pain.

ARBs

Medicines that block the main receptor for angiotensin II, relaxing blood vessels and reducing salt and water retention. They lower blood pressure and can protect the heart and kidneys in selected conditions, but are usually not combined with ACE inhibitors.

Arcanobacterium haemolyticum Infection

An infection caused by *Arcanobacterium haemolyticum*, which commonly causes pharyngitis in adolescents and young adults. It may cause fever, sore throat, tonsillar exudate, tender neck nodes, and occasionally a scarlatiniform or morbilliform rash; it can resemble group A streptococcal infection.

Arciform

Having a curved or arch-like shape. The term may describe the appearance of a skin lesion, rash, blood vessel, or other body structure.

Arcuate Uterus

A mild variation in the shape of the inside top of the uterus, present from birth, that creates a shallow curved indentation. It is usually considered a normal variant and generally has little or no effect on fertility or pregnancy.

Arcus Senilis

A greyish-white, circular lipid deposition ring appearing in the peripheral corneal stroma, commonly seen in elderly individuals as a benign finding, or in younger patients (arcus juvenilis) associated with familial hyperlipidemia.

Alternate Names:
Corneal Arcus; Arcus Lipoides; Gerontoxon

ARDS

Abbreviation for Acute Respiratory Distress Syndrome; see that entry.

Area Under The Concentration-Time Curve

A measure of the total amount of a medicine in the blood over a period of time. It helps compare how medicines are absorbed and removed and can guide dosing for selected treatments.

Aregenerative Anemia

Anemia with an inappropriately low reticulocyte response, indicating inadequate red-cell production by the bone marrow. Causes include iron, vitamin B12, or folate deficiency, kidney disease, inflammation, endocrine disease, marrow failure, and some medicines.

Arenaviruses

A family of viruses carried mainly by rodents. Some cause serious human diseases, including viral haemorrhagic fevers, after exposure to infected rodent urine, droppings, saliva, or contaminated dust.

Areola

The darker circular area surrounding the nipple. It contains small glands that help lubricate and protect the skin, especially during breastfeeding.

ARG Deficiency

Abbreviation for arginase deficiency, an inherited urea-cycle disorder in which arginine accumulates and can cause progressive spasticity, developmental problems, seizures, and elevated ammonia.

Argentine Hemorrhagic Fever

A serious viral illness caused by Junín virus, an arenavirus carried by rodents in parts of Argentina. It can cause fever, weakness, bleeding, and nervous-system problems.

Arginine Vasopressin Resistance

Reduced kidney responsiveness to arginine vasopressin, causing excessive production of dilute urine and increased thirst. It is the modern term for nephrogenic diabetes insipidus and may result from inherited disorders, kidney disease, medicines, or electrolyte abnormalities.

Alternate Names:
Nephrogenic Diabetes Insipidus; AVP Resistance

Argininosuccinate Lyase Deficiency

An inherited urea-cycle disorder caused by deficient argininosuccinate lyase. Argininosuccinic acid and ammonia can accumulate, causing poor feeding, vomiting, liver problems, developmental impairment, or life-threatening hyperammonemia.

Argininosuccinic Aciduria

A rare inherited disorder in which the body cannot safely remove waste nitrogen produced when protein is broken down. Ammonia and argininosuccinic acid build up and may cause vomiting, sleepiness, seizures, liver problems, or developmental impairment.

Argon Plasma Coagulation

A procedure that uses electrically charged argon gas to deliver heat to the surface of tissue. It can stop bleeding or destroy selected abnormal tissue, often during an endoscopic examination.

Alternate Names:
APC; Argon Plasma Hemostasis

Argyll Robertson Pupil

A small, irregular pupil that becomes smaller when focusing on a nearby object but reacts poorly or not at all to light. It is classically associated with late syphilis affecting the nervous system, but other causes are possible.

Argyria

An irreversible condition characterized by blue, bluish-grey, or metallic discoloration of the skin and mucous membranes, caused by chronic exposure to or ingestion of silver compounds or colloidal silver, leading to silver particles depositing in dermal tissue.

Alternate Names:
Silver Poisoning (Cutaneous)

Arias-Stella Reaction

A benign change in cells lining the uterus or cervix caused by pregnancy hormones or hormone medicines. Under a microscope it can resemble cancer, so the clinical setting and other findings are important.

Arithmophobia

An irrational and persistent fear of numbers or calculating mathematics, producing anxiety symptoms when confronted with mathematical tasks or specific numerals.

Alternate Names:
Numerophobia; Fear of Numbers

Arm

The part of the upper limb between the shoulder and elbow. In everyday language, “arm” may also mean the entire upper limb, including the forearm and hand.

Arm CT Scan

A scan that uses X-rays and computer processing to create cross-sectional images of the arm. It can show fractures, bleeding, inflammation, masses, and other structural problems.

Arm Fracture

A break in one or more bones of the upper limb, usually the upper arm bone or one of the forearm bones. It may cause pain, swelling, bruising, deformity, or inability to move the arm normally.

Arm MRI Scan

A scan that uses a magnetic field and radio waves to create detailed images of the arm. It can show muscles, tendons, ligaments, nerves, bone marrow, blood vessels, and masses without X-ray radiation.

Arm Pain

Pain in the shoulder, upper arm, elbow, forearm, or nearby tissues. Causes include muscle or tendon injury, nerve compression, arthritis, and blood-vessel disease; sudden severe pain with chest discomfort or breathlessness can accompany a heart attack.

Alternate Names:
Brachialgia; Upper-Limb Pain

Armpit Lump

A lump or swelling in the armpit, commonly caused by an enlarged lymph node, skin infection, cyst, or noncancerous growth. Less commonly, it may be caused by a cancer or systemic disease.

Armpit Yeast Infection

A yeast infection of the skin folds in the armpit, usually caused by *Candida*. It can cause a red, itchy, burning rash, sometimes with small spots around its edges.

Alternate Names:
Axillary Candidiasis

Arnold-Chiari Malformation

A birth defect in which part of the lower brain extends through the opening at the base of the skull into the spinal canal. It may block the normal flow of brain fluid and cause headache, neck pain, balance problems, swallowing difficulty, or weakness.

Aromatase

An enzyme that changes androgen hormones into oestrogen. It is found in tissues including the ovaries, fat, and breast and helps regulate hormone levels.

Aromatase Excess Syndrome

A rare inherited condition in which too much aromatase causes excess oestrogen production. It may cause breast development in males and early puberty, rapid growth followed by short adult height, or other hormone-related changes.

Arousal Index

The average number of brief awakenings or shifts to lighter sleep during each hour of a sleep study. A high result suggests repeatedly interrupted sleep, but its importance depends on symptoms and other sleep-study findings.

Arrector Pili

A small involuntary muscle attached to a hair follicle. When it contracts, it raises the hair and produces goosebumps.

Arrector Pili Muscle

The small involuntary muscle attached to each hair follicle. Nerve signals can make it contract, raising the hair and producing temporary goosebumps.

Alternate Names:
Piloerector Muscle; Arrectores Pilorum

Arrested Caries

A dental caries lesion that has stopped progressing, often because mineral loss has ceased and the surface has become hard, smooth, and shiny. It may remain inactive or become active again if the local environment favors renewed decay.

Arrhythmia

An abnormal heart rate or rhythm. The heartbeat may be too fast, too slow, irregular, or start from the wrong place; some arrhythmias are harmless, while others reduce blood flow or cause cardiac arrest.

Arrhythmias

Plural form; see *Arrhythmia*.

Arrhythmogenic Cardiomyopathy

An umbrella term for myocardial disorders associated with ventricular arrhythmias that are not explained by ischemic, hypertensive, or valvular heart disease. Depending on the classification used, it may include right- or left-dominant forms and other disorders. Its scope varies among expert groups, and it is broader than arrhythmogenic right ventricular cardiomyopathy.

Alternate Names:
ACM

Arrhythmogenic Right Ventricular Cardiomyopathy

An inherited disease in which heart muscle, especially in the right pumping chamber, is replaced by scar tissue and sometimes fat. This can cause dangerous irregular rhythms, fainting, or sudden cardiac arrest, particularly during exercise.

Alternate Names:
ARVC; Arrhythmogenic Right Ventricular Dysplasia

Arrhythmogenic Right Ventricular Dysplasia

Older name; see *Arrhythmogenic Right Ventricular Cardiomyopathy*.

Arsenic

A naturally occurring element that is poisonous in many forms. Exposure can cause vomiting, diarrhoea, nerve problems, heart problems, skin changes, and increased cancer risk; some compounds have limited medical uses.

Arsenic Poisoning

Illness caused by sudden or long-term exposure to arsenic. Acute poisoning can cause severe vomiting, abdominal pain, and diarrhea. Long-term exposure, especially to inorganic arsenic in drinking water or food, can cause skin darkening and thickening, nerve and other organ problems, and increased risk of skin, lung, or bladder cancer.

Alternate Names:
Arsenic Toxicity; Arsenicosis

Arsenic Toxicity

Harm caused by arsenic exposure. It may affect the digestive system, heart, nerves, blood, skin, and nails; severe exposure can be fatal.

Artemisinin

A compound originally obtained from the sweet-wormwood plant and used with other antimalarial medicines. Malaria parasites can become resistant to artemisinin when it is used alone.

Arteria Femoralis

The femoral artery, the main artery supplying the thigh and lower limb. It continues from the external iliac artery below the groin and can be felt or accessed near the groin.

Arterial Blood Gas

A blood test, usually from an artery at the wrist, that measures acidity, oxygen, carbon dioxide, and bicarbonate. It helps assess breathing, oxygen delivery, and acid–base disorders.

Arterial Blood Gas Analysis

A diagnostic blood test performed on arterial blood to assess oxygenation, ventilation (carbon dioxide elimination), and systemic acid-base balance; see *Arterial Blood Gas*.

Arterial Blood Gas Analyzer

A machine that measures acidity, oxygen, carbon dioxide, and related values in arterial blood. The results help assess how well a person is breathing and whether the blood is too acidic or alkaline.

Arterial Catheter

A thin tube placed in an artery, often at the wrist, to measure blood pressure continuously and take repeated blood samples. Possible complications include bleeding, infection, clotting, or reduced blood flow.

Arterial Catheterization

Placement of a thin tube in an artery, usually at the wrist, for continuous blood-pressure monitoring

or repeated arterial blood tests. It is used when close monitoring is needed and can cause bleeding, infection, clotting, or reduced circulation.

Arterial Dissection

A pathological process in which a disruption or tear in the tunica intima allows circulating blood under pressure to enter and cleave the media, creating a false lumen that tracks longitudinally along the arterial wall and may lead to vessel occlusion or rupture.

Arterial Duplex

An ultrasound test that shows the structure of arteries and measures blood flow through them. It can detect narrowing, blockage, aneurysm, or whether a vascular graft remains open.

Arterial Embolism

Sudden blockage of an artery by material carried in the bloodstream, usually a blood clot. It can abruptly cut off blood flow to a limb, brain, kidney, intestine, or other organ and cause ischemia or infarction.

Arterial Embolization

A procedure that deliberately blocks a selected artery, usually to stop bleeding, reduce blood supply to a tumour, or treat an abnormal blood-vessel connection.

Arterial Injury

Damage to an artery that may cause severe bleeding, a clot, narrowing, reduced blood flow, tissue loss, or life-threatening complications. It can result from trauma, surgery, or a medical procedure.

Arterial Insufficiency

Reduced blood flow through an artery to a tissue or limb, usually because the artery is narrowed or blocked. It may cause pain with walking, pain at rest, cool skin, slow-healing wounds, or weak pulses.

Arterial Line

A thin tube placed in an artery, usually at the wrist, for continuous blood-pressure monitoring and repeated arterial blood sampling. It is used in critical illness or major surgery and can cause bleeding, infection, clotting, or reduced circulation.

Arterial Resistance

The opposition blood encounters as it flows through arteries, especially the small arteries that can narrow or widen. It helps control blood pressure and how much blood reaches each tissue.

Alternate Names:
Vascular Resistance

Arterial Spin Labeling

An MRI method that uses magnetically labeled blood as a natural tracer to measure blood flow, especially in the brain, without injecting a tracer.

Arterial Stenosis

Narrowing of an artery that reduces blood flow to the tissues beyond it. Common causes include fatty plaque, inflammation, injury, or an inherited abnormality of the artery wall.

Arterial Stick

Puncture of an artery with a needle, usually to obtain an arterial blood sample. It may cause temporary pain or bruising and, rarely, bleeding, arterial injury, or reduced blood flow.

Arterial Stiffness

Reduced ability of arteries to expand and recoil with each heartbeat. It is associated with ageing, high blood pressure, diabetes, kidney disease, and fatty artery disease and is linked with higher cardiovascular risk.

Arterial Switch Operation

Open-heart surgery usually performed in newborns whose two main arteries leave the wrong pumping chambers. The arteries and coronary arteries are reconnected so blood flows normally; possible long-term complications include coronary artery problems, valve leakage, and narrowing of the arteries.

Alternate Names:

Jatene Procedure; ASO

Arterial Tension

A measurement taken from arterial blood. Depending on the context, it may mean blood pressure inside an artery or the amount of oxygen or carbon dioxide dissolved in the blood.

Arterial Thoracic Outlet Syndrome

The rarest form of thoracic outlet syndrome, occurring when the subclavian artery is compressed as it exits the chest, frequently by an anomalous cervical rib or abnormal first rib, causing upper-extremity ischemia, coldness, pallor, diminished pulses, or arterial aneurysm formation.

Alternate Names:
Arterial TOS; Subclavian Artery Compression Syndrome

Arterial Thromboembolism

Blockage of an artery by a blood clot that formed elsewhere and travelled through the bloodstream. It can suddenly reduce blood flow to the brain, heart, limb, kidney, intestine, or another organ.

Arterial Thrombosis

Formation of a blood clot inside an artery, often where a fatty plaque has damaged the vessel lining. The clot can block blood flow to the heart, brain, limb, intestine, or another organ.

Arterial Ulcer

A slow-healing wound caused by poor blood flow through an artery, usually on a toe, heel, or other pressure point. It may be deep and sharply outlined, with a pale or dead-looking base and cool, shiny, hairless surrounding skin.

Arteries

Blood vessels that carry blood away from the heart. Most carry oxygen-rich blood, but the pulmonary and umbilical arteries carry oxygen-poor blood; strong elastic and muscular walls help withstand and regulate pressure.

Alternate Names:
Arterial Vessels

Arteriogram

An image of an artery, usually made after contrast material is injected. It can show narrowing, blockage, aneurysm, abnormal connections, or other changes in blood flow.

Arteriography

An imaging study in which contrast material is injected into an artery and X-ray images show the arterial lumen and blood flow.

Arteriole

A small terminal branch of an arterial vessel that regulates blood flow into capillary beds. Its smooth-muscle wall alters vascular resistance and systemic blood pressure through vasoconstriction and vasodilation.

Alternate Names:
Resistance Vessels; Small Arteries

Arterioles

Plural form; see *Arteriole*.

Arteriolosclerosis

A form of vascular disease affecting small arteries and arterioles, characterized by mural thickening, luminal narrowing, and loss of elasticity, classically manifesting as hyaline arteriolosclerosis (associated with aging and diabetes) or hyperplastic arteriolosclerosis (associated with severe hypertension).

Arterioportal Shunting

Abnormal flow of blood from a hepatic artery into the portal venous system through a direct or small-vessel connection. It may be congenital or develop with cirrhosis, a liver tumor, trauma, or a liver procedure; large shunts can alter portal blood flow and contribute to portal hypertension.

Alternate Names:
Arterioportal Shunt; Hepatic Arterioportal Shunt

Arteriosclerosis

Thickening, hardening, and loss of elasticity in

artery walls. It encompasses multiple vascular processes, including age-related medial stiffening and intimal plaque buildup. See also: *Atherosclerosis*.

Arteriosclerotic Retinopathy

Damage or changes in the retina caused by thickened, narrowed, or hardened small blood vessels, most often after long-standing high blood pressure. Severe disease can reduce vision.

Arteriovenous Fistula

An abnormal connection between an artery and a vein that bypasses the normal capillary network. It may be present from birth, follow injury or a procedure, or be created to provide access for haemodialysis.

Arteriovenous Fistula Creation

Surgery to connect an artery to a nearby vein to create blood access for hemodialysis. Over time, the vein may become wider and stronger so it can be used for dialysis needles. It often has advantages over a graft or catheter, but its success, risks, and long-term usefulness vary from person to person.

Alternate Names:
AV Fistula Creation; Arteriovenous Fistula Surgery; Hemodialysis Fistula Placement; AVF Construction

Arteriovenous Graft

An artificial tube connecting an artery and vein to provide access for haemodialysis, usually when a person's veins cannot form a suitable fistula. It can clot or become infected.

Arteriovenous Malformation

An abnormal connection between an artery and a vein that bypasses the tiny blood vessels (capillaries) that normally link them. Arteriovenous malformations can occur in the brain, spinal cord, lungs, or other organs. Their effects depend on where they are and may include bleeding or damage to nearby tissue. Very high-flow malformations can sometimes strain the heart.

Alternate Names:
AVM

Arteriovenous Malformation Resection

Microsurgery to remove a brain arteriovenous malformation (AVM), an abnormal cluster of blood vessels (nidus) that connects arteries to veins without a normal capillary network. Through an opening in the skull, the surgeon disconnects the AVM from its blood supply and removes it. Imaging after surgery checks whether any AVM remains.

Alternate Names:
AVM Resection; Surgical Excision of Brain AVM; Cerebral AVM Removal

Arteriovenous Nicking

A change seen on retinal examination in which a thickened arteriole appears to narrow or deflect the vein where they cross. It is associated with chronic vascular changes, often related to high blood pressure, but is not specific enough to diagnose or grade hypertension by itself.

Alternate Names:
AV Nicking; Gunn's Sign; Arteriovenous Crossing Changes

Arteritis

Inflammation of an artery wall. The inflammation can narrow, weaken, or block the artery, reducing blood flow and causing pain or organ damage in the affected area.

Artery

A blood vessel that carries blood away from the heart. Most arteries carry oxygen-rich blood, except the pulmonary arteries, which carry oxygen-poor blood to the lungs. Their elastic, muscular walls withstand and regulate pressure.

Artery Occlusion

A blockage inside an artery, often caused by a clot, fatty plaque, or material that travelled from elsewhere. It can cut off blood flow and cause pain, paleness, coldness, numbness, weakness, or absent pulse.

Arthralgia

Pain in one or more joints. It describes a symptom rather than a specific disease and may occur with or

without joint inflammation. Causes include injury, overuse, infection, osteoarthritis, and autoimmune disorders; the painful joint may also be swollen, warm, or stiff.

Arthritis

A group of conditions that affect joints and the tissues around them; it is not one single disease. Depending on the type, arthritis may involve inflammation, gradual breakdown of joint tissues, infection, or crystal deposits. It can cause joint pain, swelling, warmth, stiffness, and reduced movement. Some types can also affect the skin, eyes, heart, lungs, or other organs. Examples include osteoarthritis, rheumatoid arthritis, gout, and ankylosing spondylitis.

Alternate Names:
Joint Inflammation; Articular Inflammation

Arthritis in Hands

Inflammation or wear-related damage in the joints of the fingers, thumb, or hand. Osteoarthritis and rheumatoid arthritis are common causes. It may cause pain, swelling, stiffness, or bony enlargements of the finger joints.

Alternate Names:
Hand Arthritis

Arthritis in Knee

Inflammation or wear-related damage in the knee joint. Osteoarthritis is a common cause, but other forms of arthritis can also affect the knee. Symptoms may include pain, stiffness, swelling, and reduced movement.

Alternate Names:
Knee Arthritis

Arthritis of the Wrist

Inflammation or degenerative disease affecting one or more wrist joints. Pain, swelling, stiffness, reduced grip, and limited motion may result from osteoarthritis, rheumatoid arthritis, crystal disease, injury, infection, or other inflammatory disorders.

Arthritis, Osteoarthritis

Alternate name for degenerative joint disease; see *Osteoarthritis*.

Arthritis Urethritica

An older name for reactive arthritis, inflammatory arthritis occurring after certain gastrointestinal or genitourinary infections and sometimes accompanied by urethritis, conjunctivitis, or skin findings.

Arthrocentesis

A procedure in which a needle removes fluid from a joint. The fluid can be tested for infection, blood, or crystals and may be removed to reduce pain and pressure.

Arthrodesis

Surgery that permanently joins the bones of a damaged joint so they heal as one solid unit. It can relieve severe pain and improve stability, but the fused joint no longer moves.

Arthrogram

An image of a joint taken after contrast material is placed inside or around it. It can show tears or problems in cartilage, ligaments, the joint capsule, or other joint structures.

Arthrography

Imaging of a joint after contrast material is injected into it. It can help examine the shoulder, hip, wrist, knee, or another joint when ordinary imaging does not show enough detail.

Arthrogryposis

A group of conditions present from birth in which two or more joints are permanently stiff or limited in movement. It usually results from reduced movement before birth and may involve muscles, nerves, or connective tissue.

Arthrogryposis Multiplex Congenita

A group of birth conditions causing stiffness and limited movement in several joints. The affected joints may be in the arms, legs, jaw, or spine, and muscle weakness or abnormal nerves and connective tissue may also be present.

Arthrolysis

A procedure that releases scar tissue or other restrictions around a stiff joint to improve movement. It may be performed through small cuts with a camera or through open surgery.

Arthropathy

Any disease or abnormal condition affecting a joint. It may result from inflammation, wear, injury, infection, bleeding, nerve damage, or crystals such as those that cause gout.

Alternate Names:
Joint Disease

Arthroplasty

Surgery to repair, reshape, or replace a damaged joint to reduce pain and improve movement or alignment. It may replace part or all of the joint and is used for severe arthritis, fractures, or other joint damage.

Arthropod Vector

An insect, tick, or related animal that carries and transmits an infectious organism between hosts. Examples include mosquitoes spreading malaria or ticks spreading Lyme disease.

Alternate Names:
Disease Vector

Arthroscope

A thin instrument with a light and camera used to look inside a joint through a small cut. It can help diagnose damage and guide keyhole surgery to repair or remove abnormal tissue.

Arthroscopy

Keyhole surgery in which a camera and small instruments are inserted through small cuts to examine or treat a joint. It may be used to repair cartilage or ligaments, remove loose tissue, or treat an inflamed joint lining.

Arthrosis

Degenerative damage or wear of a joint, involving loss of cartilage and changes in the underlying bone. Osteoarthritis is the most common example and can cause pain, stiffness, and reduced movement.

Arthus Reaction

A local immune reaction that causes redness, swelling, pain, and sometimes tissue damage several hours after exposure to a substance. It occurs when antibodies and the substance form deposits that activate inflammation in the affected tissue.

Articular Cartilage

Smooth, tough tissue covering the ends of bones inside a joint. It allows bones to move with little friction and helps spread forces across the joint.

Articular Cartilage Injuries

Damage to the smooth cartilage covering the ends of bones in a joint, sometimes extending into the underlying bone. It may cause pain, swelling, catching, or reduced movement and can follow injury, repeated stress, or joint disease.

Articular Ligament

A strong band of connective tissue joining bones around a joint. It stabilizes the joint and limits excessive bending, sliding, or twisting.

Alternate Names:
Joint Ligament

Articulation

A joint or connection between bones. In speech, articulation also means forming clear speech sounds using the tongue, lips, teeth, and other speech organs.

Articulation Disorder

A speech sound disorder in which an individual has difficulty producing individual speech sounds correctly with the tongue, lips, teeth, and palate, resulting in substitutions, omissions, distortions, or additions of speech sounds.

Alternate Names:
Speech Articulation Disorder; Phonetic Disorder

Artifacts

Distortions or false features in a medical image that do not represent real body structures. They may result from movement, metal, air, the imaging beam, or limits of the scanner and image-processing method.

Artificial Abortion

Older term; see *Induced Abortion*.

Artificial Heart

A mechanical device that supports or replaces the heart's pumping action. It may support one or both lower chambers temporarily or long term and requires management of power, infection, bleeding, and blood clots.

Artificial Insemination

A fertility procedure in which prepared sperm is placed into the cervix or uterus to increase the chance of pregnancy. The sperm may come from a partner or a donor.

Artificial Insemination By Donor

Fertility treatment in which sperm from a screened donor is placed into the uterus or cervix to attempt pregnancy. It may be used when partner sperm is unavailable or unlikely to result in pregnancy.

Artificial Insemination By Husband

Fertility treatment in which prepared sperm from a woman's husband or male partner is placed into the uterus or cervix to increase the chance of fertilization and pregnancy.

Artificial Intelligence

Computer systems that learn from data to recognize patterns, make predictions, or support healthcare decisions. Clinical AI performance depends on validation, monitoring for bias, and qualified professional oversight.

Alternate Names:
AI

Artificial Kidney

A dialysis device that removes metabolic waste and excess fluid from blood and helps correct electrolyte disturbances when renal function is inadequate.

Artificial Pacemaker

An implanted device that sends electrical signals to the heart when its natural rhythm is too slow or irregular. It helps maintain an adequate heart rate and may have one or more leads.

Artificial Rupture Of Membranes

Deliberate breaking of the amniotic sac during labour or an examination. It may be used to start or strengthen labour, assess the amniotic fluid, or attach internal monitors; it carries risks such as infection and umbilical-cord prolapse.

Artificial Saliva

A product that moistens the mouth and temporarily relieves discomfort from dry mouth. It may improve speaking, swallowing, and comfort but does not replace fluids, dental care, or treatment of the cause.

Alternate Names:
Saliva Substitute

Artificial Skin

A biological or manufactured covering placed over a wound to protect it and support growth of new skin. It may reduce fluid loss and contamination, but some wounds later need a permanent skin graft.

Alternate Names:
Skin Substitute

Artificial Sweeteners

Sweet-tasting substances used in place of sugar that provide few or no calories. They include chemically synthesized compounds and substances derived from plants; their sweetness and metabolism vary by type.

Artificial Urinary Sphincter

An implanted device that controls urine leakage by gently closing and releasing the urethra. It is used for selected severe stress incontinence and requires surgery and follow-up to operate and maintain the

device.

Artificial Ventilation

Support or replacement of breathing with a machine that moves air and oxygen into and out of the lungs when a person cannot breathe well enough alone. It may use a mask or a tube and requires close monitoring.

Artificial Ventricle

A mechanical device that helps or replaces the pumping action of one or both lower heart chambers in severe heart failure. The exact device and treatment goal vary.

Alternate Names:
Ventricular Assist Device

Aryepiglottic Fold

A triangular mucosal fold enclosing ligamentous and muscular fibers, extending bilaterally from the lateral margins of the epiglottis to the arytenoid cartilages, forming the lateral anatomical boundaries of the laryngeal inlet.

Arytenoid Cartilage

One of a pair of small cartilages at the back of the voice box. They anchor the vocal cords and help the laryngeal muscles open, close, and adjust the cords for breathing and speech.

ASA Physical Status Classification System

A scale used before anesthesia to summarize a patient's overall health and major medical conditions, from healthy to severely ill. It helps the care team communicate risk but does not by itself predict complications or outcome.

Asbestosis

Permanent scarring of the lungs caused by long-term inhalation of asbestos fibres. It can gradually cause breathlessness, dry cough, and reduced lung function and increases the risk of lung cancer and mesothelioma.

Asbestos-Related Disorders

Diseases that may develop years after breathing asbestos fibres, including pleural plaques, lung scarring, lung cancer, and mesothelioma. Risk increases with greater exposure and smoking; symptoms may include breathlessness, cough, or chest pain.

Ascariasis

An infection caused by the intestinal roundworm Ascaris lumbricoides, acquired by swallowing eggs from contaminated soil, food, or water. Many infections cause no symptoms, but heavy worm burdens can cause abdominal pain, malnutrition, or bowel obstruction, as well as cough and wheezing while the larvae migrate through the lungs.

Alternate Names:
Ascaris Infection; Roundworm Infection; Ascaris Lumbricoides Infection

Ascaris Lumbricoides

A large parasitic roundworm that infects the human intestines. It is transmitted when microscopic eggs in contaminated soil, food, or water are swallowed.

Alternate Names:
Giant Human Roundworm

Ascending Aorta

The first section of the aorta, rising from the heart's left pumping chamber. It gives rise to the coronary arteries and continues into the aortic arch; an aneurysm or dissection here can be life-threatening.

Ascending Aortic Aneurysm

An enlarged, weakened area in the part of the aorta that rises from the heart. It may be associated with a bicuspid aortic valve, inherited connective-tissue disease, high blood pressure, or artery-wall disease and may rupture or dissect.

Ascending Cholangitis

A bacterial infection of the bile ducts caused by obstruction, usually from a common bile-duct stone or tumor, with infection of stagnant bile. It may cause fever, chills, right-upper-quadrant pain, and jaundice; severe cases can progress to confusion and septic shock. Blood tests may show leukocytosis and

raised bilirubin, while imaging can show bile-duct dilation.

Alternate Names:
Acute Cholangitis; Acute Suppurative Cholangitis; Biliary Sepsis

Ascending Colon

The first part of the large intestine, running upward on the right side of the abdomen from the appendix region to the bend beneath the liver. It absorbs water and helps form stool.

Ascites

Extra fluid collecting in the space around the abdominal organs. It often happens with severe liver disease, but cancer, heart failure, pancreatitis, and other conditions can also cause it. It may make the belly swell, feel uncomfortable, or make breathing harder.

Ascitic Fluid

Fluid collected from the abdomen in a person with ascites. Laboratory testing can help identify liver disease, infection, cancer, pancreatitis, or other causes of the fluid buildup.

Alternate Names:
Ascitic Effusion

Ascorbic Acid

Vitamin C, a water-soluble vitamin needed to make collagen, heal wounds, absorb iron, protect cells, and support normal immune and connective-tissue function.

Ascus

A Pap-test result meaning that some cells from the cervix look slightly unusual, but it is unclear whether the change is important. Its risk classification depends on age, HPV testing, and previous results; it is not a cancer diagnosis.

ASD

Abbreviation for atrial septal defect; see *Atrial Septal Defect*.

Asepsis

The condition or practice of preventing contamination by disease-causing microorganisms, especially during medical or surgical procedures. It includes sterile technique, environmental controls, hand hygiene, and appropriate handling of instruments and materials.

Aseptic

Free from disease-causing contamination, or performed using methods that prevent microorganisms from entering a wound, specimen, medicine, or body site. Aseptic does not necessarily mean completely sterile.

Aseptic Fever

A fever caused by something other than an infection, such as inflammation, injury, cancer, or a medicine. The term means infection is not thought to be the cause; it does not mean the person is otherwise well. Unlike fever of unknown origin, the cause of an aseptic fever is known.

Aseptic Loosening

Loss of firm attachment of an artificial joint or other implant without an active infection. Repeated stress or a reaction to tiny wear particles can cause pain, instability, and eventual implant failure.

Aseptic Meningitis

Inflammation of the membranes around the brain and spinal cord without the usual evidence of bacterial meningitis. Viruses are common causes, but medicines, autoimmune disease, and other infections can also be responsible.

Aseptic Necrosis

Death of bone tissue caused by impaired blood supply without infection; see *Osteonecrosis*.

Alternate Names:
Avascular Necrosis; Osteonecrosis; Ischemic Bone Necrosis

Aseptic Technique

Practices used to prevent harmful microorganisms

contaminating a wound, body site, medicine, or specimen. They include hand hygiene, clean or sterile equipment, surface cleaning, and limiting contact with exposed sterile items.

Asherman Syndrome

Symptoms caused by scar bands inside the uterus, such as light or absent periods, pelvic pain, infertility, or pregnancy loss. The adhesions often follow a procedure inside the uterus, especially after pregnancy; see also *Intrauterine Adhesions*.

Ashman Phenomenon

A temporary wide-looking heartbeat that occurs when a short beat follows a long pause, often during atrial fibrillation. It can resemble a dangerous rhythm on an ECG, so clinicians interpret it with the full tracing and the person's symptoms.

Alternate Names:
Ashman's Phenomenon; Aberrant Intraventricular Conduction

ASL

American Sign Language, a complete visual language used by many Deaf and hard-of-hearing people. It is a primary language for many members of Deaf communities and is distinct from signed versions of spoken English.

ASO

Open-heart surgical procedure used to correct transposition of the great arteries in newborns. See *Arterial Switch Operation*.

ASOT

An abbreviation for the antistreptolysin O test, a blood test measuring antibodies against a toxin made by group A streptococcal bacteria. It can help show a recent strep infection when investigating later complications.

Asp

The standard three-letter abbreviation for aspartic acid, an amino acid used to build proteins and involved in energy production and other cell reactions.

Aspartame

A low-calorie sweetener made from two amino-acid components. It is not suitable for people with phenylketonuria because it releases phenylalanine when digested.

Aspartate Aminotransferase

An enzyme found mainly in the liver, heart, muscles, and red blood cells. When these tissues are injured, the enzyme can enter the blood and its level may rise.

Aspartate Aminotransferase Blood Test

A blood test measuring the level of the enzyme aspartate aminotransferase. A high result can indicate injury to the liver, heart, muscles, or red blood cells; other tests help identify the source.

Aspartate Aminotransferase Test

A blood test that measures aspartate aminotransferase, an enzyme found in the liver, heart, and skeletal muscle; elevated levels suggest cellular injury, particularly hepatic or cardiac tissue damage. See *Aspartate Aminotransferase* and *Liver Function Tests*.

Aspartic Acid

An amino acid that the body can make and uses to build proteins and carry out cell reactions. It is one of the components of aspartame but is not the same substance as the sweetener.

Asperger Syndrome

An older name for a form of autism. It was used for autistic people who did not have major delays in learning to speak or in intellectual development. It is no longer a separate diagnosis; clinicians now use autism spectrum disorder. A person given this diagnosis in the past may still use the name.

Alternate Names:
Asperger Disorder; Asperger's Syndrome; Asperger's Disorder

Aspergillosis

A group of infections and allergic conditions caused

by Aspergillus molds. It may affect the airways, sinuses, or lungs and can include allergic disease, a fungal growth in an existing lung cavity, or invasive infection.

Alternate Names:
Aspergillus Infection; Aspergillus Disease

Aspergillosis Precipitin

A qualitative or semi-quantitative serological test detecting circulating precipitating IgG antibodies against *Aspergillus* antigens, useful in diagnosing chronic pulmonary aspergillosis and allergic bronchopulmonary aspergillosis.

Alternate Names:
Aspergillus Antibodies; Aspergillus IgG Precipitins

Aspergillus

A genus of saprophytic molds whose airborne conidia are ubiquitous in the environment, capable of causing allergic bronchopulmonary aspergillosis, aspergilloma formation in pre-existing cavitary lung lesions, or severe invasive tissue infections in immunocompromised hosts.

Aspergillus Infection

Alternate index label; see *Aspergillosis*.

Asphalt Cement Poisoning

Illness caused by swallowing, inhaling, or having significant skin contact with hot or solvent-containing asphalt cement. Burns, breathing problems, dizziness, or chemical injury can occur.

Asphyxia

A life-threatening lack of oxygen caused by inability to breathe or by blocked blood oxygen delivery, such as from choking, drowning, strangulation, or severe airway blockage. It can quickly cause unconsciousness, brain injury, or death.

Asphyxial Death Pathology

Autopsy findings associated with impaired oxygenation or ventilation, which may include congestion, petechiae, pulmonary edema, and visceral hypoxia. These findings are usually nonspecific and vary with the circumstances, history, and toxicology.

Asphyxia Neonatorum

Failure of a newborn to start or maintain effective breathing at or soon after birth. It can reduce oxygen to the brain and other organs, causing hypoxic injury.

Asphyxiating Thoracic Dysplasia

A rare inherited disorder in which short ribs create a narrow, stiff chest that restricts breathing, especially in infancy. Kidney, liver, and limb abnormalities may also occur.

Alternate Names:
Jeune Syndrome

Aspirate

Fluid, cellular material, tissue fragments, or particulate matter evacuated from a cavity, cyst, organ, or lesion via negative-pressure suction; or foreign liquid and solid material accidentally inhaled into the tracheobronchial tree.

Alternate Names:
Aspirated Material; Biopsy Aspirate

Aspiration

Breathing food, liquid, saliva, vomit, blood, or another substance into the voice box or lungs instead of swallowing it into the oesophagus. It can cause choking, airway blockage, inflammation, or pneumonia.

Aspiration Pneumonia

A lung infection that develops after inhaling saliva, food, liquid, or stomach contents. It is more likely with swallowing difficulty, reduced consciousness, stroke, or tube feeding and may cause cough, fever, breathlessness, or chest pain.

Aspiration Pneumonitis

Chemical inflammation of the lungs after inhaling stomach contents, especially acidic fluid. It can cause coughing, wheezing, low oxygen, breathing difficulty, and fluid or collapse in parts of the lungs.

Aspiration Pneumonitis and Pneumonia

Aspiration pneumonitis is an acute chemical lung injury after inhaling gastric contents; aspiration pneumonia is infection after inhaling contaminated material. Both may cause fever, cough, hypoxia, or lung infiltrates.

Aspiration Risk

The likelihood that food, liquid, saliva, or stomach contents will enter the airway or lungs. Risk increases with swallowing difficulty, stroke, reduced alertness, nerve or muscle disease, reflux, and some dental or feeding problems.

Aspirin

A medicine that can relieve pain, lower fever, reduce inflammation, and make platelets less likely to form blood clots. Low-dose aspirin is used for selected people with cardiovascular disease, but it can cause serious bleeding and is not suitable for everyone.

Alternate Names:
Acetylsalicylic Acid; ASA

Aspirin-Exacerbated Respiratory Disease

A condition involving asthma, chronic nasal or sinus inflammation with polyps, and respiratory reactions to aspirin or some similar pain medicines. Exposure may trigger wheezing, nasal blockage, cough, or shortness of breath.

Aspirin Overdose

Acute or chronic poisoning resulting from excessive salicylate ingestion. Characteristic features include tinnitus, nausea, vomiting, hyperventilation causing early respiratory alkalosis, followed by severe uncoupled oxidative phosphorylation, high anion gap metabolic acidosis, hyperthermia, confusion, seizures, and noncardiogenic pulmonary edema.

Alternate Names:
Salicylate Toxicity; Aspirin Poisoning; Salicylism

Aspirin Poisoning

Alternate name; see *Aspirin Overdose*.

Asplenia

Absence or severe loss of spleen function. It may result from spleen removal, the spleen not developing, or a disease such as sickle cell disease. It raises the risk of severe infections, especially from encapsulated bacteria such as pneumococcus, meningococcus, and *Haemophilus influenzae* type b.

Alternate Names:
Absence of Spleen; Functional Asplenia

Assay

A laboratory method used to detect or measure a substance, biological activity, genetic feature, or response in a sample.

Assist-Control Ventilation

A ventilator setting that gives a full preset breath whenever the patient starts one and also gives breaths at a minimum rate if the patient does not breathe enough. Each breath is set by volume or pressure.

Assisted Breech Delivery

A vaginal birth in which the baby's buttocks or feet come first and a trained clinician helps deliver the body and head. It is considered only in carefully selected circumstances because breech birth can be dangerous for the baby or pregnant person.

Assisted Circulation

Mechanical or procedural support that maintains blood flow when the heart cannot pump enough on its own. It may use a pump, oxygenator, or other device for a short time or longer-term support.

Alternate Names:
Mechanical Circulatory Support

Assisted Delivery With Forceps

A vaginal birth in which a trained clinician places specially shaped instruments around the baby's head to help complete delivery. It may be considered when labour is prolonged or the baby or pregnant person needs delivery sooner.

Assisted Living

A residential setting where people receive help with daily activities such as bathing, dressing, meals, medicines, or transport while retaining some independence. It generally does not provide the continuous skilled nursing care of a hospital or nursing home.

Assisted Reproductive Technology

Clinical, surgical, and laboratory procedures that involve the in vitro manipulation of human oocytes, spermatozoa, or embryos to achieve pregnancy, including in vitro fertilization (IVF), intracytoplasmic sperm injection (ICSI), gamete intrafallopian transfer (GIFT), and frozen embryo transfer.

Alternate Names:
ART; Assisted Reproduction; Assisted Conception

Assistive Device

Equipment that helps a person move, communicate, perform daily activities, or remain independent. Examples include a cane, wheelchair, hearing aid, communication tool, brace, walker, or adapted household equipment.

Assistive Device Training

Instruction in choosing, fitting, using, and maintaining equipment such as walkers, canes, crutches, braces, or wheelchairs, including safe walking, transfers, and stair use.

Association

A relationship in which two findings, events, or conditions occur together more often than expected. An association alone does not prove that one causes the other.

Association Cortex

Areas of the brain's outer layer that combine information from different senses. They support memory, language, planning, judgment, learning, and other complex behavior rather than controlling one simple movement or sensation.

Association Study

A research study examining whether a genetic variant, exposure, or other factor occurs more often with a particular disease or finding. Such a relationship does not prove that the factor causes the disease.

Asteatotic Eczema

A dry-skin eczema pattern, also called eczema craquelé, in which fine fissures create a cracked or porcelain-like appearance, usually on the shins, arms, or trunk of older adults. Cold, dry weather, frequent washing, and diuretics can worsen it; emollients and treatment of inflammation help.

Alternate Names:
Eczema Craquelé; Winter Eczema; Winter Itch; Xerotic Eczema

Astereognosis

Inability to recognize a familiar object by touch alone even though basic touch sensation works. It usually results from damage to a brain area that combines sensory information, often after a stroke or other brain injury.

Asterixis

Brief, repeated lapses in holding a posture that cause a flapping movement, often when the arms are stretched out and the wrists are bent back. It can occur with liver or kidney failure, breathing disorders, or some medicines.

Asteroid Hyalosis

A usually harmless eye condition in which tiny calcium-and-fat particles float in the gel inside the eye and appear as bright spots. It often affects one eye and causes few symptoms, but dense particles can obscure the retina.

Asthenia

Abnormal lack of physical strength or energy. It is a symptom rather than a disease and may occur with infection, chronic illness, malnutrition, depression, or medicine effects.

Asthenic

Describing a person or condition marked by weakness, or sometimes a slender body build. In a clinical note, the surrounding context shows which meaning is intended; asthenia specifically means reduced strength or energy.

Asthenopia

Eye strain or visual fatigue that may cause aching, burning, blurred vision, headache, or difficulty focusing. Refractive errors, dry eyes, poor lighting, and prolonged screen use can contribute.

Asthenozoospermia

Abnormally reduced movement of sperm, which can make fertilization more difficult. It is assessed by semen analysis and may result from infection, a varicocele, toxins, illness, or an unknown cause.

Alternate Names:
Asthenospermia

Asthma

A chronic inflammatory disease of the airways in the lungs characterized by bronchial hyperresponsiveness and variable, typically reversible expiratory airflow limitation (reversing spontaneously or with bronchodilator therapy). When triggered, airway inflammation, bronchospasm, and mucus hypersecretion lead to episodes of wheezing, shortness of breath, chest tightness, and cough, which often vary over time and in intensity. Common triggers include respiratory viral infections, allergens, cold air, exercise, smoke, and occupational irritants.

Asthma Attack

A sudden worsening of asthma in which inflamed, narrowed airways make breathing difficult. It may cause wheezing, cough, chest tightness, or breathlessness; severe attacks can cause hypoxemia, exhaustion, or respiratory failure.

Asthma Controller Medications

Medicines used regularly to reduce airway inflammation and prevent asthma symptoms and attacks. Inhaled corticosteroids are the main controller medicines; other classes may be combined with them according to the asthma regimen.

Alternate Names:
Asthma Controllers; Long-Term Control Medications

Asthma-COPD Overlap

A pattern in which a person has features of both asthma and chronic obstructive pulmonary disease, such as variable symptoms together with persistent airflow limitation. The term describes overlapping features rather than a single, separately defined disease.

Asthma Exacerbation

A sudden or gradual worsening of asthma symptoms and airflow through the lungs. It may cause increasing wheeze, cough, chest tightness, or breathlessness and can become life-threatening.

Asthma in Older Adults

Asthma occurring later in life can be difficult to distinguish from chronic obstructive pulmonary disease, heart disease, deconditioning, or medication effects. It is characterized by variable respiratory symptoms and reversible or variable airflow limitation.

Asthma in Pregnancy

Asthma may improve, worsen, or remain unchanged during pregnancy. Poorly controlled asthma can cause maternal hypoxia and affect fetal oxygenation; symptoms and lung function may vary during pregnancy.

Asthma Medications

Medicines for asthma include regular treatments that reduce airway inflammation and reliever treatments that quickly ease narrowed airways. The regimen depends on symptoms, lung function, attack risk, age, pregnancy, inhaler technique, and response.

Asthma Quick-Relief Medications

Medicines used to ease asthma symptoms quickly by opening narrowed airways or reducing airway inflammation. They may include a short-acting bronchodilator or an inhaled corticosteroid–formoterol

combination.

Alternate Names:
Asthma Relievers; Rescue Medications

Astigmatism

A common refractive error in which the cornea or lens has an irregular or unequal curvature, so light does not focus evenly on the retina. It can cause blurred or distorted vision at any distance and may occur alone or with nearsightedness or farsightedness.

Astraphobia

An irrational and overwhelming fear of thunder and lightning, causing marked panic, anxiety, and hiding behavior during storms.

Alternate Names:
Brontophobia; Keraunophobia; Fear of Thunder and Lightning

Astringent

A substance that makes surface tissues contract and may reduce minor secretions or bleeding. Astringents are used in some skin, mouth, and wound products; they can irritate tissue, especially when applied repeatedly or to sensitive surfaces. Some work by causing surface proteins to precipitate.

Astroblastoma, MN1-Altered

A rare, circumscribed glial tumour of the central nervous system, classified as this entity when characteristic histology is accompanied by an *MN1* gene alteration. It most often arises in the cerebral hemispheres. Local recurrence can occur, and its molecular definition helps distinguish it from other central nervous system tumours with similar microscopic features.

Alternate Names:
Astroblastoma

Astrocyte

A star-shaped support cell in the brain and spinal cord. It helps nourish nerve cells, maintain the blood–brain barrier, regulate the chemical environment, and respond to injury.

Astrocytoma

A tumour arising from astrocytes, the star-shaped support cells of the brain or spinal cord. Astrocytomas vary from slow-growing to aggressive, and symptoms depend on their location and size.

Astrovirus Infection

An acute viral infection of the gastrointestinal tract caused by human astroviruses, a leading cause of non-bacterial gastroenteritis primarily in infants, young children, the elderly, and immunocompromised patients. It presents with watery diarrhea, mild abdominal pain, low-grade fever, and vomiting, typically resolving spontaneously within 2 to 4 days with oral rehydration therapy.

Alternate Names:
Astrovirus Gastroenteritis; Human Astrovirus Infection

Asymmetrical

Unequal in shape, size, distribution, or appearance between corresponding sides. Asymmetry in a pigmented skin lesion is one feature associated with melanoma, particularly alongside irregular borders or varied color.

Asymptomatic

Having a disease, infection, or abnormal finding without noticeable symptoms. A person may still have detectable disease, develop complications, or transmit an infection; this differs from presymptomatic illness, in which symptoms appear later.

Asymptomatic Adults

Adults who have no noticeable symptoms of the condition being assessed. Absence of symptoms does not exclude early or hidden disease, risk factors, or the ability to transmit an infection.

Asymptomatic Bacteriuria

Bacteria detected in a properly collected urine sample when the person has no urinary symptoms. Its clinical significance differs from symptomatic urinary infection and varies in groups such as pregnant people and those undergoing urinary-tract procedures.

Asymptomatic Bacteriuria In Pregnancy

Bacteria growing in a pregnant person's urine without burning, urgency, or other urinary symptoms. It is identified by urine culture and is associated with increased risk of kidney infection and pregnancy complications.

Asymptomatic Carrier

A person who carries an infectious organism without symptoms but may still transmit it to others. Whether transmission occurs depends on the organism, body site, and contact.

Asymptomatic HIV Infection

HIV infection without noticeable symptoms at present. HIV can still multiply and gradually weaken the immune system, and the person may transmit it without effective treatment.

Asymptomatic Infections

Infections in which the person has no noticeable symptoms. The organism may still be detectable, cause later complications, or spread to others; this differs from presymptomatic infection, in which symptoms develop later.

Alternate Names:
Subclinical Infections

Asystole

Absence of effective electrical activity in the heart's lower chambers and absence of useful pumping. It causes cardiac arrest; an apparent flat ECG tracing can also result from disconnected leads or equipment failure.

Ataxia

Loss of smooth control and coordination of movement. It is a sign rather than one specific disease and may cause an unsteady walk, poor balance, clumsy movements, slurred speech, shaking, or abnormal eye movements. It can result from a problem in the cerebellum, spinal cord, sensory nerves, or balance organs and is different from muscle weakness alone. Causes include inherited disorders, stroke, multiple sclerosis, infection, vitamin deficiency, medicines, alcohol, or other toxins. The onset may be sudden or gradual, and the course depends on the cause.

Ataxia Telangiectasia

A rare autosomal-recessive DNA-repair disorder causing progressive cerebellar ataxia, telangiectasias of the eyes or skin, immune deficiency, radiosensitivity, and increased risk of leukemia, lymphoma, or other cancers. Respiratory infections and elevated alpha-fetoprotein may occur.

Alternate Names:
A-T; Ataxia-Telangiectasia

Ataxic

Characterized by ataxia, or impaired coordination of voluntary movement. An ataxic person may have an unsteady gait, irregular limb movements, or poorly coordinated speech. The term describes a clinical finding rather than its cause; the underlying problem may involve the cerebellum, sensory pathways, or balance system. It may also describe other movements with irregular timing.

Ataxic Breathing

An irregular, unpredictable pattern in which the rate and depth of breaths vary randomly. It usually indicates severe injury to the lower brainstem and may precede breathing failure.

Ataxic Cerebral Palsy

A form of cerebral palsy caused by developmental injury or malformation of the cerebellum, characterized by problems with balance, depth perception, intention tremor, and an uncoordinated, wide-based gait.

Alternate Names:
Ataxic CP

Ataxic Gait

An abnormal, unsteady, and poorly coordinated walking pattern resulting from dysfunction in the motor coordination or sensory balance pathways. In cerebellar ataxia, the gait is characteristically wide-based, irregular, lurching, and clumsy, with difficulty maintaining a straight line and inability to perform tandem walking. In sensory ataxia (caused by dorsal column or peripheral proprioceptive loss),

the gait is wide-based with high-stepping stamping of the feet, markedly worsening with eye closure (positive Romberg sign).

Ataxophobia

An extreme, irrational fear of disorder, untidiness, or irregularity, compelling intense distress when objects or surroundings are not perfectly arranged.

Alternate Names:
Fear of Disorder

A-T Base Pair

Pairing of adenine with thymine in double-stranded DNA through two hydrogen bonds.

Alternate Names:
Adenine-Thymine Base Pair

Atelectasis

Partial or complete collapse of a region of lung, reducing the amount of air it contains. It may result from blocked airways, pressure from outside the lung, shallow breathing, or scarring and can reduce oxygen exchange.

Alternate Names:
Lung Collapse

Atelophobia

An intense, paralyzing fear of imperfection or of making mistakes, often leading to severe performance anxiety and avoidance of tasks.

Alternate Names:
Fear of Imperfection

Athelia

Congenital absence of one or both nipples, sometimes including the areola; breast tissue may be present. It may occur alone or as part of a congenital syndrome.

Common name: Absence of the nipple

Atherectomy

A minimally invasive endovascular catheter technique utilizing directional, rotational, orbital, or laser devices to physically excise, shave, vaporize, or pulverize calcified or atheromatous plaque from the intraluminal wall of diseased arteries.

Alternate Names:
Endovascular Atherectomy; Directional Atherectomy; Rotational Atherectomy; Orbital Atherectomy

Atheroembolic Renal Disease

Kidney injury caused when cholesterol crystals break from an artery plaque and block small kidney vessels, often after a vascular procedure. It may cause worsening kidney function, mottled skin, painful toes, or raised eosinophils.

Atheroma

A fatty, inflamed buildup within an artery wall that forms part of an atherosclerotic plaque. It may narrow the artery or rupture and trigger a blood clot.

Alternate Names:
Atheromatous Plaque; Arterial Plaque

Atheromatous Plaque

An asymmetrical, fibrofatty lesion developing within the tunica intima of medium and large arteries, comprising a necrotic lipid-rich core of oxidized cholesterol crystals and apoptotic debris covered by a fibrous cap of collagen and vascular smooth muscle cells.

Alternate Names:
Atheroma; Atherosclerotic Plaque

Atherosclerosis

A chronic disease of arteries in which plaques containing cholesterol, inflammatory cells, connective tissue, and often calcium build up in the inner artery wall. Plaques can gradually narrow the artery and reduce blood flow; if a plaque ruptures or erodes, a blood clot may form and suddenly block the artery. Depending on the affected artery, atherosclerosis can cause coronary artery disease, ischemic stroke, or peripheral artery disease.

Atherosclerosis of Aorta

The accumulation of lipid plaques, fibrous tissue, and calcium within the intima of the aorta, leading to hardening, loss of elasticity, and luminal

irregularity, which can serve as a source of distal thromboembolism or aortic aneurysm formation.

Alternate Names:
Aortic Atherosclerosis; Aortic Atheroma

Atherosclerosis Pathology

A chronic arterial intimal disease characterized by lipid-rich plaques with a fibrous cap, inflammation, smooth-muscle proliferation, calcification, and possible ulceration or thrombosis.

Atherosclerotic

Relating to fatty plaque buildup and hardening inside artery walls. Atherosclerotic changes can narrow an artery or encourage a clot to form.

Atherosclerotic Heart Disease

A disease in which cholesterol-containing plaque builds up inside the heart's arteries, narrowing them and reducing blood flow. It may cause chest pain, heart attack, or other heart problems.

Atherosclerotic Plaque

A buildup of cholesterol, fat, inflammatory cells, and scar-like tissue inside an artery wall. It can gradually narrow the artery or rupture and cause a blood clot.

Atherothrombotic Stroke

An ischemic stroke caused by a clot forming on fatty plaque in a large artery supplying the brain or travelling from that plaque into a brain artery. It deprives brain tissue of oxygen.

Alternate Names:
Large-Artery Atherosclerotic Stroke; Atherothrombotic Ischemic Stroke

Athetoid Cerebral Palsy

A dyskinetic subtype of cerebral palsy resulting from injury to the basal ganglia during early brain development, characterized by involuntary, slow, writhing movements of the limbs, trunk, and face, often fluctuating in muscle tone.

Alternate Names:
Dyskinetic Cerebral Palsy; Choreoathetoid Cerebral Palsy

Athetosis

Slow, involuntary, writhing movements that may affect the hands, fingers, feet, face, neck, or trunk. They result from abnormal function in brain areas that help control movement and may occur with inherited or acquired brain injury.

Athlete Foot

Alternate name; see *Athlete's Foot*.

Athlete's Foot

A common superficial fungal infection (dermatophytosis) of the skin of the feet, most commonly caused by *Trichophyton rubrum* or *Trichophyton interdigitale*. Classically presents with pruritus, erythema, scaling, maceration, and fissuring, especially in the interdigital web spaces.

Alternate Names:
Tinea Pedis; Foot Ringworm; Foot Dermatophytosis

Athlete's Heart

Normal physiological cardiac remodeling induced by intensive, prolonged physical endurance or strength training, manifested as physiological left ventricular hypertrophy, chamber dilation, and resting sinus bradycardia, without diastolic dysfunction.

Alternate Names:
Athletic Heart Syndrome; Athlete Heart Remodeling

At-Home COVID-19 Testing

At-home testing for COVID-19 commonly uses a rapid antigen test from a nasal sample. A negative result may occur early in infection despite the presence of SARS-CoV-2.

Atlantoaxial Instability

Excessive movement between the first and second cervical vertebrae, sometimes caused by trauma, rheumatoid arthritis, congenital conditions, or ligament weakness. It may cause neck pain, occipital headache, neurologic symptoms, or spinal-cord compression.

Atlantoaxial Instability in Down Syndrome

Excessive movement between the first and second cervical vertebrae in a person with Down syndrome, often related to ligament laxity or altered bone development. Many people have no symptoms; instability may cause neck pain, weakness, gait change, or spinal-cord signs, particularly with neck movement.

Atlantoaxial Joint

The complex synovial articulation between the first cervical vertebra (atlas, C1) and the second cervical vertebra (axis, C2). Comprising one median pivot joint (dens with anterior arch) and two lateral facet joints, it provides approximately 50% of total cervical rotational range of motion. Instability may arise from trauma (odontoid fractures), rheumatoid arthritis, or Down syndrome.

Alternate Names:
Atlas-Axis Joint; C1-C2 Articulation

Atlanto-Occipital Dislocation

A severe injury in which the first neck bone separates from the base of the skull. It is extremely unstable and can damage the spinal cord or brainstem, causing paralysis, respiratory failure, or death.

Atlanto-Occipital Joints

The paired joints between the upper surface of the atlas, the first cervical vertebra, and the occipital condyles at the base of the skull. They mainly allow nodding and small side-to-side movements while helping stabilize the head and upper neck.

Atlas

The first bone of the neck, supporting the skull and helping the head nod. It is ring-shaped and has openings through which important blood vessels pass.

Atom

The smallest unit of a chemical element that retains the element's properties. It contains a central nucleus surrounded by electrons.

Atonic

Lacking normal muscle tone or ability to contract. For example, an atonic bladder does not squeeze effectively to empty urine.

Atonic Seizure

A seizure causing sudden loss of muscle tone, often for only a few seconds. The person may drop their head, knees, or whole body and fall; injuries can occur during the fall.

Atopic

Having a tendency to develop allergic conditions such as eczema, allergic rhinitis, or asthma. This tendency may run in families and reflects increased sensitivity of the immune system.

Atopic Dermatitis

A chronic, relapsing, intensely itchy inflammatory skin disease involving epidermal-barrier dysfunction and immune dysregulation. It causes dry, inflamed, scaly, or lichenified lesions whose distribution varies with age; scratching can produce infection, excoriations, and sleep disturbance.

Alternate Names:
Atopic Eczema

Atopic Eruption Of Pregnancy

An itchy eczema-like rash that begins or worsens during pregnancy, often on the face, neck, chest, or skin folds. It usually improves after delivery and is not harmful to the fetus.

Atopic Rhinitis

Allergy-related inflammation inside the nose. Exposure to pollen, dust mites, mould, animals, or other triggers can cause sneezing, itching, a blocked or runny nose, and reduced smell.

Alternate Names:
Allergic Rhinitis

Atopy

A tendency to develop certain allergies, influenced by genes and the environment. These may include hay fever, asthma, eczema, or some food allergies.

Atopy is not an allergy itself, and having this tendency does not mean a person will develop these conditions.

Atorvastatin

A medicine that lowers low-density lipoprotein cholesterol by reducing cholesterol production in the liver. It lowers the risk of heart attack and stroke in appropriate people; muscle symptoms and liver problems are uncommon but important side effects.

Atovaquone–Proguanil

A combination of medicines used to prevent or treat some forms of malaria. The medicines interfere with energy production and folate use in malaria parasites; suitability depends on the type of malaria and the person's health.

ATP

Adenosine triphosphate, the main short-term energy-carrying molecule in cells. Cells release usable energy when ATP is broken down and remake it during metabolism.

ATP Synthase

A protein machine in mitochondria and some other cell membranes that uses the movement of hydrogen ions to make ATP, the main molecule cells use for immediate energy.

Atransferrinemia

A very rare inherited disorder in which the blood has little or no transferrin, the protein that carries iron. It can cause severe anemia, poor growth, and harmful iron buildup in organs.

Atresia

A birth defect in which a normal opening or passage is absent, closed, or severely narrowed. Examples include intestinal, bile-duct, heart-valve, and ear-canal atresia; effects depend on the structure involved.

Atresia Of Bile Ducts

See *Biliary Atresia*.

Atretic Cephalocele

A small, skin-covered congenital scalp nodule formed from a regressed cephalocele, usually near the midline at the parietal or occipital scalp. It may connect through a small skull defect to the dura by a fibrous stalk and can be associated with abnormal development of brain tissue or intracranial veins.

Atria

The two upper chambers of the heart. The right atrium receives blood from the body and the left atrium receives blood from the lungs; each passes blood to the lower pumping chamber on its side.

Atrial

Relating to either of the heart's two upper chambers, which receive blood and pass it to the lower pumping chambers.

Atrial Ablation

A procedure, usually catheter-based, that uses heat, cold, or another form of energy to make small areas of scar in heart tissue responsible for an abnormal atrial rhythm. The scars block unwanted electrical signals.

Atrial Arrhythmia

An abnormal heart rhythm that begins in one of the heart's upper chambers. It may cause palpitations, breathlessness, dizziness, chest discomfort, or fainting; examples include atrial fibrillation and atrial flutter.

Atrial Dyssynchrony

Poorly coordinated timing of electrical activation or contraction between the right and left atria, often related to delayed interatrial conduction. It can impair coordinated atrial emptying and timing between atrial and ventricular contraction.

Atrial Fib

Alternate name; see *Atrial Fibrillation*.

Atrial Fibrillation

An abnormal heart rhythm in which the heart's

upper chambers (atria) beat chaotically instead of contracting in an organized way. The heartbeat is often irregular and may be fast, but some people have no symptoms. Blood may pool in the atria and form clots, increasing the risk of stroke.

Alternate Names:
AF; AFib; Auricular Fibrillation

Atrial Fibrillation Ablation

A catheter procedure that creates small scars, usually around the pulmonary veins, to block electrical signals that trigger atrial fibrillation. It may reduce symptoms, but recurrence and procedure-related risks remain possible.

Atrial Fibrillation Medicines

Medicines used for atrial fibrillation may slow the heart rate, restore or maintain a regular rhythm, or reduce stroke risk by preventing clots. Choice depends on symptoms, heart structure, kidney function, bleeding risk, and other conditions.

Atrial Fibrillation With RVR

A clinical presentation of atrial fibrillation in which the rapid, chaotic atrial electrical impulses conduct frequently through the atrioventricular node, producing an irregularly irregular ventricular response with a ventricular rate exceeding 100 beats per minute at rest.

Alternate Names:
AFib with Rapid Ventricular Response; Rapid Atrial Fibrillation

Atrial Flutter

An abnormal heart rhythm caused by a fast, repeating electrical signal in the heart's upper chambers. The heartbeat may be rapid or irregular, and some people have palpitations, tiredness, dizziness, or no symptoms. Atrial flutter can allow blood clots to form and raise the risk of stroke.

Alternate Names:
AFlutter

Atrial Myxoma

A usually noncancerous tumour arising inside the heart, most often in the left atrium. It may obstruct blood flow, cause breathlessness or fainting, or release fragments that block blood vessels.

Atrial Natriuretic Peptide

A hormone released by the heart's upper chambers when they stretch from extra blood. It tells the kidneys to remove more salt and water and helps relax blood vessels, lowering blood volume and pressure.

Atrial Pseudomasses

Normal atrial structures, anatomic variants, or imaging artifacts that resemble a tumour or clot on cardiac imaging. Examples include a prominent crista terminalis, Chiari network, Eustachian valve, and Coumadin ridge.

Atrial Septal Aneurysm

A localized, mobile saccular deformity or pouching of the interatrial septum, typically protruding greater than 10 to 15 millimeters into either the right or left atrium during the cardiac cycle, often coexisting with a patent foramen ovale.

Alternate Names:
ASA (Cardiology)

Atrial Septal Defect

An opening in the wall between the heart's two upper chambers, present from birth. Blood usually flows through it from the left side to the right, sending extra blood to the lungs and the right side of the heart. Small secundum defects may close on their own or cause no symptoms; a significant shunt can enlarge the right side of the heart, disturb its rhythm, or raise pressure in the lung blood vessels. Unlike a patent foramen ovale, a flap-like opening that may stay open after birth, an atrial septal defect involves a deficiency in the septum.

Atrial Septum

The wall separating the heart's right and left upper chambers. A hole in this wall is called an atrial septal defect.

Atrial Standstill

Failure of the heart's upper chambers to produce normal electrical signals or contractions. It can

cause a very slow heartbeat, dizziness, fainting, poor circulation, or heart failure.

Atrial Switch Operation

An older operation for transposition of the major heart arteries that redirects blood inside the atria using a tunnel-like passage. The Mustard and Senning procedures are its principal forms. It restores circulation but leaves the right pumping chamber supporting the body and may cause later rhythm or heart-muscle problems.

Atrial Tachycardia

A fast heart rhythm that starts in an area of an upper chamber outside the normal pacemaker. It may cause palpitations, breathlessness, dizziness, chest discomfort, or fainting.

Atrial Thrombosis

Formation of a blood clot inside one of the heart's upper chambers, especially during atrial fibrillation. The clot can break loose and block blood flow to the brain or another organ.

Atrioventricular

Relating to the connection between a heart's upper chamber and the lower chamber on the same side. The term includes the mitral and tricuspid valves and the electrical pathway that coordinates the timing of their contractions.

Atrioventricular Block

Delayed or interrupted electrical signals between the heart's upper and lower chambers. It may cause a slow heartbeat, tiredness, dizziness, fainting, or no symptoms; severe block can impair cardiac output and may require pacing.

Atrioventricular Bundle

A bundle of specialized electrical fibers that carries signals from the heart's central relay point into the lower chambers. Its branches help both pumping chambers contract in a coordinated way.

Alternate Names:
Bundle of His

Atrioventricular Canal Defect

Alternate name; see *Atrioventricular Septal Defect*.

Atrioventricular Dissociation

A cardiac rhythm abnormality in which the atria and ventricles depolarize and contract independently under the control of separate pacemakers, occurring when ventricular pacing is faster than atrial rate or during complete atrioventricular block.

Alternate Names:
AV Dissociation

Atrioventricular Nodal Reentrant Tachycardia

A sudden, regular, fast heartbeat caused by an electrical loop near the heart's central relay point. Episodes may cause pounding heartbeat, chest discomfort, breathlessness, dizziness, or fainting and may stop as suddenly as they begin.

Alternate Names:
AV Nodal Reentrant Tachycardia; AVNRT

Atrioventricular Nodal Reentry Tachycardia

A rapid, regular heartbeat caused by a looping electrical signal near the atrioventricular node. It commonly begins and ends suddenly and may cause palpitations, dizziness, breathlessness, or fainting.

Atrioventricular Node

A small area of specialized tissue near the junction of the heart's upper and lower chambers that receives electrical signals and briefly delays them before passing them to the lower chambers. This delay allows the upper chambers to empty first.

Atrioventricular Septal Defect

A spectrum of congenital heart defects involving abnormal development of the central heart septa and atrioventricular valves. Complete forms include defects in both the atrial and ventricular septa and a common atrioventricular valve; partial forms usually include an atrial septal defect without a ventricular septal defect and have separate valve openings, often with leakage through the left atrioventricular valve. Abnormal blood flow may cause heart failure or

increased pressure in the lung arteries.

Alternate Names:
AVSD; Atrioventricular Canal Defect; Endocardial Cushion Defect

Atrioventricular Valves

The two heart valves between the upper and lower chambers: the tricuspid valve on the right and the mitral valve on the left. They open to let blood pass forward and close to prevent backflow.

Atrium

One of the heart's two upper chambers, which receive returning blood and pass it to the lower pumping chambers. The right atrium receives blood from the body; the left receives oxygen-rich blood from the lungs.

Atrophic Gastritis

See *Chronic Atrophic Gastritis*.

Atrophic Glossitis

Loss of the tongue's tiny surface projections, leaving it smooth and often red. The finding may be associated with iron, vitamin B12, or folate deficiency, or with conditions such as celiac disease. It describes a clinical finding rather than a single cause or disease. Specific names such as Hunter glossitis refer to deficiency-related forms rather than all atrophic glossitis.

Atrophic Kidney

A kidney that has become significantly smaller than normal and lost functioning parenchymal tissue, resulting from chronic ischemia (such as renal artery stenosis), recurrent infection (chronic pyelonephritis), or reflux nephropathy.

Alternate Names:
Small Kidney; Renal Atrophy

Atrophic Rhinitis

A chronic disease of the nasal cavity characterized by progressive atrophy of the nasal mucosa and underlying turbinate bone, accompanied by widening of the nasal passages, formation of foul-smelling crusts (ozena), and impaired sense of smell.

Atrophic Vaginitis

Alternate name; see *Vaginal Atrophy*.

Aerobic Vaginitis

Inflammation of the vagina in which protective lactobacilli decrease and other bacteria increase. It may cause yellow discharge, burning, or redness. Unlike bacterial vaginosis, it usually includes visible inflammation.

Allergic Vaginitis

Vaginal irritation caused by an allergic reaction to a substance that contacts vaginal or vulvar tissue, such as a medicine, lubricant, or latex. It is related to allergic contact dermatitis and differs from irritation caused by direct chemical injury.

Atrophoderma Maculatum

A rare skin condition causing flat, slightly sunken patches in which the skin becomes thinner and changes colour. The patches usually have no open sore or active infection.

Atrophy

Shrinkage and loss of function of a tissue, organ, or muscle because its cells become smaller or fewer. Causes include disuse, nerve damage, poor blood supply, malnutrition, hormone deficiency, chronic disease, and ageing; it may be partly reversible.

Atropine

A medicine that blocks acetylcholine signals at certain nerve endings. It can increase heart rate, reduce secretions, widen the pupils, and counteract selected poisonings or dangerously slow heartbeats.

Atropine In Organophosphate Poisoning

A medicine used in organophosphate poisoning to block excessive acetylcholine effects, including wet secretions, narrowed airways, slow heartbeat, vomiting, and diarrhoea. It is used with other measures to treat cholinergic toxicity.

Attachment Disorder

See *Reactive Attachment Disorder*.

Attack Rate

The proportion of people at risk who develop a particular illness during a defined outbreak or exposure period. It is commonly used to describe foodborne outbreaks and other limited events.

Attention

The ability to select information, focus on it, and maintain that focus while limiting distraction. Attention can be affected by sleep loss, stress, illness, medicines, or brain disorders.

Attention Deficit Hyperactivity Disorder

Alternate index label; see *Attention-Deficit/Hyperactivity Disorder*.

Attention-Deficit/Hyperactivity Disorder

A neurodevelopmental disorder involving persistent inattention, hyperactivity, and impulsive behaviour that affects functioning or development. Presentations may be mainly inattentive, mainly hyperactive-impulsive, or combined.

Alternate Names:
ADHD; Hyperkinetic Disorder

Attention-Deficit/Hyperactivity Disorder (ADHD)

Alternate name; see *Attention-Deficit/Hyperactivity Disorder*.

Attention-Deficit/Hyperactivity Disorder in Adults

The persistence of ADHD into adulthood, characterized by persistent patterns of inattention, executive dysfunction, disorganization, impulsivity, and emotional restlessness that interfere with occupational, social, and academic functioning.

Alternate Names:
Adult ADHD; Adult Attention-Deficit Disorder

Attenuated

Weakened or reduced in force, severity, concentration, or biological activity. An attenuated vaccine contains a weakened form of a microorganism that is intended to stimulate immunity without usually causing disease.

Attenuation Correction

A computer adjustment for the way body tissues weaken signals during medical imaging. It helps make PET, SPECT, and combined scan images more accurate by compensating for signal loss.

ATTR-CM

A progressive disease of the heart muscle caused by the abnormal clumping and buildup of misfolded transthyretin proteins in the heart walls. This protein accumulation stiffens the heart ventricles, reducing their ability to relax and pump blood effectively, resulting in heart failure.

Alternate Names:
Transthyretin Amyloid Cardiomyopathy; Transthyretin Cardiac Amyloidosis

Attributable Risk

The difference in disease risk between people exposed and not exposed to a possible cause. It estimates the extra risk associated with the exposure, but does not by itself prove causation.

Atychiphobia

An irrational and overwhelming fear of failure, causing avoidance of tasks, personal goals, or career pursuits due to anticipatory anxiety over falling short.

Alternate Names:
Fear of Failure

Atypia

An abnormal appearance of cells or tissue under a microscope, such as unusual cell size, shape, or organization. It is a descriptive finding, not a diagnosis by itself; it can occur with inflammation or repair, precancerous changes, or cancer. Pathologists interpret it according to the tissue involved and the degree of change.

Atypia Morphology

Microscopic cell or tissue features that differ from the expected pattern, such as variation in cell size or shape, irregular nuclei, or disorganized tissue structure. These changes may be reactive, precancerous, or cancerous; atypia alone does not establish cancer.

Alternate Names:
Cytologic Atypia

Atypical

Different from the usual appearance, behaviour, structure, or course of a condition. Atypical does not by itself mean that a finding is harmless, precancerous, or cancerous.

Atypical Anorexia

An eating disorder in which an individual exhibits all the cognitive and behavioral diagnostic features of anorexia nervosa—including intense fear of gaining weight, severe dietary restriction, and distorted body image—despite maintaining a body weight within or above the normal range.

Alternate Names:
Atypical Anorexia Nervosa

Atypical Antipsychotics

A group of medicines used mainly for schizophrenia, bipolar disorder, and selected other conditions. They change several brain signals and can cause sleepiness, weight gain, movement problems, high blood sugar, or other metabolic changes.

Atypical Depression

A specifier for a depressive episode in which mood temporarily improves in response to positive events, with at least two of the following: increased appetite or weight, increased sleep, a heavy feeling in the arms or legs (leaden paralysis), or marked sensitivity to rejection. It can be applied to major depressive disorder or persistent depressive disorder.

Alternate Names:
Major Depression with Atypical Features; Depression with Atypical Features

Atypical Ductal Hyperplasia

A benign breast condition in which more than the usual number of abnormal-looking cells grow within breast ducts. It is not cancer, but it is associated with an increased risk of developing breast cancer.

Atypical (Dysplastic) Nevus

A melanocytic mole with unusual clinical or microscopic features such as asymmetry, irregular border, varied color, or larger size. Most are benign, but multiple atypical nevi increase melanoma risk; a changing, bleeding, or distinctly different lesion may resemble melanoma.

Atypical Endometrial Hyperplasia

An overgrowth of abnormal cells in the lining of the uterus. It is not cancer, but it can develop into uterine-lining cancer or occur alongside it.

Atypical Facial Pain

Persistent or recurring pain in the face that does not fit a clear nerve, dental, sinus, or other recognized cause. Evaluation looks for treatable causes before considering persistent facial-pain disorders.

Atypical Features

A depressive-disorder specifier defined by mood reactivity plus at least two associated features; see *Atypical Depression*.

Atypical Fibroxanthoma

An uncommon, usually superficial skin tumor that appears as a rapidly growing red or pink nodule on sun-damaged skin, often on the head or neck of an older adult. Tissue examination distinguishes it from similar skin cancers and from pleomorphic dermal sarcoma, which extends into deeper tissues.

Atypical Genitalia

A term describing external genital anatomy that does not fit typical male or female patterns. It may reflect differences in chromosomal, gonadal, hormonal, or genital development and can occur alone or with other variations in sex characteristics.

Atypical Hemolytic Uremic Syndrome

A rare disease in which inherited or acquired abnormalities of the complement system cause uncontrolled immune activity and damage to small blood vessels, especially in the kidneys. It can destroy red blood cells, lower platelets, and cause sudden kidney injury, high blood pressure, or neurological problems. Unlike typical hemolytic uremic syndrome, it is not primarily caused by a toxin-producing diarrheal infection.

Alternate Names:
aHUS; Complement-Mediated HUS

Atypical Hyperplasia Of The Breast

A group of benign breast lesions with abnormal cells in the ducts or lobules. Atypical ductal hyperplasia and atypical lobular hyperplasia are distinct types; both are associated with an increased risk of breast cancer.

Atypical Lobular Hyperplasia

A benign breast condition in which more than the usual number of abnormal-looking cells grow in the milk-producing lobules. It is not cancer, but it is associated with an increased risk of developing breast cancer.

Atypical Lymphocyte

A lymphocyte, a type of white blood cell, with an unusual size or appearance under a microscope. It often reflects immune activity during a viral infection, but the finding alone does not identify a specific disease.

Atypical Mole

A mole with unusual clinical features, sometimes called an atypical nevus. The term *dysplastic nevus* is often used for such moles but may specifically refer to microscopic findings, so the terms are not always interchangeable. Most are noncancerous, although multiple atypical moles can increase melanoma risk and atypical features can overlap with melanoma.

Atypical Nevi

Alternate plural name; see *Atypical Mole*.

Atypical Pneumonia

A lung infection that often develops gradually and may cause more general symptoms than chest symptoms, such as headache, tiredness, sore throat, or muscle aches. Causes include certain bacteria and viruses.

Atypical Spitz Nevus

An unusual mole made of pigment-producing cells that resembles a Spitz nevus but has concerning features. Its microscopic appearance can resemble melanoma.

Atypical Teratoid Rhabdoid Tumor

A rare, fast-growing cancer of the brain or spinal cord that occurs mainly in infants and young children. It may cause vomiting, headache, sleepiness, balance problems, seizures, or developmental changes.

Alternate Names:
ATRT; Rhabdoid Brain Tumor

Audiogram

A chart that shows a person's ability to hear at different pitches or frequencies.

Audiologist

A health professional who assesses hearing and fits hearing aids.

Audiology

The healthcare field concerned with hearing, balance, and related communication problems. Audiologists test hearing and balance, provide hearing aids and other devices, offer training and support, and identify when medical or surgical care may be needed.

Audiometry

Measurement of hearing sensitivity at different sound frequencies and intensities, usually using headphones or insert earphones.

Auditory Acuity

The sensitivity or sharpness of hearing, commonly

assessed by determining the softest sounds a person can detect at different frequencies.

Auditory Area

A group of sound-processing regions in the temporal lobe. The primary auditory cortex, on the superior temporal gyrus, processes basic sound features; surrounding auditory association areas help interpret more complex sounds, including speech.

Alternate Names:
Auditory Cortex

Auditory Fatigue

A temporary decrease in hearing sensitivity or listening ability after prolonged loud sound exposure; rest usually helps, but repeated exposure can cause lasting damage.

Auditory Hallucinations

False sensory perceptions of sound occurring in the absence of any external acoustic stimulus. They may be non-verbal (such as clicks, ringing, or music) or verbal (such as single words, conversations, running commentary, or command voices). Verbal auditory hallucinations are a hallmark feature of psychotic disorders such as schizophrenia, but can also occur in severe mood disorders with psychotic features, delirium, temporal lobe epilepsy, sensory deprivation, and substance withdrawal.

Alternate Names:
Paracusia; Phonemes; Auditory Sensory Hallucinations

Auditory Information Processing Disorder

See *Auditory Processing Disorder*.

Auditory Nerve

The portion of the vestibulocochlear nerve that carries hearing signals from the inner ear to the brain.

Auditory Neuropathy Spectrum Disorder

A form of sensorineural hearing impairment characterized by preserved cochlear outer hair cell function (demonstrated by normal otoacoustic emissions or cochlear microphonics) but abnormal, dyssynchronous neural transmission along the eighth cranial nerve.

Alternate Names:
ANSD; Auditory Neuropathy

Auditory Ossicle

One of three small middle-ear bones—the malleus, incus, and stapes—that transmit and amplify vibrations from the eardrum to the inner ear. Disease, injury, or fixation of these bones can cause conductive hearing loss.

Alternate Names:
Ear Ossicle

Auditory Pathway

A chain of nerve structures carrying sound signals from the inner ear through the brainstem to the auditory cortex for recognition and interpretation.

Auditory Perception

The brain's process of detecting, recognizing, and interpreting sounds received through the auditory system.

Auditory Processing Disorder

Difficulty recognizing or interpreting spoken sounds despite normal or near-normal basic hearing sensitivity. A person may struggle to understand speech in noise, follow rapid speech, or distinguish similar sounds. It may coexist with language, attention, or learning differences.

Alternate Names:
APD

Auditory Threshold

The quietest sound a person can hear at a particular pitch or frequency. It is measured during a hearing test and helps describe the degree and type of hearing loss in each ear.

Alternate Names:
Hearing Threshold

Auerbach Plexus

An extensive intrinsic neural network of unmyeli-

nated nerve fibers and postganglionic parasympathetic ganglia situated in the muscularis externa between the circular and longitudinal smooth muscle layers throughout the gastrointestinal tract, coordinating peristalsis and motor activity.

Alternate Names:
Myenteric Plexus

Auer Rods

Needle-shaped structures sometimes seen inside immature blood cells under a microscope. They are made from fused cell granules and strongly suggest a cancer of immature myeloid blood cells, especially acute myeloid leukemia.

Auger Electrons

Very low-energy electrons released by some radioactive atoms after a change inside the atom. They travel only a tiny distance and can damage nearby DNA, a property being studied for precisely targeted radiation treatment.

Augmentation Mammaplasty

Surgical enlargement or reshaping of the breasts, typically performed using prosthetic implants (saline or silicone) or autologous fat grafting.

Alternate Names:
Breast Augmentation; Augmentation Mammoplasty

Augmentation Mammoplasty

Alternate spelling; see *Augmentation Mammaplasty*.

Augmentation Of Labor

A procedure to increase the strength or frequency of contractions after labor has begun but is progressing slowly. It may involve oxytocin or artificial rupture of the amniotic membranes.

Aura

A temporary change in vision, sensation, speech, movement, or awareness that may occur before or during a migraine or seizure. Symptoms usually develop gradually and then resolve; a first or prolonged episode may have causes other than migraine.

Aural Foreign Body

An object or insect lodged in the external auditory canal. See *Objects Or Insects In Ear*.

Aural Fullness

A feeling of pressure, blockage, or fullness in the ear. It can result from poor pressure equalization, fluid, earwax, inner-ear disease, or jaw-joint problems and may occur with hearing loss, ringing, or dizziness.

Alternate Names:
Ear Pressure; Plugged-Ear Sensation; Blocked-Ear Sensation

Aural Polyps

Soft, abnormal tissue growths in the ear canal or middle ear. They often result from long-lasting infection or inflammation; persistent discharge, pain, or bleeding can occur with more serious disease.

Auricle

The visible outer part of the ear attached to the side of the head. Its ridges collect and direct sound into the ear canal, helping the brain judge where sounds come from.

Auricular Cellulitis

A bacterial infection of the skin and soft tissue of the outer ear. The ear may become red, warm, swollen, and painful, sometimes after a scratch, bite, or piercing.

Auricular Hematoma

A collection of blood between the cartilage and skin of the outer ear, usually after a blow or sports injury. It can cause lasting thickening and deformity if the blood is not drained.

Alternate Names:
Pinna Hematoma; Subperichondrial Auricular Hematoma

Auscultation

Listening to sounds produced inside the body, usually with a stethoscope. Clinicians use it to assess the heart, lungs, abdomen, and blood vessels for findings such as murmurs, wheezing, crackles, or

abnormal blood-flow sounds.

Auscultatory Gap

A temporary disappearance of the sounds heard while a blood-pressure cuff is slowly deflated, followed by their return. If it is missed, the top blood-pressure number may be recorded falsely low.

Auspitz Sign

A skin check for psoriasis where tiny pinpoint bleeding spots appear when the silvery scales of a rash are gently scraped away.

Austin Flint Murmur

A low-pitched sound heard during the middle part of the heartbeat over the heart's apex. It is associated with severe leakage of the aortic valve and altered filling of the mitral valve.

Autism

Alternate name; see *Autism Spectrum Disorder*.

Autism Spectrum Disorder

A lifelong condition that can affect communication, social interaction, and how a person responds to change, repeated actions, strong interests, or sensory experiences. It begins during development but may be recognized later. Autistic people vary widely in their strengths and support needs.

Alternate Names:
ASD; Autistic Spectrum Disorder

Autism Spectrum Disorder (ASD)

Alternate name; see *Autism Spectrum Disorder*.

Autistic Savant

An autistic person with an unusually strong, specific ability—such as music, art, calculation, or memory—compared with their other abilities. The term describes a pattern of skills and is not itself a medical diagnosis.

Autoantibodies

Immune proteins that mistakenly recognize and attach to the body's own cells, tissues, or proteins. They may cause disease or serve as test clues; their presence alone does not prove that a person has an autoimmune disease.

Autoantibody

An immune protein that mistakenly recognizes and binds a substance from the person's own body. It may damage tissues or interfere with their function, or it may be present only as a laboratory sign without causing disease.

Autoantigen

A substance normally found in the body that is mistakenly recognized as foreign by the immune system. This mistaken response can lead to inflammation or damage to the person's own cells or tissues.

Auto-Brewery Syndrome

A rare condition in which microbes in the digestive tract are thought to ferment dietary carbohydrates and produce enough ethanol to cause intoxication without alcohol consumption. Published evidence is limited, and diagnosis requires careful exclusion of other causes.

Alternate Names:
Gut Fermentation Syndrome; Endogenous Ethanol Production

Autoclave

A machine that sterilizes equipment by exposing it to pressurized steam at a controlled temperature and time. It destroys bacteria, viruses, fungi, and spores when the correct cycle is used.

Autocrine Signaling

A mode of intercellular and intracellular communication in which a cell synthesizes and secretes a messenger molecule (such as a cytokine, hormone, or growth factor) that binds to surface receptors on the very same cell that produced it, initiating a feedback response.

Autoerythrocyte Sensitivity

A rare condition causing painful bruises or raised purple patches, historically attributed to an abnormal reaction to a person's own red-cell components.

Its cause remains uncertain, and the findings can resemble other bruising disorders.

Autogenic Drainage

A controlled-breathing method that moves mucus from the smaller airways toward the throat so it can be coughed out. It uses different breathing depths and requires instruction and practice.

Autograft

Tissue moved from one part of a person's body to another part of the same body. Because the tissue is genetically the person's own, rejection is unlikely, but the original site may have pain, scarring, or other complications.

Autoimmune

Describing an immune response that mistakenly targets the body's own cells, tissues, or proteins. It can cause inflammation, tissue damage, or impaired organ function.

Autoimmune Associated Epilepsy

See *Autoimmune Epilepsy*.

Autoimmune Autonomic Ganglionopathy

A rare, severe autoimmune disorder of the autonomic nervous system characterized by widespread sympathetic and parasympathetic failure. Manifests clinically with severe orthostatic hypotension, anhidrosis, dry mouth and eyes, tonic pupils, gastrointestinal dysmotility (gastroparesis, intestinal pseudo-obstruction), and urinary retention; strongly associated with autoantibodies directed against the ganglionic nicotinic acetylcholine receptor ($\alpha_3\beta_4$ subtype).

Alternate Names:
AAG; Subacute Autonomic Neuropathy

Autoimmune Disease

A pathological condition in which the immune system mounts an aberrant adaptive immune response against the body's own autoantigens, leading to chronic inflammation, tissue destruction, and organ dysfunction. Examples include systemic lupus erythematosus, rheumatoid arthritis, Hashimoto thyroiditis, and type 1 diabetes mellitus.

Alternate Names:
Autoimmune Disorder; Autoimmune Condition

Autoimmune Diseases

Plural form; see *Autoimmune Disease*.

Autoimmune Disorder

Alternate name; see *Autoimmune Disease*.

Autoimmune Encephalitis

Inflammation of the brain caused by an immune attack on nerve cells or their proteins. It may cause seizures, confusion, memory problems, unusual movements, behaviour changes, sleep problems, or reduced consciousness.

Autoimmune Encephalopathy

See *Autoimmune Encephalitis*.

Autoimmune Endocrine Disease

An autoimmune disorder that damages a hormone-producing gland or hormone-producing cells. Examples include autoimmune thyroid disease, Addison disease, and type 1 diabetes; it may cause too little or, less often, abnormal hormone production.

Autoimmune Enteropathy

A rare disease in which the immune system damages the lining of the small intestine, causing ongoing diarrhoea, poor nutrient absorption, weight loss, or growth problems. It may occur with other immune disorders.

Autoimmune Epilepsy

Recurrent seizures caused by an immune attack on the brain. Seizures may begin suddenly or be difficult to control and can occur with memory problems, confusion, movement changes, or other signs of brain inflammation.

Autoimmune Gastritis

Long-term inflammation that damages acid- and vitamin-B12-producing cells in the stomach. It can cause low stomach acid, iron deficiency, vitamin

B12 deficiency, anaemia, digestive symptoms, and an increased risk of certain stomach growths.

Autoimmune Hemolytic Anemia

Anemia caused when the immune system mistakenly makes antibodies that destroy red blood cells faster than the body can replace them. It may cause tiredness, pale or yellow skin, dark urine, a fast heartbeat, or shortness of breath.

Autoimmune Hepatitis

Long-term liver inflammation caused by an immune attack on liver cells. It may cause tiredness, nausea, joint pain, or jaundice, while some people have no symptoms; untreated disease can lead to scarring and liver failure.

Autoimmune Inner Ear Disease

A rare inflammatory condition characterized by rapidly progressive, bilateral sensorineural hearing loss that develops over weeks to months, caused by autoimmune attack against inner ear antigens, often accompanied by tinnitus and vertigo.

Alternate Names:
AIED

Autoimmune Keratitis

Inflammation of the clear front surface of the eye caused by or associated with immune disease. It may cause eye pain, redness, light sensitivity, blurred vision, or a corneal scar.

Autoimmune Liver Disease Panel

A group of blood tests that looks for immune proteins linked with autoimmune liver diseases. Results are interpreted with liver tests, symptoms, examination, and sometimes a liver biopsy; the panel alone cannot establish a diagnosis.

Autoimmune Lymphoproliferative Syndrome

An inherited immune disorder in which lymphocytes do not die off normally after an immune response, causing noncancerous enlargement of lymph nodes and spleen from early childhood. Autoimmune destruction of blood cells may cause anemia, low platelets, or low white-cell counts. It is often due to a defect in the Fas cell-death pathway; diagnosis uses blood counts, specialized immune-cell testing, and gene testing, and there is an increased risk of lymphoma.

Autoimmune Neutropenia

A hematologic disorder caused by the production of autoantibodies directed against specific antigens on mature neutrophils, accelerating their destruction and leading to low absolute neutrophil counts and increased susceptibility to bacterial infections.

Alternate Names:
AIN (Hematology)

Autoimmune Pancreatitis

A rare form of pancreas inflammation caused by an abnormal immune response. It may cause painless jaundice, abdominal pain, weight loss, or a mass that resembles cancer and often improves with immune-suppressing treatment.

Autoimmune Polyendocrine Syndromes

A group of inherited or acquired disorders in which immune attacks affect several hormone-producing glands. Depending on the type, features may include adrenal failure, low parathyroid hormone, thyroid disease, diabetes, chronic fungal infection, or skin changes.

Autoimmune Polyendocrinopathy

A disorder in which immune attacks affect several hormone-producing glands. One inherited form can cause chronic fungal infections of skin or mouth, low parathyroid hormone, adrenal failure, and other autoimmune conditions.

Autoimmune Polyglandular Syndrome

A group of disorders in which the immune system damages two or more hormone-producing glands. Possible effects include adrenal failure, thyroid disease, low parathyroid hormone, diabetes, or problems with reproductive hormones.

Autoimmune Thyroid Disease and

Pregnancy

Thyroid autoimmunity can cause hypothyroidism, hyperthyroidism, pregnancy loss, preterm birth, or fetal thyroid effects. Thyroid function and medicine doses are monitored closely before and during pregnancy and after delivery.

Autoimmune Thyroiditis

Immune-mediated inflammation and damage of the thyroid gland. See *Hashimoto Thyroiditis*.

Autoimmunity

An immune response directed against the body's own cells, tissues, or proteins. It may cause no harm, or it may produce inflammation and disease when it damages tissues or interferes with organ function.

Autoimmunity: Mechanisms

Autoimmunity can develop when the immune system fails to remove or control self-reactive cells, or when an infection triggers responses that also recognize body tissues. Genetic factors, immune regulation, and environmental triggers may all contribute.

Autoinflammatory Diseases

Conditions in which the body's early, nonspecific immune response becomes overactive and causes repeated or ongoing inflammation. They may cause fever, rash, joint pain, abdominal pain, or organ damage, often without disease-specific autoantibodies.

Autoinoculation

The spread of an infection from one part of a person's body to another, often by touching or scratching. This can transfer germs to broken skin, the eyes, the mouth, or another vulnerable site.

Autologous

Taken from and returned to the same person. Examples include storing a person's own blood for later transfusion or collecting and returning their own stem cells during treatment.

Autologous Blood Donation

Collection and storage of a person's own blood before an operation for possible transfusion during or after surgery. It avoids incompatibility with donor blood but may not be suitable or necessary for everyone.

Autologous Breast Reconstruction

Surgical reconstruction of the breast contour utilizing the patient's own vascularized tissue flaps harvested from donor sites such as the abdomen (e.g., deep inferior epigastric perforator [DIEP] or transverse rectus abdominis myocutaneous [TRAM] flap), back (latissimus dorsi flap), or gluteal/thigh regions.

Alternate Names:
Autogenous Tissue Reconstruction

Autologous Fat Transplant

A procedure that removes fat from one area of a person's body and injects it into another area to restore volume or change shape. Some of the transferred fat may be reabsorbed, and repeat procedures may be needed.

Alternate Names:
Autologous Fat Grafting; Fat Transfer; Lipofilling

Autologous Stem Cell Transplantation

A clinical procedure in which a patient's own hematopoietic stem cells are mobilized, harvested from peripheral blood or bone marrow, cryopreserved, and reinfused following high-dose myeloablative chemotherapy or radiation to rescue bone marrow hematopoiesis.

Alternate Names:
Auto-SCT

Autolysis

The breakdown of cells or tissues by their own enzymes, usually after the cells die. This natural process contributes to tissue decomposition and can affect specimens examined after death.

Automated External Defibrillator

A portable device that checks the heart rhythm

during cardiac arrest and gives an electrical shock when an abnormal rhythm may respond to one. It provides spoken or visual instructions for using it safely.

Automaticity

The physiological capacity of specialized cardiac pacemaker myocytes (principally in the sinoatrial node, atrioventricular junction, and His-Purkinje system) to undergo spontaneous diastolic phase 4 depolarization and generate action potentials without external neurohumoral stimulation.

Autonomic Disorder

A problem affecting nerves that control automatic body functions such as blood pressure, heart rate, digestion, sweating, bladder emptying, sexual function, and pupil size. Causes include diabetes, nerve disease, infection, immune disease, and medicines; symptoms depend on the affected functions.

Autonomic Dysreflexia

A sudden, potentially life-threatening rise in blood pressure in a person with a spinal-cord injury, usually at or above the upper chest. A problem such as a full bladder or bowel below the injury can trigger pounding headache, sweating, flushing, or heart-rate changes.

Autonomic Ganglion

A small group of nerve-cell bodies outside the brain and spinal cord that passes signals between the autonomic nervous system and organs such as the heart, intestines, glands, and bladder.

Autonomic Nervous System

The part of the nervous system that controls body functions that usually happen without conscious effort, including heart rate, blood pressure, digestion, sweating, pupil size, bladder activity, and sexual responses.

Autonomic Neuropathy

Damage to nerves that control automatic functions such as blood pressure, heart rate, digestion, sweating, bladder emptying, and sexual function. Diabetes is common, but other diseases, toxins, and medicines can also cause it.

Alternate Names:
Dysautonomia; Autonomic Nerve Dysfunction

Autophagy

A normal process in which cells break down and recycle worn-out proteins and cell parts. It helps cells survive stress and remove damaged material, but abnormal autophagy may contribute to some cancers and other diseases.

Autophobia

An abnormal, persistent fear of being alone, isolated, or without companion support, producing acute anxiety and panic symptoms when left by oneself.

Alternate Names:
Monophobia; Isolophobia; Fear of Being Alone

Autopsy

A medical examination of a body after death. It may include external examination, examination of internal organs, tissue testing, and sometimes toxicology to help determine the cause of death or study disease.

Alternate Names:
Post-Mortem Examination; Necropsy; Obduction

Autoradiography

A laboratory method that uses a radioactive label and a photographic or digital detector to show where a substance is located in a tissue, cell, or biological sample.

Autoregulation

The ability of an organ or vascular bed to maintain relatively stable blood flow despite changes in perfusion pressure.

Autosomal Dominant

Alternate name; see *Autosomal Dominant Inheritance*.

Autosomal Dominant Inheritance

Inheritance in which one altered copy of a gene on

a non-sex chromosome can cause a condition. Each child of a parent with one altered copy commonly has a one-in-two chance of inheriting it.

Autosomal Dominant PKD

Alternate name; see *Autosomal Dominant Polycystic Kidney Disease*.

Autosomal Dominant Polycystic Kidney Disease

An autosomal dominant inherited disease, usually caused by a change in the *PKD1* or *PKD2* gene, in which many cysts gradually enlarge the kidneys and can reduce kidney function. It may cause high blood pressure, pain, blood in the urine, kidney infections, liver cysts, or rarely brain-artery aneurysms.

Alternate Names:
ADPKD

Autosomal Dominant Tubulointerstitial Kidney Disease

An inherited disease that gradually damages the kidney's small tubules and surrounding tissue. Kidney function declines, often without much protein or blood in the urine; some forms cause early gout, low blood pressure, or anaemia.

Autosomal Inheritance

The passing of a genetic trait through one of the 22 pairs of chromosomes that are not sex chromosomes. Such traits can affect people of any sex and may follow dominant or recessive patterns.

Autosomal Recessive

A pattern of inheritance in which a condition usually develops only when both copies of a gene are altered. Parents with one altered copy are often healthy carriers but can pass the condition to a child.

Autosomal Recessive Disorders

Conditions that usually occur when a person inherits an altered copy of the same gene from each parent. People with one altered copy are often healthy carriers.

Autosomal Recessive Inheritance

Inheritance in which a condition usually requires altered copies of a gene from both parents. When both parents are carriers, each pregnancy commonly has a one-in-four chance of producing an affected child.

Autosomal Recessive PKD

Alternate name; see *Autosomal Recessive Polycystic Kidney Disease*.

Autosomal Recessive Polycystic Kidney Disease

An inherited disease that usually affects babies or children, causing enlarged kidneys with small cysts and progressive kidney problems. It can also cause liver scarring, high blood pressure, and breathing problems in severe early disease.

Alternate Names:
ARPKD

Autosome

Any chromosome that is not a sex chromosome. Humans usually have 22 pairs of autosomes. Genes on these chromosomes can cause inherited conditions in people of any sex.

Alternate Names:
Non-Sex Chromosome

Avascular Necrosis

Cellular death of bone components caused by an interruption of the subchondral blood supply, leading to bone collapse and secondary osteoarthritis; see *Osteonecrosis*.

Alternate Names:
AVN; Osteonecrosis; Aseptic Necrosis; Ischemic Bone Necrosis

Avascular Necrosis Of The Femoral Head

Death of bone tissue in the ball-shaped top of the thighbone because its blood supply is reduced or cut off. It may cause groin or hip pain and, over time, collapse of the bone and joint damage.

Alternate Names:
Osteonecrosis Of The Femoral Head; Avascular

Necrosis Of The Hip

Avastin

Brand name; see *Bevacizumab*.

Avian Flu

Alternate name; see *Avian Influenza*.

Avian Influenza

An infection caused by avian-adapted influenza A virus strains (such as H5N1, H5N6, or H7N9) transmitted to humans primarily via direct contact with infected poultry or contaminated environments. Clinical manifestations range from conjunctivitis and upper respiratory symptoms to fulminant viral pneumonia, acute respiratory distress syndrome (ARDS), multi-organ failure, and death.

Alternate Names:
Bird Flu; Avian Flu

AVM

Abbreviation; see *Arteriovenous Malformation*.

AVN

Abbreviation for avascular necrosis; see *Osteonecrosis*.

Avoidance Behavior

Actions taken to stay away from a feared or distressing situation, thought, place, person, or activity. Avoidance may briefly reduce anxiety but can keep the fear going and interfere with treatment, work, relationships, or daily life.

Avoidant Personality Disorder

A long-term pattern of avoiding social contact because of strong feelings of inadequacy and fear of criticism, embarrassment, or rejection. It can limit relationships and work.

Avoidant/Restrictive Food Intake Disorder

An eating disorder characterized by persistent failure to meet appropriate nutritional or energy needs, resulting in significant weight loss, nutritional deficiency, dependence on enteral feeding/supplements, or marked interference with psychosocial functioning. Unlike anorexia nervosa, the restriction is driven by sensory sensitivity, lack of interest in eating, or fear of aversive consequences (e.g., choking or vomiting), rather than body-image disturbance.

Alternate Names:
ARFID; Selective Eating Disorder

Avoidant/Restrictive Food Intake Disorder (ARFID)

Alternate name; see *Avoidant/Restrictive Food Intake Disorder*.

Avolition

A marked reduction in motivation or ability to begin and complete purposeful activities. A person may neglect hygiene, household tasks, work, or social contact. It can occur in schizophrenia, severe depression, and other conditions.

Avulsed Tooth

A tooth completely displaced from its socket by injury. Avulsion may affect a primary or permanent tooth and can damage periodontal ligament cells and the surrounding socket. Tooth viability depends partly on the condition of these tissues after displacement. It is distinct from an intruded tooth, which remains displaced within the socket.

Avulsion

An injury in which tissue is partly or completely torn away by force. It may involve skin, muscle, a nail, a fingertip, or a tooth and can cause severe bleeding, tissue loss, infection, and loss of function.

Avulsion Fracture

A break in which a tendon or ligament pulls off a small piece of attached bone, usually during a sudden movement or injury. Treatment depends on the bone, fragment position, joint involvement, age, and associated damage.

Avuncular

In medical genetics, describing the relationship between a person and their biological aunt or uncle (a

parent's sibling), or between that relative and their niece or nephew. Avuncular relationships may be shown on a family tree. A relative by marriage may be an aunt or uncle socially but is not biologically related through this connection.

Awake Craniotomy

A brain operation that opens the skull while the patient is awake for part of the procedure. The team tests functions such as speech or movement and may use electrical stimulation to map nearby areas that need protection. It is used mainly for tumors near these areas and sometimes for epilepsy surgery.

Alternate Names:
Awake Brain Surgery; Intraoperative Brain Mapping; Functional Craniotomy

Awake Fiberoptic Intubation

A method of placing a breathing tube while the person remains awake and breathes independently. Numbing medicine and a flexible camera are used to guide the tube when a difficult airway is expected.

Awareness

Conscious recognition of oneself, surroundings, thoughts, or sensations. Clinicians assess it along with alertness, attention, memory, and orientation when examining brain function.

Alternate Names:
Consciousness

Awareness Under Anesthesia

Unintended awareness or memory of events during general anaesthesia. A person may hear sounds, feel pressure or pain, or recall part of the operation; although uncommon, it can cause significant distress and needs support.

Axenfeld-Rieger Syndrome

A rare autosomal dominant developmental disorder affecting anterior eye structures and systemic tissues, characterized by anterior segment dysgenesis (such as iris hypoplasia, corectopia, and polycoria) with high risk of early-onset glaucoma, often accompanied by craniofacial and dental anomalies.

Alternate Names:
Axenfeld-Rieger Malformation

Axial Skeleton

The bones forming the central framework of the body: the skull, spine, ribs, breastbone, and associated small bones of the neck. It supports the body and protects the brain, spinal cord, heart, and lungs.

Axial Spondyloarthritis

Long-term inflammation affecting the joints between the spine and pelvis and other parts of the spine. It commonly causes back pain and stiffness that improve with movement and may eventually limit spinal flexibility.

Axilla

The hollow area beneath the shoulder, commonly called the armpit. It contains major blood vessels, nerves, lymph nodes, and tissues connecting the chest and neck with the arm.

Axillary

Relating to the armpit or to structures within it, including the axillary blood vessels, nerves, and lymph nodes.

Alternate Names:
Armpit-Related; Pertaining to the Axilla

Axillary Artery

The main artery passing through the armpit and supplying blood to the shoulder, chest wall, and arm. It continues as the brachial artery near the lower border of the armpit.

Axillary Dissection

Surgery that removes selected lymph nodes and nearby tissue from the armpit, often for cancer assessment or treatment. It may cause numbness, shoulder stiffness, fluid collection, nerve injury, or swelling of the arm.

Alternate Names:
Axillary Node Dissection

Axillary Lymphadenectomy

An operation to remove lymph nodes from the armpit, usually to assess or treat breast cancer or melanoma. Possible complications include pain, numbness, shoulder stiffness, a fluid collection, nerve injury, and arm swelling.

Axillary Lymphadenopathy

An abnormal enlargement, induration, or matted consistency of the lymph nodes within the axilla. It receives lymphatic drainage from the ipsilateral breast, upper extremity, and chest wall. Major causes include metastatic breast carcinoma, lymphomas, melanoma, acute pyogenic infections of the upper limb, cat-scratch disease (Bartonella henselae), tuberculosis, and systemic autoimmune diseases.

Alternate Names:
Axillary Adenopathy; Enlarged Axillary Nodes

Axillary Lymph Node

A lymph node in the armpit that drains lymph from the arm, chest wall, and parts of the breast. Its size or involvement by cancer, infection, or inflammation may be assessed by examination or imaging.

Axillary Nerve

A nerve from the neck that passes around the shoulder and supplies muscles that lift the arm. It also provides feeling over the outer shoulder and may be injured by shoulder dislocation or upper-arm fracture.

Axillary Nerve Dysfunction

Impairment of the axillary nerve, often from shoulder trauma, dislocation, compression, or surgery. It can cause weakness of shoulder abduction, deltoid wasting, and numbness over the lateral shoulder.

Axillary Tail Of The Breast

The extension of breast tissue toward the armpit.

Alternate Names:
Tail of Spence

Axillary Vein

A large vein in the armpit that drains blood from the arm and shoulder. It continues beneath the collarbone as the subclavian vein and returns blood toward the heart.

Axillo-Subclavian Vein Thrombosis

Deep vein thrombosis involving the axillary and subclavian veins of the upper extremity, commonly occurring in young, athletic individuals as a result of mechanical compression at the thoracic outlet during repetitive strenuous arm motions (Paget-Schroetter syndrome) or secondary to central venous catheters.

Alternate Names:
Effort Thrombosis; Paget-Schroetter Syndrome

Axis

The second bone in the neck. Its tooth-like projection acts as a pivot for the first neck bone, allowing the head and upper neck to rotate.

Axis Vertebra

The second neck vertebra, whose tooth-like projection allows the first vertebra and head to rotate while protecting the spinal cord.

Alternate Names:
C2; Axis

Axolemma

The thin outer membrane surrounding a nerve cell's axon. It maintains the electrical difference needed for nerve impulses and contains channels that allow those impulses to travel along the axon.

Axon

The long extension of a nerve cell that carries electrical signals away from the cell body toward another nerve cell, muscle, or gland.

Axonal Transport

The movement of proteins, cell parts, and other materials along a nerve cell's axon between the cell body and the axon terminal. It supports nerve-cell maintenance and communication.

Axoneme

The internal framework of tiny tubes inside a cilium or sperm tail. Together with motor proteins, it produces the bending movements that help move fluid over cells or propel sperm.

Axon Fasciculation

The process during development in which growing nerve fibres group together to form organized nerve pathways. Chemical guidance signals and cell connections help them reach their correct targets.

Axon Guidance

The process by which growing nerve fibres find and connect with their correct targets during development. Chemical signals and surrounding cells help direct their path.

Axon Hillock

The cone-shaped part where a nerve cell's main body joins its axon, the long fiber that carries signals away. It combines incoming electrical signals and usually starts the nerve impulse when those signals are strong enough.

Axonotmesis

A moderate degree of peripheral nerve injury in Seddon's classification characterized by disruption of the internal axon and its myelin sheath with subsequent Wallerian degeneration distal to the lesion site, but with anatomical preservation of the surrounding endoneurium, perineurium, and epineurium, allowing spontaneous axonal regeneration.

Axon Terminal

The end of a nerve-cell axon where chemical messengers are released to communicate with another nerve cell, muscle, or gland.

Ayurveda

A traditional system of health care from India that uses ideas about bodily balance and may include diet, lifestyle practices, massage, and herbal products. Some products can interact with medicines or contain harmful contaminants.

Ayurvedic Medicine

Health care based on traditional Indian theories of bodily balance, using individualized diet, lifestyle practices, physical treatments, and herbal products. Evidence and safety vary, and some products may interact with medicines or contain toxic ingredients.

Azole Antifungals

A group of medicines that stop fungi making ergosterol, a substance needed for strong cell membranes. This weakens or kills the fungus. They can interact with other medicines and may affect the liver or heart rhythm.

Azoospermia

The absence of sperm in semen on laboratory examination. It may result from a blockage that prevents sperm from leaving the reproductive tract or from reduced or absent sperm production in the testes.

Azotaemia

Alternate spelling; see *Azotemia*.

Azotemia

A build-up of nitrogen-containing waste products in the blood, usually because the kidneys are filtering less effectively. It may occur with dehydration, reduced kidney blood flow, or kidney disease.

Azygos Vein

A large vein running along the right side of the spine that drains blood from the chest wall into the superior vena cava. It provides an alternate route for blood when major veins are blocked.

Azygous Vein

Alternate spelling; see *Azygos Vein*.

B

2,3-Bisphosphoglycerate

A molecule made in red blood cells that binds to deoxygenated hemoglobin and reduces its affinity for oxygen. This promotes oxygen release to tissues and helps the blood adapt to changes in oxygen availability.

Alternate Names:
2,3-BPG; 2,3-DPG

Ba

The chemical symbol for barium, a metallic element used in compounds such as barium sulfate. Barium sulfate can be swallowed or given as an enema to outline parts of the digestive tract on X-rays.

Babcock Clamp

A surgical instrument with smooth, rounded jaws used to hold delicate tubular tissue gently. It may be used on the intestine, fallopian tubes, or other tissues that could be injured by a crushing clamp.

Babesia

A group of parasites transmitted mainly by certain ticks. They infect red blood cells and can cause fever, tiredness, anaemia, low platelets, jaundice, or dark urine; severe illness is more likely without a spleen or with weak immunity.

Babesia Divergens

A species of parasite that infects red blood cells and can cause babesiosis, especially in Europe. It may cause severe destruction of red cells, particularly in people without a spleen or with a weakened immune system.

Babesia Microti

A parasite and the most common cause of babesiosis in North America. It is spread by black-legged ticks, infects red blood cells, and may cause no symptoms or severe anaemia, jaundice, and organ failure.

Babesiosis

An infection caused by Babesia parasites, usually spread by ticks. The parasites enter red blood cells and may cause fever, tiredness, anaemia, low platelets, jaundice, or dark urine; severe disease can affect several organs.

Babinski Reflex

A neurological test performed by gently stroking the sole of the foot. In healthy older children and adults, the toes curl downward. In a positive Babinski reflex, the big toe points upward and the other toes fan outward. This upward response is normal in infants under two years old because their nervous systems are still maturing, but in adults, it signals underlying damage to the brain or spinal cord nerve pathways.

Alternate Names:
Babinski Sign; Extensor Plantar Reflex; Babinski Response

Baby Acne

A common, imprecise name for acne-like bumps in a newborn. It may refer to neonatal acne, which can include blackheads or whiteheads (comedones), or neonatal cephalic pustulosis, a red papular or pustular rash on the face or scalp without comedones. The terms are sometimes used interchangeably, but describe different patterns; both usually

resolve without scarring.

Baby Blues

A common short period of tearfulness, irritability, anxiety, or mood changes beginning in the first days after childbirth. It usually improves within two weeks; persistent, severe, or dangerous thoughts may indicate postnatal depression or an emergency.

Bachmann Bundle Pacing

Atrial pacing delivered near Bachmann bundle, a major muscular conduction pathway between the right and left atria. It aims to shorten interatrial conduction delay and coordinate atrial activation; its clinical role is still being studied.

Bacillaceae

A family of rod-shaped bacteria that includes species able to form resistant spores. Some members are harmless or useful, while others can cause infections such as anthrax or food poisoning.

Bacillary Angiomatosis

A vascular infection caused mainly by *Bartonella henselae* or *Bartonella quintana*, usually in people with weakened immunity. It produces friable red-to-purple papules or nodules and may involve lymph nodes, liver, spleen, bone, or other organs. Tissue testing can distinguish it from Kaposi sarcoma.

Bacillary Dysentery

An intestinal infection causing fever, abdominal cramps, and diarrhoea that may contain blood or mucus. Shigella is a common cause; some invasive strains of Escherichia coli and other bacteria can produce a similar illness.

Bacille Calmette-Guérin

A live attenuated strain of *Mycobacterium bovis* used as a tuberculosis vaccine in many countries and as an intravesical immune treatment for selected non-muscle-invasive bladder cancers.

Bacille Calmette-Guérin Vaccine

A live attenuated *Mycobacterium bovis* vaccine used in many countries to reduce severe tuberculosis in children. Its use varies with local tuberculosis risk; it can also affect tuberculin skin-test results.

Alternate Names:
BCG Vaccine

Bacilluria

The presence of rod-shaped bacteria in urine, detected by microscopy or culture. It may represent contamination, harmless colonization, or a urinary infection; symptoms, the amount of bacteria, and the organism determine its significance.

Bacillus

A rod-shaped bacterium. The word can describe bacterial shape or members of the Bacillus genus, many of which form resistant spores; some are harmless, while others cause disease.

Bacillus Anthracis

A spore-forming bacterium that causes anthrax in people and animals. Infection may affect the skin, digestive tract, or lungs and can rapidly become life-threatening.

Bacillus Cereus

A spore-forming bacterium that can cause food poisoning after contaminated food is eaten. It may cause sudden vomiting or watery diarrhoea and, rarely, serious infections in people with weakened immunity.

Bacillus Cereus Food Poisoning

Foodborne illness caused by toxins of *Bacillus cereus*. The vomiting form usually begins within 1–6 hours and is linked to toxin already formed in food; the diarrheal form usually begins within 6–24 hours after toxin is produced in the intestine. Both are generally short-lived, and fever is uncommon.

Bacitracin

An antibiotic applied to the skin that prevents susceptible bacteria from building their protective cell wall. It is used for selected superficial infections, but it can cause skin irritation or allergic reactions.

Bacitracin Overdose

Toxic effects of excessive bacitracin exposure depend on the route and amount. Topical exposure most often causes local irritation or allergic contact dermatitis; systemic exposure to injectable bacitracin can cause severe kidney injury and hypersensitivity reactions. Injectable use is now uncommon because of these risks.

Bacitracin Zinc Overdose

Toxic effects of excessive exposure to topical bacitracin zinc depend on the amount and route. Local irritation or allergic contact dermatitis is more typical than systemic poisoning; kidney injury is associated mainly with systemic bacitracin exposure.

Backache

Pain or discomfort in the back, from the neck to the buttocks. It is a symptom rather than a disease and may result from muscles, joints, discs, nerves, or pain referred from an internal organ.

Back-Blows

A first-aid technique for severe choking in a responsive person, in which five firm blows are delivered between the shoulder blades to dislodge an airway blockage. Current American Heart Association guidance alternates five back blows with five abdominal thrusts for adults and children, and with five chest thrusts for infants.

Back Injury

Damage to the muscles, ligaments, joints, discs, bones, or nerves of the back after trauma, lifting, or repeated strain. Pain and stiffness are common; weakness, numbness, loss of bladder or bowel control, or severe pain after major trauma may indicate serious injury.

Back Labor

Severe back pain during labor, sometimes associated with the fetus being positioned occiput posterior. It may occur with or without typical abdominal contractions.

Back Pain

Pain or discomfort in any part of the back, from the neck to the lower back. It is often caused by muscles, joints, or discs, but may also arise from nerves or internal organs.

Alternate Names:
Dorsalgia; Backache; Spinal Pain

Back Spasms

Sudden or sustained involuntary tightening of back muscles, causing pain, stiffness, or restricted movement. They may follow strain, awkward movement, spinal or joint problems, or irritation of nearby nerves; weakness, numbness, fever, or loss of bladder or bowel control may indicate an underlying serious condition.

Back Strains and Sprains

Injuries involving overstretching or tearing of back muscles, tendons, or ligaments. They commonly cause localized pain, stiffness, and reduced movement after lifting, twisting, overuse, or trauma; neurologic symptoms may indicate a more serious injury.

Backwash Ileitis

Inflammation in the end of the small intestine that can occur with extensive ulcerative colitis. It often occurs alongside severe inflammation of the colon and may continue directly from the colon. It can resemble Crohn disease, so the rest of the bowel findings matter.

Baclofen

A medicine that reduces muscle spasm by lowering nerve signals in the spinal cord. It can cause sleepiness, weakness, dizziness, or confusion; stopping it suddenly after regular use can cause dangerous withdrawal symptoms.

Bacteraemia

Alternate spelling; see *Bacteremia*.

Bacteremia

The presence of viable bacteria in the bloodstream.

It may be transient, intermittent, or persistent and may cause no symptoms. Bacteremia is distinct from sepsis, which is life-threatening organ dysfunction caused by a dysregulated response to infection; either can occur without the other.

Bacteria

Microscopic single-celled organisms that lack a membrane-bound nucleus. Many are harmless or beneficial, while others cause infection; some form communities and can acquire antibiotic resistance.

Bacterial Adherence

The process by which bacteria attach to body cells or surfaces, often the first step in infection. Surface proteins and tiny hair-like structures help bacteria stay in place and resist removal.

Bacterial Arthritis

Infection of a joint by bacteria, causing pain, swelling, warmth, restricted movement, and often fever. It is a medical emergency because cartilage can be rapidly damaged and bloodstream infection may develop.

Bacterial Biofilm

A community of bacteria attached to a surface and enclosed in a protective material they produce. Biofilms can resist immune defenses and antibiotics and cause persistent infections on wounds, catheters, implants, or teeth.

Bacterial Capsule

A protective outer coating around some bacteria, often made of sugars. It can help bacteria avoid being swallowed by immune cells, survive in the body, and cause disease.

Bacterial Cell Wall

A strong outer layer that gives bacteria their shape and prevents them from bursting. Many bacterial cell walls contain peptidoglycan, a material made from linked sugars and short protein chains.

Bacterial Classification

The grouping of bacteria according to their genetic features, appearance, chemistry, and evolutionary relationships. Classification helps identify organisms, understand relatedness, and guide diagnosis, infection control, and treatment.

Bacterial Conjugation

The transfer of DNA from one bacterium to another through direct contact. The transferred DNA may include genes that help bacteria resist antibiotics or cause disease.

Bacterial Conjunctivitis

Inflammation of the conjunctiva caused by bacteria. It can cause redness, irritation, and thick or pus-like discharge that may stick the eyelids together; it is often contagious. Eye pain, light sensitivity, or reduced vision may indicate corneal or other eye involvement.

Bacterial Dermatitis

Skin inflammation caused by bacterial infection. The skin may become red, warm, swollen, painful, or covered with pus or crusts. It can start in healthy skin or develop when bacteria infect an existing rash or wound.

Bacterial Dormancy

A low-activity state that allows bacteria to survive conditions in which they cannot grow. Some form highly resistant spores; others remain as ordinary cells that temporarily tolerate stress and may become active again when conditions improve.

Bacterial Endocarditis

Older term for infective endocarditis, an infection of the heart's inner lining, usually involving a valve. Most cases are caused by bacteria, but fungi can also be responsible; see *Infective Endocarditis*.

Bacterial Endocarditis Vegetations

Clumps of platelets, fibrin, microorganisms, and inflammatory material attached to a heart valve or other endocardial surface during infective endocarditis. They can damage valves or release emboli.

Bacterial Endospores

Highly resistant resting structures made by some bacteria, including Bacillus and Clostridium, when nutrients are scarce. They can survive drying, heat, chemicals, and long periods of time, then grow into active bacteria when conditions improve.

Bacterial Flagella

Thread-like structures that help some bacteria move through liquid or across surfaces. A rotating base works like a motor and turns the attached filament; flagella can also influence how bacteria attach and spread.

Bacterial Gastroenteritis

Acute inflammation of the stomach and intestines caused by pathogenic bacteria such as Salmonella, Campylobacter, Shigella, or pathogenic Escherichia coli. It commonly causes diarrhea, abdominal cramps, fever, and sometimes bloody stools or vomiting.

Bacterial Genetics

The study of bacterial genes, DNA, inheritance, and genetic change. Bacteria usually have one main chromosome and may carry extra DNA rings called plasmids that can include antibiotic-resistance genes.

Bacterial Growth Phases

The stages bacteria pass through when growing in a culture. They first adapt, then multiply rapidly, later reach a balance as nutrients fall and waste builds up, and finally decline as conditions become unsuitable.

Bacterial Infection

An illness caused by bacteria entering, multiplying, or spreading in body tissues. Many harmless bacteria normally live on the skin and in the gut, but disease-causing bacteria can invade the body or enter places that are usually free of germs, such as the bloodstream. They can damage tissue, make harmful substances, or trigger inflammation. Examples include strep throat, urinary infections, pneumonia, skin infections, and some food poisoning.

Alternate Names:
Bacterial Disease; Bacterial Illness; Bacteriosis

Bacterial Infections and Pregnancy

Bacterial infections during pregnancy can affect the urinary tract, vagina, cervix, placenta, or membranes and may affect the fetus or newborn. Their effects vary with the infection site, organism, and timing in pregnancy.

Bacterial Meningitis

A serious infection of the membranes around the brain and spinal cord. It can cause fever, severe headache, stiff neck, vomiting, confusion, seizures, or a rash and can progress rapidly.

Bacterial Meningococcal Meningitis

Meningitis caused by invasive *Neisseria meningitidis*. It may cause fever, severe headache, neck stiffness, confusion, vomiting, or a rapidly spreading purpuric rash and can progress rapidly.

Bacterial Metabolism

The chemical reactions bacteria use to obtain energy, build cell material, grow, and survive. Different bacteria use oxygen, fermentation, light, or other substances, and some of these processes are targets for antibiotics.

Bacterial Morphology

The size, shape, and arrangement of bacteria seen under a microscope. Common forms are spheres, rods, and spirals; bacteria may occur singly, in pairs, chains, clusters, or other patterns.

Bacterial Overgrowth

Small-intestinal bacterial overgrowth is an excessive number of bacteria in the small intestine, where relatively few normally live. It can cause bloating, abdominal pain, diarrhoea, weight loss, or vitamin deficiencies and may result from poor intestinal movement or structural changes.

Alternate Names:
Small Intestinal Bacterial Overgrowth; SIBO

Bacterial Pathogenesis

The ways bacteria enter the body, attach to cells, invade tissues, avoid immune defenses, and cause illness. Damage may result from direct invasion, toxins, inflammation, or disruption of normal body functions.

Bacterial Peritonitis

A bacterial infection of the lining of the abdominal cavity. It may follow bowel perforation, surgery, another abdominal infection, or infection of abdominal fluid and can cause severe pain, fever, vomiting, and sepsis.

Bacterial Pharyngitis

Bacterial infection and inflammation of the throat, often caused by group A Streptococcus. It may cause sudden sore throat, fever, painful swallowing, swollen neck glands, and sometimes white patches on the tonsils.

Bacterial Pili

Tiny hair-like structures on the surface of some bacteria. They help bacteria attach to body cells or surfaces; some also help them move or take up DNA from their surroundings.

Bacterial Pneumonia

A bacterial infection of the lungs that causes inflammation and may fill air spaces with fluid or pus. It can cause fever, cough, phlegm, chest pain, shortness of breath, and low oxygen levels.

Bacterial Prostatitis

A bacterial infection of the prostate gland. It may cause pain in the pelvis or lower back, painful or frequent urination, fever, chills, or difficulty passing urine.

Alternate Names:
Infectious Prostatitis

Bacterial Protein

A protein produced by a bacterium that may form part of its structure, support its metabolism, help it attach to host cells, or contribute to disease.

Bacterial Spore

A dormant, highly resistant form made by some bacteria when conditions are harsh. Spores can survive drying, heat, and many disinfectants and may later grow into active bacteria when conditions improve.

Bacterial Toxemia

The presence or effects of harmful bacterial substances in the bloodstream. It can occur during severe infection and may cause widespread inflammation, low blood pressure, shock, or organ injury.

Bacterial Toxin

A harmful substance produced or released by bacteria that injures host tissues or disrupts normal cellular function. Bacterial toxins are classified into exotoxins (soluble proteins secreted by live Gram-positive and Gram-negative bacteria, such as tetanus, botulinum, and diphtheria toxins) and endotoxins (lipopolysaccharide components of the outer membrane of Gram-negative bacteria released upon cell lysis that trigger profound systemic inflammation and septic shock).

Bacterial Toxins

Plural form; see *Bacterial Toxin*.

Bacterial Tracheitis

A bacterial infection and swelling of the windpipe. It can cause fever, a harsh cough, noisy or difficult breathing, and rapid narrowing of the airway.

Bacterial Transduction

The transfer of DNA from one bacterium to another by a virus that infects bacteria. The transferred DNA may give the receiving bacterium new traits, including toxin production or antibiotic resistance.

Bacterial Transformation

The uptake of loose DNA from the environment by a bacterium able to absorb it. The new DNA may change the bacterium's features, including how it causes disease or responds to antibiotics.

Bacterial Vaginosis

A common vaginal condition caused by an imbalance in the natural bacteria normally present in the vagina. When beneficial bacteria decrease and other bacteria overgrow, it can cause a thin, watery, grayish-white vaginal discharge with a noticeable, often fishy odor, along with mild irritation or burning.

Alternate Names:
BV; Gardnerella Vaginitis

Bacterial Virulence Factors

Features that help bacteria cause disease, such as attaching to cells, entering tissues, avoiding immune defenses, producing toxins, or obtaining nutrients. Examples include surface proteins, protective coatings, enzymes, and toxins.

Bactericidal

Describes a substance or treatment that kills bacteria rather than only slowing their growth. Whether a medicine is bactericidal can depend on the drug, the bacterium, and the conditions.

Bactericide

A chemical or antimicrobial agent that kills bacteria under specified conditions. Its bactericidal activity depends on the agent, bacterial species, concentration, and test conditions.

Bacteriocin

An antimicrobial peptide or protein made by a bacterial strain that inhibits or kills other bacteria, often strains of the same or a related species. Bacteriocins differ in their structure and in which bacteria they affect.

Bacteriology

The study of bacteria, including their structure, genes, growth, spread, effects on health, and role in disease. It includes laboratory methods used to identify bacteria and test antibiotic sensitivity.

Bacteriophage

A virus that infects and replicates within bacteria, either through a lytic cycle (causing host cell lysis and death) or a lysogenic cycle (integrating its genome as a prophage into the host chromosome). Phages are investigated and utilized in phage therapy as targeted antimicrobial agents against multidrug-resistant bacterial infections.

Bacteriophage Lambda

A virus that infects the bacterium Escherichia coli. It may multiply and burst the bacterial cell or insert its genetic material into the cell's DNA and remain inactive until later.

Bacteriophages

Plural form; see *Bacteriophage*.

Bacteriophage T4

A virus that infects Escherichia coli, makes many copies inside the bacterium, and usually breaks the cell open to release them.

Bacteriorhodopsin

A light-sensitive protein in some microorganisms. It uses light energy to move charged particles across the cell membrane, helping the organism produce energy.

Bacteriostasis

The stopping or slowing of bacterial growth without necessarily killing the bacteria. The immune system can then remove the remaining organisms; this differs from an agent that directly kills bacteria.

Bacteriostatic

Describes a substance that stops or slows bacteria from multiplying without directly killing them. The body's immune system can then help clear the remaining bacteria.

Bacterium

A single bacterial cell. It usually lacks a nucleus, has genetic material in the cell interior, and may have an outer cell wall; some bacteria are helpful, while others cause infection.

Bacteriuria

The presence of bacteria in urine detected by testing. It may occur with urinary symptoms as part of an infection or without symptoms; significance depends on sample quality, bacterial quantity, pregnancy, and other clinical factors.

Bacteroidaceae

A family of bacteria that commonly live in the intestine and grow without oxygen. They are usually harmless in the gut but can cause abscesses or other infections if they enter wounds or body areas that should be free of bacteria.

Bacteroides

A group of bacteria that normally live in the intestine and grow without oxygen. They are usually harmless there but can cause abscesses or bloodstream infection if bowel contents enter wounds or other sterile areas.

Bacteroides Caccae

A bacterium that normally lives in the intestine without oxygen. It is usually harmless there but may be found in mixed abdominal or bloodstream infections when intestinal bacteria escape into other tissues.

Bacteroides Dorei

A bacterium that normally lives in the human intestine and grows without oxygen. It is generally considered a harmless member of the gut microbiota.

Bacteroides Fragilis

A bacterium that normally lives in the intestine without oxygen. If bowel contents leak into the abdomen, it is an important cause of abscesses, abdominal infection, bloodstream infection, and sepsis.

Bacteroides Gingivalis

An older name for Porphyromonas gingivalis, a bacterium that grows without oxygen in dental plaque. It is associated with inflammation and destruction of the tissues supporting the teeth.

Bacteroides Ovatus

An anaerobic Gram-negative bacterium that is part of the intestinal microbiota and can contribute to opportunistic infection if it enters damaged or normally sterile tissue.

Bacteroides Thetaiotaomicron

An anaerobic Gram-negative bacterium that is an important member of the human gut microbiota and helps break down complex dietary carbohydrates; it can cause opportunistic infection outside the intestine.

Bacteroides Ureolyticus

A bacterial name historically applied to an anaerobic, urease-producing organism now generally classified as Campylobacter ureolyticus, which can be associated with wound or bloodstream infection.

Bacteroides Vulgatus

An anaerobic Gram-negative bacterium commonly found in the human intestine that can contribute to infection when the intestinal barrier is disrupted.

Bad Breath

Alternate name; see *Halitosis*.

BAER

Abbreviation for brainstem auditory evoked response; see *Brainstem Auditory Evoked Potential*.

Bagassosis

An allergic lung inflammation caused by breathing dust from mouldy bagasse, the fibrous waste left after sugarcane juice is extracted. It may cause cough, fever, breathlessness, and fatigue after workplace exposure.

Bags Under Eyes

Mild puffiness or loose skin beneath the eyes. It commonly develops with aging, inherited facial features, lack of sleep, allergies, or fluid retention and is usually harmless.

Bag-Valve Mask

A hand-operated resuscitation device, also called a manual resuscitator, consisting of a self-inflating bag, one-way valves, a face mask or airway connector, and often an oxygen reservoir. It delivers positive-pressure ventilation and may be used with a face mask, supraglottic airway, or endotracheal tube.

Alternate Names:
BVM Manual Resuscitator Bag-Valve-Mask Device

Bag-Valve-Mask Ventilation

A method of giving breathing support with a hand-squeezed bag and face mask. It is used when a person is not breathing or is not breathing well enough. The rescuer keeps the airway open and gives gentle breaths using room air or added oxygen until normal breathing returns or more advanced airway support is provided.

Alternate Names:
BVM Ventilation; Bag-Mask Ventilation; Ambu Bag Ventilation; Manual Resuscitator Ventilation

Bainbridge Reflex

An increase in heart rate that can occur when extra blood stretches the upper chambers of the heart. It helps the heart move increased venous blood forward.

Baker Cyst

A fluid-filled bulge behind the knee that forms when excess joint fluid pushes into a small sac. It often occurs with arthritis, a meniscus injury, or another cause of knee swelling. It may cause tightness, pain, or stiffness, but small cysts may have no symptoms.

Alternate Names:
Popliteal Cyst; Baker's Cyst

Baker's Cyst

Alternate spelling; see *Baker Cyst*.

Baking Powder Overdose

Toxic effects after swallowing enough baking powder, a mixture that usually contains sodium bicarbonate and acid salts. It may cause vomiting and abdominal gas; large amounts can raise blood sodium and cause metabolic alkalosis, in which the blood becomes too alkaline.

Bak Protein

A protein on the outer membrane of mitochondria, the cell's energy-producing structures, that can help start controlled cell death. When activated, it makes openings that release cell-death signals; abnormal control may contribute to cancer.

Balamuthia

A genus of free-living amoebas found in soil and water. Some species can rarely infect people, usually causing slowly progressive inflammation of the brain and sometimes skin disease.

Balamuthia Mandrillaris

A free-living amoeba found in soil and water that can rarely infect humans. It may enter through broken skin or the nose and cause severe, gradually worsening infection of the brain or skin.

Balamuthia Mandrillaris Infection

A rare, often severe and sometimes fatal infection caused by the free-living amoeba Balamuthia mandrillaris. It may begin as a skin lesion and progress to granulomatous amoebic encephalitis with headache, confusion, seizures, or focal neurologic deficits. Diagnosis is difficult and uses specialized testing, including infectious-disease and neurologic evaluation.

Balance

The ability to keep the body steady while sitting, standing, or moving. It depends on information from the inner ear, eyes, muscles, joints, and brain; problems with any of these systems can increase the risk of falls.

Balance Assessment

An evaluation of steadiness during sitting, standing, walking, and changing position. It may include movement tests and review of vision, medicines, strength, sensation, and dizziness to identify fall risk and guide support.

Balance Disorders

Problems with steadiness or coordinated movement that may cause dizziness, unsteadiness, or falls. Causes include inner-ear disease, vision problems, brain or nerve disorders, muscle weakness, medicines, and blood-pressure changes.

Balance Disorders And Vertigo

Conditions that cause unsteadiness, dizziness, or a false feeling of movement. Causes may involve the inner ear, brain, nerves, vision, muscles, medicines, or blood pressure.

Balanced Study

A study design in which comparison groups are similar with respect to selected factors that could affect outcomes. Researchers may use matching, stratification, or restricted randomization to improve balance; random assignment alone does not guarantee equal baseline characteristics on every measured factor in the enrolled groups.

Balance Impairment

Reduced ability to remain steady while sitting, standing, or walking. It may cause swaying, stumbling, or falls and can result from inner-ear disease, vision problems, weakness, nerve disease, medicines, or brain disorders.

Balance Problems

Difficulty maintaining body stability while standing or moving, often caused by disorders of the inner ear, nervous system, vision, or muscles.

Balance Training

Exercises that practise posture, weight shifting, walking, and responses to movement to improve steadiness. They may be part of rehabilitation for balance problems or fall risk.

Balanitis

Inflammation of the glans penis. When the foreskin is also inflamed, the condition is called balanoposthitis. Causes include Candida or bacterial infection, irritants, trapped moisture, and skin disorders such as psoriasis or lichen sclerosus. Symptoms may include redness, swelling, itching, discharge, or soreness; recurrent episodes may be associated with diabetes.

Balanitis Xerotica Obliterans

An older name for genital lichen sclerosus affecting the foreskin or glans penis. It can cause pale, tight skin, itching, painful erections, difficulty passing urine, or narrowing of the urinary opening.

Alternate Names:
BXO; Penile Lichen Sclerosus

Balanoposthitis

Inflammation affecting both the glans penis and the foreskin (prepuce). It may cause redness, swelling, itching, soreness, discharge, or difficulty retracting the foreskin. Causes include infection, such as Candida or bacterial infection, irritant or allergic reactions, and inflammatory skin disease; diabetes and retained moisture can increase risk.

Balantidiasis

Intestinal infection caused by the ciliated protozoan *Balantioides coli* (formerly *Balantidium coli*). It may cause diarrhoea, abdominal pain, or colitis after ingestion of cysts in faecally contaminated food or water; infection may also be asymptomatic.

Balantidium

A genus of large, single-celled parasites that can infect the large intestine. Infection may cause diarrhoea, abdominal pain, or inflammation of the colon, although many infected people have no symptoms.

Balantidium Coli

Former scientific name for *Balantioides coli*; see *Balantioides Coli*.

Balantioides Coli

The current scientific name for the ciliated protozoan formerly called *Balantidium coli*. It infects the large intestine of humans and other mammals and is usually acquired by ingesting cysts in contaminated food or water.

Balbiani Body

A temporary cluster of cell parts and genetic messages near the nucleus of a developing egg cell. It helps organize materials that the early embryo needs after fertilization.

Baldness

Commonly used term for substantial hair loss, especially androgenetic alopecia, also called pattern hair loss. In this condition, genetically susceptible hair follicles gradually become smaller under the influence of androgens.

Alternate Names:
Pattern Hair Loss

Bald Tongue

Alternate name; see *Atrophic Glossitis*.

Balint's Syndrome

A rare disorder caused by damage to both back portions of the brain. It can cause difficulty seeing more than one object at a time, reaching accurately for objects while looking at them, and directing visual attention.

Ballance Sign

A historical examination finding of fixed dullness in the left flank with shifting dullness on the right, described in association with splenic rupture and intraperitoneal bleeding. It has limited diagnostic reliability and is now mainly of historical interest.

Ball-And-Socket Joint

A joint in which the rounded end of one bone fits into a cup-shaped part of another bone. It allows movement in many directions, as in the hip and shoulder.

Ballard Score

A newborn examination used to estimate how many weeks of pregnancy had passed at birth. It assesses physical features and muscle tone or movement; the estimate is useful when pregnancy dates or early ultrasound information are uncertain.

Ballism

A movement disorder causing sudden, involuntary, large, flinging movements of an arm or leg. It usually results from damage or dysfunction in deep movement-control areas of the brain.

Ballismus

Alternate name; see *Ballism*.

Balloon Aortic Valvuloplasty

A catheter procedure in which a balloon is inflated across a narrowed aortic valve to improve blood flow from the heart. The benefit may be temporary, and the valve can narrow again; some people later need valve replacement.

Balloon Brachytherapy

A form of internal radiation treatment in which a balloon catheter is placed in a body space, often the cavity left after breast-cancer surgery, and radioactive material is temporarily put inside it to treat nearby tissue.

Balloon Catheter

A thin flexible tube with an inflatable tip. It can widen a narrowed blood vessel or body passage, open a stent, stop bleeding by applying pressure, or help perform another procedure.

Balloon Dilation

A procedure that widens a narrowed blood vessel or body passage by inflating a small balloon at the narrowed area. The result and risks depend on the site and underlying cause.

Alternate Names:
Balloon Dilatation; Balloon Angioplasty When Performed in a Blood Vessel

Balloon Occlusion

Temporary blockage of a blood vessel or other passage using an inflatable balloon on a catheter. It may control bleeding, test blood flow, or support another procedure; possible complications include reduced blood supply, clotting, and vessel injury.

Balloon Tamponade

Temporary control of bleeding or blockage by inflating a balloon inside or against a body passage or blood vessel. It applies pressure to the bleeding area but can injure tissue and requires close monitoring.

Balneology

The study of mineral waters, bathing, and spa treatments and their effects on the body.

Balneotherapy

Use of mineral or thermal water, baths, muds, or related spa methods as a therapeutic practice.

Balo Disease

A rare inflammatory demyelinating disease of the brain and spinal cord, also called Balo concentric sclerosis. MRI typically shows lesions made of alternating rings of damaged and relatively preserved myelin. It may cause progressive weakness, speech or thinking problems, seizures, or other neurologic deficits.

Alternate Names:
Balo Concentric Sclerosis

Balsam

A thick, resin-containing substance from certain plants, used in some fragrances, skin products, and traditional remedies. It can irritate the skin or cause allergic contact dermatitis in sensitive people.

Bamboo Spine

An X-ray appearance in advanced ankylosing spondylitis in which new bone bridges the spinal bones, making the spine look like a bamboo stalk. The spine may become stiff and more likely to break after injury.

Alternate Names:
Poker Spine

Band Cell

An immature neutrophil, a white blood cell that helps fight infection, whose nucleus has a curved band shape. Increased numbers may occur when the bone marrow responds to infection, inflammation, or severe stress.

Band Heterotopia

A rare birth-related brain-development condition in which a band of extra brain tissue forms below the brain's outer layer. It can cause seizures, learning problems, and developmental delay. Some cases are linked to changes in the *DCX* gene.

Alternate Names:
Double Cortex Syndrome; Subcortical Band Heterotopia

Band Keratopathy

A horizontal strip of calcium deposits in the clear front surface of the eye. It may result from long-term inflammation or high calcium levels and can cause irritation, blurred vision, or reduced sight.

B And T Cells

B cells make antibodies, while T cells coordinate immune responses or destroy infected and abnormal cells. Both are types of lymphocytes, a group of white blood cells that protect against infection and disease.

B And T Cell Screen

A blood test that measures B cells and T cells, two major groups of immune cells. It may help evaluate suspected immune deficiency, unusual blood-cell counts, or some blood cancers; results are considered with other tests.

B And T Lymphocytes

Alternate name; see *B And T Cells*.

Bandy Legs

Outward bowing of the knees so that the knees remain apart when the ankles are touching. See *Genu Varum*.

BANF

Older abbreviation for bilateral acoustic neurofibromatosis, now called *NF2-Related Schwannomatosis*.

Bankart Lesion

A tear in the front-lower rim of the shoulder socket, usually after the upper arm has dislocated. It can make the shoulder unstable and increase the chance of repeated dislocation.

Bankart Repair

An open or arthroscopic surgical procedure performed to reattach and reconstruct a torn anterior-inferior glenoid labrum and stretched joint capsule (Bankart lesion) to the glenoid rim to restore joint stability following recurrent anterior shoulder dislocations.

Bannayan-Riley-Ruvalcaba Syndrome

A rare inherited condition that can cause many noncancerous growths, a large head size, intestinal polyps, extra freckles around the penis, and increased risk of certain cancers. It results from changes in the PTEN gene.

Banti Syndrome

A historical, imprecise name for splenomegaly and blood-cell abnormalities associated with portal hypertension. It covered several different disorders and does not identify a single modern diagnosis.

Alternate Names:
Banti Disease; Banti's Syndrome

Barakat Syndrome

An inherited disorder that can cause low parathyroid hormone, hearing loss, and kidney abnormalities. These problems may occur together because of genetic changes affecting the development of several organs.

Barber Itch

An inflammatory infection of hair follicles in the beard area, often caused by bacteria or dermatophyte fungi and associated with itchy bumps or pustules.

Alternate Names:
Barber's Itch

Barber Say Syndrome

A rare congenital disorder caused by changes in the TWIST2 gene, characterized by excessive facial hair growth (hypertrichosis), loose, atrophic skin, a wide mouth, distinctive facial features, and eyelid abnormalities such as ectropion.

Barbiturate

A group of medications that slow down activity in the brain and central nervous system by enhancing the effects of calming brain chemicals. They produce effects ranging from mild relaxation and sleepiness to deep sedation and anesthesia. Because of risks of dependence and overdose, they are now mainly restricted to specialized medical uses such as controlling severe seizures or inducing general anesthesia.

Barbiturate Intoxication And Overdose

Poisoning caused by too much of a barbiturate medicine. It can cause extreme sleepiness, confusion, slow or stopped breathing, low blood pressure, coma, or death.

Barbiturates

Plural form; see *Barbiturate*.

Barbiturate Toxicity

Dose-related central nervous system depression caused by a barbiturate. Effects range from ataxia and slurred speech to coma, respiratory failure, low blood pressure, hypothermia, and loss of protective reflexes.

Bardet-Biedl Syndrome

A rare inherited disorder that may cause retinal degeneration, obesity, extra fingers or toes, kidney disease, and developmental or reproductive problems.

Alternate Names:
BBS

Bare-Metal Stent

An expandable metal mesh scaffold without an antiproliferative drug coating, deployed via endovas-

cular catheterization to maintain vascular patency in coronary or peripheral arteries following balloon angioplasty.

Alternate Names:
BMS; Uncoated Vascular Stent; Bare Stent

Bariatric Embolization

A specialized catheter procedure that reduces blood flow to selected stomach arteries to alter hunger-related signaling and support weight loss. It remains limited or investigational in many settings and may cause bleeding, stomach injury, or other vascular complications.

Bariatrics

The medical field focused on preventing and treating obesity and related conditions. Care may include nutrition, physical activity, psychological support, medicines, and weight-loss surgery.

Bariatric Surgery

Operations that reduce stomach capacity or change digestion to support substantial weight loss and improve obesity-related disease. Potential long-term effects include nutrient deficiencies and other complications related to altered digestion or absorption.

Barium

A metallic element used medically mainly as barium sulfate, a substance that outlines the digestive tract during certain X-ray examinations. Soluble barium compounds are poisonous and are different from barium sulfate.

Barium-133

A radioactive form of barium used mainly to check and calibrate radiation detectors and imaging equipment. It is not ordinarily used as a diagnostic scan or treatment for patients.

Barium Enema

An X-ray examination of the large intestine after barium is introduced into the rectum. Air may also be added to show the bowel lining more clearly. It can show abnormalities such as narrowing, diverticula, or a mass.

Barium Meal

An X-ray examination in which swallowed barium coats the swallowing tube, stomach, and first part of the small intestine. It can show narrowing, ulcers, abnormal movement, or other structural changes.

Barium Study

An X-ray examination that uses barium to outline parts of the digestive tract. Examples include a barium swallow, barium enema, and upper-GI series. It can show the shape and movement of the digestive tract.

Barium Sulfate

A liquid or paste swallowed or placed in the rectum to outline the digestive tract during X-ray examinations. It is not absorbed normally, but breathing it into the lungs or leakage through a bowel hole can cause serious complications.

Barium Swallow

An X-ray examination of the swallowing tube after a person drinks barium. It can show narrowing, abnormal shape, or problems with movement. A barium follow-through continues the examination into the small intestine.

Barlow Maneuver

A clinical physical examination test used to detect developmental dysplasia of the hip in infants. The examiner adducts the flexed hip and applies gentle posterior pressure along the shaft of the femur; a palpable clunk or sensation of the femoral head slipping out of the acetabulum indicates hip instability.

Alternate Names:
Barlow Test; Barlow Dislocation Test

Barlow's Disease

Barlow's disease is an older name for severe vitamin-C deficiency, or scurvy, causing bleeding gums, bruising, poor wound healing, and bone or joint symptoms.

Barlow Sign

A positive Barlow maneuver in an infant: gentle pos-

terior pressure on an adducted, flexed hip displaces an unstable femoral head out of the acetabulum. It indicates a dislocatable hip, not by itself the full diagnosis or severity of developmental dysplasia of the hip; see *Barlow Maneuver*.

Barlow Syndrome

Common heart valve condition where leaflets of the mitral valve billow into the left atrium during systole. See *Floppy Valve Syndrome*.

Barlow Test

A physical examination maneuver for detecting hip instability in infants. With the hip flexed, gentle pressure is applied to see whether the femoral head can be displaced out of the socket, suggesting developmental dysplasia of the hip.

Barognosis

The ability to recognize and compare the weight of objects by holding them. Losing this ability despite normal basic touch sensation may indicate a problem in brain areas that interpret sensory information.

Baroreceptor

A sensory mechanoreceptor located primarily in the carotid sinus (innervated by the glossopharyngeal nerve, CN IX) and aortic arch (innervated by the vagus nerve, CN X). It detects changes in arterial wall stretch induced by arterial blood pressure, sending afferent impulses to the solitary tract nucleus in the medulla oblongata to reflexively regulate heart rate, myocardial contractility, and peripheral vascular resistance.

Baroreceptor Reflex

A rapid automatic response that helps keep blood pressure stable. Pressure sensors in major arteries signal the brain to change heart rate and blood-vessel tightness when blood pressure rises or falls.

Baroreceptors

Plural form; see *Baroreceptor*.

Baroreflex

A rapid reflex that helps regulate blood pressure by adjusting heart rate and blood-vessel tone in response to changes in arterial pressure.

Barotitis Media

Alternate name; see *Airplane Ear*.

Barotrauma

Injury caused by a sudden or large change in pressure, often affecting the ears, sinuses, or lungs. Ear barotrauma can cause pain, blocked hearing, or eardrum injury; severe lung barotrauma can cause a collapsed lung.

Barraquer-Simons Disease

A rare acquired disorder in which fat gradually disappears from the face, arms, and upper body while remaining or increasing around the hips and legs. It may be associated with immune disease and kidney complications.

Barr Body

The tightly packed, inactive copy of an X chromosome seen inside the nucleus of many cells that contain more than one X chromosome. It helps balance gene activity between cells with different numbers of X chromosomes.

Barrel Chest

A rounded, enlarged appearance of the chest caused by increased lung volume or changes in the chest wall. It may occur with chronic obstructive pulmonary disease, severe asthma, or other long-standing lung conditions.

Barrett Esophagus

A condition in which the cells lining the lower esophagus (the swallowing tube) become damaged and change into cells similar to those found in the intestine. It is most often caused by long-term acid reflux repeatedly irritating the esophageal lining. While most people with Barrett esophagus never develop esophageal cancer, having this cell change increases the risk, so periodic monitoring is often recommended.

Barrett Esophagus Surveillance

Planned repeat examinations of the lower swallowing tube, usually with an endoscope and tissue samples, to look for precancerous cell changes or early cancer. Timing depends on whether abnormal cell changes are present and their severity.

Barrett's Esophagus

Alternate spelling; see *Barrett Esophagus*.

Barrett's Oesophagus

Alternate spelling; see *Barrett Esophagus*.

Barrier Creams

Skin products that form a protective layer against moisture, friction, irritants, and body fluids. They can help prevent or soothe irritation.

Barrier Nursing

Care practices used to stop infections from spreading between patients, staff, and visitors. They may include hand cleaning, protective clothing, masks, gloves, and keeping a person with a contagious infection separate when needed.

Alternate Names:
Isolation Nursing

Barthel Index

A scoring tool that measures how much help a person needs with daily activities such as eating, bathing, dressing, using the toilet, moving between surfaces, walking, and climbing stairs. It is used to track function and rehabilitation progress.

Bartholin Abscess

A painful collection of pus caused by infection of a Bartholin gland near the vaginal opening. It can cause severe swelling and pain when sitting or walking.

Alternate Names:
Infected Bartholin Cyst; Bartholin Gland Abscess

Bartholin Cyst

A benign, fluid-filled swelling caused by blockage of the duct of a Bartholin gland near the vaginal opening; see *Bartholin Cyst Or Abscess*.

Bartholin Cyst Or Abscess

A blockage of a Bartholin gland duct near the vaginal opening can form a usually painless, fluid-filled cyst; infection can cause a painful abscess. Rare gland tumours can resemble a cyst, particularly in older adults.

Alternate Names:
Bartholin Cyst; Bartholin Duct Cyst

Bartholin Gland

One of two small glands beside the vaginal opening that release lubricating fluid. A blocked duct can cause a cyst, and infection can cause a painful abscess with swelling and difficulty sitting or walking.

Bartholin Gland Cyst

See *Bartholin Cyst Or Abscess*.

Bartholin Gland Hyperplasia

Enlargement caused by an increase in the cells of a Bartholin gland. It may appear as a lump near the vaginal opening and can resemble a cyst or tumour.

Bartholin Gland Mucinous Cyst

See *Bartholin Cyst Or Abscess*.

Bartholinitis

Inflammation or infection of a Bartholin gland near the vaginal opening. It may cause pain, redness, swelling, or an abscess and can make sitting or walking uncomfortable.

Bartholin's Cyst

Alternate spelling; see *Bartholin Cyst Or Abscess*.

Bartholin's Glands

Alternate spelling; see *Bartholin Gland*.

Barth Syndrome

A rare inherited disorder of mitochondrial energy production caused by changes in the TAZ gene. It may cause heart-muscle disease, low muscle tone, weakness, poor growth, low neutrophil counts, and

recurrent infections.

Bartonella

A group of bacteria usually spread by fleas, lice, ticks, or contact with animals. Different species can cause cat-scratch disease, trench fever, skin lesions, heart-valve infection, or bloodstream infection.

Bartonellaceae

A family of bacteria that includes Bartonella species. Members can cause cat-scratch disease, trench fever, skin and blood-vessel lesions, bloodstream infection, or infection of the heart valves.

Bartonella Elizabethae

A species of Bartonella bacteria that has rarely been linked to bloodstream infection and inflammation of the heart valves, especially in people with underlying health problems.

Bartonella Henselae

The bacterium that most commonly causes cat-scratch disease. It is usually spread by a kitten scratch or bite and may cause a small skin bump, swollen nearby lymph nodes, fever, or, rarely, disease of other organs.

Bartonella Infections

Infections caused by Bartonella bacteria. They may produce swollen lymph nodes, fever, skin lesions, anaemia, heart-valve infection, or inflammation of organs; symptoms and severity depend on the species and immune status.

Bartonella Quintana

A Bartonella species spread mainly by body lice. It causes trench fever, with recurring fever, headache, bone pain, and weakness, and can sometimes cause bloodstream or heart-valve infection.

Bartonellosis

Infection caused by a Bartonella bacterium. Depending on the species, it may cause swollen lymph nodes, recurring fever, skin lesions, anaemia, heart-valve infection, or disease affecting several organs.

Bart's Hemoglobinopathy

A severe form of alpha-thalassemia caused by loss or inactivation of all four alpha-globin genes. Excess haemoglobin Bart's cannot deliver oxygen effectively, causing profound fetal anaemia and hydrops fetalis. It is usually fatal without fetal therapy, although survival after intrauterine transfusion has been reported.

Bartter Disease

Alternate name; see *Bartter Syndrome*.

Bartter Syndrome

An inherited kidney disorder causing excessive loss of salt and potassium in urine. It may lead to dehydration, low blood pressure, muscle cramps or weakness, frequent urination, excessive thirst, and poor growth in children.

Basal

Relating to the base of a structure or to a person's resting level of activity, such as resting metabolism or temperature measured after sleep.

Basal Body

A small structure at the base of a cilium or flagellum, such as a cell hair or sperm tail. It anchors the structure to the cell and helps organize the parts that produce movement.

Basal Cell

A cell in the deepest layer of an epithelial tissue, where it can divide and produce new cells. In the epidermis, basal cells help renew the skin and contain keratinocyte stem and progenitor cells.

Basal Cell Carcinoma

A common skin cancer arising from basal keratinocytes in the epidermis, often associated with ultraviolet exposure. It grows slowly and may appear as a pearly bump, a recurrent or nonhealing sore, or a scar-like patch. It can invade and damage nearby tissue, but spread to distant sites is rare.

Basal Cell Skin Cancer

Alternate name; see *Basal Cell Carcinoma*.

Basal Ganglia

Deep brain structures that help control movement, habits, learning, and emotions. Problems in these structures can cause tremor, stiffness, slowed movement, or unwanted movements.

Basal Ganglia Dysfunction

Abnormal function of deep brain structures that help control movement and learned habits. It may cause tremor, stiffness, slowed movement, twisting movements, or other involuntary movements, as in Parkinson disease or Huntington disease.

Basal Joint Arthritis

Alternate name; see *Thumb Arthritis*.

Basal Lamina

A thin layer beneath many lining cells that anchors them to supporting tissue. It also helps control movement of substances between the lining and the tissue below.

Basal Metabolic Rate

The amount of energy the body uses at complete rest to maintain essential functions such as breathing, circulation, temperature, and cell activity. It varies with body size, age, muscle mass, hormones, illness, and other factors.

Basal Nuclei

Groups of nerve cells deep within the brain that help start, stop, and control movement. They also contribute to learning, habits, motivation, and other thinking processes.

Basal Tear

A tear that is continuously present on the eye's surface. It keeps the cornea moist, smooth, and protected and helps wash away dust and microorganisms.

Basal Temperature

Body temperature measured immediately after waking and before eating, exercise, or other activity. A small sustained rise often occurs after ovulation and can help track menstrual cycles.

Base

A substance that can accept hydrogen ions or reduce acidity. In water, a base usually has a pH above 7; strong bases can burn tissue, while weaker bases are important in body fluids and chemical reactions.

Basedow's Disease

Older name; see *Graves Disease*.

Base Excision Repair

A way cells repair small areas of DNA damage. Enzymes remove the faulty DNA building block, fill the gap with the correct one, and seal the DNA strand.

Baseline

A starting measurement or description of a person's health before treatment, illness, or observation. Later findings are compared with it to identify improvement, worsening, or change.

Baseline EKG

An electrocardiogram recorded before treatment, a procedure, or a change in health. It provides a starting record for comparison with later heart tracings.

Alternate Names:
Baseline ECG; Reference Electrocardiogram

Basement Membrane

A thin supporting layer beneath many cells that line organs and body surfaces. It anchors the cells, helps control exchange with underlying tissue, and can act as a barrier to tumour spread.

Base Pair

Two matching building blocks joined inside DNA or RNA. In DNA, adenine pairs with thymine and cytosine pairs with guanine; in RNA, adenine usually

pairs with uracil.

Base Pairing

The matching of complementary DNA or RNA building blocks. This matching helps copy genetic information accurately and allows RNA molecules to fold into useful shapes or attach to other molecules.

Base Sequence

The exact order of DNA or RNA building blocks in a molecule. It carries genetic information and can be examined to identify inherited changes, mutations, or infectious organisms.

Basic First Aid

Immediate assistance for sudden illness or injury before definitive medical care. It aims to preserve life, prevent further harm, and support recovery until more advanced care is available.

Basic Life Support

Basic emergency care for cardiac arrest, respiratory arrest, and foreign-body airway obstruction. It includes recognition of emergencies, cardiopulmonary resuscitation, appropriate ventilation, and use of an automated external defibrillator. It also includes relief of airway obstruction before advanced care; exact tasks vary with age group and responder training.

Alternate Names:
BLS

Basic Metabolic Panel

A routine blood test measuring eight vital substances: blood sugar (glucose), calcium, four key electrolytes (sodium, potassium, chloride, and bicarbonate), and two waste products filtered by the kidneys (BUN and creatinine). It provides a rapid overview of fluid and electrolyte balance, kidney function, blood sugar control, and blood acid-base status.

Alternate Names:
BMP; Chem-7 (local name; composition varies); Chemistry Screen; Electrolyte and Kidney Panel

Basic Reproduction Number

The average number of people one infected person would infect in a population where everyone is susceptible, under specified conditions. It helps describe spread but changes with behavior, immunity, treatment, and the environment.

Basidiomycota

A major fungal group that reproduces by forming spores on club-shaped structures called basidia. It includes mushrooms, rusts, smuts, and some fungi that can cause human disease.

Basilar

Relating to the base or lowest part of a body structure. For example, a basilar finding may be near the bottom of the skull, lung, or another organ.

Basilar Artery

The artery formed by the union of the vertebral arteries that supplies the brainstem, cerebellum, and posterior brain.

Basilar Artery Aneurysm

A weak, widened area in the artery supplying the brainstem and back of the brain. It may press on nearby nerves, cause double vision or weakness, or rupture and produce life-threatening bleeding around the brain.

Basilar Artery Migraine

An older name for migraine with brainstem aura, a migraine subtype with reversible aura symptoms such as vertigo, double vision, slurred speech, unsteadiness, tinnitus, or reduced consciousness. At least two brainstem symptoms occur without motor weakness; the current term avoids implying that the basilar artery is the cause.

Alternate Names:
Migraine with Brainstem Aura; Basilar Migraine

Basilar Invagination

A condition in which the upper neck bones and the base of the skull are positioned abnormally, allowing the upper spine to press into the skull opening. It

can compress the brainstem, spinal cord, or nearby nerves.

Alternate Names:
Basilar Impression

Basilar Membrane

A flexible membrane in the cochlea that supports the organ of Corti and vibrates in response to sound. Different parts respond best to different sound frequencies.

Basilar Skull Fracture

A fracture involving one or more bones at the skull base, including the temporal, occipital, sphenoid, ethmoid, or orbital plate of the frontal bone. Findings can include cerebrospinal fluid leakage, hemotympanum, Battle sign, or periorbital bruising, but may be absent.

Basilic Vein

A superficial vein that travels up the inner side of the forearm and arm and joins the brachial veins to form the axillary vein. It is commonly used for blood sampling, intravenous access, and placement of a peripherally inserted central catheter (PICC).

Basiliximab

A monoclonal antibody that blocks the interleukin-2 receptor alpha chain on activated T cells. It is used as induction immunosuppression, especially in kidney transplantation, and increases susceptibility to infection.

Basis Pontis

The basis pontis is the front portion of the pons containing descending motor fibers and pontine nuclei that relay signals to the cerebellum.

Basket Cell

A basket cell is an inhibitory interneuron that forms synaptic contacts around the cell body or axon initial segment of another neuron.

Basophil

A rare type of white blood cell involved in allergic and inflammatory reactions. It releases substances such as histamine and can increase in number with some allergies, infections, and blood disorders.

Basophil Adenoma

An older histologic term for an anterior pituitary tumour whose cells stain with basic dyes. It was often used for corticotroph tumours that produce adrenocorticotropic hormone, but staining alone does not establish hormone secretion. Current classification relies on cell lineage.

Basophilia

An unusually high number of basophils in the blood. It may occur with allergies, inflammation, infection, an underactive thyroid, or disorders in which the bone marrow makes too many blood cells.

Basophilic Focus

A localized group of cells in a tissue sample that stains more blue-purple than nearby cells because of altered cell contents or structure. It is a microscopic finding, not a diagnosis; for example, in liver tissue it can describe a cluster of hepatocytes with increased basophilic staining.

Basophilic Stippling

The abnormal presence of multiple fine or coarse, dark-blue granules scattered throughout erythrocytes on a Romanowsky-stained peripheral blood smear. The granules represent precipitated ribosomal ribonucleic acid (RNA) and are characteristically seen in lead poisoning, thalassemias, sideroblastic anemia, and myelodysplastic syndromes.

Alternate Names:
Punctate Basophilia

Basosquamous Carcinoma

A skin cancer with features of both basal-cell and squamous-cell carcinoma. It usually develops on sun-damaged skin and may behave more aggressively than ordinary basal-cell carcinoma.

Bassen-Kornzweig Syndrome

A rare inherited disorder in which the body cannot make certain particles that carry fat in the blood.

It causes poor absorption of dietary fat, deficiencies of fat-soluble vitamins, unusual red cells, and progressive nerve or eye problems.

Bateman Purpura

Alternate name; see *Actinic Purpura*.

Bather's Itch

Alternate name; see *Swimmer's Itch*.

Bathing An Infant

Washing an infant with water for hygiene. Bathing practices vary with age, skin condition, and cultural custom.

Bathing A Patient In Bed

Washing a person who cannot safely get out of bed, usually with the assistance of a caregiver or clinical staff. It supports hygiene and comfort during illness, disability, or recovery.

Bath Salts Abuse And Addiction

Harmful use of synthetic stimulant drugs sold as "bath salts." They can cause agitation, paranoia, hallucinations, seizures, dangerous overheating, heart problems, dependence, or death.

Batrachotoxin

A very powerful poison found in some frogs and birds. It keeps nerve and heart sodium channels open, causing abnormal nerve activity, dangerous heart rhythms, paralysis, and potentially death.

Batroxobin

An enzyme derived from snake venom that changes fibrinogen, a blood protein, into fibrin, the material that strengthens a blood clot. It has been studied or used in selected bleeding and clotting settings and can alter bleeding risk.

Batson Plexus

A valveless network of epidural and paravertebral veins that connects the deep pelvic and thoracic veins to the internal vertebral venous system. Because of the lack of valves and low intravascular pressures, it provides an alternate route for the retrograde hematogenous spread of pelvic infections and metastases (especially prostate and breast carcinoma) to the spine and central nervous system.

Alternate Names:
Batson's Venous Plexus; Vertebral Venous Plexus

Batson Venous Plexus

A valveless network of epidural and vertebral veins connecting the deep pelvic and thoracic veins to the internal vertebral venous plexuses and intracranial venous sinuses. Because it lacks valves, retrograde flow occurs during increases in intra-abdominal or intrathoracic pressure (such as coughing or straining), providing a direct pathway for the hematogenous dissemination of infections and metastases (notably prostate and breast carcinoma) to the vertebral column and brain.

Alternate Names:
Batson Plexus; Vertebral Venous Plexus

Batten Disease

A group of inherited neurodegenerative disorders, also called neuronal ceroid lipofuscinoses (NCLs), caused by lysosomal accumulation of ceroid lipofuscin in cells. Subtypes vary in age of onset and progression but commonly cause worsening seizures, vision loss, cognitive decline, movement problems, and loss of acquired abilities.

Battered Child Syndrome

Older term for physical abuse of a child; see *Child Physical Abuse*. Abusive head trauma is one possible form of child physical abuse, not a synonym for the broader term.

Battey Bacillus

An older name for the group of nontuberculous mycobacteria now called Mycobacterium avium complex. These organisms can cause lung disease, swollen lymph nodes, or widespread infection, especially when immunity is severely weakened.

Battle Sign

Bruising behind the ear over the bone, which is a warning sign of a break in the base of the skull.

Bauhin Valve

The valve between the last part of the small intestine and the first part of the large intestine. It helps regulate passage of intestinal contents and limits backward movement from the colon.

Bauxite-Workers' Lung

A lung disorder caused by long-term workplace inhalation of bauxite dust. It may produce scarring or inflammation in the lungs and can cause cough, breathlessness, or reduced lung function.

Bax Protein

A protein that helps start programmed cell death when a cell is damaged or no longer needed. Excessive or insufficient Bax activity can affect cell survival and has been studied in cancer and other diseases.

Bayes Theorem

A rule for updating the likelihood of a diagnosis after new evidence. It combines the chance of the disease before the test with how accurately the test result supports or argues against that disease.

Bazin Disease

A chronic, nodular, and often ulcerating form of lobular panniculitis predominantly affecting the posterior lower legs of young or middle-aged women. It represents a delayed-type hypersensitivity reaction associated with Mycobacterium tuberculosis or other systemic antigens.

Alternate Names:
Erythema Induratum of Bazin; Erythema Induratum

Bazin's Disease

An older name for tender, inflamed lumps in the fatty tissue under the skin of the lower legs. It is sometimes linked with tuberculosis but can have other causes and may ulcerate as it heals.

B Cell

A type of white blood cell that develops in the bone marrow. After activation, it can become an antibody-producing cell or a memory cell that helps the immune system respond faster to a later infection.

Alternate Names:
B Lymphocyte; Bursa-Equivalent Lymphocyte

B-Cell Activation

The process in which a B cell receives signals after recognizing a foreign substance, then multiplies and develops into antibody-producing cells or long-lasting memory cells.

B-Cell Acute Lymphoblastic Leukemia

A rapidly progressive cancer of immature B-lymphocyte precursors in the bone marrow. Abnormal cells crowd out normal blood-forming cells and may enter the blood, lymph nodes, central nervous system, or other organs.

Alternate Names:
B-Cell ALL; B-Cell Acute Lymphocytic Leukemia; Adult B-Cell Acute Lymphoblastic Leukemia

B-Cell Acute Lymphoblastic Leukemia for Adults

Acute lymphoblastic leukemia arising from immature B-cell precursors in an adult. It can cause anemia, infection, bleeding, bone pain, and abnormal blood counts.

B-Cell Leukemia/Lymphoma Panel

A laboratory test that examines cells from blood, bone marrow, or tissue for abnormal groups of B cells. It uses cell features and marker proteins to help identify or classify some blood cancers.

B-Cell Lymphoma

A group of cancers that begin in B lymphocytes. Different types grow at different speeds and may affect lymph nodes or organs; diagnosis and treatment depend on the exact type, extent, and person's health.

B-Cell Receptor

A protein on the surface of a B cell that binds a particular foreign substance. This binding sends

signals that can make the cell multiply, mature, and produce antibodies.

B-Cell-Targeted Therapy

Treatment that targets B cells, a type of white blood cell. Depending on the disease, it may reduce their activity or number, or direct immune cells to attack B-cell cancers. Examples include anti-CD20 antibodies and CAR T-cell therapy.

Alternate Names:
B-Cell Therapy

BCGosis

Infection caused by the live attenuated *Mycobacterium bovis* BCG strain after vaccination or intravesical bladder treatment. Infection may remain local or disseminate to organs, particularly in people with immune deficiency.

Beach Chair Position

A semi-sitting position used during some operations, especially shoulder surgery. Position-related risks include pressure injury, low blood pressure, and reduced brain blood flow.

Beacopp Regimen

A combination chemotherapy regimen used mainly to treat Hodgkin lymphoma; it includes bleomycin, etoposide, doxorubicin, cyclophosphamide, vincristine, procarbazine, and prednisone, with dosing and supportive care determined by the oncology team.

Beals Syndrome

A rare inherited connective-tissue disorder present from birth. It may cause permanently bent joints, long slender fingers and toes, a curved spine, and ears with a crumpled appearance; severity varies.

Beam Hardening Artifact

A false dark band or streak on a CT image caused when bone or metal removes some parts of the X-ray beam before it reaches the detector. It can obscure nearby body structures.

Beat Number

The number assigned to a particular heartbeat or rhythmic event when beats are counted or analysed. It can help describe timing, rate, or changes in a recorded heart rhythm.

Beau Lines

Transverse depressions or grooves across the nail plate caused by temporary interruption of nail-matrix growth. They may follow severe illness, fever, trauma, malnutrition, chemotherapy, or systemic inflammatory disease.

Beau's Lines

Transverse grooves or depressions across a fingernail or toenail caused by temporary interruption of nail-matrix growth. They may follow severe illness, injury, high fever, nutritional stress, or local trauma; the timing of the groove can help estimate when the event occurred.

Becaplermin

Becaplermin is a recombinant platelet-derived growth factor gel used in selected diabetic foot ulcers with appropriate wound care.

Bechterew Disease

An older name for ankylosing spondylitis, a long-term inflammatory disease affecting the joints between the spine and pelvis and often the spine itself. It causes back pain and stiffness that may improve with movement.

Alternate Names:
Ankylosing Spondylitis; Marie-Strümpell Disease

Becker Muscular Dystrophy

An X-linked recessive muscle disease caused by reduced or abnormal dystrophin, a protein that supports muscle fibres. It usually causes slowly progressive weakness beginning in childhood or adulthood and may also affect the heart.

Becker Myotonia

An inherited muscle condition causing stiffness because muscles relax slowly after contraction. It often

begins in childhood, may improve after repeated movement, and can cause muscle enlargement, difficulty starting movement, or brief weakness.

Alternate Names:
Autosomal Recessive Myotonia Congenita; Recessive Generalized Myotonia

Becker Nevus

A usually harmless, irregularly shaped patch of darker skin that often becomes noticeable during adolescence and may develop increased hair growth. It commonly affects one shoulder or the upper trunk and is not usually cancerous.

Becker's Muscular Dystrophy

Alternate name; see *Becker Muscular Dystrophy*.

Becker'S Nevus

Alternate name; see *Becker Nevus*.

Beck Triad

The classic triad of clinical signs associated with acute cardiac tamponade: hypotension, elevated jugular venous pressure with distended neck veins, and muffled or distant heart sounds.

Beckwith-Wiedemann Spectrum

A multigenic congenital overgrowth and tumor-predisposition genomic imprinting disorder caused by epigenetic or genetic alterations on chromosome 11p15.5. Hallmarks include macrosomia, macroglossia, lateralized overgrowth (hemihypertrophy), abdominal wall defects (omphalocele, umbilical hernia), neonatal hypoglycemia from hyperinsulinism, and organomegaly (visceromegaly). Patients carry an elevated risk of childhood embryonal neoplasms, predominantly Wilms tumor and hepatoblastoma, necessitating serial abdominal ultrasound and alpha-fetoprotein screening in infancy.

Alternate Names:
BWS; Beckwith-Wiedemann Syndrome

Beckwith-Wiedemann Syndrome

Alternate name; see *Beckwith-Wiedemann Spectrum*.

Beclomethasone

Beclomethasone is a corticosteroid used by inhalation, nasal spray, or topical routes to reduce inflammation in asthma, rhinitis, or skin disease.

Becquerel

The standard scientific unit used to measure radioactivity. One becquerel represents one atomic nucleus decaying or breaking down per second. In medicine, it is used to quantify the amount of radioactive material administered during diagnostic scans or radiation treatments.

Alternate Names:
Bq; SI Unit of Radioactivity

Bed Bug

A small, wingless, blood-feeding insect of the genus *Cimex* that hides in bedding, furniture, and cracks and feeds on humans and other animals, often at night. Bites may cause itchy bumps or allergic reactions, although some people show no skin reaction. Bed bugs are not known to spread human disease.

Alternate Names:
Bedbug; Bed Bugs

Bedbug Bites

Itchy skin reactions caused by bedbugs feeding at night. Bites may appear as red, swollen, itchy marks in clusters or lines on exposed skin, sometimes days after exposure; some people have no visible reaction. Bedbugs are not known to spread disease, but scratching can cause secondary infection and allergic reactions are possible.

Bedbugs

Alternate plural; see *Bed Bug*.

Bednar Aphthae

Shallow sores on the back of a baby's palate caused by pressure or rubbing, often during feeding. They may make feeding painful and usually improve when the source of irritation is corrected.

Bedpan

A container for collecting urine or stool from a

person confined to bed or unable to use a toilet.

Bed Rest

Staying in bed or remaining mostly reclined to limit activity. Prolonged inactivity can cause muscle loss, blood clots, constipation, pressure injuries, and reduced independence.

Bedsore

A pressure injury, also called a pressure sore or pressure ulcer, caused by prolonged pressure or pressure combined with shear and friction. It usually develops over a bony area such as the heel, hip, elbow, or tailbone; limited movement, moisture, poor nutrition, and reduced sensation increase risk.

Alternate Names:
Pressure Ulcers; Decubitus Ulcers; Pressure Sores; Decubiti

Bedwetting

Alternate name; see *Enuresis*.

Bee And Wasp Sting

A sting from a bee or wasp that injects venom and usually causes immediate pain, redness, swelling, and itching. Trouble breathing, throat swelling, widespread hives, faintness, or vomiting may indicate anaphylaxis.

Beef or Pork Tapeworm Infection

Intestinal infection with Taenia saginata or Taenia solium acquired from undercooked beef or pork; T. solium eggs can also cause cysticercosis in tissues.

Beer-Drinker's Heart

Historical and informal term; see *Alcoholic Cardiomyopathy*.

Beers Criteria

A set of American Geriatrics Society criteria identifying potentially inappropriate medicines and medication situations for adults aged 65 and older. It includes drug-disease and drug-drug interactions and dose considerations for reduced kidney function; it supports, but does not replace, individualized clinical judgment.

Bee Sting

A venom-injecting injury from a bee that usually causes local pain, redness, and swelling. A severe allergic reaction can cause widespread hives, breathing difficulty, faintness, or swelling of the mouth and throat.

Alternate Names:
Apis Envenomation; Honeybee Sting

Bee Stings

Plural form; see *Bee Sting*.

Beeswax Poisoning

Illness after ingesting or inhaling a large amount of beeswax. Beeswax is generally of low toxicity, but large ingestions may cause gastrointestinal blockage or aspiration, especially in children.

Behavior

The observable actions, responses, and activities of an organism, influenced by genetic, neurobiological, psychological, and environmental factors. In medicine, behavioral assessment helps diagnose psychiatric, developmental, and neurological conditions.

Behavioral Abnormality

A deviation from typical patterns of behavior that may indicate a psychiatric, neurodevelopmental, or neurologic condition. It is assessed by history, observation, standardized measures, and developmental norms to determine clinical significance.

Behavioral Addiction

A compulsive pattern of engaging in a non-substance-related activity (such as gambling, gaming, or compulsive buying) despite significant adverse psychological, social, or occupational consequences; see *Gambling Disorder*.

Behavioral Disorder

A persistent pattern of behavior that causes clinically significant distress or impairment in daily

functioning, relationships, learning, or safety. The term is broad; interpretation considers age, development, mental health, medical conditions, environment, trauma, and substance exposure.

Behavioral Genetics

The study of how genes and environmental factors influence behavior and mental traits. Most behaviors reflect many genes interacting with life experiences, not one gene alone.

Behavioral Health Integration

A team-based approach that connects medical care with mental health and substance-use services through collaborative workflows, shared care planning, and coordinated follow-up. It addresses behavioral health conditions, health behaviors, and psychosocial factors that affect physical health. Integration may occur in primary care or specialty settings and does not require clinicians to work in the same office.

Alternate Names:
Integrated Behavioral Health Care

Behavioral Neurology

A neurology subspecialty focused on cognitive and behavioral changes caused by disorders of the brain. It assesses memory, language, attention, perception, and social behavior, often in conditions such as dementia, brain injury, or epilepsy, and may overlap with neuropsychiatry and other cognitive-disorder specialties.

Behavioral Rehabilitation

Structured therapy that helps a person change behaviors, build coping skills, and regain daily function after illness, injury, addiction, or disability. It may include counseling, goal setting, and practice of useful routines.

Behavior Disorder

A persistent pattern of actions or emotional responses that causes significant distress, interferes with daily life, or harms relationships. Causes may be developmental, psychological, medical, or environmental.

Behavior Test

A structured assessment of behavior, mood, attention, thinking, or social functioning. It may use observation, interviews, questionnaires, or standardized tasks to help identify developmental, psychiatric, or neurologic concerns.

Behavior Therapy

A form of psychotherapy based on learning principles that uses reinforcement, extinction, and other behavioral techniques to modify maladaptive behaviors. It is effective for anxiety disorders, phobias, obsessive-compulsive disorder, and habit disorders.

Behcet Disease

Alternate spelling; see *Behçet Disease*.

Behçet Disease

A long-term inflammatory disease that can cause repeated mouth and genital sores, eye inflammation, and skin problems. It may also affect the joints, blood vessels, nervous system, or digestive tract. Severe eye or organ involvement can threaten vision or organ function.

Alternate Names:
Behçet Syndrome; Silk Road Disease; Adamantiades-Behçet Syndrome

Behcet's Syndrome

Alternate spelling; see *Behçet Disease*.

Behçet's Syndrome

Alternate name; see *Behçet Disease*.

Behcet Syndrome

Alternate name; see *Behçet Disease*.

Behr Syndrome

A rare inherited neurological disorder causing progressive optic-nerve damage, poor vision, muscle stiffness, unsteady movement, and sometimes weakness or bladder problems.

Bejel

An endemic treponemal infection, also called en-

demic syphilis, caused by *Treponema pallidum* subsp. *endemicum*. It is spread mainly through close contact in affected communities and most often begins in childhood; skin, mouth, bone, and other tissues may be affected.

Alternate Names:
Endemic Syphilis

Bekam

A Malay name for cupping, a practice in which cups create suction on the skin; wet cupping may also involve superficial skin incisions.

Belching

The release of swallowed air or gas from the stomach through the mouth. Frequent belching may occur with aerophagia, gastroesophageal reflux, functional dyspepsia, or carbonated-drink consumption.

Belinostat

A cancer medicine that blocks enzymes involved in turning genes on and off. It is used for some peripheral T-cell lymphomas that have returned or resisted earlier treatment.

Belladonna

Atropa belladonna, the deadly nightshade plant, whose tropane alkaloids such as atropine and scopolamine can cause anticholinergic poisoning.

Bell-Clapper Deformity

A birth-related difference in how a testicle is attached inside the scrotum, allowing it to move and twist more freely than usual. It is often present on both sides and increases the risk of testicular torsion, a sudden emergency that cuts off blood flow.

Alternate Names:
Bell-Clapper Anomaly; High Tunica Vaginalis Insertion

Bell Palsy

A sudden, temporary weakness or paralysis of the muscles on one side of the face, caused by swelling or inflammation of the facial nerve (the seventh cranial nerve). Symptoms develop rapidly and include facial drooping, difficulty closing the eye, drooling, and altered taste. Unlike a stroke—which usually spares forehead movement—Bell palsy affects the entire side of the face, including the forehead and eyebrow.

Alternate Names:
Bell's Palsy; Idiopathic Facial Palsy

Bell's Palsy

Alternate spelling; see *Bell Palsy*.

Bell's Phenomenon

Upward and outward movement of the eyes when a person closes the eyelids forcefully. This normal protective reflex helps shield the cornea and may become visible when facial-nerve weakness prevents complete eyelid closure.

Belly

The abdomen, the region of the body between the chest and pelvis containing much of the digestive, urinary, and reproductive organs.

Below-Knee Amputation

Surgery to remove the lower leg while preserving the knee joint. It may be needed for severe injury, infection, poor blood flow, or cancer; rehabilitation focuses on healing, strength, mobility, and a prosthesis when suitable.

Bence Jones Protein

Free monoclonal immunoglobulin light chains (either kappa [κ] or lambda [λ]) produced by neoplastic plasma cells in disorders such as multiple myeloma, Waldenström macroglobulinemia, and primary amyloidosis. Readily filtered by the renal glomeruli, they can be detected by urine protein electrophoresis and immunofixation. They exhibit unique thermal solubility properties: precipitating upon heating to 40–60°C and redissolving upon boiling (100°C). In the kidneys, filtered light chains can precipitate with Tamm-Horsfall mucoprotein in distal tubules, causing obstructing casts and myeloma kidney (cast nephropathy).

Alternate Names:
Monoclonal Free Light Chains; Bence-Jones Protein

Bence-Jones Protein

Alternate spelling; see *Bence Jones Protein*.

Benchmarking

Comparing healthcare results, safety, costs, or processes with a standard or similar service. The comparison can identify areas for improvement but does not by itself prove that one service causes better outcomes.

Bendamustine

A cancer medicine that damages tumour-cell DNA and is used for selected blood cancers. It can also damage healthy bone-marrow cells, causing low blood counts, infection, tiredness, nausea, or other side effects.

Bendamustine Hydrochloride

The hydrochloride form of bendamustine, a chemotherapy medicine used for selected blood cancers. It damages DNA and may cause low blood counts, infection, infusion reactions, nausea, tiredness, or other side effects.

Bendiocarb

A carbamate insecticide that can overstimulate nerves after significant exposure. Poisoning may cause sweating, salivation, vomiting, diarrhoea, small pupils, muscle twitching, breathing difficulty, or weakness.

Bendopnea

Shortness of breath that occurs when a person bends forward. It has been described in some people with heart failure, often advanced disease, but is not specific to heart failure and may have other causes.

Alternate Names:
Forward-Bending Dyspnea

Bendroflumethiazide

A diuretic medicine that helps the kidneys remove salt and water. It is used for high blood pressure or fluid retention and may lower potassium or sodium and increase uric acid or blood sugar.

Bends

A form of decompression sickness caused by gas bubbles forming in the body when pressure falls too quickly, usually during or after diving. It commonly causes deep joint or muscle pain but can also injure the brain, spinal cord, lungs, or circulation.

Benedikt's Syndrome

A rare pattern of neurological problems caused by damage in the midbrain. It may cause a drooping eyelid or double vision on one side and tremor, poor coordination, or involuntary movements on the opposite side.

Benedikt Syndrome

A brainstem vascular stroke syndrome resulting from a paramedian lesion of the midbrain tegmentum involving the oculomotor nerve fascicles, red nucleus, and substantia nigra. It is clinically characterized by ipsilateral third cranial nerve palsy (ptosis, dilated pupil, downward-and-outward eye) and contralateral involuntary choreoathetosis, intention tremor, and ataxia.

Alternate Names:
Paramedian Midbrain Syndrome

Beneficence And Non-Maleficence

Two principles of medical ethics: beneficence means acting to benefit the patient, while non-maleficence means avoiding unnecessary harm. Good decisions balance expected benefits, risks, patient values, and available alternatives.

Benfotiamine

A fat-soluble derivative of thiamine (vitamin B1) sold as a supplement and studied for diabetic neuropathy. Evidence that it improves nerve symptoms remains limited.

Benfuracarb

A carbamate insecticide that can overstimulate nerves after significant exposure. It may cause sweating, salivation, vomiting, diarrhoea, small pupils, muscle twitching, breathing difficulty, or weakness.

Benign

Not cancerous. A benign growth does not invade nearby tissues or spread to other parts of the body, but it can still cause problems because of its size, location, or hormone production.

Alternate Names:
Nonmalignant; Noncancerous

Benign Adrenal Tumors

Noncancerous growths in an adrenal gland. Some are found by chance and cause no problems, while others release excess hormones or become large enough to cause pressure symptoms.

Benign Ameloblastoma

A usually slow-growing tumour arising from cells involved in tooth development, most often in the jaw. It is not cancer but can expand, damage bone, and displace teeth; recurrence is possible after removal.

Benign Brain Tumor

A noncancerous growth in or around the brain. Although it does not spread like cancer, it can cause headache, seizures, vision or movement problems, or fluid blockage by pressing on nearby structures.

Benign Chondroblastoma

A noncancerous cartilage-producing bone tumour that usually develops near the end of a long bone in an adolescent or young adult. It often causes pain, swelling, or reduced movement near a joint.

Benign CNS Cyst

A noncancerous, fluid-filled sac in or around the brain or spinal cord. Many cause no symptoms, but a large or strategically located cyst can press on nerves or block the normal flow of brain fluid.

Benign Ear Cyst Or Tumor

A noncancerous cyst or growth in or around the ear. Examples include an epidermal cyst or bony growth in the ear canal and a benign growth arising from a nerve near the inner ear. A lesion in the ear canal may obstruct it and reduce hearing; a growth near the inner ear may affect hearing or balance.

Benign Epithelioma

A noncancerous growth arising from epithelial cells, which line the skin and internal organs. Unlike a malignant epithelial tumour, it does not invade nearby tissue or spread to distant sites.

Benign Esophageal Stricture

A noncancerous narrowing of the esophageal lumen, most commonly resulting from chronic acid reflux injury (peptic stricture), corrosive ingestion, radiation, or prior surgery, causing progressive dysphagia.

Alternate Names:
Peptic Stricture; Esophageal Stenosis, Benign; Esophageal Stricture

Benign Fasciculation Syndrome

A neurological condition characterized by persistent, involuntary muscle twitching (fasciculations) in the absence of motor weakness, muscle denervation, sensory neuropathy, or an underlying motor neuron disease such as amyotrophic lateral sclerosis.

Benign Hemangiopericytoma

Older term; see *Solitary Fibrous Tumor*.

Benign Lesions of the Ovaries

Noncancerous ovarian growths or cysts, including functional cysts, endometriomas, dermoids, fibromas, and cystadenomas. Evaluation uses symptoms, examination, pregnancy testing, ultrasound, and sometimes tumor markers or surgery to distinguish benign disease from malignancy.

Benign Liver Tumors

Noncancerous liver growths, including hemangiomas, focal nodular hyperplasia, and hepatocellular adenomas. Many are found incidentally, but significance varies by type: adenomas can bleed and some subtypes can become cancerous, while other lesions rarely cause complications.

Benign Melanocytic Lesion

An older or imprecise term for a benign melanocytic growth, such as a melanocytic nevus or mole; unlike malignant melanoma, it is not cancerous.

Benign Melanocytic Nevi Pathology

Well-circumscribed proliferations of benign melanocytes arranged in nests or cords at the dermoepidermal junction and/or dermis. Typical lesions show maturation with depth and lack significant cytologic atypia or destructive growth.

Benign Meningioma

A usually slow-growing, noncancerous tumour arising from the membranes around the brain or spinal cord. It may cause seizures, headache, weakness, or vision problems by pressing on nearby structures.

Benign Mesenchymoma

A rare noncancerous tumour containing more than one type of tissue such as fat, cartilage, or bone. Its symptoms depend on the site and size, and diagnosis requires examination of tissue.

Benign Migratory Glossitis

Alternate name; see *Geographic Tongue*.

Benign Mixed Tumor

Alternate name; see *Pleomorphic Adenoma*.

Benign Mullerian Papilloma

A rare noncancerous, wart-like growth in the vulva or vagina formed from Müllerian-type lining cells. It often appears as a small polyp and is diagnosed by examining a tissue sample.

Benign Myoepithelioma

A noncancerous tumour of myoepithelial cells, often arising in a salivary gland or other glandular tissue. It usually grows slowly and may cause a painless lump; diagnosis depends on tissue examination.

Benign Neoplasm

A noncancerous growth of cells that remains at its original site and does not spread to distant organs. It may still cause harm by pressing on nearby structures, blocking a passage, bleeding, or producing hormones.

Benign Orgasmic Headache

A sudden severe headache during sexual activity or orgasm for which bleeding, stroke, vessel disease, and other secondary causes have been excluded.

Alternate Names:
Primary Headache Associated with Sexual Activity; Sexual-Activity Headache

Benign Paraganglioma

An outdated, potentially misleading term for a paraganglioma without detected metastases. Paragangliomas arise from paraganglionic neuroendocrine cells and may release catecholamines; no histologic feature reliably excludes metastatic potential, so current descriptions specify tumour site and whether metastases are present.

Benign Paroxysmal Positional Vertigo

A common inner-ear problem in which tiny calcium particles move into the wrong part of the balance system. Turning the head or rolling over can trigger brief spells of spinning dizziness, sometimes with nausea. Hearing is usually not affected.

Benign Peripheral Nerve Tumor

A noncancerous tumour arising from or beside a nerve outside the brain and spinal cord. It may cause a lump, pain, tingling, numbness, weakness, or no symptoms at all.

Benign Positional Vertigo

Alternate name; see *Benign Paroxysmal Positional Vertigo*.

Benign Prostatic Hyperplasia

A nonmalignant proliferation of stromal and glandular epithelial cells within the transition zone of the prostate gland, driven by androgenic stimulation (dihydrotestosterone via 5α-reductase). It is the predominant cause of bladder outlet obstruction in aging men, presenting with lower urinary tract symptoms (LUTS) comprising voiding difficulties (hesitancy, weak stream, intermittency, straining) and storage symptoms (urgency, frequency, nocturia). Medical management includes α_1-adrenergic antagonists (e.g., tamsulosin) and 5α-reductase in-

hibitors (e.g., finasteride).

Alternate Names:
BPH; Benign Prostatic Hypertrophy

Benign Prostatic Obstruction

Blockage at the bladder outlet caused by an enlarged prostate or increased muscle tone in the prostate. It may cause a weak or interrupted stream, straining, incomplete emptying, urinary retention, or recurrent infection.

Benign Rolandic Epilepsy

A childhood seizure disorder, now often called self-limited epilepsy with centrotemporal spikes. Brief seizures commonly affect the face or mouth during sleep and may cause twitching, tingling, drooling, or temporary trouble speaking; it usually ends by adolescence.

Alternate Names:
Self-Limited Epilepsy with Centrotemporal Spikes; SeLECTS; Benign Childhood Epilepsy with Centrotemporal Spikes; Rolandic Epilepsy

Benign Skin Lesions

Noncancerous growths or localized changes in the skin, including skin tags, epidermoid cysts, dermatofibromas, and seborrheic keratoses. Some benign lesions can look like skin cancer, despite being noncancerous.

Alternate Names:
Benign Cutaneous Lesions; Noncancerous Skin Lesions

Benign Tumor

Alternate name; see *Benign Neoplasm*.

Benign Urethral Lesions

Noncancerous growths or structural changes in the urethra, such as polyps, caruncles, papillomas, or inflammatory lesions. They may cause bleeding, discharge, pain, narrowing, or difficulty passing urine, but some cause no symptoms.

Benign Vulvar Lesions

Noncancerous growths or skin disorders of the vulva, including cysts, warts, inflammatory lesions, fibromas, and pigmentary lesions. Some atypical lesions require tissue examination to distinguish them from vulvar neoplasia.

Bennett Fracture

An intra-articular fracture-subluxation of the base of the first metacarpal bone. The smaller medial articular fragment remains attached to the trapezium by the anterior oblique ligament, while the main metacarpal shaft is displaced proximally, laterally, and dorsally by the pulling force of the abductor pollicis longus tendon.

Benserazide

A medicine combined with levodopa in some Parkinson treatments. It blocks levodopa from being changed into dopamine outside the brain, allowing more to reach the brain and reducing some unwanted effects.

Bentall Procedure

Open-heart surgery that replaces a diseased aortic valve, the aortic root, and the first part of the aorta with a valve-containing tube graft. The coronary arteries are reattached to the graft. The replacement valve may be mechanical or biological, with different long-term implications.

Alternate Names:
Bentall Operation; Composite Aortic Root Replacement

Bent Penis

Curvature of the penis that may be present from birth or develop later. It can be painless or cause pain, difficulty with erection or intercourse, and sometimes problems passing urine.

Bent Spine Syndrome

Alternate name; see *Camptocormia*.

Benzaldehyde

A chemical with an almond-like smell used in flavourings, fragrances, and manufacturing. Concentrated exposure can irritate the eyes, skin, or lungs; it is not a routine medical treatment.

Benzazepines

A family of chemical structures made from joined benzene and seven-membered nitrogen-containing rings. Individual compounds may have different biological or medicinal effects, so the family name alone does not identify a treatment.

Benzene

An industrial chemical and solvent found in some fuels and smoke. High short-term exposure can affect the brain and heart; repeated exposure can damage bone marrow and increase the risk of leukaemia.

Benzene Poisoning

Illness caused by breathing, swallowing, or absorbing benzene. Short-term exposure may cause dizziness, drowsiness, or irregular heartbeat; repeated exposure can damage bone marrow and increase the risk of leukaemia.

Benzhexol

Benzhexol, or trihexyphenidyl, is an anticholinergic drug used mainly to reduce tremor and rigidity in Parkinson disease or drug-induced extrapyramidal symptoms.

Benzo[a]pyrene

A polycyclic aromatic hydrocarbon (PAH) formed during the incomplete combustion of organic matter, including tobacco smoke, vehicle exhaust, and grilled meats. Its active metabolite, benzo[a]pyrene-7,8-dihydrodiol-9,10-epoxide (BPDE), forms mutagenic DNA adducts that drive chemical carcinogenesis.

Alternate Names:
BaP; 3,4-Benzopyrene; Benzo(a)pyrene

Benzoates

Salts or chemical forms of benzoic acid used mainly as food preservatives or ingredients in some products. Their effects and safety depend on the specific compound and amount; some people develop irritation or sensitivity.

Benzocaine

A local anaesthetic applied to skin or moist body surfaces to reduce sensation. Rarely, especially after excessive use, it can cause methemoglobinaemia, a condition in which blood cannot carry oxygen normally.

Benzodiazepine

A medicine that enhances the effect of the inhibitory chemical messenger GABA in the brain. It may reduce anxiety, induce sleep, relax muscles, or control seizures, but can cause sedation, impaired coordination, dependence, and dangerous breathing suppression when combined with opioids or other sedatives.

Benzodiazepine Toxicity

Excess benzodiazepine effect causing drowsiness, slurred speech, ataxia, impaired coordination, and sometimes coma or respiratory depression, especially with opioids or alcohol. Flumazenil can precipitate seizures or withdrawal in some settings.

Benzodiazepine Use Disorder

A pattern of benzodiazepine use that causes loss of control, harm, or problems at work, home, or in relationships. Regular use can cause dependence, and sudden stopping can produce life-threatening withdrawal.

Benzodiazepine Withdrawal

Symptoms after reducing or stopping regular benzodiazepine use. Anxiety, insomnia, shaking, sweating, and sensitivity to light may occur; severe withdrawal can cause seizures, hallucinations, or delirium.

Benzopyran

A chemical ring structure formed by joining benzene and pyran rings. It occurs in some natural substances and medicines; the term describes chemistry rather than one specific disease or treatment.

Benzopyrene

A group of chemicals produced by incomplete burning and found in tobacco smoke, vehicle exhaust, and heavily charred food. Some forms can damage DNA and increase cancer risk after the body

changes them chemically.

Benzopyrenes

Plural form; see *Benzopyrene*.

Benzoyl Peroxide

A topical medicine that kills acne-causing bacteria and helps remove blocked skin cells. It can cause dryness, peeling, irritation, or bleaching of hair and fabrics.

Benzphetamine

A sympathomimetic amine and stimulant formerly used in some countries as a short-term adjunct for weight reduction; it can cause dependence, cardiovascular effects, and insomnia and is restricted or unavailable in many jurisdictions.

Benztropine

An anticholinergic medicine used mainly for movement problems caused by some medicines and for acute muscle spasms called dystonia. It can cause dry mouth, blurred vision, constipation, urinary retention, confusion, or worsen glaucoma.

Benzydamine

A topical anti-inflammatory pain-relieving medicine used for painful inflammation in the mouth, throat, or skin. It may cause temporary numbness, irritation, or an allergic reaction.

Benzylamines

Chemical compounds containing a benzyl group joined to an amino group. Some are used to make medicines or other chemicals, while their effects depend on the individual compound.

Benzyl Benzoate

A topical medicine used to kill mites that cause scabies and, in some settings, lice. It can irritate the skin.

Benzylpenicillin

A penicillin antibiotic used for serious infections caused by susceptible bacteria, including some streptococcal infections, meningitis, and syphilis. Allergic reactions can be severe.

BEP Regimen

A chemotherapy combination of bleomycin, etoposide, and cisplatin, commonly used for some germ-cell cancers. Important toxicities include low blood counts, infection, kidney damage, hearing changes, nerve symptoms, and lung injury.

Berberine

A plant compound sold in some supplements and studied for blood-sugar, cholesterol, and antimicrobial effects. Evidence varies, and it can cause stomach symptoms, low blood sugar, drug interactions, or harm during pregnancy.

Bereavement

The emotional response to the death of someone important. Grief may include sadness, yearning, anger, numbness, sleep or appetite changes, and waves of distress; it varies widely and can sometimes lead to prolonged grief or depression.

Bereavement Reaction

Emotional and physical responses after someone dies, such as sadness, disbelief, anger, poor sleep, or loss of appetite. These reactions are common and do not automatically indicate a mental disorder.

Berger Disease

An older name for IgA nephropathy, a kidney disease in which an immune protein builds up in kidney filters. It may cause episodes of blood in the urine after infections, protein in the urine, high blood pressure, and kidney failure.

Berger's Disease

Alternate name; see *IgA Nephropathy*.

Beriberi

Illness caused by severe vitamin B1 deficiency. It may damage nerves and cause weakness, numbness, or difficulty walking, or affect the heart and cause swelling, fast heartbeat, and heart failure.

Berloque Dermatitis

A phototoxic skin reaction caused when perfume or cosmetics containing psoralens, classically bergamot oil, are followed by ultraviolet-A exposure. It may produce burning, redness, or blisters and then a pendant- or drip-shaped area of hyperpigmentation on the face or neck.

Bernard-Soulier Disease

Alternate name; see *Bernard-Soulier Syndrome*.

Bernard-Soulier Syndrome

A rare inherited bleeding disorder in which platelets are unusually large and do not work properly to stop bleeding. It usually involves a change in the platelet receptor that helps platelets attach to injured blood vessels. It can cause easy bruising, nosebleeds, heavy periods, or prolonged bleeding.

Alternate Names:
Glycoprotein Ib Deficiency; Platelet-Type Bleeding Disorder 1

Bernard–Soulier Syndrome

Alternate spelling; see *Bernard-Soulier Syndrome*.

Berry Aneurysm

A small, rounded balloon-like bulge at a branching point of an artery at the base of the brain. If it bursts, it can cause life-threatening bleeding around the brain.

Berylliosis

A long-term lung disease caused by sensitivity to inhaled beryllium dust or fumes. It can cause cough, breathlessness, fatigue, and scarring or inflammation that resembles sarcoidosis.

Beryllium

A light metal used in some industrial products. Breathing its dust or fumes can cause allergic lung inflammation, long-term lung disease, and increased cancer risk, especially after repeated workplace exposure.

Best Disease

An inherited macular disorder, usually caused by variants in BEST1, with abnormal accumulation of yellow material at the macula. Vision loss varies and may progress to atrophy, neovascularization, or scarring.

Beta 2-Microglobulin

A small protein released by most cells. Blood or urine levels may rise with inflammation, some blood cancers, or reduced kidney removal; the result is interpreted with symptoms and other tests.

Beta-Adrenoceptor-Blocking Drugs

Medicines that block adrenaline-like signals at beta receptors. They can slow the heart, lower blood pressure, reduce tremor, and protect the heart in selected conditions, but may cause fatigue, low pulse, or breathing problems in susceptible people.

Beta-Agonist

A pharmacological agent that stimulates beta-adrenergic receptors. Beta-2 selective agonists (such as albuterol and salmeterol) induce bronchial smooth muscle relaxation and bronchodilation in asthma and chronic obstructive pulmonary disease.

Alternate Names:
Beta-Adrenergic Agonist

Beta-Alanine

An amino acid that helps muscles make carnosine, which buffers acid during intense activity. Supplements may modestly improve some short, high-intensity exercise but commonly cause temporary tingling of the skin.

Beta Amyloid

Small protein fragments made from amyloid precursor protein. They can build up into plaques in the brain and are associated with Alzheimer disease, although plaques alone do not explain every symptom.

Alternate Names:
Aβ Peptide; Amyloid-Beta Protein

Beta-Blockers

Alternate name; see *Beta-Adrenoceptor-Blocking Drugs*.

Beta-Blockers Overdose

Poisoning from taking too much of a beta-blocker. It can cause a very slow heartbeat, low blood pressure, wheezing, low blood sugar, confusion, seizures, or shock.

Beta-Blocker Toxicity

Poisoning that can cause slow heart rate, low blood pressure, atrioventricular block, cardiogenic shock, low blood sugar, bronchospasm, seizures, or altered mental status. Propranolol may also widen the QRS complex or cause seizures.

Beta Carotene

Alternate spelling; see *Beta-Carotene*.

Beta-Carotene

A plant-derived carotenoid and provitamin A pigment found in yellow, orange, and dark green leafy vegetables (such as carrots and spinach). In the intestinal mucosa, it is enzymatically cleaved into retinal. Excessive consumption can cause benign yellow-orange discoloration of the skin (carotenodermia, characteristically sparing the sclerae). Pharmacologic high-dose beta-carotene supplementation is contraindicated in smokers due to clinical trials demonstrating an increased risk of lung cancer.

Alternate Names:
Provitamin A Carotenoid; Carotenoid Provitamin

Beta-Carotene Blood Test

A blood test measuring beta-carotene, a plant pigment that can become vitamin A. A low result may suggest poor nutrition or fat absorption; a high result may cause harmless yellow-orange skin.

Beta Cell

A cell in the pancreas that makes and releases insulin when blood glucose rises. Insulin helps body cells use glucose and keeps blood glucose from becoming too high.

Alternate Names:
Beta Cells; Pancreatic Beta Cell; Pancreatic Beta Cells

Beta-Chemokines

Small immune signals that attract white blood cells to areas of infection or inflammation. They help coordinate defense, but excessive activity can contribute to long-lasting inflammation and tissue damage.

Betacoronavirus

A group of coronaviruses that includes viruses causing respiratory illnesses in people and animals. Individual viruses differ in spread and severity; some cause mild colds, while others can cause severe pneumonia.

Beta-Endorphin

A natural pain-relieving substance made in the brain and pituitary gland. It acts on opioid receptors and also influences stress responses, mood, and some hormone functions.

Beta Globulin

A group of blood proteins identified together during a protein blood test. They include proteins that carry iron or fats and support immunity; abnormal levels can occur with inflammation, liver disease, or immune disorders.

Beta Glucans

Alternate spelling; see *Beta-Glucans*.

Beta-Glucans

Complex carbohydrates found in foods such as oats, barley, mushrooms, and yeast. Their effects vary by source; some provide fibre and may modestly affect cholesterol, blood glucose, or immune activity.

Beta-Haemolytic Streptococcus

A streptococcus that completely breaks down red blood cells around its colonies in a laboratory culture. Important group A and group B species can cause throat, skin, bloodstream, newborn, or other

serious infections.

Betaherpesvirinae

A subgroup of herpes viruses that includes cytomegalovirus and human herpesviruses 6 and 7. They remain in the body after infection and can reactivate, especially when immunity is weakened.

Beta-Human Chorionic Gonadotrophin

The measurable part of the pregnancy hormone hCG. Blood or urine testing helps detect pregnancy and can help assess some pregnancy problems or selected tumours when interpreted with other findings.

Betaine

A natural substance involved in processing homocysteine and helping cells maintain their water balance. It is also sold as a supplement, but high doses can cause side effects or interact with medicines.

Beta Interferons

Immune-modifying medicines used to reduce relapses and new brain or spinal-cord lesions in some forms of multiple sclerosis. Common effects include flu-like symptoms and injection-site reactions; monitoring may detect liver or blood-count abnormalities.

Beta-Lactam Antibiotics

A large group of antibiotics that stop susceptible bacteria building their protective cell wall. They include penicillins, cephalosporins, carbapenems, and related medicines; allergic reactions and bacterial resistance can limit their use.

Beta-Lactamase

An enzyme made by some bacteria that breaks down certain penicillin-like antibiotics and makes them ineffective. Laboratory testing can identify this resistance, and some medicines block selected beta-lactamases.

Beta-Lactamase Inhibitor

A medicine that blocks selected bacterial beta-lactamase enzymes, helping a partner beta-lactam antibiotic resist breakdown. Inhibitors differ in structure, reversibility, and the enzymes they block; examples include clavulanate, sulbactam, tazobactam, and avibactam.

Beta-Mannosidosis

A rare autosomal recessive disorder in which cells cannot break down certain complex sugars. The stored material can cause developmental delay, hearing loss, repeated infections, seizures, or skeletal and skin problems.

Betamethasone

A strong corticosteroid medicine that reduces inflammation and immune activity. It may be applied to skin or given in other forms; prolonged or extensive use can thin the skin, worsen infections, or suppress the body's steroid production.

Betamethasone Valerate

A corticosteroid applied to the skin to reduce inflammation and itching in conditions such as eczema or psoriasis. Excessive, prolonged, or covered application can thin the skin and increase absorption into the body.

Beta-Oxidation

Alternate form; see *Fatty Acid Oxidation*.

Beta Particle

A fast-moving electron or positively charged equivalent released by some radioactive atoms. It can damage nearby tissue and is therefore used carefully in selected radiation treatments and laboratory applications.

Beta Radiation

Radiation made of fast electrons or their positively charged counterparts released by unstable atoms. It can injure living tissue but can also be directed at selected tissues for treatment or used in medical testing.

Beta-Sheet

A common folded shape in proteins in which extended strands lie beside one another and are held by chemical bonds. Excessive beta-sheet folding can contribute to abnormal protein deposits in some diseases.

Beta Thalassemia

An inherited disorder caused by reduced or absent production of beta-globin, usually due to pathogenic variants in the *HBB* gene. It causes microcytic anaemia of variable severity. A single affected gene usually causes carrier status with mild or no anaemia; variants affecting both copies can cause intermedia or severe major disease. Severe disease may cause ineffective red-cell production, splenomegaly, and bone changes.

Beta-Thalassemia

Alternate spelling; see *Beta Thalassemia*.

Beta-Thalassemia Intermedia

A moderately severe inherited form of beta-thalassemia causing ongoing anaemia, enlarged spleen, jaundice, or bone changes. People may need occasional transfusions, but usually do not require regular lifelong transfusions.

Beta-Thalassemia Major

The severe, usually transfusion-dependent form of beta-thalassemia caused by disease-causing variants in both copies of the *HBB* gene. The variants may abolish or reduce beta-globin production, leading to severe anemia because the bone marrow makes red blood cells poorly. Complications can include an enlarged spleen, bone changes, and iron overload.

Alternate Names:
Cooley Anemia

Beta-Thalassemia Minor

An inherited blood trait in which a person inherits one mutated gene for beta-globin, a protein needed to make hemoglobin in red blood cells. People with this condition produce slightly smaller red blood cells and may have mild anemia, but they typically have no symptoms and lead normal lives. Because their red blood cells are small, the condition is sometimes confused with iron-deficiency anemia, even though body iron levels are normal.

Alternate Names:
Beta-Thalassemia Trait; Cooley Trait; Thalassemia Minor

Beta-Thalassemia Trait

Alternate name; see *Beta-Thalassemia Minor*.

Beta Tocopherol

One naturally occurring form of vitamin E. It acts as a fat-soluble antioxidant, but the body generally uses alpha-tocopherol more effectively; its specific clinical importance is still being studied.

Betaxolol

A relatively beta-1-selective blocker used orally for some cardiovascular conditions and topically to lower intraocular pressure in glaucoma. It may cause bradycardia, hypotension, or bronchospasm.

Bethanechol

Bethanechol is a muscarinic cholinergic agonist that stimulates bladder and gastrointestinal smooth muscle, used selectively for urinary retention or impaired motility.

Bethesda System For Reporting Thyroid Cytopathology

A six-tier standardized system for reporting thyroid fine-needle aspiration results, from nondiagnostic and benign categories to follicular-pattern, suspicious, and malignant categories; each tier guides risk assessment and management.

Bethlem Myopathy

A usually slowly progressive inherited muscle disease caused by changes in collagen VI. It causes weakness, often beginning in childhood, together with tight joints or shortened muscles, especially in the fingers, elbows, ankles, or spine; many people remain able to walk into adulthood.

Alternate Names:
Collagen VI-Related Myopathy (Mild Form); Be-

nign Congenital Myopathy with Contractures

Bevacizumab

A monoclonal antibody that blocks vascular endothelial growth factor and inhibits new blood-vessel formation. It is used for selected cancers and some eye diseases; important risks include hypertension, bleeding, thrombosis, proteinuria, impaired wound healing, and gastrointestinal perforation.

Bexarotene

An oral retinoid X-receptor agonist used mainly for cutaneous T-cell lymphoma; it commonly causes hypertriglyceridaemia, hypothyroidism, and liver abnormalities and is teratogenic.

Bezafibrate

A fibrate lipid-lowering medicine that activates peroxisome proliferator-activated receptor alpha (PPAR-alpha) and lowers triglycerides. Adverse effects can include muscle injury and liver abnormalities.

Bezoar

A compact mass of material that cannot be digested and becomes trapped in the stomach or intestine. It may contain hair, plant matter, medicines, or other substances and can cause pain, vomiting, blockage, or bleeding.

Bezold-Jarisch Reflex

An inhibitory autonomic cardiovascular reflex characterized by the triad of profound bradycardia, peripheral vasodilation with severe hypotension, and transient apnea. It is triggered by the stimulation of non-myelinated vagal sensory C-fibers in the inferoposterior wall of the left ventricle by mechanical deformation, chemical agents, or acute ischemia during inferior myocardial infarction.

BH4 Deficiency

An inherited deficiency of tetrahydrobiopterin, a cofactor needed to process phenylalanine and make several neurotransmitters. It can cause high phenylalanine, seizures, movement or developmental problems, and neurologic disease; treatment depends on the specific defect.

B Hemophilia

Alternate name; see *Hemophilia B*.

Biacetyl

Biacetyl, or diacetyl, is a diketone compound with a buttery odor used in flavoring and industry; inhalational exposure can injure the small airways.

Bias

A systematic deviation that distorts a measurement, study result, clinical judgment, or decision away from the truth or from an intended fair comparison.

Bibliotherapy

The use of reading materials as a therapeutic intervention to support mental health, educate patients about conditions, or promote behavioral change. It may be used alone or alongside other treatments for depression, anxiety, or chronic disease self-management.

Bicalutamide

A non-steroidal androgen-receptor antagonist used in prostate cancer, usually with androgen-deprivation therapy; adverse effects include hot flushes, breast enlargement, sexual dysfunction, and possible liver injury.

Bicarbonate

A substance in the blood that helps keep the body's acid level balanced. The lungs and kidneys regulate it, and a blood bicarbonate result can help identify acid–base or metabolic problems.

Bicarbonate Buffer System

The primary extracellular chemical buffer system in the human body, consisting of carbonic acid and bicarbonate ion in equilibrium with dissolved carbon dioxide, regulated by the lungs (via carbon dioxide excretion) and the kidneys (via bicarbonate reabsorption and excretion).

Biceps

The biceps is a two-headed muscle, especially the biceps brachii of the upper arm, that flexes the elbow and supinates the forearm.

Biceps Brachii Muscle

The two-part muscle on the front of the upper arm. It bends the elbow, turns the palm upward, and helps lift the arm. Injury or tendon rupture can cause weakness, pain, bruising, or a bulging "Popeye" appearance.

Biceps Reflex

Bending of the elbow after the biceps tendon is gently tapped. This reflex tests the nerve supplying the biceps and the related spinal-cord pathways, mainly at the fifth and sixth neck levels.

Bicipital

Bicipital means relating to a two-headed muscle, especially the biceps tendon, groove, or muscle of the upper arm.

Bicipital Groove

The intertubercular groove of the humerus that transmits the tendon of the long head of the biceps brachii, with the transverse humeral ligament and adjacent rotator-cuff structures contributing to tendon stability.

Bicipital Tendinitis

Irritation and degeneration of the long-head biceps tendon near the shoulder, causing pain in the front of the shoulder that may worsen with lifting, reaching overhead, or resisted elbow flexion.

Bicipital Tuberosity

The radial tuberosity, a roughened prominence on the proximal radius where the biceps brachii tendon inserts and produces flexion and supination of the forearm.

Bickerstaff Brainstem Encephalitis

A rare autoimmune post-infectious central nervous system disorder closely related to the Miller Fisher variant of Guillain-Barré syndrome. It is characterized by the clinical triad of acute progressive ophthalmoplegia, severe ataxia, and central nervous system disturbance (altered consciousness or hyperreflexia), typically accompanied by serum anti-GQ1b IgG autoantibodies.

Bicolor

Having two distinct colours; the term may describe a structure such as an iris or a skin lesion.

Biconcave

Curved inward on both sides. Normal red blood cells have this disc shape, which makes them flexible and provides a large surface area for carrying oxygen.

Biconvex

Curved outward on both sides. The term may describe the shape of a lens, implant, anatomical structure, or finding on a scan.

Bicornuate

Having two horn-like cavities or projections. A bicornuate uterus is a congenital difference in which the upper uterus forms two partly separated spaces.

Bicornuate Uterus

A uterus with two upper cavities caused by incomplete joining during development before birth. Many people have no symptoms, but it can increase the risk of miscarriage, preterm birth, or abnormal baby position.

Alternate Names:
Bicornate Uterus

Bicuspid

Having two points or flaps. The term describes some teeth, which have two main points, and some heart valves, which have two flaps instead of the usual three.

Bicuspid Aortic Valve

A congenital aortic valve with two leaflets instead of the usual three. It can lead to aortic stenosis, aortic regurgitation, enlargement of the aorta, or

other congenital heart abnormalities.

Bicuspid Valve

A valve with two leaflets. The normal mitral valve is bicuspid; in a congenital heart-valve disorder, the term usually refers to a bicuspid aortic valve, which has two leaflets instead of three. It may be associated with aortic stenosis, regurgitation, or ascending-aortic enlargement.

Bid Protein

A protein that helps connect signals from outside a cell with programmed cell death inside it. When activated, it can help mitochondria release signals that lead to destruction of a damaged or unwanted cell.

Bielschowsky Head Tilt Test

A clinical diagnostic test used to evaluate trochlear nerve (cranial nerve IV) palsy causing superior oblique muscle paresis. Hypertropia and vertical diplopia worsen when the patient tilts the head toward the ipsilateral (paretic) side and improve when tilted toward the contralateral side, as the intact vestibular ocular reflex attempts intorsion.

Alternate Names:
Bielschowsky Phenomenon; Head Tilt Test

Biermer's Anemia

Another name for pernicious anaemia, in which the body cannot absorb enough vitamin B12 because the stomach does not provide the needed absorption factor. It causes anaemia and can damage nerves if untreated.

Bier Spots

Small, pale macules surrounded by an erythematous background on the extremities, typically elicited when the limbs are placed in a dependent position. They represent a benign physiological vascular anomaly caused by exaggerated local vasoconstriction in response to increased venous pressure and resolve upon limb elevation.

Bietti's Crystalline Dystrophy

A rare inherited eye disease in which tiny crystals and progressive damage develop in the retina and sometimes the cornea. It may cause difficulty seeing at night, loss of side vision, and gradual loss of central vision.

Bifascicular Block

An ECG finding in which electrical signals are delayed or blocked in two of the three main pathways carrying signals to the lower chambers of the heart. It usually combines right bundle branch block with a block in one of the left-sided pathways; its significance depends on symptoms and other heart findings.

Bifocal

Having two points of focus. Bifocal glasses contain one area for distance vision and another for near vision, allowing both prescriptions in one lens.

Bifurcation

The point where one body structure, blood vessel, airway, nerve, or pathway divides into two branches.

Bigeminy

A heart-rhythm pattern in which each underlying beat is followed by a premature beat, creating an alternating sequence. The premature beats may arise in the atria (atrial bigeminy) or ventricles (ventricular bigeminy). Bigeminy may cause palpitations or no symptoms.

Biglycan

A protein-and-sugar component of the tissue framework around cells. It helps organize collagen and may influence inflammation, wound healing, and blood-vessel changes.

Big Toe Sign

Upward movement of the big toe, sometimes with spreading of the other toes, when the sole is stroked. In an adult, this may suggest a problem in pathways connecting the brain and spinal cord.

Biguanide

A class of medications used to manage type 2 dia-

betes, most commonly represented by metformin. They lower blood sugar levels primarily by reducing the amount of glucose produced by the liver and improving the body's sensitivity to insulin, helping muscle cells take up glucose more effectively without causing low blood sugar on their own.

Alternate Names:
Biguanide Drugs; Biguanide Antidiabetics

Biguanides

Plural form; see *Biguanide*.

Bilateral

Affecting both sides of the body or both members of a paired structure, such as both eyes, ears, knees, lungs, or kidneys.

Bilateral Acoustic Neurofibromatosis

Older name for *NF2-Related Schwannomatosis*, a tumour-predisposition disorder characterized especially by bilateral vestibular schwannomas.

Bilateral Acoustic Neuroma

Tumours affecting both vestibular nerves, usually representing bilateral vestibular schwannomas associated with NF2-related schwannomatosis. They may cause hearing loss, tinnitus, balance problems, or other cranial-nerve symptoms.

Alternate Names:
Bilateral Vestibular Schwannoma; Bilateral Acoustic Neurinoma

Bilateral Ankle Swelling

Alternate form; see *Ankle Swelling*.

Bilateral Clubfoot

Clubfoot affecting both feet. Each foot turns downward and inward and may be stiff, with the heel and calf often smaller than usual. The deformity involves the foot and ankle and is present at birth.

Bilateral Gynecomastia

Enlargement of glandular breast tissue on both sides in a male. It may result from normal hormone changes, medicines, obesity, liver or kidney disease, or rarely cancer.

Bilateral Hydronephrosis

Enlargement of the urine-collecting spaces in both kidneys because urine cannot drain normally. Causes include blockage, reflux, stones, or bladder problems; prolonged obstruction can damage kidney function.

Bilateral Microphthalmos

A congenital condition in which both eyes are abnormally small. Vision may be reduced, and other ocular or developmental differences may occur. The degree of visual impairment varies with eye size and associated structural abnormalities.

Bilateral Oophorectomy

Surgery to remove both ovaries, sometimes performed for cancer, severe endometriosis, or high inherited cancer risk. Before natural menopause it causes immediate loss of ovarian hormones and infertility.

Bilateral Peritonsillar Abscesses

Collections of pus beside both tonsils, usually after a throat infection. They can cause severe sore throat, difficulty swallowing, trouble opening the mouth, muffled speech, and airway narrowing.

Bilateral Pneumonia

Infection or inflammation affecting both lungs. It may cause fever, cough, chest discomfort, breathlessness, or low oxygen; severity depends on the cause, extent, and person's health.

Bilateral Polycystic Ovarian Syndrome

Nonstandard name; see *Polycystic Ovary Syndrome*.

Bilateral Sectoral Iris Heterochromia

A variation in iris pigmentation in which differently colored sectors occur within both irises. It may be present from birth or develop later.

Bilateral Tonic-Clonic Seizure

A seizure with loss of awareness, followed by stiffen-

ing and rhythmic jerking of both sides of the body. It may begin in both sides of the brain or spread to both sides from a focal onset.

Bile

An aqueous fluid produced continuously by the liver (about 600–1,000 mL daily) and carried through bile ducts. Most is diverted to the gallbladder between meals, where absorption of water and electrolytes concentrates it, usually about fivefold and up to twentyfold. After a meal, cholecystokinin stimulates gallbladder contraction and delivery into the duodenum; secretin stimulates bicarbonate-rich ductal secretion. Bile contains bile salts, phospholipids, cholesterol, bilirubin, and electrolytes; bile salts emulsify fats and facilitate fat and fat-soluble-vitamin absorption.

Bile Acids

Substances made by the liver and released into the intestine to help digest and absorb fats and vitamins A, D, E, and K. Abnormal blood levels can indicate liver or bile-flow problems.

Bile Acid Sequestrants For Cholesterol

Medicines that trap bile acids in the intestine so they leave in stool. The liver then uses cholesterol to make more bile acids, lowering LDL cholesterol; constipation and medicine interactions are common concerns.

Bile Culture

A laboratory test that grows microorganisms from a bile sample to identify infection in the gallbladder or bile ducts and help select effective treatment.

Bile Duct

A tube that carries bile from the liver and gallbladder into the first part of the small intestine. Blockage or inflammation can prevent bile flow and cause pain, jaundice, infection, or pancreatitis.

Bile Duct Cancer

A malignancy arising in the bile ducts, also called cholangiocarcinoma. It is classified by location as intrahepatic, perihilar, or distal; extrahepatic tumors may obstruct bile flow and cause jaundice, dark urine, pale stools, itching, abdominal pain, or weight loss.

Alternate Names:
Cholangiocarcinoma

Bile Duct Carcinoma

Alternate name; see *Bile Duct Cancer*.

Bile Duct Obstruction

A blockage that prevents bile moving from the liver or gallbladder into the intestine. It may cause jaundice, dark urine, pale stools, itching, abdominal pain, infection, or pancreatitis.

Bile Ducts

Plural form; see *Bile Duct*.

Bile Duct Stricture

Narrowing of a bile duct that slows or blocks bile flow. It may result from surgery, inflammation, stones, or cancer and can cause jaundice, pain, infection, or abnormal liver tests.

Bile Pigment

A coloured substance, mainly bilirubin, made when haemoglobin from old red blood cells is broken down. The liver processes it and excretes it in bile; build-up causes yellowing of the skin and eyes.

Bile Reflux

Backward flow of bile from the small intestine into the stomach and sometimes the esophagus. It may occur after stomach surgery or with impaired digestive movement and can contribute to irritation or inflammation.

Alternate Names:
Duodenogastric Reflux

Bile Reflux Gastritis

Inflammation of the stomach lining caused by backward flow of bile and other digestive juices from the small intestine. It can occur after stomach surgery or when normal digestive movement is impaired.

Alternate Names:

Alkaline Reflux Gastritis

Bile Salt Emulsification

The process in which bile salts break dietary fat into tiny droplets. This increases the surface area available to digestive enzymes and helps the intestine absorb fat and fat-soluble vitamins.

Bile Salt Malabsorption

Reduced reabsorption of bile acids in the small intestine, allowing excess bile acids to reach the colon and cause watery diarrhoea, urgency, or abdominal discomfort.

Alternate Names:
Bile Acid Diarrhea; Bile Acid Diarrhoea

Bile Salts

Substances made from cholesterol in the liver and released in bile. They help break fats into small droplets so the intestine can digest and absorb fats and vitamins A, D, E, and K.

Bile Secretion

Production and release of bile by liver cells into the bile canaliculi, followed by transport through the bile ducts and, between meals, storage and concentration in the gallbladder. Bile supports fat digestion and excretion of bilirubin and other substances.

Bilevel Positive Airway Pressure

Breathing support delivered through a mask, with higher air pressure when breathing in and lower pressure when breathing out. It can support breathing in conditions such as sleep apnoea or some lung and heart problems.

Bilharzia

An infection caused by Schistosoma parasites acquired when contaminated freshwater contacts the skin. It may affect the intestine, liver, urinary tract, or other organs and can cause long-term inflammation and scarring.

Biliary

Relating to bile, the gallbladder, or the tubes that carry bile from the liver to the intestine.

Biliary Atresia

A rare liver disorder in newborns and infants in which the bile ducts outside the liver are blocked, scarred, or missing. This prevents bile from draining from the liver into the intestines, causing bile to build up and damage liver tissue. Signs include prolonged jaundice (yellow skin and eyes), pale or clay-colored stools, and dark urine.

Biliary Calculi

Stones formed from hardened bile in the gallbladder or bile ducts. They may cause no symptoms or block bile flow, producing pain, jaundice, infection, or inflammation of the gallbladder or pancreas.

Biliary Cirrhosis

An older term for cirrhosis caused by long-standing bile-duct disease or obstruction. It was also formerly used for primary biliary cirrhosis, now called primary biliary cholangitis.

Biliary Colic

Steady upper-abdominal pain, usually in the right upper quadrant or epigastrium, caused by temporary blockage of the cystic duct or another bile duct, commonly by a gallstone. Despite the name, the pain is typically steady rather than cramping. It may follow a meal and last minutes to hours, easing when the obstruction clears; prolonged pain or fever may indicate a complication such as cholecystitis.

Biliary Decompression

A procedure that drains blocked bile ducts to restore bile flow. A doctor may place a stent or drainage tube through an endoscope or through the skin, depending on the cause and location of the blockage.

Biliary Dyskinesia

Gallbladder pain without gallstones or another obvious structural problem, often associated with abnormal emptying. Diagnosis requires typical symptoms and exclusion of other causes; a scan may help but

is not decisive alone.

Biliary Fever

Fever associated with infection of the bile ducts or gallbladder. In acute cholangitis, fever may occur with upper-abdominal pain and jaundice, but the full combination is not always present.

Biliary Fistula

An abnormal passage allowing bile to leak from the gallbladder or bile ducts into another organ, the abdominal cavity, or the skin. It may cause pain, infection, bile drainage, or skin irritation.

Biliary Obstruction

Alternate name; see *Bile Duct Obstruction*.

Biliary Sand

Fine crystals or thick sludge suspended in bile, usually containing cholesterol, calcium salts, or pigment. It may disappear, form gallstones, block a duct, or cause gallbladder inflammation.

Biliary Scintigraphy

A nuclear medicine scan that uses a small amount of radioactive tracer to follow bile from the liver through the gallbladder and bile ducts into the small intestine. It can help assess gallbladder inflammation, bile leaks, or how well the gallbladder empties.

Alternate Names:
Cholescintigraphy; HIDA Scan; Hepatobiliary Scintigraphy; Hepatobiliary Iminodiacetic Acid Scan

Biliary Stasis

Alternate name; see *Cholestasis*.

Biliary Stent

A small tube placed inside a bile duct to keep it open and allow bile to drain when it is narrowed or blocked. Stents can move, clog, or cause infection or pancreatitis.

Biliary System

The liver, gallbladder, and bile ducts that make, store, and carry bile into the small intestine to help digest fats.

Biliary Tract

The network of ducts carrying bile from the liver and gallbladder to the small intestine. Blockage or inflammation can cause upper-abdominal pain, jaundice, infection, or pancreatitis.

Biliary Tract Biopsy

A procedure to collect cells or a small tissue sample from a bile duct or the gallbladder for laboratory examination. A doctor may collect it during an endoscopic procedure or through the skin using imaging.

Biliary Tract Injuries

Damage to the gallbladder or bile ducts, often after abdominal surgery or trauma. Bile may leak or drainage may become blocked, causing abdominal pain, jaundice, infection, or later narrowing.

Biliary Tree

Alternate name; see *Biliary Tract*.

Bili Lights

Special blue-green light used in phototherapy to change bilirubin in a newborn's skin into forms that can be eliminated more easily. Phototherapy lowers bilirubin and helps prevent bilirubin-related brain injury.

Bilious

Containing or relating to bile. Bilious vomit is usually yellow or green because bile has entered the stomach contents.

Bilious Vomiting

Vomiting green or yellow fluid containing bile. In a newborn or infant, clearly green vomit can indicate bowel blockage.

Bilirubin

A yellow substance made mainly when old red blood cells are broken down. The liver changes it and sends

it into bile; too much bilirubin in the blood causes yellowing of the skin and eyes.

Bilirubin Blood Test

A blood test that measures bilirubin, a yellow substance made as old red blood cells break down. The result can help identify problems with red blood cells, the liver, or bile flow. In newborns, it helps assess the risk of bilirubin-related brain injury.

Bilirubin Encephalopathy

Brain injury caused by very high levels of unconjugated bilirubin, especially in newborns. Early signs may include poor feeding, sleepiness, weak or stiff muscles, and seizures; permanent injury is called kernicterus.

Bilirubin Metabolism

The process by which the body makes bilirubin from old red blood cells, carries it to the liver, changes it into a water-soluble form, and removes it in bile and stool.

Bilirubin Test

A blood test measuring total and direct (conjugated) bilirubin levels to assess liver function, biliary tract patency, and red blood cell breakdown (hemolysis); see *Bilirubin*.

Bilirubinuria

The presence of conjugated (direct), water-soluble bilirubin in urine. It may occur when liver dysfunction or blocked bile flow raises conjugated bilirubin in the blood and can make urine appear unusually dark.

Biliverdin

A green pigment formed when haemoglobin is broken down. The body normally converts it into bilirubin, which the liver processes and removes in bile.

Billroth I

A surgical procedure for partial gastrectomy in which the distal stomach (antrum and pylorus) is resected and the remaining proximal gastric remnant is anastomosed directly to the duodenum (gastroduodenostomy).

Alternate Names:
Billroth I Reconstruction; Gastroduodenostomy

Billroth II

A surgical procedure for partial gastrectomy in which the distal stomach is resected, the duodenal stump is closed, and the remaining gastric remnant is anastomosed to a loop of the proximal jejunum (gastrojejunostomy), leaving a blind duodenal limb for biliopancreatic drainage.

Alternate Names:
Billroth II Reconstruction; Gastrojejunostomy

Billroth II Operation

A surgical reconstruction procedure following partial gastrectomy in which the duodenal stump is oversewn closed and the gastric remnant is anastomosed directly to the side of a loop of proximal jejunum (gastrojejunostomy).

Billroth I Operation

A surgical reconstruction procedure following partial gastrectomy (antrectomy) in which the remaining gastric remnant is anastomosed directly to the duodenal stump (gastroduodenostomy).

Billroth's Operation

An older type of partial stomach-removal surgery. In Billroth I the remaining stomach is joined to the duodenum; in Billroth II it is joined to the jejunum, a later part of the small intestine.

Bilophila

A group of bacteria that can live without oxygen in the human intestine. Most are harmless there, but Bilophila wadsworthia has been found in some appendicitis, abdominal, wound, and bloodstream infections.

Bilophila Wadsworthia

A bacterium that tolerates bile and normally occurs in small numbers in the colon. If intestinal bacteria

enter damaged or normally sterile tissue, it may contribute to appendicitis, abdominal infection, or wound infection.

Bimanual

Performed using both hands. A bimanual pelvic examination uses one hand inside the vagina and the other on the abdomen to assess pelvic organs.

Bimatoprost

Bimatoprost is a prostaglandin analogue used as eye drops to lower intraocular pressure and, in some formulations, promote eyelash growth.

Bimedial

Describing the medial, or midline-facing, sides of two structures. It identifies a relative position, so the structures being compared must be specified.

Bimellar

Made of two thin layers or plates. The term describes the structure of a membrane, tissue, or other object and has no disease meaning by itself.

Binary Fission

A form of reproduction in which one cell divides into two genetically similar cells. It is common among bacteria and many single-celled organisms.

Binder Excipient

An inactive ingredient added during tablet manufacture to help powder particles stick together. It has no intended treatment effect but affects the tablet's strength and breakdown.

Binding Protein

A protein that attaches specifically to another molecule, such as a hormone, medicine, nutrient, DNA segment, or cell-surface signal. Binding can transport, store, activate, or block the other molecule.

Binding Site

The particular area of a molecule where another molecule attaches. The interaction can change activity, transmit a signal, allow transport, or enable a laboratory test to detect the target.

Binet-Simon Scale

An early intelligence test for children that compared performance with tasks expected at different ages. It influenced modern cognitive testing but is no longer the standard tool for clinical assessment.

Binge Drinking

An episode of heavy alcohol use. The CDC defines it as four or more standard drinks for women or five or more for men on one occasion; this amount typically raises blood alcohol concentration to 0.08

Alternate Names:
Episodic Heavy Drinking; Heavy Episodic Drinking

Binge Eating Disorder

Alternate form; see *Binge-Eating Disorder*.

Binge-Eating Disorder

An eating disorder involving recurrent episodes of consuming an unusually large amount of food in a discrete period with a sense of loss of control and marked distress. Episodes occur at least once a week for three months and are not regularly followed by compensatory behaviors such as vomiting, fasting, or excessive exercise. Body weight alone does not establish the diagnosis.

Alternate Names:
BED

Binge-Purge Disorder

An older or patient-facing name for bulimia nervosa, an eating disorder involving recurrent binge eating followed by compensatory behaviors such as self-induced vomiting, fasting, or excessive exercise.

Binocular Vision

The use of both eyes together to produce one image and judge depth. Misalignment or poor coordination between the eyes can cause double vision, eyestrain, or reduced depth perception.

Alternate Names:
Two-Eyed Vision; Binocular Visual Function

Binocular Visual Loss

Reduced vision affecting both eyes. Causes may involve the eyes, optic nerves, brain, or visual pathways; sudden loss with weakness, speech trouble, or severe headache may indicate an acute neurologic disorder.

Binswanger Disease

A form of small-vessel disease in the brain that damages deep white matter. It can cause gradually worsening thinking, walking difficulty, mood changes, and urinary problems.

Binswanger's Dementia

A form of vascular cognitive impairment caused by diffuse small-vessel disease affecting the brain's deep white matter.

Alternate Names:
Subcortical Ischemic Vascular Disease; Subcortical Arteriosclerotic Encephalopathy

Bioabsorbable Vascular Stent

A temporary endovascular scaffold constructed from biodegradable polymers (such as poly-L-lactic acid) or bioresorbable metallic alloys (such as magnesium) engineered to provide vessel patency during vascular remodeling before undergoing hydrolytic degradation and systemic resorption.

Alternate Names:
Bioabsorbable Vascular Scaffold; BVS; Bioresorbable Stent; BRS

Bioaccumulation

The gradual build-up of a substance in an organism when absorption is faster than removal. Pollutants, medicines, and metals can accumulate in tissues and may cause harm when levels become high.

Bioactive

Having an effect on living cells, tissues, or organisms, such as a bioactive drug, hormone, nutrient, or signaling molecule.

Bioassay

A test that measures the effect or activity of a substance by observing its action on living cells, tissues, organisms, or a biological system. It can be used to estimate potency, toxicity, or biologic activity.

Bioavailability

The fraction of an administered dose that reaches the systemic circulation in an active form, and the rate at which it does so. It depends on the route, absorption, and first-pass metabolism; intravenous administration has 100

Bioburden

The number and types of living microorganisms present on a surface, medical device, tissue, or medicine before sterilization. Testing it helps confirm that cleaning and sterilization methods are adequate.

Biochanin A

A naturally occurring isoflavone found mainly in legumes and other plants. It is studied for biologic effects but is not established as a treatment for disease.

Alternate Names:
Biochanin a Isoflavone; 5,7-Dihydroxy-4'-Methoxyisoflavone

Biochemical

Relating to the chemical substances and reactions that occur in living organisms, including metabolism and cellular signaling.

Biochemical Assessment

Evaluation of the body's chemical state using measurements in blood, urine, or other samples. Depending on the purpose, tests may measure glucose, salts, proteins, hormones, or nutrients to assess metabolism, nutrition, or organ function.

Biochemical Reaction

A chemical change occurring in a living cell or body, usually controlled by enzymes. It may build or break down molecules and supports energy production, growth, repair, and normal organ function.

Biochemical Recurrence

A rise in a disease-associated blood marker after treatment, before recurrence is visible on imaging or causes symptoms. In prostate cancer, it refers to a rise in prostate-specific antigen (PSA) after surgery or radiation; the threshold used depends on the treatment.

Alternate Names:
Biochemical Relapse; Biochemical Failure

Biochemistry

The study of the chemical substances and reactions occurring in living organisms. Clinical biochemistry uses laboratory measurements to assess health and disease.

Biocompatibility

The ability of a material or device to perform its intended function without causing an unacceptable harmful reaction in body tissues.

Biodegradable Implant

An implant designed to provide support temporarily and then gradually break down into substances the body can process or remove. Its safety depends on how quickly it breaks down and how tissues respond.

Biodistribution

The way a medicine, tracer, or other substance spreads through the blood and different organs over time. It affects where treatment acts, how well an image is produced, and radiation or toxicity to healthy tissue.

Bioengineering

The application of engineering principles to biology and medicine, including the design of medical devices, biomaterials, tissue-engineering systems, prostheses, and diagnostic technologies.

Bioequivalence

A finding that two versions of a medicine enter the bloodstream at a similar rate and amount when given at the same dose. It supports the expectation of comparable effects and safety for approved uses.

Bioethics

The study of moral questions in medicine, biology, research, and healthcare technology. It considers consent, privacy, fairness, benefit, harm, quality of life, and respect for patients and communities.

Biofeedback

A technique that shows information about a body function, such as muscle tension, heart rate, or breathing, so a person can learn to control it. It may support treatment of selected pain, stress, or movement problems.

Biofilm

A community of microorganisms attached to a surface and surrounded by a protective material they produce. Biofilms can form on teeth, wounds, catheters, and implants and may be difficult to remove.

Biofilm-Associated Infections

Infections caused by microorganisms living in a protective layer on tissue, wounds, teeth, or medical devices. Biofilms can make organisms more tolerant of antibiotics and host defenses, allowing infection to persist.

Biofluid

A fluid from a living body, such as blood, urine, saliva, spinal fluid, or joint fluid. Biofluids can be tested for cells, chemicals, microorganisms, medicines, or signs of disease.

Bio-Informatics

The use of computers and statistics to store, compare, and interpret biological information such as DNA sequences, genes, proteins, and medical data.

Biological

Relating to living organisms, their parts, functions, processes, or products. In medicine, a biological product is made from or resembles a substance from a living source.

Biological Availability

The amount and speed at which a medicine or other substance becomes available to produce an effect in the body. It depends on the route, absorption, breakdown, and removal of the substance.

Biological Clock

The body's internal timing system that helps coordinate daily sleep, alertness, hormone release, body temperature, and other repeating functions in response to light and other environmental signals.

Biological Half-Life

The time needed for the body to remove half of a medicine or other substance through metabolism and excretion. It differs from the physical half-life of a radioactive substance and helps guide dosing or safety decisions.

Biological Model

A cell, tissue, organism, computational system, or other representation used to study biological mechanisms, disease, or treatment responses.

Biological Process

A coordinated series of molecular, cellular, or physiological events in a living organism, such as metabolism, cell division, inflammation, or tissue repair.

Biological Relative

A person who shares genetic ancestry with someone. Family medical history uses biological relatives to assess inherited risks, while relatives by marriage or legal relationship do not share that genetic information.

Biological Therapy

Alternate name; see *Biologic Therapy*.

Biological Transport

The movement of substances such as water, salts, nutrients, medicines, or cells within the body or across cell membranes. It may occur by diffusion, channels, pumps, filtration, or transport vesicles.

Biological Valve

A prosthetic heart valve made from animal or donated human tissue. Compared with mechanical valves, it is less likely to require lifelong anticoagulation solely because of the valve, but it may wear out and need replacement.

Alternate Names:
Bioprosthetic Valve; Tissue Valve

Biological Variability

Alternate name; see *Biologic Variation*.

Alternate Names:
Biologic Variation; Physiologic Variability

Biological Warfare

The deliberate use of microorganisms, toxins, or other biological agents to cause illness, death, or disruption in people, animals, or plants.

Biologic Therapy

Treatment with a medicine or other product made from living organisms or their components. Biologic treatments include monoclonal antibodies, cytokines, vaccines, and cell-based therapies; they can target specific cells or molecules or change immune activity. Uses include some cancers and inflammatory or autoimmune diseases.

Biologic Therapy In Dermatology

Treatment of skin disease with biologic medicines, most often antibodies or receptor proteins that block specific immune signals, such as tumor necrosis factor or interleukins. These medicines are used for conditions including moderate-to-severe psoriasis, atopic dermatitis, and hidradenitis suppurativa; infection is a possible risk.

Biologic Variation

Natural fluctuation in a body measurement within one person over time or between different people. It may reflect physiologic rhythms, age, diet, or other factors and can affect interpretation of laboratory results or changes during illness.

Bioluminescence

Light produced by a living organism through a chemical reaction. It is used by some organisms for communication or defense and is used in laboratories to detect biological activity.

Biomarker

A measurable feature that gives information about a normal body process, disease, likely outcome, or response to treatment. It may be measured in blood, tissue, genes, images, or other samples.

Biomarker Testing

Laboratory testing of genes, proteins, metabolites, or other measurable features to help identify disease, estimate likely outcome, choose treatment, or monitor response.

Biomaterial

A natural or manufactured material designed to contact or interact with the body. Examples include implant surfaces, artificial joints, wound dressings, prostheses, and materials that release medicines.

Biomechanical Compliance

How easily a body structure changes size or shape when pressure or force is applied. Lung and blood-vessel compliance affect breathing and circulation, while joint compliance affects movement and stability.

Biomechanics

The study of how forces and movement affect the body. It examines walking, posture, joints, muscles, and loads to understand injury, improve rehabilitation, or design supportive devices.

Biomedical Cement

A medical material used to fill gaps, stabilize broken bone, anchor an implant, or repair tissue. Its use and strength depend on the procedure and the tissue being treated.

Biomedical Device

An instrument, implant, software system, or other product intended to diagnose, monitor, prevent, or treat disease or injury. Its safety and usefulness depend on proper design, testing, maintenance, and correct use.

Biomedical Engineering

The use of engineering, materials, computing, and design to create or improve medical devices, diagnostic tests, implants, prostheses, imaging systems, and other healthcare technologies.

Biomedical Tape

Adhesive tape designed for medical use, such as securing dressings, tubes, sensors, or small devices. Different types vary in strength, flexibility, water resistance, and risk of skin irritation.

Biomedicine

Medicine grounded in the biological sciences, including the study of disease mechanisms, diagnosis, prevention, and treatment through laboratory and clinical research.

Biometry

Measurement of body structures or functions. In eye care, optical biometry measures the eye to help calculate the strength of an artificial lens before cataract surgery.

Biomicroscopy

Examination of living tissue with a microscope. In eye care, a slit lamp provides magnified views of the cornea, front chamber, lens, and other eye structures.

Biomolecule

A molecule made by or found in living organisms, such as a protein, fat, sugar, DNA, or RNA. Biomolecules provide structure, energy, information, and control of cell functions.

Biomonitoring

Repeatedly measuring substances or body changes over time using blood, urine, breath, hair, or other samples. It can assess exposure to poisons or

medicines, treatment levels, hormones, or disease activity.

Biomphalaria

A group of freshwater snails that can carry the parasite Schistosoma mansoni. The parasite develops in the snails and can later infect people who contact contaminated freshwater.

Bionics

The use of electronic or mechanical devices to replace or support body functions, such as hearing, movement, or sensation. Examples include cochlear implants, powered prostheses, and other assistive systems.

Biophotonics

The use of light to study, diagnose, monitor, or treat living tissues and biological processes. Examples include optical imaging, fluorescence testing, laser surgery, and photodynamic therapy.

Biophysical Profile

A pregnancy assessment combining fetal-heart-rate monitoring with ultrasound. It checks fetal movement, breathing movements, muscle tone, and amniotic-fluid volume to help assess fetal well-being.

Bioprinting

An additive-manufacturing method that places living cells, biomaterials, and biologically active molecules in controlled patterns to build tissue-like constructs. It supports tissue-engineering research, disease models, and regenerative medicine; most constructs remain experimental and do not reproduce the full function of complex organs.

Alternate Names:
3D Bioprinting; Three-Dimensional Bioprinting

Biopsy

Removal of cells, fluid, or tissue from a living body for laboratory examination to diagnose disease, including cancer. A biopsy may collect a small sample or remove an entire suspicious area. Methods include fine-needle aspiration, core-needle, incisional, excisional, punch, and endoscopic biopsy; risks such as pain, bleeding, or infection depend on the site and procedure.

Biopsy Lung

Removal of a small lung-tissue sample using a needle, bronchoscope, or operation. Examination can investigate infection, inflammation, scarring, or cancer; the method depends on the lesion and procedural risks.

Biopsy Needle

A needle used to remove cells or tissue for laboratory examination. A fine needle usually collects loose cells, while a core needle removes a small cylinder that preserves the tissue's arrangement.

Biopsy Site

The body location from which cells or tissue are removed for testing. It is chosen to sample the abnormal area while limiting injury to nearby organs, nerves, and blood vessels.

Biopsy Specimen

Cells or tissue removed from the body for laboratory examination. Microscopy, special stains, immune tests, or genetic tests may be used to identify cancer, infection, inflammation, or another condition.

Biosafety

Practices, equipment, and containment methods used to prevent accidental exposure to or release of infectious organisms, biological materials, or toxins.

Biosafety Level

A classification describing the laboratory facilities, equipment, work practices, and protective measures needed to handle biological agents safely according to their risk.

Biosecurity

Measures that prevent biological agents or toxins from being accidentally or deliberately released, stolen, or misused. It includes secure facilities, controlled access, staff training, risk assessment, and responsible handling of biological materials.

Biosensor

A device that uses a biological material to recognize a substance and a detector to measure it. Medical examples include sensors for glucose, hormones, infectious organisms, or heart-related markers.

Biosimilar

A biological medicine highly similar to an already approved biological medicine, with no meaningful differences in safety or effectiveness for approved uses. Because these medicines are complex, similarity is shown through comparative testing.

Biospecimen

A sample of human tissue, cells, blood, urine, or another body fluid collected for laboratory testing or research.

Biostatistics

The use of statistics to plan medical studies, analyse health data, measure uncertainty, and interpret evidence about disease, diagnosis, prevention, and treatment.

Biosynthesis

The process by which living cells use enzymes and energy to build complex molecules from simpler substances, such as making proteins from amino acids.

Biot Breathing

An irregular breathing pattern with unpredictable changes in breath depth and timing, sometimes interrupted by pauses. Medical sources use the name inconsistently: some call it ataxic breathing, while others distinguish it from cluster breathing. It may occur with severe brainstem disease.

Biotechnology

The use of living cells, organisms, or biological molecules to develop products and processes such as vaccines, biological medicines, genetic tests, and gene therapies.

Biotelemetry

Measuring and sending body information from a person or animal to a distant receiver. It can be used for heart-rhythm, temperature, breathing, glucose, or intensive-care monitoring.

Bioterrorism

The deliberate release of infectious organisms, toxins, or other biological agents to cause illness, death, fear, or disruption. Response involves rapid detection, public-health coordination, protection, testing, isolation when needed, and treatment or prevention.

Bioterrorism Agents

Infectious organisms or toxins that could be deliberately released to cause widespread illness or panic. Public-health authorities prepare for agents causing anthrax, smallpox, botulism, plague, tularemia, or severe viral haemorrhagic fever.

Biotherapy

Treatment using living organisms, cells, genes, or biological substances to prevent or treat disease. Immunotherapy, some cell therapies, and selected biological medicines are forms of biotherapy.

Biotin

A water-soluble B vitamin needed by enzymes involved in processing fats, sugars, and amino acids. Deficiency is uncommon but can cause rash, hair loss, weakness, or neurologic symptoms; high-dose supplements can interfere with some laboratory tests, including hormone and cardiac-marker assays.

Biotinidase Deficiency

A rare inherited disorder in which the body cannot recycle biotin efficiently. Untreated deficiency can cause seizures, developmental problems, hearing or vision loss, skin rash, and weakness; biotin treatment prevents or limits these complications.

Biotin Vitamin B7

Alternate name; see *Biotin*.

Biotinylation

The attachment of biotin to another molecule, usually a protein, so it can be found or separated in a laboratory test. The biotin acts as a tag that binds to special substances, making the target easier to detect or collect. Biotinylation can occur naturally or be done artificially.

Biotransformation

The natural process by which the body changes drugs and other foreign substances, mainly through enzymes in the liver but also in other tissues. It often makes them less active and easier to remove. Phase I reactions modify the substance; phase II reactions may attach another molecule to help eliminate it. These steps are not always sequential, and the process can produce an active or harmful substance instead.

Biotrauma

Inflammation caused by mechanical injury to the lungs during breathing-machine treatment. Inflammatory signals can spread through the body and contribute to organ injury.

Biot's Breathing

Alternate spelling; see *Biot Breathing*.

BiPAP

Alternate name; see *Bilevel Positive Airway Pressure*.

BiPAP Machine

A device that delivers two levels of breathing pressure through a mask—higher during inhalation and lower during exhalation. Settings are prescribed and adjusted according to the person's breathing problem and response.

Biparental

Involving both biological parents. In genetics, biparental inheritance means that a child receives relevant genetic material from both the mother and the father.

Biparietal Diameter

The width of a baby's head measured by ultrasound from one side to the other. It helps estimate pregnancy age and monitor growth, but is interpreted with other measurements because head shape can affect the result.

Bipartite Ossification

Formation or persistence of two separate ossification centers in a bone. If they do not fuse, a bipartite bone, such as a bipartite patella, may result. This is usually an incidental developmental variant but can become painful after injury or repetitive stress.

Biphasic Reaction

A reaction in which symptoms return after an allergic reaction has fully settled, without another exposure to the trigger. It is often discussed with anaphylaxis, a severe allergic reaction, and may begin hours after the first episode. The returning symptoms may be similar to or different from the first ones.

Biphenyl Compounds

Chemicals made of two linked benzene rings. Polychlorinated biphenyls (PCBs) are long-lasting industrial pollutants; exposure can harm the liver, immune system, and hormone system and may increase cancer risk.

Bipolar

Alternate name; see *Bipolar Disorder*.

Bipolar Affective Disorder

Alternate name; see *Bipolar Disorder*.

Bipolar Disorder

A mental health condition involving episodes of unusually high or irritable mood and energy, and often episodes of depression. Bipolar I includes at least one manic episode; depression may or may not occur. Bipolar II includes hypomania, a less severe high-mood episode, and major depression. Cyclothymia is a related condition with longer-lasting, milder mood highs and lows that do not reach the level of full manic or depressive episodes.

Bipolar Disorder in Child and Teens

Bipolar disorder diagnosed in childhood or adolescence, involving episodes of mania or hypomania and, in some forms, major depression. Bipolar I requires a manic episode; depression is not required. Symptoms may overlap with other psychiatric or developmental conditions, so diagnosis considers their duration, pattern, and functional effect.

Bipolar I Disorder

A mood disorder defined by at least one manic episode lasting at least seven days or requiring hospitalization. A manic episode is a distinct period of abnormally elevated, expansive, or irritable mood and increased goal-directed activity or energy.

Bipolar II Disorder

A mood disorder characterized by at least one hypomanic episode and at least one major depressive episode, with no history of a full manic episode. The combination of hypomania and depression can cause substantial distress or impairment even though hypomania is less severe than mania.

Bipolaris

A genus of fungi found mainly in soil and plants. Some species can rarely cause eye, sinus, skin, or invasive infections, particularly in people with reduced immunity. Species are identified by laboratory culture or molecular testing.

Bipolar Neuron

A bipolar neuron has one dendrite and one axon extending from opposite sides of its cell body, as found in the retina and sensory pathways.

Birbeck Granules

Small rod- or tennis-racket-shaped structures found inside Langerhans cells. They are associated with these cells but are not by themselves proof of Langerhans cell histiocytosis.

Bird Fancier's Lung

A form of hypersensitivity pneumonitis caused by breathing proteins from bird feathers or droppings. It can cause cough and shortness of breath; repeated exposure may lead to permanent lung scarring.

Bird Flu

Common name; see *Avian Influenza*.

Birefringence

The optical property of a material in which light travels at different speeds along different axes, changing its polarization and sometimes splitting it into two rays. Polarized-light microscopy uses birefringence to identify crystals and other ordered structures in tissues or body fluids.

Birefringent

Describing a material that exhibits birefringence. See also: *Birefringence*.

Birth

The process by which a baby leaves the uterus, including labour, delivery of the baby, and delivery of the placenta.

Birth Asphyxia

Failure to establish or maintain effective breathing and oxygen supply around birth. It can injure the brain or other organs and may cause neonatal encephalopathy, but is not the same diagnosis.

Birth Control

Methods used to prevent pregnancy, including condoms, pills, implants, injections, intrauterine devices, fertility-awareness methods, and permanent procedures. Choice depends on effectiveness, health, side effects, future plans, access, and personal preference.

Birth Control And Family Planning

Planning whether and when to have children using contraception, fertility care, pregnancy advice, and reproductive health services. Care respects personal choices and considers health conditions, safety, goals, and informed consent.

Birth Control Methods

Birth-control methods include condoms, pills, im-

plants, injections, intrauterine devices, patches, rings, fertility-awareness approaches, and permanent contraception. Effectiveness, sexually transmitted infection protection, side effects, reversibility, and medical eligibility vary by method.

Birth Control Pill Overdose

Illness after taking too many contraceptive tablets. Most exposures cause little or no serious harm, but nausea, vomiting, drowsiness, or other symptoms may occur, and the product and amount taken help guide management.

Birth Control Pills

Hormonal tablets used to prevent pregnancy, usually by stopping ovulation, thickening cervical mucus, or changing the uterine lining. They do not protect against sexually transmitted infections.

Birth Defect

A structural or functional condition that originates during prenatal development and is present at birth, although it may not be recognized until later. Causes include genetic or chromosomal changes, infection, maternal illness, nutritional deficiency, or environmental exposures; many cases have no identified cause.

Alternate Names:
Congenital Anomaly; Congenital Anomalies; Congenital Malformation; Congenital Disorder

Birth Defects

Alternate name; see *Birth Defect*.

Birth Defects Testing

Prenatal or newborn testing used to screen for or diagnose structural, genetic, chromosomal, metabolic, or functional conditions present at birth. Tests may include ultrasound, serum screening, cell-free DNA, diagnostic procedures, and newborn screening.

Birth Injury

Physical harm to a newborn during labour or delivery. It may affect the skin, bones, nerves, muscles, or brain and can result from difficult delivery, the baby's position, or medical complications.

Birth Trauma

Physical injury sustained by a neonate during mechanical labor and delivery; see *Birth Injury*.

Birthmark

A congenital cutaneous irregularity or lesion present at birth or appearing within early infancy, categorized into vascular anomalies (e.g., infantile hemangiomas, port-wine stains/capillary malformations, salmon patches) and pigmented lesions (e.g., congenital melanocytic nevi, café-au-lait macules, dermal melanocytosis). Most are benign; rapid enlargement, ulceration, bleeding, or anatomical compromise of the visual axis or airway warrants specialist evaluation.

Birthmarks

Plural form; see *Birthmark*.

Birthmarks And Other Skin Pigmentation Problems

A broad term for marks present at birth or early in life and for later changes in skin colour. Examples include vascular birthmarks, pigmented moles, post-inflammatory darkening, and vitiligo, in which areas of skin lose pigment. The term covers several distinct findings rather than one diagnosis.

Birt-Hogg-Dube Syndrome

Alternate spelling; see *Birt-Hogg-Dubé Syndrome*.

Alternate Names:
BHD Syndrome

Birt-Hogg-Dubé Syndrome

An inherited condition caused by a change in the FLCN gene. It can cause small, usually harmless skin growths, cysts in the lungs with repeated collapsed lung, and an increased risk of kidney tumors. It is autosomal dominant, meaning one altered copy of the gene can cause the condition.

Birt-Hogg-Dube Syndrome (BHDS)

Alternate spelling and abbreviation; see *Birt-Hogg-Dubé Syndrome*.

Birth Pains

Birth pains are painful uterine contractions and related pressure during labor as the cervix dilates and the baby moves through the birth canal.

Birth Rate

The number of live births in a population during a specified period, usually expressed per 1,000 people per year.

Birth Spacing

The interval between successive pregnancies or births. Specify the measure: the interpregnancy interval runs from a birth to conception of the next pregnancy, while the birth-to-birth interval runs from one live birth to the next. These intervals are related but not interchangeable.

Alternate Names:
Child Spacing; Pregnancy Spacing

Birth Weight

The first weight recorded after birth; for a liveborn infant, it is preferably measured within the first hour, before significant postnatal weight loss. Low birth weight is less than 2,500 g regardless of gestational age; very low birth weight is less than 1,500 g, and extremely low birth weight is less than 1,000 g. These are overlapping categories, and lower birth weight is associated with greater risk of neonatal complications.

Bisacodyl

A stimulant laxative that increases bowel movement and helps empty the bowel. It is used short term for constipation or before some procedures; cramps, diarrhoea, and dehydration can occur.

Bisexual

Describes a person who may feel romantic or sexual attraction to people of more than one gender. It refers to an identity or orientation, not a disease or disorder.

Bisexuality

A sexual orientation involving possible romantic or sexual attraction to people of more than one gender. People experience this attraction in different ways; bisexuality is not a disease or disorder.

Bishop Score

A score used before inducing labour to describe how ready the cervix is for birth. It considers opening, thinning, softness, position, and the baby's head position; a higher score generally predicts an easier induction.

Bis In Die

Latin for "twice daily," traditionally abbreviated b.i.d. It is an older prescription abbreviation for a dosing frequency.

Bismuth

A metal used in some medicines and industrial products. Certain bismuth compounds can soothe diarrhoea or stomach symptoms, but excessive or prolonged exposure can cause nervous-system or kidney toxicity.

Bisoprolol

A beta-1-selective blocker used to treat hypertension, angina, and selected patients with heart failure. It lowers heart rate and blood pressure and may cause bradycardia, hypotension, or fatigue.

Bispecific Antibody Therapy

Treatment using an engineered antibody that binds two different targets, such as a cancer-cell marker and an immune-cell marker, to bring cells together or block more than one disease pathway. It is used for selected cancers and can cause immune reactions or other treatment-specific effects.

Bisphenol A

An endocrine-disrupting industrial chemical used predominantly in the synthesis of polycarbonate plastics and epoxy resins lining food and beverage containers. It exhibits weak estrogenic and antiandrogenic activity and has been implicated in metabolic and reproductive disturbances.

Alternate Names:
BPA; 4,4'-(Propane-2,2-diyl)diphenol

Bisphosphonate

A class of antiresorptive medications (e.g., alendronate, risedronate, zoledronic acid) that bind avidly to hydroxyapatite crystals in mineralized bone and inhibit osteoclast-mediated bone resorption, primarily by inhibiting farnesyl pyrophosphate synthase. Indicated for osteoporosis, Paget disease of bone, and hypercalcemia or bone metastases of malignancy, they carry risks of chemical esophagitis (with oral forms), atypical subtrochanteric femur fractures, and osteonecrosis of the jaw (ONJ).

Bisphosphonate-Related Osteonecrosis of the Jaw

An older term for jawbone necrosis associated with current or previous bisphosphonate exposure. The case definition includes exposed jawbone, or bone probeable through a fistula, persisting for more than eight weeks, without prior jaw radiation. Medication-related osteonecrosis is the broader term for cases linked to other antiresorptive or antiangiogenic medicines.

Alternate Names:
BRONJ

Bisphosphonates

Plural form; see *Bisphosphonate*.

Bitemporal Hemianopia

A visual field deficit characterized by the loss of vision in the outer (temporal) halves of both the right and left visual fields. It is classically caused by compression of decussating nasal retinal nerve fibers at the optic chiasm, most commonly by a pituitary adenoma, craniopharyngioma, or optic chiasm glioma.

Bitemporal Hemianopsia

Alternate spelling; see *Bitemporal Hemianopia*.

Bitewing

A dental X-ray showing the crowns of upper and lower teeth and the bone around them in one image. It is especially useful for finding decay between teeth and early loss of supporting bone.

Bitewing Radiograph

An X-ray taken inside the mouth that shows the crowns of back teeth and the nearby gum-supporting bone. It helps detect decay between teeth and bone loss from gum disease.

Bitot's Spots

Foamy, white or grey patches on the white part of the eye, usually near the cornea. They are commonly linked to vitamin A deficiency and may occur with dry eyes or poor night vision. Untreated vitamin A deficiency can damage the eye.

Alternate Names:
Bitot Spots; Conjunctival Foamy Patches; Keratinized Conjunctival Plaques

Bituminosis

A work-related breathing disorder caused by repeated exposure to bitumen or asphalt fumes and dust. It may irritate the airways and contribute to chronic cough, breathlessness, or other lung disease.

Biuret Test

A laboratory test that detects protein by turning violet when protein reacts with a copper-containing solution. It is mainly used in teaching, research, and some chemical analyses rather than routine patient diagnosis.

Bizarre Parosteal Osteochondromatous Proliferation

A rare benign but locally recurrent bone-surface lesion composed of cartilage, bone, and spindle cells; it most often affects the hands or feet.

Alternate Names:
Nora Lesion (less preferred name)

BK Virus

A common virus that usually remains inactive after childhood infection. It can reactivate when immunity is suppressed, especially after organ transplantation, and damage the transplanted kidney or urinary tract.

BK Virus Nephropathy

Kidney inflammation and damage caused by reactivation of BK polyomavirus, usually in a kidney-transplant recipient. It can impair function of the transplanted kidney and is associated with viral replication in the urinary tract or kidney.

Black Death

The major plague pandemic of the fourteenth century, caused mainly by the bacterium Yersinia pestis. It caused widespread severe illness and death and is distinct from the individual forms of plague seen today.

Black Eye

Bruising and swelling around the eye, usually caused by blunt trauma. Vision may remain normal; eye pain, double vision, reduced vision, an irregular pupil, severe headache, vomiting, or loss of consciousness can indicate an eye or orbital injury.

Alternate Names:
Periorbital Hematoma; Shiner

Black Fly

A small biting fly that can cause painful or itchy skin reactions. In some tropical regions, black flies spread the parasite that causes river blindness.

Black Hairy Tongue

A usually harmless dark, furry appearance of the tongue caused by overgrown surface projections trapping debris or pigment. It may improve with tongue cleaning, good oral hygiene, and addressing smoking or dry mouth.

Blackhead

An open comedo in which a plug of sebum and keratin widens a hair follicle's opening at the skin surface. Exposure to air darkens the plug. Blackheads are noninflammatory acne lesions, not dirt.

Blackheads

Alternate name; see *Blackhead*.

Blackish Urine

Urine that appears very dark brown or black. Causes include blood pigments such as hemoglobin or myoglobin, bilirubin, certain medicines, or homogentisic acid in alkaptonuria. Urine testing can help distinguish these causes. It is a visible sign rather than a diagnosis; the color alone does not show the cause.

Black Lung

Lung disease caused by long-term inhalation of coal dust, usually in miners. It can cause cough and breathlessness and may progress from small areas of dust-related damage to extensive permanent scarring.

Black Lung Disease

A dust-related lung disease caused by prolonged coal-dust exposure. It may cause no symptoms at first but can lead to cough, breathlessness, reduced lung function, and severe permanent scarring.

Black Nightshade Poisoning

Poisoning after eating black nightshade or its berries, which may contain toxic plant chemicals. It can cause nausea, vomiting, abdominal pain, confusion, enlarged pupils, seizures, or abnormal heart rhythms.

Black Or Tarry Stools

Black or tarry stools may indicate upper gastrointestinal bleeding, but can also result from iron or bismuth.

Blackout

A period for which a person cannot remember events, often after heavy alcohol use. Memory loss can also occur with drugs, seizures, head injury, fainting, or other causes of altered consciousness.

Alternate Names:
Amnestic Episode; Alcohol-Related Amnesia When Caused by Alcohol

Black Stain

Dark discoloration on the tooth surface, often near

the gumline, caused by external deposits or chromogenic bacteria. Dental assessment determines the cause and appropriate removal.

Black Triangle

A triangular gap between neighboring teeth near the gumline, usually caused by loss or shrinkage of the gum papilla after gum disease, injury, or dental treatment. It may trap food and can be treated cosmetically or orthodontically.

Blackwater Fever

A severe complication of malaria in which red blood cells break down inside blood vessels. It can cause dark urine, severe anaemia, jaundice, kidney failure, and shock.

Black Widow Spider

The black widow spider is a venomous spider whose bite can cause severe muscle pain, abdominal cramping, sweating, hypertension, and autonomic symptoms.

Alternate Names:
Black Widow Spider Bite; Latrodectism

Black Widow Spider Bite

Envenomation by a *Latrodectus* spider. It may cause local pain followed by severe muscle cramps, abdominal rigidity, sweating, nausea, hypertension, or other autonomic symptoms.

Bladder

A muscular hollow organ that stores urine from the kidneys and contracts to release it through the urethra during urination.

Bladder Augmentation

Surgery that enlarges the bladder, usually by adding a section of bowel or another tissue. It can increase urine storage when the bladder is too small or has high pressure.

Bladder Biopsy

Removal of a small piece of bladder lining, usually during cystoscopy, for laboratory examination. It can investigate a visible growth, unexplained blood in the urine, inflammation, or suspected bladder cancer.

Bladder Calculi

Alternate name; see *Bladder Stones*.

Bladder Catheterization

The insertion of a sterile, flexible tube (catheter) through the urethra into the urinary bladder to drain urine or instill fluids; see *Urinary Catheterization*.

Bladder Cancer

A malignant tumor arising in the urinary bladder, most often from the urothelial lining. Blood in the urine is a common presenting feature, although symptoms vary.

Alternate Names:
Urinary Bladder Neoplasm

Bladder Carcinoma

Cancer that begins in the lining of the urinary bladder, most often in cells called urothelial cells. Blood in the urine is common; smoking and some workplace chemical exposures increase risk.

Bladder Diary

A record of drinks, urination times, urine amounts, urgency, leakage, and nighttime voiding over several days. It helps describe bladder habits and patterns of urinary symptoms.

Bladder Diseases

Disorders of the bladder, including infection, stones, tumors, neurogenic dysfunction, inflammation, obstruction, and impaired emptying.

Bladder Disorders

A broad spectrum of pathological conditions affecting the urinary bladder, encompassing infectious cystitis, interstitial cystitis (bladder pain syndrome), urothelial carcinoma, neurogenic bladder dysfunction, calculi, and bladder outlet obstruction.

Alternate Names:

Bladder Diseases; Urinary Bladder Diseases; Diseases of the Bladder

Bladder Diverticula

Alternate name; see *Bladder Diverticulum*.

Bladder Diverticulum

A pouch that projects outward from the bladder wall. It may be present from birth or develop when urine repeatedly meets resistance as it leaves the bladder. Some diverticula trap urine and are associated with infection, stones, or incomplete emptying.

Bladder Exstrophy

Bladder Exstrophy is a rare birth defect in which the bladder is open and exposed outside the body through a defect in the lower abdominal wall. It is part of the exstrophy–epispadias complex and may also affect the urethra, pelvic bones, pelvic floor, abdominal muscles, and genitals. It can cause difficulty storing urine, urinary leakage, urine-control problems, and risks to the kidneys.

Bladder Exstrophy Repair

Reconstructive surgery for bladder exstrophy that places the bladder inside the body and repairs the lower abdomen and genitals. Treatment is often staged and aims to protect the kidneys and improve urine control.

Bladder Fistula

An abnormal passage between the bladder and another organ or the skin, often the vagina, bowel, or uterus. It may cause constant urine leakage, repeated infection, gas or stool in urine, or unusual vaginal wetness.

Bladder Health And Disorders

Healthy bladder function stores urine and releases it at an appropriate time. Common problems include infection, urgency, leakage, inability to empty, stones, inflammation, and nerve-related bladder dysfunction.

Bladder Infection

An infection of the bladder, usually caused by bacteria. It may cause burning urination, frequent or urgent urination, lower-abdominal discomfort, cloudy or bloody urine, and sometimes fever.

Bladder Infections in Children

Urinary tract infections involving a child's bladder, usually caused by bacteria. Symptoms may include painful urination, frequent urination, new wetting, abdominal or back pain, fever, or vomiting; infants may have only fever or poor feeding.

Bladder Infections in Teens and Adults

Bacterial infection of the bladder, commonly called cystitis. Burning urination, urgency, frequency, lower-abdominal discomfort, or blood in the urine are typical; fever, flank pain, or vomiting may indicate kidney involvement.

Bladder Inflammation

Inflammation of the bladder lining, which may result from infection, irritation, medicines, radiation, or other causes. Interstitial cystitis, also called bladder pain syndrome, is a separate chronic pain condition.

Bladder Neck

The narrow lower part of the bladder where it joins the urethra. Its muscles help control the release of urine and can contribute to blockage if they scar or fail to relax.

Bladder Neck Contracture

Scar-related narrowing of the bladder outlet, often after prostate surgery or other treatment. It can restrict urine flow and cause a weak stream, difficulty emptying, or urinary retention.

Bladder Neck Obstruction

Narrowing or blockage where the bladder joins the urethra, making it difficult for urine to leave the bladder. It may cause a weak stream, straining, incomplete emptying, urinary retention, or recurrent infection.

Bladder Neoplasm

An abnormal growth arising in the bladder. It may be noncancerous or cancerous; diagnosis requires examination, imaging, cystoscopy, and often a tissue sample to determine its type and extent.

Bladder Outlet Obstruction

A blockage where urine leaves the bladder, caused by an enlarged prostate, scarred urethra, stone, tumour, or pelvic-organ prolapse. It may cause a weak stream, difficulty starting, retention, infection, or kidney damage.

Bladder Pain

Pain or pressure felt in the lower abdomen or pelvis that may relate to infection, stones, inflammation, bladder pain syndrome, injury, or cancer. Blood in urine, fever, severe pain, or inability to urinate may accompany serious urinary disease.

Bladder Pain Syndrome

Bladder-related pain, pressure, or discomfort with lower urinary tract symptoms, such as urgency or frequency, lasting more than six weeks without infection or another identifiable cause. Symptoms often flare and settle.

Bladder Perforation

A tear or hole in the bladder wall caused by trauma, pelvic surgery, instrumentation, severe inflammation, or obstruction. Urine may leak into surrounding tissues, causing abdominal pain, distention, blood in the urine, or infection.

Bladder Problems

Conditions that interfere with storing or passing urine, such as leakage, urgency, repeated infection, stones, or inability to empty. Causes include infection, weak pelvic muscles, nerve disease, prostate enlargement, or blockage.

Bladder Prolapse

Alternate name; see *Anterior Vaginal Prolapse*.

Bladder Retraining

A planned urination schedule that gradually increases time between bathroom visits to improve bladder control and reduce urgency.

Bladder Spasm

An involuntary contraction of the bladder muscle that can cause sudden urgency, cramping, urine leakage, or pain. It may occur with infection, catheter use, bladder irritation, neurological conditions, or after surgery.

Bladder Stones

Hard mineral deposits in the bladder that may cause pain, blood in urine, frequent urination, interrupted flow, or difficulty emptying. Some cause no symptoms and are found during tests for another problem.

Bladder Trauma

Injury to the bladder caused by a blow, pelvic fracture, penetrating wound, surgery, or a medical instrument. It may cause blood in the urine, lower-abdominal pain, difficulty urinating, or leakage of urine into nearby tissues.

Blalock-Taussig Operation

A palliative shunt connecting a systemic artery to a pulmonary artery to increase blood flow to the lungs in selected cyanotic congenital heart defects. Modified versions use a small graft between the arteries; the procedure is also called a Blalock-Thomas-Taussig shunt.

Blalock-Taussig Shunt

A palliative surgical procedure designed to augment pulmonary blood flow in infants with cyanotic congenital heart defects characterized by restricted pulmonary flow (such as tetralogy of Fallot or pulmonary atresia). The classic procedure anastomosed the subclavian artery directly to the pulmonary artery, whereas the modified technique uses a synthetic Gore-Tex graft between the subclavian and pulmonary arteries.

Alternate Names:
BT Shunt; Blalock-Thomas-Taussig Shunt

Bland Diet

A temporary eating pattern using soft, mildly seasoned foods and avoiding items that worsen a person's symptoms. It may help some stomach or bowel problems but does not treat their underlying cause.

Blaschko Lines

Invisible patterns formed by the movement of skin cells before birth. Some birthmarks and skin diseases follow these lines as stripes or swirls; they usually do not follow nerves or blood vessels.

BLAST

See *Blast Cell*.

Blast Cell

An early, immature blood cell produced in the bone marrow that normally matures into a functional white blood cell, red blood cell, or platelet. Healthy bone marrow contains only a very small percentage of these cells. A large accumulation of blast cells in the bone marrow or bloodstream prevents normal blood cell development and is a defining characteristic of acute leukemias.

Blast Crisis

An advanced, rapidly worsening phase of some blood cancers in which immature blast cells fill the bone marrow or blood and behave like acute leukaemia.

Blastema

A mass of undifferentiated, highly proliferating embryonic cells capable of growth and cellular differentiation into organs, tissues, or specialized structures; in nephroblastoma (Wilms tumor), blastemal cells constitute a primitive malignant component.

Blastic Plasmacytoid Dendritic-Cell Neoplasm

A rare, fast-growing blood cancer arising from immature immune cells. It often affects the skin, bone marrow, lymph nodes, or nervous system.

Blast Injuries

Plural form; see *Blast Injury*.

Blast Injury

Physical trauma resulting from an explosion, categorized into primary (direct blast shock wave overpressure injuring air-filled organs: pulmonary barotrauma, tympanic membrane perforation, bowel perforation), secondary (penetrating injuries from flying fragments/debris), tertiary (blunt trauma from body displacement against objects), and quaternary (burns, toxic gas inhalation, crush asphyxia).

Blastocyst

An early embryo formed about five to six days after fertilization. It is a hollow group of cells with an inner group that can become the fetus and an outer layer that helps form the placenta.

Blastocystis

A common microscopic organism that may be found in the digestive tract after contaminated food or water is swallowed. Many people have no symptoms, and it is not always clear whether it causes illness. Diarrhoea, stomach cramps, bloating, or nausea may occur. Stool testing can detect it, but a positive result does not prove that it caused the symptoms.

Alternate Names:
Blastocystis Hominis; Blastocystis spp.; Blastocystosis; Intestinal Blastocystis

Blastocystis Hominis

Historical name; see *Blastocystis*.

Blastocystosis

Alternate name; see *Blastocystis*.

Blastocyst Transfer

An assisted-reproduction procedure in which an embryo grown in the laboratory for about five or six days is placed inside the uterus. The decision to transfer one or more embryos considers success rates, patient factors, and the risk of multiple pregnancy.

Blastoma

A cancer that develops from immature or embryonic cells. The specific name identifies the organ and tumour type, such as a kidney, nerve, liver, or eye

blastoma.

Blastomyces Dermatitidis

A fungus found in soil and damp organic material that can cause blastomycosis when its spores are inhaled. Infection usually affects the lungs but can spread to skin, bones, joints, or other organs.

Blastomycosis

A fungal infection caused by *Blastomyces*, usually acquired by inhaling spores from soil. It primarily affects the lungs and can cause pneumonia; disseminated infection may involve the skin, bones and joints, genitourinary system, or central nervous system. It does not spread from person to person.

Blast Phase

An advanced phase of some blood cancers in which many immature blast cells appear in the blood or marrow. The disease becomes more aggressive and may resemble acute leukaemia.

Blasts

Plural form; see *Blast Cell*.

Blautia Producta

A bacterium that normally lives in the human intestine and grows without oxygen. It is usually harmless but has occasionally been found in infections, especially in people with serious illness.

Bleb

A small thin-walled pocket containing air or fluid. In the lung, a bleb can rupture and cause a collapsed lung; on the skin, the term may describe a blister-like lesion.

Bleeder's Disease

Alternate name; see *Hemophilia*.

Bleeding

The escape of blood from blood vessels. It may be visible outside the body or occur inside a tissue, organ, or body cavity; severe, unexplained, or persistent bleeding can indicate significant blood loss or underlying disease.

Bleeding Disorder

A condition causing unusually heavy, prolonged, or spontaneous bleeding because of problems with clotting proteins, platelets, blood vessels, or medicines. Examples include hemophilia, von Willebrand disease, platelet disorders, and some forms of disseminated intravascular coagulation.

Bleeding Disorders

Alternate name; see *Bleeding Disorder*.

Bleeding Esophageal Varices

Severe bleeding from enlarged, fragile veins in the lower swallowing tube. These veins usually develop when liver disease raises pressure in veins entering the liver. Vomiting blood or passing black stools is an emergency.

Bleeding Gums

Bleeding from the gum tissue, often caused by plaque-related gingivitis, periodontitis, trauma, or vigorous brushing. It can also occur with blood disorders or medicines that affect clotting. Persistent bleeding, swelling, loose teeth, or spontaneous bleeding requires dental or medical evaluation.

Bleeding Into A Thyroid Nodule

Alternate name; see *Hemorrhagic Thyroid Nodule*.

Bleeding Tendency

An increased susceptibility to bleeding, which may result from platelet disorders, coagulation factor deficiencies, vascular abnormalities, or anticoagulant medications. Evaluation includes personal and family history, complete blood count, and coagulation studies.

Bleeding Time

An older test measuring how long a small skin puncture takes to stop bleeding. It mainly reflected platelet function and small blood vessels and has largely been replaced by more reliable laboratory tests.

Bleeding Varices

Enlarged fragile veins, usually in the swallowing tube or stomach, that have ruptured and are bleeding. Vomiting blood, black stools, weakness, or faintness indicates a life-threatening emergency.

Blennorrhea

Thick discharge containing mucus and pus from a moist body surface, especially the urethra or eye. Causes include infection and inflammation, so the affected site and other symptoms guide testing and treatment.

Bleomycin

A cancer medicine that damages tumour-cell DNA and is used for selected cancers. Its most important serious risk is lung injury; fever, skin changes, low blood counts, and allergic reactions can also occur.

Bleomycin Sulfate

The sulphate form of bleomycin, a cancer medicine that damages DNA. A serious potential adverse effect is lung injury, which can be permanent.

Blepharitis

Inflammation of the edges of the eyelids. It can cause redness, itching or burning, crusts at the eyelashes, and watery or dry eyes. It may affect the lash follicles at the front edge or the oil glands inside the eyelid and often comes back.

Alternate Names:
Eyelid Margin Disease

Blepharoconjunctivitis

Inflammation of the eyelid edges and the surface covering the eye. It can cause crusting, itching, redness, tearing, and irritation due to infection, allergy, dry eye, or blocked eyelid glands.

Blepharophimosis

Abnormally short horizontal openings between the eyelids. It may occur with drooping eyelids and other facial or developmental features and can interfere with vision.

Blepharoplasty

Surgery on the upper or lower eyelids that removes, repositions, or reshapes excess skin, muscle, or fat. It may improve eyelid function or appearance; ptosis repair is a related procedure that specifically raises a drooping eyelid.

Blepharoptosis

Drooping of the upper eyelid because of a weak muscle, damaged nerve, stretched tendon, birth difference, ageing, or a heavy eyelid. It can obstruct vision and may signal a neurological emergency if sudden.

Blepharospasm

Involuntary tightening of the muscles around the eyes, causing repeated blinking or forceful eyelid closure. It may occur alone or with eye irritation, medicines, or a movement disorder.

Blind

Having severe or complete loss of vision that substantially limits the ability to see. The cause and remaining level of vision are described because blindness varies in degree and may affect one or both eyes.

Blinded

In a research study, describing a participant, clinician, assessor, or analyst who does not know the assigned treatment or relevant result. This helps reduce expectations from influencing care or measurements.

Blinding

Keeping treatment assignments or study information hidden from selected participants, clinicians, assessors, or analysts to reduce expectation and measurement bias. A study states exactly who is unaware and what is concealed.

Blind Loop Syndrome

Poor absorption caused by excess bacteria growing in a slow-moving or bypassed part of the small intestine. It may cause bloating, diarrhoea, weight loss, and vitamin deficiencies and can follow surgery

or bowel disease.

Blindness

Severe or complete loss of vision in one or both eyes caused by disease, injury, or a developmental condition affecting the eye, optic nerve, or brain. Sudden vision loss is an emergency.

Blindness And Vision Loss

Reduced or absent ability to see caused by problems in the eye, optic nerve, brain, injury, or development. It may be sudden or gradual, partial or complete, and temporary or permanent.

Blind Spot

An area within the field of vision where sight is absent. Everyone has a normal small blind spot where the optic nerve leaves the retina, but a new or enlarged blind spot may indicate eye or nerve disease.

Blinking

Repeated brief closing and reopening of the eyelids that spreads tears, protects the cornea, and clears particles. It may increase with irritation, stress, tics, or vision problems and decrease during prolonged screen use.

Blister

A raised pocket of fluid within or beneath the outer layer of skin. Small blisters are called vesicles; larger ones are called bullae. Blisters can result from rubbing, burns, heat, infection, allergy, or inflammatory skin disease and commonly affect the hands and feet.

Alternate Names:
Bulla; Vesicle When Small

Bloating

A feeling of abdominal fullness, tightness, or visible swelling. Gas, constipation, food intolerance, or digestive disorders are common causes; persistent bloating may occur with weight loss, vomiting, pain, or early fullness.

Block

An obstruction or interruption of flow, movement, electrical signals, or communication. The meaning depends on the structure involved, such as an airway, nerve, blood vessel, or heart.

Blockage Of Upper Airway

Obstruction of airflow through the nose, mouth, throat, or voice box. It can rapidly cause suffocation; noisy breathing, inability to speak, blue skin, or severe distress may occur.

Blocked Tear Duct

Obstruction of the nasolacrimal drainage system that prevents tears from draining from the eye into the nasal cavity. It presents with epiphora (persistent tearing), mucoid discharge, and recurrent conjunctivitis or dacryocystitis. In infants, congenital nasolacrimal duct obstruction is commonly due to persistence of a membrane at the valve of Hasner and usually resolves spontaneously.

Blocked Tear Ducts

Plural form; see *Blocked Tear Duct*.

Blocked Ureter

Alternate name; see *Ureteral Obstruction*.

Blocking Agent

A substance that prevents or reduces a biological process by blocking a receptor, channel, enzyme, or other target. Its effects and risks depend on the target and the tissue affected.

Alternate Names:
Blocker; Antagonist When It Acts by Receptor Antagonism

Blocking Agents

Plural form; see *Blocking Agent*.

Blocking Antibody

An immune protein that prevents another molecule from attaching to its target or interferes with a biological interaction. It may be used as treatment, protect against disease, or contribute to an autoim-

mune disorder.

Blood

A body fluid made of plasma, red blood cells, white blood cells, and platelets. It carries oxygen, nutrients, hormones, and waste and helps fight infection, stop bleeding, and regulate temperature.

Blood-Air Barrier

The thin boundary between air in the lung air sacs and blood in nearby capillaries. Oxygen crosses into the blood and carbon dioxide crosses into the air; the barrier is made from the air-sac lining, a thin shared layer, and the capillary lining.

Alternate Names:
Alveolar-Capillary Membrane

Blood Alcohol Concentration

The amount of alcohol in a person's blood, usually expressed as a percentage or mass per volume. Effects depend on the level, timing, tolerance, other substances, and health; one result does not fully predict impairment.

Blood Alcohol Level

A measurement of alcohol concentration in blood. Its effects depend on the amount, timing, tolerance, other substances, and individual health, so a given level may affect people differently.

Blood Alcohol Test

A laboratory assay or breath test that quantifies the concentration of ethanol in the bloodstream; see *Blood Alcohol Concentration*.

Blood Bank

A medical laboratory service that collects, tests, processes, and stores donated blood and blood components. It performs blood-group typing and antibody screening; compatibility testing, including crossmatching when indicated, helps select suitable products for transfusion.

Alternate Names:
Blood Banking; Transfusion Service; Immunohematology Laboratory

Blood Banking

Alternate name; see *Blood Bank*.

Blood Biomarker

A measurable sign of a disease or condition that can be isolated or detected in a blood sample, such as a disease-associated antibody, hormone, protein, or other substance.

Blood Blister

A raised pocket under the skin containing blood, usually caused by rubbing, pinching, pressure, or another injury that breaks small blood vessels.

Blood-Borne Disease

An infection that can spread through infected blood or certain body fluids, for example through shared needles, needlestick injuries, sexual exposure, or contaminated medical equipment. Examples include HIV and hepatitis B and C.

Blood-Borne Pathogens

Alternate spelling; see *Bloodborne Pathogens*.

Bloodborne Pathogens

Infectious agents transmitted through blood or certain body fluids. Examples include HIV and hepatitis B and C viruses. Depending on the pathogen, transmission can occur through contaminated sharps or contact with mucous membranes, sexual contact, or transmission during pregnancy or birth.

Blood Brain Barrier

Alternate spelling; see *Blood-Brain Barrier*.

Blood-Brain Barrier

A highly selective physiological semipermeable border formed by capillary endothelial cells interconnected by continuous tight junctions (claudins, occludin, and junctional adhesion molecules), surrounding pericytes, a basal lamina, and astrocytic perivascular end-feet (glia limitans). It tightly regulates solute and nutrient exchange between the systemic circulation and the central nervous system

parenchyma, maintaining neural microenvironment homeostasis while protecting brain tissue from circulating neurotoxins, pathogens, and biochemical fluctuations.

Blood Cancer

A cancer affecting blood-forming tissue, blood cells, or the lymphatic system. Abnormal cells can crowd out normal cells, impair immunity, cause anaemia or bleeding, or spread to organs.

Blood Cell

A formed element of blood. Red blood cells carry oxygen, white blood cells help fight infection, and platelets—small fragments released by large cells in the bone marrow—help stop bleeding.

Alternate Names:
Hematic Cells

Blood Cholesterol

Cholesterol carried in the blood. The body needs it to build cell membranes and make hormones and bile acids. Too much LDL cholesterol can form fatty buildup in the arteries and increase the risk of heart disease and stroke. Blood cholesterol is usually checked as part of a lipid profile.

Blood Cholinesterase Test

A laboratory test measuring cholinesterase enzyme activity in red blood cells or plasma. It can help assess exposure to certain insecticides and identify an inherited enzyme deficiency that affects how the body breaks down some medicines.

Alternate Names:
Pseudocholinesterase Test; Plasma Cholinesterase; Serum Butyrylcholinesterase

Blood Chromium Test

A specialized trace element assay quantifying whole blood or serum chromium concentrations to assess occupational exposure, evaluate metal-on-metal orthopedic implant wear and systemic metallosis, or monitor trace element balance in total parenteral nutrition.

Alternate Names:
Serum Chromium; Whole Blood Chromium; Chromium Exposure Test

Blood Circulation

The continuous movement of blood from the heart through the lungs and body and back again. It delivers oxygen and nutrients and carries away carbon dioxide and other waste.

Blood Clot

A gelatinous mass formed by aggregated platelets and cross-linked fibrin mesh during the coagulation cascade, serving physiologically to achieve hemostasis following vascular injury. Pathological intravascular formation (thrombosis) can occlude arterial or venous lumen, causing myocardial infarction, ischemic stroke, deep vein thrombosis, or pulmonary embolism.

Alternate Names:
Thrombus

Blood Clot in Lung

Alternate name; see *Pulmonary Embolism*.

Blood Clots

Plural form; see *Blood Clot*.

Blood Coagulation

The linked process that changes blood from a liquid to a firm clot after injury. Too little clotting causes bleeding, while excessive or misplaced clotting can cause dangerous vessel blockage.

Blood Coagulation Disorder

A condition in which blood clots too little, too much, or at the wrong time. Bleeding disorders result from inadequate clot formation, whereas thrombophilic disorders cause excessive or misplaced clotting. Causes include genetic variants, medicines, liver disease, immune conditions, cancer, and other illness. Examples include hemophilia, von Willebrand disease, thrombocytopenia, thrombophilia, and disseminated intravascular coagulation.

Blood Component Pathogen Reduction

A process used to reduce certain infectious agents in

donated blood components. It may use ultraviolet or visible light, sometimes with an added chemical, but does not eliminate every infectious risk.

Blood Count

A blood test measuring the number and features of red cells, white cells, and platelets. It helps assess anaemia, infection, inflammation, bleeding risk, and disorders of the bone marrow.

Blood Culture

A test in which blood is placed in special bottles to see whether bacteria or fungi grow. It helps investigate bloodstream infection, sepsis, or infection of the heart valves.

Blood Culture Contamination

Accidental entry of skin or environmental organisms into a blood-culture bottle during collection or handling, rather than true infection in the blood. It can lead to unnecessary antibiotics, so results are interpreted with symptoms and other culture sets.

Blood Differential Test

A blood test measuring the numbers and proportions of different white blood cells, including neutrophils, lymphocytes, monocytes, eosinophils, and basophils. It can help investigate infection, inflammation, allergy, leukaemia, or marrow disease.

Blood Donation

Voluntary collection of whole blood or selected blood components from a screened donor for transfusion or manufacture of medical products. Eligibility checks, infection testing, sterile collection, and post-donation recovery protect donor and recipient.

Blood Donation Before Surgery

Collection and storage of a person's own blood before an operation for possible later transfusion. It can cause anaemia, and the stored blood may go unused if the operation is postponed or cancelled.

Blood Donor

A person who gives blood or blood components for transfusion or medical use. Screening protects the donor and helps ensure that donated blood is safe for the recipient.

Blood Draw

Collection of blood, usually with a needle placed in a vein, for testing, donation, or treatment. Temporary pain, bruising, dizziness, or rarely infection may occur.

Blood Dyscrasia

A broad, nonspecific term for a disorder of blood cells, platelets, or clotting components. It does not identify which component is affected or the cause; more specific terms include anemia, leukopenia, and thrombocytopenia.

Blood Film

A thin layer of peripheral blood spread onto a glass microscope slide, stained with a Romanowsky stain (e.g., Wright-Giemsa), and examined under microscopy for quantitative and qualitative evaluation of erythrocyte morphology, leukocyte differentials, platelet adequacy, and identification of bloodborne parasites.

Alternate Names:
Peripheral Blood Smear; Blood Smear; Peripheral Smear

Blood Flow

The movement of blood through vessels and organs. It depends mainly on the pressure difference and resistance in the vessels and delivers oxygen and nutrients while removing waste.

Blood Flow Velocity

The speed at which blood moves through a vessel. It is usually fastest in large arteries and slowest in capillary networks, allowing time for exchange with tissues.

Blood Gas Analysis

A test measuring blood pH, oxygen, carbon dioxide, and often bicarbonate. It helps assess ventilation, oxygenation, and acid–base balance.

Blood Gases

Measurements of oxygen, carbon dioxide, acidity, and related substances in blood. They help determine how well a person is breathing, exchanging gases, and maintaining acid-base balance.

Blood Glucose

The amount of sugar called glucose in the blood. The body regulates it using food absorption, liver production, insulin, and other hormones; levels that are too low or high can cause illness.

Blood Glucose Monitoring

Measuring glucose in the blood or in fluid just under the skin. A meter gives a reading from a blood sample, while a continuous monitor tracks glucose throughout the day. Monitoring helps people with diabetes and their clinicians follow glucose levels over time.

Alternate Names:
Blood Sugar Monitoring

Blood Glucose Monitors

Portable devices that measure capillary blood glucose, usually with a lancet, test strip, and meter. Readings can be affected by sampling technique, circulation, or device limitations.

Blood Glucose Test

A diagnostic test measuring the concentration of glucose circulating in the blood, essential for diagnosing and managing diabetes mellitus and hypoglycemia; see *Blood Glucose*.

Blood Group

A classification of blood based on markers on red cells. The ABO and Rh systems are used for routine blood matching, although other blood-group systems can also matter. Matching helps reduce harmful reactions during transfusion and pregnancy.

Alternate Names:
Blood Type; Blood Groups; ABO and Rh Grouping; Blood Typing

Blood Group Incompatibility

An immune mismatch between donor and recipient blood or between maternal and fetal blood. Antibodies can destroy red blood cells, causing a transfusion reaction or hemolytic disease of the fetus and newborn; the risk depends on the blood-group system and antibody.

Blood Groups

Alternate name; see *Blood Group*.

Blood Group Test

A laboratory test identifying an individual's ABO blood type and Rh antigen status on red blood cells, crucial prior to blood transfusions and during pregnancy; see *Blood Group*.

Blood In Semen

Blood in the fluid released during ejaculation. It is often temporary and may follow infection, inflammation, injury, or a urinary-tract procedure. Persistent or recurrent blood may occur with pain, fever, or urinary symptoms.

Alternate Names:
Hematospermia; Hemospermia

Blood in Stool

Blood passed in or with stool, which may appear bright red, dark red, or black depending on its source. Causes range from haemorrhoids to bowel inflammation, ulcers, or cancer; the appearance alone does not identify the cause.

Blood In The Eye

Bleeding on the eye surface or inside the eye. A small surface bleed may be harmless, while bleeding inside the eye, eye pain, injury, or vision change can indicate significant eye damage.

Blood in Urine

The abnormal presence of red blood cells in the urine, known medically as hematuria. It may be visible to the naked eye (making urine look pink, red, or brownish) or detected only under a microscope during a routine urine test. Common causes

include urinary tract infections, kidney stones, vigorous exercise, prostate enlargement, or conditions affecting the kidneys or bladder.

Alternate Names:
Hematuria; Blood in the Urine

Blood Lancet

Alternate name; see *Lancet*.

Blood Lead Level Test

A quantitative diagnostic laboratory assay measuring venous or capillary whole-blood lead concentration in micrograms per deciliter (μg/dL). Utilized for pediatric screening, occupational exposure monitoring, and evaluating symptomatic plumbism.

Alternate Names:
BLL Assay; Venous Blood Lead Screen; Plumbism Blood Test

Blood Loss

Loss of blood from the circulation because of injury, surgery, childbirth, internal bleeding, or disease. Severe loss can reduce oxygen delivery and cause shock.

Blood Low Red Cell Count

Alternate name; see *Anemia*.

Blood PH

A measure of how acidic or alkaline the blood is. The lungs regulate carbon dioxide and the kidneys regulate acids and bicarbonate; normal arterial pH is about 7.35–7.45.

Blood Plasma

The liquid part of blood, made mostly of water and containing proteins, salts, nutrients, hormones, gases, and waste products. It carries blood cells and dissolved substances throughout the body.

Blood Preservation

The controlled collection, processing, cooling, freezing, and storage of donated blood or its components so they remain safe and effective until transfusion.

Blood Pressure

The force of circulating blood against artery walls, recorded as two numbers in millimetres of mercury. The systolic number is the pressure when the heart contracts; the diastolic number is the pressure between beats.

Blood Pressure Cuff

The inflatable part of a blood-pressure device that wraps around an arm or another limb and briefly compresses an artery. Correct sizing improves measurement accuracy.

Blood Pressure Measurement

Measurement of arterial pressure, usually with an inflatable cuff. The result records systolic pressure during heart contraction and diastolic pressure between contractions; cuff size and positioning affect accuracy.

Blood Pressure Monitor

A device that measures arterial blood pressure, usually with an inflatable cuff and an electronic or manual pressure-reading system. It may be used in clinical settings or at home to record systolic and diastolic pressure, and some devices also detect pulse rate or irregular rhythms.

Blood Pressure Monitors For Home

Devices used to measure blood pressure outside a clinic, usually with an inflatable upper-arm cuff. Readings can vary with the device, cuff fit, body position, and measurement conditions.

Blood Pressure Regulation

The body's control of blood pressure through the heart, blood vessels, kidneys, hormones, and nervous system. These systems adjust heart pumping, blood-vessel width, and body-fluid balance.

Blood Product

A component made from donated blood for medical treatment, such as red blood cells, platelets, plasma, or cryoprecipitate. The product is selected according to the person's bleeding, anaemia, or clotting problem.

Blood Products

Plural form; see *Blood Product*.

Blood Protein

A protein dissolved in blood plasma. These proteins help transport substances, maintain fluid balance, support immunity, and control clotting; abnormal amounts can occur with inflammation, liver or kidney disease, immune disorders, or some cancers.

Blood Results

Values reported from laboratory tests on a blood sample, such as blood-cell counts, glucose, salts, hormones, or liver and kidney markers. Each value is compared with a reference interval for that test; an out-of-range result does not by itself diagnose a disease.

Blood-Retinal Barrier

A selective barrier between blood and the retina, formed by tight junctions in retinal blood vessels and the retinal pigment layer. It controls which substances enter the retina and helps maintain its stable environment.

Alternate Names:
BRB

Blood Sedimentation

The settling of red blood cells in a tube of treated blood. The erythrocyte sedimentation rate is a nonspecific sign that may rise with inflammation, infection, anaemia, pregnancy, or other conditions.

Blood Smear

A thin layer of blood spread on a glass slide, stained, and examined under a microscope. It shows the size, shape, and appearance of blood cells and can reveal abnormal cells, parasites, or cell fragments.

Blood Spatter Analysis

Forensic analysis of bloodstain patterns to help reconstruct events. It may examine stain shape, distribution, and transfer, but conclusions are limited and considered with other evidence.

Bloodstream Infection

An infection involving microorganisms in the bloodstream, usually identified by blood culture. It may arise there or spread from a localized infection or infected intravascular device. Bacteremia means bacteria are present in blood; bacteremia can be transient. Sepsis is life-threatening organ dysfunction caused by a dysregulated response to infection.

Alternate Names:
Bloodstream Infections; BSI

Blood Substitutes

Fluids or artificial products intended to replace some functions of blood. Most restore circulating volume; some are designed to carry oxygen. None replaces every function of blood.

Blood Sugar

The amount of glucose in the blood. Insulin, glucagon, the liver, food, activity, illness, and other hormones affect it. Persistently high or very low levels can cause symptoms and serious organ injury.

Blood Sugar Test

A test measuring glucose in the blood. It may be done while fasting, at a random time, or after a glucose drink, and helps diagnose or monitor diabetes and other disorders of glucose control.

Blood Test

Analysis of blood cells or substances dissolved in blood, including chemicals, proteins, hormones, antibodies, or genetic material. Results help investigate symptoms, diagnose disease, assess organ function, and monitor treatment.

Blood-Testis Barrier

A barrier formed by tight connections between supporting Sertoli cells in the sperm-producing tubules. It separates developing sperm cells from the blood and immune system and helps maintain the conditions needed for sperm development.

Alternate Names:
BTB

Blood Thinner

A common name for medicines that lower the chance of harmful blood clots forming or growing. The term includes anticoagulants, which slow the body's clotting process, and antiplatelet medicines, which make platelets less likely to clump together. They do not literally thin the blood or usually dissolve an existing clot, and they can cause serious bleeding.

Blood Transfusion

The administration of whole blood or a specific blood component, such as red blood cells, platelets, plasma, or cryoprecipitate, to treat blood loss, anaemia, thrombocytopenia, or a clotting-factor deficiency. Red cells improve oxygen-carrying capacity; platelets, plasma, and cryoprecipitate support haemostasis. ABO/Rh typing, antibody screening, and compatibility testing help reduce transfusion reactions. Risks include febrile or allergic reactions, acute haemolysis, circulatory overload, and rare transfusion-transmitted infection; the decision depends on the patient's symptoms, laboratory results, bleeding, and overall clinical context.

Blood Typing

A laboratory test identifying markers on red blood cells, especially the ABO and Rh systems. It helps select compatible blood for transfusion and identifies some pregnancy-related risks from blood-group incompatibility.

Blood Urea Nitrogen

The amount of nitrogen from urea in the blood. Urea is made when the body breaks down protein and is removed mainly by the kidneys; the result is interpreted with creatinine, hydration, and the clinical situation.

Blood Urea Nitrogen Test

A clinical serum chemistry test measuring the amount of nitrogen derived from urea, the principal end product of protein catabolism formed in the liver. Elevated serum concentrations (azotemia) occur in acute or chronic renal impairment, prerenal hypoperfusion, severe dehydration, and upper gastrointestinal hemorrhage.

Alternate Names:
BUN Test; Serum Blood Urea Nitrogen; Urea Nitrogen Test

Blood Vessel

A tubular component of the circulatory system that transports blood throughout the body, comprising arteries, arterioles, capillaries, venules, and veins. Structurally, muscular and elastic vessels consist of three concentric tunics: the tunica intima (endothelial lining), tunica media (vascular smooth muscle and elastin fibers regulating vascular tone and resistance), and tunica adventitia (connective tissue supporting autonomic nerves and vasa vasorum).

Blood Vessel Inflammation

Inflammation of the blood vessel walls that can restrict blood flow and damage tissues. See *Vasculitis*.

Blood Vessels

Plural form; see *Blood Vessel*.

Blood Viscosity

How thick blood is and how much it resists flowing. It is influenced mainly by the number of red blood cells, but also by blood proteins and temperature. Excessively thick blood can slow circulation and increase clot risk.

Blood Volume

The total amount of blood circulating in the body, including plasma and blood cells. Too little can cause low blood pressure and shock; too much can strain the heart and lungs.

Bloom Syndrome

A rare autosomal-recessive disorder caused by pathogenic changes in both copies of the *BLM* gene, which encodes a DNA helicase. It causes marked short stature, a sun-sensitive telangiectatic facial rash, recurrent infections, and a greatly increased risk of multiple cancers, often at unusually young ages.

Blount Disease

A growth disorder in which the upper part of the shinbone grows unevenly, causing worsening bowing of one or both legs. It can affect young children or adolescents and may cause an abnormal gait, unequal leg length, or knee damage.

Blue Baby

An infant whose skin, lips, or nail beds look blue because the blood carries too little oxygen or circulation is reduced. This can occur with heart, lung, airway, or blood disorders.

Alternate Names:
Blue Babies

Blue Bottle

A common name for a bluebottle jellyfish. Its tentacles can inject venom that causes immediate stinging pain, raised marks, redness, and sometimes muscle cramps, breathing difficulty, or a severe allergic reaction.

Blue Discoloration Of The Skin

A blue or gray tint of the skin, lips, or nail beds caused by low oxygen, reduced blood flow, or abnormal haemoglobin. Sudden or widespread discoloration, especially with breathing difficulty or confusion, is an emergency.

Blue Finger/Toes

Alternate name; see *Peripheral Cyanosis*.

Blue-Green Algae

Blue-green algae are cyanobacteria that can grow rapidly in water. Some release toxins that cause skin irritation, vomiting, liver injury, breathing problems, or neurologic illness when people or animals are exposed.

Blue Nevi

Alternate plural name; see *Blue Nevus*.

Blue Nevus

A usually benign blue, blue-gray, or blue-black mole caused by pigment-producing cells deep in the skin. Most remain small and stable. A cellular blue nevus may be larger and, rarely, become cancerous.

Blue Nightshade Poisoning

Illness caused by eating blue nightshade or a related poisonous plant containing glycoalkaloids. Symptoms may include vomiting, diarrhoea, abdominal pain, confusion, weakness, seizures, or abnormal heart rhythm; severe poisoning can be life-threatening.

Blue NæVus

Alternate spelling; see *Blue Nevus*.

Blue Rubber Bleb Nevus Syndrome

A rare disorder with multiple slow-flow venous malformations, typically soft blue or purple compressible skin nodules and lesions in the gastrointestinal tract. Gastrointestinal bleeding can cause iron-deficiency anaemia, and other organs may be involved; evaluation may include imaging, endoscopy, and blood counts.

Blue Sclera

A blue-gray tint in the white part of the eye. It often happens when this layer is thinner than usual, so darker tissue underneath shows through. It can be linked to inherited conditions such as osteogenesis imperfecta, which makes bones break easily.

Blue Sclerae

Alternate plural name; see *Blue Sclera*.

Blue Toe Syndrome

The acute onset of localized cyanosis, purplish discoloration, and painful ischemia of one or more toes in the presence of intact distal pulses, caused by microembolization of atheromatous debris or small cholesterol crystals from proximal arterial sources.

Alternate Names:
Trash Foot; Digital Atheroembolism

Blumberg Sign

Rebound tenderness: abdominal pain that worsens when pressure on the abdomen is suddenly released.

It can indicate irritation of the peritoneum but is not specific to one disease.

Blunt Abdominal Trauma

An injury to the abdomen without an object piercing the skin, often caused by a crash, fall, or blow. It can damage the spleen, liver, kidneys, bowel, or pancreas, sometimes without early visible bruising.

Blunted Affect

Reduced outward expression of emotion. A person may show less facial movement, voice variation, or body language than expected, although their internal feelings may be stronger. It can occur in mental or neurologic disorders.

Blunt Force Trauma

Injury caused by a blow from a blunt object or by striking a blunt surface, without penetration by a sharp edge. It can produce bruises, grazes, torn skin, internal bleeding, fractures, or organ damage.

Blurred Vision

Vision that appears out of focus, hazy, or unclear. Causes include an incorrect glasses prescription, dry eye, eye disease, medicines, migraine, or neurologic illness. Sudden blurring with pain, weakness, or vision loss can occur with serious eye or neurologic disease.

Blush

Alternate name; see *Blushing*.

Blushing

Temporary redness or warmth of the face caused by increased blood flow in the skin. Common triggers include emotion, heat, exercise, alcohol, hormonal changes, medicines, fever, and some illnesses.

B Lymphocyte

Alternate name; see *B Cell*.

B-Lymphocyte

Alternate spelling; see *B Cell*.

B-Lynch Suture

A surgical stitch placed around the uterus to control severe bleeding after childbirth when the uterus remains relaxed and medicines have not stopped the bleeding. It compresses the uterus while usually preserving the possibility of future pregnancy.

B-Mode Ultrasound

The usual two-dimensional ultrasound image created from echoes of sound waves sent into the body. It shows the size, shape, and structure of organs and soft tissues without using radiation.

BMP

Routine blood test panel that evaluates electrolyte levels, blood sugar, and kidney function. See *Basic Metabolic Panel*.

Board-Like Rigidity

Severe involuntary tightening of the abdominal muscles, making the abdomen feel hard. It can indicate irritation of the abdominal lining from serious inflammation, infection, bleeding, or perforation.

Boas' Sign

Pain or unusual skin sensitivity below the right shoulder blade, traditionally associated with gallbladder disease. It is not specific enough to establish a diagnosis on its own.

Bobble-Head Doll Syndrome

A rare childhood movement disorder causing repeated forward-and-back head movements, often associated with a fluid-filled cyst or another lesion near the third ventricle of the brain.

Bocavirus

A group of small viruses that can infect humans and animals. Human bocavirus most often affects the airways of young children, although infection may cause illness in other tissues or people with weakened immunity.

Bocavirus Infection

A viral infection, usually of the airways in young

children. It may cause a runny nose, cough, fever, wheezing, bronchiolitis, or pneumonia, often together with another infection. Breathing difficulty or dehydration can occur in more severe illness.

Bochdalek Hernia

A birth defect in which abdominal organs move through an opening in the back and side of the diaphragm into the chest. It can prevent normal lung development and cause severe breathing problems in a newborn.

Bock's Disease

Older name; see *Sarcoidosis*.

BODE Index

A scoring tool for chronic obstructive pulmonary disease that combines body weight, breathing-test results, breathlessness, and walking distance. A higher score suggests more severe disease and a greater risk of hospital admission or death; it does not predict an individual outcome with certainty.

Alternate Names:
BODE Score; COPD Multidimensional Index

Bodily Secretion

A substance made and released by cells or glands, such as sweat, saliva, mucus, tears, digestive juices, or hormones. Secretions protect tissues, aid digestion, regulate body functions, or help remove waste.

Body Aches

Widespread muscle or body pain that can occur with infection, fever, exercise, inflammation, medicines, or other illness. Severe pain may occur with weakness, dark urine, breathing difficulty, chest pain, or high fever in serious illness.

Body Cavity

An enclosed space inside the body that contains and protects organs. Major cavities include the skull, spinal canal, chest, abdomen, and pelvis; their linings may produce small amounts of lubricating fluid.

Body Cell Mass

The living, metabolically active cells of the body, including cells in muscles, organs, blood, and other tissues. It excludes stored fat and water outside cells and is sometimes estimated in nutrition assessment.

Body Composition

The relative amounts of fat, muscle and other lean tissue, bone mineral, and water in the body. It provides more information about health and nutrition than body weight alone, although estimates vary by method.

Body Dysmorphia

Alternate name; see *Body Dysmorphic Disorder*.

Body Dysmorphic Disorder

A disorder involving persistent preoccupation with one or more perceived appearance flaws that are not observable or appear slight to others. The preoccupation is accompanied by repetitive behaviors or mental acts, such as checking, grooming, comparing, or seeking reassurance, and causes significant distress or impairment.

Alternate Names:
BDD

Body Fat

Adipose tissue that stores energy, cushions organs, insulates the body, and releases hormones and other signals. Too much or too little body fat can affect metabolism, movement, fertility, immunity, and other aspects of health.

Body Fluid

Water and dissolved substances inside and around the body's cells. Body fluid includes fluid inside cells and fluid outside them, such as blood plasma and the fluid between tissues. It carries nutrients and waste and helps regulate body temperature.

Alternate Names:
Bodily Fluids

Body Fluid Exposures

Occupational or accidental contact with blood or

potentially infectious body fluids through the eyes, mouth, broken skin, or a penetrating injury. The possibility of infection depends on the fluid, route, and source.

Body Fluids

Alternate name; see *Body Fluid*.

Body Habitus

A person's general build, including body size, shape, muscle, fat distribution, and proportions. Clinicians may record it during an examination, but it does not by itself diagnose disease or predict health.

Body Height

The vertical distance from the soles of the feet to the top of the head, measured while standing when possible. It helps assess growth and nutrition and is used in medication, kidney-function, and other calculations.

Body Identification

The process of establishing who a deceased person is. It may use fingerprints, dental records, medical information, DNA, personal effects, or visual recognition, with the method chosen according to the circumstances.

Body Image

A person's thoughts, feelings, and beliefs about their body and appearance. Distress or inaccurate beliefs about appearance can occur in body dysmorphic disorder, eating disorders, depression, or other mental-health conditions.

Body Lice

Infestation with human body lice, which live mainly in clothing and move to the skin to feed. Bites can cause intense itching, and infestation is associated with clothing and bedding.

Alternate Names:
Pediculosis Corporis; Body Louse Infestation

Body Mass Index

A screening measure calculated by dividing weight in kilograms by height in meters squared. It helps assess weight in relation to height, but it does not directly measure body fat or provide a complete assessment of health. Results are interpreted with age and other clinical factors; children and teens are assessed using age- and sex-specific percentiles.

Alternate Names:
BMI; Quetelet Index; BMI Calculation

Body Odor

Smell produced when skin secretions, especially sweat, are broken down by skin microorganisms. A sudden or unusual change may be related to diet, medicines, infection, or a metabolic disorder.

Body Odor and Sweating

Alternate index label; see *Sweating And Body Odor*.

Body Odour

Smell from the breakdown of skin secretions by microorganisms. The smell can change with sweating, hygiene, diet, medicines, infection, or some metabolic diseases.

Body Of The Epididymis

The middle part of the epididymis, where sperm continue to mature as they move from the head toward the tail.

Body Of The Sternum

The broad middle part of the breastbone between the manubrium and xiphoid process. It joins most of the ribs through their costal cartilages.

Body Piercing

Creation of an opening through skin or a mucous membrane to insert jewellery. Possible complications include pain, bleeding, infection, scarring, allergic reaction, and damage to teeth, nerves, or cartilage.

Body Plethysmography

A breathing test performed inside a sealed cabin to measure lung volumes, including air that cannot be exhaled. It helps identify restricted lungs, over-

expanded lungs, and some airway problems.

Body Position

The arrangement of the body or a body part, such as standing, lying on the back, lying face down, or lying on the side. Position can affect breathing, circulation, examination results, and medical procedures.

Body Region

A named area of the body used to describe the location of an organ, symptom, injury, or examination finding, such as the chest, abdomen, pelvis, or arm.

Body Ringworm

A fungal infection of the skin on the body, usually causing an expanding, ring-shaped, scaly rash with a more active edge and clearer centre. It can spread through direct contact or contaminated objects.

Alternate Names:
Tinea Corporis; Dermatophytosis of Glabrous Skin

Body Space

A normal or potential compartment inside the body, such as the space around the lungs or abdominal organs. Air, blood, fluid, or infection can collect there and interfere with organ function.

Body Substance

Material produced by or found in the body, including blood, saliva, urine, faeces, mucus, tissue, and other secretions. Some substances can carry infection and require appropriate handling precautions.

Body Surface

The outside of the body, mainly the skin and accessible mucous membranes. Clinicians may estimate its area when assessing burns, calculating some medicine doses, or making physiological measurements.

Body Surface Area

An estimate of the body's external area, usually calculated from height and weight. It is used in burn assessment, some medicine doses, and selected medical calculations; it is an estimate rather than a direct measurement.

Body Temperature

A measure of the body's thermal state, reflecting the balance between heat production and heat loss. The average normal oral temperature is approximately 37°C (98.6°F), although healthy individuals exhibit a range, typically around 36.1–37.2°C (97–99°F). Body temperature varies with age, circadian rhythm, physical activity, hormonal changes, environmental conditions, and illness. It can be measured orally, rectally, axillary, tympanically (ear), temporally (forehead), or oesophageally. Readings differ by site: rectal temperatures are generally higher and axillary temperatures generally lower than oral measurements. The measurement site and method should be documented for accurate clinical interpretation.

Body Temperature Norms

Expected temperature ranges vary with age, time of day, activity, illness, and whether temperature is measured by mouth, ear, armpit, skin, or rectum. The measurement method and symptoms are considered when interpreting fever or low temperature.

Body Wall

The layers of skin, connective tissue, muscle, and sometimes bone that surround and protect a body compartment, such as the chest or abdomen. They also help movement, breathing, and support.

Body Weight

The measured mass of a person, including fat, muscle, bone, water, and organs. It helps assess growth, nutrition, and fluid changes and is used with other information for some medical calculations.

Boeck's Sarcoid

Older name; see *Sarcoidosis*.

Boerhaave's Syndrome

Alternate name; see *Boerhaave Syndrome*.

Boerhaave Syndrome

A spontaneous, full-thickness rupture of the esophageal wall caused by a sudden rise in pressure, most often during forceful vomiting or retching, although vomiting may be absent. Unlike a Mallory–Weiss tear, which affects only the lining, this rupture can let esophageal contents leak into the mediastinum or pleural space, causing severe infection, sepsis, or shock.

Alternate Names:
Boerhaave's Syndrome; Boerhaave's Syndrome

Bogros' Space

A layer of tissue behind the groin region and in front of the abdominal lining. Surgeons use this natural plane when repairing some groin hernias.

Bohn Nodules

Small, harmless cysts containing keratin that appear on a newborn's gums or the roof of the mouth. They usually disappear without treatment and do not interfere with feeding.

Bohr Effect

The tendency of haemoglobin to release more oxygen when tissues become more acidic or contain more carbon dioxide. This helps active tissues receive oxygen where energy use and carbon-dioxide production are greatest.

Bohring Syndrome

A rare genetic disorder associated with severe developmental delay, poor growth before birth, distinctive facial features, reduced movement, and frequent feeding or breathing difficulties.

Boil

A painful, pus-filled skin abscess centered on an infected hair follicle and surrounding tissue, most commonly caused by *Staphylococcus aureus* bacteria. It typically begins as a tender, red nodule that progressively enlarges, develops a central yellowish head of pus, and eventually ruptures to drain. Multiple or recurrent boils are termed furunculosis, whereas a deeper, connected cluster of several boils is classified as a *Carbuncle*.

Alternate Names:
Furuncle

Boils

Alternate name; see *Boil*.

Boils and Carbuncles

Alternate name; see *Boil* and *Carbuncle*.

Bolt Device

A threaded fastener used in some orthopedic fixation systems to stabilize bone fragments or connect parts of an external fixator. Its design and use depend on the specific fixation system.

Bolus

A single measured amount of medicine or fluid given over a short time, usually by injection or infusion. In digestion, it means food that has been chewed and is ready to swallow.

Bolus Gastrostomy Feeding

Delivery of a measured amount of liquid nutrition or fluid into the stomach through a gastrostomy tube over a short period, often by syringe or gravity. It is a form of enteral feeding.

Alternate Names:
Bolus G-Tube Feeding; G-Tube Bolus Feeding; Bolus Enteral Nutrition; Enteral Bolus Nutrition; Syringe Feeding

Bolus Infusion

Delivery of a measured amount of fluid or medicine into a vein over a short period. The dose and speed depend on the medicine, the person's condition, and the intended effect; errors can cause serious harm.

Bombay Blood Group

A rare inherited blood type in which red blood cells lack the H marker needed to form A or B markers. It may look like type O but is usually compatible only with blood from another Bombay-type donor.

Bombesin Receptor

A protein on or inside a cell that binds bombesin-

like signalling substances and changes cell activity. These receptors help regulate processes such as hormone release, digestion, and cell growth and are studied in some cancers.

Bone

A strong living tissue that forms the skeleton, supports the body, protects organs, enables movement with muscles, stores minerals, and contains marrow that makes blood cells. Bone is continually broken down and rebuilt.

Bone-Anchored Hearing Implant

A hearing device fixed to the skull bone that transmits sound vibrations to the inner ear, bypassing the outer or middle ear. It may be used for selected conductive, mixed, or single-sided hearing loss.

Bone And Mineral Disorders

Diseases affecting bone strength, bone formation, or the body's balance of calcium and phosphate. Examples include osteoporosis, rickets, osteomalacia, parathyroid disorders, and inherited bone diseases.

Bone Callus

New tissue that forms around a broken bone during healing. It first consists of a soft blood clot and connective tissue, then cartilage and immature bone, which are gradually reshaped into stronger bone.

Bone Cancer

Cancer that starts in bone, such as osteosarcoma or chondrosarcoma, or cancer that has spread there from another organ. Persistent focal pain, swelling, or a fracture after minor injury may occur; diagnosis uses imaging and tissue testing.

Bone Cement

A self-curing acrylic biomaterial composed of polymethylmethacrylate (PMMA) utilized in orthopedic and spine surgery to anchor prosthetic joint components, fill osseous voids, and stabilize vertebral compression fractures during vertebroplasty or kyphoplasty.

Alternate Names:
Polymethylmethacrylate; PMMA; Acrylic Bone Cement

Bone Conduction

Hearing sound through vibrations carried by the skull to the inner ear, bypassing the outer and middle ear. Bone-conduction testing helps identify whether hearing loss comes from the outer or middle ear or from the inner ear and nerve.

Bone Cyst

A fluid-filled or blood-filled space within bone. Many bone cysts are benign, but they can weaken the bone and cause pain, swelling, or fracture. Common types include simple bone cysts and aneurysmal bone cysts.

Alternate Names:
Bone Cysts

Bone Densitometry

See *Bone Mineral Density Test*.

Bone Density

The amount of mineral packed into a measured area of bone. It is usually estimated with a DXA scan; lower density is associated with greater fracture risk, while age and other risk factors affect interpretation.

Bone Density Scan

A noninvasive radiological scan measuring bone mineral content per volume to detect osteopenia and osteoporosis and evaluate fracture risk; see *Bone Densitometry* and *Dual-Energy X-Ray Absorptiometry*.

Bone Density Screening

A DXA scan that measures bone mineral at sites such as the hip and spine. It helps identify osteoporosis and estimate fracture risk, especially in people with age-related or other risk factors.

Bone Development

The formation, growth, and shaping of bones from before birth through adulthood. Bones lengthen and widen as new tissue is made and old tissue is removed; hormones, nutrition, activity, and injury

influence this process.

Bone Disease

Any condition that weakens, deforms, inflames, infects, or otherwise damages bone. Examples include osteoporosis, fractures, infections, tumours, inherited skeletal disorders, and diseases caused by abnormal mineral or hormone levels.

Bone Dysplasia

A disorder of bone formation or growth that gives one or more bones an unusual size, shape, or strength. Some bone dysplasias are inherited, while others arise during development for different reasons. Effects vary and may include short stature, deformity, or bones that break easily.

Bone Fracture

A partial or complete break in a bone caused by injury, repeated stress, or weakened bone. Pain, swelling, bruising, deformity, and loss of function may occur. An open fracture or associated nerve or blood- vessel injury is a serious complication.

Bone Fractures

Alternate name; see *Bone Fracture*.

Bone Graft

Bone tissue or a substitute placed in a bone defect to support repair, join bones together, rebuild an area, or help a fracture heal. The material may come from the person, a donor, or a synthetic source.

Bone Grafting

A surgical procedure that transplants bone tissue—either from the patient, a donor, or a synthetic matrix—to repair, stabilize, or promote healing of fractured or diseased bone; see *Bone Graft*.

Bone Health

The strength, structure, and ability of bones to grow, repair, and resist fractures. It is influenced by age, nutrition, hormones, physical activity, medicines, smoking, alcohol, and medical conditions.

Bone Infarction

Death of bone and bone-marrow tissue caused by loss of blood supply. The term often refers to an affected area in the middle or shaft of a long bone; it is related to osteonecrosis, which can occur in different parts of bone. Some bone infarcts cause no symptoms and are found on imaging done for another reason.

Alternate Names:
Bone Infarct

Bone Infection

Infection of bone, usually caused by bacteria. It may reach bone through the bloodstream, spread from nearby tissue, or enter through surgery or an open injury, causing pain, swelling, fever, or poor healing.

Bone Lesion Biopsy

Removal of a small sample from an abnormal area of bone with a needle or operation for laboratory examination. Testing can distinguish infection, noncancerous growth, and cancer; the biopsy route can affect later surgical planning.

Bone Markers in Osteoporosis

Blood or urine measurements reflecting bone formation or resorption. They provide information about bone turnover and may change with osteoporosis treatment; they measure different features from bone density and fracture-risk estimates.

Bone Marrow

Soft tissue inside many bones. Red marrow makes red cells, white cells, and platelets; yellow marrow stores fat and can produce more blood cells when the body needs them.

Bone Marrow Aspiration

Removal of a small amount of liquid marrow, usually from the back of the hipbone, with a needle. It is examined to assess blood-cell development, abnormal cells, infection, or genetic changes.

Bone Marrow Aspiration And Biopsy

Two ways of sampling marrow, usually from the back of the hipbone. Aspiration collects liquid marrow for cell and genetic testing; biopsy removes a small solid core to assess marrow structure, cell production, scarring, infection, or cancer.

Bone Marrow Biopsy

A procedure that removes marrow, usually from the back of the hipbone, for examination. It may include liquid aspiration and a solid core to assess blood-cell production, abnormal cells, scarring, infection, or cancer.

Bone Marrow Culture

A laboratory test in which marrow is placed in special conditions to grow and identify bacteria, fungi, or other organisms when an infection of the marrow or bloodstream is suspected.

Bone Marrow Depression

Reduced production of blood cells by the marrow. It can cause anaemia, increased infection risk from too few white cells, bleeding from too few platelets, or a combination of these problems.

Bone Marrow Disorder

Any disease that affects the marrow's production of red cells, white cells, or platelets. It may cause anaemia, frequent infections, bleeding, abnormal blood counts, or symptoms from abnormal marrow cells.

Bone Marrow Donation

Collection of blood-forming stem cells from a donor's bone marrow, usually by aspiration from the pelvic bones under anaesthesia. It is one source of cells for transplantation and is distinct from peripheral blood stem-cell donation by apheresis.

Alternate Names:
Bone Marrow Harvest

Bone Marrow Edema

An MRI finding in which marrow has an abnormal signal that often reflects extra fluid or tissue injury. It is not a diagnosis by itself and may occur with injury, overuse, inflammation, reduced blood flow, or other conditions. The cause is judged from the scan and other findings.

Bone Marrow Failure

A condition in which the marrow cannot make enough red cells, white cells, or platelets. Causes include inherited disorders, aplastic anaemia, medicines, toxins, infections, marrow cancers, and other diseases.

Alternate Names:
Marrow Failure Bone Marrow Failure Syndrome

Bone Marrow Fibrosis

An increase in scar-like fibrous tissue within the bone marrow, where blood cells are made. It can disrupt normal blood-cell production and occur in myelofibrosis or as a result of other blood, cancer, inflammatory, or infectious disorders. A marrow sample can show the change.

Bone Marrow Hyperplasia

An increase in the number of marrow cells because blood-cell production has accelerated. It may be a response to ongoing red-cell destruction, blood loss, low oxygen, or another increased demand for blood cells.

Bone Marrow Necrosis

Death of the blood-forming tissue inside bones. It can occur with severe sickle-cell disease, blood cancers, or infection and may cause severe bone pain, anaemia, low white-cell or platelet counts, and fever.

Bone Marrow Transplantation

A treatment in which healthy blood-forming stem cells are infused to replace or restore bone-marrow cells damaged by disease or treatment. The cells may come from the patient or a donor. It is used for selected blood cancers, marrow failure, and some inherited disorders; risks include infection, graft failure, organ toxicity, and graft-versus-host disease after a donor transplant.

Alternate Names:
BMT; Bone Marrow Transplant

Bone-Marrow Transplantation

Alternate name; see *Bone Marrow Transplantation*.

Bone Mass

The amount of bone tissue in the skeleton or in a particular area. Greater bone mass generally provides more strength, while low bone mass can increase the risk of osteoporosis and fractures.

Alternate Names:
Bone Mineral Content; Skeletal Bone Mass

Bone Matrix

The material surrounding bone cells that gives bone its shape and strength. It contains a flexible framework, mainly type I collagen, reinforced with mineral crystals made largely from calcium and phosphate.

Bone Metastases

Areas of cancer that have spread to bone from another part of the body. They may cause bone pain, weaken the bone and lead to fracture, raise blood calcium, or press on the spinal cord or nerves.

Alternate Names:
Metastatic Bone Disease; Skeletal Metastases

Bone Metastasis

See *Bone Metastases*.

Bone Mineral Content

Measurement of the total amount of bone mineral present in a designated skeletal region. See *Bone Mineral Density*.

Bone Mineral Density

The amount of mineral, mainly calcium, in a measured area of bone. A DXA scan estimates bone strength, helps diagnose osteoporosis, assesses fracture risk, and monitors treatment together with age and other risk factors.

Alternate Names:
BMD; Bone Density; Bone Mineral Content

Bone Mineral Density Test

A test that estimates the amount of mineral in bone, most commonly using dual-energy X-ray absorptiometry (DXA) at the hip and spine. Results help assess bone strength and fracture risk and support diagnosis or monitoring of osteoporosis.

Bone Morphogenetic Protein

A family of growth factors belonging to the transforming growth factor-beta (TGF-beta) superfamily that orchestrate osteogenesis, chondrogenesis, and bone remodeling, utilized therapeutically in spinal fusion and non-union fracture repair.

Alternate Names:
BMP

Bone Necrosis

Death of bone tissue, usually because its blood supply is reduced or because of severe injury, infection, radiation, or prolonged corticosteroid use. It can cause pain, bone collapse, joint damage, and fracture.

Bone Neoplasm

An abnormal growth of cells arising in bone. It may be noncancerous or cancerous; imaging and often a biopsy determine its type, behaviour, and extent.

Bone Tumors Of The Hip

Growths in the bones around the hip, including the pelvis and upper thighbone. They may start in bone or spread there from another part of the body; some are noncancerous and others are cancerous. See also *Bone Neoplasm* and *Bone Metastases*.

Bone Pain

Aching or other discomfort arising from bone. Causes include injury, fracture, infection, reduced blood supply, metabolic disease, overuse, or cancer. Persistent, severe, or unexplained pain can be associated with serious underlying disease.

Bone Pain Or Tenderness

Pain when a bone is used, pressed, or touched. It may result from injury, fracture, infection, inflammation, metabolic disease, or cancer.

Bone Plate

A metal or other body-compatible plate fixed to bone with screws. It holds broken pieces in position, supports healing, or helps correct a deformity during orthopaedic surgery.

Bone Regeneration

Formation of new bone to repair or replace bone that is damaged, missing, or diseased. It occurs naturally during fracture healing and may be supported by grafts, implants, or other treatments.

Bone Remodeling

The lifelong replacement of old bone with new bone. Cells remove worn bone and other cells build replacement bone, helping maintain strength, shape, and the body's calcium balance.

Bone Resorption

The removal and breakdown of bone tissue, which releases minerals into the blood. It is normal during bone renewal, but excessive resorption can weaken bones and contribute to osteoporosis.

Bones And Joints

Bones provide support and protection, while joints connect bones and allow movement. Joints may be fixed, slightly movable, or freely movable and are held together by tissues such as cartilage, ligaments, and joint fluid.

Bone Sarcoma

A malignant tumour that begins in bone, such as osteosarcoma, chondrosarcoma, or Ewing sarcoma. It is distinct from cancer that spreads to bone from another organ.

Bone Saw

A surgical instrument used to cut bone during procedures such as amputation, joint replacement, fracture repair, or orthopaedic reconstruction.

Bone Scan

A specialized imaging test that uses a small, safe amount of radioactive substance (tracer) injected into a vein to look for areas of bone damage or abnormal bone turnover. A special camera scans the body to highlight spots where bone is healing, inflamed, or growing unusually fast, helping detect fractures, bone infections, arthritis, or cancer that has spread to bone.

Alternate Names:
Bone Scintigraphy; Skeletal Scintigraphy; Radionuclide Bone Scan

Bone Screws

Screws used during orthopaedic surgery to hold broken bone pieces together or attach plates, joint components, or other implants. Their size, material, and placement depend on the bone and the operation.

Bones of the Skeleton

The body's framework of bones and cartilage, providing support, protection, leverage for movement, mineral storage, and marrow-based blood-cell production.

Bone Spurs

Extra projections of bone that usually form near joints after long-term wear, arthritis, injury, or abnormal stress. They may cause no symptoms or may irritate nearby tissues and restrict movement.

Alternate Names:
Osteophytes

Bone Transplantation

Transfer of bone tissue or a bone substitute to repair a defect, support fracture healing, or assist reconstruction of the spine, jaw, or a joint. The graft may come from the person, a donor, or a manufactured material.

Bone Tumor

Alternate name; see *Bone Neoplasm*.

Bone Tumor-Epidermoid Cyst-Polyposis

A historical descriptive name for Gardner syndrome, an inherited adenomatous polyposis condition associated with numerous colorectal polyps, osteomas,

epidermoid cysts, and a high risk of colorectal cancer.

Bone Turnover Markers

Substances measured in blood or urine that reflect how quickly bone is being built or broken down. They may support assessment of some metabolic bone disorders or treatment response but do not replace bone-density testing.

Bone Type

A way of grouping bones by shape. Long bones support movement, short bones provide stability, flat bones protect organs or provide broad muscle attachment, irregular bones have complex shapes, and sesamoid bones lie within tendons.

Bone X-Ray

An X-ray picture of a bone or group of bones used to look for fractures, abnormal shape, arthritis, infection, bone loss, or some tumours.

Bongkrek Poisoning

Severe poisoning caused by bongkrekic acid in contaminated fermented foods, especially coconut or corn products. It can cause vomiting, abdominal pain, weakness, liver failure, neurologic injury, and death.

Bonnevie-Ullrich Syndrome

An older name for the physical features sometimes associated with Turner syndrome, a condition involving an absent or altered X chromosome. Features may include short stature, a webbed neck, and reduced ovarian function.

Bony Exostosis

A localized extra growth of bone, often arising on the jaw or palate. It is usually benign and may cause a hard lump or interfere with nearby tissues, depending on its size and location.

Bony Labyrinth

A system of channels inside the dense part of the skull bone that houses the inner ear. It contains the cochlea for hearing and the vestibule and semicircular canals for balance.

Borborygmi

Rumbling or gurgling sounds made when gas and liquid move through the intestines. They are often normal, but major changes together with pain, vomiting, swelling, or inability to pass stool may signal bowel disease.

Borborygmus

A single rumbling or gurgling intestinal sound caused by movement of gas and liquid through the bowel. Its significance depends on symptoms and the overall abdominal examination.

Borderline

Describes a result or condition near the boundary between normal and abnormal or between diagnostic categories. It is an equivocal finding whose significance depends on the measurement, symptoms, and other clinical information.

Borderline Ovarian Cancer

An ovarian epithelial tumour with atypical proliferating cells but no destructive stromal invasion. It generally behaves less aggressively than invasive ovarian cancer, although recurrence can occur.

Borderline Personality Disorder

A mental disorder marked by an enduring pattern of instability in emotions, self-image, and relationships, often with impulsive behavior and difficulty regulating emotions. Features may include intense reactions to perceived abandonment, rapidly shifting moods, chronic emptiness, anger, or self-injury. Symptoms vary and cause significant distress or impairment.

Alternate Names:
BPD; Emotionally Unstable Personality Disorder (EUPD)

Bordetella

A group of small bacteria that can infect the airways of humans or animals. Bordetella pertussis causes whooping cough; other species usually affect animals

but can rarely cause opportunistic human infection.

Bordetella Avium

A bacterium that mainly causes respiratory disease in turkeys and other birds. Human infection is very rare and is usually reported in people with weakened immunity or serious underlying illness.

Bordetella Bronchiseptica

A bacterium that commonly causes respiratory infection in dogs and other animals. It rarely infects humans, but may cause pneumonia or bloodstream infection, especially in people with weakened immunity.

Bordetella Hinzii

A bacterium found mainly in poultry. It rarely causes respiratory or bloodstream infection in humans, usually in people with weakened immunity or significant underlying disease.

Bordetella Parapertussis

A bacterium that can cause a whooping-cough-like respiratory infection. Illness is often milder than infection with Bordetella pertussis, but prolonged coughing can still occur and the infection can spread to others.

Bordetella Pertussis

The bacterium that causes whooping cough, a highly contagious respiratory infection. It attaches to airway lining, produces toxins that disrupt airway function, and can cause repeated coughing, vomiting, breathing pauses, and serious illness in infants.

Bordetella Petrii

An environmental bacterium that rarely causes human disease. When it is found in a specimen, clinicians decide whether it represents true infection by considering the body site, symptoms, and other test results.

Boric Acid

A chemical used in some industrial products, insecticides, and limited topical preparations. Swallowing it or absorbing a large amount can poison the body.

Boric Acid Poisoning

Illness caused by swallowing or absorbing too much boric acid. It may cause vomiting, diarrhoea, abdominal pain, skin changes, kidney injury, seizures, shock, or death.

Borna Disease

An uncommon viral infection of the nervous system caused by Borna disease virus. It is mainly recognized in animals; human infection is rare and may cause severe inflammation of the brain.

Bornholm Disease

A contagious viral illness causing sudden attacks of severe chest or upper-abdominal muscle pain, often with fever, headache, or vomiting. It is usually caused by an enterovirus and generally resolves with supportive care.

Boron

A chemical element found naturally in food, water, soil, and industrial materials. Small dietary amounts are generally tolerated, but excessive exposure can cause digestive symptoms, skin problems, reproductive effects, or developmental toxicity.

Borrelia

A group of spiral-shaped bacteria spread mainly by ticks or lice. Different species cause Lyme disease, relapsing fever, or other infections, with symptoms and treatment depending on the species and exposure.

Borrelia afzelii

Species of spirochete bacteria transmitted by tick bites, primarily in Europe and Asia, causing Lyme disease. See *Lyme Disease*.

Borrelia Burgdorferi

A spiral-shaped bacterium spread by infected blacklegged ticks and the main cause of Lyme disease in North America and parts of Europe. Infection may affect the skin, joints, nervous system, or heart.

Borrelia Infection

Infection with a Borrelia bacterium. Depending on the species, it may cause Lyme disease or relapsing fever, with symptoms such as fever, headache, fatigue, rash, muscle pain, or joint and nerve problems.

Borrelia Miyamotoi

A bacterium spread by some hard-bodied ticks that causes hard-tick relapsing fever. Illness commonly includes repeated episodes of fever, headache, fatigue, chills, and muscle or joint aches.

Borreliosis

Infection caused by a Borrelia bacterium. Human forms include Lyme disease and relapsing fever; symptoms differ according to the species, stage of infection, route of spread, and organs involved.

Bortezomib

A cancer medicine that blocks proteasomes, cell structures that remove unwanted proteins. This can kill susceptible cancer cells and is used mainly for multiple myeloma and some lymphomas; nerve damage, low blood counts, digestive symptoms, and infections can occur.

Bosentan

A medicine that blocks endothelin, a substance that narrows blood vessels. It is used for pulmonary arterial hypertension and can cause liver injury or harm a developing fetus.

Bosniak Classification

A system for describing kidney cysts on contrast CT or MRI according to their walls, septations, mineral deposits, and solid parts. Categories help estimate cancer risk and guide monitoring, further imaging, or surgery.

Boston Criteria

Clinical and brain-imaging rules used to estimate the likelihood of cerebral amyloid angiopathy in living people. Age, symptoms, and MRI findings such as bleeding in certain parts of the brain are considered. The criteria classify cases as possible or probable; definite diagnosis generally requires examination of brain tissue.

Alternate Names:
Boston Criteria for Cerebral Amyloid Angiopathy

Bot Fly

Alternate spelling; see *Botfly*.

Botfly

A dipteran fly of the family Oestridae (notably *Dermatobia hominis*, the human botfly) whose parasitic larvae infest mammalian skin and tissues, producing obligate furuncular or wound myiasis. In humans, the larva develops within the dermis, causing an erythematous, tender, boil-like nodule featuring a central punctum for larval respiration, frequently accompanied by serosanguinous drainage and localized sensations of movement.

Bothriocephalus

An older name for a group of fish tapeworms. Related tapeworm infections may cause abdominal symptoms and, when prolonged, can reduce vitamin B12 absorption and lead to anaemia.

Botryomycosis

A chronic bacterial infection that forms firm granules within lesions and can resemble a fungal infection. It most often affects the skin and tissue beneath it but may involve internal organs, especially in people with weakened immunity.

Bottle Feeding

Feeding an infant expressed breast milk or infant formula from a bottle.

Botulinum Toxin

A substance made by Clostridium botulinum that temporarily blocks nerve signals to muscles and some glands. Carefully measured injections treat selected muscle spasms, movement disorders, migraine, sweating, and cosmetic concerns; too much can cause weakness or breathing failure.

Botulism

A rare, life-threatening illness caused by toxins produced by the bacterium extitClostridium botulinum. The toxin attacks the nervous system by blocking the nerve signals that tell muscles to move. It causes paralysis that typically starts in the face—leading to drooping eyelids, blurred or double vision, and difficulty speaking or swallowing—and spreads downward to the arms, legs, and breathing muscles. It can occur from eating improperly canned or preserved food, from infected wounds, or in infants who swallow bacterial spores.

Alternate Names:
Clostridial Botulism; Botulinum Poisoning

Bouchard Nodes

Hard, bony enlargements (osteophytes) of the proximal interphalangeal (PIP) joints of the hands, characteristic of osteoarthritis. They result from articular cartilage degeneration, subchondral sclerosis, and reactive marginal osteophyte formation, causing localized stiffness, reduced range of motion, and angular deviation (distinguished from Heberden nodes of the distal interphalangeal joints).

Alternate Names:
Proximal Interphalangeal Osteophytes; PIP-Joint Nodes; Bouchard's Nodes

Bouchard's Node

Singular form; see *Bouchard Nodes*.

Bouchard's Nodes

Alternate spelling; see *Bouchard Nodes*.

Bougie

A slender medical instrument used to examine or gradually widen a narrowed passage, such as the food pipe or urethra. Use can cause pain, bleeding, perforation, or infection.

Bougienage

Gradual widening or examination of a narrowed body passage with a bougie. It may relieve swallowing or urinary obstruction; complications include bleeding or perforation.

Bouin's Solution

A laboratory liquid containing picric acid, formaldehyde, and acetic acid that preserves tissue for microscopic examination. It is hazardous to handle and can interfere with some later genetic tests.

Bounding Pulse

A hyperdynamic, high-amplitude arterial pulse characterized by a rapid, forceful upstroke and wide pulse pressure (Corrigan or water-hammer pulse), classically associated with aortic regurgitation, thyrotoxicosis, severe anemia, fever, patent ductus arteriosus, or septic shock.

Alternate Names:
Hyperdynamic Pulse; Water-Hammer Pulse; Corrigan Pulse

Bourbon Virus

A rare tick-associated viral infection that can cause fever, tiredness, poor appetite, nausea, and low white-cell or platelet counts. No specific treatment or vaccine is established; reported care is supportive, and symptoms can overlap with other serious infections.

Boutonneuse Fever

A tick-borne infection caused usually by Rickettsia conorii. It commonly causes fever, headache, rash, and a dark sore at the bite site; untreated infection can cause serious illness.

Boutonniere Deformity

A finger shape problem where the middle joint stays bent inward and the tip bends backward, often caused by an injury or rheumatoid arthritis.

Bouveret Syndrome

A rare blockage near the stomach outlet caused by a gallstone that has entered the intestine through an abnormal connection from the gallbladder. It can cause persistent vomiting, upper-abdominal pain, bloating, and inability to eat.

Bovine

Relating to cattle or to material obtained from cattle.

In medicine it may describe an animal disease, a biological product, tissue used in treatment, or an infection that can pass between cattle and people.

Bovine Anaplasmosis

A tick- or blood-spread infection of cattle caused by Anaplasma marginale. The bacterium infects red blood cells and destroys them, causing anaemia, weakness, fever, reduced milk production, or death.

Bovine Papillomavirus

A group of papillomaviruses that infect cattle and can cause skin warts or other growths. Different strains vary in their effects; human disease is not the usual concern.

Bovine Spongiform Encephalopathy

A fatal disease of cattle caused by misfolded proteins called prions. It progressively damages the brain and nervous system; people can rarely develop variant Creutzfeldt–Jakob disease after eating contaminated cattle tissue.

Bowditch Effect

The intrinsic autoregulatory property of cardiac muscle whereby an increase in heart rate leads to a progressive, stepwise increase in the force of myocardial contraction due to intracellular accumulation of calcium ions.

Alternate Names:
Treppe Phenomenon; Frequency-Dependent Inotropy

Bowel

The small and large intestines. They receive partly digested food, absorb nutrients and water, move contents forward, and form and store stool before it leaves the body.

Bowel Cancer

Cancer arising in the colon or rectum. It may cause a persistent change in bowel habit, blood in stool, anaemia, weight loss, abdominal pain, or no early symptoms.

Bowel Death

Alternate name; see *Bowel Infarction*.

Bowel Disorders

Pathological conditions affecting the small or large intestine, encompassing inflammatory bowel disease (Crohn disease, ulcerative colitis), infectious enterocolitis, ischemic bowel disease, bowel obstruction, and colorectal neoplasms.

Alternate Names:
Intestinal Diseases; Bowel Diseases; Intestinal Disorders

Bowel Habit Changes and Bloating

A group of digestive symptoms consisting of diarrhea, constipation, gas, and abdominal bloating. They may result from diet, infection, medicines, food intolerance, or disorders such as irritable bowel syndrome; persistent, severe, bloody, or unexplained symptoms can be associated with underlying disease.

Bowel Habits

A person's usual pattern of passing stool, including how often it happens and the stool's form and ease of passage. Changes may include new constipation, diarrhea, urgency, or a different pattern.

Bowel Incontinence

Alternate name; see *Fecal Incontinence*.

Bowel Infarction

Death of part of the intestine because its blood supply is blocked or severely reduced. It can cause severe abdominal pain, bloody stool, vomiting, and abdominal tenderness and is a life-threatening emergency.

Bowel Ischemia

Reduced blood flow to the intestine, causing injury from too little oxygen. It may cause sudden or worsening abdominal pain, vomiting, or bloody stool and can progress to bowel death if circulation is not restored.

Bowel Movement

The passing of stool from the rectum through the anus. Stool frequency and form vary among healthy people.

Bowel Obstruction

A blockage that prevents food, fluid, and gas from moving through the intestine. It can cause cramping pain, swelling, vomiting, and inability to pass stool or gas and may lead to bowel damage or perforation.

Bowel Preparation

Emptying and cleansing the colon before a colonoscopy or other bowel procedure, usually with dietary changes and a laxative solution. The quality of preparation affects how well lesions can be seen.

Alternate Names:
Bowel Prep; Colon Cleansing; Colonic Preparation

Bowel Program

A planned routine using food, fluids, medicines, movement, and scheduled toilet visits to produce regular bowel movements and manage constipation or loss of bowel control.

Bowel Retraining

A structured routine that uses regular toilet times, suitable food and fluids, physical activity, and helpful posture to establish predictable bowel movements and improve constipation or bowel-control problems.

Bowel Resection

Surgical removal of a diseased, obstructed, or ischemic section of the intestine (small bowel or colon); see *Small Bowel Resection*, *Large Bowel Resection*, and *Colectomy*.

Bowel Sounds

Gurgling or clicking sounds made as the intestines move gas and liquid. Their presence and pattern can provide clues during an abdominal examination but cannot diagnose a disorder by themselves.

Bowel Transit Time

The time food and other contents take to travel through the digestive tract. Testing it can help investigate unusually slow or fast movement when a bowel-movement or digestive disorder is suspected.

Bowel Urgency

A sudden, hard-to-delay need to pass stool. It can occur with diarrhoea, infection, irritable bowel syndrome, inflammatory bowel disease, or disorders of the rectum and may lead to accidents.

Bowenoid Papulosis

An HPV-associated squamous intraepithelial lesion of genital or perianal skin, usually presenting as multiple reddish-brown or violaceous papules. Biopsy shows atypical cells resembling squamous-cell carcinoma in situ, although many lesions behave indolently.

Bowen's Disease

Squamous cell carcinoma in situ, an early form of non-melanoma skin cancer confined to the epidermis. It classically presents as a slowly enlarging, well-demarcated, erythematous, scaly or crusted plaque, most commonly on sun-exposed areas. Full-thickness epidermal dysplasia is present on biopsy; if left untreated, approximately 3–5% progress to invasive squamous cell carcinoma.

Alternate Names:
Squamous Cell Carcinoma in Situ; Bowen's Disease

Bow Legs

An angular deformational alignment of the lower extremity characterized by outward lateral bowing of the tibia and femur such that the knees remain abnormally separated when the medial malleoli of the ankles are approximated.

Alternate Names:
Genu Varum; Bowlegs; Bandy Legs

Bowlegs

Alternate name; see *Bow Legs*.

Bowler's Thumb

Irritation or scarring of the digital nerve along the thumb caused by repeated pressure from a bowling ball. It may produce pain, numbness, tingling, or a tender lump and may improve with rest or equipment changes.

Bowman Capsule

A cup-shaped structure at the beginning of each kidney filtering unit. It surrounds a knot of tiny blood vessels and collects the fluid filtered from blood before it passes through the rest of the kidney tubule.

Bowman Membrane

A thin, strong layer near the front of the cornea that supports and protects the eye's clear surface. Significant injury can scar it because it does not normally grow back.

Bowman's Capsule

The cup-shaped beginning of a kidney filtering unit. It surrounds a cluster of small blood vessels and receives the fluid filtered from blood.

Bowman's Gland

A small gland high inside the nose that releases watery fluid onto the smell-sensing lining. The fluid helps dissolve scent molecules and clear the surface so odours can be detected.

Boxed Warning

The strongest safety warning required in a medicine's prescribing information when there is a serious or life-threatening risk. It explains a major hazard but does not necessarily mean the medicine is unsuitable for every patient.

Boxer Fracture

A transverse or comminuted fracture through the distal metaphysis or neck of the fifth metacarpal bone (and occasionally the fourth metacarpal), characteristically accompanied by volar angulation of the metacarpal head resulting from direct axial loading with a clenched fist.

Boxer's Ear

A deformity of the outer ear caused by repeated injury or untreated blood collection around the ear cartilage. It can produce thickened, scarred tissue with a cauliflower-like appearance.

Boxer's Fracture

A break near the knuckle end of the fifth metacarpal, the hand bone below the little finger. It commonly follows punching and causes pain, swelling, tenderness, or a changed knuckle shape.

BPH (Benign Prostatic Hyperplasia)

Abbreviation; see *Benign Prostatic Hyperplasia*.

Braces and Retainers

Alternate name; see *Dental Braces*.

Brachial

Relating to the upper arm, including its bones, muscles, blood vessels, and nerves. The brachial artery supplies the arm, and the brachial plexus carries nerve signals to and from the arm and hand.

Brachial Artery

The main artery of the upper arm. It carries blood from the armpit toward the elbow, where it divides into the radial and ulnar arteries, and it is commonly used to measure a pulse or blood pressure.

Brachialgia

Pain that travels from the neck or shoulder down the arm. It often results from irritation of a neck nerve or the brachial plexus and may occur with numbness, tingling, or weakness.

Brachialis Muscle

A strong muscle at the front of the upper arm, beneath the biceps. It is the main muscle that bends the elbow and works whether the palm faces up, down, or sideways.

Brachial Plexopathy

Damage or dysfunction of the nerve network supplying the shoulder, arm, and hand. It can cause

pain, weakness, numbness, or paralysis after injury, pressure, inflammation, a tumour, or radiation.

Brachial Plexus

A network of nerves formed mainly by the ventral rami of spinal nerves C5–T1. It supplies motor and sensory innervation to the shoulder and upper limb. Its fibers pass through roots, trunks, divisions, and cords before forming terminal branches. These include the musculocutaneous, axillary, radial, median, and ulnar nerves.

Brachial Plexus Cords

Three parts of the nerve network supplying the arm, named lateral, posterior, and medial because of their position around an artery in the armpit. They join to form nerves controlling movement and feeling in the upper limb.

Brachial Plexus Injuries

Damage to the nerve network supplying the shoulder and upper limb, caused by stretching, pressure, or a penetrating injury. Symptoms range from pain or numbness to weakness or paralysis, depending on the nerves affected.

Brachial Plexus Injury

Damage to the nerve network of the shoulder and arm, sometimes occurring during a difficult birth or after trauma. It may cause weakness, loss of movement, numbness, or paralysis; recovery depends on the severity and nerves involved.

Brachial Plexus Injury In Newborns

Damage to the nerves supplying a newborn's shoulder, arm, and hand, usually associated with birth. The affected arm may be weak or still; severity ranges from temporary weakness to permanent loss of movement or sensation.

Brachial Plexus Neuropathies

Disorders affecting the nerve network that supplies the shoulder, arm, and hand. They can cause pain, weakness, numbness, or loss of movement because of injury, pressure, inflammation, tumours, or radiation.

Brachial Plexus Roots

The first portions of the nerve network that supplies the arm, arising from the lower neck and upper chest. Damage to different roots produces characteristic patterns of weakness, numbness, and pain.

Brachial Plexus Trunks

Three sections of the brachial plexus—upper, middle, and lower—that carry nerve fibres toward the arm. Injury to the upper trunk can cause weakness of the shoulder and elbow, while lower-trunk injury can mainly affect the hand.

Brachial Vein

Deep veins accompanying the brachial artery that drain the arm and join the basilic vein to form the axillary vein.

Brachiocephalic Artery

The first and largest arterial branch arising from the aortic arch, which ascends obliquely behind the manubrium of the sternum before bifurcating into the right common carotid and right subclavian arteries.

Alternate Names:
Innominate Artery

Brachiocephalic Trunk

The first large branch of the aorta in the chest. It carries blood toward the right side of the head, neck, and arm and divides into the right common carotid and right subclavian arteries.

Brachiocephalic Veins

Two large veins formed by the joining of veins from the head, neck, and arm. They drain blood from these areas into the superior vena cava, which returns it to the heart.

Brachioplasty

An operation to remove or reshape excess skin and tissue of the upper arm. Possible complications include scars, altered sensation, bleeding, fluid collection, infection, and wound problems.

Common name: Arm Lift

Brachioradialis Reflex

A deep tendon stretch reflex elicited by briskly tapping the tendon of the brachioradialis muscle near the styloid process of the radius with a reflex hammer, producing forearm flexion and slight pronation. It is innervated by the radial nerve and tests the integrity of the C5 and C6 cervical spinal cord segments and nerve roots.

Alternate Names:
Supinator Reflex; Radial Reflex

Brachioradial Pruritus

A localized neuropathic itch, burning, or tingling affecting the outer forearms, often associated with irritation of cervical nerve roots, especially C4–C6. The skin may look normal or show scratch marks from rubbing.

Brachium

The part of the upper limb between the shoulder and elbow. It contains the upper-arm bone, muscles that move the shoulder and elbow, and major nerves and blood vessels.

Brachycephalic

Describes a skull that is relatively short from front to back and broad from side to side. It may be a normal family characteristic or part of a condition affecting skull growth.

Brachycephaly

A broad, short skull shape. It may develop from pressure on an infant's head or from early joining of skull bones; effects on brain growth vary with the cause.

Brachydactyly

A birth condition in which one or more fingers or toes are shorter than usual because of altered development of their bones or surrounding tissues. It may occur alone or as part of an inherited syndrome.

Brachytherapy

Internal radiation treatment in which a radioactive source is placed inside or close to a tumour. It delivers a concentrated dose to a limited area and may use a temporary applicator or a source left in place permanently.

Alternate Names:
Brachy Therapy Internal Radiation Therapy

Brachytherapy Seed

A tiny radioactive source placed in or near a tumour to deliver local radiation. Seeds may be temporary or permanent and are used most often for selected cancers, including prostate cancer.

Bradyarrhythmia

A heart rhythm disorder with an abnormally slow rate or slow conduction. Causes include sinus-node dysfunction and atrioventricular block; the rate alone does not determine whether it is clinically significant.

Alternate Names:
Bradycardia Arrhythmia

Bradycardia

A slower-than-usual heart rate, often below 60 beats per minute in adults. It can be normal during sleep or in trained athletes, but may result from heart-conduction disease or medicines and cause dizziness, fainting, tiredness, or breathlessness.

Bradycardia Of Prematurity

A slow heart rate in a premature infant, often occurring with pauses in breathing and low oxygen. It commonly reflects immature breathing and heart control and is monitored and treated according to its frequency and severity.

Bradycardia (Slow Heart Rate)

Alternate name; see *Bradycardia*.

Bradycardia-Tachycardia Syndrome

Alternate name; see *Sick Sinus Syndrome*.

Bradykinesia

Slowness and reduced size of voluntary movements. It can make starting or repeating actions difficult and may occur with stiffness, tremor, reduced arm

swing, a less expressive face, or a shuffling walk in Parkinson disease and related disorders.

Bradykinesia and Athetosis

Hypokinetic and dyskinetic movement patterns characterized by generalized slowness of movement initiation (bradykinesia) or continuous slow, writhing, twisting involuntary movements (athetosis), frequently observed in Parkinson disease, secondary parkinsonism, or basal ganglia encephalopathies.

Alternate Names:
Slowness of Movement; Hypokinesia and Athetosis; Extrapyramidal Slowness

Bradykinetic

Describes abnormally slow movement, especially the reduced speed and size of movement seen in Parkinson disease and related neurologic disorders.

Bradykinin

A natural chemical messenger that widens some blood vessels and allows more fluid to leave them. It contributes to inflammation, swelling, pain, and rare reactions to certain blood-pressure medicines.

Bradyphrenia

Unusually slow thinking or mental processing. It may cause delayed responses and difficulty completing tasks and can occur with neurologic disease, mental illness, medicines, depression, or other conditions.

Bradypnea

Abnormally slow breathing, often fewer than 12 breaths per minute in an adult. It may result from sedative or opioid effects, brain disease, low body temperature, hormone disorders, or severe illness and can lead to respiratory failure.

Bradypnoea

Abnormally slow breathing. Causes include medicines, neurologic disease, metabolic disturbance, low body temperature, or severe illness; difficult, shallow breathing or confusion may occur in serious cases.

BRAF Gene

A gene that encodes a signaling protein in the RAS-RAF-MEK-ERK pathway, which regulates cell growth and division. Activating BRAF variants can drive cancers such as melanoma, thyroid cancer, and colorectal cancer and may guide targeted treatment.

Braille System

A raised-dot writing and reading system used by people who are blind or have low vision. Patterns represent letters, numbers, punctuation, and symbols and can be read by touch.

Brain

The main organ of the nervous system, protected inside the skull. It processes senses, controls movement and body functions, and supports thinking, memory, emotions, language, and consciousness.

Brain Abscess

A pocket of pus and infection inside the brain. It can develop when infection spreads from the blood, nearby ear or sinus disease, surgery, or an injury and may cause headache, fever, seizures, or weakness.

Brain Aneurysm

A weakened bulge in an artery supplying the brain. If it bursts, it can cause sudden severe headache, vomiting, neck stiffness, collapse, or other neurological problems.

Brain Aneurysm Repair

Treatment to prevent a brain aneurysm from bleeding or bleeding again. A surgeon may place a clip or a specialist may seal the aneurysm from inside the artery with coils or another device.

Brain Arteriovenous Malformation

A tangle of blood vessels in the brain where arteries connect directly to veins without the usual tiny connecting vessels. It may cause no symptoms, but can bleed or cause seizures, headaches, or weakness.

Alternate Names:
Cerebral Arteriovenous Malformation; Brain AVM; Intracranial AVM

Brain AVM

Alternate name; see *Brain Arteriovenous Malformation*.

Brain Atrophy

Alternate name; see *Cerebral Atrophy*.

Brain Biopsy

A surgical procedure in which a small sample of brain tissue is removed for diagnostic microscopic and histological evaluation; see *Stereotactic Brain Biopsy* and *Biopsy*.

Brain Cancer

Cancer affecting brain tissue or its coverings. Symptoms depend on the location and may include seizures, headache, weakness, speech or vision changes, personality change, or pressure-related vomiting; diagnosis usually requires brain imaging and sometimes tissue testing.

Alternate Names:
Malignant Brain Tumor; Primary Brain Neoplasm

Brain Concussion

Alternate name; see *Concussion*.

Brain Death

Permanent loss of all functions of the brain, including the brainstem. Once formally determined according to applicable medical standards and law, it means the person has died.

Brain Disorder

Any illness or abnormality affecting the brain's structure or function, including stroke, infection, tumour, epilepsy, injury, degenerative disease, or a condition present from birth.

Brain Edema

Swelling caused by extra fluid in brain tissue. It can increase pressure inside the skull after injury, stroke, infection, bleeding, tumour, or severe illness and may cause headache, vomiting, seizures, confusion, or reduced consciousness.

Brain Embolism

Alternate name; see *Embolic Stroke*.

Brain Fog

An informal description of difficulty concentrating, thinking clearly, remembering, or finding words. It is a symptom rather than a diagnosis and may occur with poor sleep, stress, illness, medicines, depression, or other conditions.

Brain Fornix

A curved bundle of nerve fibres deep in the brain that helps connect the hippocampus with other areas involved in memory. Damage may cause difficulty learning or remembering information.

Brain Haemorrhage

Alternate spelling; see *Brain Hemorrhage*.

Brain Health

A broad term for the brain's ability to support thinking, memory, learning, movement, emotions, communication, and consciousness, and for the factors that affect these functions.

Brain Hemorrhage

Bleeding within or around the brain, often caused by high blood pressure, an aneurysm, a blood-vessel malformation, injury, or blood-thinning treatment. It may cause sudden severe headache, weakness, speech trouble, vomiting, seizure, or reduced consciousness.

Brain Herniation

Dangerous displacement of brain tissue caused by severe swelling, bleeding, a tumour, or another increase in pressure inside the skull. It can compress the brainstem and impair breathing and consciousness.

Brain Imaging

Tests that create pictures of brain structure or activity. CT and MRI show tissue, bleeding, swelling, tumours, and strokes; blood-vessel or nuclear scans answer more specific questions.

Alternate Names:
Neuroimaging; Cerebral Imaging

Brain Injuries

Alternate name; see *Brain Injury*.

Brain Injury

Damage or impaired function of the brain caused by trauma, lack of oxygen, stroke, infection, toxins, or another disease. Effects vary with the location and severity and may affect movement, sensation, thinking, behaviour, or consciousness.

Brain Lesions

Areas of brain tissue that look or function abnormally because of a tumour, stroke, infection, inflammation, injury, loss of nerve insulation, or a blood-vessel disorder. Symptoms depend mainly on the lesion's location and size.

Brain Malformations

Structural differences in the brain that develop before birth. They may result from genetic changes, disrupted fetal development, infection, or other prenatal influences and can affect movement, learning, seizures, or other neurologic functions.

Brain Mapping

Methods used to identify where brain functions and structures are located. Imaging, electrical recordings, or direct stimulation may guide research or help surgeons avoid important areas during selected operations.

Brain Metastases

Cancer deposits that have spread to the brain from another organ. They may cause headache, seizures, weakness, speech or vision changes, confusion, or no symptoms and are assessed with brain imaging.

Brain Metastasis

Alternate singular form; see *Brain Metastases*.

Brain Monitoring

Repeated or continuous recording of brain activity, pressure inside the skull, or oxygen levels in brain tissue. Methods include electroencephalography (EEG) to assess seizures, sleep, or anaesthesia and intracranial-pressure monitoring after brain injury.

Brain MRI

A noninvasive magnetic resonance imaging scan of the head that generates cross-sectional images of the brain and surrounding tissues without ionizing radiation; see *MRI Brain*.

Brain Natriuretic Peptide Test

A blood test measuring BNP or NT-proBNP, substances released when the heart is stretched. A raised result can support a diagnosis of heart failure; levels are affected by symptoms, age, kidney function, and other findings.

Brain Neoplasm

An abnormal intracranial growth arising within the brain parenchyma (e.g., gliomas, neuronal-glial tumors), the meninges (meningioma), or cranial nerves, or secondary to metastatic spread from systemic malignancies (most frequently lung, breast, melanoma, or renal cell carcinoma). Manifestations arise from elevated intracranial pressure (early-morning headache, projectile vomiting, papilledema) or focal parenchymal compression causing seizures, focal neurological deficits, cognitive changes, or personality alterations.

Brain Neoplasms

Plural form; see *Brain Neoplasm*.

Brain PET Scan

A scan that uses a small amount of radioactive tracer to show chemical activity in the brain. It can help investigate selected tumours, memory disorders, seizures, or brain function when other scans do not answer the question.

Brain Sand

Brain sand is an older name for corpora arenacea, tiny calcified deposits commonly found in the pineal gland and sometimes other brain regions.

Brain SPECT

A nuclear-imaging scan that uses a radioactive tracer to map regional brain blood flow or, with specific tracers, other brain functions. It can help locate a seizure focus in selected people with epilepsy and assess blood-flow patterns in some dementia evaluations.

Brain Stem

Alternate spelling; see *Brainstem*.

Brainstem

The lower part of the brain that connects the upper brain to the spinal cord. It helps control breathing, heartbeat, blood pressure, swallowing, and alertness. It also carries signals between the brain and the rest of the body.

Brainstem Auditory Evoked Potential

A hearing test that records electrical responses along the auditory nerve and brainstem after sounds are played. It helps assess hearing, especially in newborns or people unable to complete standard hearing tests, and can detect dysfunction along the auditory pathway.

Alternate Names:
BAEP; Brainstem Auditory Evoked Response; BAER

Brainstem Auditory Evoked Response

Alternate name; see *Brainstem Auditory Evoked Potential*.

Brainstem Death

A term used in some jurisdictions for death diagnosed by permanent loss of brainstem function. Definitions and legal criteria vary; in many jurisdictions, death by neurologic criteria requires permanent loss of all functions of the entire brain, including the brainstem. See *Brain Death*.

Brain Stem Glioma

Alternate spelling; see *Brainstem Gliomas*.

Brainstem Gliomas

Gliomas arising in the midbrain, pons, or medulla. They may affect eye movements, facial function, swallowing, balance, strength, or breathing; imaging and tumor biology guide diagnosis and management, which differs between children and adults.

Brainstem Tumor

A growth arising in the brainstem, which connects the brain with the spinal cord and controls important functions. Symptoms may include problems with eye movement, balance, swallowing, speech, strength, or breathing.

Brain Stimulation

Use of electrical, magnetic, or other energy to change brain activity. Methods include electroconvulsive therapy, transcranial magnetic stimulation, and deep-brain stimulation; their uses, benefits, and risks differ.

Brain Surgery

An operation on the brain or nearby structures to remove or sample a tumor, relieve pressure, treat bleeding, repair an abnormal blood vessel, or control selected seizures. Risks depend on the area and procedure and can include bleeding, infection, or neurologic loss.

Brain Tumor

An abnormal growth of cells in the brain or its coverings. It may be benign or malignant, begin in the brain, or spread there from cancer elsewhere. It can cause symptoms by affecting nearby tissue, blocking fluid flow, bleeding, or raising pressure inside the skull; symptoms may include seizures, headache, vomiting, weakness, or changes in thinking.

Brain Tumor Resection

The surgical removal (excision) of a benign or malignant brain neoplasm, typically performed via craniotomy; see *Craniotomy* and *Brain Tumor*.

Brain Tumors in Adults

Tumors arising in or near the adult brain, including primary gliomas, meningiomas, metastases, and

other lesions. Symptoms depend on location and may include headache, seizures, weakness, personality change, vision problems, or cognitive decline.

Brain Tumour

Alternate spelling; see *Brain Tumor*.

Brain Ventricles

Four connected spaces inside the brain that contain and circulate cerebrospinal fluid. This fluid cushions the brain and spinal cord, carries substances, and helps remove waste; blockage can cause pressure and hydrocephalus.

Brain Wave

A rhythmic pattern of electrical activity generated by synchronized postsynaptic potentials of cerebral neurons, recorded on an electroencephalogram (EEG). Brain waves are classified into frequency bands: delta (0.5–4 Hz, slow-wave sleep), theta (4–8 Hz, drowsiness), alpha (8–13 Hz, relaxed wakefulness with eyes closed), beta (13–30 Hz, active focus), and gamma ($>$ 30 Hz, cognitive processing). Alterations in wave frequency, voltage, or symmetry aid in diagnosing epilepsy, sleep disorders, encephalopathies, and brain death.

Alternate Names:
Cerebral Electrical Activity; EEG Rhythms

Brain Waves

Plural form; see *Brain Wave*.

Branchial

Relating to structures that develop from the paired tissue arches in an embryo's early head and neck. These arches contribute to parts of the face, throat, voice box, muscles, bones, blood vessels, and nerves.

Branchial Arch

One of several paired structures in an embryo that develop into parts of the face, throat, voice box, muscles, bones, blood vessels, and nerves of the head and neck.

Branchial Cleft

A groove between developing head-and-neck arches in an embryo. If part of it remains after birth, it may form a cyst, a narrow passage, or an opening, usually on the side of the neck.

Branchial Cleft Anomalies

Alternate name; see *Branchial Cleft Anomaly*.

Branchial Cleft Anomaly

A congenital remnant of the embryonic branchial apparatus that forms a cyst, blind-ending sinus, or tract connecting the throat and skin (fistula), usually along the side of the neck. Most arise from the second branchial cleft and may cause a neck lump, recurrent infection, or drainage.

Branchial Cleft Cyst

A fluid-filled lump on the side of the neck that is present from birth, though it may not be noticed until later. It forms when tissue from early development does not disappear. It can become swollen or painful if infected.

Branchial Cyst

Alternate name; see *Branchial Cleft Cyst*.

Branchioma

A rare cyst or growth arising from tissue related to early head-and-neck development. It often appears as a lump along the side of the neck.

Branchio-Oto-Renal Syndrome

An inherited disorder that can cause neck cysts or openings, hearing loss, and kidney abnormalities. The combination and severity vary, and some affected people have only one or two of these features.

Brass-Founder's Ague

An older name for metal-fume fever, a short-lived flu-like illness after breathing fumes from heated metals such as zinc or brass. Symptoms may include fever, chills, headache, muscle aches, cough, and nausea.

Braxton Hicks Contractions

Irregular tightening of the uterus during pregnancy, often becoming more noticeable later in pregnancy. Unlike labour contractions, they usually do not steadily strengthen or cause progressive cervical dilation.

Alternate Names:
False Labor; Practice Contractions

Brazilian Pemphigus Foliaceus

An endemic form of superficial pemphigus seen especially in parts of Brazil. Autoimmune attack on epidermal cell connections causes fragile superficial blisters and erosions without the deep mucosal disease typical of pemphigus vulgaris.

Common name: Fogo Selvagem

Brazilian Trypanosomiasis

Chagas disease, a parasitic infection caused by *Trypanosoma cruzi*. It is transmitted mainly by triatomine insects or congenitally and may later cause cardiomyopathy, arrhythmias, megaesophagus, or megacolon.

BRCA

BRCA1 and BRCA2 are genes that help repair damaged DNA. An inherited harmful change in either gene increases the risk of breast, ovarian, fallopian-tube, primary peritoneal, prostate, and pancreatic cancers.

BRCA1

Tumor suppressor gene; inherited mutations markedly increase the lifetime risk of breast and ovarian cancers. See *BRCA*.

BRCA1 And BRCA2

Genes that help repair breaks in DNA and limit abnormal cell growth. An inherited harmful variant raises the risk of several cancers and may affect screening, preventive surgery, and treatment choices for the person and relatives.

BRCA1 And BRCA2 Gene Testing

A blood or saliva test looking for harmful inherited changes in BRCA1 or BRCA2. Results can guide cancer screening, preventive options, and treatment and may provide important information for biological relatives.

BRCA1 Gene

A gene involved in repairing damaged DNA and limiting tumor formation. An inherited harmful variant increases the risk of breast, ovarian, fallopian-tube, peritoneal, prostate, and pancreatic cancers; genetic counseling helps interpret test results.

BRCA2

Tumor suppressor gene involved in DNA repair; mutations confer elevated risks of breast, ovarian, and prostate cancers. See *BRCA*.

BRCA2 Gene

A gene that helps repair serious DNA damage. An inherited harmful variant increases the risk of breast, ovarian, prostate, pancreatic, and some other cancers and may affect relatives; genetic counseling helps explain testing and options.

Breakbone Fever

An older name for dengue fever, reflecting the severe muscle and joint pain that may occur with this mosquito-borne viral infection. Fever, headache, rash, nausea, or dangerous bleeding may also develop.

Breakthrough Bleeding

Unscheduled uterine bleeding or spotting during use of hormonal contraception or hormone therapy. It can occur with combined or progestin-only methods, and its timing and duration vary by method and by how long it has been used.

Breakthrough Infection

An infection that occurs despite vaccination or another preventive measure intended to reduce its risk. Protection and illness severity vary with the germ, intervention, timing, and person's immune system.

Breakthrough Pain

A short flare of pain that occurs despite otherwise controlled persistent pain. It may happen unexpectedly or be triggered by activity or procedures.

Breast

One of the two organs on the front of the chest, made of milk-producing tissue, ducts, fat, connective tissue, blood vessels, nerves, and skin. It can be affected by benign conditions and cancer.

Breast Abscess

A localized collection of pus within breast tissue, usually caused by infection. It may occur during lactation or outside it and can cause a tender lump, redness, warmth, or fever.

Breast Anatomy

The breast contains skin, fat, milk-producing lobules, ducts, connective tissue, blood vessels, nerves, and lymph vessels that extend toward the armpit. Its appearance changes with age, hormones, pregnancy, and breastfeeding.

Breast And Thoracic Cancer Surgery

Operations for cancers of the breast or chest, including selected cancers of the lung, pleura, food pipe, mediastinum, or chest wall. Surgery may remove a tumour and nearby lymph nodes, with further treatment based on the cancer type and stage.

Alternate Names:
Breast and Thoracic Oncologic Surgery

Breast Augmentation

A procedure to increase breast size or change its shape, usually with an implant or transferred fat. Risks include infection, bleeding, scarring, altered sensation, implant problems, and the need for further surgery.

Alternate Names:
Breast Enlargement; Augmentation Mammoplasty

Breast Augmentation Surgery

An operation that enlarges or reshapes the breasts using implants or transferred tissue. Possible risks include infection, bleeding, scarring, altered sensation, implant problems, and later procedures.

Breast Biopsy

A diagnostic procedure in which a tissue sample is removed from a suspicious breast lump or lesion for microscopic evaluation by a pathologist; see *Biopsy* and *Stereotactic Breast Biopsy*.

Breast Bone

A common name for the breastbone, or sternum, a flat bone in the centre of the chest. It joins the ribs and helps protect the heart and lungs.

Breast Calcifications

Small calcium deposits seen in breast tissue on a mammogram. Many patterns are benign, while some grouped, irregular, or branching patterns are associated with breast cancer, including ductal carcinoma in situ.

Breast Cancer

A malignant growth arising from breast tissue, most often from cells lining the ducts or lobules. It can be invasive or in situ and may appear as a lump, skin or nipple change, or abnormal imaging; early disease may cause no symptoms.

Breast Cancer And Lymphedema

Swelling caused by impaired lymph drainage after breast-cancer surgery or radiation. It may cause lasting heaviness, tightness, or skin changes in the arm, breast, or chest.

Breast Cancer and Pregnancy

Breast cancer diagnosed during pregnancy. The related term pregnancy-associated breast cancer also includes cases diagnosed within a year after birth or during lactation.

Breast Cancer and Your Genes

Alternate name; see *Breast Cancer Genetics*.

Breast Cancer Genetics

The study of inherited gene changes that affect

breast-cancer risk. Important genes include *BRCA1*, *BRCA2*, *PALB2*, *TP53*, *PTEN*, and *CHEK2*.

Breast Cancer Grade

A description of how abnormal breast-cancer cells look under a microscope and how quickly they are likely to grow. Grade is different from cancer stage, which describes the cancer's size and spread.

Breast Cancer in Men

Breast cancer arising in male breast tissue. It is uncommon but may present as a painless lump, nipple retraction, discharge, or skin change; diagnosis uses imaging and biopsy.

Breast Cancer Prevention

Measures intended to reduce the chance of developing breast cancer. They include population-level risk reduction and, for people at substantially increased risk, risk-reducing medicines or surgery; no measure eliminates risk.

Breast Cancer Recurrence

Return of breast cancer after treatment, either near the original site, in nearby lymph nodes, or in distant organs. Persistent symptoms or a lump may have cancerous or noncancerous causes.

Breast Cancer Screening

Testing to find breast cancer before symptoms appear, usually with mammography. Ultrasound or MRI may be added for selected people according to age, breast density, inherited risk, and other factors.

Breast Cancer Staging

Assessment of how far breast cancer has grown or spread, including the tumour's features, nearby lymph nodes, and distant organs. The stage helps estimate outlook and choose treatment.

Breast Carcinoma

A malignant epithelial tumour arising in breast tissue, most often from cells lining the ducts or lobules. Invasive ductal and invasive lobular carcinoma are common forms.

Breast-Conserving Surgery

An operation that removes a breast tumor with a margin of surrounding tissue while preserving most of the breast. It may be used as part of breast-conserving therapy; radiation therapy is often given afterward, depending on the cancer and treatment plan.

Alternate Names:
BCS; Lumpectomy; Partial Mastectomy

Breast-Conserving Therapy

Treatment for selected breast cancers that removes the tumor while preserving most of the breast, usually combining surgery with radiation therapy. For appropriately selected early-stage cancers, survival is similar to mastectomy. The choice depends on the cancer's features and the person's clinical circumstances.

Alternate Names:
BCT; Breast-Conserving Treatment

Breast Cyst

A fluid-filled sac in breast tissue. Simple breast cysts are benign and do not increase breast cancer risk; cysts with internal debris or solid components are distinct findings and may have different significance.

Breast Cysts

Alternate name; see *Breast Cyst*.

Breast Cytology

Examination of individual cells from a breast lump, nipple discharge, or needle sample. It can suggest infection, a harmless change, or cancer, but a core biopsy is often needed to determine the full tissue pattern.

Breast Density

The relative amount of milk-gland and connective tissue compared with fat on a mammogram. Dense breast tissue can hide small cancers and is linked with higher breast-cancer risk.

Breast Development

Growth and maturation of breast tissue, begin-

ning mainly at puberty and changing with hormones, pregnancy, breastfeeding, ageing, and some medicines. Uneven development is common.

Breast Development in Boys

Enlargement or development of breast tissue in a boy, most often gynecomastia caused by a temporary imbalance between estrogen and androgen effects. It may be persistent, painful, asymmetric, or rapidly enlarging.

Breast Duct

A channel that carries milk from milk-producing areas toward the nipple. Blockage, inflammation, or abnormal cells in a duct can cause a lump, pain, or nipple discharge.

Breast Engorgement

Overfilling and swelling of the breasts with milk and extra tissue fluid, usually a few days after birth. Both breasts may feel firm, warm, painful, and make the nipples harder for an infant to grasp.

Breast Enlargement In Males

Alternate name; see *Gynecomastia*.

Breast Examination

Inspection and gentle examination of the breasts, nipples, and nearby lymph nodes to assess lumps, pain, skin or nipple changes, and other findings. It may be followed by imaging or biopsy when needed.

Breast Feed

Alternate name; see *Breastfeeding*.

Breastfeeding

Feeding an infant human milk, either directly from the breast or as expressed milk. Human milk provides nutrition and immune factors. Exclusive breastfeeding means the infant receives only human milk, apart from specified medicines, vitamins, and rehydration solution. It is distinct from continued breastfeeding alongside complementary foods.

Breastfeeding-Associated Nipple and Skin Changes

Dermatologic and mucosal complications of the nipple-areolar complex occurring during lactation, including painful erythema, skin fissures, milk blisters (blebs), contact dermatitis, Raynaud phenomenon of the nipple, and infectious mastitis or candidiasis.

Alternate Names:
Nipple Trauma in Breastfeeding; Sore Nipples; Nipple Fissures in Lactation

Breastfeeding With Rheumatoid Arthritis

Breastfeeding in a person with rheumatoid arthritis. Disease activity, fatigue, hand function, and medicine compatibility can affect the experience; compatibility varies among antirheumatic medicines.

Breast Finding

Any noticeable breast change, such as a lump, pain, skin change, nipple inversion, or discharge. Causes range from normal variation and benign conditions to breast cancer.

Breast Hamartoma

A benign lump made of an overgrowth of mature breast tissue, including fat, fibrous tissue, and milk-gland tissue. It is also called a fibroadenolipoma. Its appearance on imaging often reflects this mixture of normal tissue types and can vary with the amount of each.

Breast Health

The condition of breast tissue and function, and the field concerned with breast disease, its prevention, and its diagnosis.

Breast Imaging-Reporting And Data System

A standard system for describing mammogram, breast ultrasound, and breast MRI findings. Its numbered categories indicate whether results are normal, benign, probably benign, suspicious, or already known to be cancer and help guide follow-up.

Breast Hematoma

A collection of blood within breast tissue, usually after an injury, operation, or biopsy. It may cause bruising, swelling, pain, or a lump. As it heals, it can change in size or feel and may resemble another breast mass on examination or imaging.

Breast Implant-Associated Anaplastic Large Cell Lymphoma

A rare cancer of immune cells that can develop in the fluid or scar tissue around a breast implant. It is a T-cell lymphoma, not breast carcinoma, and has been linked mainly to textured implants. It may cause lasting swelling, a lump, pain, or hardening around the implant.

Breast Implant Capsular Contracture

Alternate name; see *Capsular Contracture*.

Breast Implant Rupture

A tear or hole in the outer shell of a breast implant. A saline implant usually deflates, while silicone gel may stay within the surrounding scar capsule or leak beyond it; silicone rupture may cause no obvious symptoms. Imaging can help detect a rupture.

Breast Infection

Infection and inflammation of breast tissue, often occurring during breastfeeding. It can cause local pain, warmth, redness, swelling, and fever; worsening symptoms or a pus-filled lump may indicate an abscess.

Breast Infection (Mastitis)

Inflammation or infection of breast tissue, often during breastfeeding but also possible in other settings. Pain, redness, warmth, swelling, fever, and a lump may occur; an abscess can develop if infection persists.

Breast Lift

Surgery that raises and reshapes sagging breast tissue by removing extra skin and, when needed, repositioning the nipple. It changes shape rather than necessarily increasing breast size and can leave scars or alter sensation.

Breast Lipoma

A benign lump made of mature fat cells in the breast. It is often soft, movable, and painless, although its feel can vary. Imaging or a tissue sample may be used to distinguish it from other breast lumps. It is made of mature fat cells rather than breast duct or milk-gland cells.

Breast Lobe

One of the larger sections of a breast's milk-producing gland. It contains smaller lobules and ducts that carry milk toward the nipple.

Breast Lobule

A small milk-producing unit within the breast, made of tiny milk glands and ducts. Lobules enlarge and become more active during pregnancy and breastfeeding.

Breast Lymphedema

Persistent swelling of the breast caused by poor drainage of lymph fluid. It can occur after breast surgery or radiation damages or removes lymph vessels or nodes, and may cause heaviness, tenderness, or skin thickening. The swelling may affect one or both breasts. See also *Lymphedema*.

Breast Lymphoma

A lymphoma that involves breast tissue. It may begin in the breast, called primary breast lymphoma, or spread there from lymphoma elsewhere in the body. It is a cancer of lymphocytes, not the usual breast cancers that begin in ducts or lobules.

Breast Lump

A swelling, mass, or thickened area in breast tissue. Many breast lumps are noncancerous and may result from cysts, fibroadenomas, hormone changes, or injury. Appearance and feel alone cannot reliably show the cause; examination and imaging, and sometimes biopsy, help identify it.

Breast Lump Removal

An operation to remove a breast lump, usually so it can be examined or because it causes symptoms or concern. The need for surgery depends on exam-

ination, imaging, biopsy results, and the person's preferences.

Breast Lumps

Alternate name; see *Breast Lump*.

Breast Lumps (Benign)

Noncancerous breast masses such as cysts, fibroadenomas, fat necrosis, or fibrocystic changes. Their features can overlap with those of malignant breast masses.

Breast Milk

Milk made by the breasts after childbirth. It provides energy, nutrients, fluid, and immune substances that support an infant's growth and help protect against some infections.

Breast Milk Expression and Storage

The manual or mechanical extraction of human breast milk and its subsequent storage following strict hygiene, refrigeration, and freezing protocols to preserve bioactive immunoglobulins, micronutrients, and enzymatic properties while preventing microbial contamination.

Alternate Names:
Pumping and Storing Breast Milk; Breast Milk Storage; Milk Expression

Breast Milk Jaundice

Yellowing of the skin and eyes that begins after the first week in an otherwise well, feeding, and growing breastfed infant. It is usually temporary; other causes of newborn jaundice include blood-group incompatibility, infection, and liver disease.

Alternate Names:
Human Milk Jaundice; Late-Onset Neonatal Jaundice

Breast MRI

An imaging test using a strong magnet and radio waves to create detailed pictures of breast tissue. Contrast is often used; MRI is added for selected screening, implant, or diagnostic questions rather than replacing mammography for everyone.

Breast MRI Scan

A scan that uses magnetic fields and radio waves, sometimes with injected contrast, to show breast tissue in detail. It can help assess high cancer risk, an abnormality, implants, or the extent of known cancer.

Breast Neoplasm

An abnormal growth of cells in breast tissue. It may be noncancerous or cancerous; imaging and often a biopsy determine its type, behaviour, and extent.

Breast Pain

Pain or tenderness in one or both breasts. Common causes include hormonal changes, cysts, infection, injury, medicines, or chest-wall problems; it may be focal or occur with a lump.

Alternate Names:
Mastalgia; Mastodynia

Breast Pain (Mastalgia)

Pain or tenderness in one or both breasts. It may be cyclic or related to hormones, injury, cysts, infection, medicines, or chest-wall structures; it can also occur with a mass, skin change, or nipple discharge.

Breast Quadrant

One of four areas used to describe where a finding is located in the breast: upper or lower, and inner or outer. The location helps describe examination and imaging findings.

Breast Rash

A change such as redness, scaling, itching, or irritation of breast skin. Causes include dermatitis, allergy, infection, or rarely inflammatory breast cancer; it may be persistent, one-sided, painful, or involve the nipple.

Breast Reconstruction

Surgery to rebuild the shape and appearance of a breast, most often after mastectomy. It may use an implant, tissue transferred from another part of the body, or both, and may include reconstruction of the nipple and areola. Reconstruction can be immediate

or delayed and may involve several procedures.

Breast Reduction

Surgery that removes breast tissue, fat, and skin to reduce breast size and relieve symptoms such as back, neck, or shoulder pain. Possible effects include scars, altered sensation, breastfeeding difficulty, and uneven shape.

Breast Screening

Testing people without breast symptoms to find breast cancer early, most commonly with mammography. Screening schedules vary with local guidelines, personal risk, family history, and previous findings.

Breast Self-Examination

Deliberate, regular inspection and feeling of the breasts to look for changes. Routine breast self-examination has not been shown to reduce breast-cancer deaths and can lead to unnecessary investigations.

Breast Skin And Nipple Changes

Changes such as dimpling, redness, scaling, inversion, crusting, or discharge may result from benign conditions, infection, hormonal changes, or cancer. They may be persistent, one-sided, or bloody.

Breast Surgeon

A surgeon who diagnoses and treats breast conditions, including benign disease, breast cancer, reconstruction, and operations that reduce cancer risk.

Breast Surgery

An operation on the breast to remove or examine a lump, treat cancer, reduce size, reconstruct shape, or address another condition. The type of surgery depends on the diagnosis, extent of disease, and person's goals.

Breast Ultrasound

Imaging that uses sound waves to examine breast tissue. It helps assess a lump, distinguish fluid from solid tissue, investigate a mammogram finding, guide a biopsy, and evaluate selected implants or dense breasts.

Breath

Air moved into and out of the lungs. Its smell, depth, rate, pattern, and oxygen or carbon-dioxide content can provide clues about breathing, infection, metabolism, or other health problems.

Breath Alcohol Test

A test measuring alcohol in exhaled air to estimate alcohol concentration in the blood. Results depend on timing, the device, sampling, and health factors and may be used in clinical or legal settings.

Breathalyzer

A device that estimates alcohol concentration in the blood by measuring alcohol in exhaled air. Results can be affected by timing, device accuracy, recent drinking, mouth alcohol, and sampling conditions.

Breath Analysis

Testing exhaled air for specific substances or gases. Examples include breath-alcohol tests, urea breath tests for *Helicobacter pylori*, exhaled nitric oxide tests for airway inflammation, and hydrogen or methane tests for carbohydrate malabsorption or suspected small-intestinal bacterial overgrowth.

Breath Focus

A mindfulness or relaxation exercise that directs attention to the sensations of breathing. It is used in meditation and other practices that train attention or relaxation.

Alternate Names:
Breath-Focused Meditation; Breathing-Focused Mindfulness

Breath-Holding Spell

A benign, involuntary paroxysmal nonepileptic phenomenon occurring in young children (typically between 6 months and 6 years of age), precipitated by emotional distress, anger, or minor physical pain. The episode begins with vigorous crying followed by prolonged expiration, apnea, and brief loss of consciousness, occasionally accompanied by generalized

hypertonia or clonic jerks. Two distinct forms are recognized: cyanotic spells (most common, driven by rapid apnea and hypocapnia) and pallid spells (mediated by severe vagal bradycardia or transient asystole). Spontaneous recovery is rapid and complete; coexisting iron-deficiency anemia is frequent and its correction reduces spell frequency.

Breath-Holding Spells

Plural form; see *Breath-Holding Spell*.

Breathing

Movement of air into and out of the lungs. It brings oxygen into the body and removes carbon dioxide through coordinated activity of the brain, nerves, muscles, and airways.

Breathing Difficulty

Alternate name; see *Dyspnea*.

Breathing Difficulty First Aid

Immediate supportive care intended to maintain breathing and circulation during acute respiratory distress before definitive treatment.

Alternate Names:
First Aid for Dyspnea; Emergency Respiratory Support; Respiratory Distress Management

Breathing Exercises

Deliberate changes in breathing pattern used to support relaxation, lung expansion, airway clearance, breath control, or rehabilitation.

Breathlessness

Alternate name; see *Dyspnea*.

Breath Odor

An unpleasant smell from the mouth or exhaled air. Common causes include dental or gum disease, dry mouth, tobacco, food, medicines, and infection; persistent odor may be associated with an underlying oral or systemic condition.

Breath Sounds

Sounds made as air moves through the airways and lungs, heard with a stethoscope. Reduced, absent, or unusual sounds can provide clues about mucus, narrowing, fluid, collapse, or other lung problems.

Breath Stacking

A breathing technique in which several small breaths are taken without fully exhaling, increasing the amount of air in the lungs. It can help produce a stronger cough in people with weak breathing muscles.

Breath Test

Analysis of exhaled air to detect a substance made by the body or by microorganisms. Examples include tests for Helicobacter pylori and tests measuring hydrogen or methane after a sugar drink to assess digestion and absorption.

Breech Baby

A fetus positioned in the womb with the buttocks or feet pointing downward toward the birth canal instead of the head. Most babies turn into a head-down (vertex) position before late pregnancy, but those remaining breech near term may be delivered by cesarean section or planned vaginal breech birth, or turned via external cephalic version.

Alternate Names:
Breech fetus; Breech presentation.

Breech Birth

Birth in which the baby is positioned bottom or feet first rather than head first. The safest delivery plan depends on the exact position, pregnancy stage, baby and parent factors, and the team's experience.

Breech Delivery

Birth when the fetus presents buttocks or feet first rather than head first. Breech presentations include frank, complete, and footling types.

Breech Presentation

A fetal position in which the buttocks or feet point toward the birth canal. Types include frank, complete, and footling breech; risks include cord prolapse, difficulty delivering the head, and birth injury.

Alternate Names:
Breech position; Malpresentation.

Bregma

The point on the skull where the main seam between the frontal and parietal bones meets the seam between the two parietal bones. In infants it lies beneath the soft spot at the front of the skull.

Bremsstrahlung

Radiation produced when fast electrons slow down or change direction near matter. It is relevant to some imaging and radiation treatments and requires appropriate shielding and safety controls.

Brenner Tumor

A rare ovarian growth made of cells resembling those lining the urinary tract. Most are small, one-sided, noncancerous, and found incidentally, but uncommon borderline or cancerous forms also occur.

Brenner Tumour

A usually noncancerous ovarian growth whose cells resemble those lining the urinary tract. Rare borderline and cancerous forms occur and are distinguished by tissue examination.

Breslau Bacillus

An older name for Salmonella Typhimurium, a bacterium that can cause foodborne gastroenteritis with diarrhoea, abdominal cramps, fever, and vomiting.

Breslow Thickness

The depth, measured in millimetres, to which a melanoma has grown into the skin. It is an important part of staging and helps estimate the risk of spread and guide treatment.

Bretylium Tosylate

An older medicine that can suppress certain dangerous abnormal heart rhythms, especially ventricular fibrillation. It is now rarely used because of limited availability, side effects, and newer treatments.

Brevibacillus

A group of spore-forming bacteria found in soil, water, and food. Human infection is uncommon but can occur opportunistically, especially in people with weakened immunity or medical devices.

Brevibacterium

A group of bacteria found on skin, in soil, and in food. They commonly contribute to body or cheese odour; rare species can cause opportunistic infection, particularly in people with serious illness or devices.

Brevibacterium Casei

A species of Brevibacterium found in the environment and occasionally on people. It rarely causes bloodstream or device-related infection, usually in a person with major underlying illness or an indwelling device.

Brevundimonas

A group of environmental water-associated bacteria that rarely cause human disease. Opportunistic infections, including bloodstream or wound infection, are more likely in people with weakened immunity or medical devices.

Brevundimonas Diminuta

An environmental water-associated bacterium that rarely causes opportunistic human infection. Reported illnesses include bloodstream, wound, or device-related infection, mainly in people with serious underlying disease.

Brevundimonas Vesicularis

An environmental bacterium that rarely causes human infection. When it is isolated from a clinical sample, symptoms, specimen quality, and other results determine whether it represents true disease or contamination.

Bricklayer's Disease

An older occupational term for lung disease caused by breathing dust during masonry work, especially silica-containing dust. Long-term exposure can cause silicosis, which scars the lungs and impairs breathing.

Bridge To Transplant

Temporary treatment or mechanical support that keeps a person with advanced heart failure alive and stable until a heart transplant can be performed. The device, timing, and risks depend on heart function and overall health.

Bridge Work

A fixed dental replacement for one or more missing teeth. Artificial teeth are attached to prepared neighbouring teeth or implants, restoring some chewing function and appearance.

Brief Psychotic Disorder

A sudden episode of delusions, hallucinations, severely disorganized speech, or markedly disorganized behavior lasting at least one day but less than one month, followed by a return toward usual functioning.

Alternate Names:
Brief Reactive Psychosis; Acute Transient Psychosis

Brief Resolved Unexplained Event

A sudden, brief episode in an infant younger than one year that has fully resolved and remains unexplained after an appropriate history and examination. It involves a change in breathing, colour, muscle tone, or responsiveness. BRUE replaced the broader, less specific term apparent life-threatening event (ALTE).

Alternate Names:
BRUE

Brill's Disease

Recurrence of epidemic typhus years after the first infection because dormant Rickettsia prowazekii becomes active again. It is usually milder than the original illness but can still be spread by body lice.

Brill-Zinsser Disease

Recurrent epidemic typhus caused by reactivation of dormant Rickettsia prowazekii years after the original infection. The illness is usually milder but can be transmitted by body lice.

Brimonidine Tartrate

A medicine that reduces certain nerve signals and blood-vessel activity. Eye drops lower pressure inside the eye, and skin preparations can reduce some facial redness; side effects and interactions are possible.

Brine Bath

Bathing in salty water, sometimes used for comfort or certain skin conditions. It does not treat every skin problem, and hot water or salt can worsen irritation, dry skin, wounds, or some medical conditions.

Brittle Asthma

An uncommon, older term for severe asthma marked by sudden, unpredictable attacks or major variation in airflow despite treatment. It is not a consistently used modern asthma classification.

Brittle Bone Disease

An inherited disorder, usually osteogenesis imperfecta, in which bones break easily. It can also cause short stature, loose joints, blue-gray eye whites, hearing loss, dental problems, or other skeletal changes.

Brittle Nail Syndrome

A pattern of nails that split, peel, crack, or break easily, often because of repeated wetting and drying, detergents, trauma, ageing, or inflammatory nail disease. Iron deficiency, thyroid disease, fungal infection, and inherited disorders can contribute; changes may be persistent, painful, or widespread.

Brivudine

An antiviral medicine used in some countries for shingles. It is not used with fluoropyrimidine cancer medicines or certain related treatments because the interaction can be fatal.

Broad-Based Gait

A walking pattern in which the feet are set farther apart than usual, often reflecting impaired balance. It may occur with cerebellar ataxia or severe loss of lower-limb proprioception.

Broad Casts

Wide urinary casts formed in dilated kidney tubules, often when urine flow is slow or kidney tissue is damaged. Waxy broad casts are associated with advanced chronic kidney disease, but broad casts alone do not establish a diagnosis or disease stage.

Alternate Names:
Renal Failure Casts; Wide Casts

Broad-Complex Tachycardia

A fast heart rhythm with wide QRS complexes on an electrocardiogram, usually at least 120 milliseconds. It may arise in the ventricles or from an upper-chamber rhythm conducted abnormally, including through an accessory pathway.

Alternate Names:
Wide-Complex Tachycardia

Broad Ligament

A sheet of tissue extending from the sides of the uterus to the pelvic walls. It helps support the uterus, fallopian tubes, and ovaries and contains blood vessels, nerves, and connective tissue.

Broad Nasal Bridge

An unusually wide upper part of the nose between the eyes. It may be a normal family feature or part of a condition present from birth or an inherited syndrome.

Broca Aphasia

A language disorder in which speech is slow, effortful, and difficult to produce, while understanding may be relatively preserved. It usually follows damage to the dominant frontal language area, often from a stroke.

Broca's Aphasia

A nonfluent language disorder caused by damage to the dominant frontal language region. Speech is effortful and limited, while understanding may be better preserved than speaking or repeating words.

Broca's Area

A region in the dominant frontal lobe that helps plan and produce spoken language. Damage can cause slow, effortful speech and difficulty forming words, while understanding may be relatively preserved.

Brodie Abscess

A chronic, well-circumscribed subacute pyogenic bone abscess that represents a localized form of osteomyelitis. It characteristically develops in the metaphysis of long bones (most frequently the proximal or distal tibia) in children and young adults, presenting as a lytic bone lesion with a surrounding ring of sclerotic bone on radiography.

Brodie's Abscess

Alternate name; see *Brodie Abscess*.

Brodmann Area

A region of the cerebral cortex anatomically defined and numbered (1 through 52) based on its distinct cellular architecture (cytoarchitectonics), with specific areas corresponding to distinct functional neurological roles (such as area 4 for primary motor cortex).

Brody Disease

A rare inherited muscle disorder causing painless stiffness and slow muscle relaxation after strenuous or repeated exercise. It often begins in childhood and may affect the face, eyelids, or hands; symptoms can resemble myotonia but arise from a different muscle problem.

Alternate Names:
Brody Myopathy; SERCA1-Related Muscle Disease

Broken Ankle

A break in one or more bones forming the ankle joint. It usually causes pain, swelling, bruising, and difficulty bearing weight; deformity, an open wound, numbness, or poor circulation may indicate associated injury.

Broken Arm

A break in one or more arm bones, usually causing pain, swelling, bruising, deformity, or loss of function. An open injury, severe deformity, numbness, or reduced circulation may indicate associated

tissue or nerve injury.

Broken Blood Vessel in Eye

Alternate name; see *Subconjunctival Hemorrhage*.

Broken Bone

Alternate name; see *Bone Fracture*.

Broken Clavicle

Alternate name; see *Broken Collarbone*.

Broken Collarbone

A break in the clavicle, usually after a fall or direct blow. It causes pain, swelling, tenderness, and reduced shoulder movement; numbness, breathing difficulty, or a skin-threatening deformity may indicate associated injury.

Broken Finger

A fracture of one or more finger bones, usually caused by a blow, crush, or twist. Pain, swelling, bruising, deformity, or reduced movement may occur.

Alternate Names:
Finger Fracture

Broken Foot

A break in one or more foot bones after a fall, blow, twist, or repeated stress. Pain, swelling, bruising, and difficulty walking are common; deformity, an open wound, or numbness may indicate associated injury.

Broken Hand

A fracture of one or more hand bones, including metacarpals or finger bones. It can cause pain, swelling, bruising, deformity, or reduced movement.

Broken Heart Syndrome

Temporary weakening of the heart muscle, often after severe emotional or physical stress. It can resemble a heart attack with chest pain or breathlessness, but the coronary arteries usually have no blocking clot.

Broken Hip

Alternate name; see *Hip Fracture*.

Broken Leg

A break in one or more leg bones, usually causing pain, swelling, bruising, deformity, or inability to bear weight. An open injury, numbness, or loss of circulation may indicate associated injury.

Broken Little Finger

Alternate name; see *Broken Finger*.

Broken Nose

A break in one or more nasal bones that may cause pain, swelling, bruising, bleeding, deformity, or difficulty breathing through the nose. Persistent bleeding, clear fluid leakage, or severe deformity may indicate associated injury.

Broken Or Dislocated Jaw

A break or displacement of the jaw that can cause pain, swelling, an altered bite, limited movement, loose teeth, or difficulty speaking, swallowing, or breathing.

Broken Or Knocked Out Tooth

A tooth damaged or completely forced out of its socket by injury. A completely displaced tooth is called an avulsed tooth; fractures may involve the enamel, dentine, pulp, or root.

Broken Ribs

Breaks in one or more ribs, usually causing local chest pain that worsens with breathing, coughing, or movement. Severe breathing difficulty, increasing pain, coughing blood, or major trauma may indicate associated chest injury.

Broken Toe

A break in a toe bone, usually after a direct blow or crush. Pain, swelling, bruising, and tenderness are common; deformity, an open wound, numbness, or poor circulation may indicate associated injury.

Alternate Names:
Toe Fracture; Phalanx Fracture

Broken Wrist

A break in one or more bones near the wrist, often causing pain, swelling, bruising, deformity, or reduced hand function. Numbness, pale or cold fingers, an open wound, or severe deformity may indicate associated injury.

Bromelain

A mixture of enzymes from pineapple. It is sold as a supplement and studied for pain and inflammation, but evidence and product strength vary; it can cause allergy, stomach upset, or interactions with medicines.

Bromhexine

A medicine that thins sticky mucus in the airways so it may be coughed up more easily. It can cause stomach upset or rash and rarely causes a serious skin reaction.

Bromhidrosis

Unusually strong or unpleasant body odour produced when skin microorganisms break down apocrine or eccrine sweat and other secretions. It commonly affects the armpits, feet, or groin and may be associated with hyperhidrosis, occlusion, infection, or retained skin debris.

Bromides

Salts or compounds containing bromide. Excessive or prolonged exposure can cause bromism, with symptoms affecting the nervous system, mood, digestion, or skin.

Bromine

A reactive chemical used in industry and some flame-resistant materials. Bromine and many bromine compounds can irritate or burn tissue, while substantial exposure can cause poisoning affecting several organs.

Bromism

Poisoning caused by prolonged or excessive exposure to bromide compounds. It may cause confusion, drowsiness, poor coordination, mood or behaviour changes, digestive symptoms, acne-like eruptions, or other neurologic problems.

Bromobenzenes

Industrial chemicals made by attaching one or more bromine atoms to benzene. Exposure can irritate the eyes, skin, and airways or cause other toxic effects, depending on the specific compound and amount.

Bromocriptine

A dopamine-receptor agonist that lowers prolactin release and can also reduce growth-hormone release. It is used to treat hyperprolactinemia, acromegaly, and Parkinson disease; one formulation is also used for type 2 diabetes. Side effects can include nausea, dizziness, and low blood pressure.

Bromoderma

An inflammatory skin eruption linked to bromine or bromide exposure. It may appear as acne-like, pustular, or other irritated lesions and usually improves when the source is identified and removed.

Bromodosis

Unpleasant foot odour caused when microorganisms break down sweat, moisture, and skin debris. It may occur with excessive sweating, skin maceration, or fungal or bacterial infection.

Bromophos

An organophosphate insecticide. Exposure can overstimulate nerves and cause sweating, excess saliva, vomiting, breathing difficulty, weakness, seizures, or collapse.

Brompheniramine Overdose

Poisoning from taking too much brompheniramine, an antihistamine. It may cause severe sleepiness or agitation, confusion, dry mouth, rapid heartbeat, seizures, or dangerous heart rhythms.

Bromthymol Blue

A chemical indicator that changes colour according to acidity and alkalinity. It is used in laboratories and is not a medicine or treatment.

Bronchi

The two main airways carrying air from the windpipe into the lungs. Each divides into smaller branches; the right main bronchus is wider and more vertical, so inhaled objects are more likely to enter it.

Bronchial

Relating to the bronchi, the large airways branching from the windpipe. Bronchial disease may cause cough, wheezing, mucus production, narrowing, or reduced airflow.

Bronchial Artery

An artery from the body's general circulation that supplies the walls of the bronchi and supporting lung tissues. It differs from the pulmonary arteries, which carry blood to the lungs for oxygen exchange.

Bronchial Artery Embolization

A catheter procedure that blocks bleeding arteries supplying the airways, usually for severe or repeated hemoptysis. A rare serious complication is spinal-cord ischemia from blockage of an artery supplying the spinal cord.

Alternate Names:
BAE; Bronchial Embolization; Embolization of Bronchial Arteries

Bronchial Asthma

See *Asthma*.

Bronchial Biopsy

Removal of a small tissue sample from an airway during bronchoscopy. Laboratory examination can investigate inflammation, infection, abnormal growths, or cancer; bleeding and breathing complications are possible.

Bronchial Breath Sounds

Harsh, high-pitched, hollow breath sounds with a prolonged expiratory phase and an audible pause between inspiration and expiration. Normally auscultated over the trachea and main bronchi, their presence over peripheral lung fields indicates abnormal transmission through consolidated lung tissue, as in lobar pneumonia.

Bronchial Carcinoid

A usually slow-growing neuroendocrine tumour arising in an airway. Typical carcinoids are generally less aggressive than atypical carcinoids, but either can block an airway, cause coughing or bleeding, or spread to other sites.

Bronchial Carcinoma

See *Lung Cancer*.

Bronchial Circulation

The systemic arterial blood supply providing oxygenated blood and nutrients to the conducting airways, supporting stroma, and visceral pleura of the lungs, arising from bronchial arteries branching off the thoracic aorta or intercostal arteries.

Bronchial Fistula

An abnormal passage between an airway and another structure, such as the space around the lung, food pipe, or skin. It can cause persistent air leakage, coughing, infection, or breathing failure.

Bronchial Hemorrhage

Bleeding from airway blood vessels, usually seen as coughing up blood. Heavy bleeding can block the airway or cause breathing failure.

Bronchial Hyperresponsiveness

An increased tendency of the airways to narrow in response to stimuli, measured with tests such as a methacholine challenge. It is common in asthma but is not specific to asthma and can occur in other airway diseases, including chronic obstructive pulmonary disease.

Alternate Names:
Airway Hyperreactivity

Bronchial Obstruction

Partial or complete blockage of an airway by mucus, an inhaled object, a tumour, swelling, or pressure from outside. It can reduce airflow and lead to lung

collapse, repeated infection, wheezing, or breathlessness.

Bronchial Stenosis

Narrowing of an airway caused by scarring, inflammation, infection, injury, a tumour, or a previous procedure. It can cause localised wheezing, breathlessness, repeated infection, or poor mucus clearance.

Bronchial Stricture

Abnormal narrowing of an airway caused by scarring, inflammation, infection, a tumour, or previous instrumentation. It may produce localised wheezing, cough, repeated infection, or collapse of the lung beyond the narrowing.

Bronchial Tree

The branching network of airways from the windpipe through the main, lobar, and smaller bronchi and bronchioles toward the air sacs. It conducts and distributes air throughout the lungs.

Bronchial Tubes

The two main bronchi and their branches, which carry air from the windpipe into the lungs and divide into progressively smaller airways.

Alternate Names:
Bronchi; Bronchial Tree When Referring to the Branching Airway System

Bronchial Vein

A vein that drains blood from the walls of the larger airways and nearby lung tissue. It empties partly into veins returning blood to the heart and partly into pulmonary veins.

Bronchiectasis

A long-term condition in which parts of the airways become permanently widened and damaged. The airways may not clear mucus well, so mucus builds up and can lead to a persistent cough, repeated chest infections, and breathlessness. Causes include severe or repeated infections, other lung or immune conditions, and airway blockage; sometimes the cause is unknown. Some people also cough up blood.

Bronchiole

A small airway of the lower respiratory tract ($<$ 1 mm in diameter) that branches from segmental bronchi and is characterized histologically by the absence of cartilage and submucosal glands in its wall. Bronchioles are lined by ciliated cuboidal-to-columnar epithelium and secretoglobin-secreting club cells, surrounded by a circumferential layer of smooth muscle responsive to autonomic control. They subdivide into terminal bronchioles and respiratory bronchioles, which open into alveolar ducts.

Bronchiolectasis

Permanent widening of the small airways, usually caused by chronic inflammation, infection, or blockage. It may occur with bronchiectasis and contribute to poor mucus clearance and repeated infection.

Bronchioles

Plural form; see *Bronchiole*.

Bronchiolitis

Inflammation and blockage of the smallest airways, usually from a viral infection in infants and young children. It can cause cough, wheezing, fast breathing, chest retractions, poor feeding, and low oxygen.

Bronchiolitis Obliterans

A rare disease in which inflammation and scarring permanently narrow or close the smallest airways. It can follow severe infection, inhaled injury, autoimmune disease, or transplantation and causes persistent cough and breathlessness.

Bronchitis

Inflammation of the larger airways. Acute bronchitis is usually caused by a virus and causes cough, with or without mucus, while chronic bronchitis means mucus-producing cough for at least three months in two successive years.

Bronchoalveolar Lavage

A bronchoscopy procedure in which sterile fluid is put into a small lung area and then collected. The sample can be tested for infection, inflammation,

abnormal cells, or other lung disease.

Bronchocele

Abnormal widening of a bronchus filled with mucus, usually because an airway is blocked or developed abnormally. It may cause cough, repeated infection, or no symptoms and is assessed with imaging.

Bronchocentric Granulomatosis

A rare, non-necrotizing or necrotizing granulomatous inflammatory disorder centered primarily on conducting bronchi and bronchioles, frequently associated with tissue eosinophilia and severe asthma or allergic bronchopulmonary aspergillosis.

Bronchoconstriction

Narrowing of the bronchi caused by contraction of the smooth muscle in their walls. It increases resistance to airflow and commonly occurs in asthma or after exposure to certain allergens, irritants, or medicines. Airway swelling and mucus can also narrow the airways but are distinct mechanisms.

Bronchoconstrictor Agents

Substances that narrow the airways by tightening airway muscle or causing inflammation. Examples include histamine, leukotrienes, irritant gases, and some medicines.

Bronchodilator

A medicine that relaxes muscles around the airways, widening them and making breathing easier. It can relieve or prevent wheezing and breathlessness in asthma, chronic obstructive pulmonary disease, and other conditions with narrowed airways.

Alternate Names:
Bronchodilators

Bronchodilator Response

The change in airflow measured by spirometry after a bronchodilator is given. Improvement can support variable airway narrowing, but no response does not exclude asthma and a response does not prove one specific disease.

Bronchodilator Reversibility

Improvement in measured airflow after an inhaled bronchodilator. It can support variable airway narrowing, but one result alone cannot confirm or exclude asthma or chronic obstructive pulmonary disease.

Bronchoesophageal Fistula

An abnormal connection between an airway and the food pipe. It may be present from birth or develop from cancer, infection, injury, or treatment and can cause coughing during swallowing, repeated pneumonia, or breathing problems.

Bronchogenic Carcinoma

See *Lung Cancer*.

Bronchogenic Cyst

A birth-related fluid-filled cyst that develops from early airway or food-pipe tissue, often near the windpipe or central chest. It may cause no symptoms or press on nearby structures.

Bronchomalacia

Weakness of an airway wall that allows it to collapse too much, especially during breathing out. It may cause noisy breathing, cough, breathlessness, repeated infections, or difficulty clearing mucus.

Bronchophony

An examination finding in which spoken sounds are heard unusually clearly through a stethoscope over part of the lung. It can occur when lung tissue is solidified by infection or another process but is not diagnostic by itself.

Bronchopleural Fistula

An abnormal connection between an airway and the space around the lung, often after lung surgery or severe infection. It can cause a persistent air leak, breathlessness, infection, or air under the skin.

Bronchopneumonia

Infection causing scattered areas of inflammation and consolidation around the small airways in one or

more lung lobes. It may cause fever, cough, mucus, chest pain, fast breathing, and low oxygen.

Bronchoprovocation Test

A breathing test used to look for airways that narrow too easily, often when asthma is suspected but routine spirometry is normal. A substance such as methacholine is inhaled in increasing amounts while breathing is measured. A significant fall in airflow supports airway sensitivity, but does not by itself prove asthma.

Alternate Names:
Methacholine Challenge Test; Bronchial Provocation Test

Bronchopulmonary Dysplasia

A chronic lung disease affecting some infants born very preterm, often after neonatal respiratory distress syndrome. Immature lung development and injury associated with inflammation, infection, oxygen, or breathing support contribute. It may cause prolonged need for oxygen or other respiratory support, wheezing, or pulmonary hypertension.

Bronchopulmonary Segments

Natural sections of a lung lobe, each supplied by its own airway branch and pulmonary artery branch. Their separation helps doctors describe disease and allows some operations to remove only an affected segment.

Bronchoscope

A thin tube with a light and camera used to examine the windpipe and airways. Instruments passed through it can remove an object or collect tissue, fluid, or mucus for testing.

Bronchoscopic Culture

Laboratory testing of fluid or tissue collected during bronchoscopy to look for bacteria, fungi, or mycobacteria when sputum or other ordinary samples are not sufficient.

Bronchoscopy

Examination of the windpipe and airways with a flexible or rigid camera tube. It can investigate persistent cough, infection, bleeding, or a lung mass and can remove foreign material or collect samples; sedation or anaesthesia is used.

Bronchospasm

Sudden tightening of airway muscles that narrows the breathing passages. It can cause wheezing, cough, chest tightness, and difficulty breathing and may be triggered by asthma, allergy, infection, irritants, or airway procedures.

Bronchostenosis

Narrowing of a bronchus that restricts airflow. Causes include scarring, inflammation, infection, a tumour, an inhaled object, pressure from outside, or a previous procedure and may cause wheezing or repeated infection.

Bronchus

One of the two main branches of the windpipe that carries air into a lung. Each divides into smaller branches; the right main bronchus is wider and more vertical, making it a more common site for inhaled objects to lodge.

Bronchus Disease

Any condition affecting one or more bronchi, the air passages leading into the lungs. Infection, asthma, chronic inflammation, blockage, scarring, or a tumour may reduce airflow and cause cough, wheezing, or repeated infection.

Bronchus Neoplasm

An abnormal growth arising in a bronchus. It may be noncancerous or cancerous; imaging, bronchoscopy, and tissue testing help determine its type, extent, and treatment.

Brooke Disease

A rare inherited skin disorder involving abnormal thickening of the outer skin or hair follicles. Because the eponym has been used for more than one condition, the original source and clinical features are checked.

Brooke-Spiegler Syndrome

An inherited disorder causing multiple usually non-cancerous skin tumours, often on the head and neck. It is commonly linked to changes in the CYLD gene and may include cylindromas, spiradenomas, or trichoepitheliomas.

Broselow Tape

A colour-coded tape that estimates a child's weight from body length during an emergency and is used to identify approximate medicine doses, fluid amounts, equipment sizes, and defibrillator settings.

Alternate Names:
Broselow Pediatric Emergency Tape; Pediatric Length-Based Resuscitation Tape

Brown Adipose Tissue

A specialized type of adipose tissue characterized by multilocular lipid droplets, abundant mitochondria, and high levels of uncoupling protein 1 (UCP1, thermogenin), specialized for non-shivering thermogenesis in newborns and hibernating mammals.

Alternate Names:
Brown Fat; BAT

Brown Fat

A type of body fat containing many energy-producing structures that generate heat. It is especially important for keeping newborns warm and can also be activated by cold in adults.

Brown Lung Disease

Alternate name; see *Byssinosis*.

Brown Recluse Spider

A venomous spider whose bite may initially be mild but can later cause painful skin damage, blistering, or tissue death. Rarely, its venom causes fever, red-cell destruction, kidney injury, or other systemic illness.

Brown Recluse Spider Bite

Alternate name; see *Spider Bites*.

Brown Sequard Syndrome

Alternate spelling; see *Brown-Sequard Syndrome*.

Brown-Sequard Syndrome

A rare neurological condition caused by damage to one half (one side) of the spinal cord, often resulting from a puncture wound, spinal injury, tumor, or blood flow blockage. Because nerve pathways cross to opposite sides of the body at different points, the condition creates a distinct pattern of symptoms: loss of muscle movement and fine touch sensation on the same side of the body as the injury, combined with loss of pain and temperature sensation on the opposite side.

Alternate Names:
Spinal Cord Hemisection; Brown-Séquard Syndrome

Brown Stain

A brown discoloration of the teeth caused by pigments from food, drinks, tobacco, or bacteria. Surface stains differ from intrinsic discoloration caused by decay, enamel defects, or other changes within the tooth.

Brown Syndrome

Limited ability to lift the eye when it is turned inward, because the superior oblique tendon cannot glide freely through its pulley, the trochlea. The affected eye appears lower than the other in that gaze direction and double vision may occur. It can be present at birth or develop from inflammation, injury, sinus disease or surgery, or rheumatic disease such as rheumatoid arthritis. Some cases resolve spontaneously.

Brown Teeth

Brown discolouration of teeth caused by surface stains, decay, enamel defects, excess fluoride, medicines, injury, or other conditions. A dental examination identifies the cause and appropriate treatment.

Brow Presentation

A fetal position in which the forehead leads because the head is partly extended. The head presents a wide diameter, so persistent brow presentation at

term may prevent vaginal birth.

Brucella

A group of bacteria that usually infect animals but can infect people through unpasteurised dairy products, inhalation, or contact with infected animals or tissues. Human infection causes brucellosis.

Brucella Abortus

A Brucella species mainly associated with cattle. It can infect people exposed to infected animals, tissues, or unpasteurised dairy products and cause prolonged fever and other brucellosis symptoms.

Brucella Canis

A Brucella species associated with dogs. It rarely infects people after contact with infected dogs or reproductive material and may cause prolonged fever or other brucellosis symptoms.

Brucellaceae

A family of bacteria that includes Brucella and related animal-associated species. Some members cause brucellosis, an infection that can pass from animals to people.

Brucella Melitensis

A Brucella species mainly associated with goats and sheep and a frequent cause of severe human brucellosis, usually acquired through unpasteurised dairy products or infected animals.

Brucella Suis

A Brucella species associated with pigs and some wildlife. It can infect people through animal contact or contaminated food and may cause prolonged illness or infection in bones and organs.

Brucellosis

An infection caused by Brucella bacteria, usually acquired from infected animals, animal tissues, or unpasteurised dairy products. It may cause prolonged fever, sweats, tiredness, headache, and muscle or joint pain.

Bruce Protocol

A graded treadmill test in which speed and slope increase at set stages. It assesses exercise capacity, symptoms, heart-rate and blood-pressure responses, and signs of reduced blood flow to the heart.

Bruch's Membrane

A thin supporting layer between the retina and the blood-rich tissue behind it. It helps nourish and maintain the retina and can become damaged in ageing, diabetes, and some retinal diseases.

Bruck's Syndrome

A rare inherited disorder combining fragile bones with joint stiffness or fixed contractures present from birth. It results from changes affecting connective tissue and may cause repeated fractures and limited movement.

Brudzinski Sign

Involuntary bending of the hips and knees when the neck is gently bent forward. It can occur with irritation of the tissues around the brain and spinal cord, including meningitis, but does not confirm the diagnosis.

Brugada ECG Pattern Type 1

A characteristic ECG pattern with raised ST segments and an inverted T wave in certain right-sided chest leads. It may occur with Brugada syndrome, fever, medicines, or other conditions. The ECG pattern alone does not establish the inherited syndrome or predict the same risk in every person.

Alternate Names:
Type 1 Brugada Pattern; Coved ST Elevation Pattern

Brugada Phenocopy

A temporary ECG pattern resembling Brugada syndrome but caused by another problem, such as fever, abnormal blood salts, reduced heart blood flow, medicines, or poisoning. The pattern resolves when the cause is corrected and is distinguished from inherited disease.

Alternate Names:
Acquired Brugada Pattern; BrP

Brugada Syndrome

A rare, inherited heart rhythm disorder caused by abnormal electrical channels in heart muscle cells, even though the physical structure of the heart is completely normal. It can trigger dangerously fast, irregular heartbeats in the lower chambers (ventricles), which can cause fainting, seizures, or sudden cardiac arrest, often during rest or sleep, and sometimes triggered by high fever. It is diagnosed by a characteristic electrical pattern seen on an electrocardiogram (ECG).

Brugia

A group of parasitic worms spread by mosquitoes that can cause lymphatic filariasis. The infection may damage lymph vessels and lead to recurrent fever, swelling, or long-term enlargement of limbs or genital tissues.

Bruise

Extravasation of blood into the subcutaneous tissue or dermis beneath intact skin (contusion or ecchymosis), resulting from mechanical disruption of small capillaries by blunt force. Hemoglobin undergoes enzymatic degradation from red-blue heme to green biliverdin, yellow-brown bilirubin, and golden-brown hemosiderin as it resolves. Spontaneous, widespread, or disproportionate bruising suggests underlying coagulopathy, thrombocytopenia, vascular fragility, or medication effect.

Alternate Names:
Contusion; Ecchymosis

Bruises

Plural form; see *Bruise*.

Bruising

Purplish, blue, green, or yellow skin discolouration caused by blood leaking into tissue, usually after injury. Colour changes as the blood is broken down; widespread or unexplained bruising may be associated with medicines, blood disorders, or other illness.

Bruit

An abnormal whooshing sound heard over a blood vessel, usually with a stethoscope, caused by turbulent blood flow. It may suggest narrowing but does not by itself establish the cause or severity.

Brunner Gland

Singular form; see *Brunner Glands*.

Brunner Glands

Compound branched tubuloalveolar submucosal glands located exclusively in the duodenum, concentrated primarily in the bulb and proximal descending portions. They secrete an alkaline, bicarbonate-rich, mucin-containing fluid that protects the duodenal mucosa from gastric acid erosion and optimizes luminal pH for pancreatic digestive enzymes.

Alternate Names:
Duodenal Submucosal Glands; Brunner's Glands

Brunner's Gland

Alternate name; see *Brunner Glands*.

Brunner's Glands

Alternate name; see *Brunner Glands*.

Bruns Syndrome

Episodic, sudden attacks of severe headache, vomiting, vertigo, and syncope triggered by abrupt neck movements, caused by transient obstruction of cerebrospinal fluid flow in the fourth ventricle by a mobile mass, such as a cysticercal cyst or ependymoma.

Brush Burns

Superficial friction injuries caused by scraping skin against a rough surface. They cause pain, redness, and grazes; deep, extensive, or infected injuries can involve tissue damage or infection.

Brushfield's Spots

Small gray or white spots arranged around the coloured part of the eye. They are common in people with Down syndrome but can also occur in healthy people and usually do not affect vision.

Bruton Agammaglobulinemia

An X-linked primary immunodeficiency disorder caused by mutations in the Bruton tyrosine kinase (*BTK*) gene, resulting in failure of pre-B cells to differentiate into mature B lymphocytes, profound pan-hypogammaglobulinemia, and recurrent pyogenic bacterial infections beginning after maternal antibodies wane.

Alternate Names:
X-Linked Agammaglobulinemia; XLA

Bruxism

Repeated clenching or grinding of the teeth, often during sleep. It can wear down or crack teeth and cause pain in the jaw, face, or ear, or cause headaches. It may be linked to sleep problems, stress, or some medicines.

Alternate Names:
Teeth Grinding; Tooth Clenching

Bryant's Traction

An older treatment in which an infant's or young child's legs are gently elevated with traction to treat selected hip or thigh conditions. It is rarely used because of complications including nerve injury and impaired circulation.

B-Type Natriuretic Peptide

A hormone released mainly by heart muscle when it is stretched or under pressure. A blood test measures BNP to help assess possible heart failure. NT-proBNP is a separate peptide measured by a distinct test; the results are not interchangeable. Age and kidney function, among other factors, affect measured levels.

Alternate Names:
BNP; Brain Natriuretic Peptide

Bubo

A tender, enlarged lymph node, usually in the groin, armpit, or neck, caused by infection or inflammation. Buboes are classically linked with plague but also occur in sexually transmitted and other infections.

Bubonic Plague

A serious infection caused by Yersinia pestis, usually spread by infected flea bites. It causes fever and painful swollen lymph nodes and can spread to the blood or lungs.

Buccal

Relating to the cheek or its inner lining. A buccal medicine is placed between the cheek and gum so it dissolves and is absorbed through the mouth.

Buccal Gland

A small salivary gland in the cheek that releases mucus into the mouth. The secretion helps keep the cheek lining moist and supports chewing and swallowing.

Buccal Mucosa

The non-keratinized stratified squamous mucous membrane lining the inside of the cheeks, bounded by the labial commissures anteriorly, the retromolar trigone posteriorly, and the alveolar sulci superiorly and inferiorly. It contains the opening of the parotid duct (Stensen duct) opposite the maxillary second molar and serves as a site for clinical examination of exanthems (such as Koplik spots in measles), oral lichen planus (Wickham striae), aphthous stomatitis, leukoplakia, and drug absorption.

Buccal Smear

A sample of cells gently collected from the inside of the cheek for laboratory testing. It may be used for genetic analysis or, less commonly, to investigate infection or abnormal cells.

Buccinator

A muscle in the cheek that presses the cheek against the teeth. It helps keep food between the teeth and assists sucking, blowing, chewing, and speaking.

Buckle Fracture

Alternate name; see *Torus Fracture*.

Budd-Chiari Syndrome

An uncommon, life-threatening disorder caused by

obstruction of hepatic venous outflow at any level from the hepatic venules to the entrance of the inferior vena cava into the right atrium. It classically manifests with the clinical triad of abdominal pain, painful hepatomegaly, and rapidly developing ascites. The obstruction is most commonly thrombotic, strongly associated with underlying hypercoagulable states and myeloproliferative neoplasms (particularly polycythemia vera with the *JAK2* V617F mutation), antiphospholipid syndrome, paroxysmal nocturnal hemoglobinuria, pregnancy, or inherited thrombophilias. Doppler ultrasonography is the diagnostic imaging modality of choice.

Alternate Names:
Chiari-Budd Syndrome; Hepatic Venous Outflow Obstruction; Hepatic Vein Thrombosis

Budesonide

A corticosteroid that reduces inflammation. It is used in selected inhaled, nasal, digestive, or rectal treatments for conditions such as asthma, chronic obstructive lung disease, allergic symptoms, and inflammatory bowel disease; side effects depend on the route and dose.

Budvicia

A group of water-associated bacteria related to Yersinia. They rarely cause human disease, but some isolates have been associated with urinary or other opportunistic infections.

Budvicia Aquatica

A water-associated bacterium that has rarely been isolated from human urinary infections, including infections in people with urinary catheters. Its significance depends on symptoms and specimen quality.

Buerger Disease

A nonatherosclerotic inflammatory disease of small and medium arteries and veins, strongly associated with tobacco exposure. Recurrent inflammation and clotting reduce blood flow and can cause pain, coldness, ulcers, or gangrene in the hands or feet.

Alternate Names:
Buerger's Disease; Thromboangiitis Obliterans; TAO

Buerger's Disease

Alternate name; see *Buerger Disease*.

Buerger Test

A bedside examination for impaired arterial blood flow in the leg. Pallor on elevation and redness when the leg is lowered may occur with severe peripheral arterial disease, but these findings are not specific.

Buffalo Hump

A pad of fat at the back of the neck and upper back. It may occur with obesity, long-term corticosteroid excess, some HIV treatments, or Cushing syndrome and is assessed together with other findings.

Buffer

A chemical solution that resists a change in acidity when small amounts of acid or base are added. Buffers help maintain stable conditions in blood, cells, medicines, and laboratory tests.

Buffer System

A chemical solution consisting of a weak acid and its conjugate base (or a weak base and its conjugate acid) that resists changes in hydrogen ion concentration and pH upon the addition of small amounts of acidic or basic substances.

Buffy Coat

The thin pale layer of white blood cells and platelets that forms between plasma and red blood cells when a blood sample is spun. It can be collected for laboratory testing.

Bufonidae

The family of amphibians commonly called true toads. Some species produce bufotoxins in their skin glands; swallowing or absorbing these toxins can affect the heart and nervous system.

Buformin

An older biguanide medicine for diabetes that has

been withdrawn or restricted in many countries because it can cause dangerous lactic-acid buildup, especially when kidney function is poor.

Bug Spray Poisoning

Illness after exposure to an insecticide. Effects depend on the chemical and may include skin or eye irritation, vomiting, breathing difficulty, unusual sweating, confusion, seizures, or other nervous-system problems; severe poisoning can be life-threatening.

Bulbar

Relating to the lower brainstem or to the nerves controlling swallowing, speaking, chewing, coughing, and movement of the tongue and soft palate. Bulbar weakness can allow food or saliva to enter the airway.

Bulbar Conjunctiva

The part of the eye's clear moist covering that lies over the white of the eye. It joins the inner surface of the eyelids around the front of the eye and can become inflamed or injured.

Bulbar Palsy

A lower motor neuron syndrome caused by damage to motor nuclei or fibers of the lower cranial nerves in the brainstem, especially nerves IX, X, and XII. It can cause slurred speech, difficulty swallowing, a weak cough, tongue weakness or wasting, and sometimes breathing problems. It differs from pseudobulbar palsy, which results from bilateral upper motor neuron pathway damage.

Bulbar Paralysis

Alternate name; see *Bulbar Palsy*.

Bulbocavernosus

A paired muscle in the pelvic floor that helps empty the urethra and contributes to erection and ejaculation. It surrounds structures at the base of the penis or the vaginal opening.

Bulbospongiosus

A paired pelvic-floor muscle that helps empty the urethra and assists erection and the release of genital secretions during sexual activity.

Bulbourethral Gland

Either of a pair of small, pea-sized male accessory glands (Cowper glands) situated posterolateral to the membranous urethra within the deep perineal space. During sexual arousal, they secrete an alkaline, clear, mucoid pre-ejaculatory fluid that lubricates the penile urethra and neutralizes acidic residual urine prior to ejaculation.

Alternate Names:
Cowper Gland; Cowper's Gland; Bulbourethral Glands

Bulbourethral Glands

Plural form; see *Bulbourethral Gland*.

Bulging

Projecting or swelling outward beyond the usual shape. A bulge may involve a disc, membrane, organ, skin area, or body wall, and its significance depends on the structure and cause.

Bulging Disc

An intervertebral disc that extends beyond the edge of nearby vertebrae over a broad area. This age-related change is common and may cause no symptoms. In some cases it narrows space around a nerve and contributes to pain, tingling, or weakness; it differs from a focal disc herniation.

Bulging Eyes

Alternate name; see *Exophthalmos*.

Bulging Fontanelle

An outward protrusion or tense swelling of an infant's soft spot (fontanelle) when the baby is calm and upright, indicating elevated intracranial pressure from conditions such as meningitis, encephalitis, hydrocephalus, or intracranial hemorrhage.

Alternate Names:
Tense Fontanelle; Fontanelle Protrusion

Bulimia

Alternate name; see *Bulimia Nervosa*.

Bulimia Nervosa

An eating disorder marked by repeated episodes of eating unusually large amounts of food while feeling unable to stop. These episodes are followed by repeated behaviors to prevent weight gain, such as vomiting, misusing laxatives, fasting, or excessive exercise. A person's view of themselves is strongly affected by body shape or weight.

Alternate Names:
Bulimia; Bulimic Disorder; Binge-Purge Disorder

Bulla

A large fluid-filled blister on the skin or a mucous membrane, or a large air-filled space in an organ such as the lung. The plural is bullae; the term describes the shape of the lesion rather than its cause.

Bullae

Large fluid-filled blisters on or beneath the skin or a mucous membrane. They can result from friction, burns, infection, allergy, medicines, or autoimmune disease; widespread or infected bullae may cause complications.

Bullectomy

An operation to remove one or more large air-filled spaces (bullae) in damaged lung tissue, often to relieve compression of healthier lung.

Alternate Names:
Excision of Pulmonary Bullae; Resection of Giant Bulla

Bullet Track

The path a firearm projectile takes through the body, from the entry wound through injured tissues to an exit wound or a retained bullet. The path may damage skin, organs, blood vessels, nerves, or bone.

Bullet Wounds

Penetrating or perforating injuries caused by firearm projectiles. They may damage skin, organs, blood vessels, nerves, and bones, even when the external wound looks small.

Bull Neck

Marked swelling of the neck that makes it look thick or rounded. It is classically seen in severe diphtheria of the throat, when swollen lymph nodes and nearby tissues enlarge the neck. The term describes an appearance, not a diagnosis by itself.

Alternate Names:
Bull-neck

Bullosa Hereditaria

Historical term; see *Epidermolysis Bullosa*.

Bullous

Describes a condition involving large, raised, fluid-filled blisters. Bullous disease can result from infection, burns, medicines, allergy, or an autoimmune reaction.

Bullous Myringitis

A painful infection or inflammation of the eardrum that causes small fluid-filled blisters on its surface. It often occurs with a middle-ear infection and may cause temporary hearing loss or fever.

Bullous Disease of Diabetes (Bullosis Diabeticorum)

A rare diabetes-related blistering disorder producing spontaneous, usually painless, tense blisters on the feet or lower legs. Lesions often heal without scarring; secondary infection or another blistering disorder can complicate the picture.

Bullous Emphysema

A severe manifestation of chronic obstructive pulmonary disease characterized by the formation of large, thin-walled air-filled spaces (bullae) exceeding one centimeter in diameter within the lung parenchyma, predisposing to compression of healthy lung and pneumothorax.

Alternate Names:
Vanishing Lung Syndrome

Bullous Impetigo

A contagious superficial bacterial skin infection, usually caused by Staphylococcus, that produces fragile fluid-filled blisters and yellow or varnish-like crusts. It is especially common in infants and young children.

Bullous Pemphigoid

An autoimmune subepidermal blistering disease, most common in older adults, caused by antibodies to proteins at the skin's basement membrane. It often begins with an itchy, hive-like rash followed by tense, fluid-filled blisters. Mucosal involvement is uncommon, and blisters are generally less fragile than those in pemphigus.

Alternate Names:
BP

Bullous Systemic Lupus Erythematosus (BSLE)

A rare autoimmune subepidermal blistering disease occurring in people with systemic lupus erythematosus. It produces tense blisters on normal or inflamed skin and is distinguished from other blistering disorders by its clinical and immunologic features.

Bullying

Repeated physical, verbal, social, or online aggression involving a power imbalance. It can harm mental and physical health.

Bumetanide

A diuretic that makes the kidneys remove extra salt and water in urine. It is used for swelling related to heart, liver, or kidney disease; excessive fluid loss can cause dehydration and abnormal blood salts.

Bumps

Raised or palpable areas on or under the skin. Causes range from harmless cysts, blocked follicles, and insect bites to injury, allergy, infection, or tumours; bumps may be growing, painful, hard, or persistent.

BUN

Alternate name; see *Blood Urea Nitrogen Test*.

Bundle Branch Block

Alternate spelling; see *Bundle-Branch Block*.

Bundle-Branch Block

A delay or blockage along the specialized electrical pathways that carry heartbeat signals through the heart's lower chambers (ventricles). This causes one ventricle to contract slightly later than the other. It is detected as a widened signal pattern on an electrocardiogram (ECG). It is divided into **right bundle-branch block** (which can occur in healthy people or with lung/heart conditions) and **left bundle-branch block** (which is more frequently associated with underlying heart disease).

Bundle Branch Reentry Tachycardia

A form of monomorphic ventricular tachycardia occurring in patients with severe underlying structural heart disease and conduction system disease, in which the reentrant electrical circuit involves the bundle of His and the right and left bundle branches.

Bundle Of His

A short pathway of specialised heart tissue that carries electrical signals from the atria to the ventricles. It divides into right and left branches so the lower chambers contract in a coordinated way.

Bundle of Kent

An abnormal, congenital accessory muscular conduction pathway directly connecting atrial myocardium to ventricular myocardium, bypassing the physiological delay of the atrioventricular node; the anatomical substrate of Wolff-Parkinson-White syndrome.

Alternate Names:
Accessory Atrioventricular Pathway

Bungarotoxins

Poisons in the venom of krait snakes that disrupt nerve signals to muscles. A bite can cause drooping eyelids, weakness, progressive paralysis, and breathing failure.

Bunion

A progressive structural forefoot deformity (hallux valgus) characterized by lateral deviation of the great toe and medial prominence of the first metatarsal head at the first metatarsophalangeal (MTP) joint. It often causes local adventitial bursitis, erythema, pain with ambulation, and difficulty accommodating footwear.

Alternate Names:
Hallux Valgus; Bunions

Bunionectomy

Surgery to correct a bunion by cutting or shifting bone and adjusting surrounding tissues around the big-toe joint.

Bunionette

A bony prominence at the outer side of the joint below the little toe. It may become painful, red, or swollen from pressure, tight shoes, or altered foot mechanics.

Alternate Names:
Tailor's Bunion; Bunion of the Fifth Toe

Bunion Removal

Alternate name; see *Bunionectomy*.

Bunions

Plural form; see *Bunion*.

Bunioplasty

Surgery to correct a bunion by realigning the toe joint and, when needed, balancing nearby soft tissues. The operation is selected according to the deformity and symptoms.

BUN-to-Creatinine Ratio

The ratio of blood urea nitrogen to creatinine. It can provide context when assessing kidney function and hydration, but diet, bleeding, medicines, muscle mass, and other factors affect it; no single cutoff reliably distinguishes prerenal from intrinsic kidney injury.

Bunyaviridae

An older virus-family grouping that included several viruses spread by insects, ticks, or rodents. Modern classification has changed; individual viruses differ in the illnesses they cause.

Bunyaviruses

A historical collective name for segmented RNA viruses now grouped in the order *Bunyavirales*. Some cause human diseases, including hantavirus disease and Rift Valley fever.

Bunyavirus Infection

An illness caused by a virus in the group historically called bunyaviruses. This group includes viruses that cause hantavirus disease, Rift Valley fever, and some mosquito- or tick-borne infections. Symptoms depend on the virus.

Buphthalmos

Enlargement of an infant's or young child's eye caused by high pressure inside the eye while its outer coat is still flexible. It is usually associated with congenital or infantile glaucoma and can threaten vision.

Bupivacaine

A long-acting local anaesthetic that temporarily blocks nerve signals to prevent pain during local, nerve-block, or epidural procedures. Too much in the bloodstream can cause seizures, dangerous heart effects, or cardiac arrest.

Bupivacaine Hydrochloride

The hydrochloride form of bupivacaine, a long-acting local anaesthetic used to block pain signals. Accidental injection into a blood vessel can cause severe neurologic or heart toxicity.

Buprenorphine

A medicine that partly activates opioid receptors and is used to treat opioid-use disorder and some pain. It can cause dependence and overdose, especially with other sedatives, although respiratory suppression is limited compared with full opioid agonists.

Buprenorphine/Naloxone Toxicity

Opioid toxicity from excessive buprenorphine exposure, characterized by somnolence, miosis, hypoventilation, hypoxia, or coma; risk increases with alcohol, benzodiazepines, or other sedatives. Buprenorphine binds tightly to opioid receptors, so naloxone effects may be delayed or shorter than the toxicity.

Bupropion

A medicine used for depression and, in some settings, to help stop smoking. It changes norepinephrine and dopamine signalling and may cause insomnia, dry mouth, or anxiety; it increases seizure risk and is unsuitable for some seizure or eating disorders.

Buried Penis

A normally developed penis that is concealed by surrounding skin, scar tissue, or excess suprapubic fat. It may cause hygiene problems, recurrent inflammation, difficulty urinating, or sexual difficulties; causes can be congenital, obesity-related, inflammatory, or associated with circumcision complications.

Burkholderia

A group of environmental bacteria found in soil and water. Some species cause melioidosis or glanders, while others cause difficult-to-treat lung, bloodstream, or wound infections, especially in people with chronic lung disease or weakened immunity.

Burkholderiaceae

A family of mainly environmental bacteria that includes Burkholderia. Some members cause serious infections in people or animals, while others are harmless or used in environmental research.

Burkholderia Cenocepacia

A bacterium in the Burkholderia cepacia complex that can cause severe, persistent lung infection, especially in people with cystic fibrosis or other chronic lung disease.

Burkholderia Cepacia

An environmental bacterium in the Burkholderia cepacia complex. It can cause opportunistic lung, bloodstream, wound, or device-related infection, particularly in people with cystic fibrosis or weakened immunity.

Burkholderia Gladioli

An environmental bacterium that can rarely cause lung, bloodstream, or wound infection, especially in people with cystic fibrosis or weakened immunity.

Burkholderia Mallei

The bacterium that causes glanders, an infection mainly affecting horses and related animals. People can become infected through contact with infected animals or tissues.

Burkholderia Pseudomallei

The bacterium that causes melioidosis. Infection follows contact with contaminated soil or water and may cause pneumonia, abscesses, bloodstream infection, or long-term illness.

Burkitt Lymphoma

A very fast-growing cancer of B lymphocytes, often involving the abdomen, jaw, bone marrow, or nervous system. The pattern differs between endemic, sporadic, and immunodeficiency-associated forms.

Burkitt's Lymphoma

Alternate spelling; see *Burkitt Lymphoma*.

Burkitt's Tumor

Alternate name; see *Burkitt Lymphoma*.

Burn

Tissue trauma caused by thermal agents, chemicals, electricity, radiation, or friction. Burns are classified by depth into superficial (first-degree: erythema, epidermal sparing, no blisters), partial-thickness (second-degree: extending into dermis, weeping blisters, severe pain), full-thickness (third-degree: leathery, white/charred, destruction of dermal appendages and sensory nerves), and fourth-degree (involving deep fascia, muscle, or bone). Extent is quantified by percentage of total body surface area (TBSA) using the Wallace Rule of Nines; severe burns ($>$ 20% TBSA) require prompt fluid

resuscitation (e.g., Parkland formula).

Alternate Names:
Thermal Injury; Burn Trauma; Burns

Burning Feet

Burning, tingling, or painful sensations in the feet, often caused by nerve damage from diabetes, nutritional deficiency, alcohol, medicines, or nerve compression. Symptoms may be new, progressive, or associated with weakness.

Burning Mouth Syndrome

Long-lasting burning, scalding, or tingling in the mouth, often felt daily for months or longer even though the mouth looks normal. Taste changes or dry mouth may also occur. Sometimes no cause is found; similar symptoms can also result from low nutrient levels, infection, medicines, allergy, diabetes, or hormone changes.

Burning Thigh Pain

Alternate name; see *Meralgia Paresthetica*.

Burn Injury

Alternate name; see *Burn*.

Burnout

A work-related state of emotional exhaustion, mental distance or cynicism, and reduced effectiveness caused by chronic workplace stress. It is not the same as depression, although both may occur together.

Burns

Plural form; see *Burn*.

Burn Shock

Shock after a major burn, caused by fluid and protein leaking from blood vessels, reduced circulating blood volume, and systemic inflammatory responses. It can impair blood flow to organs and is most likely after extensive burns.

Burn Surgery

Surgical care for serious burns, including assessing depth and area, removing dead tissue, covering wounds, performing skin grafts, and treating scars or movement-limiting contractures.

Burnt-Out Joint

An older description of a joint in which active inflammation has subsided but permanent damage, deformity, pain, or restricted movement remains.

Burn Wound Infections

Infection of damaged skin or deeper tissue after a burn. Features can include increasing pain, redness or swelling spreading beyond the burn, pus, foul odour, delayed healing or graft loss, fever, or other signs of systemic illness.

Burping

Release of swallowed air or gas from the stomach through the mouth. Occasional burping is normal; frequent, painful, or newly worsening burping may result from swallowed air, reflux, food intolerance, or another digestive disorder.

Burr Cells

Erythrocytes that exhibit numerous (usually 10 to 30) short, blunt, evenly spaced, and symmetrical spicules across their entire surface membrane. They are typically observed in end-stage renal disease and uremia, severe hypomagnesemia, and pyruvate kinase deficiency.

Alternate Names:
Echinocytes; Crenated Red Cells

Burr Hole Evacuation

A neurosurgical procedure in which a small opening is drilled through the skull to drain blood or fluid pressing on the brain. It is often used to drain a chronic subdural hematoma. A temporary drain may be left in place to reduce fluid buildup.

Alternate Names:
Burr Hole Drainage; Trephination; Chronic Subdural Hematoma Drainage; Burr Hole Craniostomy

Bursa

A small fluid-filled sac that reduces friction between

moving tissues, such as a tendon and bone or skin and bone, especially near a joint. Inflammation of a bursa is called bursitis.

Alternate Names:
Bursae Synovial Bursae

Bursa Inflammation

Alternate name; see *Bursitis*.

Bursectomy

Surgical removal of a bursa, a small fluid-filled sac that reduces friction between tissues.

Bursitis

Inflammation of a bursa, the small fluid-filled sac that cushions movement between tendons, muscles, bones, and skin. It causes localized pain, tenderness, swelling, or reduced movement and may result from pressure, injury, infection, or arthritis.

Bursitis Of The Heel

Inflammation of a bursa near the heel, causing localized tenderness, swelling, and pain when walking or when pressure is applied. It may follow repeated friction, injury, inflammatory arthritis, or infection.

Alternate Names:
Retrocalcaneal Bursitis

Bursitis Of The Foot

Inflammation of a small fluid-filled sac that cushions movement near a foot joint or tendon. It can cause local pain, tenderness, or swelling; see also *Bursitis* and *Bursitis Of The Heel*.

Bursitis of the Knee

Alternate name; see *Knee Bursitis*.

Bursopathy

Any disorder of a bursa, including inflammation, infection, bleeding, thickening, or degeneration. Affected bursae may cause localized pain, swelling, tenderness, and restricted movement around a joint.

Burton Line

A thin, purplish-blue or black discoloration line along the gingival margin at the base of the teeth. Caused by the precipitation of lead sulfide following the chemical reaction between circulating lead and hydrogen sulfide produced by oral bacterial decay; it represents a classical physical sign of chronic lead poisoning (plumbism).

Alternate Names:
Burtonian Line; Lead Line

Buruli Ulcer

A chronic skin infection caused by *Mycobacterium ulcerans*, usually affecting an arm or leg. Its toxin, mycolactone, causes a painless nodule, plaque, or swelling that can progress to an undermined ulcer with extensive tissue destruction and little early inflammation.

Burundanga

A colloquial term for scopolamine (hyoscine hydrobromide), a tropane alkaloid and muscarinic receptor antagonist that induces central anticholinergic effects, anterograde amnesia, sedation, and severe toxicity.

Alternate Names:
Scopolamine; Hyoscine; Hyoscine Hydrobromide

Buserelin

A synthetic gonadotropin-releasing hormone analogue. Continuous treatment first briefly increases and then suppresses pituitary reproductive hormones, lowering ovarian or testicular hormone production in selected fertility and hormone-sensitive conditions.

Buspirone

A nonbenzodiazepine medicine used mainly for generalized anxiety disorder. It acts on serotonin signaling and usually takes days to weeks to help; it does not provide immediate relief from an acute panic attack.

Busulfan

An alkylating chemotherapy medicine used mainly to prepare the body for blood-forming stem-cell transplantation and sometimes to treat chronic myeloid leukemia. It can suppress bone marrow

and may cause seizures, infertility, lung injury, or liver damage.

Butanol

A flammable industrial alcohol used as a solvent. Swallowing it or substantial exposure to its vapor can irritate the eyes, skin, and airways and may cause dizziness, vomiting, drowsiness, or other nervous-system effects.

Butazolidin Overdose

Toxic effects from excessive phenylbutazone, an older nonsteroidal anti-inflammatory drug. Severe exposure may cause gastrointestinal bleeding, kidney injury, bone-marrow suppression, metabolic disturbances, or seizures.

Butocarboxim

A carbamate insecticide that inhibits acetylcholinesterase. Significant exposure can cause cholinergic poisoning, with sweating, salivation, vomiting, diarrhea, wheezing, muscle weakness, seizures, or respiratory failure.

Buttiauxella

A genus of environmental gram-negative bacteria in the Enterobacterales; human infection is uncommon and usually opportunistic.

Buttiauxella Agrestis

A species of environmental Gram-negative bacteria found in water, soil, and other natural settings. It is rarely reported from human clinical samples; when detected, the specimen source and the patient's symptoms determine whether it represents infection or harmless contamination.

Buttiauxella Ferragutiae

A species of environmental Gram-negative bacteria. It is uncommon in human disease; its significance in a laboratory specimen depends on source, repeat cultures, symptoms, and other evidence.

Buttiauxella Gaviniae

A species of Buttiauxella bacteria found mainly in environmental samples. Human infection is uncommon; its significance in a clinical specimen depends on the patient's condition.

Buttiauxella Noackiae

A species of environmental Gram-negative bacteria that is rarely associated with human infection. Its significance depends on where it was found, whether it was recovered repeatedly, and whether the patient has compatible symptoms or signs of infection.

Buttock

Either of the paired rounded prominences of the posterior pelvic region overlying the gluteal musculature (gluteus maximus, medius, and minimus) and dense subcutaneous adipose tissue. The gluteal region facilitates upright bipedal posture, locomotion, and sitting weight distribution, and provides landmarks for deep intramuscular injections (e.g., ventrogluteal site).

Alternate Names:
Gluteal Region; Nates; Buttocks

Buttocks

Plural form; see *Buttock*.

Button Batteries

Button batteries are small batteries that can cause severe tissue injury if swallowed or inserted into the nose or ear.

Buttonhole Deformity

Buttonhole deformity is a finger deformity with flexion of the proximal interphalangeal joint and hyperextension of the distal interphalangeal joint, often due to central slip injury or rheumatoid disease.

Button Magnets In The Nasal Cavity

Small magnets placed in or inhaled into the nose can attract across the nasal partition and cut off its blood supply. They may cause tissue death or a hole in the nasal septum.

Buttressing

Buttressing is reinforcement or thickening that supports a weakened structure; in bone it may describe cortical stress adaptation or surgical structural support.

Butylamine

Butylamine is an irritating industrial amine whose vapor or liquid can injure the eyes, skin, and respiratory tract after exposure.

Butyric Acid

Butyric acid is a short-chain fatty acid produced by gut bacteria during fiber fermentation and used by colon cells as an energy source; concentrated exposure irritates tissue.

B Virus

A herpes virus carried mainly by macaques. It can cause a rare but severe infection of the brain and spinal cord in people after a bite, scratch, or contact with infected animal tissue.

Bx

A common medical abbreviation for biopsy, the removal of cells or tissue for microscopic or laboratory examination.

By-Pass

Alternate spelling; see *Bypass*.

Bypass

Creation of an alternative route around a blocked or narrowed passage. A bypass can restore blood flow or redirect body contents, using a natural pathway, tube, vein, or artificial graft depending on the organ involved.

Bypass Graft

A vein or artificial tube surgically connected to route blood around a blocked or weakened artery. Grafts are used in coronary, leg, and aortic operations; blood flow, infection, clotting, and long-term narrowing affect their durability.

Bypass Surgery

An operation that creates a new route around a blocked or diseased passage. Examples include coronary and leg-artery bypasses and gastric bypass; possible complications include bleeding, infection, clotting, and narrowing of the connection.

Byssinosis

An occupational lung disease caused by repeated inhalation of dust from cotton, flax, hemp, or other textile fibers. It can cause chest tightness, cough, and breathing difficulty that worsen during or after work exposure.

Alternate Names:
Brown Lung Disease

C

C-11 Hydroxylase Deficiency

A form of congenital adrenal hyperplasia caused by impaired 11-beta-hydroxylase activity. Reduced cortisol synthesis increases adrenal androgens and deoxycorticosterone, which may cause androgen excess, virilization, hypertension, and low potassium.

C-17 Hydroxylase Deficiency

A form of congenital adrenal hyperplasia caused by impaired 17-alpha-hydroxylase activity. It reduces cortisol and sex-steroid production and may cause hypertension, low potassium, undervirilization, or absent puberty.

C1-INH

Abbreviation for C1 esterase inhibitor, a complement-regulating protein. Inherited or acquired deficiency or dysfunction can cause recurrent episodes of bradykinin-mediated angioedema affecting the skin, abdomen, or airway.

C1Q Nephropathy

A rare kidney disorder in which an immune protein called C1q collects in the kidney's filtering units. It may cause blood or protein in the urine, swelling, high blood pressure, or reduced kidney function.

C282Y Mutation

A change in the HFE gene that is the most common genetic cause of hereditary hemochromatosis, a condition in which the body stores too much iron. Having two copies of this mutation increases the risk, although not everyone with two copies develops the disease.

CA-125

A blood protein that may rise in ovarian and some other cancers. It can also increase with menstruation, pregnancy, endometriosis, infection, liver disease, or other noncancerous conditions, so it cannot diagnose ovarian cancer alone.

Alternate Names:
Cancer Antigen 125; Carbohydrate Antigen 125; MUC16

CA-125 Blood Test

See *CA-125*.

CA 19-9

A substance measured in blood that may be increased in pancreatic and other digestive-system cancers. It can also rise with blocked bile ducts or inflammation, so it cannot screen for or diagnose cancer by itself.

CA 27-29

A blood test that measures a protein sometimes released by breast-cancer cells. It may help monitor selected people with known breast cancer but cannot by itself screen for or diagnose cancer.

Cabazitaxel

A taxane chemotherapy medicine used with prednisone for metastatic castration-resistant prostate cancer after docetaxel. It can cause low white-cell counts, infection, diarrhea, and serious allergic reactions.

Cabergoline

A dopamine D2-receptor agonist used to suppress

prolactin secretion and treat hyperprolactinemia; it is also used in selected Parkinson disease settings and requires monitoring for adverse effects.

CABG

Abbreviation; see *Coronary Artery Bypass Grafting*.

Cabot Ring

A thread-like or ring-shaped remnant sometimes seen inside a red blood cell on a blood smear. It may occur when red blood cells are being made abnormally, including in severe anemia, but it is not a diagnosis by itself.

Cachectic

Affected by cachexia, a severe wasting syndrome involving involuntary weight loss, muscle loss, weakness, and often reduced appetite in chronic disease.

Cachetic

Common misspelling; see *Cachectic*.

Cachexia

A wasting syndrome caused by serious long-term illness, marked by ongoing unintentional loss of weight, muscle, and body fat. It may cause poor appetite, weakness, and inflammation and cannot be corrected by nutrition alone.

Cacosmia

A distorted sense of smell in which ordinary odors seem unusually foul or unpleasant. It may occur with nose or sinus disease, infection, seizures, head injury, or another nervous-system disorder.

CAD

Coronary artery disease, narrowing or blockage of the arteries supplying the heart, usually caused by fatty plaque. It can reduce oxygen to heart muscle and cause chest pain, heart attack, heart failure, or dangerous rhythms.

CADASIL Syndrome

An inherited disorder of small brain blood vessels caused by changes in the NOTCH3 gene. It may cause migraine with aura, repeated strokes, mood changes, and gradually worsening memory or thinking problems.

CAD (Coronary Artery Disease)

Expanded form of the abbreviation; see *CAD*.

Cadherin

A cell-surface protein that helps neighboring cells attach to one another and keeps tissues organized. Loss or alteration of cadherins can allow some cancer cells to invade nearby tissue and spread.

Cadmium

A toxic metal found in tobacco smoke, some batteries and pigments, workplace dust, and contaminated food or soil. Long-term exposure can damage the kidneys, lungs, and bones and increases the risk of some cancers.

Caduceus

A winged staff with two entwined snakes, traditionally associated with Hermes. It is often used incorrectly as a medical symbol and differs from the single-snake Rod of Asclepius.

Cadusafos

An organophosphate pesticide that blocks acetylcholinesterase, causing excess nerve signaling after exposure. Poisoning may produce sweating, salivation, vomiting, diarrhea, small pupils, muscle weakness, breathing difficulty, or seizures.

Caecal

Relating to the caecum, the pouch at the beginning of the large intestine where the small intestine joins the colon and the appendix begins.

Caecitis

Inflammation of the caecum, the first part of the large intestine. It may result from infection, inflammatory bowel disease, reduced blood flow, neutropenia, or spread of nearby inflammation and can cause right-sided abdominal pain and fever.

Caecopexy

An operation that attaches the caecum, the first pouch of the large intestine, to nearby tissue to prevent or treat abnormal movement or twisting.

Caecostomy

An operation that creates an opening from the caecum to the abdominal wall. It may temporarily release pressure, drain the bowel, or divert stool when the normal route is blocked or unsafe.

Caecotomy

A surgical incision into the caecum, the first part of the large intestine, to gain access to its interior or as part of another abdominal operation. The incision is generally closed during the procedure.

Caecum

The first pouch-like part of the large intestine, located where the ileum joins the colon and attached to the appendix.

Caesarean Birth

Alternate name; see *Cesarean Section*.

Caesarean Section

Alternate spelling; see *Cesarean Section*.

Cafe-Au-Lait Macules

Alternate spelling; see *Café-Au-Lait Macules*.

Café-Au-Lait Macules

Flat, light-brown skin patches with relatively uniform pigmentation. Multiple lesions may be associated with genetic disorders such as neurofibromatosis type 1.

Cafe-Au-Lait Spot

Alternate name; see *Café-Au-Lait Macules*.

Café Au Lait Spot

Alternate name; see *Café-Au-Lait Macules*.

Café Coronary

Older term for choking caused by food blocking the airway; see *Choking*.

Caffeine

A stimulant found in coffee, tea, chocolate, soft drinks, and energy drinks. It increases alertness and can raise heart rate, cause shakiness, or disturb sleep.

Caffeine Intoxication

Alternate name; see *Caffeine Toxicity*.

Caffeine Overdose

Alternate name; see *Caffeine Toxicity*.

Caffeine Toxicity

Illness caused by taking in too much caffeine. It may cause restlessness, shaking, nausea, vomiting, or a fast heartbeat. Severe poisoning can cause dangerous heart rhythms, seizures, or loss of consciousness.

Caffeine Withdrawal

A group of symptoms after suddenly reducing or stopping regular caffeine use. Headache, tiredness, low mood, poor concentration, irritability, nausea, or flu-like feelings usually begin within a day and improve within several days.

Caisson Disease

Decompression sickness caused by gas bubbles forming in tissues or blood after a rapid fall in surrounding pressure, such as after diving. It can cause joint pain, skin changes, breathing problems, brain or spinal-cord injury, or collapse.

Caladium Plant Poisoning

Poisoning from chewing or swallowing caladium, whose needle-like calcium oxalate crystals irritate the mouth and throat. Burning, pain, drooling, and swelling may occur; trouble breathing or swallowing is an emergency.

Calamine

A topical preparation, usually containing zinc oxide with small amounts of ferric oxide, used to relieve itching and irritation. It is applied to the skin and has a mild astringent effect.

Calbindin

A protein that binds calcium inside cells and helps control calcium levels and cell signaling, especially in nerve and intestinal cells. Laboratories may also use it as a marker to identify certain tissues.

Calcaneal Spur

A bony growth from the heel bone, usually where the plantar fascia or Achilles tendon attaches. It may cause no symptoms; when heel pain occurs, the associated soft-tissue inflammation is often more important than the spur itself.

Calcaneal Tendon

Alternate name; see *Achilles Tendon*.

Calcaneal Valgus

An outward tilting of the heel so that the foot rolls toward the body's midline. It may occur with flat feet, altered lower-limb alignment, or developmental and neuromuscular conditions and can affect walking or cause pain.

Calcaneum

Alternate name for the calcaneus; see *Calcaneus*.

Calcaneus

The largest tarsal bone, forming the heel. It supports body weight and articulates with the talus and cuboid; fractures may occur after falls from height.

Calcarine Sulcus

An anatomical fissure located on the medial surface of the occipital lobe of the brain, running horizontally from the parieto-occipital sulcus to the occipital pole; its upper and lower banks constitute the primary visual cortex (Brodmann area 17).

Alternate Names:
Calcarine Fissure

Calcifediol

The main circulating storage form of vitamin D, also called 25-hydroxyvitamin D. A blood test for calcifediol is used to assess vitamin-D status before the body converts it to the active hormone calcitriol.

Calciferol

A fat-soluble form of vitamin D that helps the body absorb calcium and phosphate and maintain healthy bones, muscles, and immune function. The body changes it into active vitamin-D hormones.

Calcification

Deposition of calcium salts in tissue. It is normal in bone and teeth; in other tissues it may follow local injury or inflammation, or occur when calcium or phosphate levels in the blood are abnormal. The affected tissue and distribution of deposits help distinguish these processes.

Calcific Bursitis

A condition in which calcium deposits form in or around a bursa, often near the shoulder, causing pain, tenderness, swelling, and restricted movement. Treatment depends on severity and may include rest, physical therapy, medicines, drainage, or deposit removal.

Alternate Names:
Calcifying Bursitis; Hydroxyapatite Bursitis

Calcific Tendinitis

A condition in which calcium crystals build up inside a tendon, most often a rotator-cuff tendon in the shoulder. It can cause sudden severe pain, stiffness, and restricted movement, sometimes followed by gradual improvement as deposits break down.

Calcific Uremic Arteriolopathy

Alternate name; see *Calciphylaxis*.

Calcified Granuloma

A small area of past inflammation that has healed and become hardened by calcium deposits. It is

often found in the lung after an old infection and usually does not represent active disease.

Calcineurin

A protein that helps activate T cells, which are immune cells, after they receive signals. Medicines that block it reduce immune activity and are used to prevent transplant rejection and treat selected immune diseases.

Calcinos

Older or shortened term; see *Calcinosis*.

Calcinosis

Abnormal deposition of insoluble calcium salts in the skin or deeper soft tissues, often associated with autoimmune connective-tissue disease, kidney disease, trauma, or an abnormal calcium-phosphate balance. Firm white or yellow nodules or plaques may be painful, restrict movement, ulcerate, or release chalky material.

Calcinosis Cutis

Deposition of calcium salts in the skin or subcutaneous tissue, producing firm white or yellow papules, nodules, or plaques. Lesions may be painless or tender, restrict movement, ulcerate, or discharge chalky material; the cause and blood calcium or phosphate levels guide evaluation.

Calciphylaxis

A rare disorder in which calcification and fibrosis of small blood vessels, followed by thrombosis, reduce blood flow and cause severe tissue injury. It usually occurs with advanced kidney disease but can also occur without it. Painful, purplish skin lesions may progress to ulcers and tissue death.

Alternate Names:
Calciphylaxis Cutis; CUA; Vascular Calcification-Uremic Syndrome

Calcitonin

A hormone made by specialized cells in the thyroid gland. It helps lower blood calcium by reducing calcium release from bone and increasing calcium loss through the kidneys, although it has a smaller role than parathyroid hormone in adults.

Calcitonin Blood Test

A blood test that measures calcitonin, a hormone produced by thyroid C cells. It is used mainly to evaluate or monitor medullary thyroid carcinoma and may be affected by other thyroid, kidney, gastrointestinal, or medicine-related factors.

Calcitriol

The active hormone made from vitamin D, mainly by the kidneys. It increases intestinal absorption of calcium and phosphate and helps regulate parathyroid hormone, bone formation, and blood-mineral levels.

Calcitriol And Analogues

Medicines related to the active form of vitamin D that reduce excessive parathyroid-hormone release and help correct mineral imbalance in some kidney disorders. They can raise calcium or phosphate, so blood levels require monitoring.

Calcium

A mineral needed for strong bones and teeth, muscle movement, nerve signals, blood clotting, and normal cell function. Blood calcium exists in an active free form and forms attached to proteins or other substances.

Calcium Blood Test

A blood test that measures calcium, usually as total calcium. The result may be interpreted with albumin, a blood protein, or measured as ionized calcium when the active form is needed. It helps assess parathyroid, bone, and kidney disorders.

Calcium Carbonate

A calcium supplement and antacid that neutralizes stomach acid. Excessive use can cause constipation, high blood calcium, or kidney problems and may interfere with medicine absorption.

Calcium Carbonate Overdose

Overdose of calcium carbonate that may cause gas-

trointestinal symptoms, hypercalcemia, alkalosis, kidney injury, or kidney stones.

Calcium Carbonate With Magnesium Overdose

Taking too much of these antacid ingredients can cause nausea, vomiting, constipation or diarrhea, weakness, confusion, abnormal calcium or magnesium levels, and kidney injury. Effects are more severe with impaired kidney function.

Calcium Channel

A protein in the cell membrane that controls calcium entry into cells. Calcium channels help regulate muscle contraction, the release of substances, nerve signals, and heart rhythm.

Calcium Channel Blocker Toxicity

Poisoning from excessive exposure to a calcium-channel blocker. It can impair heart contraction and conduction and widen blood vessels, causing low blood pressure, slow heart rate, heart block, high blood glucose, shock, or cardiac arrest; severity depends on the drug and amount.

Calcium Chloride

A calcium salt given by injection for severe low blood calcium, dangerously high potassium, or certain toxic exposures. Leakage outside the vein can cause serious tissue injury.

Calcium Citrate

A calcium supplement that is absorbed even when stomach acid is low. It may prevent or treat calcium deficiency but can cause constipation and, in some people, contribute to kidney stones.

Calcium Deficiency

Inadequate calcium intake or absorption over time, which can impair bone mineralization and contribute to rickets in children or osteomalacia and bone loss in adults. It is distinct from hypocalcemia, an abnormally low calcium concentration in the blood, which has several possible causes and can produce neuromuscular symptoms.

Calcium for Osteoporosis

Calcium is a mineral required for bone formation and maintenance. Adequate intake supports osteoporosis prevention and treatment, but calcium alone does not reverse established osteoporosis; excessive supplementation can cause constipation, kidney stones, or hypercalcemia.

Calcium Gluconate

A calcium salt taken by mouth or given by injection to treat calcium deficiency and some emergencies, including dangerously high potassium or magnesium. Intravenous treatment requires medical monitoring because it can affect the heart and veins.

Calcium Homeostasis

Regulation of calcium concentration in the blood and tissues by coordinated actions of the bones, intestines, kidneys, parathyroid glands, and vitamin D. Calcium homeostasis supports nerve signaling, muscle contraction, blood clotting, and bone maintenance.

Calcium Hydroxide Poisoning

Exposure to a strongly alkaline chemical that can burn the mouth, throat, esophagus, skin, or eyes. Eye, breathing, or swallowing problems may occur with severe exposure.

Calcium Phosphate

A mineral that forms much of the hard structure of bones and teeth. Excess calcium phosphate can also deposit in soft tissues, especially after tissue damage or when blood calcium or phosphate levels are abnormal.

Calcium Pyrophosphate Arthritis

Inflammation caused by calcium pyrophosphate crystals in cartilage or a joint. Sudden attacks, often called pseudogout, commonly affect the knee or wrist; chronic deposits can cause ongoing arthritis and joint damage.

Calcium Pyrophosphate Crystals

Rhomboid or rod-shaped crystals that deposit in cartilage and other joint tissues. In joint fluid, they

are usually weakly positively birefringent or may show no birefringence under polarized light; their deposition causes calcium pyrophosphate deposition disease.

Alternate Names:
CPP Crystals; CPPD Crystals

Calcium Pyrophosphate Deposition

Alternate index label; see *Calcium Pyrophosphate Deposition Disease*.

Calcium Pyrophosphate Deposition Disease

A disorder in which calcium pyrophosphate crystals collect in cartilage and joints. It may cause sudden painful swelling of one joint, usually the knee or wrist, or a chronic arthritis that resembles osteoarthritis or rheumatoid arthritis.

Calcium Sensing Receptor

A protein in the parathyroid glands and kidneys that detects the blood calcium level. It helps control parathyroid hormone and influences how much calcium and phosphate the kidneys keep or remove.

Calcium Signaling

A way cells communicate using changes in calcium concentration. These signals help control muscle contraction, secretion of substances, energy use, movement, and activity of genes.

Calcium Stones

The most common type of kidney stone, made mainly of calcium oxalate or calcium phosphate. Low urine volume and certain mineral imbalances increase risk; stones may cause severe side pain, blood in the urine, blockage, or infection.

Calcium Test

A blood test measuring total or ionized calcium to evaluate parathyroid function, bone disorders, kidney disease, and electrolyte balance; see *Calcium*.

Calciuria

Calcium excretion in urine. It is measured in a timed or 24-hour collection when assessing calcium balance, kidney-stone risk, or disorders of mineral metabolism. Excess calcium in urine is called hypercalciuria and may occur with endocrine disease, kidney-tubule disorders, diet, or certain medicines.

Calculi

Alternate plural; see *Calculus*.

Calculus

A hard concretion that forms in an organ or duct, often composed of mineral salts. Examples include urinary, biliary, and salivary stones; mineralized dental plaque is called dental calculus.

Calculus Removal

Professional dental treatment that removes hardened plaque from teeth and below the gumline using hand or ultrasonic instruments. It helps control gum inflammation and may include deep cleaning of affected tooth roots.

Caldwell-Luc Operation

An operation that reaches the maxillary sinus through the upper gum and jawbone. It is used selectively to treat or examine certain sinus lesions, chronic disease, or foreign bodies when less invasive routes are unsuitable.

Calf

The back part of the lower leg between the knee and ankle. It contains the gastrocnemius, soleus, blood vessels, nerves, and other tissues and helps point the foot downward and propel walking.

Calf Pseudohypertrophy

An enlarged, firm appearance of the calf muscles caused mainly by replacement of damaged muscle with fat and fibrous tissue rather than increased muscle strength. It is seen especially in Duchenne and Becker muscular dystrophies and some related disorders.

Alternate Names:
Pseudohypertrophy of the Calves; Muscular Pseudohypertrophy

Calibration

Checking and, when necessary, adjusting a medical or laboratory instrument against a known standard so its measurements are accurate and reliable. Regular calibration supports correct diagnosis, treatment, and patient safety.

Caliciviridae

A family of viruses that includes norovirus and sapovirus, which commonly cause vomiting and diarrhea. Other members infect animals; illness depends on the particular virus, the person or animal infected, and the route of exposure.

Calipers

An instrument with two arms used to measure distance, thickness, or body dimensions. In health care, calipers may measure skinfold thickness, joint movement, wounds, or the size of body structures.

Calla Lily Poisoning

Poisoning from chewing or swallowing calla lily, whose needle-like calcium oxalate crystals irritate the mouth and throat. Burning, pain, drooling, and swelling may occur; breathing or swallowing difficulty requires emergency care.

Callosal

Relating to the corpus callosum, the broad bundle of nerve fibers connecting the left and right halves of the brain. Callosal abnormalities can affect communication between the two sides.

Callosity

A small area of thick, hardened skin caused by repeated pressure or rubbing. It commonly develops on the hands or feet and may become painful if the pressure continues.

Callosotomy

Surgical division of the corpus callosum to reduce the spread of certain severe, treatment-resistant seizures between the cerebral hemispheres.

Callus

A thick, hardened area of skin formed by repeated pressure or rubbing. Calluses commonly occur on hands or feet, usually cause no harm, and may become painful or crack when extensive.

Calluses and Corns

Localized areas of thickened skin caused by repeated pressure or friction. Calluses are broader; corns are more focal and often painful. Diabetes, poor circulation, or infection requires professional foot care rather than self-cutting.

Calmodulin

A protein inside cells that senses calcium and passes its signals to other proteins. It helps control muscle contraction, movement of substances through cell membranes, chemical reactions, and activity of genes.

Calnexin

A protein inside cells that helps newly made proteins fold into the correct shape. It checks proteins before they are sent to other parts of the cell or broken down.

Calor

Abnormal warmth of a body part, usually caused by increased blood flow during inflammation. It may occur with redness, swelling, pain, or reduced function.

Caloric Restriction

Deliberately eating fewer calories without causing malnutrition. It may help with weight loss and some metabolic risks, but it should provide enough protein, vitamins, minerals, and other nutrients.

Caloric Stimulation

A balance test in which warm or cool air or water is placed in the ear canal. The temperature briefly stimulates the inner-ear balance organs and helps compare the balance nerve on each side.

Calorie

A unit of energy. In nutrition, one Calorie with a capital C equals one kilocalorie (kcal), the energy needed to raise the temperature of one kilogram of water by one degree Celsius.

Alternate Names:
Kilocalorie; Kcal; Calories

Calorimetry

Measurement of heat production or gas exchange to estimate how much energy the body uses. Indirect calorimetry uses oxygen consumption and carbon-dioxide production to help assess metabolism and nutritional needs.

Calot Triangle

The hepatocystic triangle is bounded by the cystic duct, the common hepatic duct, and the inferior surface of the liver. It contains the cystic artery in most people and is a landmark in gallbladder surgery. Calot's original triangle instead used the cystic artery as its superior boundary; the two descriptions should not be conflated.

Alternate Names:
Triangle of Calot; Cystohepatic Triangle

Calpain

A group of enzymes activated by calcium that cut selected proteins inside cells. They help regulate cell movement, signaling, programmed cell death, and platelet activity; abnormal calpain activity contributes to some muscle and nervous-system diseases.

Calpainopathy

An inherited muscle disease caused by harmful changes in both copies of the CAPN3 gene. It slowly weakens hip, pelvic, shoulder, and trunk muscles, often causing shoulder-blade winging, back curvature, difficulty climbing, and walking problems while usually sparing facial and heart muscles.

Alternate Names:
Limb-Girdle Muscular Dystrophy R1 (LGMD R1); LGMD 2A; Calpain-3 Deficiency

Calponin

A protein that binds to actin, a component of the cell's internal framework, and helps regulate contraction in smooth muscle. Laboratory staining for calponin can help identify muscle-related cells in tissue samples.

Calprotectin

A protein released mainly by activated white blood cells. Measuring it in stool helps detect inflammation in the intestines, particularly in inflammatory bowel disease, and can help distinguish it from some noninflammatory conditions.

Calreticulin

A protein inside cells that helps newly made proteins fold correctly and helps regulate calcium storage and immune signaling. Harmful changes in its gene are found in some blood cancers involving excessive production of blood cells.

Calretinin

A calcium-binding protein found in certain nerve cells and cells lining body cavities. Pathologists may use calretinin staining to help distinguish mesothelioma from some other cancers in a tissue sample.

Calvaria

The dome-shaped upper part of the skull that covers and protects the brain. It is formed mainly by the flat bones of the forehead, top and sides of the head, and back of the skull.

Calvarium

The dome-like portion of the skull formed mainly by the frontal, parietal, and occipital bones. It encloses and protects the upper parts of the brain.

Calyx

A cup-shaped body structure that supports tissue or collects fluid. In the kidney, renal calyces collect urine from the pyramids and carry it toward the renal pelvis.

Cambridge Classification

A grading system used with endoscopic retrograde cholangiopancreatography to describe chronic pancreatitis. It rates abnormalities of the main pancreatic duct and its branches, from normal or uncertain findings to mild, moderate, or severe disease.

Cameron Lesions

Long, shallow erosions or ulcers in the stomach where it is squeezed by the diaphragm, usually in people with a large hiatal hernia. They may cause chronic blood loss, iron-deficiency anemia, or visible gastrointestinal bleeding.

Camphor

A strong-smelling substance used in some topical products and traditional remedies. Swallowing even a relatively small amount can cause nausea, agitation, drowsiness, or rapidly developing seizures and may be life-threatening.

Camphor Overdose

Toxic exposure to too much camphor, causing nausea, vomiting, agitation, drowsiness, seizures, coma, or slowed breathing. Seizures may begin quickly after ingestion.

Camphor-Phenol Product Poisoning

Toxicity after swallowing a topical product containing camphor and phenol. Camphor can cause nausea, agitation, drowsiness, and rapidly developing seizures; phenol can injure tissues and affect the nervous system, heart, liver, or kidneys.

Campimetry

Measurement and mapping of the area a person can see while looking straight ahead. It helps detect and describe visual-field loss caused by disease of the retina, optic nerve, or brain pathways.

Campomelic Dysplasia

A rare inherited disorder caused by changes affecting the SOX9 gene. It causes bowed long bones, poorly developed shoulder blades, characteristic facial features, and often serious problems with breathing or other organs.

Camptocormia

Severe forward bending of the trunk that worsens while standing or walking and improves when lying down. It may result from muscle disease, Parkinson disease, dystonia, or another nerve or muscle disorder.

Camptodactyly

A fixed bending deformity of one or more fingers, usually at the middle finger joint. It may be present from birth or develop later because of shortened tendons, muscles, connective tissue, or joint structures.

Campylobacter

A group of bacteria that commonly cause foodborne intestinal infection. Illness may include fever, abdominal cramps, diarrhea, or bloody stools; some species can invade the bloodstream or cause later nerve or joint problems.

Campylobacter Coli

A Campylobacter species that can cause foodborne intestinal infection, usually after contaminated meat, water, or other food. Symptoms include fever, abdominal cramps, diarrhea, and sometimes bloody stools.

Campylobacter Enteritis

An acute bacterial foodborne or waterborne diarrheal illness caused predominantly by *Campylobacter jejuni*, presenting with fever, severe cramping abdominal pain mimicking appendicitis, and inflammatory bloody diarrhea, with potential post-infectious Guillain-Barre syndrome.

Alternate Names:
Campylobacteriosis

Campylobacter Fetus

A Campylobacter species that can cause bloodstream infection and infections of blood vessels, joints, the brain, or other tissues. Serious disease is more likely in older adults and people with weakened immunity.

Campylobacter Food Poisoning

A foodborne infection caused by Campylobacter bacteria, often from undercooked poultry, unpasteurized milk, or contaminated water. It causes diarrhea, cramps, and fever and may rarely trigger bloodstream infection or nerve inflammation.

Campylobacter Infection

A bacterial infection, usually caused by C. jejuni or C. coli, acquired from contaminated poultry, food, water, or unpasteurized milk. It causes fever, cramps, and diarrhea that may be bloody; rare complications include bloodstream infection, arthritis, or Guillain–Barré syndrome.

Campylobacteriosis

Infection caused by Campylobacter bacteria, usually producing fever, abdominal pain, and diarrhea that may be bloody. Dehydration is common; rare complications include bloodstream infection, reactive arthritis, and Guillain–Barré syndrome.

Campylobacter Jejuni

A major cause of foodborne intestinal infection, usually acquired from undercooked poultry, contaminated water, or unpasteurized milk. It commonly causes fever, abdominal cramps, and diarrhea that may contain blood.

Campylobacter Serology Test

A blood test that detects antibodies produced after Campylobacter infection. It may support evaluation of selected complications after infection, but stool molecular testing or culture is generally used to diagnose active intestinal disease.

Canagliflozin

A medicine that lowers blood glucose by causing the kidneys to remove more glucose in urine. It may also reduce some heart-failure and kidney risks, but can cause genital infections, dehydration, low blood pressure, or ketoacidosis.

Canaliculus

A small anatomical channel. The tear canaliculi are tiny passages in the eyelids that carry tears from the eye surface into the lacrimal sac and then the nose.

Canalith Repositioning Maneuver

A series of guided head and body movements designed to relocate displaced otolith calcium carbonate crystals (canaliths) from a semicircular canal back into the utricle, where they no longer provoke positional nystagmus or vertigo. Most commonly performed as the Epley maneuver for posterior canal benign paroxysmal positional vertigo (BPPV) or the Lempert (barbecue roll) maneuver for horizontal canal BPPV.

Canalith Repositioning Maneuvers

Plural form; see *Canalith Repositioning Maneuver*.

Canalization

Formation or restoration of a channel through tissue, a blood vessel, or an embryonic structure. In a blood clot, canalization means that small channels form through the clot and partly restore blood flow.

Canal Of Schlemm

A circular drainage channel at the edge of the cornea that carries aqueous fluid from the front of the eye into the bloodstream. Poor drainage can raise eye pressure and contribute to glaucoma.

Canavan Disease

A rare inherited disorder in which deficiency of the ASPA enzyme damages the brain's white matter. It usually begins in infancy with poor muscle tone, delayed development, increasing head size, feeding problems, and later severe movement and communication impairment.

Cancellous Bone

Porous bone made of thin supporting plates or struts. It is found inside many bones, especially near joints and in the vertebrae, and contains marrow while helping distribute forces.

Cancer

A group of diseases in which abnormal cells grow

without normal control. They can invade nearby tissue or spread to other parts of the body; this spread is called metastasis. Cancer can begin in almost any tissue. Some cancers, such as leukemia, do not form solid tumors. A benign growth is not cancer and does not spread in this way.

Cancer And Lymph Nodes

Cancer cells may travel from a primary tumor to nearby lymph nodes through lymphatic vessels. Examination, imaging, or biopsy of these nodes helps determine the cancer's extent and guide treatment.

Cancer-Associated Thrombosis

A blood clot in a vein or artery occurring with active cancer or its treatment. Cancer, surgery, immobility, central lines, and some treatments increase risk; anticoagulant treatment is chosen according to clot location, bleeding risk, and cancer status.

Cancer Care Team

The health professionals who work together to diagnose, treat, and support a person with cancer. Depending on the illness, the team may include medical and radiation oncologists, surgeons, pathologists, nurses, pharmacists, therapists, and palliative-care specialists.

Cancer Cell

A cell with changes that allow it to grow and survive without normal control. Cancer cells may lose their specialized function, resist cell death, invade nearby tissues, enter blood or lymph, and form tumors elsewhere.

Cancer Cluster

A group or area with more cancer cases than expected during a specified time. Investigation compares the number and types of cancers with reliable background rates and examines possible shared exposures while considering chance variation.

Cancer Genetics

The study of inherited and acquired genetic changes that affect cancer risk, behavior, or treatment. Testing may identify inherited risk syndromes or changes in a tumor that help guide treatment and family counseling.

Cancer Grading

Assessment of how abnormal cancer cells and their tissue pattern look under a microscope. The grade gives information about likely growth behavior and is different from staging, which describes how far the cancer has spread.

Cancer Immunotherapy

Cancer treatment that helps the immune system recognize or attack cancer cells. Methods include checkpoint inhibitors, engineered immune cells, immune-stimulating proteins, and some vaccines; use and side effects depend on the cancer and treatment.

Cancer in Lung

Alternate name; see *Lung Cancer*.

Cancer Mutations

Genetic changes in cancer cells that can alter growth, survival, or spread. Most develop during life and are not inherited. Some drive cancer development, while others have little effect; testing selected changes can help guide prognosis or targeted treatment.

Cancer Nutrition

Nutrition care for people with cancer, who may lose appetite or weight because of the disease or treatment. Individual plans may address calories, protein, fluids, swallowing, nausea, diarrhea, and cachexia while respecting the person's goals and treatment.

Cancer of the Ear

Cancer arising in the outer ear or ear canal; less often, it begins in the middle ear or temporal bone. Most cancers of the outer ear and ear canal arise from skin cells, commonly as squamous cell carcinoma or basal cell carcinoma.

Cancer of the Tongue

Malignant tumor arising in the tongue, most often squamous cell carcinoma. It may appear as a per-

sistent sore, lump, bleeding area, or numb patch, or cause difficulty swallowing or unexplained tongue pain.

Cancer Of Unknown Origin

Alternate index label; see *Carcinoma Of Unknown Primary*.

Cancer Of Unknown Primary

Alternate name; see *Carcinoma Of Unknown Primary*.

Cancer Pain

Pain caused by a tumor, its spread, or its treatment. It may be constant or intermittent and can arise from bone, nerves, organs, surgery, radiation, or medicines; treatment combines control of the cause with suitable pain relief and supportive care.

Alternate Names:
Malignancy-Related Pain; Oncologic Pain

Cancer Prevention

Actions that lower the chance of developing cancer or find precancerous changes early. They include avoiding tobacco, limiting alcohol, vaccination against cancer-causing infections, protecting skin from ultraviolet light, reducing harmful exposures, and recommended screening.

Cancer Progression

Growth or spread of cancer or worsening of its effects over time. Progression may occur at the original site, in nearby lymph nodes, or in distant organs and is assessed with symptoms, examination, imaging, laboratory tests, or biopsy.

Cancer Recurrence

Cancer that returns after a period when it could not be detected. It may recur near the original site or in another part of the body and may be called local, regional, or distant recurrence.

Cancer-Related Fatigue

Persistent physical, emotional, or mental exhaustion caused by cancer, its treatment, or related problems. It may occur even after little activity and may not improve fully with sleep or rest.

Cancer Risk

The likelihood that a person will develop cancer. It is influenced by age, inherited variants, family history, tobacco, alcohol, certain infections, radiation, environmental exposures, body weight, and chance; having a risk factor does not guarantee cancer.

Cancer Screening

Testing people who have no symptoms to find selected cancers or precancerous changes early, when treatment may work better. Each test has specific age, risk, interval, benefits, and possible harms.

Cancers of the Oral Mucosa

Malignant tumors arising in the moist lining of the mouth, most commonly squamous cell carcinoma. They may cause persistent ulcers, red or white patches, lumps, bleeding, pain, numbness, or swallowing difficulty; tobacco, alcohol, HPV, and other factors can contribute.

Cancer Staging

Describing how far a cancer has grown or spread. Assessment may include the primary tumor, nearby lymph nodes, distant metastases, scans, and tissue examination; stage helps guide treatment and estimate prognosis.

Cancer Surveillance

Ongoing monitoring for cancer recurrence, progression, treatment effects, or new cancers after diagnosis or treatment. It may include examinations, imaging, laboratory tests, and symptom review according to the cancer and treatment.

Cancer Survivor

A person living with cancer from diagnosis through treatment and afterward. The term includes people whose cancer is controlled or cured and those with ongoing disease; follow-up may address recurrence, late effects, emotional health, and quality of life.

Cancer Susceptibility Genes

Genes in which inherited harmful variants increase the chance of developing one or more cancers. Examples include BRCA1, BRCA2, APC, and mismatch-repair genes; carrying a risk variant does not guarantee that cancer will develop.

Cancer Treatment

Any intervention aimed at curing, prolonging survival, or palliating symptoms in malignant neoplasms. Major modalities include surgical resection, radiation therapy, cytotoxic chemotherapy, endocrine/hormone therapy, targeted molecular inhibitors, immunotherapy (checkpoint inhibitors, CAR-T cells), and hematopoietic stem-cell transplantation, coordinated in multimodality protocols tailored to tumor histology, stage, molecular profile, and patient functional status.

Cancer Treatment-Induced Premature Menopause

The premature and often irreversible cessation of ovarian endocrine and reproductive function (iatrogenic premature ovarian insufficiency) resulting from gonadotoxic chemotherapy, pelvic radiotherapy, or surgical bilateral oophorectomy.

Alternate Names:
Treatment-Induced Early Menopause; Iatrogenic Premature Ovarian Insufficiency; Chemotherapy-Induced Menopause

Cancer Treatment-Related Bleeding

Bleeding or easy bruising that develops during cancer treatment, often because chemotherapy, radiation, or stem-cell transplantation lowers the platelet count. Signs may include nosebleeds, bleeding gums, unusual bruises, tiny red or purple skin spots, blood in urine or stool, or unusually heavy menstrual bleeding. Persistent or heavy bleeding can indicate significant blood loss or low platelet counts.

Cancer Treatments

Plural form; see *Cancer Treatment*.

Cancrum Oris

A rapidly destructive infection of the mouth and face, seen mainly in severely malnourished or medically vulnerable children. It begins with painful tissue death around the gums and can spread through the cheek and other facial tissues.

Candela

The international unit used to measure the brightness of a light source in a specified direction. It is a physical unit, not a measure of a medicine's light dose or the amount of light reaching tissue.

Candida

A group of yeasts that may normally live on the skin, in the mouth, or in the digestive and genital tracts. Overgrowth can cause mouth, genital, skin, or, in vulnerable people, bloodstream and organ infections.

Candida Albicans

The Candida species most often causing human infection. It can cause oral thrush, vaginal yeast infection, moist skin-fold rash, or serious bloodstream and organ infection in people with weakened defenses.

Candida Albicans Infection

Infection caused by Candida albicans. It may be limited to the mouth, vagina, or skin, or may invade the bloodstream and organs, especially in people who are hospitalized or have weakened immunity.

Candida Auris

A yeast that can live on skin without symptoms or cause bloodstream, wound, or ear infection. It often resists several antifungal medicines, spreads readily in health-care settings, and requires specialized testing and strict infection-control measures.

Candida Auris Infection

Infection or symptom-free colonization caused by Candida auris. Invasive infection may affect the blood or organs, especially in hospitalized or immunocompromised people; treatment is guided by susceptibility testing because resistance is common.

Candida Dubliniensis

A yeast related to Candida albicans that can live in the mouth and cause oral thrush or, rarely, invasive infection. It is more likely to cause disease when immune defenses are impaired.

Candida Esophagitis

Yeast infection of the esophagus, usually caused by Candida. It commonly causes painful or difficult swallowing and chest discomfort, especially in people with weakened immunity or after certain medicines.

Candida Glabrata

A Candida species that can cause genital, urinary, bloodstream, or other invasive infection. It may resist some commonly used antifungal medicines, so laboratory susceptibility testing can help guide treatment.

Candida Infection Of The Skin

A superficial yeast infection, often in warm, moist skin folds. It causes a red, itchy, sore rash that may have small separate spots around its edge and is more common with moisture, diabetes, obesity, or immune suppression.

Candidal Intertrigo

A Candida yeast infection in warm, moist skin folds such as the armpits, groin, under the breasts, or beneath an abdominal fold. It causes a red, moist, itchy or burning rash, sometimes with small spots at the edge.

Candidal Vaginitis

Alternate name; see *Vulvovaginal Candidiasis*.

Candidal Vulvovaginitis

Alternate index label; see *Vulvovaginal Candidiasis*.

Candida Parapsilosis

A Candida species that can cause bloodstream and catheter-related infection, especially in newborns, hospitalized people, and those receiving intravenous treatment. It may spread between patients through hands or contaminated equipment.

Candida Tropicalis

A Candida species that can cause mouth or genital infection and may invade the bloodstream or organs. Serious infection is more likely in people with neutropenia, cancer, or other immune impairment.

Candidemia

Candida yeast infection of the bloodstream. It can spread to organs and is more common with central lines, surgery, intensive care, recent antibiotics, or weakened immunity.

Candidiasis

Alternate name; see *Yeast Infection*.

Canefield Fever

An older name for leptospirosis, a bacterial infection acquired through water or soil contaminated with urine from infected animals. It can cause fever, headache, muscle pain, jaundice, kidney injury, meningitis, or bleeding.

Canicola Fever

A form of leptospirosis caused by a strain of Leptospira bacteria commonly carried by dogs. It may cause fever, headache, muscle aches, red eyes, kidney injury, or liver involvement after contact with infected urine or contaminated water.

Canine Teeth

The pointed teeth between the incisors and premolars. They help tear food and guide the jaws during biting and chewing.

Canker

Alternate name; see *Canker Sore*.

Canker Sore

A painful, shallow ulcer on the moist lining of the mouth, usually round or oval with a red border. It is not contagious and commonly heals within one to two weeks; persistent, severe, or unusual sores may have other causes.

Alternate Names:
Aphthous Ulcer

Canker Sores

Alternate name; see *Canker Sore*.

Cannabidiol

A cannabinoid from the cannabis plant that usually does not produce the "high" caused by THC. A purified form treats selected severe seizure disorders; other products vary in strength, purity, side effects, and medicine interactions.

Cannabinoid

A substance that acts on cannabinoid receptors or related signaling systems. Cannabinoids may come from plants, the body, or laboratories; effects can include pain relief, appetite changes, sedation, impaired memory, or intoxication.

Cannabinoid Hyperemesis Syndrome

A subtype of cyclic vomiting syndrome marked by recurrent episodes of severe nausea and vomiting, often with abdominal pain, in the setting of prolonged, frequent cannabis use. Hot baths or showers may temporarily ease symptoms; sustained cannabis abstinence is associated with their resolution.

Cannabinoid Receptor

A cell-surface protein, mainly CB1 or CB2, that responds to cannabinoids made by the body or found in cannabis and medicines. It helps regulate pain, appetite, mood, memory, immune activity, and inflammation.

Cannabinol

A cannabinoid formed as THC breaks down with age or exposure to air. It may have mild psychoactive effects, but its medical benefits and safety are less well established than those of some other cannabinoids.

Cannabis

A plant containing cannabinoids such as THC and CBD. Use can alter perception, memory, coordination, mood, and heart rate; it may have selected medical uses but can also cause dependence, anxiety, psychosis, or other harms.

Cannabis-Related Disorders

Clinically significant problems related to cannabis use, including intoxication, withdrawal, cannabis use disorder, and substance-induced psychiatric or medical effects.

Cannabis Use Disorder

A pattern of cannabis use that causes significant difficulty controlling use or problems at home, work, school, relationships, or health. Tolerance and withdrawal may occur, with irritability, anxiety, sleep problems, or reduced appetite after stopping.

Cannula

A thin hollow tube placed in a blood vessel, body cavity, or tissue to deliver medicines or fluids, remove material, measure pressure, provide oxygen, or allow access for another device.

Cannula Hub

The connector at the outer end of a cannula that attaches it to tubing, a syringe, or another device. It may include a port or valve for giving fluids, taking samples, or flushing the cannula.

Cannulation

Placement of a cannula into a blood vessel, body cavity, duct, or other passage. It provides access for giving fluids or medicines, removing material, monitoring, collecting samples, or performing a procedure.

Canola Oil

A vegetable oil relatively low in saturated fat and containing mostly monounsaturated and polyunsaturated fats. Replacing solid fats with canola oil can support a heart-healthy eating pattern when total calories remain appropriate.

Canrenone

A metabolite related to spironolactone that blocks aldosterone's action. It promotes loss of sodium and water while reducing potassium loss and has been used in some countries for conditions involving fluid retention or excess aldosterone.

Cantharides

Preparations made from blister beetles that contain cantharidin, a powerful irritant. Swallowing or applying it can cause severe mouth, stomach, kidney, and urinary-tract injury and may be life-threatening.

Canthotomy

A surgical cut through the outer corner of the eyelids, usually performed urgently to relieve dangerous pressure around the eye and protect vision after severe orbital swelling or injury.

Canthus

The corner where the upper and lower eyelids meet. The inner canthus is beside the nose, and the outer canthus is toward the temple.

Cantlie Line

An imaginary line across the liver from the gallbladder to the large vein behind the liver. It follows the middle hepatic vein and marks the functional division between the right and left liver, including their blood supply and bile drainage.

Cantu Syndrome

A rare genetic condition, usually caused by an ABCC9 or KCNJ8 gene change. It may cause excessive hair growth, distinctive facial features, loose skin, enlarged bones, skeletal differences, and an enlarged or abnormal heart.

Capacitation

The final physiological maturation process that mammalian spermatozoa undergo within the female reproductive tract, involving the removal of glycoprotein coats and seminal plasma proteins from the acrosome, enabling the sperm to undergo the acrosome reaction and fertilize an oocyte.

Capacity

A person's ability, at a particular time, to understand information about a medical decision, appreciate how it applies to them, weigh the options, and communicate a choice.

Capacity And Competence

Capacity is the clinical ability to make a specific decision by understanding, using, and communicating relevant information. Competence is a legal determination; the two terms are related but not interchangeable.

Capecitabine

An oral chemotherapy medicine that the body converts to fluorouracil, which interferes with cancer-cell DNA production. It is used for selected cancers and can cause diarrhea, mouth sores, hand-foot syndrome, low blood counts, or heart problems.

Capgras Delusion

A psychiatric misidentification syndrome in which an individual maintains a fixed, unshakeable delusion that a close relative, spouse, or companion has been replaced by an identical-looking imposter, double, or clone. Hypothesized to stem from a neuroanatomical disconnection between visual facial recognition pathways in the fusiform gyrus and emotional familiarity processing in the amygdala.

Alternate Names:
Capgras Syndrome; Illusion of Doubles

Capgras Syndrome

A fixed false belief that someone familiar has been replaced by an identical impostor. It may occur with psychotic illness, dementia, brain injury, seizures, or other neurologic disorders and needs clinical assessment.

Capillaria

A group of parasitic roundworms. Different species can cause intestinal infection, liver disease, or infection of other tissues; symptoms and treatment depend on the species and affected organ.

Capillaria Philippinensis

A parasitic roundworm acquired by eating raw or undercooked freshwater fish. It infects the intestine and can cause persistent watery diarrhea, abdominal pain, weight loss, poor absorption of nutrients, and loss of blood proteins.

Capillaroscopy

Examination of tiny blood vessels, usually in the skin beside a fingernail, with magnification. It can show widened or missing vessels, bleeding, and abnormal patterns that support evaluation of connective-tissue and small-vessel disease.

Capillary

The smallest type of blood vessel, forming networks that connect arterioles with venules. Its thin wall allows exchange of oxygen, nutrients, fluid, and waste between blood and tissues.

Alternate Names:
Capillaries

Capillary Bed

A network of capillaries within a tissue that connects small arteries to small veins. It provides a large surface for exchange of oxygen, carbon dioxide, nutrients, hormones, fluid, and waste.

Capillary Blood Gas

A test of blood acidity and carbon dioxide using a small sample from a heel or finger. It is often used in babies and children when an arterial sample is difficult; oxygen results may not match an arterial blood gas.

Alternate Names:
CBG

Capillary Electrophoresis

A laboratory method that separates charged molecules in a very thin tube using an electric field. It can analyze proteins, medicines, DNA, or other substances in a sample, depending on the test.

Capillary Exchange

The movement of oxygen, carbon dioxide, nutrients, fluid, hormones, and waste between blood in capillaries and nearby tissues.

Capillary Fragility Test

Clinical assessment measuring the resistance of capillary walls to pressure, used to evaluate platelet or vascular disorders. See *Tourniquet Test*.

Capillary Hemangioma

Older name; see *Infantile Hemangioma*.

Capillary Leak Syndrome

A condition in which fluid and proteins escape from small blood vessels into surrounding tissues. It can cause sudden swelling, low blood pressure, thickened blood, shock, and organ failure; severe infection, medicines, immune disease, or rare unexplained episodes may trigger it.

Capillary Malformation

A congenital difference in small skin blood vessels that produces a flat pink, red, or violaceous patch, such as a port-wine stain. It usually persists and may darken or thicken over time; location and associated findings determine whether eye, brain, or other specialist evaluation is needed.

Capillary Microscope

A microscope used to magnify tiny blood vessels, especially those beside the fingernails. It helps assess vessel shape, size, bleeding, and areas without vessels in some circulation and connective-tissue disorders.

Capillary Nail Refill Test

A bedside check of circulation in which a nail bed is pressed until it turns pale and the time for color to return is observed. Temperature, lighting, age, skin color, shock, and vascular disease affect the result, so it is not used alone.

Capillary Permeability

How easily fluid and dissolved substances pass through the walls of small blood vessels. Increased permeability can allow extra fluid and proteins to enter nearby tissues and cause swelling.

Capillary Plasma

The liquid component of blood obtained from small vessels in skin or tissue, containing water, electrolytes, proteins, hormones, nutrients, and waste products.

Capillary Refill

A bedside assessment of peripheral perfusion performed by briefly pressing a nail bed or skin and measuring the time for normal color to return. Delayed refill may indicate poor circulation, shock, hypothermia, or vascular disease.

Capillary Refill Time

The number of seconds it takes for color to return to a fingertip or nail bed after pressure blanches the skin and is released. A return time longer than about 2 seconds is commonly treated as prolonged, but thresholds vary with age and measurement site; skin temperature and technique also affect the result. Prolonged refill may indicate reduced blood flow to the extremities.

Capillary Sample

A small blood specimen obtained by puncturing the skin, usually a finger or heel, for bedside glucose, hemoglobin, newborn screening, or other point-of-care tests.

Capillary Vessel

A microscopic vessel with a thin endothelial wall where blood exchanges oxygen, carbon dioxide, nutrients, fluid, and waste with surrounding tissue.

Capitate

The largest wrist bone, located centrally in the distal row of carpal bones. It connects with several other wrist bones and the third metacarpal, helps transmit force through the wrist, and can rarely develop blood-supply loss after fracture.

Capitation

A health-care payment arrangement in which a clinician or organization receives a fixed amount per enrolled person for specified services over a set period, whether or not that person uses the services.

Caplan's Syndrome

A lung disorder combining rheumatoid arthritis with pneumoconiosis caused by long-term inhalation of coal or mineral dust. It produces multiple lung nodules and may cause cough or breathing difficulty.

Caplan Syndrome

The coexistence of rheumatoid arthritis with occupational pneumoconiosis (most commonly coal workers' pneumoconiosis or silicosis), characterized by the development of multiple discrete, round, peripheral pulmonary nodules measuring 0.5 to 5 centimeters on chest radiography. Histologically, the nodules resemble enlarged rheumatoid nodules with central necrotic debris surrounded by chronic inflammatory cells and dust-laden macrophages.

Alternate Names:
Rheumatoid Pneumoconiosis; Silicoarthritis

Capnocytophaga

A group of bacteria found mainly in the mouths of dogs, cats, and people. Some species can cause serious human infection after animal bites or scratches, especially in people without a functioning spleen or with weakened immunity.

Capnocytophaga Canimorsus

A bacterium commonly found in the mouths of dogs and cats. It can cause rapidly severe bloodstream infection, meningitis, or skin infection after a bite or scratch, especially in older adults or people without a functioning spleen or with weakened immunity.

Capnocytophaga Infection

Infection caused by Capnocytophaga bacteria, often after a dog or cat bite, scratch, or contact with animal saliva. It may cause a wound infection, fever, bloodstream infection, or meningitis, with greatest risk in people with impaired immunity or no spleen.

Capnocytophaga Ochracea

A bacterium found mainly in the human mouth and associated with dental plaque and gum disease. Infection outside the mouth is uncommon but can occur when immune defenses are severely weakened.

Capnograph

A monitor that measures and displays carbon dioxide in exhaled air, often showing both the end-tidal value and a waveform. It is used to assess ventilation and to monitor selected patients during anesthesia, sedation, transport, or resuscitation.

Capnography

Continuous measurement and display of carbon dioxide in exhaled air. The waveform and end-tidal value help assess breathing, airway blockage, circulation, and correct placement of a breathing tube during anesthesia, sedation, or emergency care.

Caps

A prescription abbreviation for capsules, oral medicines enclosed in a shell that dissolves in the digestive tract. Abbreviations can be misread, so complete dosage-form wording is safer on prescriptions.

Capsaicin

The substance that makes chili peppers feel hot. Applied in controlled amounts to the skin, it can reduce some nerve and joint pains by temporarily lowering pain signaling; it commonly causes initial burning or redness.

Capsid

The protein shell surrounding a virus's genetic material. It protects the genome and helps the virus attach to and enter host cells; its structure influences which cells can be infected and how the immune system responds.

Capsid Proteins

Proteins that assemble around a virus's genetic material to form its protective shell. Some also help the virus attach to and enter cells and are recognized by the immune system.

Capsular Contracture

Abnormal tightening and hardening of scar tissue around an implanted device, especially a breast implant. It may make the area firm, painful, distorted, or displaced and sometimes requires corrective surgery.

Capsular Warning Syndrome

A clinical syndrome characterized by recurrent, stereotyped episodes of transient focal motor or sensory deficits affecting the face, arm, and leg without cortical signs (such as aphasia or visual neglect). Occurring repeatedly within a 24- to 72-hour window, it indicates impending lacunar infarction of the internal capsule due to branch atheromatous disease of a lenticulostriate artery.

Alternate Names:
Internal Capsule Warning Syndrome; Fluctuating Lacunar TIA

Capsule

A protective covering around an organ, joint, or other structure, or an oral medicine enclosed in a dissolvable shell. The exact meaning depends on whether the term is used in anatomy or pharmacology.

Capsulectomy

Surgical removal of some or all of the scar-tissue capsule around an organ, implant, or other structure. It may be performed for painful tightening, infection, abnormal tissue, or revision of a reconstruction.

Capsule Endoscope

A swallowable capsule containing a tiny camera and transmitter. As it travels through the digestive tract, it sends images, especially of the small intestine, where conventional endoscopes may not reach easily.

Capsule Endoscopy

A test in which a person swallows a small wireless camera that takes pictures of the digestive tract, especially the small intestine. The capsule usually passes naturally but can become stuck where the bowel is narrowed.

Capsule Of Glisson

The layer of connective tissue surrounding the liver. It extends inward around the liver's blood vessels, bile ducts, and nerves and helps support and protect these structures.

Capsule Of Tenon

A thin connective-tissue sheath surrounding the eyeball and separating it from the fat of the eye socket. It allows smooth eye movement and creates a space used for some eye injections and operations.

Capsulotomy

A procedure that makes an opening in a capsule. In the eye, a laser may open a cloudy capsule after cataract surgery; in other surgery, a capsule around an implant or joint may be opened to reduce tightness. The method and risks depend on the body part.

Captopril

An angiotensin-converting enzyme inhibitor used for high blood pressure, heart failure, and some kidney problems. It can cause cough, high potassium, low blood pressure, or swelling.

Captopril Renal Scan

A kidney imaging test using a radioactive tracer before and after captopril. It compares kidney blood flow and function and may help evaluate high blood pressure caused by narrowing of a kidney artery.

Caput Medusae

Enlarged veins spreading out from the navel, caused by increased pressure in the portal vein system, usually from liver disease. They are a physical sign of abdominal collateral circulation rather than a disease by themselves.

Caput Succedaneum

Soft swelling of a newborn's scalp caused by pressure during labor. It can cross the skull's suture lines and usually disappears within hours to a few days; rapidly enlarging swelling or pallor may indicate other complications.

Carbachol

A medicine that mimics acetylcholine and stimulates muscarinic receptors. In selected eye procedures, it constricts the pupil and can lower pressure inside the eye; effects may include sweating, slow heartbeat, or breathing problems.

Carbamate

A chemical group found in some medicines and pesticides. Carbamate insecticides can temporarily block acetylcholinesterase, causing excess nerve activity with sweating, salivation, vomiting, weakness, wheezing, or seizures.

Carbamazepine

A medicine used for focal seizures, trigeminal neuralgia, and selected bipolar disorder. Important risks include severe skin reactions, low blood counts, liver injury, low sodium, dizziness, and interactions with many other medicines.

Carbamazepine Toxicity

Overdose causing drowsiness, ataxia, nystagmus, anticholinergic effects, hypotension, seizures, coma, or sodium-channel-mediated QRS widening and dysrhythmias. Serial drug levels and ECGs help guide care; activated charcoal, sodium bicarbonate for cardiotoxicity, and hemodialysis may be used in severe cases.

Carbamide

Another name for urea, a waste product made when the body breaks down protein and removed mainly by the kidneys. Urea is also used in some skin creams to soften and hydrate thick or dry skin.

Carbamoyl Phosphate Synthetase Deficiency

An inherited urea-cycle disorder caused by deficient carbamoyl phosphate synthetase I. The liver cannot efficiently convert ammonia into urea, so hyperammonemia may cause poor feeding, vomiting, sleepiness, seizures, coma, or developmental injury.

Carbapenem

A group of powerful beta-lactam antibiotics that kill bacteria by blocking construction of their cell wall. They are reserved mainly for serious infections because resistance and important side effects can limit treatment choices.

Carbapenem-Resistant Enterobacteriaceae

Alternate name; see *CRE Infection*.

Carbapenem-Resistant

Enterobacteriaceae Infection

Alternate name; see *CRE Infection*.

Carbapenem-Resistant Organisms

Bacteria that cannot be reliably treated with carbapenem antibiotics, often because they produce enzymes that destroy these medicines. They can cause difficult infections and spread in health-care settings, where strict infection control is important.

Carbaryl

A carbamate insecticide that temporarily blocks acetylcholinesterase. Substantial exposure can cause sweating, excess saliva, vomiting, diarrhea, small pupils, muscle weakness, wheezing, seizures, or breathing failure.

Carbidopa

A medicine given with levodopa for Parkinson disease. It blocks conversion of levodopa to dopamine outside the brain, allowing more levodopa to reach the brain and reducing nausea, vomiting, and low blood pressure.

Carbimazole

An antithyroid medicine that the body converts to methimazole. It reduces production of thyroid hormones and can rarely cause dangerously low white-cell counts or liver injury.

Carbofuran

A highly toxic carbamate pesticide that blocks acetylcholinesterase. Ingestion, inhalation, or skin exposure can rapidly cause sweating, vomiting, muscle weakness, seizures, breathing failure, and death.

Carbohydrate

An essential nutrient that provides the body's main source of cellular energy. Consisting of carbon, hydrogen, and oxygen, carbohydrates include sugars (simple carbohydrates like glucose and fructose) and starches and fibers (complex carbohydrates found in grains, legumes, and vegetables). The body breaks down most digestible carbohydrates into glucose, which fuels the brain, muscles, and organs.

Carbohydrate Counting

A way to plan meals by estimating the grams of carbohydrate in food. People using insulin may match their insulin dose to the amount eaten; accurate reading of food labels and advice from a diabetes team are important.

Carbohydrate Metabolism

The processes cells use to break down, store, and make sugars. These processes provide energy and help keep blood glucose stable; problems can occur in diabetes and inherited disorders of sugar storage.

Carbohydrates

Plural form; see *Carbohydrate*.

Carbolic Acid

Phenol, a chemical once used as a surgical antiseptic and still found in some industrial products. It kills microorganisms by damaging proteins and cell membranes but can severely burn skin, eyes, and internal organs.

Alternate Names:
Phenol

Carbolic Acid Poisoning

Exposure to phenol, a corrosive and systemically toxic chemical that can cause burns, altered consciousness, metabolic acidosis, and organ injury.

Carbon

A chemical element forming the backbone of organic molecules such as carbohydrates, fats, proteins, and nucleic acids.

Carbonate

A chemical form of carbon dioxide found in minerals and body fluids. Carbonate salts are used in some antacids and supplements; their effects, absorption, and risks depend on the particular salt.

Carbon Dioxide

A gas produced when cells use energy and removed mainly by the lungs during exhalation. The body controls its blood level through breathing; excess

can cause headache, confusion, drowsiness, or respiratory failure.

Carbon Dioxide Absorber

A device in some anaesthesia breathing systems that removes carbon dioxide from exhaled air. It allows selected gases to be reused while helping prevent carbon-dioxide build-up during controlled breathing.

Carbon Dioxide Transport

The movement of carbon dioxide from body tissues to the lungs. Blood carries it dissolved in plasma, attached to haemoglobin, and mainly as bicarbonate; the lungs remove it during exhalation.

Carbonic Anhydrase Inhibitors

Medicines that block carbonic anhydrase, an enzyme involved in fluid and acid balance. They reduce fluid production in the eye to lower eye pressure and have selected uses for swelling, seizures, or metabolic disorders.

Carbon Ion Therapy

A form of particle radiation treatment that uses carbon ions to damage tumor DNA. It may deliver concentrated energy and has higher biological effectiveness than conventional X-rays for some tumors, but availability is limited.

Carbon Monoxide

A colorless, odorless gas that binds hemoglobin and prevents blood from delivering enough oxygen. Poisoning may cause headache, dizziness, nausea, confusion, collapse, or death.

Carbon Monoxide Poisoning

A life-threatening condition caused by inhaling carbon monoxide, an odorless, colorless gas. When inhaled, it binds tightly to hemoglobin in red blood cells, displacing oxygen and preventing the blood from delivering oxygen to the body's tissues and vital organs. Symptoms include headache, dizziness, nausea, confusion, weakness, chest pain, and loss of consciousness.

Carbon Monoxide Toxicity

Tissue hypoxia caused by inhaled carbon monoxide binding hemoglobin and impairing cellular oxygen use. Headache, dizziness, nausea, confusion, syncope, myocardial ischemia, seizures, or coma may occur; pulse oximetry can be misleading, so co-oximetry and exposure history are important. Give 100% oxygen and consider hyperbaric therapy for selected severe cases.

Carbon Tetrachloride

A toxic industrial solvent that can damage the liver and kidneys when swallowed or inhaled.

Carbophenothion

An organophosphate insecticide that blocks acetylcholinesterase. Significant exposure can cause sweating, excess saliva, vomiting, muscle weakness, confusion, seizures, breathing failure, and death.

Carboplatin

A platinum chemotherapy medicine that damages cancer-cell DNA and prevents it from being copied. It can lower blood counts, especially platelets, and may cause nausea, anemia, kidney effects, nerve symptoms, or allergic reactions.

Carboprost

A prostaglandin medicine that strongly contracts the uterus. It is used in selected cases of severe bleeding after childbirth and for some pregnancy-related procedures; it can cause diarrhea, vomiting, fever, and dangerous airway tightening in people with asthma.

Carbosulfan

A carbamate insecticide that blocks acetylcholinesterase and overstimulates nerves. Exposure can cause sweating, salivation, vomiting, diarrhea, small pupils, muscle weakness, wheezing, seizures, or breathing failure.

Carboxyhaemoglobin

Hemoglobin bound to carbon monoxide. This reduces the blood's ability to carry and release oxygen; an increased level supports recent carbon-monoxide

exposure, and levels vary with symptoms and timing.

Carboxyhemoglobin

A compound formed when carbon monoxide binds to hemoglobin. It prevents hemoglobin from carrying and releasing oxygen normally, causing headache, dizziness, confusion, collapse, or death in severe poisoning.

Carboxyhemoglobinemia

An abnormally high level of carboxyhemoglobin in the blood after carbon-monoxide exposure. It reduces oxygen delivery and may cause headache, nausea, confusion, fainting, heart injury, brain injury, or death.

Carboxylesterase

An enzyme that breaks ester bonds in medicines, toxins, and natural fats. Differences in its activity can change how quickly some substances are broken down and can affect their effects, interactions, or toxicity.

Carboxyl Group

A chemical group containing carbon, oxygen, and hydrogen that gives many molecules acidic properties. It is found in amino acids, fatty acids, and numerous medicines and metabolic compounds.

Carboxylic Acid

An organic compound containing a carboxyl group, which gives it acidic properties. Many important fatty acids, amino-acid products, and substances involved in metabolism are carboxylic acids.

Carboxy-Lyases

Enzymes that break a carbon-carbon bond and release carbon dioxide. They participate in many biochemical reactions, including processes that make or break down amino acids and other molecules.

Carboxypeptidase H

An enzyme inside cells that helps turn newly made precursor proteins into active hormones and nerve-signalling substances by trimming amino acids from one end.

Carbuncle

A group of connected boils, usually caused by Staphylococcus aureus, forming a painful swollen area with several pus-draining openings. Fever may occur, and risk is increased by diabetes or a weakened immune system.

Carbuncles and Boils

Alternate index label; see *Boils and Carbuncles*.

Carcinoembryonal Antigen

Another name for carcinoembryonic antigen, or CEA, a blood marker that may rise in colorectal and other cancers. It can also increase for noncancerous reasons and is not suitable for general cancer screening.

Carcinoembryonic Antigen

A protein measured in blood that may be increased in colorectal and some other cancers. It can also rise with smoking, liver disease, bowel inflammation, or other noncancerous conditions, so it is mainly used to monitor selected known cancers rather than to screen for cancer.

Carcinoembryonic Antigen Tumor Marker

Carcinoembryonic antigen, a substance measured mainly in blood to help monitor some colorectal and other cancers. Levels can also rise from smoking or noncancerous conditions, so CEA cannot diagnose cancer by itself.

Carcinogen

A substance, form of radiation, or infection that can cause cancer by damaging cells or changing how they grow. Risk depends on the type and amount of exposure.

Carcinogenesis

The multistep process by which normal cells acquire changes that allow uncontrolled growth and become

cancer. Changes may arise from inherited traits, random errors, infections, tobacco, radiation, chemicals, or other exposures and often accumulate over time.

Carcinogenic

Capable of causing or promoting cancer by damaging genetic material or altering how cells grow, divide, repair themselves, or avoid cell death.

Carcinoid

A usually slow-growing neuroendocrine tumor that can arise in the digestive tract, appendix, or lungs. Some release hormones or other substances that cause flushing, diarrhea, wheezing, or heart-valve disease.

Carcinoid Flushing

Sudden, transient cutaneous erythema and warmth, predominantly affecting the face, neck, and upper chest, provoked by systemic release of serotonin, bradykinin, and histamine from a metastatic neuroendocrine (carcinoid) tumor with hepatic metastases.

Alternate Names:
Carcinoid Flush

Carcinoid Heart Disease

Damage to the inner lining and valves of the heart caused by hormone-like substances released by a neuroendocrine tumor. It mainly affects the tricuspid and pulmonary valves and can lead to right-sided heart failure.

Carcinoid Syndrome

A group of symptoms caused by serotonin and other substances released into the blood by some neuroendocrine tumors. It usually occurs when a tumor has spread to the liver, but can occur without liver spread in some cases. Symptoms may include facial flushing, diarrhea, wheezing, and a fast heartbeat; long-term exposure can damage heart valves.

Carcinoid Tumor

A well-differentiated neuroendocrine tumor arising from enterochromaffin (Kulchitsky) cells, most commonly within the gastrointestinal tract (ileum, appendix, rectum) or bronchopulmonary system. Often secretes vasoactive peptides and amines, particularly serotonin (5-HT), bradykinin, and prostaglandins. Hepatic metastasis or primary bronchial drainage bypasses liver first-pass metabolism, leading to carcinoid syndrome characterized by paroxysmal cutaneous flushing, secretory diarrhea, bronchospasm, and carcinoid heart disease (fibrotic endocardial plaques causing tricuspid regurgitation and pulmonary stenosis). Diagnostic evaluation includes 24-hour urinary 5-hydroxyindoleacetic acid (5-HIAA), serum chromogranin A, and somatostatin-receptor imaging (e.g., Ga-68 DOTATATE PET-CT).

Alternate Names:
Neuroendocrine Tumors (NETs); Carcinoid Neoplasms; Carcinoid Tumors

Carcinoid Tumors

Plural form; see *Carcinoid Tumor*.

Carcinoma

A cancer that begins in epithelial cells, which cover body surfaces and line organs and glands. Common types include adenocarcinoma, squamous-cell carcinoma, basal-cell carcinoma, and urothelial carcinoma; behavior depends on site and cell features.

Carcinoma En Cuirasse

An advanced form of breast cancer in which cancer cells spread through lymphatic vessels in the skin, causing widespread hardening and thickening that can make the chest wall resemble armor.

Carcinoma Erysipeloides

Spread of an internal cancer through lymph vessels in the skin, producing a red, firm, sharply outlined area that can resemble the infection erysipelas. It most often occurs with cancers of the breast or digestive tract.

Carcinoma In Situ

A group of abnormal cells that look like cancer cells but remain where they first formed. They have not grown into nearby tissue. Some types may later

grow into surrounding tissue and become invasive cancer. In some cancers, carcinoma in situ is also called stage 0 disease.

Alternate Names:
CIS

Carcinoma Of Unknown Primary

A heterogeneous group of biopsy-confirmed metastatic epithelial malignancies in which the primary anatomical site remains unidentified despite comprehensive standardized diagnostic evaluation (detailed history, thorough clinical examination, whole-body contrast CT or PET-CT, endoscopies, and serum tumor markers). Accounts for approximately 3–5% of all invasive cancers. Diagnostic workup hinges on immunohistochemistry (IHC) profiling of the biopsy specimen: cytokeratin 7 (CK7) and cytokeratin 20 (CK20) expression patterns, alongside specific lineage markers including thyroid transcription factor-1 (TTF-1) for lung/thyroid, CDX2 for gastrointestinal, and GATA3 or mammaglobin for breast neoplasms. Favorable subsets (e.g., poorly differentiated neuroendocrine carcinoma, axillary lymphadenopathy in women, isolated cervical adenopathy, or peritoneal carcinomatosis) receive site-specific curative-intent therapies; unfavorable subsets receive empiric broad-spectrum platinum- or taxane-based systemic chemotherapy or molecularly targeted therapies guided by comprehensive genomic profiling.

Alternate Names:
CUP; Cancer Of Unknown Primary; Occult Primary Malignancy

Carcinomatosis

Widespread spread of carcinoma to multiple surfaces or organs, often along the lining of the abdomen, chest, or other body cavities. It usually indicates advanced cancer and may cause fluid buildup, pain, bowel problems, or breathing difficulty.

Carcinosarcoma

An uncommon cancer containing both gland- or surface-lining cancer cells and connective-tissue cancer cells. It most often begins in the uterus, tends to grow aggressively, and is diagnosed by examining a tissue sample.

Cardia

The upper part of the stomach surrounding the opening where the esophagus enters. It helps receive swallowed food and can be affected by reflux, inflammation, hiatal hernia, or stomach cancer.

Cardiac

Relating to the heart. The word may describe the heart muscle, chambers, valves, electrical system, blood supply, rhythm, or diseases such as coronary disease, cardiomyopathy, and heart failure; in "cardia," it instead refers to the upper stomach.

Alternate Names:
Heart-Related; Cardiac-Related

Cardiac Ablation

A procedure that uses heat, cold, or another form of energy to create small scars in heart tissue that produces or conducts abnormal electrical signals. The scars block those signals and can treat certain abnormal heart rhythms.

Cardiac Ablation Procedures

Procedures that use heat, cold, or another energy source to treat heart-rhythm disorders by creating controlled scars that block abnormal electrical signals. Risks include bleeding, blood-vessel injury, recurrence, and damage to nearby heart structures.

Cardiac Allograft

A donor heart transplanted into another person, usually for end-stage heart failure. Lifelong immune-suppressing treatment is needed to reduce rejection; complications include infection, rejection, coronary-vessel disease, cancer, and graft failure.

Cardiac Allograft Vasculopathy

Progressive narrowing of the heart's blood vessels after transplantation caused by abnormal thickening of their inner walls. It may silently reduce blood flow and cause graft failure, rhythm problems, heart attack, or sudden death.

Cardiac Amyloidosis

A restrictive heart-muscle disease caused by extracellular deposits of amyloid fibrils, formed from misfolded proteins. The main types are immunoglobulin light-chain (AL) and transthyretin (ATTR) amyloidosis; deposits stiffen the heart and impair filling, and may also affect its electrical system. Symptoms can include breathlessness, swelling, abnormal heart rhythms, and heart failure.

Cardiac Amyloidosis Diagnosis

Evaluation combines symptoms, examination, blood and urine tests, heart imaging, and sometimes tissue biopsy. Specialized nuclear imaging may support transthyretin amyloidosis only after testing has excluded light-chain amyloidosis.

Cardiac Amyloidosis Staging

Classification of disease severity and likely outcome using clinical findings, heart imaging, and blood tests. Different staging systems apply to light-chain and transthyretin amyloidosis, and higher stages generally indicate more advanced disease.

Cardiac Arrest

Sudden loss of effective heart function, causing unresponsiveness and absent or abnormal breathing. It results from a severe electrical or mechanical problem and stops blood flow to the brain and other organs; without resuscitation, it is fatal.

Alternate Names:
Cardiopulmonary Arrest; Circulatory Arrest; Sudden Cardiac Arrest

Cardiac Arrhythmia

Alternate name; see *Arrhythmia*.

Cardiac Arrhythmias

Abnormal heart rates or rhythms caused by problems forming or conducting electrical impulses. They include rhythms that are too fast, too slow, or irregular and may cause palpitations, dizziness, fainting, or no symptoms.

Cardiac Axis

The average direction in which the heart's lower chambers become electrically activated, estimated from an electrocardiogram. A leftward or rightward shift may reflect normal variation or heart, conduction, or lung disease.

Cardiac Biomarkers

Substances measured in blood to detect or assess heart-muscle injury. Troponin is the preferred marker; levels can also rise in other conditions and vary with symptoms, electrocardiography, imaging, and serial measurements.

Cardiac Cachexia

Severe unintentional loss of weight and muscle associated with advanced heart failure or other serious heart disease. It can cause weakness and reduced function and reflects inflammation, altered metabolism, poor appetite, and increased nutritional needs.

Cardiac Catheter

A thin flexible tube inserted through a blood vessel and guided to the heart. It can measure pressures, take blood samples, inject contrast for imaging, or deliver treatment.

Cardiac Catheterization

A procedure in which thin tubes are guided through a blood vessel to the heart to measure pressures, assess oxygen levels, inject contrast, image coronary arteries, or perform treatment. Possible risks include bleeding, rhythm problems, vessel injury, and kidney effects.

Cardiac Cirrhosis

Alternate name; see *Congestive Hepatopathy*.

Cardiac Conduction System

Specialized heart tissue that creates and carries electrical signals so the chambers contract in the correct order. It includes the sinoatrial node, atrioventricular node, bundle of His, bundle branches, and Purkinje fibers.

Cardiac Contractility

The strength of heart-muscle contraction at a given level of filling and resistance. It affects how much blood the heart can pump with each beat.

Cardiac CT

Computed-tomography imaging of the heart and nearby blood vessels. Depending on the protocol, it can assess coronary calcium, coronary narrowing, heart structure, valves, and selected aspects of heart function.

Cardiac CT Angiography

A noninvasive scan using contrast and computed tomography to show the coronary arteries and heart structures. It is useful for assessing selected people with chest pain and can show narrowing, plaque, and coronary calcium.

Cardiac Cycle

The events in one complete heartbeat. During diastole the heart chambers relax and fill with blood; during systole the ventricles contract and pump blood into the lungs and the rest of the body.

Cardiac Defibrillation

Delivery of an electrical shock to interrupt ventricular fibrillation or pulseless ventricular tachycardia during cardiac arrest. It is used with cardiopulmonary resuscitation as part of resuscitation for these shockable rhythms.

Cardiac Device Infections

Infection involving a pacemaker, implantable defibrillator, its pocket, or a lead. It may cause redness, pain, drainage, fever, bloodstream infection, or infection of the heart lining and often requires antibiotics and removal of infected hardware.

Cardiac Diet

A general term for an eating pattern intended to reduce cardiovascular risk, commonly emphasizing vegetables, fruits, whole grains, legumes, nuts, and unsaturated fats while limiting excess sodium and saturated or trans fats. It is not a single standardized diet, and individual nutritional needs vary.

Cardiac Electrophysiology Study

An electrophysiology study in which thin tubes are placed through a blood vessel into the heart to record and stimulate its electrical activity. It helps find the cause of some abnormal rhythms or unexplained fainting.

Cardiac Enzymes

Older term; see *Cardiac Biomarkers*.

Cardiac Event Monitors

Portable devices that record or send an electrocardiogram when symptoms occur or at planned times. They help detect intermittent abnormal rhythms that may be missed during a short clinic ECG.

Alternate Names:
Cardiac Event Monitor; Ambulatory ECG

Cardiac Failure

Alternate name; see *Heart Failure*.

Cardiac Fibroma

A rare noncancerous tumor made of fibrous tissue in the heart, usually in a ventricle or septum. It may obstruct blood flow, interfere with electrical signals, or cause rhythm problems and heart failure.

Cardiac Gated SPECT

A heart scan using a small radioactive tracer while images are synchronized with the heartbeat. It can assess blood flow to heart muscle, pumping strength, wall movement, and areas that are damaged or still viable.

Cardiac Glycoside

A medicine or plant substance that can strengthen heart contraction and slow electrical conduction through the heart. Digoxin is the main clinical example; the safe dose is narrow and toxicity can cause dangerous rhythms.

Cardiac Glycoside Overdose

Toxic exposure to a cardiac glycoside such as digoxin. It may cause nausea, vomiting, confusion, visual changes, slow or fast abnormal rhythms, high potas-

sium, seizures, or cardiac arrest.

Cardiac Glycoside Plant Poisoning

Poisoning from plants such as oleander or foxglove that contain cardiac glycosides. It can cause nausea, vomiting, visual changes, slow heart rate, heart block, dangerous rhythms, and high blood potassium.

Cardiac Hemangioma

A rare noncancerous tumor made of blood-vessel tissue in or around the heart. Many cause no symptoms, but a large or strategically located tumor may obstruct flow, disturb rhythm, or cause fluid around the heart.

Cardiac Imaging Tests

Tests that show the heart's structure, movement, blood flow, or tissue. They include echocardiography, CT, MRI, and nuclear scans; the appropriate test depends on symptoms, the suspected condition, kidney function, and the clinical question.

Cardiac Index

The amount of blood the heart pumps each minute adjusted for body size. It helps assess pumping function, especially in seriously ill people; blood pressure, symptoms, organ function, and overall clinical status affect its significance.

Cardiac Intravascular Ultrasound

An ultrasound probe on a catheter that creates cross-sectional images from inside a coronary artery. It helps measure plaque, vessel size, narrowing, tears, calcium, and stent expansion during selected procedures.

Cardiac Ischemia

Alternate name; see *Myocardial Ischemia*.

Cardiac Markers

Blood tests used to detect myocardial injury or cardiac stress, including troponin, creatine kinase-MB, and natriuretic peptides. Results are interpreted with symptoms, electrocardiography, imaging, timing, and other causes of abnormal values.

Cardiac Metastases

Cancer that has spread to the heart or its surrounding tissues from another organ. Lung and breast cancers, melanoma, lymphoma, and kidney cancer are common sources; spread may cause fluid around the heart, obstruction, rhythm problems, or heart failure.

Cardiac MRI

Magnetic-resonance imaging that shows heart structure, pumping, blood flow, scar, swelling, infiltrative disease, and congenital abnormalities without x-rays. Contrast may be avoided or used cautiously in selected people with severe kidney disease.

Cardiac Muscle

Involuntary muscle that forms the myocardium, the main muscular layer of the heart. Its cells are electrically connected so the chambers contract in a coordinated way to pump blood.

Cardiac Myocyte

A specialized, striated muscle cell of the myocardium interconnected by intercalated discs containing desmosomes and gap junctions for synchronized electrical and mechanical coupling. Excitation-contraction coupling is mediated by calcium-induced calcium release via L-type calcium channels and ryanodine receptors. Irreversible injury or necrosis (as in acute myocardial infarction) disrupts contractile function and causes release of intracellular cardiac biomarkers (cardiac troponins I and T, CK-MB) into the circulation.

Cardiac Myocytes

Plural form; see *Cardiac Myocyte*.

Cardiac Myxoma

The most common primary noncancerous tumor of the heart, usually arising in the left atrium. It can obstruct blood flow, cause breathlessness or constitutional symptoms, or release clots; surgical removal is usually recommended.

Cardiac Output

The volume of blood pumped by the heart each minute. It depends mainly on heart rate and stroke volume, the amount ejected with each beat, and helps indicate whether circulation is adequate.

Cardiac Output Measurement

Measurement of blood pumped by the heart each minute using methods such as echocardiography, a pulmonary-artery catheter, oxygen-consumption calculations, or noninvasive monitors. The method's accuracy depends on the patient and testing conditions.

Cardiac Pacemaker

Alternate name; see *Pacemaker*.

Cardiac Pacemaker Types

Single-chamber pacemakers stimulate one heart chamber; dual-chamber devices coordinate the atrium and ventricle; biventricular or resynchronization devices stimulate both ventricles to improve timing in selected heart-failure patients.

Cardiac Pacemaker Implantation

The surgical placement of an electronic pulse generator and transvenous leads under the skin of the chest to regulate bradycardia or irregular heart rhythms; see *Pacemaker Implantation* and *Cardiac Pacemaker*.

Cardiac Perforation

A hole or tear through the heart wall, sometimes caused by injury or a medical procedure. It can cause bleeding around the heart, cardiac tamponade, shock, and death.

Cardiac PET

A nuclear-imaging test using a positron-emitting tracer to assess heart-muscle blood flow, metabolism, and living or scarred tissue. Selected tracers can also help evaluate inflammation or infiltrative heart disease.

Cardiac PET Imaging

Positron-emission tomography using a radioactive tracer to measure blood flow and metabolism in heart muscle. It can quantify blood flow and help distinguish living from scarred tissue, but availability, radiation exposure, and tracer choice affect its use.

Cardiac Power Output

A measure combining blood pressure and cardiac output to estimate how effectively the heart is pumping. It is useful in severe heart failure or cardiogenic shock, but clinicians interpret it with examination findings, organ function, and other circulation measurements.

Alternate Names:
CPO

Cardiac Radiation Injury

Damage to the heart or its blood vessels that may appear months or years after radiation to the chest. It can cause inflammation or scarring around the heart, coronary disease, valve disease, heart-muscle weakness, or rhythm and conduction problems.

Cardiac Radionuclide Imaging

Heart imaging performed after a small radioactive tracer is given, usually with SPECT or PET. It can assess blood flow, metabolism, living or scarred heart muscle, inflammation, and, when synchronized with the heartbeat, pumping function.

Cardiac Rehabilitation

A medically supervised program after conditions such as heart attack, coronary procedures, bypass surgery, or heart failure. It combines gradual exercise, education, risk-factor reduction, medicine support, nutrition, and emotional care to improve recovery and reduce future risk.

Cardiac Rehabilitation Phases

Stages used to describe cardiac rehabilitation, commonly including early activity during or soon after hospitalization, a structured recovery program, and longer-term self-management. Some systems divide rehabilitation into four phases, so the labels and

number of phases vary by program.

Cardiac Rehab Outcomes

Cardiac rehabilitation can improve exercise ability, blood-pressure and cholesterol control, confidence, quality of life, and psychological well-being after selected heart conditions. Benefits vary with the program, health condition, and participation.

Cardiac Resynchronization Therapy

A pacing treatment that coordinates contraction of the heart's lower chambers. It is used in selected people with symptomatic heart failure and delayed electrical activation and can improve symptoms, pumping, and survival when appropriate.

Cardiac Rhabdomyoma

A usually noncancerous tumor of heart muscle, most often found in children and associated with tuberous sclerosis. It may shrink on its own but can obstruct blood flow or disturb rhythm and pumping if large.

Cardiac Sarcoidosis

Sarcoidosis involving the heart, characterized by granulomatous inflammation of the myocardium that may lead to fibrosis. It can cause atrioventricular conduction block, ventricular arrhythmias, or ventricular dysfunction and heart failure; severe cases may result in sudden cardiac death.

Cardiac Sarcoma

A rare cancer arising from supporting or connective tissue of the heart. It may obstruct blood flow, disturb heart rhythm, impair pumping, or release clots that travel to other parts of the body.

Cardiac Septum

The wall separating the right and left chambers of the heart, consisting of atrial and ventricular portions and preventing normal mixing of oxygenated and deoxygenated blood.

Cardiac Skeleton

A strong connective-tissue framework around the heart valves and parts of the wall between the chambers. It supports the valves, provides attachment for heart muscle, and helps electrically separate the upper and lower chambers.

Cardiac SPECT

A nuclear scan that shows blood flow to the heart muscle and can help identify reduced flow, prior damage, or living muscle. When synchronized with the heartbeat, it can also assess chamber movement and pumping function.

Cardiac Stress Test

A test that observes the heart while it works harder, usually during exercise or after a medicine increases its workload. It may include an ECG or imaging and can help detect reduced blood flow or abnormal rhythms.

Cardiac Stress Testing

Assessment of the heart during exercise or medicine-induced stress to look for reduced blood flow, abnormal rhythms, or limited pumping reserve. The method is chosen according to the person's ability to exercise and the clinical question.

Cardiac Syncope

Fainting caused by a heart problem that briefly reduces blood flow to the brain. Causes include an abnormal heart rhythm, obstruction to blood flow, or severe heart-muscle weakness. It may occur during exertion or without warning.

Cardiac Syndrome X

Older term, usually referring to microvascular angina; see *Coronary Microvascular Angina*.

Cardiac Tamponade

A life-threatening medical emergency in which fluid, blood, or pus builds up in the pericardium (the sac surrounding the heart). The accumulated fluid puts severe pressure on the heart, preventing its chambers from fully expanding and filling with blood between beats. This dramatically reduces the amount of blood pumped to the body, causing a dangerous drop in blood pressure, muffled heart sounds, and shock.

Cardiac Tamponade Physiology

Pressure from blood or fluid around the heart prevents the chambers from relaxing and filling. This lowers cardiac output and may cause low blood pressure, a marked breathing-related change in pulse pressure, and shock.

Cardiac Transplantation

Replacement of a failing heart with a donor heart in carefully selected people with end-stage heart failure. Lifelong immune-suppressing treatment and regular monitoring are needed for rejection, infection, coronary-vessel disease, and other complications.

Cardiac Tumors

Tumors involving the heart may begin there or spread from another organ. They are rare and may obstruct blood flow, disturb rhythm, cause fluid around the heart, or release clots; treatment depends on type, location, size, and spread.

Cardiac Ventriculography

Imaging of the heart's lower chambers to assess their size, wall movement, and ability to pump blood. It may use x-rays with contrast or another imaging method and is now often replaced by echocardiography or MRI.

Cardiac Volume

The amount of blood in a heart chamber at a particular time. The amount before contraction and after contraction helps assess chamber size, filling, and pumping function.

Cardiac Wall

The three-layered wall of the heart: the inner endocardium, muscular myocardium, and outer epicardium. It supports the heart's structure, electrical activity, contraction, and interaction with surrounding tissues.

Cardialgia

An uncommon, nonspecific term for pain in the precordial region, the front of the chest over the heart. It describes the location of pain, not its cause, and is not synonymous with angina.

Cardinal Body Part

A major body region or structure used in anatomical description or clinical examination, such as the head, neck, chest, abdomen, pelvis, limbs, or an important internal organ.

Cardinal Cell Part

A main component of a cell, such as its membrane, cytoplasm, nucleus, or an organelle. Each part has a role in maintaining the cell, processing information, or performing specialized functions.

Cardinal Ligament

A band of strong connective tissue extending from the cervix and upper vagina to the sidewall of the pelvis. It helps support the uterus and vagina and contains the uterine blood vessels, which cross over the ureter.

Alternate Names:
Mackenrodt's Ligament; Lateral Cervical Ligament; Transverse Cervical Ligament

Cardinal Signs of Inflammation

The four classic signs of inflammation are heat (calor), pain (dolor), redness (rubor), and swelling (tumor). Inflamed tissue may also lose some normal function.

Cardiobacteriaceae

A family of bacteria that includes Cardiobacterium. Some members can enter the bloodstream and infect heart valves, causing infective endocarditis.

Cardiobacterium

A slow-growing bacterium in the HACEK group that can enter the bloodstream and infect heart valves. It may cause prolonged fever, fatigue, weight loss, a new murmur, or embolic complications.

Cardiobacterium Hominis

The Cardiobacterium species most often associated with human infection. It can cause slowly developing infective endocarditis with fever, fatigue, weight loss, a new heart murmur, valve damage, or clots traveling to other organs.

Cardiofaciocutaneous Syndrome

A rare genetic disorder affecting the heart, facial appearance, skin, hair, growth, and development. It is usually caused by a change in a gene involved in cell-growth signals.

Alternate Names:
CFC Syndrome

Cardiogenic Shock

A severe, life-threatening condition that occurs when the heart suddenly cannot pump enough blood and oxygen to meet the body's vital needs, despite having enough fluid in the circulation. It most often develops as a complication of a major heart attack that severely damages the heart muscle. Symptoms include dangerously low blood pressure, cold and clammy skin, rapid breathing, confusion, and reduced urine output.

Cardiolipin

A fat-like molecule found mainly in the inner membrane of mitochondria, the cell's energy-producing structures. Antibodies against cardiolipin can be associated with antiphospholipid syndrome and abnormal blood clotting.

Cardiologist

A doctor trained to diagnose and treat diseases of the heart and blood vessels, including coronary disease, rhythm disorders, valve disease, heart failure, and high blood pressure.

Cardiology

The medical specialty concerned with the structure and function of the heart and cardiovascular system. Cardiologists prevent, diagnose, and treat coronary and structural heart disease, heart failure, arrhythmias, congenital heart disease, and vascular disorders. The field also includes cardiovascular risk assessment and prevention.

Cardiomegaly

Enlargement of the heart seen on examination or imaging. It may result from enlarged chambers, thickened heart muscle, fluid around the heart, or a combination; causes include high blood pressure, valve disease, cardiomyopathy, and congenital disease.

Cardiometabolic

Relating to the interaction between heart and blood-vessel disease and metabolic conditions such as obesity, insulin resistance, diabetes, and abnormal blood lipids.

Cardiomyopathy

A disease of the heart muscle that can make it enlarged, thickened, stiff, or weak. These changes can make it harder for the heart to pump or fill with blood and may cause heart failure or abnormal heart rhythms. Major types include dilated, hypertrophic, and restrictive cardiomyopathy.

Cardiomyopathy Classification

A system for describing cardiomyopathy by its heart structure and function, other organs involved, genetic pattern, cause, and functional severity. This information helps communicate diagnosis, guide testing, and estimate prognosis.

Cardio-Oncology

The medical field focused on preventing and treating heart and blood-vessel problems in people with cancer. It monitors effects of chemotherapy, targeted or immune treatment, and chest radiation while helping cancer therapy continue safely when possible.

Cardiopathy

Any disease or disorder of the heart, including problems of the heart muscle, valves, coronary arteries, electrical rhythm, or structure present from birth.

Cardioplegia

Temporary stopping and protection of the heart during open-heart surgery, usually by delivering a cold solution that changes electrical and metabolic activity. It allows the surgeon to operate while limiting heart-muscle injury.

Cardiopulmonary

Relating to the heart and lungs or to their combined function. For example, cardiopulmonary exercise testing assesses how the heart, lungs, blood, and muscles respond during physical activity.

Alternate Names:
Cardiorespiratory

Cardiopulmonary Bypass

A heart-lung machine temporarily takes over circulation and oxygen exchange during some operations. It pumps and oxygenates blood while the heart is stopped or opened; possible complications include bleeding, inflammation, clots, stroke, and organ injury.

Cardiopulmonary Bypass Machine

A machine that temporarily pumps and oxygenates blood during selected heart or major-vessel operations. It allows surgeons to work while the heart is stopped or the lungs are not carrying out their usual gas exchange.

Alternate Names:
Heart-Lung Machine; Cardiopulmonary Bypass Pump

Cardiopulmonary Bypass Pump

Mechanical device that temporarily takes over the functions of the heart and lungs during cardiac surgery. See *Heart-Lung Machine*.

Cardiopulmonary Exercise Testing

A monitored treadmill or bicycle test that measures how the heart, lungs, blood, and muscles respond as exercise becomes harder. It helps assess unexplained breathlessness, exercise limitation, and severity of heart or lung disease.

Cardiopulmonary Resuscitation

Emergency care for a person whose heart has stopped pumping blood effectively. It uses chest compressions and, when appropriate, rescue breaths to keep blood and oxygen moving until the heart can be restarted or professional care takes over. An automated external defibrillator may also be used to treat certain heart rhythms.

Alternate Names:
Closed-Chest Cardiac Massage

Cardiorenal Syndrome

A condition in which heart and kidney dysfunction worsen one another. Sudden or long-term heart disease can injure the kidneys, and sudden or long-term kidney disease can strain the heart; treatment must address both organs.

Cardiorespiratory

Relating to the heart, blood vessels, and respiratory system considered together, as in cardiorespiratory fitness, monitoring, or failure.

Cardiorespiratory Endurance

The ability of the heart, lungs, blood, and muscles to deliver and use oxygen during sustained physical activity. It is influenced by fitness, heart and lung disease, anemia, muscle condition, and other factors.

Alternate Names:
Cardiorespiratory Fitness; Aerobic Endurance

Cardioscope

A historical term for an instrument used to view the interior of the heart directly. The associated procedure, cardioscopy, did not become established and has been superseded by modern cardiac imaging.

Cardioselective Beta-Blockers

Beta-blocker medicines that mainly block beta-1 receptors in the heart, slowing the heart rate and reducing its workload. They may still narrow airways at higher doses and are used for selected heart, blood-pressure, and rhythm conditions.

Cardiospasm

Older term; see *Achalasia*.

Cardiotocography

Electronic recording of the fetal heart rate and uterine contractions, most often during labor. Monitoring may be continuous or intermittent; the heart-rate pattern is interpreted in relation to contractions, gestational age, and the clinical situation.

Cardiotomy

A surgical incision into a heart chamber to gain access to its interior during an operation.

Cardiotoxicity

Injury or impaired function of the heart caused by a medicine, toxin, radiation, or disease. It may produce rhythm problems, reduced heart-muscle strength, chest pain from poor blood flow, or heart failure.

Cardiotoxicity From Chemotherapy

Heart injury caused by some chemotherapy medicines. It may weaken heart muscle, reduce pumping, or cause rhythm problems during or after treatment; risk depends on the medicine, dose, other treatments, and existing heart disease.

Cardiotoxin

A substance that directly injures heart muscle or disrupts the heart's electrical activity or blood supply. It may cause abnormal rhythms, reduced pumping, heart failure, or heart-muscle injury.

Cardiovascular

Relating to the heart and blood vessels, including circulation, blood pressure, and diseases affecting the heart or vascular system.

Cardiovascular Agents

Medicines that act on the heart or blood vessels. They include treatments for high blood pressure, abnormal rhythms, angina, heart failure, blood clots, and abnormal cholesterol levels.

Cardiovascular Changes In Pregnancy

During pregnancy, blood volume and cardiac output increase to support the uterus and developing baby. The rise in plasma is greater than the rise in red cells, causing normal dilutional anemia; heart rate and blood-vessel resistance also change.

Cardiovascular Disease

Disease of the heart or blood vessels, including coronary artery disease, heart failure, abnormal rhythms, valve disease, stroke-related vascular disease, and disorders of arteries or veins.

Cardiovascular Disease and Pregnancy

Heart disease may worsen during pregnancy because blood volume and cardiac output increase, while pregnancy can reveal previously unrecognized disease. Risk depends on the specific lesion and ventricular function; coordinated cardiology and maternal-fetal care guides monitoring, medicines, and delivery.

Cardiovascular Health

The condition of the heart and blood vessels and the habits that protect them. Regular activity, not using tobacco, healthy eating, adequate sleep, and control of blood pressure, cholesterol, diabetes, and weight can lower cardiovascular risk.

Cardiovascular Infection

An infection involving the bloodstream, heart, heart valves, or blood vessels. Examples include infective endocarditis, myocarditis, infected vascular grafts, and infected pacemakers or other devices.

Cardiovascular Injury

Damage to the heart or blood vessels caused by trauma, reduced blood flow, inflammation, toxins, surgery, or another disease. Effects may include bleeding, impaired circulation, heart-muscle injury, or abnormal rhythms.

Cardiovascular-Kidney-Metabolic (CKM) Syndrome

A condition involving the interconnected effects of metabolic risk factors, chronic kidney disease, and cardiovascular disease. Its stages range from no identified risk factors (stage 0) to established cardiovascular disease (stage 4).

Cardiovascular Neoplasm

A noncancerous or cancerous tumor arising in the heart, blood vessels, or related tissues. Its symptoms and treatment depend on the tissue type, location, size, effect on circulation, and whether it has spread.

Cardiovascular Pharmacology

The study of how medicines affect the heart, blood vessels, blood pressure, rhythm, blood clotting, and cholesterol or lipid metabolism, including their uses, interactions, benefits, and risks.

Cardiovascular Prevention in Diabetes

Medical and lifestyle strategies to reduce the high risk of heart attacks and strokes in diabetic patients, including blood pressure control, statin therapy, glucose management, smoking cessation, and healthy diet.

Alternate Names:
Diabetic Cardiovascular Risk Reduction; Heart Disease Prevention in Diabetes

Cardiovascular Risk Reduction

Actions that lower the chance of heart attack, stroke, heart failure, and vascular death. They include avoiding tobacco, controlling blood pressure, cholesterol, and diabetes, staying active, eating well, maintaining a healthy weight, and taking indicated medicines.

Cardiovascular Screening

Assessment for cardiovascular risk or disease, often before symptoms develop. It may include blood-pressure measurement, cholesterol and diabetes testing, review of family history and tobacco use, and targeted tests based on age and risk.

Cardiovascular Surgery

Operations on the heart or major blood vessels, including bypass surgery, valve repair or replacement, aortic surgery, and heart transplantation. Many open procedures require a heart-lung machine and specialized care before and after surgery.

Cardiovascular System

The heart, blood, and network of arteries, arterioles, capillaries, venules, and veins that circulate blood through the pulmonary and systemic circuits. It delivers oxygen, nutrients, hormones, and immune cells, carries carbon dioxide and other waste for removal, and helps regulate temperature and blood pressure.

Cardioversion

Restoration of a more regular heart rhythm using a synchronized electrical shock or medicine. Before cardioversion for some atrial rhythms, clinicians assess clot risk and may give anticoagulant treatment to reduce the risk of stroke.

Cardiovirus

A group of viruses in the picornavirus family. Some infect people or animals and may cause fever, muscle inflammation, heart inflammation, or other illness; effects depend on the species and the person's defenses.

Carditis

Inflammation of the heart muscle, inner lining, valves, or surrounding sac. It may result from infection, an immune reaction, medicines, or another inflammatory disease and can cause chest pain, breathlessness, rhythm problems, or heart failure.

Care Coordination

Organizing communication and health-care activities among clinicians, services, patients, and caregivers so care remains safe, continuous, and appropriate when people move between settings or receive several types of treatment.

Caregiver

A family member, friend, or paid worker who helps another person with health care, personal activities, daily tasks, transportation, medicines, or emotional support.

Caregiver Burden

The emotional, physical, social, or financial strain of providing ongoing care for another person. It may lead to exhaustion, low mood, sleep problems, isolation, or difficulty meeting one's own health needs.

Caregiver Stress

Strain caused by caring for another person, often leading to tiredness, worry, irritability, sleep problems, or reduced well-being. Support, respite, counseling, and practical help can reduce its effects.

Caries

A biofilm-mediated, multifactorial disease in which acids from bacterial metabolism of fermentable carbohydrates cause net demineralization of enamel, dentin, or cementum. Early lesions may be arrested or remineralized, but progressive disease forms cavities and can reach the pulp, causing pain or infection.

Caries Risk Assessment

Evaluation of a person's chance of developing tooth decay by reviewing past and current cavities, plaque, diet, fluoride exposure, saliva, oral hygiene, tooth structure, medicines, and medical conditions. Results guide prevention and follow-up.

Carina

The ridge at the bottom of the windpipe where it divides into the right and left main bronchi. It is a landmark during bronchoscopy and breathing-tube placement; inhaled objects more often enter the wider, more vertical right bronchus.

Cariogenic

Likely to promote tooth decay, especially by supplying sugars that plaque bacteria convert into acids or by supporting conditions that remove minerals from teeth.

Cariogram

A computer-based tool that combines factors such as diet, plaque bacteria, fluoride exposure, saliva, previous cavities, and social or clinical history to estimate tooth-decay risk and show where prevention may help.

Carisoprodol

A prescription muscle relaxant used short term for acute painful muscle conditions. It can cause drowsiness, dizziness, impaired coordination, misuse, dependence, and dangerous breathing suppression, especially with alcohol or sedatives.

C-Arm Fluoroscopy

A movable X-ray system that gives live images during a medical procedure. It helps show bones, instruments, blood vessels, or other body parts while the procedure is being performed.

Carminative

A substance used to relieve flatulence by helping gas pass from the digestive tract. The term describes an intended or traditional effect, not one specific medicine.

Alternate Names:
Antiflatulent; Gas-Relieving Agent

Carmine

A red coloring made from cochineal insects and used in some foods, cosmetics, and medicines. Rarely, it causes allergy, wheezing, hives, or anaphylaxis in sensitive people.

Carmustine

A chemotherapy medicine that damages DNA and is used for selected brain tumors, blood cancers, and other cancers. It can lower blood counts and cause nausea, infertility, liver problems, or delayed lung injury.

Carnett Sign

A clinical diagnostic test used to distinguish somatic abdominal wall pain from visceral intra-abdominal pain. The examiner palpates the point of maximal tenderness while the patient tenses the abdominal wall musculature by raising their head and shoulders or lifting both straight legs. Increased or unchanged pain indicates abdominal wall origin (positive Carnett sign), whereas diminished pain suggests an intra-abdominal visceral source.

Alternate Names:
Carnett's Sign; Abdominal Wall Tenderness Test

Carney Complex

A rare inherited disorder, usually caused by a PRKAR1A gene change, that can produce multiple noncancerous skin, heart, and endocrine tumors. It may also cause excess hormones and requires lifelong, organ-specific monitoring.

Carney Triad

A rare condition involving combinations of a stomach gastrointestinal stromal tumor, a benign cartilage tumor in the lung, and a paraganglioma outside the adrenal gland. It usually occurs sporadically and more often affects young women.

Carnitine

A substance that transports long-chain fats into mitochondria, the cell structures that make energy, so the fats can be used as fuel. The body usually makes enough; severe deficiency can cause weakness, low blood sugar, or heart and muscle disease.

Carnitine Deficiency

An abnormally low amount of carnitine, which transports long-chain fatty acids into mitochondria for energy production. Primary inherited or secondary deficiency can cause muscle weakness, low blood sugar, cardiomyopathy, or episodes of metabolic decompensation.

Carnitine Palmitoyltransferase II Deficiency

A rare inherited disorder in which muscle cells cannot use long-chain fats normally for energy. Exercise, fasting, cold, or infection can trigger muscle pain, stiffness, muscle breakdown, dark urine, and kidney injury; symptoms may be absent between attacks.

Alternate Names:
CPT II Deficiency; CPT2 Deficiency

Carnosine

A small molecule made from beta-alanine and histidine, found mainly in muscle and nervous tissue. It helps buffer acidity; claims that supplements prevent disease or improve performance remain uncertain.

Carnosinemia

A rare inherited disorder in which deficient carnosinase causes excess carnosine in blood and urine. Children may have developmental delay, low muscle tone, seizures, or other neurologic problems of varying severity.

Caroli Disease

A rare inherited disorder in which the larger bile ducts inside the liver are widened in segments. It can cause repeated bile-duct infections, stones, abdominal pain, jaundice, and, in some people, liver scarring or kidney disease.

Carotene

An orange-yellow plant pigment found in foods such as carrots and leafy vegetables. Some forms, especially beta-carotene, can be converted to vitamin A; excess intake may harmlessly turn the skin yellow-orange.

Carotenemia

Yellow-orange color of the skin caused by too much carotene, a pigment in foods such as carrots and sweet potatoes. It often shows on the palms and soles; the whites of the eyes stay white, unlike in jaundice.

Alternate Names:
Carotenoid Pigments

Carotenoid

A class of fat-soluble tetraterpenoid pigments synthesized by plants, algae, and photosynthetic microorganisms, responsible for yellow, orange, and red pigmentation. Provitamin A carotenoids (such as β-carotene, α-carotene, and β-cryptoxanthin) are cleaved in the intestinal mucosa by β-carotene oxygenase to form retinal (vitamin A). Non-provitamin A carotenoids (including lutein, zeaxanthin, and lycopene) exert potent antioxidant effects; lutein and zeaxanthin selectively concentrate in the retinal macula lutea to filter harmful blue light and mitigate phototoxic damage.

Carotenoids

Plural form; see *Carotenoid*.

Carotid

Relating to the paired arteries in the neck whose internal branches supply the brain and whose external branches supply much of the head and neck.

Carotid Artery

One of the major arteries supplying the head and neck. Each common carotid divides into an internal branch that supplies the brain and an external branch that supplies much of the face, scalp, and neck.

Carotid Artery Disease

Narrowing or blockage of a carotid artery, usually from fatty plaque. It can reduce blood flow to the brain or release a clot and cause a transient ischemic attack or ischemic stroke.

Carotid Artery Dissection

A tear in the inner lining of a main artery in the neck. Blood can enter the wall and weaken or narrow the artery, sometimes causing head or neck pain, a drooping eyelid, stroke-like symptoms, or a stroke.

Carotid Artery Stenosis

Narrowing of an artery in the neck that supplies the brain, usually from fatty plaque. It may reduce blood flow or release a clot and increase the risk of a transient ischemic attack or stroke.

Carotid Artery Stenting

A procedure that places a small mesh tube inside a narrowed carotid artery to keep it open. It is used selectively to reduce stroke risk; clot release, stroke, bleeding, and re-narrowing are possible complications.

Carotid Body

A small group of sensing cells near the division of the common carotid artery. It detects changes in blood oxygen, carbon dioxide, and acidity and sends signals that help adjust breathing.

Carotid Body Tumor

A usually slow-growing growth beside the point where the main neck artery divides. It often causes a painless lump, but may press on nearby nerves or blood vessels. A small number spread to other parts of the body.

Alternate Names:
Carotid Body Tumour; Chemodectoma; Carotid Paraganglioma; Glomus Caroticum Tumor

Carotid Bruit

A blowing sound heard over a carotid artery when blood flow is turbulent. It can occur with plaque but does not reliably show how narrow the artery is; ultrasound or other vascular imaging is needed when disease is suspected.

Carotid Cavernous Fistula

An abnormal connection between blood vessels near the carotid artery and a large vein behind the eye. It may cause a bulging or red eye, a pulsing noise, double vision, high eye pressure, or reduced vision. Brain and blood-vessel imaging is used for diagnosis. Treatment depends on the type and may include endovascular closure.

Alternate Names:
Caroticocavernous Sinus Fistula; CCF; Carotid-Cavernous Sinus Fistula

Carotid Doppler Ultrasound

A noninvasive vascular ultrasound using sound waves and Doppler effect to evaluate blood flow and detect narrowing or atherosclerotic plaques in the carotid arteries; see *Carotid Duplex Ultrasound*.

Carotid Duplex Ultrasound

An ultrasound test that shows plaque and measures blood flow through the carotid arteries. It helps estimate narrowing without radiation and may guide decisions about medicines, surgery, or stenting.

Carotid Endarterectomy

Surgery to open a carotid artery and remove fatty plaque from its inner wall. It can reduce stroke risk in selected people with significant narrowing, especially after symptoms, but carries risks such as stroke, heart attack, and nerve injury.

Carotid Glomus

A specialized peripheral chemoreceptor sensory organ located in the adventitia of the carotid bifurcation, containing glomus type I cells that detect arterial hypoxemia, hypercapnia, and acidosis to

reflexively stimulate respiration via the glossopharyngeal nerve.

Alternate Names:
Carotid Body

Carotid Occlusion

Complete blockage of an artery supplying the brain, usually from plaque or a blood clot. Some people have no symptoms because other vessels compensate, but sudden weakness, speech trouble, or vision loss is an emergency.

Carotid Sinus Hypersensitivity

An exaggerated reflex response to tactile mechanical stimulation of the carotid sinus baroreceptors, producing marked bradycardia (cardioinhibitory type), profound hypotension (vasodepressor type), or both, predisposing to presyncope or syncope.

Carotid Sinus Massage

A clinical maneuver that stimulates pressure-sensitive receptors near the carotid artery to assess carotid sinus reflexes or help terminate selected supraventricular tachycardias. It can cause marked slowing of the heart, a fall in blood pressure, or fainting, so it is performed with electrocardiographic and blood-pressure monitoring after assessment of vascular risks.

Alternate Names:
Carotid Sinus Stimulation; Carotid Baroreceptor Massage

Carotid Stenosis

Narrowing of a carotid artery, usually from fatty plaque. It may reduce blood flow to the brain or release a clot, causing a transient ischemic attack or stroke; treatment depends on symptoms, severity, and overall risk.

Carpal Bones

The eight small bones forming the wrist: scaphoid, lunate, triquetrum, pisiform, trapezium, trapezoid, capitate, and hamate. They connect the forearm to the hand and work together to allow wrist movement and transmit force.

Alternate Names:
Carpals

Carpal Joints

The joints between the wrist bones and between the wrist, forearm, and hand bones. Together they allow the wrist to bend, straighten, move side to side, and rotate with the forearm.

Carpal Tunnel

A narrow passage on the palm side of the wrist formed by the wrist bones and a strong ligament. It contains the median nerve and finger-flexing tendons; pressure on the nerve causes carpal tunnel syndrome.

Carpal Tunnel Biopsy

Removal of a small tissue sample from the carpal tunnel or its contents when an unusual infiltrative, inflammatory, infectious, or tumor-related process is suspected. It is not a routine test for ordinary carpal tunnel syndrome.

Carpal Tunnel Release

Surgery that cuts the ligament forming the roof of the wrist tunnel to relieve pressure on the median nerve. It may improve numbness, tingling, pain, and weakness when symptoms do not respond to suitable nonsurgical care.

Carpal Tunnel Syndrome

Compression of the median nerve as it passes through the carpal tunnel at the wrist. It commonly causes numbness, tingling, burning, or pain in the thumb, index and middle fingers, and thumb-side part of the ring finger. Symptoms often worsen at night, and weakness at the base of the thumb may develop.

Alternate Names:
CTS; Median Nerve Entrapment

Carpal Tunnel Syndrome Tests

Examination and nerve tests used to assess suspected median-nerve compression. Wrist-position or tapping tests may reproduce symptoms, while nerve-conduction studies and ultrasound can support diagnosis and assess severity when needed.

Carpometacarpal Joint

A joint between a wrist bone and the base of a hand bone. The thumb joint is a mobile saddle-shaped joint that allows opposition and is commonly affected by osteoarthritis.

Carpus

The group of eight small bones forming the wrist between the forearm and the metacarpals of the hand. The carpus provides stability while allowing controlled wrist movement.

Carrageenan

A substance extracted from red seaweed and used to thicken or stabilize some foods and medicines. Different forms have different properties; evidence about effects on human inflammation depends on the type and amount consumed.

Carrier

In genetics, a person who has one altered copy of a gene for a recessive condition and usually has no symptoms. A carrier can pass the altered gene to a child; the chance that the child is affected depends on the other biological parent's genes and the condition's inheritance pattern.

Carrier Excipient

An inactive ingredient that supports an active medicine in a formulation. It may help control the medicine's dose, stability, absorption, appearance, or delivery and can occasionally cause allergy or intolerance.

Carrier-Mediated Transport

Movement of a substance across a cell membrane with help from a specific carrier protein. It may use no direct energy when moving down a concentration gradient or use energy to move against that gradient.

Carrier Screening

Genetic testing for people without symptoms to find whether they carry a harmful gene variant that could be passed to a child. Results can guide reproductive choices and may identify the need to test a partner or relatives.

Carrier State

A state in which a person harbors an infectious microorganism without symptoms and may shed it. The ability to transmit the infection and how long the carrier state lasts depend on the microorganism and stage of infection.

Carry-Over Effect

Persistence of an earlier treatment's effect into a later measurement or treatment period. It can distort results in crossover studies or make a person's current clinical state difficult to interpret.

CAR T-Cell

A T lymphocyte genetically changed to carry a receptor that recognizes a specific marker on cancer cells. These cells can be used as treatment for selected blood cancers but may cause severe immune reactions or nervous-system effects.

CAR T-Cell Therapy

An immunotherapy in which a person's T cells are changed in a laboratory to carry a chimeric antigen receptor (CAR) that recognizes a specific marker on cancer cells. The cells are grown and infused back into the body. This treatment is used for selected blood cancers and may cause serious immune or nervous-system effects.

Carteolol

A nonselective beta-blocker used mainly as eye drops to lower pressure inside the eye in open-angle glaucoma or ocular hypertension. It can sometimes slow the heartbeat, lower blood pressure, or worsen breathing problems.

Cartilage

A tough, flexible tissue found in joints, the ear, nose, rib cage, and spinal discs. It cushions joints, supports body structures, and resists pressure, but it has limited blood supply and heals slowly after injury.

Cartilage Disease

A disorder that damages cartilage in joints or supporting structures. It can cause pain, stiffness,

swelling, deformity, impaired growth, or loss of smooth movement and may result from injury, aging, inflammation, or inherited disease.

Cartilaginous Joint

A joint in which bones are connected by cartilage and allow little or limited movement. Examples include joints between spinal bones and the joint joining the two front pelvic bones.

Caruncles

Small fleshy anatomical projections. Examples include the lacrimal caruncle at the inner corner of the eye and the urethral caruncle near the opening of the urethra.

Carvallo Sign

A physical examination finding in which the pansystolic murmur of tricuspid regurgitation increases in intensity during inspiration. The accentuation is caused by increased venous return to the right heart during the inspiratory phase of respiration.

Alternate Names:
Carvallo's Sign; Rivero-Carvallo Sign

Carvedilol

A beta-blocker that also relaxes blood vessels. It slows the heart and reduces its workload and is used for selected cases of high blood pressure, heart failure, and after a heart attack; it can lower blood pressure and heart rate.

CAS

Alternate name; see *Childhood Apraxia Of Speech*.

Casanthranol

A stimulant laxative that increases bowel movement and secretion of water into the intestine. Prolonged or excessive use can cause diarrhea, dehydration, electrolyte abnormalities, and reliance on laxatives.

Cascade

A series of linked reactions in which one activated step triggers the next. Examples include the blood-clotting, complement, and inflammatory cascades.

Cascara

A plant-derived stimulant laxative that increases bowel movement. Prolonged or excessive use can cause diarrhea, dehydration, electrolyte imbalance, and reliance on laxatives; its use is restricted in some places.

Case Definition

Standardized clinical, laboratory, and exposure criteria used to classify a person as a suspected, probable, or confirmed case during surveillance or an outbreak investigation. It may differ from the criteria used to diagnose one patient.

Case Fatality Rate

The proportion of people diagnosed with a disease who die from it during a stated period. It describes severity in a particular group, but depends on accurate diagnosis, follow-up, treatment, and the population studied.

Case-Fatality Rate

Alternate spelling; see *Case Fatality Rate*.

Casein

The main family of proteins in cow's milk and other mammalian milk. It supplies amino acids and minerals and forms curds during digestion and cheese-making; it can trigger reactions in people with cow's-milk protein allergy.

Casein Kinase

A family of enzymes that attach phosphate groups to proteins and thereby change their activity. Casein kinases help regulate cell signaling, growth, DNA repair, development, and the body's internal clock.

Case Management

Coordinated planning, referral, and follow-up of health and social services to help a person receive appropriate care, avoid gaps or duplication, and meet clinical, functional, and personal goals.

Caseous

Cheese-like, especially describing the soft, crumbly,

dull, opaque appearance of caseous necrosis, a pattern of tissue death classically seen in tuberculosis and some other infections. The word derives from Latin *caseus*, meaning "cheese"; casein, a major milk protein that forms curds, has the same root.

Caseous Necrosis

A form of tissue death producing soft, crumbly, white or yellow material that resembles cheese. It is classically seen in granulomas caused by tuberculosis, though similar changes can occur in some other chronic infections.

Cashew Allergy

An immune reaction to cashew proteins that may cause itching, hives, swelling, vomiting, wheezing, or life-threatening anaphylaxis. People with this allergy should avoid cashews and follow an emergency action plan.

Caspase

A group of enzymes that cut specific proteins inside cells. Some initiate orderly programmed cell death, while others activate inflammation and immune defense against infection.

Caspase Activation

Conversion of inactive caspase enzymes into their active form inside a cell. Depending on the caspase and triggering signal, this can start programmed cell death or activate inflammation and immune defense.

Caspofungin

An intravenous antifungal medicine that blocks construction of an important fungal cell-wall component. It is used for serious Candida infections and selected Aspergillus infections and may cause liver-test abnormalities, infusion reactions, or low potassium.

Caspofungin Acetate

The acetate salt form of caspofungin, an intravenous antifungal medicine that blocks fungal cell-wall construction. It is used for selected serious Candida and Aspergillus infections under medical supervision.

Cassette

A holder that contains recording or imaging material. In traditional radiography, it held the film or image receptor during exposure; the word may also describe holders used in laboratory or monitoring equipment.

Cast

A rigid or semi-rigid support placed around an injured limb or joint to limit movement while a bone, ligament, tendon, or other tissue heals. It must be monitored for swelling, pressure injury, numbness, or poor circulation.

Castleman Disease

A group of uncommon disorders causing abnormal enlargement and activity of lymph nodes. Disease may affect one lymph-node area or the whole body and can cause fever, fatigue, anemia, weight loss, and organ problems.

Cast Nephropathy

A classic renal manifestation of multiple myeloma in which excessive circulating monoclonal immunoglobulin free light chains (Bence-Jones proteins) precipitate with Tamm-Horsfall mucoprotein in distal tubules, forming dense casts that obstruct tubules and induce giant cell inflammation.

Alternate Names:
Myeloma Kidney

Castor Oil

A vegetable oil from the seeds of Ricinus communis. Taken by mouth, it acts as a stimulant laxative; excessive use can cause cramping, diarrhea, dehydration, and electrolyte disturbances.

Castor Oil Overdose

Excessive ingestion of castor oil, causing intestinal irritation, cramping, nausea, vomiting, and diarrhea. Severe exposure can cause dehydration, low blood pressure, or fluid and electrolyte imbalance.

Castration

Removal or functional suppression of the testes or

ovaries, reducing production of sex hormones. It may be surgical or achieved with medicines and can affect fertility, sexual function, mood, and bone health.

Catabolism

The set of chemical processes that break down complex molecules such as carbohydrates, fats, and proteins into simpler substances, releasing energy that cells can use. Examples include digestion-related breakdown, glycolysis, and fat oxidation.

Catagen

The short transition phase of the hair cycle between active growth and rest. The hair follicle shrinks, hair growth stops, and the hair remains attached until the later shedding phase.

Alternate Names:
Catagen Phase; Regression Phase of Hair Growth

Catalase

An enzyme that breaks down hydrogen peroxide into water and oxygen. It protects cells from oxidative damage and helps some bacteria survive inside immune cells.

Catalepsy

A state of greatly reduced movement and responsiveness in which a person may remain rigid or hold an imposed posture. It can occur with catatonia, narcolepsy, neurologic disease, or some psychiatric conditions.

Cat Allergy

An immune reaction to proteins in cat saliva, skin flakes, or other secretions. It can cause sneezing, itchy eyes, wheezing, hives, or asthma symptoms; severity varies with exposure and individual sensitivity.

Catalyst

A substance that speeds a chemical reaction without being used up. It works by providing an easier reaction pathway; enzymes are biological catalysts, and catalysts change reaction speed without changing the final balance of products and reactants.

Catamenial Epilepsy

A pattern in which seizures become more frequent or severe at certain times in the menstrual cycle. Hormone changes may contribute, and a seizure diary can help guide neurologic treatment.

Catamenial Pneumothorax

Repeated collapse of a lung occurring around the start of menstruation, usually because of thoracic endometriosis. It often affects the right side and causes sudden chest pain or breathlessness; recurrent cases need specialist evaluation and may require surgery or hormone treatment.

Alternate Names:
Endometriosis-Related Pneumothorax; Catamenial Thorax

Cataplexy

A sudden, brief loss of muscle strength triggered by strong emotion such as laughter, surprise, or anger. Awareness usually remains clear; it is strongly associated with narcolepsy and may cause the head, jaw, knees, or whole body to buckle.

Cataract

Clouding of the eye's natural lens, which reduces the passage of light to the retina. It can cause blurred or faded vision, glare, poor contrast, and difficulty seeing at night.

Cataract Removal

Surgery that removes a cloudy natural lens from the eye and usually replaces it with an artificial intraocular lens. It is performed when the cataract interferes with vision, work, driving, reading, or other daily activities.

Cataracts

Alternate index label; see *Cataract*.

Alternate Names:
Adult Cataracts; Cataracts in Adults

Cataract Surgery

Surgery to remove the eye's clouded natural lens, usually replacing it with an artificial intraocular

lens to focus light. Phacoemulsification is a common technique for removing the lens.

Catastrophic Aging

A rapid loss of physical or mental function in an older person after illness, an operation, a fall, or another stress. Limited ability to recover can make decline harder to reverse; early treatment and rehabilitation may help.

Catastrophic Reaction

An unusually intense emotional or behavioral response to a situation that may seem minor to others. It can occur with dementia, brain injury, or other neurologic disease and may involve shouting, fear, crying, or agitation.

Alternate Names:
Catastrophic Response; Catastrophic Emotional Reaction

Catatonia

A serious syndrome involving marked changes in movement, speech, and response to the environment. Features may include immobility, mutism, staring, unusual postures, rigidity, repetitive movements, or copying speech or actions; causes include psychiatric and medical disorders.

Catbite

A puncture wound caused by a cat's teeth. Cat bites can push bacteria deep into tissue and may infect tendons, joints, or bone.

Catch-Up Immunization

Vaccination of a person who is behind the recommended schedule using age- and risk-appropriate intervals. A delayed series usually does not need to be restarted, but minimum ages, intervals, and medical precautions must be followed.

Catechin

A group of plant compounds found in tea, cocoa, some fruits, and other foods. They show antioxidant effects in laboratory studies, but catechin supplements are not proven treatments and may cause side effects or interact with medicines.

Catechol

A chemical compound with two neighboring hydroxyl groups, used in industry and involved in making some biologically active substances. Contact or inhalation can irritate tissues and substantial exposure may be toxic.

Catecholamine

A class of chemical messengers derived from tyrosine, including dopamine, norepinephrine (noradrenaline), and epinephrine (adrenaline). Depending on where they are released, they act as neurotransmitters or hormones. Their effects vary by tissue and include roles in sympathetic stress responses, movement, attention, and cardiovascular function.

Alternate Names:
Catecholamines

Catecholamine Blood Test

A blood test measuring epinephrine, norepinephrine, and dopamine. It may help evaluate unusual hormone release from a pheochromocytoma or related tumor, although metanephrine testing is often preferred for initial screening.

Catecholamine Crisis

A sudden, life-threatening surge of stress hormones causing very high blood pressure, rapid or irregular heartbeat, sweating, headache, and possible injury to the heart, brain, kidneys, or other organs. It can occur with certain adrenal or nerve tumors.

Catecholaminergic Polymorphic Ventricular Tachycardia

A rare inherited rhythm disorder in which exercise or strong emotion triggers dangerous fast rhythms from the heart's lower chambers. The heart may look normal and the resting ECG may be normal; fainting or cardiac arrest can occur, especially in children and young adults.

Alternate Names:
Bidirectional Ventricular Tachycardia; Stress-Induced Polymorphic VT

Category Five Hurricane

A Saffir–Simpson hurricane with sustained winds of at least 157 miles per hour (252 km/h), capable of catastrophic damage and prolonged loss of habitability.

Category I Fetal Heart Tracing

A reassuring fetal heart-rate pattern with a baseline of 110–160 beats per minute, moderate variability, and no late or variable decelerations. It is usually consistent with adequate fetal oxygenation at that time.

Category II Fetal Heart Tracing

A fetal heart-rate pattern that is not clearly normal or abnormal. It requires continued monitoring and assessment of the mother, fetus, labor, and changes over time because it may become reassuring or concerning.

Category III Fetal Heart Tracing

An abnormal intrapartum fetal heart rate pattern associated with increased risk of fetal acidemia. It consists of absent baseline variability with recurrent late decelerations, recurrent variable decelerations, or bradycardia; a sinusoidal pattern is also Category III. The classification describes the tracing, not a diagnosis of acidemia.

Category Three Hurricane

A Saffir–Simpson hurricane with sustained winds of 111–129 miles per hour (178–208 km/h), capable of devastating damage.

Category Two Hurricane

A Saffir–Simpson hurricane with sustained winds of 96–110 miles per hour (154–177 km/h), capable of extensive damage to structures and vegetation.

Catenin

A family of proteins that helps neighboring cells attach and communicate. Beta-catenin also carries growth signals inside cells; abnormal activity can allow some cancers to grow or spread.

Caterpillar Dermatitis

An itchy or painful skin reaction after contact with irritating or venomous caterpillar hairs or spines. Eye exposure, breathing difficulty, or widespread symptoms may occur in more severe reactions.

Caterpillars

The larval stage of butterflies and moths. Hairs or spines on some species can cause painful skin inflammation, eye injury, or allergic reactions after contact or inhalation.

Cathartic

A substance that promotes bowel emptying, usually by increasing stool water, intestinal movement, or both. Excessive or prolonged use can cause diarrhea, dehydration, electrolyte imbalance, or dependence on laxatives.

Alternate Names:
Purgative; Laxative

Cathepsin

A family of enzymes that break down proteins inside cells, especially in lysosomes, the cell's recycling compartments. They help with immune activity, tissue remodeling, and bone turnover; abnormal activity may contribute to inflammation, bone loss, or cancer.

Cathepsin D

An enzyme in lysosomes that breaks down proteins in an acidic environment. It also participates in cell death and immune processes; abnormal activity has been studied in cancer and nervous-system disease.

Cathepsin H

An enzyme in lysosomes that breaks down proteins and helps activate some biologically active peptides. It contributes to normal cell maintenance and may be altered in certain diseases.

Cathepsin K

An enzyme made by osteoclasts, the cells that remove old bone. It breaks down the protein framework of bone; excessive activity can contribute to

bone loss and osteoporosis.

Cathepsin L

An enzyme in lysosomes that breaks down proteins and helps process antigens for immune recognition. It also participates in tissue remodeling and can assist entry or spread of some infectious agents.

Cathepsins B

A group of protein-cutting enzymes, including cathepsin B, that help recycle proteins inside cells. Abnormal activity can contribute to inflammation, tissue remodeling, invasion of nearby tissue by tumors, and spread of cancer.

Cathepsin Z

An enzyme found mainly in lysosomes that cuts proteins into smaller pieces. It helps cells process materials and may contribute to immune responses and inflammation.

Catheter

A thin flexible tube placed in a blood vessel, body cavity, or duct to deliver medicines or fluids, drain urine or other material, measure pressure, collect samples, or guide a procedure.

Catheter-Associated Urinary Tract Infection

A symptomatic urinary tract infection in a person with a urinary catheter or recent catheterization. Bacteriuria is common with catheter use, and pyuria alone does not distinguish infection from asymptomatic colonization. The 48-hour catheter threshold is used in surveillance definitions, not as a stand-alone clinical diagnosis.

Alternate Names:
CAUTI

Catheter-Associated UTI

A urinary infection associated with an indwelling catheter. Risk rises with prolonged use, and symptoms may include fever, lower abdominal or flank pain, or confusion; avoiding unnecessary catheters and removing them early lowers risk.

Catheter-Directed Thrombolysis

A procedure that uses imaging to guide a thin tube into a blood clot. Clot-dissolving medicine is delivered through the tube to help break up the clot. It may be used for selected serious clots; the treatment can cause dangerous bleeding.

Alternate Names:
CDT; Endovascular Thrombolysis; Catheter-Directed Clot Lysis

Catheterization

Placement of a catheter into a blood vessel, body cavity, duct, or other passage to drain, infuse, measure, collect samples, or perform a procedure. Risks include pain, bleeding, infection, blockage, and injury to nearby tissue.

Catheterized Urine Culture

A urine culture performed on a specimen collected through urinary catheterization, usually when a clean-catch sample cannot be obtained or when catheter-associated infection is being assessed. Collection technique and timing affect interpretation because colonization and contamination may cause bacterial growth without symptomatic infection.

Catheter-Related Infections

Infections caused by microorganisms entering along or contaminating an indwelling catheter. They may cause local redness, pain, drainage, fever, or bloodstream infection; treatment can involve antibiotics and catheter removal or replacement.

Catheter-Related UTI

A urinary tract infection associated with an indwelling urinary catheter, usually caused by bacteria entering or traveling along it. Diagnosis requires compatible symptoms and appropriately collected urine testing because bacteria may be present without infection.

Cathexis

The investment of emotional or psychological energy in a person, idea, object, or activity, a term used mainly in psychology and psychoanalytic theory.

Cation

An atom or molecule with a positive electrical charge, such as sodium, potassium, calcium, or hydrogen. These charged particles help control fluid balance, nerve signals, muscle contraction, and blood acidity.

Alternate Names:
Positively Charged Ion

Cat-Nap

A short period of sleep, usually during the day. Frequent unintended sleep may be associated with inadequate sleep, a medicine effect, or a sleep disorder.

CAT Scan

Older name; see *Computed Tomography*.

Cat Scratch Disease

An infection caused by *Bartonella henselae*, usually when a scratch or bite from a kitten or cat introduces bacteria carried in flea dirt. A small bump may form at the injury, followed one to three weeks later by tender swelling of nearby lymph nodes and sometimes a low fever. Most cases resolve on their own; rarely, infection affects the eyes, liver, spleen, brain, bones, or heart valves, especially in people with weakened immunity.

Cat-Scratch Disease

Alternate spelling; see *Cat Scratch Disease*.

Cat's Cry Syndrome

Alternate name; see *Cri-Du-Chat Syndrome*.

Cat's Eye Reflex

A bright white reflection from the pupil, called leukocoria, rather than the usual red reflection in photographs. It can signal cataract, retinal disease, or retinoblastoma, especially in a child.

Caudad

Toward the tail or lower end of the body; in human anatomy, generally toward the feet or away from the head.

Cauda Equina

The bundle of lumbar, sacral, and coccygeal nerve roots that continues below the end of the spinal cord. These nerves control sensation and movement in the legs and help control the bladder, bowel, and sexual organs.

Alternate Names:
Cauda Equina Nerve Roots; Horse-Tail Nerve Bundle

Cauda Equina Syndrome

A serious neurological condition that occurs when the bundle of nerve roots at the lower end of the spinal cord (called the cauda equina, or 'horse's tail') becomes severely compressed, commonly by a herniated disc, spinal injury, tumor, or infection. Because these nerves supply the bladder, bowel, and legs, compression can cause sharp lower back and leg pain, weakness or numbness in both legs, numbness in the groin and buttocks ('saddle anesthesia'), and loss of bladder or bowel control.

Caudal

Directed toward the tail end of the body; in general human anatomy, usually toward the feet or away from the head. In neuroanatomy, direction follows the curved axis of the central nervous system, so caudal in the cerebrum points toward the back of the head.

Caudal Dysplasia

A group of birth defects in which the lower spine and nearby structures do not develop fully. It may cause abnormalities of the legs, pelvis, bowel, bladder, or genital organs and is more common with maternal diabetes.

Caudate Nucleus

A curved group of nerve cells deep in the brain that helps control movement, learning, memory, motivation, and behavior. Disease affecting it may contribute to movement or cognitive problems.

Cauliflower Ear

A thick, irregular deformity of the outer ear caused when blood or fluid collects between its cartilage

and covering, usually after blunt injury or repeated friction. Persistent separation of the cartilage covering from the ear can lead to permanent deformity.

Alternate Names:
Auricular Hematoma Deformity; Boxer's Ear; Wrestler's Ear

Caulking Compound Poisoning

Poisoning or injury after contact with or swallowing a caulking product. Symptoms depend on its ingredients and may include eye, skin, or airway irritation, vomiting, drowsiness, or aspiration into the lungs.

Causalgia

Severe persistent burning pain, sensitivity, and other sensory changes after injury to a peripheral nerve. It is now usually considered complex regional pain syndrome type II and may include swelling, color or temperature changes, and movement difficulty.

Alternate Names:
Complex Regional Pain Syndrome Type II; Causalgic Pain

Cause Of Death

The disease, injury, or toxic exposure that starts the chain of events leading directly to death. It differs from the immediate mechanism, such as respiratory failure, and from contributing conditions.

Causes of Cancer

Cancer develops after changes in cells allow abnormal growth and survival. Risk can be increased by inherited variants, tobacco, alcohol, certain infections, ultraviolet or other radiation, harmful chemicals, chronic inflammation, and random changes during cell division.

Alternate Names:
Carcinogenesis; Cancer Etiology; Oncogenic Factors

Caustic

Able to chemically burn or destroy living tissue, as strong acids and alkalis can. Swallowing or contact with a caustic substance can injure the mouth, esophagus, stomach, skin, eyes, or airway and may be an emergency.

Cauterization

Intentional destruction or sealing of tissue with heat, electricity, chemicals, or another energy source. It may control bleeding, remove abnormal tissue, or close small vessels and wounds.

Cautery

Use of heat, electricity, chemicals, or another energy source to destroy or seal tissue, commonly to control bleeding or remove a small abnormal area.

Cautery Device

A medical instrument that uses heat, electricity, or another energy source to seal bleeding vessels or destroy unwanted tissue. Use can cause burns or damage surrounding structures if poorly controlled.

Caveola

A small pocket-like fold in a cell membrane that helps organize signals, move materials into or out of the cell, and respond to stretching or mechanical stress.

Caveolins

Proteins that form or regulate caveolae, small pockets in cell membranes. They help organize cell signals, handle fats, move materials across membranes, and respond to mechanical stress.

Cavernous Hemangioma

A cluster of enlarged, thin-walled blood vessels that may occur in the skin, brain, spinal cord, or other tissues. Symptoms depend on location and may result from bleeding, pressure, pain, or altered function.

Cavernous Malformations

Clusters of unusually wide, fragile blood vessels, usually in the brain or spinal cord. They may cause no symptoms, but bleeding or pressure on nerve tissue can produce headaches, seizures, weakness, numbness, vision problems, or other neurologic changes.

Alternate Names:
Cavernoma; Cerebral Cavernoma

Cavernous Sinus

A large venous channel beside the pituitary gland that drains blood from the eye and face. It contains important eye-movement nerves and the internal carotid artery; infection or clotting there can be life-threatening.

Cavernous Sinus Thrombosis

A dangerous blood clot, often infected, in the venous channel behind the eyes. It usually follows infection of the face, nose, sinuses, teeth, or orbit and may cause severe headache, fever, bulging eyes, double vision, or vision loss.

Cavities

Holes or damaged areas in teeth caused by acids made by plaque bacteria from sugars and other carbohydrates. Decay can reach the inner pulp and cause pain or infection; dental care may include fluoride, fillings, or root-canal procedures.

Alternate Names:
Tooth Decay; Dental Caries; Dental Cavitation

Cavities And Tooth Decay

Progressive loss of tooth structure caused by acids produced when plaque bacteria use sugars. Decay can move from enamel into dentin and the pulp, causing sensitivity, pain, infection, abscess, or tooth loss.

Cavity

Alternate name; see *Cavities*.

Cavum

An anatomical cavity or hollow space in the body. The word is usually followed by a location or structure name; for example, the cavum septi pellucidi is a normal fluid-filled space in the brain.

CBC

See *Complete Blood Count*.

Alternate Names:
Complete Blood Count

CBC Blood Test

See *Complete Blood Count*.

CCP

Cyclic citrullinated peptide, a target used in a blood test for antibodies associated with rheumatoid arthritis. A positive anti-CCP result supports the diagnosis and may indicate greater risk of joint damage, but it is not diagnostic alone.

CCTA

Alternate name; see *Coronary Computed Tomography Angiography*.

CCU

A hospital unit providing continuous heart monitoring and specialized treatment for people with serious acute cardiac problems, such as heart attack, dangerous rhythm disturbance, or severe heart failure.

Alternate Names:
Coronary Care Unit; Cardiac Care Unit

CD4 Count

The number of CD4 T lymphocytes in a blood sample. It helps assess immune function and the risk of opportunistic infection in people with HIV; results are interpreted with viral load, symptoms, treatment, and trends over time.

CD4-Positive T Cell

A type of white blood cell that coordinates immune responses. Different CD4 cells help activate other immune cells, support antibody production, defend mucosal surfaces, or limit excessive inflammation.

CD8-Positive T Cell

A type of white blood cell that recognizes abnormal signals on infected or altered cells. Cytotoxic CD8 cells can destroy virus-infected, cancerous, or otherwise abnormal cells.

Cd Antigens

Proteins or other markers on the surface of cells that help identify cell types, especially immune cells.

Laboratory antibodies against these markers can classify cells, diagnose blood disorders, and guide selected treatments.

C. Diff

Alternate index label; see *C. Difficile Infection*.

C. Difficile

Clostridioides difficile is a spore-forming bacterium that can multiply in the bowel, especially after antibiotics disrupt normal bacteria. Its toxins cause watery diarrhea and colon inflammation, which can become severe or recur.

C. Difficile Colitis

Inflammation of the colon caused by a *Clostridioides difficile* infection. It can cause diarrhea and abdominal pain; severe cases may develop pseudomembranous colitis. See *C. Difficile Infection*.

C. Difficile Infection

An acute infectious toxin-mediated colitis caused by the spore-forming, gram-positive anaerobic bacillus *Clostridioides difficile* (formerly *Clostridium difficile*). Precipitated primarily by antibiotic exposure (e.g., fluoroquinolones, clindamycin, broad-spectrum cephalosporins, carbapenems) which disrupts the normal protective gut microbiome, facilitating spore germination and vegetative cell proliferation. Pathogenicity is driven by the production of large clostridial exotoxins: Toxin A (enterotoxin) and Toxin B (potent cytotoxin), which disrupt actin cytoskeleton and tight junctions of colonocytes via Rho GTPase glucosylation, causing intense mucosal inflammation, pseudomembrane formation (yellow-white mucosal plaques composed of fibrin, mucin, and neutrophils), and watery diarrhea. Clinical spectrum ranges from mild self-limited diarrhea to fulminant pseudomembranous colitis, toxic megacolon, bowel perforation, and septic shock. Diagnosis requires a two-step laboratory algorithm: glutamate dehydrogenase (GDH) antigen enzyme immunoassay combined with sensitive nucleic acid amplification testing (NAAT) for toxin genes and toxin A/B enzyme immunoassay. First-line medical therapy consists of oral fidaxomicin or oral vancomycin, with fecal microbiota transplantation (FMT) reserved for recurrent refractory episodes.

Alternate Names:
Clostridioides Difficile Infection; CDI; Pseudomembranous Colitis

Cea

An abbreviation for carcinoembryonic antigen, a blood marker used mainly to monitor selected cancers rather than to screen people without symptoms.

CEA Assay

A laboratory test measuring carcinoembryonic antigen in a specimen, usually blood. It is mainly used to monitor selected known cancers and cannot diagnose or exclude cancer by itself.

CEA Blood Test

A blood test measuring carcinoembryonic antigen, used mainly to monitor selected cancers such as colorectal cancer and assess treatment response or recurrence. Smoking, inflammation, and other noncancerous conditions can also raise it.

Cebocephaly

A rare congenital malformation within the holoprosencephaly spectrum, marked by a small, flattened nose with a single nostril and closely spaced eyes, usually with major brain abnormalities.

Cecal Hemorrhage

Bleeding from the caecum, the first part of the large intestine. Causes include inflammation, infection, reduced blood flow, polyps, diverticular disease, or cancer and may produce blood in the stool or anemia.

Cecal Infection

Infection of the caecum, the first part of the large intestine. It may cause right-sided abdominal pain, fever, diarrhea, or tenderness. The cause and treatment depend on the infection.

Cecal Neoplasm

A noncancerous or cancerous growth arising in the

caecum. It may cause bleeding, anemia, abdominal pain, altered bowel habits, or blockage and is usually evaluated with colonoscopy and tissue sampling.

Cecal Volvulus

Twisting of the caecum and nearby colon around the tissue that supports them, causing large-bowel blockage. It can produce sudden abdominal pain, swelling, vomiting, and inability to pass stool or gas and may cause bowel ischemia or perforation.

Cecostomy

A surgically created opening from the caecum to the abdominal wall to release pressure, drain bowel contents, or divert stool. It may be temporary or permanent depending on the underlying problem.

Cecum

The first pouch-like part of the large intestine, in the lower right abdomen where the small intestine joins the colon. The appendix arises from it; disease can include inflammation, tumors, bleeding, or twisting that blocks the bowel.

Cedar Leaf Oil Poisoning

Toxic exposure to cedar-leaf oil, usually after swallowing or inhaling it. It may irritate the mouth, stomach, lungs, or nervous system and can cause vomiting, dizziness, seizures, or breathing problems.

Cefaclor

A second-generation cephalosporin antibiotic used for selected susceptible bacterial infections. It can cause allergic reactions, nausea, diarrhea, or antibiotic-associated colitis.

Cefadroxil

An oral first-generation cephalosporin antibiotic used for selected susceptible skin, throat, urinary, and other infections. Possible effects include allergy, nausea, diarrhea, and antibiotic-associated colitis.

Cefamandole

A second-generation cephalosporin antibiotic used in some settings for susceptible bacterial infections. It can cause allergy or diarrhea and may increase bleeding risk, especially in people with poor nutrition or liver disease.

Cefatrizine

An older oral cephalosporin antibiotic used in some countries for susceptible bacterial infections. Its usefulness depends on local availability, bacterial resistance, allergy risk, and current treatment guidance.

Cefazolin

An injectable first-generation cephalosporin antibiotic used for selected susceptible infections and commonly given before surgery to prevent infection. Allergy, diarrhea, and dose adjustment in kidney disease may be important.

Cefdinir

An oral third-generation cephalosporin antibiotic used for selected susceptible respiratory, skin, and other infections. It may cause diarrhea, nausea, allergic reactions, or antibiotic-associated colitis and can interact with iron-containing products.

Cefepime

An injectable fourth-generation cephalosporin used for serious infections caused by susceptible bacteria, including some hospital-acquired infections. Kidney-dose adjustment is important because accumulation can cause confusion, seizures, or other neurologic toxicity.

Cefixime

An oral third-generation cephalosporin used for selected susceptible urinary, respiratory, ear, and other bacterial infections. It can cause diarrhea or allergy, and unnecessary use promotes antibiotic resistance.

Cefmenoxime

An injectable third-generation cephalosporin used in some countries for susceptible bacterial infections. Possible effects include allergic reactions, diarrhea, and antibiotic-associated colitis.

Cefmetazole

An injectable cephamycin antibiotic used in some countries for selected abdominal, pelvic, and other infections caused by susceptible bacteria. Allergy, diarrhea, and antibiotic-associated colitis are possible.

Cefonicid

A long-acting second-generation cephalosporin antibiotic used for selected susceptible infections. Its use is limited in many places; dose selection depends on kidney function, local resistance, and the infection site.

Cefoperazone

A third-generation cephalosporin active against many gram-negative bacteria and sometimes combined with a beta-lactamase inhibitor. It can cause allergy, diarrhea, bleeding, or impaired bile flow and requires appropriate monitoring.

Cefotaxime

An injectable third-generation cephalosporin used for serious susceptible infections, including meningitis, pneumonia, bloodstream infection, and sepsis. Allergy, diarrhea, and antibiotic-associated colitis are possible.

Cefotetan

An injectable cephamycin antibiotic used for selected serious infections and surgical prevention. It covers some anaerobic bacteria but can cause allergy, diarrhea, bleeding, or a reaction if alcohol is consumed around treatment.

Cefotiam

A second-generation cephalosporin used in some countries for susceptible respiratory, urinary, skin, and other bacterial infections. Allergy, gastrointestinal effects, and antibiotic-associated colitis are possible.

Cefoxitin

An injectable cephamycin antibiotic used for selected abdominal, pelvic, skin, and other infections, including some involving anaerobic bacteria. Allergy, diarrhea, and antibiotic-associated colitis can occur.

Ceftazidime

An injectable third-generation cephalosporin with activity against Pseudomonas aeruginosa and other susceptible gram-negative bacteria. It is used for selected serious infections and can cause allergy, diarrhea, or neurologic effects when it accumulates in kidney disease.

Ceftazidime-Avibactam

A combination antibiotic in which avibactam blocks some bacterial enzymes that destroy ceftazidime. It is used for selected difficult gram-negative infections, including some resistant organisms; kidney-dose adjustment and susceptibility testing are important.

Ceftibuten

An oral cephalosporin antibiotic used for selected susceptible respiratory, urinary, and other bacterial infections. It may cause diarrhea or allergy, and inappropriate use promotes resistance and antibiotic-associated colitis.

Ceftizoxime

An injectable third-generation cephalosporin used for selected serious infections caused by susceptible bacteria, including some abdominal, pelvic, urinary, and anaerobic infections. Allergy, diarrhea, and antibiotic-associated colitis are possible.

Ceftriaxone

An injectable third-generation cephalosporin used for many serious susceptible bacterial infections, including meningitis, pneumonia, bloodstream infection, and gonorrhea. Allergy, diarrhea, biliary problems, and antibiotic-associated colitis are possible.

Cefuroxime

A second-generation cephalosporin available by mouth or injection for selected respiratory, ear, urinary, skin, and other bacterial infections. It can cause allergy, nausea, diarrhea, or antibiotic-associated colitis.

Celiac Artery

A major branch of the abdominal aorta that supplies the upper digestive organs, including the stomach, liver, gallbladder, spleen, pancreas, and first part of the small intestine. It divides into the left gastric, splenic, and common hepatic arteries.

Celiac Crisis

A rare, severe complication of celiac disease marked by profuse diarrhea or vomiting, dehydration, and major electrolyte disturbances. It can progress to low blood pressure, confusion, or shock.

Celiac Disease

An inherited autoimmune disorder in which eating gluten—a protein found in wheat, barley, and rye—triggers an abnormal immune reaction that attacks and damages the lining of the small intestine. Over time, the immune attack flattens the tiny finger-like projections (villi) that absorb nutrients, leading to digestive issues such as chronic diarrhea, abdominal bloating, and weight loss, as well as malnourishment, iron deficiency, and fatigue.

Celiac Plexus

A network of nerves in the upper abdomen that carries signals to and from the stomach, liver, pancreas, intestines, and other organs. It can be targeted with an injection for selected severe abdominal pain.

Celiac Sprue

Alternate name; see *Celiac Disease*.

Celiac Trunk

The first major branch of the abdominal aorta, supplying the upper digestive organs. It divides into the left gastric, splenic, and common hepatic arteries and is surrounded by nerves of the celiac plexus.

Celiac Trunk Stenosis

Narrowing of the celiac trunk, caused by plaque or, in some people, compression by the diaphragm's median arcuate ligament. It may cause upper abdominal pain after meals and weight loss, although imaging findings do not always explain symptoms.

Cell

The smallest living unit that can perform life processes. Human cells usually contain DNA in a nucleus and specialized internal structures that produce energy, make proteins, communicate, and maintain the body's tissues.

Cell Adhesion

The attachment of cells to one another or to the supporting material around them. It helps maintain tissue structure, transmit signals, guide movement, and organize healing and development.

Cell Aggregation

Clumping of cells through interactions between their surfaces or surrounding proteins. It is important in development, immune responses, wound healing, and formation of blood clots.

Cell Body

The main part of a cell containing the nucleus and most internal structures. In a nerve cell, it excludes long extensions such as the axon and dendrites.

Alternate Names:
Perikaryon

Cell-Cell Junction

A specialized connection between neighboring cells that provides attachment, communication, or controlled passage of substances. Examples include tight junctions, desmosomes, and gap junctions.

Cell-Cell Signaling

The ways cells send and receive messages through direct contact, electrical activity, or chemicals such as hormones and neurotransmitters. Signaling coordinates growth, movement, immune responses, repair, and other body functions.

Cell Count

The number of cells in a sample of blood, body fluid, tissue, or laboratory culture. It helps assess blood-cell levels, inflammation, infection, immune function, or abnormal cell growth.

Cell Culture

Growth of cells outside the body in a controlled nutrient environment. It is used for research, medicine testing, diagnosis, production of biological products, and study of how cells respond to disease or treatment.

Cell Cycle

The series of stages through which a cell grows, copies its DNA, checks for damage, and divides into two cells. Disruption of cycle control can contribute to developmental disorders and cancer.

Cell Death

The loss of a cell's ability to remain alive. It may be a controlled process that removes old or damaged cells, or an uncontrolled result of injury, infection, toxins, lack of oxygen, or severe disease.

Cell Dedifferentiation

Loss of some specialized features by a mature cell, making it more like an immature cell. It can occur during repair or development and may contribute to abnormal growth in some cancers.

Cell Density

The number of cells in a given area or volume of tissue or fluid. It can change with growth, inflammation, healing, infection, or cancer and is measured in laboratory samples and tissue studies.

Cell Differentiation

The process by which an unspecialized cell develops the structure and function of a specialized cell type, such as a nerve, muscle, blood, or skin cell.

Cell Division

The process by which one cell produces new cells. Mitosis makes most body cells for growth and repair, while meiosis makes reproductive cells with half the usual number of chromosomes.

Cell-Free DNA

Non-encapsulated extracellular DNA fragments circulating freely in blood plasma or other biofluids, released from apoptotic or necrotic cells; analyzed in non-invasive prenatal screening (NIPT) and oncology liquid biopsies.

Alternate Names:
cfDNA; Circulating Cell-Free DNA

Cell-Free Fetal DNA Screening

A prenatal blood screening test that analyzes cell-free DNA fragments in a pregnant person's blood; a small fraction comes from the placenta and reflects fetal chromosomes. It estimates the chance of common chromosome number conditions, including trisomies 21, 18, and 13, but does not diagnose them. A high-risk or no-call result may be followed by counseling and diagnostic testing.

Alternate Names:
Cell-Free Fetal DNA Test; Cell-Free DNA Prenatal Screening; NIPT; NIPS

Cell-Free Fetal Test

Alternate name; see *Cell-Free Fetal DNA Screening*.

Cell Fusion

Joining of two cells or their outer membranes to form one larger cell, sometimes with several nuclei. It occurs in normal development and repair and can also occur during infection or disease.

Cell Growth

Increase in a cell's size and contents through production of proteins, membranes, energy stores, and other components. Abnormal growth signals can contribute to tissue overgrowth or cancer.

Cell-Matrix Junction

A specialized connection anchoring a cell to the supporting material around it. It also transmits signals that influence cell shape, movement, survival, and tissue organization.

Cell Maturation

Development of an immature cell into a mature cell with a specialized structure and function. It is essential for producing healthy blood, nerve, muscle, immune, and other body cells.

Cell-Mediated Immune Response

Alternate name; see *Cell-Mediated Immunity*.

Cell-Mediated Immunity

Immune defense carried out mainly by T lymphocytes and other cells rather than by antibodies. It is important for controlling infected cells, cancer cells, and organisms that live inside cells.

Cell Migration

Movement of cells through tissue or across a surface in response to chemical, mechanical, or environmental signals. It is important in development, immune defense, wound healing, and cancer spread.

Cell Motility

The ability of cells to move through or across a surface using their internal framework, attachment structures, or specialized projections such as cilia and flagella. It supports development, immunity, wound healing, and cancer spread.

Alternate Names:
Cell Locomotion

Cell Movement

Directed or random movement of a cell through tissue or across a surface. It is important in development, immune responses, wound repair, inflammation, and the spread of cancer.

Cell Nucleus

The membrane-covered compartment containing most of a cell's DNA. It helps control gene activity, growth, division, repair, and production of proteins needed for normal cell function.

Cellophane

A thin, transparent film made from regenerated cellulose. It has been used as a temporary covering for burns and other wounds; the term names the material, not a specific modern dressing or medical device.

Cell Pellet

The concentrated layer of cells collected at the bottom of a tube after spinning a sample in a centrifuge. It may be removed for microscopic, genetic, chemical, or other laboratory testing.

Cell Physiology

The study of how cells obtain energy, transport substances, communicate, respond to signals, repair themselves, and perform specialized functions.

Cell Polarity

The unequal arrangement of structures and activities within a cell, giving it distinct sides or directions. It enables organized transport, signaling, movement, development, and tissue structure.

Cell Proliferation

Increase in cell number through repeated division. Normal proliferation supports growth and repair, while excessive or uncontrolled proliferation can cause tissue overgrowth, benign tumors, or cancer.

Cell Secretion

Release of substances made by cells, such as hormones, enzymes, nerve chemicals, mucus, or immune signals. Secretion supports communication, digestion, protection, movement, and regulation of body processes.

Cell Senescence

A state in which a cell remains active but permanently stops dividing, often because of aging, stress, or DNA damage. Senescent cells can help prevent cancer but may contribute to inflammation when they accumulate.

Alternate Names:
Cellular Senescence; Replicative Senescence

Cell Signaling

The process by which cells detect information through receptors and transmit signals inside the cell to change functions such as growth, movement, metabolism, or immune activity.

Cell Sorting

Separation of cells into groups according to features

such as size, density, surface markers, or fluorescence. It is used in research, diagnosis, blood-cell analysis, and preparation of selected cells for treatment.

Cell Structure

The arrangement of a cell's membrane, cytoplasm, nucleus, and internal structures. These parts work together to produce energy, make proteins, communicate, divide, and carry out specialized functions.

Cell Surface

The outer membrane of a cell and the molecules attached to it. It controls movement of substances, attachment, recognition, communication, and interactions with immune cells and surrounding tissue.

Cell Survival

The ability of a cell to remain alive and functional despite injury, lack of nutrients, toxins, infection, or other stress. It depends on the cell type, the severity and duration of the stress, and the cell's repair systems.

Cell Therapy

Treatment that uses living cells to replace damaged cells, restore a function, or change an immune response. Uses range from established blood-forming stem-cell transplantation to experimental treatments; benefits and risks depend on the cells and disease.

Cell Transplantation

Transfer of living cells into a person to replace missing cells, restore tissue function, or modify immunity. Blood-forming stem-cell transplantation is established for selected diseases; rejection, infection, graft-versus-host disease, and other risks may occur.

Cellular

Relating to cells or to processes occurring within or between cells.

Cellular Adaptation

A reversible change in a cell's size, number, structure, or function in response to altered demands or mild injury. Adaptation may help a cell survive but can become harmful if the stress continues.

Cellular Immunity

Immune defense carried out mainly by T cells, natural killer cells, macrophages, and other cells rather than antibodies alone. It helps destroy infected or abnormal cells and control inflammation.

Cellular Metabolic Process

A chemical reaction or linked pathway in a cell that produces energy, builds cell components, or breaks down nutrients and waste.

Cellular Quiescence

A reversible, non-dividing physiological state in which a cell exits the active cell division cycle and enters the G0 phase in response to anti-mitogenic signals or nutrient deprivation, while retaining the capacity to re-enter the proliferative cycle upon appropriate growth factor stimulation.

Cellular Respiration

The process cells use to release energy from food. Most cells use oxygen to convert nutrients into ATP, the cell's usable energy, while limited energy can be made without oxygen.

Cellular Swelling

Early reversible cell injury in which failure of membrane pumps causes sodium and water to collect inside the cell. It commonly follows reduced blood flow, low oxygen, toxins, or other stresses.

Alternate Names:
Hydropic Change; Hydropic Degeneration; Cloudy Swelling

Cellular Vesicle

A small membrane-bound compartment that transports, stores, or releases substances inside or outside a cell. Vesicles help move proteins, fats, hormones, and waste.

Cellulite

A common harmless dimpled or uneven appearance

of skin, usually on the thighs, hips, or buttocks, caused by the arrangement of fat, connective tissue, and skin. It is different from cellulitis, a bacterial infection.

Cellulitis

A bacterial infection of the deeper skin and tissue beneath it, causing spreading redness, warmth, swelling, tenderness, and sometimes fever or chills. It commonly follows a break in the skin and can spread rapidly or enter the bloodstream.

Cellulomonas

A group of bacteria found mainly in soil, plants, and other environmental materials. They break down cellulose; human infection is rare and usually occurs opportunistically in people with severe illness or weakened immunity.

Cellulomonas Hominis

A rare environmental bacterium that has occasionally caused human infection, usually in people with weakened immunity or serious underlying illness. Its significance depends on symptoms, the body site, and laboratory identification.

Cellulose

A complex carbohydrate forming the structure of plant cell walls. Humans cannot digest it, but it is dietary fiber that adds bulk to stool and can support regular bowel movements when enough fluid is consumed.

Cellulosimicrobium

A group of environmental bacteria found mainly in soil. Human infection is rare but may affect people with serious illness, implanted devices, or weakened immune defenses and can involve the blood, heart, or other tissues.

Cellulosome

A group of enzymes joined together by some microorganisms to break down cellulose in plant cell walls. It helps the organism digest plant material and is studied for biotechnology and biofuel production.

Cell Wall

A rigid outer layer surrounding plant, fungal, and bacterial cells. It provides shape and protection; human and animal cells have a flexible membrane but no cell wall.

Celosomy

A rare birth defect involving incomplete closure of the body wall, allowing abdominal or chest organs to protrude outside the body. The term is used for severe omphalocele-like malformations and requires specialist newborn care.

Cement

A material used to fill spaces or attach an artificial joint or other prosthesis to bone. Dental cement bonds or protects dental work; the appropriate type depends on the procedure.

Cemento-Enamel Junction

The boundary where tooth enamel covering the crown meets cementum covering the root. Its shape varies, and an exposed junction may be sensitive or more vulnerable to decay.

Cementoma

A usually noncancerous jaw lesion containing cementum-like mineralized tissue. Its behavior and treatment depend on the specific subtype, location, size, symptoms, and relationship to nearby teeth.

Cementum

A thin mineralized layer covering a tooth root. Fibers of the periodontal ligament attach to it and help anchor the tooth in its socket; it can be lost with gum disease.

Cenesthesia

The general awareness of one's body, including its condition, position, and internal sensations. Disturbance may occur in some neurologic or psychiatric illnesses and can alter how bodily sensations are experienced.

Centenarian

A person aged 100 years or older. Centenarians are a diverse group; some remain independent, while others need substantial support, and age alone does not determine health or cognitive ability.

Center

A central point, region, or facility organized around a function. In medicine, the term may describe an anatomical location, a treatment facility, or the middle of a measured structure.

Centigram

A metric unit of mass equal to one hundredth of a gram, or 10 milligrams, used for small quantities of medicines or specimens.

Centimeter

A metric unit of length equal to one hundredth of a meter, commonly used in clinical measurements such as wound size, tumor dimensions, and anatomical distances.

Centipede

A many-legged arthropod whose bite can inject venom and cause local pain, swelling, and redness; severe allergic reactions are uncommon but possible.

Centipoise

A unit of dynamic viscosity equal to one millipascal-second, used to describe the flow resistance of blood, fluids, medicines, and other materials.

Central

Located near the middle of the body or an organ, rather than near its edge. The word may describe a body structure, nervous-system area, blood line, symptom, or pattern of disease.

Central Apnea

A pause in breathing caused by absent or reduced respiratory effort from impaired brainstem signaling, rather than upper-airway obstruction.

Central Auditory Processing Disorder

Difficulty interpreting sounds in the brain despite adequate hearing. People may struggle to understand speech in noise, follow rapid instructions, identify sounds, or distinguish similar words.

Central Centrifugal Cicatricial Alopecia

A primary scarring hair-loss disorder that usually begins at the crown and expands outward. It is most common in women of African ancestry and may cause scalp tenderness, itching, or hair breakage. Inflammation destroys follicles, leading to permanent hair loss in affected areas.

Central Cord Syndrome

The most common form of incomplete traumatic spinal cord injury, typically resulting from hyperextension trauma in patients with preexisting cervical spondylosis. It is characterized by disproportionately greater motor weakness and impairment in the upper extremities compared to the lower extremities, accompanied by variable sensory loss and bladder dysfunction.

Alternate Names:
Cervical Central Cord Syndrome; Schneider Syndrome

Central Core Disease

An inherited muscle disorder, often caused by an RYR1 gene change, that may cause low muscle tone, delayed motor development, and weakness. Some affected people can develop life-threatening overheating with certain anesthetics.

Alternate Names:
CCD; Core Myopathy; RYR1-Related Central Core Disease

Central Cyanosis

Bluish discoloration of the lips, tongue, or oral mucosa associated with reduced arterial oxygenation or abnormal hemoglobin. The often-quoted threshold of about 5 g/dL of deoxygenated hemoglobin refers to capillary blood and is approximate; visible cyanosis also depends on total hemoglobin concentration, perfusion, and other factors.

Central Deafness

Severe hearing loss caused by damage to sound-processing pathways or areas of the brain, rather than the outer, middle, or inner ear. Hearing tests may show poor understanding despite detected sounds.

Central Diabetes Insipidus

Excessive urination and intense thirst caused by too little antidiuretic hormone from the brain. The kidneys cannot conserve enough water, so dehydration and high blood sodium may develop.

Central Fatigue

Mental tiredness or reduced concentration linked to changes in how the brain and spinal cord process activity. It can occur with neurologic or long-term illness and is different from muscle weakness.

Alternate Names:
Mental Fatigue

Central Hypothyroidism

A condition with too little thyroid hormone because the brain's pituitary gland or hypothalamus does not provide enough stimulation to the thyroid.

Central Line

A catheter inserted into a large vein with its tip in or near the heart, used to give medications or nutrition, draw blood, or monitor central venous pressures.

Central Line-Associated Bloodstream Infection

A surveillance-defined primary bloodstream infection in a patient with a central line present within the preceding 48 hours, with no other identified infection source. This definition does not establish that the catheter caused the infection; a catheter-related bloodstream infection is a distinct clinical diagnosis.

Alternate Names:
CLABSI

Central Line Placement

Insertion of a catheter into a large vein, commonly in the neck, chest, or groin, with its tip near the heart. It allows long-term medicines, nutrition, fluids, blood sampling, or monitoring.

Central Nervous System

The brain and spinal cord. It receives and interprets information, controls movement and many automatic body functions, and supports thought, memory, emotion, and regulation of hormones.

Central Nervous System Germinoma

A malignant germ-cell tumor usually arising in the brain, often near the pineal or suprasellar region. It may cause headache, visual or endocrine abnormalities, hydrocephalus, or impaired puberty; MRI, tumor markers, and specialist evaluation are important.

Central Nervous System Lymphoma

A lymphoma involving the brain, spinal cord, cerebrospinal fluid, or eye that can cause neurologic or visual symptoms.

Central Nervous System Vascular Malformations

Abnormal groups or connections of blood vessels in or around the brain or spinal cord. Some cause no symptoms, while others can cause headaches, seizures, weakness, or bleeding; treatment depends on the type, size, location, and risk.

Central Neurofibromatosis

Alternate name; see *Neurofibromatosis Type 2*.

Central Pain Syndrome

Chronic pain caused by damage or dysfunction in the brain or spinal cord. Pain may be burning, aching, electric, or unusually sensitive to touch and may occur after stroke, spinal-cord injury, multiple sclerosis, or other lesions.

Central Placenta Previa

Older term for complete placenta previa; see *Pla-*

centa Previa.

Central Pontine Myelinolysis

Brain injury caused most often by correcting very low blood sodium too quickly. Damage in the pons may cause weakness, trouble speaking or swallowing, confusion, reduced consciousness, or locked-in syndrome.

Central Precocious Puberty

Central precocious puberty begins when the hypothalamus and pituitary activate the normal puberty pathway unusually early. It causes early secondary sexual characteristics and accelerated bone maturation; causes vary, and hormone-suppressing treatment can delay progression in selected cases.

Central Retinal Artery Occlusion

A sudden blockage of the main artery supplying the retina, causing severe, usually painless loss of vision in one eye. It is an eye stroke requiring emergency assessment for related vascular disease.

Central Retinal Vein Occlusion

A blockage in the main vein that drains blood from the retina, the light-sensitive layer at the back of the eye. It can cause sudden blurred or lost vision in one eye. Treatment depends on the effect on vision and the cause.

Central Serous Chorioretinopathy

A disorder in which fluid collects beneath the retina, usually at the macula, causing blurred or distorted central vision. It is associated with leakage from blood vessels in the choroid and dysfunction of the retinal pigment epithelium; corticosteroid exposure is a recognized risk factor.

Central Serous Choroidopathy

Alternate name for central serous chorioretinopathy; see *Central Serous Chorioretinopathy*.

Central Sleep Apnea

Repeated pauses in breathing during sleep because the brain temporarily stops sending signals to breathe, without physical airway blockage. It may occur with heart failure, high altitude, or opioid use.

Alternate Names:
CSA

Central Sleep Apnea Syndromes

Repeated pauses or reductions in breathing during sleep caused by diminished respiratory drive rather than upper-airway blockage. Causes include heart failure, opioids, neurologic disease, high altitude, and treatment-emergent patterns; evaluation and therapy depend on the underlying mechanism.

Central Sulcus

A prominent anatomical landmark on the lateral cerebral cortex separating the precentral gyrus of the frontal lobe (primary motor cortex) from the postcentral gyrus of the parietal lobe (primary somatosensory cortex).

Alternate Names:
Rolandic Fissure; Sulcus of Rolando

Central Venous Catheter

A thin tube ending in a large vein near the heart. It provides reliable access for prolonged or irritating treatments and monitoring but can cause infection, blood clots, bleeding, or injury.

Central Venous Catheter Dressing Change

A standardized sterile nursing procedure involving the aseptic removal of existing catheter dressings, chlorhexidine-based antisepsis of the percutaneous exit site, and application of a sterile transparent semipermeable occlusive dressing.

Alternate Names:
CVC Dressing Change; Central Line Dressing Care; Catheter Site Dressing

Central Venous Catheter Flushing

The pulsatile instillation of sterile preservative-free 0.9% sodium chloride or heparinized lock solution through a central venous catheter lumen using positive pressure to prevent intraluminal thrombus formation, fibrin buildup, and catheter occlusion.

Alternate Names:
CVC Flushing; Central Line Heparin Lock; Catheter Patency Flushing

Central Venous Line

A vascular catheter whose tip lies in a major central vein, commonly the superior vena cava, for reliable long-term or high-concentration intravenous access.

Central Venous Pressure

Pressure measured in or near the right atrium, usually through a central venous catheter. It reflects right-sided filling conditions but is affected by ventilation, heart function, vascular tone, and measurement technique; it correlates imperfectly with circulating blood volume and fluid responsiveness.

Central Vertigo

Dizziness or an illusion of motion caused by dysfunction in the brainstem, cerebellum, or central vestibular pathways. It may occur with neurologic signs, severe imbalance, or less position-dependent symptoms.

Central Vision

Detailed vision directed at the point of gaze, provided primarily by the macula and fovea; it is needed for reading and recognizing faces.

Centriacinar Emphysema

A form of emphysema in which damage begins in the small airways and nearby air sacs, usually in the upper lungs. It is strongly linked to smoking and can cause cough, wheezing, breathlessness, and reduced exercise ability.

Centric-Fusion Translocation

A Robertsonian translocation in which the long arms of two acrocentric chromosomes fuse near their centromeres, leaving a combined chromosome and usually losing the short arms.

Centrifugation

Spinning a specimen at high speed to separate components by density, such as cells from plasma or precipitated material from a liquid.

Centrifuge

A machine that spins samples rapidly to separate their parts by density. Laboratories use it to separate blood cells from plasma, concentrate urine material, or prepare tissue samples for testing; speed is recorded in revolutions or relative force.

Centrilobular Emphysema

A type of permanent lung damage in which the small airways and nearby air sacs are destroyed, usually from long-term smoking or inhaled irritants. It often affects the upper lungs and can cause breathlessness, cough, wheezing, and reduced ability to exercise.

Alternate Names:
Centriacinar Emphysema; Proximal Acinar Emphysema

Centriole

A cylindrical microtubule structure in the centrosome that helps organize the mitotic spindle and, in some cells, forms the basal body of a cilium or flagellum.

Centromere

The constricted chromosome region where sister chromatids remain attached and the kinetochore forms for accurate chromosome segregation during cell division.

Centronuclear Myopathy

A group of inherited muscle diseases in which muscle fibers develop abnormally. Symptoms range from severe weakness and breathing problems at birth to milder adult-onset weakness, often affecting the shoulders, hips, eyelids, eye movements, face, or feet.

Alternate Names:
CNM; Myotubular Myopathy (General)

Centrosome

The main microtubule-organizing center of an animal cell, containing a pair of centrioles and coordinating the spindle during mitosis.

Centrum

The main body of a vertebra, located in front of the spinal canal. It bears much of the body's weight and joins neighboring vertebrae through shock-absorbing discs.

Cephacetrile

An older first-generation cephalosporin antibiotic that inhibits bacterial cell-wall synthesis; it is not commonly used in current practice.

Cephalalgia

Headache or pain in the head, including pain arising from cranial or related structures. It is a symptom with many possible primary and secondary causes.

Cephalexin

An oral first-generation cephalosporin that inhibits bacterial cell-wall synthesis and treats selected skin, respiratory, urinary, and other susceptible infections.

Cephalgia

Alternate spelling; see *Headache*.

Cephalhaematoma

A collection of blood beneath the membrane covering a newborn's skull bone, usually caused by birth-related pressure or injury. It is limited by skull sutures and usually resolves without treatment.

Cephalhematoma

A traumatic subperiosteal collection of blood over a neonatal cranial bone, commonly the parietal bone, resulting from rupture of periosteal blood vessels during delivery; clinically distinguished from caput succedaneum by remaining strictly bounded by cranial suture lines.

Cephalic

Relating to the head or toward the head; in obstetrics, a cephalic presentation means the fetus presents head first.

Cephalic Vein

A superficial vein on the lateral side of the upper limb that drains the hand and forearm and joins the axillary vein near the shoulder.

Cephalohematoma

A collection of blood trapped under the outer layer of a newborn's skull bone, usually caused by pressure during a long labor or delivery with vacuum suction or forceps. Because the blood is held tightly to a single bone, the swelling stays on one side of the head and does not cross the skull's bone seams (sutures). It is usually harmless and shrinks away on its own within a few weeks, though the breaking down of trapped blood can sometimes cause mild newborn jaundice.

Alternate Names:
Cephalhematoma; Cephalohaematoma.

Cephalometry

Measurement of the skull and facial structures, usually on standardized radiographs, used in orthodontic planning and assessment of craniofacial growth.

Cephalopelvic Disproportion

A situation in which the fetal head cannot pass easily through the mother's pelvis because of their relative size or shape. It may prevent vaginal delivery, but cannot always be confirmed before labor.

Cephaloridine

An older injectable first-generation cephalosporin antibiotic whose use declined because of nephrotoxicity and the availability of safer alternatives.

Cephalosporin

A bactericidal beta-lactam antibiotic that inhibits bacterial cell wall synthesis by covalently binding penicillin-binding proteins (PBPs), disrupting peptidoglycan transpeptidation. Structured on a 7-aminocephalosporanic acid nucleus, cephalosporins are divided into five generations: first generation (cefazolin, cephalexin; primarily gram-positive cocci); second (cefuroxime, cefoxitin, cefotetan; added gram-negative and anaerobes); third (ceftriaxone, ceftazidime; potent gram-negative cov-

erage and CNS penetration); fourth (cefepime; broad-spectrum with pseudomonal coverage); and fifth (ceftaroline; active against methicillin-resistant *Staphylococcus aureus* [MRSA]). Adverse effects include hypersensitivity reactions, drug-induced immune hemolytic anemia, and predisposition to *Clostridioides difficile* infection.

Cephalosporins

Plural form; see *Cephalosporin*.

Cephalothin

An older injectable first-generation cephalosporin that inhibits bacterial cell-wall synthesis and was used for susceptible serious infections.

Cephapirin

A first-generation cephalosporin antibiotic formerly used for susceptible bacterial infections; current availability and indications vary by country.

Cephradine

A first-generation cephalosporin antibiotic related to cephalexin that inhibits bacterial cell-wall synthesis and treats selected susceptible infections.

Ceramide

A type of fat that forms part of cell membranes and helps the outer skin retain water and block irritants. Ceramides also participate in signals controlling cell growth and survival.

Cercaria

A cercaria is a free-swimming larval stage of a trematode parasite; contact with some species can cause swimmer's itch or other infection.

Cercarial Dermatitis

Alternate name; see *Swimmer's Itch*.

Cerclage

A procedure in which a strong stitch is placed around the cervix to help prevent it opening too early during pregnancy. It may be placed through the vagina or abdomen and requires obstetric follow-up.

Cerebellar

Relating to the cerebellum, the part of the brain that helps coordinate balance, posture, eye movements, and accurate movement. Cerebellar disease may cause clumsiness, tremor, or unsteady walking.

Cerebellar Ataxia

Poor coordination caused by disease or injury affecting the cerebellum or its connections. It may cause an unsteady walk, clumsy movements, slurred speech, tremor, or abnormal eye movements.

Cerebellar Cortex

The folded outer layer of the cerebellum containing Purkinje and granular neurons that coordinates balance, posture, timing, and precision of movement.

Cerebellar Disease

A disorder of the cerebellum causing impaired coordination, gait ataxia, dysmetria, tremor, abnormal eye movements, or speech changes.

Cerebellar Dysmetria

Inaccurate control of the distance or force of a movement because of cerebellar dysfunction. A person may reach past a target, stop short, or have difficulty judging movement size.

Cerebellar Hemangioblastoma

A usually benign, highly vascular tumor of the cerebellum that may cause headache, imbalance, vomiting, or hydrocephalus and can occur with von Hippel-Lindau disease.

Cerebellar Hypoplasia

Incomplete development of the cerebellum, usually beginning before birth. It may cause poor coordination, abnormal eye movements, seizures, delayed development, or problems with balance and movement.

Cerebellar Neoplasm

A benign or malignant tumor involving the cerebel-

lum; symptoms may include poor coordination, imbalance, abnormal eye movements, headache, vomiting, or hydrocephalus.

Cerebellar Nuclei

Deep clusters of cerebellar neurons that receive processed signals from the cerebellar cortex and send coordinated motor output to the brainstem and thalamus.

Cerebellar Peduncle

One of three pairs of large, compact white matter fiber tracts (superior, middle, and inferior cerebellar peduncles) that physically and functionally connect the cerebellum to the midbrain, pons, and medulla oblongata, respectively.

Cerebellar Tonsillar Herniation

The life-threatening downward displacement of the cerebellar tonsils through the foramen magnum into the upper cervical spinal canal, causing direct compression of the cardiorespiratory and vasomotor centers of the medulla oblongata.

Alternate Names:
Coning; Tonsillar Herniation

Cerebellar Tumor

A growth in or near the cerebellum that may cause poor coordination, unsteady walking, abnormal eye movements, vomiting, or pressure buildup.

Cerebellar Vermis

The midline portion of the cerebellum that helps control trunk posture, gait, balance, and coordination of eye and head movements.

Cerebellitis

Inflammation of the cerebellum, often after an infection and sometimes from an immune reaction. It may cause sudden poor coordination, unsteady walking, slurred speech, abnormal eye movements, headache, or reduced alertness.

Cerebellopontine Angle

The angle-shaped region at the junction of the cerebellum, pons, and petrous temporal bone. Lesions in this space may affect cranial nerves and commonly include vestibular schwannoma.

Cerebellopontine Angle Tumor

A growth in the space between the cerebellum and brainstem. It may press on nerves that control hearing, balance, facial movement, or sensation and cause hearing loss, dizziness, facial weakness, headache, or poor coordination.

Cerebellum

A region at the back of the brain, behind the brainstem, that coordinates balance, posture, eye movements, and accurate voluntary movement. Injury or disease can cause unsteady walking, clumsy movements, tremor, or slurred speech.

Cerebral

Relating to the cerebrum or, more broadly, to the brain.

Cerebral Amyloid Angiopathy

A brain small-vessel disease, usually affecting older adults, in which amyloid—usually amyloid-beta—builds up in the walls of small and medium-sized vessels in the cerebral cortex and the membranes covering the brain. The deposits make vessels fragile and can cause bleeding in the brain's outer regions (lobar hemorrhage) or smaller bleeds (microbleeds). The disease may also cause brief episodes of neurologic symptoms or cognitive impairment. It can occur with Alzheimer disease, but the two conditions are distinct.

Cerebral Aneurysm

An abnormal focal enlargement of an artery in or around the brain. It may remain asymptomatic or rupture and cause subarachnoid hemorrhage. Risk factors include hypertension, smoking, certain inherited disorders, and family history.

Cerebral Angiography

An X-ray test in which contrast dye is put into an artery to make the blood vessels of the brain visible. It can show aneurysms, abnormal artery-to-vein

connections, narrowing, or blockage and is usually done with a thin tube called a catheter.

Cerebral Aqueduct

A narrow channel through the midbrain connecting the third and fourth brain ventricles. It allows cerebrospinal fluid to flow, and blockage can enlarge the ventricles and increase pressure.

Cerebral Arteriovenous Malformation

Alternate name; see *Brain Arteriovenous Malformation*.

Cerebral Artery

An artery that carries blood to part of the brain. A blockage can cause an ischemic stroke, while a break in the vessel can cause bleeding in or around the brain; the effects depend on which artery is involved.

Cerebral Atrophy

Loss or shrinkage of brain tissue, which may occur with aging, disease, injury, infection, or stroke. It is a finding, not a diagnosis by itself; its meaning depends on how much tissue has changed, where it has changed, and the person's symptoms.

Alternate Names:
Brain Atrophy

Cerebral Autoregulation

The brain's ability to keep its blood flow relatively steady when blood pressure changes. This control can fail after severe brain injury, stroke, low oxygen, high carbon dioxide, or effects from some medicines.

Cerebral Calcification

Abnormal calcium deposition in brain tissue, with causes including inherited, metabolic, infectious, vascular, and age-related disorders.

Cerebral Cavernous Malformation

A low-flow, angiographically occult vascular malformation of the central nervous system composed of a compact cluster of endothelial-lined sinusoidal spaces (caverns) engorged with blood, lacking intervening normal brain parenchyma, elastic lamina, or smooth muscle. May occur sporadically or as an autosomal dominant familial disorder linked to mutations in *KRIT1* (CCM1), *CCM2*, or *PDCD10* (CCM3). Manifestations include seizures, persistent headaches, focal neurologic deficits, and recurrent intraparenchymal microhemorrhages. On MRI, lesions display a characteristic reticulated "popcorn" appearance with a blooming rim of hemosiderin hypointensity on T2- and susceptibility-weighted imaging.

Cerebral Cavernous Malformations

Plural form; see *Cerebral Cavernous Malformation*.

Cerebral Cortex

The folded outer layer of the cerebrum containing nerve cells that support thinking, sensation, movement, language, memory, and awareness. Its folds increase the amount of working brain tissue within the skull.

Cerebral Crus

A bundle of nerve fibers in the midbrain that carries movement signals from the brain's outer layer toward the brainstem and spinal cord. Damage can cause weakness or poor control on the opposite side.

Cerebral Diplegia

A form of cerebral palsy in which stiffness and weakness affect both legs more than the arms. It can make standing, walking, balance, and other movements difficult.

Cerebral Edema

Swelling caused by excess fluid in or around brain tissue. It can raise pressure inside the skull, reduce blood flow, and cause headache, vomiting, confusion, seizures, coma, or life-threatening brain displacement.

Cerebral Embolism

Alternate name; see *Embolic Stroke*.

Cerebral Haemorrhage

Bleeding in or around the brain caused by a damaged blood vessel. It can injure brain tissue, increase pressure inside the skull, and cause sudden headache, weakness, confusion, seizures, or loss of consciousness.

Cerebral Hemisphere

One of the two large halves of the cerebrum, each containing specialized but interconnected cortical regions.

Cerebral Hemorrhage

Bleeding into brain tissue, usually from a damaged blood vessel. It can injure nearby brain cells, cause swelling and pressure, and produce sudden weakness, speech trouble, headache, reduced alertness, or death.

Cerebral Hypoxia

Too little oxygen reaching the brain, often because of cardiac arrest, severe breathing failure, low blood pressure, or choking. Prolonged oxygen shortage can permanently injure brain cells.

Cerebral Infarction

Permanent brain injury caused by blocked blood flow in a brain artery. The blockage may result from a clot formed in a narrowed artery or a clot traveling from the heart or another vessel.

Cerebral Ischemia

Reduced blood flow and oxygen reaching brain tissue. It may cause temporary symptoms, such as a transient ischemic attack, or permanent injury if the interruption lasts long enough.

Cerebral Lobes

Major regions of the cerebrum with different but overlapping functions: the frontal lobe supports planning and movement, the parietal sensation and spatial awareness, the temporal hearing and memory, and the occipital vision.

Cerebral Malaria

A life-threatening form of malaria in which parasites cause brain dysfunction, often with confusion, seizures, abnormal behavior, or coma. It is usually caused by Plasmodium falciparum.

Cerebral Palsy

A group of permanent disorders of movement and posture caused by nonprogressive disturbances in the developing brain. Motor limitations vary and may be accompanied by seizures, intellectual disability, communication or feeding problems, or vision, hearing, and musculoskeletal conditions. The brain disturbance does not progress, although symptoms and functional needs can change with age.

Alternate Names:
CP

Cerebral Peduncle

One of two bundles of nerve fibers in the midbrain that carry movement signals from the cerebrum to the brainstem and spinal cord. Damage can cause weakness or loss of coordinated movement on the opposite side.

Cerebral Perfusion Pressure

The pressure pushing blood through the brain, estimated from average arterial pressure minus pressure inside the skull. It falls when blood pressure drops or brain swelling raises skull pressure.

Cerebral Salt Wasting

Excessive loss of sodium and water in urine associated with brain injury or disease. It can cause low blood sodium and dehydration; replacement is guided by clinical and laboratory findings.

Cerebral Salt-Wasting Syndrome

A clinical disorder of hyponatremia and extracellular fluid volume depletion occurring in acute central nervous system disease (such as subarachnoid hemorrhage or head trauma), characterized by renal natriuresis, polyuria, and true intravascular hypovolemia.

Alternate Names:
CSWS

Cerebral Schistosomiasis

A rare form of schistosomiasis in which parasite eggs, most often from *Schistosoma japonicum*, reach the brain and trigger inflammation with granuloma formation. Depending on the affected area, it may cause headache, seizures, confusion, vision changes, or weakness. Diagnosis combines brain imaging with tests for schistosome infection, such as examination of stool or urine for eggs or blood antibody tests; brain biopsy may be needed when the diagnosis remains uncertain.

Cerebral Thrombosis

Formation of a blood clot within a cerebral artery, reducing blood flow and potentially causing an ischemic stroke.

Cerebral Toxoplasmosis

A severe, life-threatening opportunistic central nervous system infection caused by the reactivation of latent Toxoplasma gondii tissue cysts, occurring almost exclusively in patients with advanced cellular immunodeficiency (such as individuals with AIDS with CD4 counts below 100 cells/μL or recipients of organ transplants). It presents with progressive headache, fever, altered mental status, seizures, and focal neurological deficits, with contrast neuroimaging characteristically revealing multiple ring-enhancing brain lesions with surrounding vasogenic edema predominantly in the basal ganglia and corticomedullary junction.

Alternate Names:
Toxoplasma Encephalitis; CNS Toxoplasmosis; Toxoplasmic Encephalitis

Cerebral Tumor

An abnormal growth in or involving the brain. Symptoms depend on its location, size, growth, and effect on pressure inside the skull and may include headache, seizures, weakness, or changes in thinking.

Cerebral Tumours

Abnormal growths in the cerebrum, the largest part of the brain. They may be noncancerous or cancerous and can cause seizures, headache, changes in thinking, weakness, speech problems, or vision changes.

Cerebral Vasospasm

Abnormal narrowing of cerebral arteries that can reduce brain perfusion and cause delayed cerebral ischemia, especially after aneurysmal subarachnoid hemorrhage.

Cerebral Venous Sinus Thrombosis

A blood clot in a large vein or drainage channel of the brain. It can cause headache, seizures, visual problems, weakness, brain bleeding, or increased pressure inside the skull.

Cerebral Ventricle

One of four interconnected fluid-filled internal cavities of the brain (paired lateral ventricles, midline third ventricle, and fourth ventricle) lined by ependymal cells and containing choroid plexuses that synthesize cerebrospinal fluid (CSF). CSF circulates from the lateral ventricles through the interventricular foramina of Monro into the third ventricle, traverses the cerebral aqueduct of Sylvius into the fourth ventricle, and exits via the foramina of Luschka and Magendie into the subarachnoid space, providing mechanical buoyancy, hydrostatic cushioning, and biochemical waste clearance.

Alternate Names:
Cerebral Ventricles; Ventricular System

Cerebral Ventricles

Plural form; see *Cerebral Ventricle*.

Cerebral Ventriculography

Imaging of the brain's fluid-filled ventricles to assess their size, shape, connections, or blockage. Modern scans usually use computed tomography or magnetic resonance imaging rather than older invasive methods.

Cerebral Ventriculomegaly

Enlargement of one or more fluid-filled spaces inside the brain. It may result from blocked fluid drainage, loss of brain tissue, or developmental variation; its importance depends on the cause and severity.

Cerebral Visual Impairment

Reduced vision caused by damage to the brain's visual pathways or visual-processing areas rather than the eyes. It may cause poor visual attention, difficulty recognizing objects, or inconsistent use of vision.

Cerebriform Nevus Sebaceous

A usually harmless birthmark made of overgrown oil glands, often on the scalp or face, with a soft, folded surface resembling the brain. It can rarely develop another tumor, so persistent or changing lesions need review.

Cerebritis

Inflammation and infection of brain tissue before a definite abscess forms, usually caused by bacteria, fungi, or parasites. It can cause headache, fever, seizures, or neurologic deficits; imaging may show inflammation before a defined abscess forms.

Cerebroplacental Ratio

The ratio of the fetal middle cerebral artery and umbilical artery pulsatility indices, measured by Doppler ultrasound. Each index summarizes changes in blood-flow speed during the heartbeat. A low ratio for gestational age can indicate redistribution of blood flow toward the fetal brain in response to reduced placental oxygen supply; the ratio is interpreted with fetal growth and other Doppler findings.

Cerebrosides

Fat-containing substances found especially in the membranes and protective coverings of nerve cells. They help maintain nerve structure and are broken down abnormally in some inherited storage diseases.

Cerebrospinal Fluid

A clear fluid surrounding the brain and spinal cord and filling spaces inside the brain. It cushions the nervous system, helps carry nutrients and waste, and is continuously produced and reabsorbed by the body.

Alternate Names:
Spinal Fluid

Cerebrospinal Fluid Analysis

Laboratory examination of cerebrospinal fluid, usually obtained by lumbar puncture. It may assess infection, bleeding, inflammation, demyelinating disease, or malignant cells. Analysis can include opening pressure, appearance, cell counts, protein, glucose, microbiology, and other tests selected for the clinical question.

Cerebrospinal Fluid Collection

A procedure, usually lumbar puncture, that collects cerebrospinal fluid for laboratory analysis; it can help evaluate infection, bleeding, inflammation, malignancy, and other disorders of the central nervous system.

Cerebrospinal Fluid Culture

A laboratory test that attempts to grow bacteria, fungi, or other microorganisms from cerebrospinal fluid to investigate meningitis or another central nervous system infection. Results depend on prior antimicrobial treatment, specimen volume, transport, and the clinical context.

Cerebrospinal Fluid Cytology

Microscopic examination of cells in cerebrospinal fluid to evaluate suspected malignancy, infection, inflammation, or hemorrhage. It is especially useful for detecting leptomeningeal tumor involvement when interpreted with clinical and imaging findings.

Cerebrospinal Fluid Leak

Escape of cerebrospinal fluid through a tear in the membranes surrounding the brain or spinal cord, often causing positional headache.

Cerebrotendinous Xanthomatosis (CTX)

A rare inherited disorder of bile-acid synthesis, usually caused by *CYP27A1* variants. Cholesterol-derived substances accumulate in the brain, tendons, and other tissues and may cause cataracts, chronic diarrhea, tendon xanthomas, seizures, ataxia, or progressive neurologic disease.

Cerebrovascular

Relating to the brain's blood vessels and blood flow.

Cerebrovascular problems can reduce oxygen delivery and cause strokes, brief warning episodes, bleeding, or lasting problems with movement, speech, vision, or thinking.

Alternate Names:
Brain-Vascular; Cerebral Vascular

Cerebrovascular Accident

A stroke caused by a blocked brain artery or bleeding in the brain. It can suddenly cause weakness, numbness, trouble speaking, vision loss, confusion, severe headache, or loss of balance and requires emergency care.

Cerebrovascular Accident Prevention

Measures to reduce the risk of stroke, including controlling blood pressure, diabetes, and lipids, avoiding tobacco, treating atrial fibrillation when indicated, and using appropriate antithrombotic therapy.

Cerebrovascular Disease

A group of disorders affecting blood vessels and blood flow in the brain, including stroke, transient ischemic attack, aneurysm, and vascular malformations.

Cerebrovascular Disorder

A disorder of brain blood vessels or cerebral blood flow, including ischemia, hemorrhage, aneurysm, malformation, and venous thrombosis.

Cerebrovascular Occlusion

Blockage or closure of a blood vessel supplying the brain, reducing blood flow and potentially causing brain injury or an ischemic stroke.

Cerebrum

The largest part of the brain, made of two connected halves. It supports conscious movement, sensation, language, memory, thinking, emotions, and vision; different areas specialize in different functions.

Certification

A formal process confirming that a person, service, laboratory, or facility meets specified training, quality, safety, or professional standards.

Certified Nurse-Midwife

An advanced-practice nurse trained and credentialed to provide reproductive, pregnancy, birth, postpartum, and newborn care, including management of normal pregnancy and referral of complications.

Certolizumab Pegol

A biologic medicine that blocks tumor necrosis factor and treats selected inflammatory diseases, including rheumatoid arthritis and Crohn disease. It can increase the risk of serious infections.

Ceruloplasmin

The main protein that carries copper in the blood. It is made mostly by the liver; unusually low or high levels can occur in Wilson disease, inflammation, liver disease, or other conditions.

Alternate Names:
Caeruloplasmin

Ceruloplasmin Blood Test

A blood test measuring ceruloplasmin, the main copper-carrying protein in plasma; it is used with other copper studies to evaluate Wilson disease and disorders of copper metabolism.

Cerumen

Earwax, a waxy substance made in the ear canal. It traps dust and helps protect and moisturize the canal; too much can block hearing or cause discomfort.

Cerumen Impaction

Earwax packed tightly enough to block the ear canal or prevent examination of the eardrum. It may cause blocked hearing, pressure, ringing, itching, pain, or dizziness.

Alternate Names:
Earwax Impaction

Ceruminous Adenocarcinoma

A malignant tumor of the ceruminous glands in the

external ear canal that may cause pain, discharge, hearing loss, or a persistent ear-canal mass.

Cervical

Relating to the neck or to the cervix, the lower opening of the uterus. The meaning depends on context, such as cervical spine, cervical pain, or cervical cancer.

Cervical Adenocarcinoma

A malignant gland-forming tumor arising in the uterine cervix; it may be HPV-associated or HPV-independent and commonly presents with abnormal bleeding or discharge.

Cervical Arthritis

Degenerative or inflammatory disease of the neck joints that can cause neck pain, stiffness, reduced motion, and sometimes nerve or spinal-cord compression.

Cervical Atlas

The first bone of the neck, called C1. It is a ring-shaped vertebra that supports the skull and moves around the second neck vertebra when the head turns.

Cervical Biopsy

Removal of a small piece of tissue from the cervix for laboratory examination. It is commonly performed after an abnormal screening result to look for precancerous or cancerous changes.

Cervical Cancer

Cancer arising in the cervix, most often after persistent infection with a high-risk human papillomavirus type. Early disease may cause no symptoms; later signs include unusual bleeding, discharge, or pelvic pain.

Cervical Cancer Screening and Prevention

Prevention and early detection of cervical cancer through human papillomavirus (HPV) vaccination and screening for cervical precancer or cancer using cervical cytology, primary high-risk HPV testing, or both.

Alternate Names:
Cervical Cancer Screening

Cervical Cap

A flexible contraceptive barrier placed over the cervix to keep sperm from entering the uterus. It is used with spermicide and must remain in place for the recommended time after sex.

Cervical Carcinoma

A malignant tumor of the uterine cervix, most commonly associated with persistent high-risk human papillomavirus infection.

Cervical Cerclage

A procedure that places a strong stitch around the cervix during pregnancy to help keep it closed when early opening raises the risk of pregnancy loss or premature birth. It may be placed through the vagina or abdomen.

Cervical Change

An alteration in the uterine cervix. In labor, it usually means cervical effacement (thinning and shortening) or dilation (opening); the phrase alone does not name a specific cervical lesion or abnormal cell change.

Cervical Dilatation

Opening of the cervix during labor, measured from closed to about 10 centimeters. The cervix also becomes thinner and shorter, allowing the baby's head to pass into the birth canal.

Cervical Dilation

The opening of the cervical canal during labor, progressing from closed to about 10 centimeters. It occurs with thinning and shortening of the cervix and is needed for vaginal birth.

Cervical Disc Herniation

A neck disc bulges or tears and presses on a nearby nerve root or the spinal cord. It may cause neck

pain, arm pain, tingling, numbness, or weakness.

Cervical Discitis

Infection or inflammation of a disc between the bones of the neck. It often causes persistent neck pain and stiffness and may also affect nearby bone.

Cervical Dislocation

Abnormal displacement of one cervical vertebra relative to another, usually from trauma, that can destabilize the neck and injure the spinal cord.

Cervical Dysplasia

See *Cervical Intraepithelial Neoplasia*.

Cervical Dystocia

Failure of the uterine cervix to dilate normally during labor, which can delay or prevent vaginal delivery.

Cervical Dystonia

Involuntary tightening of neck muscles that pulls the head into an unusual position. It may cause neck pain, twisting, jerky movements, or tremor.

Alternate Names:
Spasmodic Torticollis

Cervical Ectropion

A common condition in which cells normally lining the cervical canal extend onto the outer cervix. It may cause increased discharge or bleeding after sex, but it is usually benign and is not the same as cervical cancer.

Cervical Facet Joint Syndrome

Neck pain thought to come from the small joints between the neck bones. This name describes a possible source of pain; it does not by itself prove which joint is causing it.

Cervical Effacement

Thinning and shortening of the cervix during labor, measured from 0% to 100%. Complete effacement leaves the cervix very thin and usually occurs with opening of the cervix.

Cervical Endometriosis

Endometrial-like tissue in or on the cervix that may cause bleeding after sex, pelvic pain, or an abnormal cervical lesion.

Cervical Exam In Labor

A vaginal examination during labor that checks how open and thin the cervix is and how low and positioned the baby's head is. Repeated examinations help assess progress, but are limited when infection or bleeding is a concern.

Cervical Ganglion

A cluster of nerve-cell bodies in the sympathetic chain of the neck that relays autonomic signals to the head, neck, and upper chest.

Cervical Incompetence

Older term; see *Cervical Insufficiency*.

Cervical Insufficiency

Painless cervical shortening or dilation in the second trimester that can lead to pregnancy loss or preterm birth, often with no or only mild contractions.

Cervical Intraepithelial Neoplasia

Biopsy-confirmed abnormal changes in the surface squamous cells of the cervix, usually associated with persistent high-risk human papillomavirus infection. CIN is graded from 1 to 3 by how abnormal the cells look and how much tissue is affected. CIN is not cancer; many low-grade changes clear, while high-grade changes have a greater chance of becoming cancer if not monitored or treated.

Alternate Names:
CIN

Cervical Length Screening

Ultrasound measurement of the cervix, usually through the vagina, to estimate the risk of premature birth. A shorter cervix can increase risk, but interpretation depends on gestational age, pregnancy history, symptoms, and the measurement method.

Cervical Lymphadenopathy

One or more enlarged or otherwise abnormal lymph nodes in the neck. It often occurs with an infection, but can also result from immune disease or cancer.

Cervical Lymphadenitis

Infection or inflammation of one or more lymph nodes in the neck. The nodes may become swollen and painful, often during or after an infection of the throat, ear, teeth, or skin.

Cervical MRI Scan

Magnetic resonance imaging of the cervical spine that uses a magnetic field and radio waves to produce detailed images of the neck vertebrae, discs, spinal cord, nerves, and surrounding soft tissues.

Cervical Mucus

Fluid made by glands in the cervix. It becomes thinner and more slippery around ovulation, which can help sperm move, and thicker at other times. During pregnancy, it helps form a protective plug in the cervical canal.

Cervical Muscle Strain

An overstretch or small tear in a neck muscle, often after sudden movement, overuse, or holding the neck in one position for a long time. It can cause pain, tenderness, and stiffness.

Cervical Myelopathy

Dysfunction of the spinal cord caused by compression in the cervical spine, often producing hand clumsiness, gait disturbance, weakness, sensory changes, or abnormal reflexes.

Cervical Osteoarthritis

Alternate name; see *Cervical Spondylosis*.

Cervical Osteomyelitis

Infection of one or more bones in the neck. It may cause persistent neck pain, tenderness, fever, or weakness and needs prompt medical assessment.

Cervical Pain

Alternate name; see *Neck Pain*.

Cervical Plexus

A network of nerves in the neck that carries sensation from the neck and part of the head and helps control some neck muscles and the diaphragm.

Cervical Polyp

A benign, finger-like growth originating from the mucosal lining of the cervix, most commonly from the endocervical canal. Cervical polyps are soft, reddish, and rich in microscopic blood vessels. While many cause no symptoms and are discovered during routine pelvic examinations, they can cause abnormal vaginal bleeding, postcoital spotting, or increased watery discharge; malignant transformation is rare.

Cervical Polyps

Plural form; see *Cervical Polyp*.

Cervical Pregnancy

A rare ectopic pregnancy implanted in the endocervical canal below the internal opening of the cervix. It may present with painless vaginal bleeding after a missed period; the vascular implantation can cause severe hemorrhage. On ultrasound, the gestational sac lies below the internal opening.

Alternate Names:
Cervical Ectopic Pregnancy

Cervical Radiculopathy

Irritation or compression of a nerve leaving the neck, often from a disc problem or arthritis. It can cause neck pain spreading into the arm, with tingling, numbness, or weakness.

Cervical Rib

An extra rib growing from a neck vertebra, usually the lowest one. It often causes no symptoms but can narrow the space for nerves or blood vessels and produce arm pain, numbness, or swelling.

Cervical Rib Syndrome

Pressure on nerves or blood vessels in the space

between the neck and arm, caused by an extra rib or nearby tight tissue. It may cause arm pain, tingling, weakness, swelling, or color change. See also *Thoracic Outlet Syndrome*.

Cervical Ripening

Softening, thinning, and early opening of the cervix before or during labor. It may occur naturally or be induced with medicines or mechanical methods when labor needs to be started; the method depends on cervical findings, pregnancy factors, and uterine-scar history.

Cervical Ripening Agents

Medicines or mechanical devices used to soften and prepare the cervix before labor induction. Options include prostaglandins and cervical balloons; selection and dosing depend on the cervix, pregnancy, contraindications, and local obstetric protocol.

Cervical Screening

Testing used to detect high-risk human papillomavirus infection and precancerous or cancerous changes of the cervix. The method and interval depend on age, prior results, vaccination, immune status, and local guidelines.

Cervical Spine

The seven bones in the neck, numbered C1 through C7. They support the head, protect the upper spinal cord, allow neck movement, and contain openings for important blood vessels.

Cervical Spine CT Scan

Computed tomography of the cervical spine that uses x-rays and computer reconstruction to show the bones and alignment of the neck; it is particularly useful for detecting fractures and other bony abnormalities.

Cervical Spine Fracture

A break in one or more of the seven bones in the neck, usually from a fall, crash, or other injury. It can damage the spinal cord, so suspected fractures need urgent medical assessment.

Cervical Spine Instability

Abnormal movement between the bones of the neck because of injury, worn joints, or disease. It can cause pain or, if severe, press on or injure the spinal cord.

Cervical Spinal Cord Injury

Damage to the spinal cord in the neck, often from a fracture or other injury. It can cause weakness or paralysis, loss of feeling, or problems controlling breathing, the bladder, or the bowel.

Cervical Spinal Stenosis

Narrowing of the space in the neck bones that holds the spinal cord and nerves. It may cause neck pain, numbness, weakness, or trouble walking; some people have no symptoms.

Cervical Spine Involvement in Rheumatoid Arthritis

Rheumatoid arthritis can inflame joints near the top of the neck, especially the joint between the first two neck bones. This may make the bones unstable or press on the spinal cord, causing pain, weakness, numbness, or trouble walking.

Cervical Spine Pain

Alternate name; see *Neck Pain*.

Cervical Spine Trauma

An injury to the neck bones, discs, ligaments, spinal cord, or exiting nerves. It may cause pain, weakness, numbness, or paralysis; severe injury can destabilize the spine or damage the spinal cord.

Cervical Spondyloarthropathy

Wear or inflammation affecting the joints and discs of the neck. It may cause neck stiffness and pain, or press on nerves or the spinal cord, producing arm symptoms, weakness, or walking problems.

Cervical Spondylosis

Age-related wear of the neck, including changes in discs, bones, joints, and ligaments. It may cause neck pain and stiffness and, if nerves or the spinal

cord are compressed, limb symptoms.

Alternate Names:
Degenerative Cervical Spine Disease

Cervical Spondylotic Myelopathy

Pressure on the spinal cord in the neck caused by age-related changes in the bones and discs. It can cause hand clumsiness, weakness, numbness, or problems with balance and walking.

Alternate Names:
CSM

Cervical Squamous Cell Carcinoma

A cancer that begins in the flat surface cells of the cervix, most often after persistent infection with a high-risk human papillomavirus type. It may cause unusual bleeding or discharge, but early disease may have no symptoms.

Cervical Squamous Intraepithelial Lesion

Alternate name; see *Cervical Intraepithelial Neoplasia*.

Cervical Stenosis

Narrowing or complete closure of the passage through the cervix, the lower part of the uterus. It may be present from birth or develop after menopause, cervical surgery, radiation, endometrial procedures, or cervical or uterine cancer. It often causes no symptoms, but may cause painful or absent periods, abnormal bleeding, trapped blood or pus in the uterus, or rarely infertility. This term refers to the cervix; narrowing of the spinal canal is called cervical spinal stenosis.

Cervical Strain (Whiplash)

Injury to the neck muscles, ligaments, and other soft tissues caused by rapid flexion and extension, commonly during a motor-vehicle collision. Neck pain, stiffness, headache, and shoulder or arm symptoms may occur.

Cervical Vertebrae

The seven bones of the neck, numbered C1 through C7. They support the head, protect the upper spinal cord, and allow neck movement; openings in several of them carry the vertebral arteries.

Cervicitis

Inflammation of the cervix, commonly caused by a sexually transmitted infection, changes in normal vaginal bacteria, chemical irritation, or allergy. It may cause discharge, bleeding after sex, or pelvic discomfort, but can be symptomless.

Cervicogenic Headache

Head pain caused by a problem in the neck, such as a joint, disc, muscle, or nerve disorder. Pain often starts in the neck and spreads to one side of the head and may worsen with neck movement.

Alternate Names:
Cervical Headache; Neck-Related Headache

Cervix

The lower part of the uterus that opens into the vagina. It lets menstrual blood leave the uterus, allows sperm to enter, produces cervical mucus, and widens during childbirth.

Cervix Carcinoma

Cancer arising from the cervix, most often related to persistent high-risk human papillomavirus infection; screening and HPV vaccination reduce risk, and treatment depends on stage.

Cervix Cryosurgery

Freezing abnormal surface cells of the cervix with a very cold probe. It may treat selected precancerous changes after appropriate testing; watery discharge and cramping are common temporarily.

Cervix Disease

Any disorder affecting the lower part of the uterus, including infection, polyps, precancer, cancer, scarring, or pregnancy-related changes. Symptoms and treatment depend on the specific condition.

Cervix Neoplasm

A benign, precancerous, or malignant growth of the cervix; evaluation may include pelvic examination,

HPV testing, cytology, colposcopy, and biopsy.

Cervix Uteri

The cervix uteri is the lower portion of the uterus that projects into the vagina and forms the passage between the uterus and birth canal.

Cesarean Delivery

Alternate name; see *Cesarean Section*.

Cesarean Section

Delivery of a baby through cuts in the abdomen and uterus. It may be planned or done urgently when vaginal birth is unsafe for the pregnant person or baby. The operation is usually done with spinal or epidural medicine so the person is awake but does not feel pain.

Alternate Names:
Caesarean Section; Caesarean Delivery; LSCS

Cesium

A chemical element whose radioactive isotope cesium-137 can cause serious external or internal radiation injury after contamination or exposure.

Cessation of Menstruation

Cessation of menstrual periods, called amenorrhea; it is a normal part of menopause but may also result from pregnancy, illness, endocrine disorders, medications, stress, excessive exercise, or inadequate nutrition.

Cestoda

The tapeworm class of flatworms; human infection follows ingestion of eggs or larval tissue and can cause intestinal disease or tissue cysts.

Cestode

A cestode is a tapeworm, a segmented parasitic flatworm that can infect humans or animals through contaminated food, water, or intermediate hosts.

Cestodiasis

Infection or infestation caused by cestodes, commonly called tapeworms. Disease may involve the intestine or tissues, depending on the species and life-cycle stage.

Alternate Names:
Tapeworm Infection; Cestode Infection

Cetirizine

A second-generation H1 antihistamine used for allergic rhinitis and urticaria; it is less sedating than older antihistamines but can still cause drowsiness.

Cetrimide

An antiseptic and detergent used in some skin preparations and laboratories. It reduces microorganisms by disrupting cell membranes, but concentrated or swallowed amounts can irritate or burn tissues.

Cetrorelix

A hormone-blocking medicine used during assisted reproduction to prevent premature ovulation. It temporarily blocks gonadotropin-releasing hormone receptors; injection-site reactions, headache, nausea, or allergy may occur.

Cetuximab

A monoclonal antibody that blocks the epidermal growth factor receptor. It is used for selected colorectal, head-and-neck, and other cancers and commonly causes acne-like rash.

Cevimeline

A muscarinic receptor agonist used to stimulate salivary secretion and relieve dry mouth, especially in selected patients with Sjögren syndrome.

Cevimeline Hydrochloride

A medicine that stimulates muscarinic receptors to increase saliva. It is used mainly for dry mouth in Sjögren syndrome and can cause sweating, nausea, or blurred vision.

CF

Alternate name; see *Cystic Fibrosis*.

CF (Cystic Fibrosis)

Abbreviation for cystic fibrosis, an inherited disor-

der caused by CFTR variants that produce thick secretions, chronic lung infection, pancreatic insufficiency, infertility in many males, and other organ complications.

C Fiber

A thin nerve fiber that carries slow, aching pain, warmth, and itch from the skin and other tissues to the spinal cord and brain.

CFS

Chronic fatigue syndrome, a condition involving substantial persistent fatigue with post-exertional worsening and associated symptoms that are not explained by another disorder.

Alternate Names:
Chronic Fatigue Syndrome; Myalgic Encephalomyelitis/Chronic Fatigue Syndrome

CFS (Chronic Fatigue Syndrome)

Abbreviation for myalgic encephalomyelitis/chronic fatigue syndrome, a complex illness involving substantial reduction in activity, post-exertional malaise, unrefreshing sleep, and often cognitive impairment or orthostatic intolerance.

CFTR Modulator Therapy

Medicines that improve the amount or function of defective CFTR protein in people with cystic fibrosis. The appropriate combination depends on the person's CFTR variants; treatment can improve breathing, nutrition, and salt-water balance.

CHA2DS2-VASc Score

A score estimating stroke risk in a person with atrial fibrillation. It considers heart failure, high blood pressure, age, diabetes, previous stroke, blood-vessel disease, and sex; the result helps clinicians decide whether a blood thinner may offer more benefit than harm.

Alternate Names:
CHA2DS2-VASc; Atrial Fibrillation Stroke Risk Score

Chaddock Reflex

Alternate name; see *Chaddock Sign*.

Chaddock Sign

An upward movement of the big toe when the skin along the outer foot is stroked. It can be a sign of damage to nerve pathways in the brain or spinal cord that control movement.

Alternate Names:
Chaddock's Sign

Chadwick Sign

A bluish-purplish discoloration of the cervix, vagina, and vulval mucosa caused by local venous engorgement and heightened vascularity in early pregnancy, typically observable by speculum examination around 6 to 8 weeks of gestation.

Alternate Names:
Chadwick's Sign; Jacquemier Sign

Chafing

Skin irritation caused by repeated friction, moisture, heat, or tight clothing, producing redness, burning, tenderness, and sometimes erosions in opposing or rubbing areas.

Chagas Cardiomyopathy

The chronic, progressive inflammatory and fibrosing cardiac disease resulting from long-standing infection with the protozoan parasite Trypanosoma cruzi (Chagas disease), emerging 10 to 30 years after primary infection in up to 30% of chronically infected individuals. It is characterized by biventricular enlargement, apical left ventricular aneurysms, conduction system disease (notably right bundle branch block and left anterior fascicular block), malignant ventricular tachyarrhythmias, heart failure, and systemic thromboembolism.

Alternate Names:
Chagasic Cardiomyopathy; Chronic Chagasic Cardiomyopathy; Chagas Heart Disease; Trypanosoma Cruzi Cardiomyopathy

Chagas Disease

An infection caused by the protozoan *Trypanosoma*

cruzi. In endemic regions, it is usually transmitted when feces of infected triatomine ("kissing") bugs contaminate a bite wound or mucous membrane. Transmission can also occur congenitally, through transfusion or transplantation, or from contaminated food. Acute disease is often mild or asymptomatic; chronic infection can cause cardiomyopathy, arrhythmias, or enlargement of the esophagus or colon.

Alternate Names:
American Trypanosomiasis; Trypanosoma cruzi Infection

Chagasic Megacolon

A severe gastrointestinal complication of chronic Chagas disease (Trypanosoma cruzi infection) caused by parasite-induced destruction of intramural autonomic ganglia in the myenteric (Auerbach) plexus of the large intestine. The resulting denervation produces loss of coordinated peristalsis, progressive organ dilatation, and muscular hypertrophy predominantly affecting the sigmoid colon and rectum, clinically manifesting with severe intractable constipation, abdominal distention, fecaloma impaction, and risk of sigmoid volvulus.

Alternate Names:
Mega-Megacolon in Chagas Disease; Chagas Megacolon

Chagoma

A red, swollen lump where the parasite causing Chagas disease enters the body. It may be painful and accompanied by swollen nearby lymph nodes during the early stage of infection.

Chain Of Custody

A dated record showing who collected, stored, transferred, tested, and finally disposed of an item or specimen. It helps prove that medical, forensic, or laboratory evidence was identified correctly and was not altered or mixed up.

Chain-Termination Codon

A codon that signals the end of protein translation; the three standard stop codons are UAA, UAG, and UGA in messenger RNA.

Chalazion

A usually painless, firm eyelid lump caused by blockage and inflammation of a meibomian oil gland.

Challenge Agent

A substance, organism, allergen, or physiologic stimulus deliberately administered in a controlled test to provoke and measure a response.

Challenge Testing

A controlled exposure to a suspected trigger, such as a food or medication, to assess whether it produces a reproducible reaction.

Alternate Names:
Provocation Testing; Challenge Test

Chamberlain Procedure

An anterior mediastinotomy surgical technique involving an incision through the second or third left anterior intercostal space with resection of cartilage, designed to biopsy anterior mediastinal masses or aortopulmonary window lymph nodes that are inaccessible via cervical mediastinoscopy.

Alternate Names:
Anterior Mediastinotomy

Chamomile Extract

An extract of chamomile flowers used in traditional and complementary products; allergic reactions and medicine interactions are possible, while evidence varies by indication.

Chanarin-Dorfman Disease

A rare inherited lipid-storage disorder, usually caused by changes in the *ABHD5* gene, in which triglycerides accumulate in skin, liver, muscle, blood cells, and other tissues. It commonly causes congenital ichthyosis and may also cause liver disease, cataracts, hearing loss, muscle weakness, or developmental problems.

Alternate Names:
Chanarin-Dorfman Syndrome; Dorfman-Chanarin Disease; Neutral Lipid Storage Disease With Ichthyosis

Chance Fracture

A horizontal flexion-distraction injury of the thoracolumbar spine involving a transverse fracture line through the vertebral body, pedicles, laminae, and spinous process. Classically associated with lap-type seatbelt restraint deceleration injuries in motor vehicle collisions, it is frequently accompanied by blunt intra-abdominal organ trauma.

Alternate Names:
Seatbelt Fracture; Flexion-Distraction Spine Fracture

Chancre

The usually painless, firm ulcer that forms at the entry site of primary syphilis. It is commonly single, has a clean base, and may be accompanied by enlarged nearby lymph nodes; it can heal without treatment while the infection persists.

Alternate Names:
Syphilitic Chancre

Chancroid

A sexually transmitted infection caused by *Haemophilus ducreyi*, producing one or more painful, ragged genital ulcers with a purulent base and tender, sometimes suppurative groin lymph nodes. Clinical diagnosis requires excluding syphilis and genital herpes; antibiotic treatment and partner evaluation are important.

Chandelier Sign

Marked pain elicited by moving the cervix during a pelvic examination, also called cervical motion tenderness. It can support suspicion of pelvic inflammatory disease in the appropriate clinical context, but is nonspecific and may occur with other pelvic conditions.

Chandipura Virus Infection

An acute, fulminant pediatric encephalitis caused by Chandipura virus, a vesiculovirus belonging to the family Rhabdoviridae and transmitted by phlebotomine sandflies (Phlebotomus papatasi). Predominantly affecting children under 15 years of age in central and western India, it is characterized by the rapid onset of high fever, vomiting, and altered sensorium, progressing within 24 to 48 hours to generalized convulsions, coma, and respiratory failure, carrying an exceptionally high case-fatality rate.

Alternate Names:
Chandipura Encephalitis; Chandipura Viral Encephalitis

Change in Bowel Habits

A new change in stool frequency, consistency, caliber, or pattern, including persistent diarrhea, constipation, or alternating bowel habits. Associated bleeding, weight loss, anemia, or severe pain can indicate underlying disease.

Channelopathy

A disorder caused by abnormal proteins that control movement of charged particles through cell membranes. It can affect nerves, muscles, or the heart and may cause seizures, weakness, or abnormal rhythms.

Channelrhodopsin

A microbial light-gated ion-channel protein, originally identified in algae, that conducts ions across a cell membrane when illuminated. Different types conduct cations or anions; in optogenetics, they are used to change the electrical activity of genetically targeted cells with light.

Chaplain

A trained spiritual-care professional who supports patients and families with religious, existential, emotional, or ethical concerns in healthcare settings.

Chapped Hands

Dry, cracked, inflamed skin of the hands caused by irritants, cold, low humidity, frequent washing, eczema, or allergy; fissures can become painful or infected.

Chapped Lips

Dry, scaling, fissured lips caused by weather, licking, dehydration, irritants, medicines, or cheilitis; persistent lesions may be associated with infection or another disorder.

Charcoal

A black carbon-rich material made by heating organic matter with little oxygen. In medicine, specially prepared charcoal may be given in selected poisonings to reduce absorption of some substances, but it is not useful for every poisoning.

Charcot Arthropathy

Progressive joint damage caused by loss of protective sensation, so repeated injuries go unnoticed. The joint may become warm, swollen, unstable, and deformed, especially in people with diabetic nerve damage.

Charcot-Bouchard Aneurysm

A proposed microaneurysmal dilation of a small penetrating cerebral artery associated with chronic hypertension. Hypertensive small-vessel arteriopathy is an established cause of deep brain hemorrhage; the frequency and causal role of discrete Charcot-Bouchard aneurysms remain debated.

Charcot Foot

Progressive bone and joint damage in the foot or ankle associated with peripheral neuropathy and loss of protective sensation. Repeated, often unnoticed injury can cause fractures, instability, and deformity. A warm, red, swollen foot can indicate active Charcot neuroarthropathy.

Alternate Names:
Charcot's Foot

Charcot Joint

Severe destruction of a joint caused by loss of pain and position sensation. Repeated unnoticed injury can fragment bone, loosen or dislocate the joint, and produce major deformity.

Charcot-Leyden Crystals

Slender, microscopic hexagonal bipyramidal crystals composed of eosinophil lysophospholipase (galectin-10) protein. They are found in sputum, stool, tissues, and bodily fluids in conditions characterized by eosinophilic inflammation, notably bronchial asthma, allergic rhinitis, and invasive parasitic infestations.

Alternate Names:
Charcot-Leyden Crystal; Galectin-10 Crystals

Charcot-Marie-Tooth Disease

A group of inherited peripheral-nerve disorders that damage nerves supplying the feet, legs, hands, and arms. Symptoms usually include gradually worsening weakness, muscle wasting, numbness, foot deformity, and difficulty walking. It is genetically heterogeneous and may follow autosomal dominant, autosomal recessive, or X-linked inheritance.

Alternate Names:
CMT; Hereditary Motor and Sensory Neuropathy (HMSN)

Charcot's Joints

Charcot's joints are severely damaged, unstable joints caused by loss of protective sensation, classically in diabetic neuropathy or other neurologic disease.

Charcot's Triad

Charcot's triad is fever, jaundice, and right-upper-quadrant pain, a classic but incomplete clinical pattern of acute ascending cholangitis.

Charcot Triad

The combination of fever, pain in the upper-right abdomen, and jaundice, traditionally associated with acute infection of blocked bile ducts. This pattern is important but may be absent even in serious disease.

Charcot Triad of Cholangitis

The combination of fever, pain in the upper-right abdomen, and jaundice. It is a classic pattern of infection in blocked bile ducts, but many people with serious infection do not have all three signs.

Charcot-Wilbrand Syndrome

A rare neuropsychiatric syndrome after brain injury characterized by loss of visual imagery and visual dreaming, sometimes with difficulty recognizing or interpreting visual information.

Chargaff Rule

The observation that double-stranded DNA contains approximately equal amounts of adenine and thymine and of guanine and cytosine, reflecting complementary base pairing.

CHARGE Syndrome

A genetic condition, usually involving a new change in the CHD7 gene, that can affect the eyes, ears, heart, breathing passages, growth, development, and reproductive system. Features vary widely.

Charles Bonnet Syndrome

Visual hallucinations occurring in a person with significant vision loss who otherwise understands that the images are not real. The images may be simple patterns or detailed scenes; similar hallucinations can have other causes.

Charley Horse

A sudden painful muscle cramp, commonly in the calf or thigh. It may follow exercise, dehydration, prolonged positioning, nerve problems, or certain medicines and usually lasts from seconds to minutes.

Char Syndrome

A rare genetic disorder, usually caused by variants in *TFAP2B*, characterized by distinctive facial features, a heart defect such as patent ductus arteriosus, and abnormalities of the fifth fingers or toes.

Chasing The Dragon

Inhalation of vapor produced by heating heroin, a method of drug use that can cause dependence, overdose, toxic exposures, and neurological injury.

Chaulmoogra Oil

Chaulmoogra oil is a historical plant oil once used to treat leprosy and some skin diseases; it has largely been replaced by effective antimicrobial therapy.

CHD

Alternate index label; see *Congenital Heart Disease*.

Checkpoint Inhibitor

A class of monoclonal antibody immunotherapies that block negative inhibitory regulators of T-cell activation (such as PD-1, PD-L1, or CTLA-4), thereby relieving immune suppression and unleashing antitumor cytotoxic T-lymphocyte responses.

Alternate Names:
Immune Checkpoint Inhibitor; ICI

Checkpoints

Regulatory signals that help prevent immune cells from attacking healthy tissues. Some cancers use checkpoint pathways to evade immunity; checkpoint-inhibitor medicines block selected signals to restore antitumor immune activity.

Chediak-Higashi Syndrome

A rare inherited immune disorder caused by changes in both copies of the LYST gene. It can cause unusually light or silvery hair, repeated infections, easy bruising, nerve problems, and a severe inflammatory crisis.

Cheek

The facial region forming the side wall of the mouth, containing skin, muscle, fat, salivary structures, nerves, and blood vessels.

Cheilectropion

An eversion deformity of the lip, usually involving the lower lip. It may result from scarring, congenital malformation, or loss of tissue support.

Cheilitis

Inflammation of one or both lips that can cause dryness, peeling, cracks, swelling, pain, or sores. Causes include irritation, allergy, infection, low nutrient levels, sun exposure, or skin disease.

Cheilitis Glandularis

A rare inflammatory disorder of minor salivary glands in the lips, usually the lower lip, causing enlarged gland openings, swelling, mucus or saliva discharge, and sometimes eversion of the lip. Persistent lesions need biopsy or specialist assessment

because chronic inflammation can mimic or coexist with neoplasia.

Cheilitis Granulomatosa

Persistent swelling of one or both lips caused by granulomatous inflammation. It may occur alone or as part of Melkersson–Rosenthal syndrome or Crohn disease, which may also involve recurrent swelling, facial palsy, or a fissured tongue.

Cheilodynia

Pain of the lips, which may result from inflammation, infection, trauma, allergy, dryness, nerve pain, or another oral or dermatologic disorder.

Cheilognathopalatoschisis

A birth defect in which the upper lip, the gum-bearing part of the jaw, and the roof of the mouth do not join completely before birth. It can interfere with feeding, speech, hearing, and tooth development.

Cheilognathoschisis

A congenital cleft of the lip and alveolar part of the upper jaw, with or without associated palatal involvement.

Cheiloplasty

Plastic or reconstructive surgery of the lip, performed to repair congenital clefting, trauma, tumors, scars, or other deformity.

Cheiloschisis

Cleft lip, a congenital fissure of the upper lip caused by incomplete fusion of facial processes during embryonic development. It may occur alone or with cleft palate.

Cheilosis

A disorder of the lips characterized by dryness, scaling, fissuring, or inflammation. Causes include irritation, nutritional deficiency, infection, and systemic disease.

Cheiromegaly

Abnormal enlargement of one or both hands, classically associated with excess growth hormone but also possible with local overgrowth or other disorders.

Cheiropompholyx

A hand-limited form of dyshidrotic eczema causing recurrent, intensely itchy, small fluid-filled blisters on the palms or sides of the fingers. The blisters may be followed by peeling or painful cracks.

Chelating Agent

A substance or medication that binds tightly to heavy metals or minerals in the bloodstream and tissues, forming a stable chemical complex that the body can safely excrete through urine or stool. In medicine, these agents are used to remove toxic levels of metals such as lead, mercury, arsenic, or excess copper.

Chelating Agents

Plural form; see *Chelating Agent*.

Chelation

The formation of a stable complex between a metal ion and a molecule with multiple binding sites. In medicine, chelation can be used under supervision to bind and promote elimination of selected toxic metals.

Chelation Study

A test that uses a metal-binding substance and imaging or blood measurements to assess how the body handles a mineral or to locate abnormal deposits. The exact method depends on the clinical question.

Chelation Therapy

Treatment using a medicine that binds a specific harmful or excess metal so the body can remove it in urine or stool. It is used only for selected poisonings or disorders because it can harm the kidneys or alter essential minerals.

Chemexfoliation

Application of a chemical solution to remove controlled layers of skin, improving selected scars, pigmentation, wrinkles, or superficial lesions.

Chemical

A substance defined by its molecular composition and properties; medical effects depend on dose, route, exposure duration, metabolism, and biological target.

Chemical Ablation

Destruction of tissue by applying or injecting a chemical. Examples include chemical cautery of small lesions and sclerotherapy, in which a chemical irritates a vein so it closes.

Chemical Burn

Acute destructive tissue injury resulting from exposure to caustic acidic, alkaline, or organic chemical agents. Strong acids (e.g., sulfuric, hydrochloric, nitric) produce coagulative necrosis with protein precipitation, forming a protective surface eschar that tends to limit deep penetration. Strong alkalis (e.g., sodium hydroxide, lye, lime, ammonia) cause saponification of cellular fatty acids and liquefactive necrosis, enabling rapid, deep, and progressive tissue destruction. Initial emergency management mandates immediate, voluminous water irrigation for a minimum of 15–30 minutes (with exceptions for lime or elemental sodium), removal of contaminated clothing, and agent-specific antidotal therapy (e.g., topical calcium gluconate for hydrofluoric acid burns).

Chemical Burn Or Reaction

Tissue injury caused by contact with a corrosive or irritating chemical, commonly affecting the skin or eyes; severity depends on the substance, concentration, contact time, and tissue involved.

Chemical Burns

Plural form; see *Chemical Burn*.

Chemical Carcinogenesis

Development of cancer after exposure to chemicals that cause DNA damage, abnormal cell signaling, chronic tissue injury, or altered gene regulation.

Chemical Cleavage

Breaking a chemical bond with a reagent, used in laboratory analysis, molecular biology, synthesis, or controlled degradation of a larger molecule.

Chemical Cofactor

A nonprotein chemical helper required for an enzyme or biologic reaction, such as a metal ion, vitamin-derived coenzyme, or other small molecule.

Chemical Eye Injury

Damage to the eye from an acidic or alkaline substance. Alkaline chemicals can continue penetrating tissue and cause progressive damage.

Chemical Fractionation

Separation of a mixture into fractions according to chemical or physical properties such as solubility, charge, size, or binding affinity.

Chemical Impurity

An unintended chemical present in a medicine, specimen, or material, potentially affecting safety, stability, measurement accuracy, or biologic activity.

Chemical Injury

Tissue damage caused by contact with a corrosive or irritating chemical. Acids and alkalis can destroy tissue differently; effects depend on concentration, exposure time, and affected body area.

Chemical Peel

A dermatologic skin-resurfacing procedure involving the controlled topical application of chemical exfoliating agents to induce epidermal and dermal necrosis followed by re-epithelialization and neocollagenesis. Stratified by histologic depth of injury: superficial peels (α-hydroxy glycolic/lactic acids, β-hydroxy salicylic acid, Jessner solution) penetrate the epidermis to treat superficial dyschromia and acne; medium-depth peels (trichloroacetic acid [TCA] 35–50%) penetrate the papillary dermis

to target actinic keratoses and moderate rhytids; and deep peels (Baker-Gordon phenol formulation) penetrate the reticular dermis for severe photoaging, requiring cardiac monitoring due to systemic phenol cardiotoxicity.

Chemical Peels

Plural form; see *Chemical Peel*.

Chemical Pleurodesis

A therapeutic procedure in which a sclerosing chemical agent (such as sterile talc slurry, doxycycline, or bleomycin) is instilled into the pleural space via a chest tube to induce intense parietal and visceral pleural inflammation, obliterating the pleural cavity to prevent recurrent pneumothorax or malignant pleural effusion.

Chemical Pneumonitis

Lung inflammation and injury after inhaling or breathing in irritating chemicals, stomach contents, fuels, or other toxic substances. It may cause cough, shortness of breath, wheezing, low oxygen, and chest imaging changes.

Chemistry

The study of substances, their composition, properties, reactions, and transformations, forming the basis of biochemistry, pharmacology, toxicology, and laboratory medicine.

Chemo

Informal shorthand for chemotherapy, treatment using drugs that destroy cancer cells, inhibit their growth, or suppress abnormal immune cells.

Chemoattractant

A chemical signal that guides cells, especially immune cells, toward its source. Such signals help direct cells to areas of infection, inflammation, tissue repair, or normal development.

Chemo Brain

Problems with memory, concentration, word-finding, or mental processing that may occur during or after cancer treatment. Symptoms can affect work and daily activities and may have several contributing causes.

Chemodectoma

A usually slow-growing tumour arising from specialized hormone-sensing nerve tissue, most often near the carotid artery in the neck. It may cause a neck lump or press on nearby nerves and blood vessels.

Chemoembolization

A treatment that delivers cancer medicine through an artery feeding a tumour and then blocks that artery. It is used mainly for selected liver cancers to concentrate treatment and reduce the tumour's blood supply.

Chemokine

A small signaling protein that directs immune cells to sites of infection, inflammation, or tissue repair. Different chemokines attract different cell types by binding to matching receptors.

Chemokine Receptor

A cell-surface receptor that binds chemokines and directs immune-cell movement; some also serve as entry cofactors for viruses such as HIV.

Chemokinesis

Increased or altered movement of a cell in response to a chemical, without movement specifically toward or away from the chemical source. It differs from chemotaxis, which is directional.

Chemoprevention

The use of a medicine or other chemical substance to lower the chance of cancer developing or returning. It may be considered for selected high-risk people, but benefits, side effects, and evidence differ by cancer and medicine.

Chemoradiation

Treatment that gives chemotherapy and radiation during the same treatment period. The medicine may make cancer cells more sensitive to radiation

and may treat cancer elsewhere, but combined side effects can be greater.

Chemoradiotherapy

Cancer treatment that combines chemotherapy with radiation treatment. The medicines may make cancer cells more sensitive to radiation or treat cells elsewhere, but combined treatment can increase tiredness, nausea, skin changes, and other side effects.

Chemoreceptor

A specialized sensory nerve ending or cell that detects changes in the chemical composition of blood or surrounding fluids. In the body, internal chemoreceptors in the brainstem and major arteries monitor levels of oxygen, carbon dioxide, and acidity (pH) in the blood, automatically signaling the respiratory and cardiovascular centers to adjust breathing rate and heart function.

Chemoreceptor Cell

A sensory cell that detects chemical changes such as oxygen, carbon dioxide, pH, taste molecules, or odorants and converts them into neural or physiologic signals.

Chemoreceptor Reflex

An autonomic homeostatic reflex initiated by peripheral (carotid and aortic bodies) or central (medullary) chemoreceptors in response to hypoxia, hypercapnia, or acidosis, driving increases in minute ventilation, sympathetic vasomotor tone, and blood pressure.

Chemoreceptors

Plural form; see *Chemoreceptor*.

Chemoreceptor Trigger Zone

A brain area that detects vomiting-provoking chemicals in the blood or cerebrospinal fluid and activates brain circuits that produce nausea and vomiting.

Chemoresistance

Reduced response of cancer cells or other target cells to a medicine that previously inhibited or destroyed them. It may be present from the start or develop during treatment.

Chemosensitivity

How strongly cells or a tumor respond to a chemical treatment. A sensitive tumor may shrink or stop growing, but laboratory sensitivity tests do not always predict a person's treatment response.

Chemosensitization

Making cancer cells or microorganisms more vulnerable to treatment by adding an agent that improves delivery, blocks resistance, or increases treatment-related damage.

Chemosis

Swelling of the clear membrane covering the white part of the eye. It may result from allergy, infection, irritation, injury, surgery, or fluid retention and can make the eye look blistered.

Chemosurgery

Chemosurgery uses a chemical agent to destroy selected abnormal tissue, historically including chemical treatment of skin lesions; modern use is specialized.

Chemotactic Factors

Chemical signals that attract or repel cells by forming a concentration gradient. During infection or tissue injury, they help direct immune cells to the affected area.

Chemotaxis

Directed movement of a cell or organism toward or away from a chemical stimulus. It is important in immune-cell recruitment and inflammatory responses.

Chemotherapy

Treatment using medicines to kill cancer cells or slow their growth, often by disrupting cell division or damaging DNA. It may be used alone or with surgery or radiation. Healthy fast-growing cells can

also be affected, causing nausea, hair loss, anemia, or reduced immunity.

Chemotherapy Extravasation

Leakage of an intravenous cancer medicine into tissue around the vein. Some medicines can cause severe pain, blistering, or tissue death; management depends on the medicine and extent of tissue exposure.

Chemotherapy-Induced Nausea and Vomiting

A common and debilitating adverse effect of antineoplastic therapy mediated by central neurokinin-1 (NK1) and peripheral/central serotonin (5-HT3) receptor pathways, categorized as acute, delayed, anticipatory, or breakthrough emesis.

Alternate Names:
CINV

Chemotherapy-Induced Oral Mucositis

Painful inflammation and ulceration of the mouth caused by injury to rapidly dividing oral lining cells during chemotherapy or some cancer treatments. It can impair eating, drinking, and speech and increase infection risk; oral care, pain control, nutrition, and treatment of infection are important.

Chemotherapy-Induced Peripheral Neuropathy

Nerve damage caused by some cancer medicines. It commonly produces tingling, numbness, burning pain, or unusual sensitivity in the hands and feet and may affect balance, movement, or daily activities.

Chemotherapy Regimen

A specific combination of anticancer drugs, dosing schedule, and treatment cycles designed for a particular cancer type and stage. Regimens are standardized by evidence-based protocols and may be modified based on response, toxicity, and patient factors.

Chemotherapy Treatment

Chemotherapy uses medicines that damage or inhibit rapidly dividing cancer cells. It may be given before or after local treatment, for advanced disease, or for symptom control; effects and monitoring depend on the drugs, cancer, treatment goal, and organ function.

Cherry Angioma

A common harmless growth made of small blood vessels, usually a bright-red or purple spot or bump on the trunk or limbs. It may bleed after injury but usually needs no treatment unless the diagnosis is uncertain or removal is wanted.

Alternate Names:
Campbell de Morgan Spot

Cherry Eye

Prolapse of the gland of the third eyelid, producing a rounded red mass at the inner corner of the eye. The term is used especially in veterinary ophthalmology.

Cherry Hemangioma

Alternate name; see *Cherry Angioma*.

Cherry-Red Spot

A bright-red area at the center of the retina surrounded by pale retina. It occurs when the surrounding retina becomes swollen or loses blood flow and may indicate a serious metabolic, vascular, or storage disorder.

Cherubism

A rare inherited condition in which both sides of the jaw enlarge because of overgrowth of bone-removing tissue. It usually begins in childhood and often improves after puberty, but it can affect teeth, chewing, speech, or appearance.

Chest

The thorax, the region between the neck and abdomen containing the heart, lungs, major vessels, and other structures protected by the ribs and sternum.

Chest Cold

Alternate name; see *Acute Bronchitis*.

Chest CT

Computed tomography of the chest using x-rays and computer reconstruction to produce cross-sectional images of the lungs, heart, blood vessels, mediastinum, pleura, and chest wall.

Chest CT Scan

A specialized cross-sectional X-ray examination of the lungs, heart, great vessels, and chest wall; see *Chest CT*.

Chest Infection

An infection of the airways or lung, commonly caused by a virus or bacterium. It may cause cough, mucus, fever, wheezing, chest discomfort, or shortness of breath; severe breathing difficulty, confusion, blue lips, or persistent high fever may indicate severe illness.

Chest MRI

Magnetic resonance imaging of the chest using a magnetic field and radio waves to evaluate soft tissues, blood vessels, heart structures, mediastinum, chest wall, and selected lung or pleural abnormalities.

Chest Pain

Pain, pressure, burning, or discomfort in the chest. Causes include heart, lung, digestive, muscle, bone, or anxiety-related problems. New severe pain, breathlessness, sweating, faintness, or spreading pain requires emergency care.

Alternate Names:
Angina Pectoris; Thoracalgia; Chest Discomfort

Chest Physiotherapy

Techniques that help move mucus out of the lungs, including positioning, gentle percussion, breathing exercises, coughing techniques, and selected breathing devices. It may help some people with bronchiectasis, cystic fibrosis, or recovery after surgery.

Chest Tightness

A sensation of pressure, constriction, or heaviness in the chest that may arise from heart, lung, gastrointestinal, musculoskeletal, or anxiety-related causes.

Chest Tube

A flexible tube inserted into the pleural space to remove air, blood, or fluid and help the lung re-expand.

Chest Tube Insertion

Placement of a flexible tube through the chest wall into the space around a lung to remove air, blood, pus, or fluid and help the lung expand. It is connected to a drainage system and requires monitoring for bleeding, infection, or persistent air leak.

Chest Tube Thoracostomy

Placement of a tube through the chest wall into the space around a lung to drain air, blood, pus, or fluid. It may be needed for a collapsed lung, bleeding, infected fluid, or certain problems after chest or heart surgery.

Chest Wall

The layers of skin, muscle, ribs, breastbone, spine, and supporting tissues that surround the chest. They protect the heart and lungs and move with the breathing muscles to help expand and contract the chest.

Chest Wall Deformity

An abnormal shape of the ribs, breastbone, spine, or surrounding tissues. A sunken or protruding breastbone is often mainly cosmetic, but severe deformity or scoliosis can restrict breathing or affect the heart.

Chest Wall Pain

Alternate index label; see *Costochondritis*.

Chest X-Ray

An imaging test using a small amount of radiation to show the lungs, heart, ribs, and chest structures. It can detect pneumonia, collapsed lung, fluid, some fractures, and changes in heart size.

Chewing

The coordinated use of teeth, jaw muscles, and joints to break food into smaller pieces for swallowing and digestion; pain or missing teeth can interfere.

Chewing Tobacco

Alternate name; see *Smokeless Tobacco*.

Cheyne-Stokes Respiration

A repeating pattern in which breathing gradually becomes deeper and faster, then shallower, followed by a pause. It may occur during sleep with heart failure, stroke, brain disease, or at high altitude.

CHF

Heart failure in which the heart cannot pump or fill well enough for the body's needs. Reduced circulation can cause breathlessness, tiredness, leg swelling, and fluid buildup in the lungs or elsewhere.

CHH

Abbreviation for congenital or central hypogonadotropic hypogonadism, in which deficient hypothalamic or pituitary signaling leads to low sex-hormone production and absent or incomplete puberty. Some forms also cause reduced or absent sense of smell.

Chiari-Frommel Syndrome

Continued milk production and absent menstrual periods after pregnancy, usually caused by persistently high prolactin levels. Evaluation looks for pituitary disorders, medicines, thyroid disease, and other causes.

Chiari I Malformation

A condition in which the lower part of the cerebellum extends through the opening at the skull base. It may cause headaches worsened by straining, neck pain, balance problems, or no symptoms.

Chiari Malformation

A structural abnormality in which part of the cerebellum extends downward through the opening at the base of the skull. Different types vary in severity and may cause headache, balance problems, swallowing difficulty, or no symptoms.

Chickenpox

An acute, highly contagious primary infection with varicella-zoster virus. An itchy generalized rash appears in successive crops as spots, blisters, and crusts, often with fever and malaise; adults, pregnant people, newborns, and immunocompromised people have higher risk of pneumonia or other severe complications.

Chickenpox (Varicella)

A contagious infection caused by varicella-zoster virus, producing an itchy blistering rash, fever, and malaise. Complications include bacterial skin infection, pneumonia, cerebellitis, and severe disease in pregnancy or immunocompromise.

Chicken Soup And Sickness

A supportive-care topic concerning the use of warm fluids and nutrition during illness; chicken soup may ease hydration or congestion but does not replace diagnosis or treatment.

Chief Cell

A cell in the stomach lining that makes pepsinogen, an inactive substance that becomes the protein-digesting enzyme pepsin in stomach acid.

Chigger Bites

Itchy skin reactions caused by larval mites. Small red bumps or blisters often develop where clothing is tight and may itch for days. Washing the skin, avoiding scratching, and itch treatment usually provide relief.

Chiggers

Larval harvest mites whose bite causes intensely itchy grouped red papules or welts; symptoms result from skin irritation, not from the mite burrowing into human tissue.

Chignon

Temporary swelling of a baby's scalp where a vac-

uum device was applied during assisted delivery. It results from the suction and usually disappears within a day or two without treatment.

CHIK

Alternate name; see *Chikungunya*.

Chikungunya

A mosquito-borne viral disease caused by chikungunya virus, usually producing abrupt fever and severe, often symmetric joint pain. Headache, muscle pain, joint swelling, nausea, fatigue, and rash may occur; joint symptoms can persist for months or years.

Alternate Names:
Chikungunya Fever; Chikungunya Virus Disease; CHIKV Infection

Chikungunya Fever

An acute arboviral febrile illness caused by the Chikungunya virus (genus *Alphavirus*) transmitted by *Aedes* mosquitoes, characterized by high fever, maculopapular rash, and severe, often incapacitating bilateral polyarthralgia and polyarthritis that may persist chronically.

Chikungunya Virus

An alphavirus transmitted primarily by infected female Aedes aegypti and Aedes albopictus mosquitoes. Infection can cause abrupt fever, severe polyarthralgia, joint swelling, rash, and prolonged inflammatory joint symptoms.

Chilaiditi Syndrome

The symptomatic clinical presentation of Chilaiditi sign, defined as the anatomical interposition of a loop of colon or small intestine between the superior surface of the liver and the right hemidiaphragm. Manifests with intermittent abdominal pain, constipation, nausea, vomiting, or abdominal distention, occasionally mimicking a perforated hollow viscus with pseudo-pneumoperitoneum on abdominal radiography.

Alternate Names:
Hepatodiaphragmatic Interposition Syndrome

Chilblain

A localized, pruritic, and painful inflammatory cutaneous vascular reaction precipitated by exposure to non-freezing cold and damp temperatures. Pathophysiologically driven by persistent vasoconstriction of superficial dermal arterioles coupled with delayed vasodilatation upon rewarming, leading to vascular leakage, edema, and perivascular lymphocytic infiltration. Clinically manifests as erythematous, violaceous, or purpuric papules, macules, or nodules primarily affecting acral sites (toes, fingers, nose, ears). Usually self-limiting within 1–3 weeks; management focuses on slow rewarming, warm dry protective garments, smoking cessation, and oral calcium channel blockers (nifedipine) for severe or recurrent cases.

Alternate Names:
Chilblains; Pernio

Chilblains

Plural form; see *Chilblain*.

Child Abuse

Physical, sexual, or emotional harm, or serious neglect, inflicted on a child by a caregiver or another person. Warning signs may include unexplained injuries, changing accounts, fear, developmental changes, or unmet basic needs; suspected abuse requires safeguarding action under local law.

Child Adoption

Child adoption is the legal process by which parental rights and caregiving responsibility are transferred to adoptive parents; medical care includes records, consent, and family history.

Childbed Fever

An older name for fever caused by infection after childbirth, miscarriage, or abortion. The infection often affects the uterus and may cause lower abdominal pain, foul-smelling discharge, or worsening illness.

Child Behavior

The observable actions, responses, and conduct of children, influenced by developmental stage, tem-

perament, environment, and neurobiological factors. Behavioral assessment helps identify developmental disorders, emotional difficulties, and parenting needs.

Childbirth

The process of giving birth. Labour usually includes cervical opening, birth of the baby, and delivery of the placenta; timing and the need for medical assistance vary between pregnancies.

Child Development

Progressive physical, cognitive, language, emotional, and social changes from infancy through adolescence, assessed against developmental milestones and individual variation.

Child Health

The physical, developmental, mental, and social well-being of children, including prevention, nutrition, immunization, safety, and treatment of illness.

Child Health Services

Child health services provide preventive care, immunization, growth and developmental monitoring, screening, treatment, and support for children and families.

Childhood

The developmental period between infancy and adolescence, during which physical growth, brain development, learning, and social skills progress.

Childhood Absence Epilepsy

An epilepsy syndrome that usually begins in school-aged children with frequent brief pauses in awareness. During a seizure, the child may stare and stop responding for seconds, then quickly return to normal without confusion.

Childhood ADHD

Attention-deficit/hyperactivity disorder beginning in childhood, with persistent developmentally inappropriate inattention, hyperactivity, or impulsivity that causes impairment across one or more settings.

Childhood Angiosarcoma

A rare malignant tumor arising from blood-vessel or lymphatic-endothelial cells in a child; diagnosis and treatment require specialist pediatric oncology care.

Childhood Apraxia Of Speech

A speech-sound disorder in which a child has difficulty planning and coordinating the movements needed for clear speech.

Childhood Asthma

Asthma beginning during childhood, involving variable airway narrowing and inflammation that cause wheezing, cough, chest tightness, or shortness of breath.

Childhood Cataracts

Cataracts occurring during infancy, childhood, or adolescence. They may be inherited, present at birth, caused by injury or inflammation, or associated with another condition, and can interfere with visual development.

Childhood Cyclic Vomiting

Recurrent stereotyped episodes of intense nausea and vomiting separated by periods of normal health. It is a functional gut-brain disorder diagnosed after other causes are considered and may be associated with migraine.

Childhood Depression

Depressive illness in a child, which may present as persistent sadness, irritability, loss of interest, withdrawal, sleep or appetite change, low energy, poor concentration, or physical complaints. Suicidal thoughts may accompany severe depression.

Childhood Disintegrative Disorder

A historical diagnostic term for marked developmental regression after at least two years of apparently typical development, with loss of language, social, motor, or adaptive skills. It is no longer a separate DSM-5 diagnosis; such presentations are assessed within autism spectrum disorder and for neurologic or other medical causes.

Alternate Names:
CDD; Heller's Syndrome; Heller's Dementia; Disintegrative Psychosis

Childhood Ependymoma

A tumor arising from ependymal cells lining the brain ventricles or spinal canal in children; symptoms depend on location and obstruction of cerebrospinal-fluid flow.

Childhood Fibrosarcoma

A malignant tumor of fibroblastic connective tissue in children, usually presenting as a growing mass; treatment depends on location, extent, and tumor biology.

Childhood Ganglioglioma

A usually slow-growing mixed neuronal and glial brain tumor in children or young adults, often presenting with long-standing focal seizures.

Childhood Giant Axonal Neuropathy

The childhood-onset form of giant axonal neuropathy, a rare inherited neurodegenerative disorder causing progressive peripheral neuropathy, ataxia, weakness, developmental or cognitive changes, and characteristic tightly curled hair in many affected people.

Childhood Interstitial Lung Disease

A group of rare lung disorders in infants and children that affect the tissue around the air sacs and may interfere with oxygen exchange. They can cause rapid breathing, cough, low oxygen, poor growth, or limited exercise ability.

Childhood Leiomyosarcoma

A rare malignant tumor of smooth muscle in a child; it may arise in soft tissue or an organ and requires biopsy, staging, and specialist treatment.

Childhood Leukemia

Cancer of blood-forming cells in a child, most often acute lymphoblastic or acute myeloid leukemia; symptoms may include pallor, bruising, fever, bone pain, or recurrent infection.

Childhood Liposarcoma

A rare malignant tumor derived from fat-forming tissue in a child; diagnosis requires imaging and biopsy, and treatment is individualized by a sarcoma team.

Childhood Muscular Dystrophy

A group of inherited disorders causing progressive muscle weakness and wasting beginning in childhood. Different types vary in inheritance, muscles affected, heart and breathing involvement, and rate of progression.

Childhood Obesity

Alternate index label; see *Pediatric Obesity*.

Childhood Osteosarcoma

A malignant bone tumor that commonly develops near the ends of long bones during adolescence; pain, swelling, or a fracture may occur and treatment combines chemotherapy and surgery.

Childhood Rhabdomyosarcoma

A malignant tumor showing skeletal-muscle differentiation, occurring mainly in children and adolescents; it may arise in the head and neck, urinary or reproductive tract, or limbs.

Childhood Schizophrenia

A rare psychotic disorder beginning in childhood, involving disturbances in thinking, perception, behavior, and emotional functioning.

Alternate Names:
Very Early-Onset Schizophrenia (VEOS); Early-Onset Schizophrenia

Childhood Vaccine Hesitancy

A caregiver's reluctance, uncertainty, delay, or refusal regarding one or more vaccines recommended for a child, even when vaccination services are available. It can reflect concerns about vaccines, confidence, perceived need, practical barriers, or other factors, and may vary by vaccine and context.

Child Maltreatment

Abuse or neglect of a child, including physical, sexual, or emotional abuse and failure to provide needed care or supervision. It can harm a child's safety, health, growth, and development.

Alternate Names:
Child Abuse

CHILD Naevus

A congenital skin and limb disorder named for congenital hemidysplasia with ichthyosiform erythroderma and limb defects. It causes one-sided scaly skin changes with asymmetrical limb or skeletal abnormalities and may involve other organs.

Child Neglect

Failure to provide a child with adequate food, shelter, clothing, supervision, education, emotional care, or medical care. It can impair growth, development, safety, and health and requires safeguarding assessment when suspected.

Child Neglect And Emotional Abuse

Failure to provide a child's basic needs or repeated behavior that harms emotional development, safety, or wellbeing; suspected abuse requires safeguarding assessment and appropriate reporting under local law.

Child Physical Abuse

Intentional physical injury or harm inflicted on a child by a caregiver or another person, including hitting, burning, shaking, or fractures. Suspected abuse can involve immediate safety risks.

Child Poisoning

Exposure of a child to a medicine, chemical, plant, or other substance that may cause harm. Symptoms can be delayed or absent initially, depending on the substance and amount.

Child Psychiatry

The medical specialty concerned with assessment and treatment of emotional, behavioral, developmental, and psychiatric disorders in children and adolescents.

Child Psychology

The study of children's cognitive, emotional, social, and behavioral development and the effects of relationships, learning, biology, and environment.

Child-Pugh Classification

A scoring system used to estimate the severity of chronic liver disease. It combines blood bilirubin, albumin, and clotting results with fluid in the abdomen and liver-related confusion; the score supports, but does not replace, individual assessment.

Child-Pugh Score

A score estimating the severity and prognosis of chronic liver disease, especially cirrhosis. It uses bilirubin, albumin, prothrombin time or INR, ascites, and hepatic encephalopathy. It may inform perioperative risk and clinical assessment, but does not by itself determine whether liver transplantation is indicated.

Alternate Names:
Child-Turcotte-Pugh Score; CTP Score

Children

Humans in the developmental period between infancy and adolescence; medical assessment must account for age-specific anatomy, physiology, growth, communication, and consent.

Children And Grief

The emotional and behavioral response of children to death or major loss, which varies by developmental stage and may include sadness, regression, anger, worry, or physical symptoms.

Children's Cancer Centers

Specialized services that coordinate diagnosis, treatment, rehabilitation, psychosocial support, survivorship care, and research for children and adolescents with cancer.

Alternate Names:
Pediatric Oncology Centers; Childhood Cancer Clinics

CHILD Syndrome

Congenital hemidysplasia with ichthyosiform nevus and limb defects, a rare disorder usually caused by an *NSDHL* variant. It causes one-sided skin abnormalities with limb, skeletal, and sometimes neurologic or internal-organ differences.

Chill

An episode of shivering accompanied by a subjective sensation of intense cold and cutaneous vasoconstriction. In febrile states, endogenous pyrogens (IL-1, TNF-α, IL-6) act on the preoptic hypothalamic thermoregulatory center to elevate the core temperature set-point, triggering involuntary somatic muscle shivering and peripheral vasoconstriction to elevate body temperature to the new set-point. Severe, uncontrollable shaking chills (rigors) are strongly indicative of systemic bacteremia, pyelonephritis, or sepsis.

Chills

Plural form; see *Chill*.

Chilomastix Mesnili

A usually harmless single-celled organism that may be found in stool. Its presence generally does not cause illness and can indicate exposure to contaminated food or water.

Chimera

An organism or tissue containing genetically distinct cell populations derived from different zygotes or embryos, or a laboratory construct combining genetic material from different sources.

Chimeric Antigen Receptor

A synthetic receptor engineered to recognize a selected target on a cell surface. It is placed into immune cells, especially T cells, to direct them against cancer cells in some cellular immunotherapies.

Chimeric Antigen Receptor T-Cell Therapy

Alternate name; see *CAR T-Cell Therapy*.

Chimerism

The presence in one person of groups of cells with different genetic origins. It may occur naturally, after an organ or stem-cell transplant, or when cells pass between a pregnant person and fetus.

Chin

The lower facial prominence formed mainly by the mandible and overlying soft tissue, contributing to facial contour, speech, chewing, and airway anatomy.

Chin Augmentation

A cosmetic procedure that increases chin projection with an implant, injectable filler, or bone surgery to change facial contour; risks include infection, asymmetry, nerve injury, and implant problems.

Chinese Herbal Medicine

The use of plant, mineral, or animal-derived preparations within traditional Chinese medicine. Products vary in composition and may interact with medicines or contain contaminants, so reliable sourcing and medical guidance are important.

Chinese Restaurant Syndrome

An older, controversial term for short-lived symptoms such as headache, flushing, or palpitations attributed to eating restaurant food; evidence does not show that monosodium glutamate causes these symptoms in most people at usual dietary exposures.

Chionablepsia

Temporary eye pain and blurred vision caused by ultraviolet light reflected from snow or ice, commonly called snow blindness. Symptoms may appear hours after exposure and usually improve as the cornea heals.

Alternate Names:
Snow Blindness; Photokeratitis

CHIP

Clonal hematopoiesis of indeterminate potential: an age-related finding in which blood-forming cells

acquire a gene change and expand without meeting criteria for a blood cancer. It can increase the future risk of myeloid cancer and cardiovascular disease and may require monitoring.

Chiropody

Care of the feet, including assessment and treatment of skin, nail, pressure, and biomechanical problems.

Alternate Names:
Podiatry

Chiropractic

A healthcare practice that mainly uses hands-on treatment for muscle, joint, and spine problems, especially spinal manipulation. Benefits and risks vary by the condition, technique, and practitioner's training.

Chiropractic Care For Back Pain

Manual therapy, primarily spinal manipulation and mobilization, provided for acute and chronic low back pain when indicated. Evidence supports its use for acute low back pain in particular, though it is not appropriate for all causes of back pain.

Chiropractor

A healthcare practitioner who provides manual or manipulative treatment, especially for musculoskeletal conditions, according to the practitioner's training and local regulation.

Alternate Names:
Chiropractic Practitioner; Chiropractic Clinician

Chitin

A strong natural substance forming the cell walls of fungi and the outer coverings of insects, spiders, and shellfish. Humans do not digest it, but exposure to chitin-containing material can contribute to allergic or airway irritation in some people.

Chlamydia

In common clinical use, an infection with *Chlamydia trachomatis*, a sexually transmitted bacterium that often causes no symptoms but may cause discharge, painful urination, pelvic inflammatory disease, infertility, eye infection, or newborn infection. The word can also refer to the bacterial genus, which includes species causing respiratory or bird-associated infections.

Chlamydiaceae

A family of bacteria that includes Chlamydia species. Some cause sexually transmitted infections, eye disease, or respiratory infection; diagnosis depends on the species, specimen, symptoms, and laboratory testing.

Chlamydia (Chlamydial Genitourinary Infections)

Genitourinary infection caused by Chlamydia trachomatis, often without symptoms. Untreated infection can cause cervicitis, pelvic inflammatory disease, ectopic pregnancy, infertility, or neonatal infection; testing, treatment, and partner management are important.

Chlamydial Pneumonia

An atypical pneumonia caused by obligate intracellular bacteria of the genus *Chlamydia* or *Chlamydophila*. Major etiologic species include *Chlamydophila pneumoniae* (causing community-acquired pneumonia in adults and adolescents characterized by biphasic illness with pharyngitis and hoarseness followed by persistent nonproductive cough and subsegmental infiltrates), *Chlamydia trachomatis* (causing afebrile pneumonia in infants aged 1–3 months marked by a classic staccato cough, tachypnea, hyperinflated lungs, and peripheral eosinophilia), and *Chlamydophila psittaci* (psittacosis acquired via bird exposure, presenting with severe headache, high fever, and hepatosplenomegaly). First-line treatment across etiologies consists of macrolides (azithromycin) or tetracyclines (doxycycline).

Chlamydial Pneumonias

Plural form; see *Chlamydial Pneumonia*.

Chlamydia Pneumoniae Infection

A respiratory infection caused by Chlamydia pneumoniae, formerly called Chlamydophila pneumoniae. It commonly causes gradual-onset atypical pneumo-

nia, bronchitis, or upper-respiratory symptoms.

Chlamydia Psittaci

A bacterium that causes psittacosis, a zoonotic infection usually acquired by inhaling organisms from infected birds.

Chlamydia Trachomatis

A bacterium that commonly causes sexually transmitted infection of the urogenital tract and can also cause conjunctivitis or pneumonia.

Chlamydial Urethritis

Inflammation of the urethra caused by the sexually transmitted bacterium *Chlamydia trachomatis*. It may cause burning during urination or discharge, but many people have no symptoms.

Candidal Balanitis

Inflammation of the glans penis caused by Candida yeast; see *Balanitis*.

Chlamydia Trachomatis Infection

A bacterial infection spread mainly through sexual contact. It often causes no symptoms but may cause discharge or painful urination and can lead to pelvic inflammatory disease, infertility, eye infection, or newborn infection.

Chlamydiosis

Infection caused by bacteria of the genus Chlamydia. Depending on the species and site, it may cause sexually transmitted infection, conjunctivitis, pneumonia, or other disease.

Chloasma

Patchy brown or gray-brown darkening of the skin, usually on the face. It is often related to pregnancy, hormones, and sunlight and is commonly called melasma.

Alternate Names:
Melasma; Mask of Pregnancy

Chloracne

An acne-like eruption caused by exposure to certain halogenated aromatic compounds, such as dioxins and related industrial chemicals.

Chloral Hydrate

A sedative-hypnotic compound with limited modern use because of toxicity, dependence, respiratory depression, and cardiac or gastrointestinal adverse effects.

Chlorambucil

An oral chemotherapy medicine that damages DNA and is used mainly for some chronic leukemias and lymphomas. It can lower blood counts and increase infection risk.

Chloramphenicol

An antibiotic that stops bacteria from making essential proteins. It is reserved for selected serious infections when safer or more suitable medicines are unavailable because it can rarely cause dangerous bone-marrow suppression and other severe effects.

Chloranemia

An older term for anemia in which red blood cells contain too little hemoglobin and appear unusually pale. Iron deficiency is a common cause; modern evaluation uses blood counts and iron studies.

Chlordane

A persistent organochlorine insecticide formerly used for termite control; exposure can affect the nervous system and liver and has environmental persistence.

Chlordecone

A persistent organochlorine pesticide that can cause neurologic, reproductive, and liver effects after significant exposure and remains in the environment for long periods.

Chlordiazepoxide

A benzodiazepine medicine that slows brain activity and may be used short term for alcohol-withdrawal symptoms or severe anxiety. It can cause drowsiness, dependence, impaired coordination, and dangerous

breathing suppression with alcohol or opioids.

Chlordiazepoxide Overdose

Overdose of chlordiazepoxide, a benzodiazepine, that can cause drowsiness, impaired coordination, respiratory depression, and coma, especially with other sedatives.

Chlorethoxyfos

An organophosphate insecticide that can block a nerve enzyme, causing sweating, vomiting, weakness, breathing problems, seizures, or other poisoning symptoms after exposure.

Chlorfenvinphos

An organophosphate insecticide that can cause cholinergic toxicity by inhibiting acetylcholinesterase; use is restricted or prohibited in many places.

Chlorhexidine

A broad-spectrum antiseptic used for skin, mucosal, and oral preparation; it can cause irritation, allergy, or rare severe anaphylaxis.

Chloride

A negatively charged mineral in blood and other body fluids. It works with sodium and other electrolytes to control fluid balance, nerve and muscle function, and the body's acid level.

Chloride Channel

A protein forming a passage for chloride ions across a cell membrane. Chloride channels help control electrical signals, fluid movement, and muscle or nerve function.

Chloride In Diet

Chloride consumed in food, usually as part of salt. It helps maintain fluid balance, nerve signals, and stomach acid; excessive intake often accompanies excess sodium.

Chloride Ion

The negatively charged form of chlorine and a major extracellular electrolyte that helps maintain fluid balance, osmotic pressure, acid–base status, and electrical neutrality.

Chloride Shift

An electrochemical exchange process in red blood cells mediated by the anion exchanger 1 (band 3 protein), wherein bicarbonate generated by carbonic anhydrase exits the erythrocyte in exchange for an incoming plasma chloride ion in systemic capillaries, reversed in pulmonary capillaries.

Alternate Names:
Hamburger Phenomenon

Chloride Test

A blood or urine laboratory test measuring chloride, a major extracellular anion vital for maintaining fluid balance, blood volume, and acid-base equilibrium; see *Chloride* and *Basic Metabolic Panel*.

Chlorinated Lime

Chlorinated lime, or bleaching powder, releases chlorine and is used as a disinfectant; concentrated exposure can burn skin, eyes, and airways.

Chlorinated Lime Poisoning

Exposure to chlorinated lime, a hypochlorite-containing corrosive that can injure the skin, eyes, airways, or gastrointestinal tract.

Chlorine

A reactive halogen element and disinfectant; inhalation of chlorine gas can injure the eyes and airways and cause chemical pneumonitis or pulmonary edema.

Chlorine Poisoning

Inhalation or contact exposure to chlorine gas, which irritates the eyes and airways and can cause cough, bronchospasm, chemical pneumonitis, or pulmonary edema.

Chlormadinone Acetate

A synthetic progestogen used in some hormonal medicines; effects and risks include changes in bleed-

ing, mood, metabolism, and thrombotic risk depending on the formulation.

Chlormethine

Chlormethine, or mechlorethamine, is an alkylating anticancer drug used systemically or topically for selected cancers and cutaneous T-cell lymphoma.

Chlorodeoxyadenosine

Another name for cladribine, a purine-analog medicine used for selected blood cancers and multiple sclerosis; prolonged lymphocyte suppression and infection risk are important considerations.

Chloroform

A volatile solvent and environmental contaminant that can irritate the lungs and nervous system and damage the liver or kidneys after significant exposure.

Chlorogenic Acid

A natural plant compound found in coffee, fruits, and vegetables. It has antioxidant effects in laboratory studies, but evidence is insufficient to use supplements to prevent or treat disease.

Chloroleukemia

A rare form of myeloid leukaemia associated with greenish masses of abnormal immature blood-forming cells outside the bone marrow. These masses are also called myeloid sarcoma or chloroma.

Alternate Names:
Granulocytic Sarcoma; Chloroma; Myeloid Sarcoma

Chloroma

A mass of immature myeloid blood-forming cells growing outside the bone marrow, usually associated with acute myeloid leukaemia. It may affect skin, bone, lymph nodes, or internal organs and is also called myeloid sarcoma.

Alternate Names:
Myeloid Sarcoma; Granulocytic Sarcoma; Extramedullary Myeloid Tumor

Chlorophyllin

A water-soluble, copper-containing derivative of chlorophyll used in some products and studied for effects such as odor control; clinical uses depend on evidence and context.

Alternate Names:
Chlorophyllin Copper Complex; Sodium Copper Chlorophyllin

Chlorophyll Poisoning

Ingestion of chlorophyll-containing products, which usually causes mild gastrointestinal effects; product ingredients and dose determine clinical risk.

Chloropicrin

A pungent soil fumigant and irritant that can injure the eyes, skin, and respiratory tract after exposure.

Chloroprene

An industrial chemical used to make chloroprene rubber; repeated or high exposure can irritate tissues and has carcinogenic concern.

Chloropsia

A visual disturbance in which objects appear green or greenish. It may result from retinal or visual-pathway disease, medicines, toxins, migraine, or other conditions; onset may be sudden or persistent.

Chloroquine

An antimalarial medicine used for susceptible Plasmodium species and selected autoimmune conditions; retinal toxicity, cardiotoxicity, and drug interactions require attention.

Chlorothiazide

A thiazide diuretic used to treat high blood pressure and fluid retention. It increases urine production and may cause low sodium, low potassium, dehydration, or high blood sugar.

Chlorpheniramine

A first-generation antihistamine used for allergy symptoms; drowsiness, dry mouth, blurred vision, urinary retention, and other anticholinergic effects

may occur.

Chlorphentermine

An older stimulant appetite suppressant related to amphetamines; it is not routinely used because of cardiovascular, psychiatric, and dependence risks.

Chlorpromazine

A first-generation antipsychotic and phenothiazine used for schizophrenia, severe nausea, and selected other conditions; adverse effects include sedation, hypotension, movement disorders, and QT prolongation.

Chlorpromazine Overdose

Overdose of chlorpromazine that may cause sedation, hypotension, anticholinergic effects, seizures, cardiac conduction abnormalities, or neuroleptic malignant syndrome.

Chlorpropamide

A first-generation sulfonylurea that lowers blood glucose by stimulating pancreatic insulin release; prolonged hypoglycemia and hyponatremia are important risks.

Chlorpyrifos

An organophosphate insecticide that inhibits acetylcholinesterase; significant exposure can cause cholinergic toxicity with secretions, bronchospasm, bradycardia, weakness, or seizures.

Chlortalidone

Chlortalidone, also called chlorthalidone, is a long-acting thiazide-like diuretic used mainly for hypertension and fluid retention.

Chlorthalidone

A long-acting thiazide-like diuretic used for hypertension and edema; it can cause hyponatremia, hypokalemia, hyperuricemia, and kidney-related electrolyte changes.

Chlorzoxazone

A centrally acting muscle relaxant used for painful muscle spasm in some countries; drowsiness and rare serious liver injury are important risks.

Choanal Atresia

A birth defect in which tissue blocks one or both passages from the nose to the throat. Blockage on both sides can cause severe breathing difficulty in a newborn, especially during feeding.

CHO Cell

A Chinese hamster ovary cell line widely used to produce recombinant proteins, antibodies, vaccines, and other biologic medicines.

Chocolate Cyst

A chocolate cyst is an ovarian endometrioma filled with old blood from endometriosis, which can cause pelvic pain, infertility, or an adnexal mass.

Choice Behavior

The process of selecting among alternatives, studied in psychology and neuroscience to understand decision-making, impulsivity, and reward processing. Abnormal choice behavior may be relevant to addiction, eating disorders, and psychiatric conditions.

Choke

Airway blockage by food or another object that prevents normal airflow and can rapidly cause inability to speak, cyanosis, loss of consciousness, or death.

Choking

Blockage of the airway by food or another object, making breathing difficult or impossible. Severe obstruction can prevent speaking, effective coughing, or breathing.

Choking First Aid for Adults and Children

Immediate emergency management for complete foreign-body airway obstruction (FBAO) in conscious adults and children over 1 year of age, utilizing subdiaphragmatic abdominal thrusts (Heimlich maneuver) or alternating back blows and chest thrusts.

Alternate Names:
Heimlich Maneuver; Foreign Body Airway Obstruction Management; FBAO First Aid

Choking First Aid for an Unresponsive Person

Advanced resuscitation algorithm for an unresponsive patient with foreign body airway obstruction, involving immediate initiation of cardiopulmonary resuscitation (CPR), visualization of the oral cavity prior to rescue breaths, and avoidance of blind finger sweeps.

Alternate Names:
Unconscious Choking Management; Obstructed Airway CPR; Foreign Body CPR

Choking First Aid for Infants

Emergency rescue intervention for complete foreign-body airway obstruction in conscious infants under 1 year of age, consisting of 5 prone back blows delivered between the scapulae followed by 5 supine chest thrusts while firmly supporting the head.

Alternate Names:
Infant Choking Management; Infant Foreign Body Airway Relief; Infant FBAO

Cholagogue

A substance that encourages the gallbladder to release bile into the small intestine. Bile helps the body digest fats; gallstones or blocked bile ducts can affect the action or safety of cholagogues.

Alternate Names:
Gallbladder Stimulant; Biliary Evacuant

Cholangiitis

Inflammation of the tubes that carry bile from the liver and gallbladder to the intestine. Infection, a blockage, autoimmune disease, or another bile-duct disorder may cause it.

Cholangiocarcinoma

A cancer arising from the cells lining the bile ducts, classified as intrahepatic, perihilar, or distal by location. Perihilar and distal tumors may obstruct bile flow and cause jaundice, itching, dark urine, or pale stools; intrahepatic tumors may present as a liver mass or with nonspecific symptoms.

Alternate Names:
Bile Duct Cancer; Cholangiocellular Carcinoma

Cholangiography

Imaging of the bile ducts after contrast material makes them visible. It can show gallstones, narrowing, leaks, or blockage and may be performed during surgery, through the skin, or during endoscopy.

Cholangiohepatitis

Inflammation of the bile ducts and liver, often caused by infection, blockage, parasites, or repeated bile-duct inflammation. It may cause fever, pain under the right ribs, jaundice, abnormal liver tests, and sometimes serious infection.

Cholangitis

Inflammation or infection of the tubes that carry bile from the liver and gallbladder to the intestine. A blockage from a gallstone or narrowing can cause fever, pain, jaundice, and rapidly worsening bloodstream infection.

Cholate

The ionized form of cholic acid, a primary bile acid that helps emulsify dietary fat and is conjugated and secreted by the liver.

Cholecalciferol

Vitamin D3, produced in skin by ultraviolet light and obtained from food or supplements, then converted to active metabolites that regulate calcium and phosphate.

Cholecyst

The gallbladder, a small sac beneath the liver that stores and concentrates bile. When food enters the intestine, it contracts and releases bile to help digest dietary fats.

Cholecystectomy

Surgery to remove the gallbladder, a small organ under the liver that stores bile. It may be needed for painful gallstones, gallbladder inflammation,

gallstone-related pancreatitis, or selected polyps. It is often done through small cuts using a camera, but open surgery may be needed when this is not safe. Bile still flows from the liver into the intestine after surgery.

Alternate Names:
Gallbladder Removal

Cholecystitis

Inflammation of the gallbladder, which may be acute or chronic. Acute cholecystitis is most often caused by a gallstone blocking the cystic duct, but it can occur without stones, particularly in critically ill people. It causes persistent upper-right abdominal pain and may involve fever, nausea, and vomiting. Repeated inflammation can scar the gallbladder.

Cholecystography

An imaging test of the gallbladder after contrast material is given to show how it fills, concentrates bile, and empties. Ultrasound, CT, or other modern tests are usually preferred for current gallbladder evaluation.

Cholecystokinin

A hormone released by the small intestine after food, especially fat and protein, enters it. It makes the gallbladder release bile, stimulates digestive enzymes, and helps create a feeling of fullness.

Cholecystoses

Non-inflammatory disorders causing deposits, wall thickening, or other structural changes in the gallbladder, including cholesterolosis and adenomyomatosis. Many are incidental, but symptoms and imaging findings determine whether further evaluation is needed.

Cholecystostomy

Drainage of the gallbladder through a catheter or other route, commonly performed percutaneously under imaging guidance. It relieves gallbladder distension and drains bile; it does not necessarily create a permanent surgical opening or stoma.

Choledochal Cyst

A congenital cystic dilatation of the extrahepatic or intrahepatic biliary ductal system, classified into five types by Todani: Type I (solitary extrahepatic fusiform or saccular dilatation, comprising $> 80\%$ of cases); Type II (extrahepatic bile duct diverticulum); Type III (choledochocele confined to the duodenal wall); Type IV (multiple intra- and extrahepatic cysts); and Type V (Caroli disease, isolated intrahepatic dilatations). Frequently associated with an anomalous pancreaticobiliary ductal junction (APBDJ), promoting pancreatic enzyme reflux into the biliary tree with resultant chronic cholangitis, stone formation, pancreatitis, and an elevated lifetime risk of cholangiocarcinoma. The classic clinical triad of right upper quadrant pain, palpable mass, and jaundice is seen in a minority of patients. Definitive management is complete surgical excision of the extrahepatic cyst and gallbladder with Roux-en-Y hepaticojejunostomy to prevent malignant degeneration.

Alternate Names:
Choledochal Cysts; Biliary Duct Cysts

Choledochal Cysts

Plural form; see *Choledochal Cyst*.

Choledocholithiasis

One or more gallstones in the common bile duct. The stones usually move there from the gallbladder but can form in the duct. They may cause no symptoms unless they obstruct bile flow; obstruction can cause abdominal pain or jaundice and may lead to bile-duct infection (cholangitis) or pancreatitis.

Cholelithiasis

The presence of one or more stones in the gallbladder. The stones are usually made mainly of cholesterol, bilirubin pigment, or a mixture; they may cause no symptoms or block a bile duct and cause pain or other complications.

Cholera

An acute intestinal infection caused by toxigenic *Vibrio cholerae*, usually acquired through contaminated water or food. It can produce sudden profuse wa-

tery diarrhoea, vomiting, severe dehydration, shock, and death within hours if untreated. Rehydration is central to treatment; safe water, sanitation, food hygiene, and vaccination in selected settings reduce spread.

Choleresis

The production and release of bile by liver cells. Bile helps digest fats and carries some waste products from the liver into the intestine.

Choleretic

A substance that encourages the liver to make or release bile. Bile helps digest fats and remove some waste products; gallstones or blocked bile ducts can affect its action or safety.

Alternate Names:
Bile-Secretory Agent; Bile-Flow Stimulant

Cholescintigraphy

Nuclear medicine scan that tracks the flow of bile from the liver into the gallbladder and small intestine. See *Biliary Scintigraphy*.

Cholestasis

Reduced production or flow of bile. It may cause itching, yellow skin or eyes, dark urine, pale stools, and abnormal liver tests; a blockage and liver-cell causes must be distinguished.

Alternate Names:
Biliary Stasis

Cholestasis Of Pregnancy

A pregnancy-related liver disorder in which bile acids build up in the blood and often cause intense itching without a rash, especially on the palms and soles. It can increase risks to the fetus, so testing and obstetric monitoring are important.

Cholesteatoma

A growth of trapped skin cells in the middle ear or bone behind the ear. It can cause repeated smelly ear discharge and hearing loss, and may damage nearby bone or other structures if it grows.

Cholesterol

A lipid required for cell membranes and synthesis of steroid hormones and bile acids. Excess atherogenic cholesterol can contribute to arterial plaque.

Cholesterol And Lifestyle

Diet, physical activity, weight, smoking, and alcohol use can affect blood cholesterol and cardiovascular risk. Lifestyle changes complement medicines when cholesterol remains high.

Cholesterol And Lipids

Fatty substances in the blood, including LDL cholesterol, HDL cholesterol, and triglycerides, that play critical roles in cellular function and energy metabolism. Abnormal lipid levels, particularly high LDL and triglycerides with low HDL, promote atherosclerosis and increase the risk of heart attack and stroke.

Cholesterol Crystal Embolization

Small pieces of cholesterol plaque breaking loose from a large artery and blocking smaller arteries. It may damage the kidneys, skin, eyes, brain, or intestines, often after a vascular procedure.

Cholesterol Crystals

Needle-shaped or rhomboid cholesterol deposits within atherosclerotic plaques. If released from a plaque, they can lodge in small arteries and cause cholesterol crystal embolization, reducing blood flow and provoking inflammation in affected tissues.

Cholesterol Emboli

Cholesterol crystals released from an atherosclerotic plaque that lodge in small arteries and cause ischemia or inflammation in downstream tissues.

Cholesterol Embolism

Blockage of small arteries by cholesterol crystals released from an artery wall, often after vascular procedures or disruption of atherosclerotic plaque.

Cholesterol Embolization

A condition in which tiny pieces of fatty material

from an artery wall break loose and travel into smaller blood vessels. It can damage the kidneys, skin, eyes, brain, or intestines, sometimes after a vascular procedure or blood-thinning treatment.

Cholesterolemia

The presence and concentration of cholesterol in the blood. Abnormal elevation is a risk factor for atherosclerotic cardiovascular disease.

Cholesterol Lowering

Reduction of cholesterol concentrations in blood, usually through changes in lipid metabolism or treatment. It is an intended therapeutic effect and is not synonymous with hyperlipidemia, which means elevated concentrations of cholesterol or other blood lipids.

Cholesterolosis

Deposition of cholesterol esters in the gallbladder mucosa, producing yellow speckling or a "strawberry gallbladder." It is often incidental but may coexist with gallstones or chronic gallbladder inflammation.

Cholesterol Synthesis

The process by which cells, especially liver and intestinal cells, make cholesterol from smaller molecules. Cholesterol is needed for cell membranes, hormones, and bile acids, but excess production contributes to high blood cholesterol.

Cholesterol Test

A blood test measuring circulating cholesterol fractions—including LDL, HDL, and total cholesterol—to estimate cardiovascular disease risk; see *Cholesterol* and *Lipid Profile*.

Cholesterol Testing And Results

Laboratory assessment of blood lipids, usually including total cholesterol, LDL cholesterol, HDL cholesterol, and triglycerides, used to estimate cardiovascular risk and guide prevention or treatment.

Cholestyramine

Cholestyramine is a bile-acid sequestrant used to lower LDL cholesterol and sometimes to treat bile-acid diarrhea or itching from cholestasis.

Choline

Choline is an essential nutrient used to make cell membranes and acetylcholine and to support liver and nervous-system function.

Cholinergic

Relating to acetylcholine, a chemical messenger used by nerves. Cholinergic signals affect muscles, glands, the heart, digestion, breathing, and parts of the brain.

Cholinergic Crisis

A life-threatening excess of acetylcholine, often after organophosphate or carbamate poisoning. It can cause sweating, salivation, vomiting, diarrhea, pinpoint pupils, wheezing, muscle weakness, seizures, and respiratory failure.

Cholinergic Neuron

A nerve cell that releases acetylcholine as its principal neurotransmitter.

Alternate Names:
Acetylcholine-Releasing Neuron; Cholinergic Nerve Cell

Cholinergic Toxidrome

A poisoning pattern caused by excessive acetylcholine activity, often producing salivation, tearing, urination, diarrhea, vomiting, bronchial secretions, slow heart rate, muscle fasciculations, weakness, or respiratory failure.

Cholinergic Urticaria

A chronic inducible urticaria triggered by increased body temperature or sweating, such as during exercise, hot bathing, spicy food, or emotional stress. It causes numerous small, short-lived itchy wheals, sometimes with flushing or angioedema; rare breathing or circulatory symptoms require emergency care.

Cholinesterase

Cholinesterase enzymes break down acetylcholine; inhibition increases cholinergic activity and is used therapeutically but can also cause poisoning.

Chondritis

Inflammation of cartilage, such as the cartilage of the ear, nose, ribs, or larynx. It may result from infection, trauma, or immune-mediated disease.

Chondroblastic Osteosarcoma

A type of bone cancer in which the cancer cells make cartilage-like material. It often affects the widened ends of long bones in adolescents and young adults and is diagnosed from imaging and a tissue sample.

Chondroblastoma

A chondroblastoma is an uncommon usually benign cartilage-forming bone tumor, often arising near the end of a long bone in adolescents or young adults.

Chondrocalcinosis

Calcium-crystal deposits in cartilage or other joint tissues that appear on imaging. They are often linked to calcium pyrophosphate deposition disease and may cause joint pain and swelling or be found without symptoms.

Chondrocyte

A mature cell that makes and maintains cartilage, the firm flexible tissue found in joints, airways, and other places. Chondrocytes help keep cartilage smooth and strong, but cartilage usually heals slowly because it has little direct blood supply.

Alternate Names:
Cartilage Cell

Chondrodermatitis Nodularis Helicis

A painful inflammatory nodule affecting the skin and cartilage of the ear's helix or antihelix, often related to repeated pressure, sleeping on one side, cold, sun, or local trauma. A firm tender crusted lesion can resemble skin cancer, so persistent or atypical lesions may need biopsy; pressure relief is an important treatment.

Chondrodysplasia

A disorder of cartilage and bone development that causes abnormal skeletal growth. Depending on the type, it may produce short limbs, short stature, enlarged joints, or other bone abnormalities.

Chondrodysplasia Punctata

A group of disorders of cartilage and bone development marked by punctate, or stippled, calcifications near the ends of bones or in cartilage on imaging. The pattern and severity vary by subtype; possible features include shortened limbs, distinctive facial features, cataracts, or respiratory problems. The term describes a radiographic and clinical group, not one single genetic disorder.

Chondroitin Sulfate

A sulfated glycosaminoglycan found in cartilage and other connective tissues; it is also marketed in supplements for osteoarthritis, with variable evidence of benefit.

Chondroma

A usually harmless tumour made of mature cartilage. It most often forms inside a bone, especially in the hands and feet, or on the bone surface. Many cause no symptoms; some cause pain, growth, or fracture.

Chondromalacia

Softening or breakdown of cartilage, especially the cartilage under the kneecap. It may cause pain at the front of the knee, grinding, or discomfort with stairs, squatting, or prolonged sitting.

Chondromalacia Patellae

Softening or damage to the cartilage under the kneecap. It may cause pain at the front of the knee, especially when climbing stairs, squatting, or sitting with the knee bent for a long time.

Chondromyxoid Fibroma

A rare benign cartilage-forming bone tumor, usually arising in the metaphysis of a long bone and presenting with localized pain or an incidental radiographic lesion.

Chondrosarcoma

A cancer that forms cartilage, usually within a bone. It is more common in adults and often grows slowly, though some types can grow faster or spread. Rarely, it begins in soft tissue rather than bone.

Chondrosarcoma Of The Breast

An extremely rare breast cancer whose cells produce cartilage-like tissue. It usually appears as a growing breast mass and is diagnosed by examining tissue; treatment generally requires complete surgical removal by a specialist team.

Chopart's Joint

The combined joint across the middle of the foot, between the hindfoot and midfoot. It includes the talonavicular and calcaneocuboid joints and helps the foot adapt to surfaces and transfer force during walking.

Chorangioma

A benign vascular tumor of the placenta, usually small and incidental but occasionally associated with fetal anemia, hydrops, growth restriction, or other complications when large.

Chordae Tendineae

Strong, thin cords inside the heart that connect the mitral and tricuspid valves to small muscles. They help keep the valves from turning inside out when the heart contracts.

Chordee

Chordee is abnormal downward or other curvature of the penis, commonly associated with hypospadias or scar tissue and sometimes requiring surgical correction.

Chordoma

A rare, usually slow-growing malignant tumor arising from embryonic notochordal remnants in the axial skeleton. It most often develops in the sacrum near the tailbone, the skull base, or another vertebra and can invade nearby tissues, causing pain or neurologic symptoms.

Chorea

Uncontrolled, brief, irregular movements that flow unpredictably from one body part to another. It may result from inherited disease, autoimmune illness, medicines, infection, or damage to movement-control areas of the brain.

Chorea and Myoclonus

Two distinct types of involuntary movement. Chorea consists of brief, irregular movements that flow unpredictably between body parts; myoclonus consists of sudden, shock-like muscle jerks. Either may occur in neurologic or metabolic disorders, and the terms are not synonyms.

Choreoathetosis

A movement disorder combining brief, unpredictable jerks with slower twisting movements. It can result from injury or disease affecting movement-control areas deep in the brain, inherited conditions, or certain medicines.

Chorioamnionitis

Infection or inflammation of the amniotic fluid, membranes, placenta, or decidua, usually due to ascending polymicrobial infection. Maternal fever, uterine tenderness, fetal tachycardia, and maternal leukocytosis may occur; treatment requires broad-spectrum antibiotics and delivery planning.

Alternate Names:
Intraamniotic Infection

Choriocarcinoma

A fast-growing cancer arising from cells that normally help form the placenta. It usually develops after a pregnancy or molar pregnancy and produces high levels of the pregnancy hormone hCG; it can spread but often responds well to chemotherapy.

Chorion

The outer membrane surrounding an early embryo. Its finger-like projections help form the fetal part of the placenta, where oxygen, nutrients, and waste are exchanged between fetal and maternal blood supplies.

Chorionic Gonadotrophin

Chorionic gonadotrophin, especially hCG, is a placental hormone that maintains early pregnancy and is measured in pregnancy tests and selected tumor evaluations.

Chorionic Villus Sampling

A prenatal test usually performed around 10 to 13 weeks by removing a small placental sample through the abdomen or cervix. It can identify many chromosome and inherited disorders but carries a small miscarriage risk.

Chorion Villus Sampling

Chorion villus sampling removes placental tissue for genetic or chromosomal testing, usually early in pregnancy; it carries a small procedure-related miscarriage risk.

Chorioretinitis

Inflammation involving the choroid and retina, often caused by infection, autoimmune disease, or systemic inflammatory illness. It can produce floaters and impaired vision.

Choroid

The blood-vessel-rich layer between the retina and the white outer coat of the eye. It supplies oxygen and nutrients to the outer retina and helps absorb stray light inside the eye.

Choroidal Dystrophies

Inherited disorders causing progressive degeneration of the choroid, retinal pigment epithelium, and retina, leading to night blindness, visual-field loss, and eventual vision impairment.

Choroidal Melanoma

A cancer arising from pigment-producing melanocytes in the choroid, the vascular layer beneath the retina. It may cause visual changes or be found incidentally and can spread, especially to the liver; treatment depends on size and location.

Choroidal Neovascularization

Pathologic growth of new blood vessels from the choroid through Bruch membrane into the space beneath the retinal pigment epithelium or the subretinal space. These vessels may leak or bleed, causing retinal damage, scarring, and central vision loss. It is associated with neovascular age-related macular degeneration, pathologic myopia, and some inflammatory eye diseases.

Alternate Names:
Choroidal Neovascularisation; CNV

Choroideremia

An X-linked inherited chorioretinal dystrophy caused by pathogenic variants in *CHM*, leading to progressive degeneration of the retinal pigment epithelium, photoreceptors, and choroid. Affected males typically develop night blindness followed by progressive peripheral visual-field loss; central vision is often preserved until later. Heterozygous females are usually asymptomatic but may show retinal changes.

Choroiditis

Inflammation of the choroid, the blood-vessel-rich layer between the retina and the outer wall of the eye. It is a form of posterior uveitis and may occur with inflammation of the retina; symptoms can include floaters, blurred vision, or blind spots.

Choroid Plexus

A network of tissue inside the brain's ventricles that produces most of the cerebrospinal fluid.

Choroid Plexus Carcinoma

A cancer arising from the choroid plexus, tissue that produces cerebrospinal fluid, potentially causing pressure buildup, headaches, vomiting, or neurologic problems.

Choroid Plexus Cyst

A fluid-filled cyst within the choroid plexus of a fetal cerebral ventricle. An isolated cyst with otherwise reassuring prenatal assessment is usually benign, but its significance depends on other ultrasound findings and screening results.

Choroid Plexus Tumor

A growth arising from the tissue that makes cerebrospinal fluid inside the brain. It occurs most often in children and may block fluid flow or produce too much fluid, causing hydrocephalus, headache, vomiting, or increasing head size.

Christmas Disease

An inherited bleeding disorder, also called hemophilia B, caused by low or abnormal clotting factor IX. It can cause prolonged bleeding or bleeding into joints and muscles and is treated with replacement or other specialist therapy.

Chromaffin

Describes cells that contain stored adrenaline-like hormones. They are found mainly in the inner part of the adrenal glands and in related nerve tissue and release these hormones during stress or in response to nerve signals.

Chromaffinoma

A tumor of cells that can produce adrenaline-like hormones, usually in the adrenal gland or nearby nerve tissue. Hormone release may cause episodes of high blood pressure, headache, sweating, and palpitations.

Chromate

Chromate is a hexavalent chromium compound that can cause irritant or allergic dermatitis, nasal injury, respiratory disease, and cancer after occupational exposure.

Chromatic

Chromatic means relating to color or wavelengths of light; chromatic vision depends on cone photoreceptors and neural processing.

Chromatids

Chromatids are the two copies of a replicated chromosome joined at the centromere before separating during cell division.

Chromatin

The combination of DNA and proteins that packages genetic material inside the cell nucleus. Its arrangement controls which genes are available for use and helps regulate DNA copying and repair.

Chromatography

A laboratory separation method in which substances partition between a stationary phase and a moving phase, allowing identification or measurement of components in a mixture.

Chromatopsia

A visual disturbance in which objects appear abnormally colored. It may result from retinal disease, toxic exposure, medication effects, or other disorders of the visual system.

Chromhidrosis

A rare disorder in which coloured sweat, often yellow, green, blue, or black, appears because pigment is produced in apocrine glands. Similar discoloration can result when ordinary sweat becomes coloured by surface bacteria or chemicals, a process called pseudochromhidrosis; evaluation distinguishes these causes and looks for an underlying medicine or skin disorder.

Chromium

Chromium is a metallic element; trivalent chromium is a trace nutrient, while hexavalent compounds can be toxic, corrosive, mutagenic, and carcinogenic.

Chromium In Diet

Reference information on chromium as a trace element involved in carbohydrate and fat metabolism. Chromium deficiency is rare; most people obtain adequate chromium from normal dietary intake, and routine chromium supplementation is generally not recommended.

Chromoblastomycosis

A chronic implantation infection caused by pigmented fungi, usually after minor trauma introduces the organism into skin. It produces slowly enlarging warty, scaly, or tumorous plaques, most often on

the legs; biopsy may show muriform bodies, and prolonged antifungal treatment is often required.

Chromopertubation

A fertility test performed during laparoscopy in which colored fluid is passed through the uterus while the fallopian tubes are viewed. Fluid spilling from the tube ends suggests that they are open; no spill may indicate blockage or surrounding scar tissue.

Chromosomal Abnormality

A change in the number or structure of chromosomes. It may involve an extra or missing chromosome, or a missing, repeated, rearranged, or exchanged chromosome segment, and can affect development, health, or fertility.

Chromosomal Breakage Syndromes

A group of inherited DNA-repair disorders in which chromosomes are unusually fragile or break easily. They may cause congenital anomalies, growth or developmental problems, bone-marrow failure, immune abnormalities, and increased cancer risk.

Chromosomal Microarray

A genetic test that detects gains and losses of chromosome material, including copy-number variants and some regions of homozygosity; it is commonly used for developmental delay, intellectual disability, congenital anomalies, or autism-spectrum presentations.

Chromosome

A thread-like structure made of DNA and proteins that carries genetic information. Most human body cells normally contain 46 chromosomes arranged in 23 pairs.

Chromosome 1

The largest human chromosome, containing many genes involved in development, cell function, and disease. Extra, missing, or rearranged material can cause genetic disorders.

Chromosome 13

A human chromosome containing genes important for development and cell function. Abnormal chromosome 13 number or structure can cause disorders such as trisomy 13.

Chromosome 2

A large human chromosome containing many genes involved in growth, development, and normal body function. Changes in its number or structure can cause genetic disease.

Chromosome 3

A human chromosome containing genes involved in development, immune function, and cell regulation. Deletions, duplications, or other changes may cause genetic disorders or cancer.

Chromosome 4

A human chromosome containing many genes involved in development and cellular function. Structural or numerical abnormalities can cause congenital or inherited conditions.

Chromosome 5

A human chromosome containing genes involved in development, immunity, and cell regulation. Loss of part of its short arm causes the genetic condition cri-du-chat syndrome.

Chromosome Complement

The complete set of chromosomes in a cell, including their number and sex-chromosome composition, usually described by a karyotype.

Chromosome Duplication

A structural chromosome abnormality in which a segment of genetic material is copied one or more additional times, potentially altering gene dosage and development.

Chromosome X

One of the human sex chromosomes. Most females have two X chromosomes and most males have one X and one Y; genes on the X chromosome can cause

X-linked disorders when altered.

Chromosome Y

The sex chromosome typically present in most males and absent in most females. It contains the sex-determining *SRY* gene and other genes important for testis development and sperm production.

Chronic

Persisting or recurring over a long period, in contrast to acute; the appropriate duration depends on the disease or clinical context.

Chronic Adrenal Insufficiency

Long-term inadequate production of adrenal hormones. It may be primary, as in Addison disease, or secondary or tertiary when pituitary or hypothalamic disorders reduce adrenal stimulation.

Chronic Allograft Nephropathy

Gradual loss of function in a transplanted kidney over months or years, caused by immune injury, high blood pressure, recurrent disease, medicines, or other damage. Testing and biopsy help identify the cause.

Chronic Atrophic Gastritis

Long-term inflammation that destroys glands in the stomach lining. It may reduce stomach acid and intrinsic factor, impair iron or vitamin B12 absorption, and increase the risk of anemia or stomach tumors.

Chronic Autoimmune Hashimoto Thyroiditis

A long-term immune-system attack on the thyroid gland that gradually damages thyroid tissue and often causes too little thyroid hormone. It may produce tiredness, cold intolerance, weight change, or an enlarged thyroid.

Chronic Autoimmune Thyroiditis

Long-term inflammation caused by the immune system attacking the thyroid, usually called Hashimoto thyroiditis. It commonly leads to low thyroid hormone and may be associated with thyroid antibodies.

Chronic Bacterial Prostatitis

A recurring bacterial infection of the prostate that may cause repeated urinary infections, burning or urgent urination, pelvic discomfort, or painful ejaculation. Diagnosis uses urine tests; antibiotic treatment often lasts several weeks.

Alternate Names:
NIH Category II Prostatitis; Recurrent Bacterial Prostatitis

Chronic Bronchitis

A productive cough on most days for at least three months in each of two consecutive years, after other causes are excluded. It is a clinical syndrome associated with airway inflammation and commonly occurs with chronic obstructive pulmonary disease.

Alternate Names:
Chronic Mucous Bronchitis

Chronic Bronchitis With Cor Pulmonale

Chronic mucus-producing airway disease complicated by high blood pressure in the lung arteries and strain or failure of the right side of the heart (cor pulmonale). Chronic obstructive pulmonary disease is a common underlying cause.

Chronic Bronchitis With Emphysema

Coexisting chronic mucus-producing airway disease and emphysema, in which air sacs in the lungs are damaged. They commonly occur together in chronic obstructive pulmonary disease, but spirometry is needed to confirm persistent airflow obstruction.

Chronic Caries

Tooth decay that develops slowly over time. It may cause a firm dark area, a cavity, sensitivity, or no symptoms; without dental treatment, decay can reach the inner tooth, causing pain, infection, or tooth loss.

Chronic Cholecystitis

Repeated or persistent inflammation of the gallbladder, usually related to gallstones and impaired emptying. It may cause episodic right-upper-abdominal pain, nausea, or food intolerance and can lead to scarring or a contracted gallbladder.

Chronic Compartment Syndrome

Alternate name; see *Chronic Exertional Compartment Syndrome*.

Chronic Coronary Syndrome

Long-term coronary artery disease with stable or recurring symptoms caused by reduced blood flow to the heart muscle. It may occur with exertion or emotional stress and can also be present without symptoms.

Chronic Cough

A cough lasting longer than eight weeks. Common causes include asthma, nasal drainage, acid reflux, smoking, and some blood-pressure medicines.

Alternate Names:
Persistent Cough

Chronic Daily Headaches

Headaches occurring on at least 15 days each month for more than three months. They may reflect chronic migraine, tension-type headache, frequent pain-medicine use, or another disorder.

Chronic Disease

A disease or condition that persists for a prolonged period, often months or years, and may require continuing monitoring or management.

Chronic Ear Infection

A persistent, recurrent, or long-standing infection of the middle ear, often associated with a persistent eardrum perforation and painless or foul-smelling ear drainage.

Alternate Names:
Chronic Middle-Ear Infection

Chronic Endometritis

Long-lasting inflammation of the inner lining of the uterus. It may be linked to infection or tissue left after pregnancy and can cause irregular bleeding, pelvic discomfort, or difficulty becoming pregnant; some people have no symptoms.

Chronic Eosinophilic Leukaemia

A rare blood cancer in which the bone marrow makes too many eosinophils, a type of white blood cell, because of abnormal cell growth. It may cause tiredness, fever, weight loss, an enlarged spleen, or damage to the heart, lungs, nerves, or skin.

Chronic Eosinophilic Pneumonia

A usually noninfectious lung inflammation in which eosinophils, a type of white blood cell, collect in lung tissue. It often causes weeks of cough, breathlessness, fever, night sweats, or weight loss and may recur after treatment.

Chronic Exertional Compartment Syndrome

Exercise-related increased pressure within a muscle compartment that causes predictable pain, tightness, or neurologic symptoms during activity.

Chronic Fatigue Syndrome

A chronic, multisystem illness marked by substantial reduction in function, fatigue not substantially relieved by rest, post-exertional malaise (worsening of symptoms after exertion), and unrefreshing sleep. Common diagnostic criteria require symptoms for more than 6 months and either cognitive impairment or orthostatic intolerance. It can coexist with other conditions; clinical evaluation also considers other possible causes. No confirmatory test is available.

Alternate Names:
CFS; Myalgic Encephalomyelitis (ME); Systemic Exertion Intolerance Disease (SEID)

Chronic Fever

A fever that continues or repeatedly returns over a long period. Causes include infection, inflammatory disease, cancer, and medicines; pattern and accompanying symptoms help distinguish causes.

Chronic Gastritis

Long-lasting inflammation of the stomach lining, often caused by *Helicobacter pylori* infection or an autoimmune reaction. It may cause no symptoms or upper-abdominal discomfort. In atrophic forms, long-term inflammation can destroy stomach glands and increase the risk of anemia or stomach cancer. Causes include *Helicobacter pylori* infection and autoimmune gastritis. Depending on the cause and duration, some forms may progress to gland loss, atrophy, or intestinal metaplasia; these changes do not occur in every case.

Chronic Glomerulonephritis

Long-standing inflammation and scarring of the kidney glomeruli that can progressively reduce filtration and lead to chronic kidney disease or kidney failure.

Chronic Granulomatous Disease

An inherited immune disorder in which certain white blood cells cannot effectively kill some bacteria and fungi. It causes repeated serious infections, swollen lymph nodes, pneumonia, skin infections, and inflammation called granulomas.

Chronic Hypertension

Persistently elevated systemic arterial blood pressure present over time, whether due to an identified underlying cause or without an identifiable secondary cause. It is distinct from hypertension arising only during pregnancy.

Chronic Hypertension In Pregnancy

Hypertension that predates pregnancy or is diagnosed early in pregnancy. It increases the risk of preeclampsia, fetal growth problems, preterm birth, and placental complications and requires ongoing maternal and fetal monitoring.

Chronic Idiopathic Constipation

Long-lasting difficult or infrequent bowel movements without an identified structural or metabolic cause. Symptoms may include hard stools, straining, incomplete emptying, or abdominal discomfort; management may include dietary changes, activity, and medicines.

Chronic Constipation

A long-term pattern of difficult or infrequent bowel movements, often with hard stools, straining, or a feeling that the bowel has not emptied fully. Causes include slow movement through the bowel, medicines, other health conditions, or problems with the muscles used to pass stool.

Chronic Diarrhea

Loose or watery stools that continue or keep returning for more than four weeks. It is a symptom rather than a disease and may result from infection, inflammation, poor absorption, food intolerance, medicines, or changes in bowel function.

Chronic Inflammation

Inflammation that continues for weeks, months, or years. It can occur with persistent infection, autoimmune disease, long-term irritation, or obesity and may cause ongoing tissue damage while the body attempts repair.

Chronic Inflammatory Demyelinating Polyneuropathy

An immune disorder that damages the insulating covering of nerves outside the brain and spinal cord. It causes gradually worsening or recurring weakness, numbness, poor balance, and reduced reflexes in the limbs.

Chronic Inflammatory Response Syndrome

A proposed diagnosis linking nonspecific symptoms to exposure to water-damaged buildings. Reported symptoms include fatigue, headache, cognitive difficulty, and respiratory complaints. Its diagnostic criteria and proposed biomarkers have not been independently validated as a distinct clinical syndrome.

Chronic Interstitial Nephritis

Long-term inflammation and scarring of the kidney tissue between the tubules. It may result from medicines, repeated infection, urinary obstruction,

toxins, autoimmune disease, or inherited disorders and can gradually reduce kidney function.

Chronic Intestinal Pseudo-Obstruction

Repeated symptoms of bowel blockage without a physical obstruction, caused by poor nerve or muscle function in the intestine. It may cause abdominal swelling, pain, vomiting, constipation, and inability to absorb nutrition.

Chronicity

How long a disease, symptom, or process has lasted or how long it tends to continue. A condition may be described as acute when it is recent and short-lasting, or chronic when it persists over a long period.

Chronic Kidney Disease

Kidney damage or reduced kidney function that lasts at least three months. Diabetes and high blood pressure are common causes. Early disease may cause no symptoms; later it can cause swelling, tiredness, poor appetite, nausea, or kidney failure. It differs from sudden kidney injury.

Alternate Names:
CKD; Chronic Renal Disease

Chronic Kidney Disease-Mineral and Bone Disorder

A systemic disorder of mineral and bone metabolism resulting from chronic kidney disease, characterized by abnormalities of calcium, phosphorus, parathyroid hormone, or vitamin D metabolism; abnormalities in bone turnover, mineralization, linear growth, or strength (renal osteodystrophy); and extra-skeletal vascular or soft-tissue calcification.

Alternate Names:
CKD-MBD; Renal Mineral and Bone Disorder

Chronic Kidney Disease Progression

Worsening loss of kidney function or increasing kidney damage over time. Progression is assessed with trends in estimated glomerular filtration rate, albumin in urine, blood pressure, symptoms, and other findings.

Chronic Kidney Disease Staging

Classification of kidney disease by cause, eGFR category, and albuminuria category. G1 through G5 represent eGFR from normal or high to kidney failure; staging is applied when abnormalities persist for at least 3 months and helps estimate progression and complications.

Chronic Kidney Failure

Kidney failure lasting more than three months, generally corresponding to a glomerular filtration rate below 15 mL/min/1.73 m^2 or ongoing kidney replacement therapy. It is an advanced state of chronic kidney disease, not a synonym for all CKD.

Chronic Lead Poisoning

Illness caused by long-term or repeated exposure to lead. It may cause abdominal pain, constipation, tiredness, anemia, nerve damage, high blood pressure, or kidney injury. In children, it can impair learning, attention, growth, or development. Treatment begins with stopping the exposure; some people need specialist-directed chelation.

Chronic Leukemia

A blood cancer that develops gradually as abnormal white blood cells multiply and remain in the blood or bone marrow. Some types progress slowly but still require regular medical monitoring.

Chronic Limb-Threatening Ischemia

Severe, long-lasting reduction of blood flow to a limb, usually from narrowed or blocked arteries. It causes pain at rest, ulcers that do not heal, or gangrene and can lead to limb loss.

Chronic Liver Disease

A broad term for long-term liver damage or disease. Causes include viral infection, alcohol, fatty-liver disease, autoimmune disease, blocked bile flow, medicines, and inherited disorders. It may occur with or without cirrhosis; progressive scarring can lead to cirrhosis or liver failure.

Chronic Liver Failure

Long-term loss of the liver's ability to perform es-

sential functions such as protein synthesis, detoxification, bile processing, and metabolic regulation. It may result from advanced cirrhosis or other chronic liver diseases and can lead to jaundice, ascites, bleeding tendency, hepatic encephalopathy, portal hypertension, and other organ complications.

Chronic Low Back Pain

Persistent or recurring pain in the lumbar or lumbosacral region lasting longer than 12 weeks. Multifactorial etiologies include degenerative disc disease, lumbar spinal stenosis, spondylosis, facet arthropathy, and central pain sensitization.

Alternate Names:
Chronic Lumbago; Long-Term Back Pain

Chronic Lymphocytic Leukemia

A usually slow-growing blood cancer in which abnormal B lymphocytes build up in the blood, bone marrow, and lymph nodes. It may cause enlarged lymph nodes, tiredness, repeated infections, anaemia, or no symptoms at first.

Alternate Names:
Chronic Lymphoid Leukemia

Chronic Lymphocytic Thyroiditis

An autoimmune disease in which immune attack gradually damages the thyroid, often causing hypothyroidism, fatigue, cold intolerance, constipation, dry skin, or goiter.

Chronic Megacolon

Persistent abnormal enlargement and impaired propulsion of the colon. Causes include severe constipation, aganglionosis, neurologic disease, metabolic disorders, medications, or chronic intestinal obstruction.

Chronic Meningitis

Persistent inflammation of the membranes around the brain and spinal cord, usually lasting four weeks or longer. Causes include tuberculosis, fungal or other infections, cancer, autoimmune disease, and medication reactions; symptoms may develop gradually or fluctuate.

Chronic Mesenteric Ischemia

A condition caused by long-standing narrowing of the arteries supplying the gastrointestinal tract, most commonly from atherosclerosis of the celiac axis and mesenteric arteries. It typically causes dull, cramping abdominal pain 30 to 60 minutes after meals (intestinal angina), resulting in fear of eating (sitophobia) and significant unintentional weight loss.

Alternate Names:
Chronic Mesenteric Ischaemia; Intestinal Angina; Abdominal Angina; CMI

Chronic Migraine

Headache on at least 15 days each month for more than three months, with migraine features on at least eight days. Pain may be one-sided or throbbing and may include nausea or sensitivity to light or sound.

Chronic Mitral Regurgitation

Long-standing leakage through the mitral valve during left-ventricular contraction. It may be primary, such as from prolapse, rheumatic disease, or endocarditis, or secondary to left-ventricular enlargement or ischemia; chronic volume overload can enlarge the left atrium and ventricle and lead to atrial fibrillation, pulmonary hypertension, or heart failure.

Chronic Motor Or Vocal Tic Disorder

A neurodevelopmental disorder with persistent motor or vocal tics lasting more than one year; symptoms often fluctuate and may be treated with education, behavioral therapy, or medicines when impairment is significant.

Chronic Mucocutaneous Candidiasis

Persistent or recurrent *Candida* infections of the skin, nails, and mucous membranes, often beginning in childhood. It may reflect a specific inherited T-cell or IL-17 pathway defect, or occur with autoimmune or endocrine disease.

Chronic Myelogenous Leukemia

A blood cancer in which the bone marrow makes too many abnormal white blood cells, usually because of

the BCR::ABL1 gene change. It may progress over time but is often controlled with targeted medicines.

Chronic Myeloid Leukemia

A blood cancer usually caused by the Philadelphia chromosome, which creates the BCR::ABL1 gene. The bone marrow produces too many abnormal white blood cells, and targeted treatment can often control the disease.

Chronic Myelomonocytic Leukemia

A rare blood cancer in which the bone marrow makes too many monocytes, a type of white blood cell, along with abnormal blood-forming cells. It can cause anemia, infections, bleeding, fatigue, or an enlarged spleen.

Chronic Neutrophilic Leukaemia

A rare blood cancer in which the bone marrow continually makes too many mature neutrophils, a type of white blood cell, without infection being the main cause. It may cause tiredness, fever, weight loss, or an enlarged spleen.

Chronic Obstructive Pulmonary Disease

A progressive, long-term lung disease that causes chronic airflow obstruction and breathing difficulty. Primarily caused by long-term exposure to irritating gases or particles—most commonly cigarette smoke—it encompasses two main overlapping conditions: extbfchronic bronchitis (long-standing inflammation and excessive mucus in the airways) and extbfemphysema (gradual destruction of the tiny air sacs in the lungs). Typical symptoms include persistent cough, excess phlegm, wheezing, and shortness of breath.

Chronic Otitis Media

Long-lasting or repeated inflammation or infection in the space behind the eardrum. It may cause fluid or ongoing discharge, hearing loss, or changes to the eardrum and small bones in the ear. In some cases, it can lead to a cholesteatoma.

Chronic Pharyngitis

Long-lasting or repeated soreness and inflammation of the throat. It may be linked to smoke or other irritants, dry air, allergies, mucus dripping from the nose, or stomach contents coming up into the throat.

Chronic Pain

Pain that persists or recurs for longer than three months. It may have an identifiable ongoing cause or persist after healing, and is influenced by complex interactions among biological, psychological, and social factors.

Chronic Pain Syndrome

Long-lasting pain accompanied by substantial effects on movement, sleep, mood, relationships, or daily activities. Treatment addresses pain and these related effects rather than relying only on pain medicines.

Chronic Pancreatitis

Repeated or long-term inflammation that permanently scars the pancreas. It may cause upper-abdominal pain, poor digestion, weight loss, diabetes, or oily stools; alcohol, smoking, inherited disorders, and blocked ducts are possible causes.

Chronic Paroxysmal Hemicrania

A primary headache disorder causing frequent, short-lasting, severe one-sided headaches with autonomic symptoms and a characteristic response to indomethacin.

Alternate Names:
CPH; Chronic Paroxysmal Hemicrania Syndrome

Chronic Pelvic Pain

Pain in the pelvic area that lasts for six months or longer. It may be constant or come and go, and may be related to reproductive, urinary, digestive, muscle, nerve, or pain-processing conditions. Sometimes more than one cause is present, or no single cause can be found.

Chronic Pelvic Pain in Women

Pain in the pelvis lasting or recurring for months and affecting daily life, sexual activity, urination, bowel function, or mood. Causes may include endometriosis, pelvic floor disorders, bladder or bowel

disease, adhesions, neuropathic pain, or no single identifiable cause.

Chronic Pelvic Pain Syndrome

Persistent or recurring pain in the pelvis, area between the genitals and anus, lower abdomen, back, or scrotum without a proven ongoing bacterial infection. Urinary symptoms, painful ejaculation, muscle tension, and sexual problems may also occur.

Alternate Names:
CPPS; NIH Category III Prostatitis; Chronic Nonbacterial Prostatitis

Chronic Progressive External Ophthalmoplegia

A slowly worsening muscle disorder causing drooping eyelids and limited movement of both eyes. It often begins in adulthood and may occur alone or with weakness of other muscles; inherited mitochondrial disease is a common cause.

Alternate Names:
CPEO; Progressive External Ophthalmoplegia (PEO)

Chronic Pyelonephritis

Long-term inflammation and scarring of the kidneys, often after repeated infections or backward flow of urine. It can gradually reduce kidney function and may cause high blood pressure, poor growth, or kidney failure.

Chronic Recurrent Multifocal Osteomyelitis

A rare autoinflammatory bone disorder, often beginning in children or adolescents, causing recurrent sterile inflammation and pain at multiple bone sites.

Alternate Names:
CRMO

Chronic Rejection

Progressive immune-mediated injury to a transplanted organ or tissue, often developing over months or years. Persistent antibody- or T-cell-mediated responses damage graft tissue and vessels, causing fibrosis, vascular narrowing, and gradual loss of function. The pattern varies by organ.

Chronic Renal Failure

Older term for kidney failure lasting more than three months. It refers to advanced chronic kidney disease, not to all chronic kidney disease; current terminology favors *Chronic Kidney Failure* or specifies kidney failure and its duration.

Chronic Respiratory Failure

Persistent failure of the respiratory system to maintain adequate oxygenation, carbon-dioxide removal, or both. It may result from lung disease, neuromuscular weakness, chest-wall disorders, or other conditions; it may be hypoxemic, hypercapnic, or both.

Alternate Names:
Long-Term Respiratory Insufficiency

Chronic Rhinitis

Long-lasting inflammation or irritation of the nose causing congestion, runny nose, sneezing, itching, or mucus draining into the throat. Causes include allergy, irritants, medicines, and structural problems; management depends on the cause.

Alternate Names:
Persistent Rhinitis

Chronic Rhinosinusitis

Inflammation of the nasal lining and paranasal sinuses lasting at least 12 weeks, with symptoms such as nasal obstruction, discharge, facial pressure, or reduced smell. Diagnosis also requires objective evidence of inflammation on examination, nasal endoscopy, or imaging; the condition may occur with or without nasal polyps.

Alternate Names:
Chronic Sinusitis; CRS

Chronic Rhinosinusitis With Nasal Polyps

Long-lasting inflammation of the nose and sinuses with soft, swollen growths called nasal polyps. It can cause blocked breathing through the nose, drainage, reduced smell, facial pressure, or recurrent sinus symptoms.

Chronic Sinusitis

Alternate name; see *Chronic Rhinosinusitis*.

Chronic Spontaneous Urticaria

Recurrent itchy wheals, angioedema, or both for six weeks or longer without a consistent external trigger. It has heterogeneous mechanisms; autoimmune or autoallergic mechanisms are present in some patients but do not explain every case.

Alternate Names:
CSU; Chronic Idiopathic Urticaria

Chronic Stiff Neck

Persistent reduced movement or tightness in the neck. Muscle strain, arthritis, disc disease, inflammation, or nerve problems may be responsible; fever, injury, weakness, numbness, or severe headache may indicate another underlying condition.

Chronic Subdural Hematoma

A collection of blood and breakdown products between the dura and arachnoid that develops over weeks, often after minor trauma in older adults, causing headache, confusion, weakness, or gait change.

Chronic Suppurative Otitis Media

Persistent inflammation and infection of the middle ear with recurrent or continuous ear discharge, usually through a perforated tympanic membrane. It can cause conductive hearing loss and may lead to cholesteatoma or other complications.

Alternate Names:
CSOM; Chronic Otitis Media with Discharge; Chronic Suppurative Middle-Ear Infection

Chronic Tension-Type Headache

A primary headache occurring on at least 15 days per month for more than three months. It is usually bilateral, pressing or tightening, and mild to moderate, without worsening during routine activity. Marked nausea or vomiting is absent; headache caused by a structural brain disorder is classified as secondary, not tension-type headache.

Chronic Thromboembolic Pulmonary Hypertension

Pulmonary hypertension caused by persistent organized clot and scar-like obstruction in the pulmonary arteries, usually after pulmonary embolism. A recognized acute embolism is not required; some people have no known history of one. The condition can strain the right side of the heart.

Chronic Toxicity

Harm caused by repeated or long-term exposure to a substance, even when each individual dose is small. Damage may build up over time and affect organs such as the brain, liver, kidneys, lungs, or nerves.

Chronic Traumatic Encephalopathy

A brain disorder associated with repeated blows or jolts to the head over time. It may be linked with later changes in memory, thinking, mood, behavior, or movement; diagnosis cannot be confirmed during life by a single test.

Chronic Urticaria

Repeated itchy raised welts, swelling, or both that last or recur for six weeks or longer. It may occur without a clear trigger or be brought on by factors such as cold, heat, or pressure. Each welt usually fades within a day without leaving a scar.

Chronic Venous Disease

Long-term difficulty returning blood from the legs to the heart because veins leak, are blocked, or do not receive enough help from leg muscles. It can cause varicose veins, swelling, skin changes, and ulcers.

Chronic Venous Insufficiency

Poor return of blood from the legs because the vein valves do not close properly or the veins are blocked. It can cause swelling, aching, varicose veins, dark or hardened skin, and ulcers near the ankle.

Chronic Venous Stasis

Persistent pooling of blood in the lower limbs caused by impaired venous return. It can produce edema,

skin discoloration, dermatitis, and venous ulcers.

Chronic Villitis

Inflammation of the chorionic villi, the branching placental structures that exchange oxygen and nutrients between maternal and fetal blood. It is identified by microscopic examination of the placenta and may be caused by infection or occur without an identified infection, as in villitis of unknown etiology. It is associated with placental dysfunction and fetal growth restriction, although the significance varies with its extent and cause.

Chronic Vulvar Pain

Alternate index label; see *Vulvodynia*.

Chronobiology

Chronobiology studies biological timing and rhythms, including circadian sleep-wake cycles, seasonal rhythms, and their effects on health.

Chronotropic

Chronotropic describes an influence on heart rate; a positive chronotropic effect increases rate, while a negative effect decreases it.

Churg-Strauss Disease

Former name; see *Eosinophilic Granulomatosis With Polyangiitis*.

Churg-Strauss Syndrome

A rare disease in which inflamed small and medium blood vessels are associated with asthma and too many eosinophils, a type of white blood cell. It can damage the lungs, nerves, skin, heart, or kidneys.

Alternate Names:
EGPA; Eosinophilic Granulomatosis with Polyangiitis

Chvostek Sign

Twitching of facial muscles after tapping over the facial nerve near the ear. It can occur with low blood calcium but is not reliable enough by itself to diagnose that condition.

Chvostek's Sign

Chvostek's sign is twitching of facial muscles after tapping near the facial nerve, sometimes associated with hypocalcemia but neither sensitive nor specific.

Chylangioma

Alternate name; see *Lymphangioma*.

Chyle

A milky fluid formed in intestinal lymph vessels after a meal. It contains lymph and absorbed dietary fat and normally travels through the thoracic duct into the bloodstream.

Chylomicron

A particle made by the intestine after eating fat. It carries dietary fat and cholesterol through the lymph and blood, then leaves remnants for the liver to remove.

Chylomicronemia Syndrome

Severe elevation of triglyceride-rich chylomicrons in blood, usually from genetic or acquired impairment of triglyceride clearance; it can cause abdominal pain, eruptive xanthomas, and recurrent acute pancreatitis.

Chylothorax

A buildup of chyle in the space around a lung, usually after injury or blockage of the thoracic duct. It can cause breathlessness; management may involve drainage, dietary measures, or surgery to address the leak.

Chylous Ascites

Accumulation of lymphatic fluid rich in triglycerides within the abdominal cavity. It can result from lymphatic obstruction, malignancy, trauma, surgery, infection, or congenital disease and may cause abdominal distention, malnutrition, or immune-cell loss.

Chyluria

Passage of lymphatic fluid into the urine, giving it a milky appearance. It usually results from an

abnormal communication between lymphatic vessels and the urinary tract.

Chyme

A semifluid mixture of partially digested food and gastric or intestinal secretions that passes from the stomach into the small intestine.

Alternate Names:
Digestive Chyme; Gastric Chyme

Chymotrypsin

Chymotrypsin is a pancreatic digestive enzyme that cleaves proteins in the small intestine; abnormal pancreatic release can contribute to tissue injury.

CIC

Commonly, clean intermittent catheterization: periodic insertion of a catheter to empty the bladder, followed by removal; other expansions are possible by context.

Cicatricial Alopecia

Hair loss caused by destruction and scarring of hair follicles, usually leading to permanent loss in affected areas.

Alternate Names:
Scarring Alopecia; Cicatricial Hair Loss

Cicatrization

Cicatrization is healing by formation of a scar after tissue injury, with replacement of damaged tissue by fibrous connective tissue.

Ciclopia

A rare severe congenital malformation in which the eyes are fused or a single median eye develops, usually as part of holoprosencephaly.

CICO Emergency

A life-threatening airway emergency in which a breathing tube cannot be placed and enough oxygen cannot be delivered by mask or another airway device. Management may involve an emergency surgical airway.

Alternate Names:
Cannot Intubate, Cannot Oxygenate; CICO; Failed Airway Crisis; Emergency Front-of-Neck Airway Scenario

Cidofovir

Cidofovir is an antiviral nucleotide analogue used for selected serious DNA-virus infections; kidney toxicity requires careful dosing and monitoring.

CIDP

Chronic inflammatory demyelinating polyneuropathy is a chronic, immune-mediated, peripheral neuropathy characterized by progressive or relapsing symmetrical weakness and sensory loss in all four limbs, with areflexia or hyporeflexia, lasting for more than eight weeks.

Cigarette

A small cylinder of tobacco or other material wrapped in paper for smoking; smoke exposure delivers nicotine and many toxic and carcinogenic substances.

Cigarette Smoking

Alternate form; see *Smoking*.

Ciguatera

Food poisoning caused by eating reef fish containing ciguatoxins. It may cause gastrointestinal illness followed by neurologic symptoms such as paresthesias and temperature-sensation disturbance.

Ciguatera Poisoning

Ciguatera poisoning follows eating reef fish containing ciguatoxins. Gastrointestinal symptoms may be followed by neurologic sensations such as temperature reversal, tingling, itching, weakness, or abnormal heart rate; no reliably proven antidote exists.

Alternate Names:
Ciguatera Fish Poisoning (CFP); Ciguatoxicity

Ciguatera Toxicity

Food poisoning from ciguatoxins in contaminated reef fish. It typically causes early nausea, vomiting,

diarrhea, and abdominal pain followed by perioral or distal paresthesias, itching, weakness, and temperature reversal; bradycardia or hypotension can occur. No reliably proven antidote exists.

Ciguatera Toxin

Alternate name; see *Ciguatoxin*.

Ciguatoxin

A heat-stable toxin produced by marine microorganisms and accumulated in some reef fish, causing ciguatera poisoning with gastrointestinal, neurologic, and temperature-sensation symptoms.

Cilia

Tiny hair-like structures on cells that move fluid, mucus, or particles across a tissue surface. In the airways, they help clear inhaled material; some cilia also sense signals and help move an egg cell.

Ciliary Body

A ring-shaped part of the eye between the iris and choroid. Its muscle changes the lens shape for focusing, and its processes make the fluid that fills the front of the eye.

Ciliary Body Melanoma

A melanoma arising in the uveal tract behind the iris. It may be asymptomatic or cause blurred vision, floaters, pain, or a visible change in the pupil or iris; ophthalmic examination and imaging guide diagnosis and eye-preserving or surgical treatment.

Ciliary Dyskinesia

Abnormal movement of cilia that impairs clearance of mucus from the airways and can cause recurrent respiratory infections.

Ciliary Flush

A violaceous, ring-like injection of deep episcleral vessels encircling the corneal limbus, serving as a cardinal physical sign of active intraocular inflammation such as iritis, keratitis, or acute angle-closure glaucoma.

Alternate Names:

Perilimbal Injection; Ciliary Injection

Ciliary Muscle

A ring of smooth muscle in the eye that changes the lens shape for focusing at different distances and helps regulate aqueous humor outflow through ciliary-body structures.

Ciliary Neuralgia

Pain arising from or felt along the ciliary nerves around the eye, often described as deep orbital or eye pain; causes vary.

Ciliated

Bearing cilia, tiny hair-like cell projections that move material across a tissue surface. Ciliated cells line parts of the respiratory and reproductive tracts; impaired ciliary function can disrupt mucus clearance or transport.

Ciliopathy

A disorder caused by abnormal cell cilia, the tiny structures that move material or sense signals. It may affect development, vision, kidney function, breathing, or several organs.

Cimetidine

Cimetidine is an H2-receptor antagonist that reduces gastric acid secretion; it has numerous drug interactions and is used less often than newer agents.

Cinacalcet

A calcimimetic drug that activates calcium-sensing receptors and lowers parathyroid hormone, used for selected forms of hyperparathyroidism and hypercalcemia.

Cineangiocardiography

Radiographic recording of the heart and blood vessels during passage of contrast material, used to visualize cardiac chambers, valves, and coronary or great vessels.

Cineangiography

Motion-picture X-ray imaging of the heart or blood

vessels while contrast material passes through them, used to show blood flow and moving cardiac structures.

Cinefluorography

Motion-picture recording of fluoroscopic images, used to document movement of organs or contrast material during a diagnostic examination.

Cineplasty

Surgical creation of a muscle-controlled stump or related reconstruction, historically used to improve control of a prosthetic limb.

Cingulotomy

A brain operation that interrupts selected nerve fibers involved in emotion and pain processing. It is reserved for rare, severe conditions that have not improved with other treatments and can cause bleeding, seizures, personality changes, or other brain injury.

Cinnarizine

Cinnarizine is an antihistamine with calcium-channel-blocking properties used in some countries for motion sickness and vestibular symptoms.

Ciprofloxacin

Ciprofloxacin is a fluoroquinolone antibiotic used for selected bacterial infections; tendon injury, nerve effects, QT effects, and resistance limit indiscriminate use.

Circadian Rhythm

An endogenous, self-sustaining biological oscillation with a period of approximately 24 hours that governs cellular metabolism, sleep-wake cycles, body temperature, autonomic tone, and endocrine secretion (such as the nocturnal surge of melatonin and the early-morning awakening surge of cortisol). Synchronized to the 24-hour solar cycle by environmental zeitgebers, primarily photic input received by intrinsically photosensitive retinal ganglion cells (ipRGCs) expressing melanopsin, which transmit signals along the retinohypothalamic tract to the master pacemaker in the suprachiasmatic nucleus (SCN) of the anterior hypothalamus. Molecular regulation is driven by an intracellular autoregulatory transcription-translation feedback loop involving *CLOCK*, *BMAL1*, *PER*, and *CRY* genes.

Circadian Rhythms

Plural form; see *Circadian Rhythm*.

Circadian Rhythm Sleep Disorder

A family of sleep disturbances arising from a persistent misalignment between an individual's endogenous biological circadian rhythm and external societal light-dark cycles, including delayed sleep phase disorder, advanced sleep phase disorder, shift-work disorder, and jet lag.

Circle of Willis

A ring-shaped network of arteries at the base of the brain that connects the front and back blood supplies. It may provide an alternate route for blood if an artery narrows or becomes blocked, but its structure varies and it may not provide enough backup flow.

Circulating Tumor Cell

A cancer cell that has detached from a tumor and entered the bloodstream. Testing may help study cancer spread or treatment response, but clinical use depends on the specific validated test and cancer.

Circulating Tumor DNA

Small fragments of DNA released by cancer cells into the blood. Testing them may help identify tumour changes, monitor treatment, or detect remaining disease, but it does not replace tissue diagnosis in every situation.

Circulation

Continuous movement of blood through the heart and blood vessels, or of lymph through lymphatic vessels, to transport oxygen, nutrients, hormones, and waste.

Circulatory

Relating to the movement of blood or lymph and

to the organs and vessels that carry them.

Circulatory System

The heart and blood-vessel network that pumps and distributes blood through pulmonary and systemic circuits; broadly, the term may include the lymphatic system.

Circumcision

Surgical removal of the foreskin covering the head of the penis. It may be performed for cultural, religious, preventive, or medical reasons; possible complications include bleeding, infection, pain, and injury, although serious problems are uncommon with proper care.

Circumduction

A compound, sequential circular joint movement combining flexion, abduction, extension, and adduction such that the distal end of an extremity moves in a circle while the proximal shaft delineates a cone, seen at ball-and-socket joints such as the shoulder and hip.

Circumflex

Curving around; the circumflex coronary artery is a branch of the left coronary artery that travels around the heart's lateral and posterior surface.

Circumflex Artery

A branch of the left coronary artery that runs around the left side and back of the heart. It supplies blood to the left atrium and much of the outer and back wall of the left ventricle.

Circumvallate Papillae

Circumvallate papillae are large taste papillae arranged near the back of the tongue and surrounded by a trench containing taste buds and serous glands.

Circumvallate Placenta

An extrachorial placental configuration in which the chorionic plate is smaller than the basal plate, producing a raised circumferential edge; it may be associated with bleeding, abruption, or growth restriction.

Cirrhosis

Advanced liver scarring in which fibrous bands and regenerating nodules distort the liver's structure and blood flow. It usually develops after long-term liver injury, such as from chronic hepatitis, alcohol-associated liver disease, or metabolic or autoimmune disease, and can cause portal hypertension and reduced liver function. Cirrhosis may remain compensated without major symptoms or become decompensated, causing complications such as abdominal fluid buildup, variceal bleeding, or hepatic encephalopathy; it also increases the risk of liver cancer.

Cirrhosis Of The Liver

Alternate name; see *Cirrhosis*.

Cisplatin

A platinum-based chemotherapy drug that forms DNA cross-links and is used to treat several cancers; important toxicities include kidney injury, hearing loss, neuropathy, and nausea.

Cisterna Chyli

A widened, sac-like part of the lymphatic system in the upper abdomen. It receives lymph from the lower body and intestines and continues upward as the thoracic duct.

Cisterna Magna

The largest subarachnoid cistern, located in the posterior cranial fossa between the inferior surface of the cerebellum and the dorsal aspect of the medulla oblongata, which receives cerebrospinal fluid directly from the fourth ventricle via the median aperture (foramen of Magendie).

Alternate Names:
Cerebellomedullary Cistern

Citalopram

Citalopram is a selective serotonin-reuptake inhibitor used to treat depression and some anxiety disorders; nausea, sexual effects, and QT prolongation are important considerations.

Citrate

Citrate is a salt or ion of citric acid that participates in metabolism and binds calcium; it is used in anticoagulant blood collection and some stone-prevention treatments.

Citrate Synthase

An enzyme that begins an important energy-producing process inside cells. It joins acetyl-CoA with oxaloacetate to make citrate, the first step of the citric acid cycle, which helps release energy from food.

Citric Acid Cycle

A series of chemical reactions inside mitochondria, the cell's energy-making structures, that breaks down food-derived molecules and produces energy. It also makes substances needed to build proteins, fats, and other cell components.

Citric Acid Urine Test

A urine test measuring citrate excretion, used mainly in the evaluation of recurrent kidney stones because low urinary citrate increases the risk of calcium stone formation.

Citrullinaemia

An inherited disorder of the urea cycle causing citrulline and ammonia buildup, which can lead to vomiting, confusion, seizures, coma, or death.

Citrullinemia

An inherited disorder in which the body cannot properly remove nitrogen through the urea cycle. Citrulline and ammonia build up, causing vomiting, poor feeding, sleepiness, confusion, seizures, coma, or death.

CJD

Alternate name; see *Creutzfeldt-Jakob Disease*.

CK

Creatine kinase, an enzyme found in skeletal muscle, heart muscle, and brain whose blood level may rise after tissue injury.

Alternate Names:
Creatine Phosphokinase; Creatine Kinase Enzyme

CKD-Mineral Bone Disorder

A complication of chronic kidney disease in which abnormal calcium, phosphate, vitamin D, and parathyroid hormone levels weaken bones and may cause calcium deposits in blood vessels and other tissues.

Cladribine

Cladribine is a purine analogue used for selected blood cancers and multiple sclerosis; lymphocyte depletion and infection risk require monitoring.

Clagett Procedure

A staged surgical procedure for chronic pleural empyema with bronchopleural fistula, consisting of open thoracic fenestration (open window thoracostomy) to drain the pleural space, followed by sequential cavity debridement, antibiotic irrigation, and eventual secondary chest wall closure.

Alternate Names:
Open Window Thoracostomy Closure; Clagett Window

Clammy Skin

Skin that feels cool, damp, or unusually sweaty. It may occur with heat, anxiety, pain, low blood sugar, shock, or other illness.

Clamp

A surgical instrument used to grasp, compress, occlude, or hold tissue, blood vessels, tubing, or other structures.

Clang Association

Clang association is speech in which word choice is driven by sound, rhyme, or pun rather than meaning, seen particularly in mania or psychosis.

Clarithromycin

Clarithromycin is a macrolide antibiotic used for selected bacterial and mycobacterial infections; interactions and QT prolongation are important risks.

Clark Level Of Invasion

An older system describing how deeply a melanoma has grown through the skin layers. Modern melanoma assessment relies more on tumor thickness, ulceration, spread, and other features.

Class IA Antiarrhythmics

Heart-rhythm medicines that slow electrical conduction and lengthen the time heart cells need before they can fire again. They treat selected abnormal rhythms but can themselves cause dangerous rhythm disturbances.

Class IB Antiarrhythmics

Heart-rhythm medicines that reduce abnormal electrical activity, especially in injured heart muscle. They are used mainly for selected fast rhythms arising from the lower chambers and require monitoring.

Class IC Antiarrhythmics

Strong heart-rhythm medicines that slow electrical conduction without greatly changing recovery time. They can treat selected upper-chamber rhythms but may be dangerous in people with structural heart disease.

Classic Galactosemia

A serious inherited disorder caused by severe deficiency of galactose-1-phosphate uridyltransferase. Milk feeding can rapidly cause jaundice, liver dysfunction, hypoglycemia, infection, and neurologic injury; lifelong galactose restriction is required.

Classic Migraine

A migraine attack preceded or accompanied by an aura, such as temporary visual, sensory, or speech changes. Headache may follow, with nausea and light or sound sensitivity, although patterns vary.

Classic Type Pfeiffer Syndrome

A genetic craniosynostosis syndrome, usually related to an *FGFR2* variant, causing early fusion of skull sutures, broad or deviated thumbs and great toes, and variable facial, airway, neurologic, or developmental problems.

Class III Antiarrhythmics

Heart-rhythm medicines that lengthen the recovery period between electrical beats. They treat selected abnormal rhythms but may slow the heart, affect organs, or prolong the electrical interval and cause dangerous rhythms.

Clathrin

A major polymeric coat protein composed of three heavy and three light chains forming a three-legged triskelion, which self-assembles into a polyhedral basket-like lattice that coats and internalizes endocytic vesicles during receptor-mediated endocytosis.

Claude Syndrome

A brainstem stroke syndrome caused by an ischemic or hemorrhagic infarction of the dorsal midbrain tegmentum affecting the oculomotor nerve fascicles, red nucleus, and cerebellothalamic tract. Clinical features include ipsilateral third cranial nerve palsy (ptosis, dilated pupil, and ophthalmoplegia) and contralateral cerebellar ataxia, tremor, and dysmetria.

Alternate Names:
Claude's Syndrome; Inferior Rubro-Spinal Syndrome

Claudication

Pain, aching, cramping, or weakness in a limb brought on by walking or other exertion. Vascular claudication, usually caused by reduced arterial blood flow, improves with rest; neurogenic claudication, often caused by lumbar spinal stenosis, typically improves with sitting or leaning forward.

Claudication Distance

The distance a person can walk before exertional limb pain begins. It is used to describe symptoms and monitor change.

Claustrophobia

An intense fear of enclosed or confined spaces that may cause anxiety, panic, or avoidance. Symptoms can occur in places such as elevators, tunnels, or MRI scanners.

Clavicle

The collarbone, a curved bone running from the breastbone to the shoulder blade. It supports the shoulder and commonly breaks after a fall or direct blow, causing pain, swelling, or visible deformity.

Clavicle Fracture

A break in the collarbone that may occur during birth or after trauma. A newborn may show asymmetric arm movement or tenderness; older children and adults may have pain, swelling, or deformity. Diagnosis is usually made by examination and imaging.

Clavus

A clavus is a localized painful thickening of skin, or corn, caused by repeated pressure or friction.

Claw Foot

A shape of the toes in which they bend upward where they join the foot and downward at the middle and tips. It can develop when foot muscles are unbalanced, after nerve damage, with arthritis, or from shoes that do not fit well.

Claw Hand

A deformity in which the large finger joints bend backward while the smaller joints bend inward. It is commonly caused by ulnar-nerve damage and may impair grip and hand function.

Claw Toe

A toe deformity characterized by extension at the metatarsophalangeal joint and flexion at the proximal and distal interphalangeal joints.

Clay-Colored Stool

Pale, gray, or white stool caused by reduced bile reaching the intestine. It can occur with bile-duct obstruction, liver disease, or pancreatic disease, especially when accompanied by jaundice or dark urine.

Alternate Names:
Acholic Stool; Pale Stool

Clean-Catch Specimen

A urine sample collected after cleansing the surrounding area and beginning urination, with the middle portion collected in a sterile container to reduce contamination.

Clean Catch Urine Sample

A midstream urine specimen collected after cleaning the genital area to reduce contamination and improve interpretation of urinalysis or culture.

Cleaning Supplies And Equipment

Materials and devices used to remove soil and microorganisms from surfaces or equipment; selection and disinfection level depend on the item and infection risk.

Clearance

The rate at which the body removes a medicine or other substance from the blood. The liver, kidneys, and sometimes other organs contribute; clearance helps determine how much medicine is needed and how often it should be given.

Clear Cell Carcinoma

Clear cell carcinoma is a cancer whose cells appear clear because of glycogen or lipid; it can arise in organs such as kidney, ovary, or endometrium.

Clear Cell Carcinoma Of The Ovary

A type of ovarian cancer whose cells look clear under a microscope. It is often associated with endometriosis and may be found at an earlier stage, but can resist some standard treatments and increase the risk of blood clots; treatment depends on stage and overall health.

Clear Cell Renal Cell Carcinoma

The most common type of kidney cancer in adults. The cancer cells look clear under a microscope because they contain stored fat and sugar; it may cause blood in the urine, pain, or a mass, but early disease may cause no symptoms.

Alternate Names:
CcRCC; Conventional Renal Cell Carcinoma

Clear Cell Renal Cell Carcinoma Pathology

A renal carcinoma composed of clear cells containing lipid and glycogen, commonly arranged in nests or sheets separated by a delicate branching vasculature. Diagnosis and grading depend on architecture, cytology, necrosis, and invasion.

Clear Liquid Diet

A limited diet consisting of transparent liquids such as water, clear broth, apple juice, and black coffee that leave minimal residue. It is used for short periods before procedures, during acute illness, or after surgery to maintain hydration while resting the gastrointestinal tract.

Clear Margins

A laboratory finding that no abnormal or cancer cells are seen at the edge of tissue removed during a procedure. It suggests the abnormal area may have been completely removed, but it does not by itself rule out disease elsewhere.

Cleft Lip

A birth defect in which the upper lip does not join completely before birth. The opening may be small or extend toward the nose and may occur alone or with a cleft palate, affecting feeding, teeth, or speech.

Cleft Lip And Cleft Palate

Congenital openings in the upper lip, the palate, or both, caused when developing facial tissues do not join completely. A cleft lip may occur alone or with a cleft palate; a cleft palate may also occur alone. The extent varies, and these conditions may affect feeding, speech, hearing, or tooth development.

Alternate Names:
Cleft Lip And Palate

Cleft Lip And Palate Repair

Surgery to close a cleft in the lip, palate, or both and improve feeding, speech, hearing, breathing, or appearance. Repair is usually staged during childhood and requires long-term dental and specialist follow-up.

Cleft Palate

A birth defect in which there is an opening in the roof of the mouth. It may occur alone or with a cleft lip and can cause problems with feeding, speech, hearing, or teeth.

Cleidocranial Dysostosis

An inherited bone disorder, usually caused by a RUNX2 gene change, in which the collarbones may be small or absent and skull bones close late. Extra teeth, delayed tooth eruption, short stature, and joint problems are common.

Cleidocranial Dysplasia

An inherited disorder of bone development affecting the collarbones and skull. It can cause delayed closure of skull joints, unusual teeth, short stature, and other skeletal differences.

Clemastine

Clemastine is a first-generation antihistamine used for allergic symptoms; sedation, anticholinergic effects, and impaired driving are concerns.

Click-Murmur Syndrome

Alternate name; see *Mitral Valve Prolapse*.

Climacteric

The period of physiologic change around the end of reproductive capacity, including the menopausal transition. It may involve changes in menstruation, vasomotor symptoms, and other endocrine effects.

Climate Change

Long-term changes in temperature, precipitation, and weather patterns, largely driven by human-produced greenhouse gases. Health effects include heat illness, worsened air quality, infectious-disease changes, injuries, and effects on food, water, and mental health.

Clindamycin

Clindamycin is a lincosamide antibiotic used for selected infections; diarrhea and Clostridioides difficile colitis are important adverse effects.

Clinical

Relating to direct observation, examination, diagnosis, or treatment of a patient, rather than solely to laboratory or basic research findings.

Clinical Biology

A field of laboratory medicine that analyzes patient samples using biological, biochemical, and molecular tests to diagnose or monitor disease. In some health systems, it is the broad name for diagnostic laboratory specialties; the exact scope differs by country.

Clinical Chemistry

The laboratory discipline that applies chemical and biochemical methods to measure substances or activities in patient specimens. It analyzes blood, urine, and other body fluids for electrolytes, glucose, lipids, enzymes, hormones, and drug levels, providing data used to assess health and disease.

Alternate Names:
Clinical Biochemistry

Clinical Communication

Exchange of information between healthcare professionals, patients, and caregivers to support diagnosis, treatment, safety, and informed decisions.

Clinical Counseling

Guidance provided in healthcare to help patients make informed decisions about health, prevention, treatment, and self-management.

Clinical Depression

A depressive illness causing persistent sadness or loss of interest, together with changes in sleep, appetite, energy, thinking, or self-worth that significantly interfere with daily life.

Clinical Deterioration

Worsening health that increases the risk of organ failure, disability, or death. Warning signs may include new confusion, breathing difficulty, abnormal vital signs, reduced urine, worsening pain, or poor circulation.

Clinical Diagnostics

The use of history, examination, laboratory tests, imaging, pathology, and other methods to identify or evaluate a health condition and guide care.

Clinical Disease

Disease that produces recognizable signs or symptoms or other findings detectable in a patient, as opposed to a silent or subclinical state.

Clinical Frailty Scale

A scale used by a healthcare professional to describe how fit, independent, or frail an older person is. It considers activity, daily function, and illness burden and supports care planning.

Clinical Handover

The transfer of responsibility for a patient's care from one healthcare professional or team to another. A safe handover states the diagnosis, current condition, risks, pending tasks, and what to do if the patient worsens.

Clinical Imaging

Medical imaging used to visualize anatomy, physiology, or disease, including radiography, ultrasound, computed tomography, magnetic resonance imaging, and nuclear medicine.

Clinical Microbiology

The laboratory discipline that detects and identifies bacteria, viruses, fungi, and parasites in patient specimens. It may also test antimicrobial susceptibility and help distinguish infection from colonization or contamination.

Clinical Neurophysiology

The diagnostic medical discipline that assesses and monitors function of the central, peripheral, and autonomic nervous systems and skeletal muscles, mainly through electrophysiologic testing. Methods include electroencephalography, electromyography, nerve-conduction studies, evoked potentials, and intraoperative monitoring. Results help localize and characterize neurologic and neuromuscular disorders.

Clinical Nutrition

The use of nutrition science to prevent, identify, and manage health problems. It includes assessment of food intake and nutritional status, dietary treatment, and nutrition support when ordinary eating is not enough or is unsafe.

Clinical Pharmacology

The medical science of medicines and their effects in people. It includes how medicines work, how the body absorbs and removes them, how they are used, and how their benefits, interactions, and risks are assessed.

Clinical Presentation

The symptoms, signs, examination findings, and test results seen in a person with a health problem. The presentation can differ with the cause, severity, age, other illnesses, and the time since the problem began.

Clinical Psychologist

A licensed mental-health professional who assesses and treats psychological, emotional, behavioral, and cognitive problems using psychotherapy and other evidence-based interventions within local scope of practice.

Clinical Reasoning

The process healthcare professionals use to combine a person's symptoms, examination, test results, history, and risks when deciding what diagnosis is most likely and what care is appropriate.

Clinical Trial

A planned study in which people receive or are observed for an intervention to evaluate its safety, effects, or outcomes. Trials may be conducted in phases and for many types of health interventions.

Clinical Trial Phases

Stages for testing a medical treatment: Phase I mainly examines safety and dose, Phase II studies early effectiveness and safety, Phase III compares it with usual care in larger groups, and Phase IV monitors longer-term use.

Clinicopathologic Correlation

Combining a person's symptoms, examination, scans, laboratory tests, and tissue findings to reach the most accurate diagnosis, especially when a small sample may not show the whole disease.

Clinistix

Clinistix is a reagent-strip method historically used to detect glucose in urine through an enzymatic color reaction.

Clinitest

Clinitest is a tablet-based copper-reduction test historically used to detect reducing substances in urine, including glucose; it is less specific than modern methods.

Clinodactyly

A finger or toe that curves sideways from birth or during development, most often the little finger. It is usually mild but may interfere with movement or occur with a genetic condition.

Clinoid Process

A small bony projection at the base of the skull near the eye socket and major nerves and blood vessels. It helps form the support around the pituitary region and optic canal.

CLIP

A device used to hold tissue or structures together; surgical clips can close blood vessels, mark tissue, or occlude structures such as the vas deferens.

Clitoral

Relating to the clitoris, an erectile organ with a dense concentration of sensory nerves at the front of the vulva.

Clitorectomy

Surgical removal of all or part of the clitoris, sometimes with removal of adjacent vulvar tissue; nonconsensual forms constitute female genital mutilation and can cause serious harm.

Clitoridectomy

Surgical removal of part or all of the clitoris. In medicine it may be performed for selected tumors or severe disease; nonmedical removal is a harmful practice with no health benefit.

Clitoris

A small, sensitive erectile organ located at the anterior junction of the labia minora, beneath the clitoral hood (prepuce). The clitoris is the primary source of female sexual pleasure and is homologous to the male penis.

Clitorodynia

Persistent or recurrent pain, burning, or marked sensitivity of the clitoris. Causes may include infection, skin disease, nerve pain, trauma, pelvic-floor dysfunction, or another vulvar pain disorder.

Clitoromegaly

Clitoromegaly is enlargement of the clitoris, which may be congenital or acquired from androgen excess, endocrine disease, medication, or other causes.

Clivus

A central, sloped bony surface on the floor of the posterior cranial fossa formed by the fusion of the basilar part of the sphenoid bone and the basiocciput, extending anterior to the foramen magnum and providing a bed for the pons and basilar artery.

CLL

Alternate name; see *Chronic Lymphocytic Leukemia*.

Cloacal Abnormalities

A group of rare birth-related conditions in which the urinary, genital, and intestinal structures do not separate or develop normally. They may affect the bladder, bowel, spine, external genitalia, and reproductive organs.

Cloacal Exstrophy

A very rare birth defect in which the lower abdominal wall, bladder, bowel, spine, and reproductive or urinary organs do not form normally and may be exposed. It is associated with complex surgical and long-term medical needs.

Cloacitis

Inflammation of a cloaca or cloacal region, particularly in disorders affecting the common terminal outlet of the urinary, genital, and intestinal tracts.

Clodronate

Clodronate is a bisphosphonate that reduces bone resorption and is used in selected bone and cancer-related conditions.

Clofazimine

Clofazimine is a riminophenazine antimicrobial used mainly in multidrug treatment of leprosy and selected mycobacterial infections; skin discoloration is common.

Clomifene

Clomifene, or clomiphene, is a selective estrogen-receptor modulator used to induce ovulation in selected infertility settings.

Clomipramine

Clomipramine is a tricyclic antidepressant particularly effective for obsessive-compulsive disorder; anticholinergic, cardiac, and overdose toxicity are important.

Clonal Evolution

The gradual change of a cancer as groups of tumor cells acquire different genetic changes. Groups that grow faster, spread more easily, or resist treatment can become dominant and make the cancer progress or recur.

Clonal Expansion

Multiplication of cells descended from one original cell. It may occur when immune cells respond to a trigger or when an abnormal cell population grows in cancer or another disorder.

Alternate Names:
Clonal Proliferation; Clone Expansion

Clonazepam

Clonazepam is a benzodiazepine anticonvulsant and anxiolytic that enhances GABA activity; sedation, dependence, and respiratory depression can occur.

Clonic Seizure

A seizure causing repeated, rhythmic jerking of muscles. It may affect one part of the body or both sides, with or without loss of awareness; the cause and seizure type are determined from the episode and medical assessment.

Clonidine

Clonidine stimulates central alpha-2 receptors to reduce sympathetic outflow and is used for hypertension and selected other conditions; abrupt withdrawal can cause rebound hypertension.

Clonidine Toxicity

Alpha-2-adrenergic agonist poisoning causing somnolence, miosis, bradycardia, hypotension, respiratory depression, and sometimes transient hypertension early after ingestion. Management is supportive with airway and cardiovascular monitoring; naloxone may improve opioid-like central depression in selected cases.

Clonorchiasis

Infection with the Chinese liver fluke, Clonorchis sinensis. It affects the biliary tract and may cause inflammation, obstruction, and long-term hepatobiliary complications.

Clonus

Repeated, rhythmic muscle jerks triggered by suddenly stretching a muscle, often at the ankle. It commonly indicates overactive reflexes from a problem affecting the brain or spinal cord.

Clopidogrel

Clopidogrel is an antiplatelet drug that irreversibly blocks the platelet P2Y12 receptor, reducing arterial thrombosis risk after selected cardiovascular events or procedures.

Closed-Angle Glaucoma

Glaucoma caused by blockage of the eye's drainage angle, so fluid cannot leave and pressure rises. Sudden attacks can cause severe eye pain, blurred vision, halos, headache, nausea, and permanent sight loss.

Closed Comedo

A small skin lesion formed when a follicular opening is blocked by sebum and keratin but remains covered by the epidermis.

Alternate Names:
Whitehead

Closed Fracture

A fracture in which the broken bone does not communicate through a wound with the external environment.

Closed-Loop Insulin Delivery

Automated insulin delivery systems that combine continuous glucose monitoring with an insulin pump and control algorithm. The algorithm adjusts basal insulin delivery based on sensor glucose values in real time. Hybrid closed-loop systems require user-initiated meal boluses but automatically manage basal rates.

Closed Reduction

Nonoperative realignment of a fractured or dislocated bone or joint by manipulation without surgically opening the site.

Closed Reduction Of A Fractured Bone

A nonsurgical procedure that realigns a broken bone by manipulating it through the skin without opening the fracture site, usually followed by immobilization and imaging to confirm alignment.

Closed Suction Drain With Bulb

A flexible drain connected to a compressible bulb that creates gentle negative pressure to remove blood or fluid from a surgical or injured area; the bulb is emptied and output recorded as directed.

Closed Surgical Wound Care

Care of an incision whose edges are closed with sutures, staples, adhesive, or strips, including keeping it clean and dry as instructed and watching for infection or separation.

Clostridial Infection

Infection caused by anaerobic, spore-forming bacteria of the genus *Clostridium* or related genera such as *Clostridioides*. These infections may cause antibiotic-associated colitis, food poisoning, botulism, tetanus, or destructive wound disease; the species and toxins determine the clinical syndrome.

Alternate Names:
Clostridial Infections; Clostridium Infection

Clostridial Myonecrosis

A rapidly progressive, life-threatening necrotizing infection of skeletal muscle caused primarily by Clostridium perfringens or other histotoxic clostridia. Typically arising after deep traumatic injuries, compound fractures, or surgery, it is characterized by severe pain out of proportion to exam findings, rapid tissue edema, bronze skin discoloration, bullae, palpable gas crepitus, and systemic toxemia.

Alternate Names:
Gas Gangrene; Clostridial Gangrene

Clostridioides Difficile

A spore-forming bacterium that can overgrow after antibiotics disturb normal gut bacteria. Its toxins inflame the colon and cause watery diarrhea, abdominal pain, fever, and sometimes life-threatening colitis.

Clostridioides Difficile Colitis

Alternate name; see *Clostridium Difficile Colitis*.

Clostridioides Difficile Infection

Diarrhea and colon inflammation caused by overgrowth of Clostridioides difficile, often after antibiotic use. It may be mild or severe and can recur; diagnosis requires appropriate stool testing in a person with symptoms.

Clostridioides Difficile Pathogenesis

Antibiotics can remove protective bowel bacteria, allowing C. difficile to multiply. Its toxins injure the colon and cause inflammation and diarrhoea, while hardy spores can survive in the environment and spread infection.

Clostridium

A genus of anaerobic, usually spore-forming bacteria that includes species capable of causing diseases such as tetanus, botulism, gas gangrene, and antibiotic-associated colitis.

Clostridium Botulinum

A bacterium that produces botulinum toxin, which blocks nerve signals to muscles and causes weakness or paralysis. Food, wounds, or swallowed spores can cause botulism, a medical emergency affecting breathing and swallowing.

Clostridium Difficile

Former taxonomic name; see *Clostridioides Difficile*.

Clostridium Difficile Colitis

Clostridioides difficile colitis is antibiotic-associated inflammation of the colon caused by toxin-producing bacteria. It causes watery diarrhea, abdominal pain, fever, and sometimes severe colitis; diagnosis and treatment depend on symptoms, testing, recurrence, and severity.

Alternate Names:
C. Diff Colitis; Clostridioides Difficile-Associated Diarrhea (CDAD); Pseudomembranous Colitis

Clostridium Difficile Infection

Alternate name; see *C. Difficile Infection*.

Clostridium Perfringens

A bacterium that can cause rapidly destructive muscle infection with gas in tissues or food poisoning with sudden diarrhea and abdominal cramps. Severe wound infection requires emergency surgery and antibiotics.

Clostridium Perfringens Food Poisoning

An acute foodborne toxico-infection caused by ingestion of large numbers of vegetative cells of Clostridium perfringens type A that sporulate in the intestine and produce enterotoxin. It typically develops 6 to 24 hours after eating contaminated cooked meats, poultry, or gravies held at warm temperatures, causing intense abdominal cramps and watery diarrhea that usually subside within 24 hours.

Clostridium Tetani

A soil bacterium whose toxin causes tetanus after entering a wound. It produces painful muscle stiffness and spasms, often beginning in the jaw, and can interfere with swallowing and breathing; vaccination prevents it.

Clot

A semisolid mass of blood formed during clotting. A clot can stop bleeding, but one that blocks a blood vessel can reduce blood flow or travel elsewhere and cause serious injury.

Clot Buster

A medicine that breaks down a blood clot, also called a thrombolytic medicine. It may be used urgently for selected strokes, heart attacks, or lung clots, but it can cause dangerous bleeding and is not safe for everyone.

Cloth Dye Poisoning

Exposure to cloth dyes that may cause irritation, gastrointestinal symptoms, allergic reactions, or systemic toxicity depending on the chemical composition.

Clotrimazole

Clotrimazole is an azole antifungal used topically or orally in selected formulations for fungal infections of skin, mouth, or vagina.

Clotting

The body's process of stopping bleeding by narrowing a damaged vessel, forming a platelet plug, and producing a protein mesh that strengthens the plug. Excessive or inappropriate clotting can block blood vessels.

Cloudy Cornea

Loss of corneal transparency from edema, scarring, infection, dystrophy, trauma, or deposits, potentially causing blurred vision, pain, photophobia, or glare.

Clove Oil

Clove oil contains eugenol and is used in some dental and topical products; concentrated ingestion or exposure can cause irritation, liver injury, or seizures.

Clozapine

Clozapine is an atypical antipsychotic for treatment-resistant schizophrenia and selected suicidality risk; neutropenia, myocarditis, seizures, constipation, and metabolic effects require monitoring.

Clubbing

Enlargement and rounding of the fingertips or toes with more curved nails and loss of the normal nail angle. It may accompany long-term lung, heart, bowel, liver, or other disease.

Clubbing Of The Fingers Or Toes

Bulbous enlargement of fingertip or toe soft tissue with increased nail curvature caused by chronic changes in the nail bed; it can accompany lung, heart, gastrointestinal, or other disease.

Clubbing of the Nails

Rounding and widening of the fingertips or toes with increased nail curvature and loss of the normal nail-fold angle. It may be inherited or associated with lung, heart, gastrointestinal, liver, or other disease; acquired clubbing can accompany progressive illness.

Club Drugs List And Side Effects

Club drugs include substances such as MDMA, ketamine, GHB, and others used recreationally in social settings. Effects may include agitation, hallucinations, seizures, dangerous temperature elevation, respiratory depression, cardiovascular toxicity,

impaired consent, and overdose.

Club Foot

Alternate spelling; see *Clubfoot*.

Clubfoot

A congenital foot-and-ankle deformity in which the foot points downward and turns inward, with the heel tilted inward and the forefoot turned toward the midline. The foot is usually stiff and does not move fully into a normal position. Talipes equinovarus is the common specific form; "clubfoot" may also refer more broadly to other congenital foot-position deformities. It may affect one or both feet.

Clubfoot (Talipes Equinovarus)

Alternate name; see *Clubfoot*.

Clubfoot Repair

Treatment to gradually straighten a baby's turned-in foot, usually with gentle stretching and casts, followed by a brace. Some children need a small tendon procedure or later surgery if the deformity returns or is severe.

Clubhand

A birth defect in which the hand and wrist curve toward the thumb or little-finger side because forearm bones or other tissues developed abnormally. Treatment depends on function and may include therapy or surgery.

Clumping

The gathering of cells, particles, or proteins into groups. In a laboratory sample, clumped red blood cells or platelets can affect test results; in the body, clumping can sometimes block vessels.

Cluster

A group of similar events, findings, cells, or cases occurring together in space, time, or clinical pattern.

Cluster Headache

Repeated attacks of extremely severe pain around or behind one eye, lasting about 15 minutes to three hours. The same side may tear, redden, swell, or feel congested, and the person often becomes restless.

Cluster Headaches

Alternate name; see *Cluster Headache*.

Clutton's Joints

Painless swelling of both knees or other large joints caused by long-term inflammation in children with congenital syphilis. Joint movement is usually preserved; the underlying infection is syphilis.

CMTC

Abbreviation for cutis marmorata telangiectatica congenita, a congenital vascular skin anomaly causing persistent reticulated red or purple mottling. It may be isolated or associated with limb asymmetry, ulcers, or other vascular abnormalities.

CMV

Cytomegalovirus, a common herpesvirus that may cause mild or asymptomatic infection but can cause serious disease in fetuses and people with weakened immunity.

Alternate Names:
Cytomegalovirus (CMV)

CMV Blood Test

A blood test that looks for cytomegalovirus antibodies, viral proteins, or viral genetic material. Antibodies usually show past or recent exposure, while viral material can help detect active infection, especially in people with weakened immunity.

CMV Colitis

Inflammation of the colon caused by cytomegalovirus, usually in someone with severely weakened immunity. It may cause bloody diarrhea, abdominal pain, fever, or weight loss and is confirmed with appropriate testing, often including biopsy.

CMV Pneumonia

Pneumonia caused by cytomegalovirus, usually in people with substantial immune suppression; fever,

cough, shortness of breath, and low oxygen may occur and require targeted evaluation and antiviral treatment.

CMV Retinitis

Infection and inflammation of the retina caused by cytomegalovirus, usually in people with severely weakened immunity. It may cause floaters, blurred or missing areas of vision, and blindness unless treated urgently.

CNS Infection

Infection of the brain, spinal cord, meninges, or cerebrospinal-fluid spaces caused by bacteria, viruses, fungi, parasites, or other organisms; presentation and treatment depend on the pathogen and anatomic site.

CNS Lymphoma

A lymphoma involving the central nervous system, most often diffuse large B-cell lymphoma. It may involve brain parenchyma, meninges, eyes, or cerebrospinal fluid.

CO2 Blood Test

A blood chemistry measurement that usually estimates serum total carbon dioxide, which largely reflects bicarbonate. It helps assess acid-base and electrolyte disorders; sodium, chloride, kidney function, and blood-gas results provide additional context.

Coagulate

To change from a liquid to a semisolid or solid state, especially the formation of a blood clot through coagulation.

Alternate Names:
Clot; Clot Formation

Coagulation

The body's process for stopping bleeding by forming a stable blood clot. Platelets first gather at an injured vessel, then blood proteins create a mesh of fibrin that strengthens the plug; too little clotting causes bleeding, while too much can cause harmful clots.

Coagulation Cascade

A linked series of reactions involving blood-clotting proteins that ends by forming fibrin, the mesh that strengthens a platelet plug. Problems at different steps can cause excessive bleeding or harmful clotting.

Coagulation Defects

Problems in blood vessels, platelets, or clotting proteins that make bleeding last too long or cause harmful clots to form. Causes may be inherited, acquired, medicine-related, or due to liver or other disease.

Coagulation Factor

A blood protein required for the coagulation cascade and formation of a stable fibrin clot; deficiencies or inhibitors can cause bleeding, while excessive activation can contribute to thrombosis.

Coagulation Factor Deficiencies

Inherited or acquired disorders in which one or more clotting factors are reduced or function abnormally, causing excessive bleeding. The clinical pattern and laboratory findings depend on the affected factor.

Coagulation Factor V Leiden

An autosomal dominant genetic variant (G1691A point mutation in the factor V gene) that confers resistance to proteolytic cleavage and inactivation by activated protein C (APC resistance), representing the most common inherited thrombophilia in Caucasian populations.

Coagulation Profile

A group of blood tests that assess how quickly blood clots, commonly including prothrombin time/INR and activated partial thromboplastin time. Results help investigate bleeding, clotting, liver disease, vitamin K deficiency, and monitor selected medicines.

Coagulation Time

The time a blood sample takes to form a clot under specified laboratory conditions. Modern tests usually measure particular clotting pathways more precisely to investigate bleeding or abnormal clot-

ting.

Coagulative Necrosis

A type of tissue death, usually caused by loss of blood flow, in which the tissue's basic shape remains for a while. It can occur in most solid organs but usually not in the brain.

Coagulopathy

A disorder of hemostasis, the processes that form and dissolve blood clots. It can impair clot formation or regulation, leading to abnormal bleeding or harmful clots. Causes include inherited clotting disorders, medicines, liver disease, low platelet counts, and severe illness.

Coal Worker's Pneumoconiosis

Lung disease caused by breathing coal dust over many years. It may begin with small areas of dust damage and progress to extensive scarring, causing cough, breathlessness, and reduced lung function.

Coal Workers' Pneumoconiosis (Black Lung Disease)

An occupational lung disease caused by long-term inhalation of coal mine dust. It can produce small nodules and progressive massive fibrosis, leading to cough, breathlessness, impaired lung function, pulmonary hypertension, or respiratory failure; exposure prevention is central.

Coarctation

A localized narrowing of a tubular anatomical structure, especially coarctation of the aorta, which obstructs blood flow and produces characteristic pressure differences.

Coarctation of the Aorta

A narrowing in the aorta, the main artery carrying blood from the heart to the body. It is usually near the branches that supply the head and arms. The narrowing reduces blood flow to the lower body and makes the heart pump harder. Blood pressure may be higher in the arms than in the legs, and pulses in the legs may be weak. Severity ranges from severe narrowing in infancy to mild narrowing found later; other heart defects may occur.

Coarse Crackles

Wet, bubbling sounds heard through a stethoscope as air moves through fluid or secretions in larger airways. They may occur with pneumonia, bronchiectasis, chronic lung disease, or fluid in the lungs and are not specific to one condition.

Coats Disease

An uncommon retinal disorder characterized by abnormal retinal blood vessels, leakage, exudation, and sometimes retinal detachment, usually affecting one eye in childhood.

Cobalamin

Vitamin B12, a nutrient needed for DNA production, healthy red blood cells, nerve function, and normal processing of certain fats and proteins.

Cobalamin Deficiency

Alternate index label; see *Vitamin B12 Deficiency*.

Cobalt

Cobalt is a metal present in vitamin B12 and some industrial materials; excess exposure can injure the heart, thyroid, lungs, or skin.

Cobalt-57

A radioactive form of cobalt used as a test source for checking and calibrating gamma cameras. It is mainly used for equipment quality control and is not normally given to patients as a diagnostic or treatment medicine.

Cobalt-Chromium

A strong, corrosion-resistant metal mixture used for cast dental restorations, partial dentures, crowns, and selected medical devices. Some people may develop sensitivity, and prolonged exposure to cobalt can be harmful.

Cobalt Poisoning

Toxic exposure to cobalt that may cause gastrointestinal, neurologic, thyroid, cardiac, or lung effects

after significant or prolonged exposure.

Cocaine

A stimulant drug that blocks monoamine reuptake and can also act as a local anesthetic; use can cause dependence, cardiovascular complications, seizures, stroke, and overdose.

Cocaine-Associated Cardiomyopathy

Cardiac muscle dysfunction associated with cocaine exposure, which may involve ischemia, myocarditis, arrhythmia, hypertension, or direct myocardial toxicity. Presentation ranges from chest pain and reduced ejection fraction to heart failure or sudden death.

Cocaine Cardiotoxicity

Cocaine overstimulates the heart and blood vessels, raising heart rate and blood pressure and sometimes tightening the heart's arteries. It can cause chest pain, heart attack, dangerous rhythms, heart failure, or sudden death, even without longstanding artery disease.

Cocaine Intoxication

A toxic reaction to cocaine that may cause agitation, overheating, high blood pressure, seizures, abnormal rhythms, heart attack, stroke, or sudden death.

Cocaine-Related Psychiatric Disorders

Alternate name; see *Cocaine Use Disorder*.

Cocaine Substance Use

Use of cocaine, a stimulant that can cause dependence, agitation, seizures, heart attack, stroke, dangerous overheating, and severe psychiatric or cardiovascular complications.

Cocaine Toxicity

A toxic state caused by cocaine, often producing agitation, high blood pressure, rapid heart rate, hyperthermia, seizures, coronary vasospasm, myocardial infarction, or stroke.

Cocaine Use Disorder

A pattern of cocaine use that becomes difficult to control or causes problems with health, work, relationships, or safety. Craving, repeated use despite harm, tolerance, and withdrawal may occur.

Alternate Names:
Cocaine Dependence; Cocaine Abuse; Cocaine Addiction

Cocaine Withdrawal

Physical and emotional symptoms after stopping or reducing cocaine, including fatigue, depressed mood, increased appetite, sleep changes, irritability, and cravings. Severe depression or suicidal thoughts may occur.

Cocarboxylase

Cocarboxylase is thiamine pyrophosphate, the active coenzyme form of vitamin B1 required for several oxidative carbohydrate and amino-acid reactions.

Coccidioides Complement Fixation

A blood test that detects complement-fixing antibodies to Coccidioides; antibody levels can support diagnosis and help assess the severity or progression of coccidioidomycosis.

Coccidioides Immitis

A dimorphic soil fungus and a principal cause of coccidioidomycosis, or Valley fever, acquired by inhaling airborne arthroconidia. Infection is usually pulmonary but can disseminate, especially in people with impaired cellular immunity.

Coccidioides Precipitin Test

A serologic test that detects antibodies to Coccidioides, typically early immunoglobulin M antibodies, and supports evaluation of suspected coccidioidomycosis when interpreted with symptoms and other testing.

Coccidioidomycosis

A fungal infection caused by Coccidioides fungi, usually acquired by breathing spores from disturbed

soil. It most often affects the lungs and causes cough, fever, tiredness, or chest pain; rarely, it spreads to the skin, bones, joints, or brain.

Common name: Valley fever

Coccidioidomycosis and Valley Fever

Infection caused by Coccidioides fungi, acquired by inhaling spores from disturbed soil in endemic regions. It may cause a self-limited respiratory illness, but dissemination to skin, bone, joints, or meninges can occur, especially in pregnancy or immunosuppression.

Coccidiosis

Infection caused by microscopic parasites called coccidia. It usually affects the intestine and may cause watery diarrhea, stomach cramps, vomiting, dehydration, or weight loss; severe or widespread disease is more likely when immunity is weakened.

Coccus

A round or nearly round bacterium. These bacteria may occur alone, in pairs, chains, or clusters; their shape helps describe them but does not identify the species or illness by itself.

Coccydynia

Pain in the region of the coccyx, often worsened by sitting. Causes include trauma, childbirth, degenerative change, and less commonly infection or tumor.

Alternate Names:
Coccygodynia; Tailbone Pain

Coccygectomy

Surgical removal of the coccyx, reserved for selected cases of severe persistent coccygeal pain or a lesion that has not responded to conservative treatment.

Coccyx

The small pointed bone at the bottom of the spine, commonly called the tailbone. It connects to the sacrum, supports pelvic-floor tissues, and may become painful after a fall, childbirth, or prolonged sitting.

Cochlea

The spiral-shaped part of the inner ear that changes sound vibrations into nerve signals. Fluid movement inside it stimulates sensory hair cells, allowing the brain to recognize pitch and loudness.

Cochlear Duct

The coiled, endolymph-filled membranous tube of the inner ear, situated between the scala vestibuli and scala tympani, housing the organ of Corti along its basilar membrane for auditory sensory transduction.

Alternate Names:
Scala Media

Cochlear Implant

A surgically implanted neural prosthetic device designed to restore functional auditory sensation in individuals with severe-to-profound sensorineural hearing loss who derive negligible benefit from conventional acoustic amplification. It bypasses damaged or non-functional sensory hair cells of the organ of Corti to provide tonotopically organized direct electrical stimulation to spiral ganglion neurons of the cochlear nerve (CN VIII). The device comprises external hardware (microphone, speech processor, and magnetic transmitter coil) that captures and digitizes acoustic signals, and internal components (hermetically sealed subcutaneous receiver-stimulator package and an intracochlear electrode array surgically threaded into the scala tympani of the cochlea).

Cochlear Implants

Plural form; see *Cochlear Implant*.

Cockayne Syndrome

A rare inherited disorder in which cells cannot repair some types of DNA damage normally. It causes poor growth, developmental delay, worsening nerve problems, sensitivity to sunlight, hearing or vision loss, and an appearance of premature aging.

Cockcroft-Gault Formula

An equation that estimates creatinine clearance (CrCl) from serum creatinine, age, body weight,

and sex. The result is multiplied by 0.85 for women. It is used as an estimate of kidney function, particularly for medication dosing, but is less accurate in people with unusual body size or rapidly changing kidney function.

Alternate Names:
Cockcroft-Gault Equation; Creatinine Clearance Estimation Formula

Code Black

A hospital emergency alert for a serious security or safety threat. The exact meaning differs between hospitals, so staff follow the facility's emergency policy.

Code Blue

A hospital alert that summons a team for a person with suspected or actual cardiac or respiratory arrest. Some hospitals also use it for another life-threatening medical emergency. The exact meaning and response can vary by hospital.

Codeine Overdose

Overdose of codeine, an opioid, that can cause respiratory depression, impaired consciousness, pinpoint pupils, and coma. Naloxone may be required in emergency care.

Codman Triangle

A triangular area of new bone seen on an X-ray when a rapidly growing bone lesion lifts the outer covering of bone. It suggests aggressive bone disease but does not identify a specific diagnosis.

Codon

A group of three genetic building blocks in messenger RNA that specifies one amino acid or signals the end of protein production. Several different codons can specify the same amino acid.

Coefficient of Inbreeding

The probability that the two copies of a gene at a locus in an individual are identical by descent from a common ancestor; it is used in population and medical genetics.

Coenzyme

A small organic molecule that helps an enzyme carry out a chemical reaction. Many coenzymes come from vitamins and temporarily carry chemical groups or electrons.

Coenzyme Q

A fat-soluble molecule in mitochondrial membranes that transfers electrons during cellular energy production. It also acts as an antioxidant, and the body makes it naturally, although levels may change with age or illness.

Coenzyme Q10

CoQ10, a lipid-soluble compound in mitochondrial electron transport and an antioxidant; it is also sold as a dietary supplement, although benefits vary by condition.

Cofactor

A nonprotein helper, such as a mineral ion or vitamin-derived molecule, that an enzyme needs to perform a chemical reaction. Without its cofactor, the enzyme may not work normally.

Coffee-Ground Emesis

Vomit containing dark brown or black granular material from blood altered by stomach acid. It may indicate upper gastrointestinal bleeding.

Coffin-Lowry Syndrome

A rare inherited developmental disorder, usually linked to an RPS6KA3 gene change. It can cause intellectual disability, distinctive facial features, short stature, spinal curvature, tapered fingers, and sudden falls triggered by surprise.

Alternate Names:
CLS

Cogan'S Syndrome

A rare immune disorder causing inflammation of the cornea and inner ear. It may produce eye pain, reduced vision, dizziness, ringing, or hearing loss and can sometimes inflame large blood vessels.

Cognition

The mental processes involved in acquiring, storing, retrieving, and using information, including attention, memory, language, reasoning, and judgment.

Cognitive

Relating to mental processes such as attention, memory, learning, language, reasoning, perception, judgment, problem solving, and decision-making.

Cognitive Behavioral Therapy

A structured talking therapy that helps a person identify unhelpful thoughts and behaviors and practice more useful responses. It is used for depression, anxiety, insomnia, pain, and other conditions.

Cognitive Behavioral Therapy For Back Pain

A structured psychological treatment that addresses pain-related thoughts, behaviors, sleep, activity, and coping to reduce disability and improve function in chronic back pain.

Cognitive Behavioral Therapy For Insomnia

A structured talking treatment for persistent insomnia. It changes unhelpful beliefs and habits about sleep and uses methods such as a regular sleep schedule, limiting time awake in bed, relaxation, and stimulus control.

Cognitive Behavior Therapy

A talking treatment that helps a person notice unhelpful thoughts and behaviors and develop more useful ways to respond. It is used for problems such as anxiety, depression, pain, insomnia, and some eating disorders.

Cognitive Behavioural Therapy

A structured psychological treatment that helps a person identify and change unhelpful thoughts and behaviors. It is used for conditions such as anxiety, depression, insomnia, pain, and some eating disorders.

Cognitive Decline

A reduction over time in one or more cognitive abilities, such as memory, attention, language, reasoning, or visuospatial function.

Cognitive Distortion

An inaccurate, irrational, or exaggerated thought pattern that reinforces negative emotions or maladaptive beliefs; see *Cognitive Distortions*.

Cognitive Distortions

Repeated patterns of inaccurate or unhelpful thinking, such as assuming the worst, seeing situations as all good or all bad, or believing one knows what others think. They can worsen anxiety or depression and may be addressed in therapy.

Cognitive Fitness

The active maintenance of mental sharpness and brain health through stimulating activities, physical exercise, social engagement, and proper nutrition. Regular challenges such as learning new skills, puzzles, reading, and social interaction support neuroplasticity and cognitive reserve.

Cognitive Function

The mental abilities used for attention, memory, language, learning, reasoning, judgment, planning, problem solving, and understanding information.

Alternate Names:
Cognition; Cognitive Ability

Cognitive Health And Memory

Cognitive health encompasses the ability to think clearly, learn, remember, and make decisions, with memory being a core component that involves encoding, storing, and retrieving information. Age-related changes in processing speed and recall are normal, but persistent decline may signal mild cognitive impairment or dementia.

Cognitive Impairment

A decline in thinking abilities such as memory, attention, language, judgment, or problem solving. It may be mild with independence preserved or severe

enough to interfere with everyday activities.

Cognitive Rehabilitation

Structured therapy to improve cognitive function or help a person compensate for difficulties with memory, attention, language, or executive skills after illness or injury.

Cognitive Reserve

The brain's ability to use alternative strategies or networks to maintain function despite injury or disease.

Cognitive Screening

A brief assessment used to identify possible problems with memory, attention, language, or other cognitive functions. It does not by itself diagnose dementia or another disorder.

Cognitive Symptoms

Changes in thinking abilities such as attention, memory, processing speed, language, judgment, planning, or problem solving. They may occur with neurologic disease, mental-health conditions, medicines, sleep problems, substance use, or other medical conditions.

Cognitive Therapy

A psychological treatment that helps a person identify and change unhelpful thoughts and beliefs and develop more adaptive behaviors; cognitive behavioral therapy combines it with behavioral methods.

Cogwheel Rigidity

A type of muscle stiffness where moving an arm or leg feels jerky and catches like moving gears, commonly seen in Parkinson's disease.

Cohort

A group of people who share a defined characteristic or experience during a specified period and are studied over time or compared with another group.

Cohort Study

An observational study that identifies groups based on an exposure or other characteristic and compares the incidence of disease or other outcomes between them over time. It may be prospective or retrospective and commonly estimates relative risk.

Coincidence Detection

The PET-scanning method of recording two gamma rays that reach opposite detectors at nearly the same time after a radioactive tracer changes inside the body. Their path helps the scanner locate where the tracer is concentrated.

Coitus

Sexual intercourse, traditionally meaning penile-vaginal penetration; the term does not include every form of sexual activity or intimate contact.

Coitus Interruptus

The withdrawal method of contraception, in which the penis is removed from the vagina before ejaculation; it is less reliable than many other contraceptive methods.

Coke

Slang for cocaine, a stimulant drug; the word can also mean a carbon fuel product, so context is essential.

Cold

Alternate name; see *Common Cold*.

Cold Abscess

A pocket of pus that develops slowly with little redness, warmth, or pain. It may occur with tuberculosis or other long-term infections.

Cold Agglutinin

A type of abnormal immune protein (antibody) that binds to red blood cells when blood cools down below normal body temperature, such as in the fingers, toes, ears, or nose. When this occurs, red blood cells can clump together and be broken down prematurely by the immune system, leading to fatigue, pale or bluish skin in the extremities upon cold exposure, and hemolytic anemia.

Cold Agglutinin Disease

An autoimmune blood disorder in which antibodies become active in cooler parts of the body and cause red blood cells to stick together and break down. It may cause anemia, fatigue, jaundice, or cold-related color changes.

Cold Agglutinins

Plural form; see *Cold Agglutinin*.

Cold Agglutinin Syndrome

A condition in which antibodies become active in cool parts of the body, making red blood cells clump and break down. It may cause anemia or blue, painful fingers and toes.

Cold Allergy

Alternate name; see *Cold Urticaria*.

Cold Exposure

Alternate index label; see *Hypothermia*.

Cold Hands

Hands that feel unusually cold, which may result from environmental exposure, reduced blood flow, Raynaud phenomenon, anemia, thyroid disease, or other medical conditions.

Cold Injury

Harm caused by low temperature, including hypothermia, frostbite, chilblains, and nonfreezing tissue injury. Risk increases with prolonged exposure, wetness, wind, or poor circulation and may affect the whole body or a local area.

Cold Intolerance

Unusual sensitivity or inability to tolerate cold temperatures, which may occur with hypothyroidism, anemia, low body weight, vascular disease, or other conditions.

Cold Ischemia Time

The duration during organ transplantation between the initiation of hypothermic organ preservation perfusion in the donor and the re-establishment of warm arterial blood reperfusion in the recipient, an important determinant of primary graft function.

Cold Medicines And Children

Safety guidance for giving medicines to children with cold symptoms; many combination products provide little benefit in young children and can cause dosing errors or serious adverse effects.

Cold Panniculitis

Inflammation of subcutaneous fat after exposure to cold, producing firm, red or violaceous, sometimes tender plaques or nodules. It is most often seen on the cheeks of infants or on exposed areas and usually improves with warming and avoidance of further cold.

Cold Sore

A recurrent localized viral infection of the vermilion border of the lips or perioral skin caused predominantly by herpes simplex virus type 1 (HSV-1) and occasionally HSV-2. Following primary oral inoculation, the virus ascends sensory nerve axons and establishes lifelong latency in the sensory neurons of the trigeminal ganglion. Reactivation is triggered by stressors including ultraviolet radiation, febrile illness, physical trauma, menses, or immunosuppression. Prodromal paresthesias (tingling, pruritus, or burning) precede the eruption of grouped, painful, thin-walled umbilicated vesicles on an erythematous base that rupture, exude serous fluid, and form honey-colored crusts that heal without scarring in 7–14 days. Early administration of oral nucleoside analogues (valacyclovir, famciclovir) shortens healing time and reduces viral shedding.

Cold Sores

Plural form; see *Cold Sore*.

Cold Urticaria

Raised, itchy patches or swelling that appear after the skin is exposed to cold. A large area of cold exposure, such as swimming in cold water, can rarely cause fainting or a life-threatening allergic reaction.

Colectomy

Surgery to remove part or all of the colon. It may treat cancer, severe inflammatory bowel disease, diverticular complications, blocked bowel, or inherited high cancer risk; the amount removed depends on the disease.

Colibacillosis

Disease caused by pathogenic strains of Escherichia coli, which may produce intestinal infection, urinary-tract infection, sepsis, or other illness.

Colic

Severe wave-like pain caused by contraction or blockage of a hollow organ, such as the intestine, gallbladder, or urinary tract. The term also describes repeated crying in an otherwise healthy young infant.

Colicky Pain

Intermittent, wave-like cramping pain caused by contraction, distension, or obstruction of a hollow organ; common examples include biliary, renal, and intestinal colic.

Coliform

A group of bacteria used as an indicator of possible contamination in water or food. Finding them does not prove that disease-causing bacteria are present, because many coliforms are harmless environmental organisms.

Colitis

Inflammation of the colon, which may cause diarrhea, abdominal pain, blood or mucus in stool, fever, or urgency. Causes include infection, inflammatory bowel disease, reduced blood flow, medicines, and radiation.

Collagen

A strong protein that forms much of the body's connective tissue. Different types support and strengthen skin, bone, cartilage, tendons, ligaments, blood vessels, and many internal structures.

Collagenase

An enzyme that breaks down collagen, a major structural protein in skin, bone, cartilage, and connective tissue. Natural collagenases help remodel tissue, while medicines or bacterial enzymes can be used in selected treatments or cause tissue damage.

Alternate Names:
Collagen-Digesting Enzyme; Collagen-Degrading Enzyme

Collagen Disease

An older, broad term for diseases that affect connective tissues and often involve abnormal immune activity. Modern medical writing usually names the specific disease instead.

Collagen Implant

A medical material made from or based on collagen, a structural protein, used to support tissue repair or add soft-tissue volume. Sources may be animal-derived or manufactured. Its uses, durability, and risks depend on the product and the treated body area.

Collagenous Colitis

A type of microscopic colitis in which a thick layer of collagen develops beneath the colon lining. It usually causes persistent, watery, nonbloody diarrhea and may require colon biopsy for diagnosis.

Collapsed Arch

Alternate name; see *Flat Feet*.

Collapsed Lung

A common description of pneumothorax, in which air in the pleural space compresses the lung. It may cause sudden chest pain and shortness of breath and can be life-threatening when tension develops. Atelectasis is a different cause of loss of lung expansion, usually involving blockage or compression of lung tissue.

Collapse Of The Lung

See *Lung Collapse*.

Collapsing Glomerulopathy

An aggressive and histologically distinctive variant of focal segmental glomerulosclerosis (FSGS) characterized by global or segmental collapse of the glomerular capillary tuft accompanied by marked hypertrophy and hyperplasia of overlying visceral epithelial cells (podocytes). Associated with human immunodeficiency virus infection (HIV-associated nephropathy), high-risk *APOL1* genotypes, interferon therapy, and severe parvovirus B19 infection.

Alternate Names:
Collapsing FSGS; Collapsing Focal Segmental Glomerulosclerosis

Collapsing Pulse

A bounding arterial pulse characterized by a rapid, forceful upstroke followed by an abrupt, sudden collapse, best appreciated by elevating the patient's arm while grasping the radial artery with the palmar aspect of the fingers. It is characteristic of aortic regurgitation and high-output states such as severe anaemia, thyrotoxicosis, or arteriovenous fistulas.

Alternate Names:
Corrigan Pulse; Water-Hammer Pulse

Collateral

Providing an alternative or parallel route, such as collateral blood vessels that supply tissue around an obstruction; in other contexts it means accompanying or secondary.

Collateral Circulation

Alternate blood-vessel routes that develop or enlarge when a main artery becomes narrowed or blocked. They may partly maintain blood flow to tissue, but they may not prevent symptoms or injury if the blockage is severe.

Collateral Ligament Injury

A sprain or tear of a strong ligament on the inner or outer side of the knee. It may cause pain, swelling, tenderness, or looseness after a twisting or sideways force; treatment depends on severity and may include a brace and rehabilitation.

Collecting Duct

Small kidney tubes that receive fluid from several filtering units and adjust its water and salt content before it becomes urine. Antidiuretic hormone helps them return water to the blood.

Colles Fracture

A fracture of the distal radius, near the wrist, in which the hand-side fragment tilts or shifts toward the back of the hand (dorsally). It often follows a fall onto an outstretched hand and may involve shortening or fragmentation of the bone.

Alternate Names:
Colles' Fracture; Colles' Fracture

Collimator

A device in an imaging camera that allows radiation traveling in selected directions to reach the detector. It helps form a clearer image, but its design affects the balance between detail and the ability to detect weak signals.

Colloids

Fluids containing large particles that tend to stay in blood vessels longer than simple salt solutions. Some are used to support circulation, but they can cause fluid overload, allergic reactions, or kidney problems and are chosen according to the clinical situation.

Coloboma

A birth defect caused by incomplete formation of part of the eye, leaving a notch or gap in the iris, retina, choroid, or optic nerve. Vision problems vary with the structure and amount affected.

Coloboma Of The Iris

A congenital keyhole- or notch-shaped defect in the iris caused by incomplete embryonic closure, sometimes associated with colobomas in the retina, optic nerve, or other organs.

Colocolonic Intussusception

Telescoping of one part of the colon into the next section. It is uncommon in adults and may be

caused by a polyp, tumor, or other lesion, producing intermittent pain, bloating, vomiting, or altered bowel movements.

Cologne Poisoning

Ingestion of cologne containing alcohol and fragrances that may cause intoxication, hypoglycemia, respiratory depression, or gastrointestinal irritation.

Cologuard

A stool-based colorectal-cancer screening test combining DNA-marker analysis with a fecal blood test; a positive result requires diagnostic colonoscopy.

Colon

The main part of the large intestine between the small intestine and rectum. It absorbs water and salts and stores and moves stool through its ascending, transverse, descending, and sigmoid sections.

Colon Cancer

A malignant tumor arising in the colon, usually from gland-forming cells in the bowel lining. Many cases develop from precancerous polyps, but some arise through other pathways. Symptoms may include blood in the stool, a persistent change in bowel habits, abdominal discomfort, unexplained weight loss, fatigue, or iron-deficiency anemia; early cancer may cause no symptoms. Diagnosis usually involves colonoscopy and biopsy, followed by staging to guide treatment. Management may include surgery, chemotherapy, targeted therapy, or immunotherapy depending on the stage and tumor features.

Alternate Names:
Colon Carcinoma; Cancer of the Colon; Bowel Cancer (informal or regional term)

Colon Cancer Prevention

Colorectal-cancer risk can be reduced through recommended screening, physical activity, healthy weight, limiting alcohol, avoiding tobacco, and a diet rich in fiber-containing plant foods. Screening can detect precancerous polyps and early cancer before symptoms develop.

Colon Cancer Screening

Testing intended to detect colorectal cancer or precancerous polyps before symptoms develop in people at average risk. Options include stool-based tests and direct visualization such as colonoscopy; the appropriate method and interval depend on age, risk, prior findings, and local guidelines. People with symptoms or increased inherited or personal risk may need diagnostic or earlier specialist evaluation rather than routine screening.

Colonic Diverticulitis

Alternate name; see *Diverticulitis*.

Colonic Inertia

Abnormally slow movement of stool through the colon, causing persistent constipation, bloating, abdominal discomfort, and infrequent bowel movements. It is diagnosed after other causes of constipation have been considered.

Colonic Ischemia

Reduced blood flow to the colon causing tissue injury. It may produce sudden abdominal pain, bloody diarrhea, and tenderness and can result from low blood pressure, narrowed arteries, clots, medicines, or inflammation of blood vessels.

Colonic Mucosa

The inner lining of the colon. It absorbs water and salts, makes mucus, and contains cells that help protect the colon.

Colonic Polyps

Alternate name; see *Colon Polyps*.

Colonic Pseudo-Obstruction

Massive clinical and radiological dilation of the colon, predominantly involving the cecum and right colon, in the complete absence of a mechanical or physical obstructing lesion; associated with severe non-operative medical illnesses or recent surgery.

Alternate Names:
Ogilvie Syndrome; Acute Colonic Pseudo-Obstruction

Colonic Stenosis

Narrowing of part of the large intestine that makes it harder for stool and gas to pass. Causes include scar tissue, inflammation, cancer, or reduced blood supply; symptoms may include pain, bloating, constipation, vomiting, or bowel blockage.

Colonic Tissue Culture

Microbiologic cultivation and identification of biopsy tissue harvested from the colonic mucosa during colonoscopy to detect fastidious bacterial pathogens, mycobacteria (e.g., *Mycobacterium tuberculosis*), or fungal organisms.

Alternate Names:
Colon Biopsy Culture; Colonic Mucosal Culture

Colonization

The presence and growth of microorganisms on or in the body without tissue damage or illness. Colonization can occur before infection, but it does not by itself explain symptoms or require antibiotics.

Colonoscope

A flexible, lighted instrument with a camera that is inserted through the anus to examine the rectum and colon. It can contain channels for air, irrigation, biopsy tools, or devices used to remove polyps.

Colonoscopy

An examination of the rectum and colon using a flexible camera. It can find inflammation, bleeding, tumors, and polyps and allows tissue sampling or removal of some polyps during the same procedure.

Colon Polyps

Growths from the inner lining of the colon. Many are harmless, but some can slowly become colorectal cancer; removing polyps during colonoscopy can prevent some cancers, and follow-up depends on their number, size, and type.

Alternate Names:
Colorectal Adenomas

Colony-Forming Unit

A laboratory estimate of the number of living microorganisms in a sample, based on the colonies that grow in culture. One colony may come from one organism or from a group of organisms.

Colony-Stimulating Factors

Natural or manufactured substances that signal the bone marrow to make more blood cells. Some are used to prevent or treat low white-cell counts caused by cancer treatment or other illness.

Colorado Tick Fever

A viral infection spread by certain ticks, usually causing sudden fever, headache, tiredness, and muscle aches. Some people develop a rash, nausea, or low blood counts; most recover with supportive care, but severe illness can occur.

Color Blindness

Reduced or absent ability to distinguish certain colors under normal lighting. It is often inherited, especially through X-linked variants, but may also result from eye disease, neurologic disease, aging, or medicines.

Color Doppler

An ultrasound technique that uses colors to show the direction and relative speed of blood flow over a regular gray-scale image. It helps assess vessels, heart valves, and circulation.

Colorectal Adenocarcinoma

The most common cancer of the colon and rectum, arising from gland-forming cells in the bowel lining. It may cause bleeding, anemia, altered bowel habits, pain, or no early symptoms and can spread to other organs.

Colorectal Adenoma

A usually noncancerous gland-forming growth in the colon or rectum that may gradually develop into colorectal cancer.

Colorectal Cancer

Cancer arising in the colon or rectum, including colon cancer and rectal cancer. It may cause bleed-

ing, altered bowel habits, iron-deficiency anemia, abdominal pain, weight loss, or no early symptoms. Diagnosis usually involves colonoscopy and biopsy; evaluation and treatment depend on the tumor's location, stage, and molecular features.

Colorectal Cancer Genetics

The study of inherited variants that increase the risk of colorectal cancer. Important inherited syndromes include Lynch syndrome, involving DNA mismatch-repair genes, and familial adenomatous polyposis, involving the APC gene.

Colorectal Cancer Screening

Testing intended to detect colorectal cancer or precancerous lesions in people without symptoms. Recommended starting age, test, and interval vary by country, guideline, and individual risk; people with symptoms or increased risk may need diagnostic evaluation or earlier screening.

Colorectal Cancer Screening Tests

Tests used to detect colorectal cancer or precancerous polyps in people without symptoms. They include stool-based tests and examinations that visualize the colon, such as colonoscopy, CT colonography, and flexible sigmoidoscopy. The appropriate test and interval depend on age, risk, and local guidance.

Colorectal Polyp

A small growth of tissue that protrudes from the inner lining of the colon or rectum. Most polyps are benign and cause no symptoms, but certain types (known as adenomas) have the potential to slowly transform into colorectal cancer over many years if not detected and removed.

Alternate Names:
Bowel Polyp; Bowel Polyps; Colorectal Polyps

Colorectal Polyps

Plural form; see *Colorectal Polyp*.

Colorectal Surgery

A surgical specialty focused on the medical, endoscopic, and operative care of disorders of the colon, rectum, anus, and pelvic floor. It includes benign and malignant disease, such as colorectal cancer, inflammatory bowel disease, diverticular disease, and anorectal disorders. Procedures may include endoscopic evaluation, bowel resection, reconstruction, and stoma creation.

Color Vision Deficiency

Reduced ability to distinguish some colors, commonly red and green. It is often inherited because of differences in the eye's color-sensing cells, but it can also develop from eye disease, optic-nerve or brain disorders, medicines, or toxins. The type and severity vary.

Color Vision Test

An eye test that assesses the ability to distinguish colors or identify color patterns. It helps detect inherited color-vision deficiency and acquired abnormalities caused by eye, optic-nerve, brain, medicine, or toxic disorders.

Colostomy

Surgery that brings part of the large intestine through an opening in the abdomen, called a stoma. Stool and gas leave through the stoma into a pouch. A colostomy may be temporary or permanent and may be needed for cancer, bowel blockage, severe infection, injury, or other bowel disease. Stoma nurses can teach people how to care for it and return to usual activities.

Alternate Names:
Bowel Stoma; Large Intestinal Stoma; Colic Stoma

Colostrum

The thick yellowish breast fluid made during late pregnancy and the first days after birth. It provides concentrated nutrition and immune protection, especially through antibodies, to the newborn.

Colpitis

Inflammation of the vagina caused by infection, altered vaginal bacteria or yeast, irritation, allergy, or hormonal changes. Symptoms may include discharge, itching, burning, pain, odor, or painful intercourse.

Colporrhaphy

Surgery that repairs a weakened front or back wall of the vagina. It may support the bladder or bowel when pelvic tissues bulge into the vagina and cause pressure, discomfort, or difficulty emptying.

Colposcope

A lighted magnifying instrument used to examine the cervix, vagina, or vulva closely and guide biopsy of suspicious areas.

Colposcopy

An examination using a magnifying instrument to inspect the cervix, vagina, and vulva after a screening test shows an abnormality. The clinician may apply solutions and take tissue samples from suspicious areas.

Colposcopy-Directed Biopsy

A specialized gynecologic diagnostic procedure in which acetic acid- or Lugol iodine-enhanced cervical, vaginal, or vulvar epithelial abnormalities visualized under colposcopic magnification are biopsied for histopathologic evaluation of dysplasia or malignancy.

Alternate Names:
Colposcopic Biopsy; Cervical Punch Biopsy; Directed Cervical Biopsy

Columnar Cells

Tall, roughly column-shaped epithelial cells found in linings such as the digestive tract. They may absorb, secrete, or transport material and can bear cilia or microvilli.

Columnar Epithelium Lined Lower Esophagus

Alternate index label; see *Barrett's Esophagus*.

Coma

A state of profound unresponsiveness in which a person cannot be awakened and does not show purposeful responses. It is a medical emergency with many possible causes.

Alternate Names:
Comatose State; Unconsciousness

Coma Scale

A standardized tool for describing level of consciousness using eye opening, verbal response, and motor response.

Combination Inhalers

Inhalers containing two or more medicines, such as an inhaled corticosteroid with a long-acting bronchodilator. They may simplify regular treatment for asthma or chronic obstructive pulmonary disease; the prescribed device and schedule must be followed.

Combination Therapy

Use of two or more treatments together to address a disease or mechanism. The benefits and risks depend on the condition and the specific combination.

Combined Electrolyte Imbalances

Abnormal blood levels of calcium, phosphate, and potassium. This combination does not have one single cause; each result must be confirmed and interpreted with kidney function, medicines, symptoms, and the rest of the electrolyte panel.

Combined Hormone Therapy

Hormone therapy containing both estrogen and a progestogen, generally used when endometrial protection is needed in a person with a uterus.

Alternate Names:
Estrogen-Progestogen Therapy; Combined Menopausal Hormone Therapy

Combined Hyperlipidemia

A blood-fat disorder with high cholesterol and triglycerides, often increasing harmful lipoproteins and raising the long-term risk of artery disease.

Alternate Names:
Mixed Hyperlipidemia; Combined Hyperlipoproteinemia

Combined Oral Contraceptive Pill

Oral contraceptive formulations containing both an

estrogen (typically ethinylestradiol) and a progestin that prevent pregnancy primarily through feedback inhibition of gonadotropins to suppress ovulation, accompanied by thickening of cervical mucus and endometrial thinning.

Alternate Names:
Combined Oral Contraceptives; COCP; Combination Birth Control Pills; The Pill

Combined Spinal-Epidural Analgesia

A form of regional pain relief that gives medicine into the spinal fluid for rapid relief and places a catheter outside it for continued dosing. It is often used during labor or surgery and requires monitoring.

Comedocarcinoma

A form of ductal carcinoma in situ of the breast characterized by central necrosis within malignant ducts, which may produce a comedo-like appearance.

Comedonal Acne

A form of acne in which open comedones (blackheads) and closed comedones (whiteheads) predominate, with little inflammatory redness or swelling. It results from blockage of hair follicles by sebum and keratin.

Comedones

Plugs of sebum and keratin within hair follicles, appearing as open blackheads or closed whiteheads and representing a primary lesion of acne.

Comfort Measures Only

A care plan focused on relief of pain, breathlessness, distress, and other symptoms rather than treatments intended to prolong life.

Commando Procedure

Extensive heart surgery for severe infection destroying both the aortic and mitral valve areas and the tissue between them. The surgeon removes infected tissue, rebuilds the damaged area, and replaces both valves when necessary.

Alternate Names:
Aortomitral Fibrous Body Reconstruction; Intervalvular Fibrosa Reconstruction

Commensal

Describing a microorganism that lives on or in the body and benefits from the relationship without normally harming the person. Many harmless skin and bowel bacteria are commensal.

Comminuted

Describing a fracture in which one bone breaks into several pieces. These fractures may be caused by high-energy injury and can be unstable or involve nearby tissues, so treatment depends on the bone, alignment, skin, nerves, and blood vessels.

Comminuted Fracture

A broken bone divided into several pieces, usually by a high-energy injury. It may be unstable and damage nearby skin, muscles, nerves, or blood vessels, so treatment depends on the site and severity.

Commissurotomy

Surgical incision or separation of a commissure, especially a fused cardiac valve commissure, to relieve obstruction.

Commode

A portable toilet or chair placed near a bed for a person who cannot easily reach a bathroom.

Common Bile Duct

The tube formed when ducts from the liver and gallbladder join. It carries bile into the first part of the small intestine, where bile helps digest dietary fat.

Common Carotid Artery

One of two major arteries carrying blood from the heart toward the head and neck. Each divides into an internal branch supplying the brain and an external branch supplying the face and scalp.

Common Cold

A viral infection of the nose and throat. It can cause a runny or blocked nose, sneezing, sore throat,

cough, and mild aches or fever. Many different viruses cause colds, which spread through close contact and droplets from the nose or mouth. Most people improve within a week, though a cough or runny nose may last longer.

Alternate Names:
Acute Viral Rhinopharyngitis; Head Cold

Common Cold In Babies

A viral infection of a baby's nose and throat causing a runny or blocked nose, cough, sneezing, and feeding difficulty. Babies may develop dehydration or breathing difficulty, with signs such as poor feeding, fewer wet diapers, or fast breathing.

Common Fibular Nerve

A major nerve that passes around the outer side of the knee into the lower leg and foot. It helps lift and turn the foot and carries feeling from much of the lower leg and top of the foot.

Alternate Names:
Common Peroneal Nerve

Common Iliac Arteries

Two large arteries formed where the abdominal aorta divides. Each artery supplies blood to the pelvis and then divides into arteries serving the pelvic organs and lower limb.

Common Iliac Vein

A vein formed by the union of the internal and external iliac veins. The right and left common iliac veins unite to form the inferior vena cava.

Common Medical Abbreviations And Terms

Medical abbreviations and terms summarize diagnoses, tests, medicines, anatomy, and treatment instructions. Because abbreviations can be ambiguous or unsafe, patients should ask clinicians or pharmacists to explain unfamiliar wording rather than infer its meaning.

Alternate Names:
Medical Acronyms; Clinical Terminology

Common Migraine

A migraine attack without a preceding aura. It usually causes moderate or severe throbbing pain lasting four to 72 hours, often with nausea or sensitivity to light or sound and worsening with routine activity.

Alternate Names:
Migraine Without Aura; Migraine Without Neurologic Aura

Common Peroneal Nerve Dysfunction

Impairment of the common peroneal nerve, often from compression near the fibular head, trauma, surgery, or systemic nerve disease. It may cause foot drop, weakness of ankle eversion or dorsiflexion, and sensory loss over the lateral leg or dorsum of the foot.

Common Peroneal Neuropathy

A peripheral nerve disorder causing weakness of ankle dorsiflexion and eversion, sensory loss over the anterolateral leg and dorsum of the foot, and possible foot drop.

Common Uterine and Ovarian Growths

Three usually noncancerous types of growth: fibroids arise from uterine muscle, cysts are fluid-filled sacs often found in the ovaries, and polyps are tissue projections from the uterine lining or cervix.

Common Variable Immunodeficiency

A primary antibody-deficiency disorder characterized by low immunoglobulin G with low immunoglobulin A and/or M and impaired responses to vaccines. It causes recurrent sinus, ear, and lung infections and may also cause chronic gastrointestinal disease, autoimmunity, enlarged lymph nodes, granulomas, or increased lymphoma risk.

Commotio Cordis

Sudden cardiac arrest after a blunt blow to the chest at a vulnerable moment in the heartbeat, usually without visible damage to the heart. Survival depends on rapid cardiopulmonary resuscitation and defibrillation.

Communicable Disease

An illness caused by an infectious agent or its products that can spread directly or indirectly between people, animals, or environmental sources. Transmission routes include respiratory particles, contact, vectors, and contaminated food or water. Prevention and control depend on the disease and may include immunization, sanitation, treatment, and public-health surveillance or locally required notification.

Alternate Names:
Communicable Diseases; Transmissible Disease

Communicating Hydrocephalus

A buildup of cerebrospinal fluid that enlarges the brain's fluid-filled spaces because the fluid is not absorbed normally after it circulates. It can cause headache, vomiting, walking difficulty, sleepiness, or thinking problems.

Communicating With Patients

The clinical exchange of information, concerns, preferences, and decisions between healthcare professionals and patients, using clear language, listening, empathy, and confirmation of understanding.

Communicating With Someone With Aphasia

Communication strategies for a person with impaired language from brain injury or disease, including short sentences, extra time, visual cues, and supported conversation rather than assuming impaired intelligence.

Communication Disorder

A neurodevelopmental condition involving persistent difficulties in the comprehension, expression, articulation, or social use of verbal or nonverbal language; see *Language Disorder*.

Communicating With Someone With Dysarthria

Communication strategies for a person whose speech muscles are weak or poorly coordinated, including reducing background noise, confirming messages, and using writing or augmentative aids when needed.

Community-Acquired

Acquired outside a healthcare facility or before healthcare exposure. For example, community-acquired pneumonia begins outside a hospital and may involve different organisms and resistance patterns from hospital-acquired disease.

Community Acquired Infection

An infection caught outside a healthcare facility or present when a person is admitted, rather than acquired during recent healthcare treatment. Examples include some lung, urinary-tract, and skin infections.

Community-Acquired Pneumonia

Pneumonia acquired outside a hospital or long-term-care facility. It may cause cough, fever, chest pain, breathlessness, and low oxygen; diagnosis and treatment depend on examination, imaging, severity, likely organisms, comorbidities, and local antibiotic guidance. CURB-65 or PSI can help assess the need for hospital care but does not replace clinical judgment.

Alternate Names:
CAP

Community-Acquired Pneumonia In Adults

A lung infection that begins outside a hospital or long-term-care facility. It may cause cough, fever, chest pain, breathlessness, or low oxygen; treatment and the need for hospital care depend on severity and other health conditions.

Community Health Worker

A trained member of a community who helps connect people with health services, education, prevention, and social support.

Community Mental-Health Treatment

Mental-health assessment, treatment, rehabilitation, and support delivered outside a hospital, such as in clinics, homes, schools, or community programs. It may include medication management, psychotherapy, crisis support, peer support, and help with housing, work, or daily functioning.

Community Rehabilitation

Therapy and support delivered at home, in clinics, or in community settings to improve movement, communication, independence, participation, and daily functioning after illness or injury.

Community Reintegration

The process of returning to everyday life and taking part in work, education, family, social, and leisure activities after illness or injury. Support may include rehabilitation, changes to the home or workplace, transport help, and practical or emotional support.

Comorbidity

The presence of two or more health conditions in the same person. The conditions may affect one another and can make symptoms, medicine choices, and treatment planning more complicated.

Compact Bone

Dense outer bone tissue arranged in strong cylindrical units called osteons. It provides most of the skeleton's strength and protects inner marrow while supporting movement and weight-bearing.

Alternate Names:
Cortical Bone; Dense Bone

Comparison

A reference in an imaging report to earlier studies used to assess whether a finding has changed.

Compartment Pressure

The pressure inside a closed group of muscles, nerves, and blood vessels. If it rises too much, blood flow can fall and cause permanent tissue damage; measurements support but do not replace examination.

Compartment Syndrome

A painful, emergency medical condition that occurs when pressure within an enclosed muscle compartment builds to dangerous levels, usually following a severe fracture, crush injury, or tight bandage or cast. As swelling increases within the inflexible connective tissue (fascia), blood flow to the muscles and nerves is cut off, causing intense, unrelenting pain (often disproportionate to the injury), numbness, and muscle weakness, risking permanent tissue damage if not relieved quickly.

Compensated Heart Failure

Heart failure in which symptoms and fluid buildup are stable or controlled with treatment. The heart failure is still present and can worsen, especially if a new illness or other problem develops.

Competence

A legal determination that a person can make a particular decision or manage a matter. In clinical care, decision-making capacity is assessed for each specific choice.

Competitive Antagonist

A medicine or substance that occupies the same receptor as another substance but does not activate it. By competing for that site, it reduces the other substance's effect; increasing the other substance may overcome the competition.

Competitive Inhibition

Reduced activity of an enzyme when another substance competes with its usual target for the same binding site. The effect is often reversible, and more of the usual target may reduce the inhibitor's effect.

Complement

A group of blood proteins that strengthens immune defense. When activated, complement can mark germs for removal, attract immune cells, increase inflammation, or directly damage some microbes.

Complementary Sequence

A DNA or RNA sequence whose building blocks pair with those of another sequence. This matching allows genetic strands to bind and is used in copying, testing, and regulating genetic information.

Complement C1Q Deficiency

A rare inherited lack of a complement protein needed for immune defense and removal of antibody-bound material. It can cause repeated infections and au-

toimmune illness resembling lupus, including rash, joint, kidney, or blood problems.

Complement C2/C4 Deficiency

Inherited or acquired lack of complement C2 or C4, proteins needed especially for the classical complement pathway. It can increase susceptibility to infections with encapsulated bacteria and autoimmune disease resembling lupus. Testing may show low CH50 with low C2 or C4; management may include vaccination, infection treatment, and care for autoimmune disease or recurrent infections.

Complement C3

A major blood protein in the complement immune system. When activated, it helps mark microbes for removal and promotes inflammation; severe deficiency can cause repeated serious infections.

Complement Cascade

A chain reaction involving many immune proteins in blood and tissues. It marks microbes for destruction, attracts immune cells, increases inflammation, and can directly break holes in some microbes.

Complement Component 4

A blood test measuring complement component C4, part of the classical complement pathway; low levels may occur with immune-complex disease, hereditary angioedema, or complement consumption.

Complement Component C3

A blood test measuring complement component C3, a major protein of the complement immune system; abnormal levels can support evaluation of immune-complex disease, infection, or complement deficiency.

Complement Component Deficiency

A genetically determined deficiency in one of the proteins of the complement cascade, predisposing to recurrent pyogenic infections (early classical components), severe autoimmune immune-complex disorders (C1q, C2, C4), or disseminated *Neisseria* infections (terminal membrane attack complex C5-C9).

Complement Deficiencies

Conditions caused by too little or absent activity of one or more complement proteins. They can increase the risk of particular infections and autoimmune diseases; the effects depend on the missing protein.

Complement Deficiency

Reduced or absent activity of one or more complement proteins, increasing susceptibility to some infections or autoimmune disease.

Complement Fixation Test For C Burnetii

A serologic test detecting complement-fixing antibodies to Coxiella burnetii, the bacterium that causes Q fever; antibody phase patterns and titers help distinguish recent from persistent infection.

Complement System

A group of blood proteins that supports immune defense by destroying microbes and promoting inflammation and phagocytosis.

Complete Blood Count

A blood test that counts red and white blood cells and platelets and measures hemoglobin, the oxygen-carrying protein in red cells. It may also report cell size and other features. A version with a differential gives counts of the main types of white cells. Results can help assess anemia, infection, and blood disorders.

Complete Breech

A type of breech presentation in which the fetus has both hips and knees flexed (in a cross-legged sitting posture) so that the buttocks and feet present together at the maternal pelvic inlet. It accounts for approximately 5–10% of breech presentations.

Alternate Names:
Flexed breech; Complete breech presentation.

Complete Cystectomy

Surgery to remove the entire urinary bladder, usually for invasive bladder cancer. Because urine can

no longer leave through the bladder, the surgeon creates a urinary diversion such as an ileal conduit, a continent reservoir, or a new bladder from bowel.

Complete Denture

A removable artificial set of teeth replacing all teeth in the upper jaw, lower jaw, or both. It rests on the gums and may improve chewing, speech, and appearance but can require adjustment for comfort and stability.

Complete Miscarriage

Pregnancy loss in which all pregnancy tissue has passed from the uterus, usually followed by easing bleeding and cramps. Examination, hormone testing, or ultrasound can help confirm that no tissue remains and distinguish miscarriage from ectopic pregnancy; heavy bleeding, severe pain, dizziness, or fever may occur with complications.

Alternate Names:
Complete Spontaneous Abortion

Complete Response

No detectable evidence of cancer after treatment on the tests used. It does not prove that every cancer cell has been eliminated, and recurrence may still occur.

Complex Carbohydrates

Carbohydrates made of many linked sugar units, including starch and dietary fiber. They occur in foods such as grains, beans, vegetables, and potatoes; fiber is not fully digested and supports bowel function.

Complex Febrile Seizure

A seizure triggered by fever in a young child that lasts more than 15 minutes, affects only part of the body, or happens more than once during the same illness. It can occur with brain infection or another underlying cause. Most children recover fully, but the risk of another seizure is higher than with a simple febrile seizure.

Alternate Names:
Atypical Febrile Seizure; Complicated Febrile Seizure

Complex Regional Pain Syndrome

Long-lasting pain, usually in an arm or leg, that may begin after injury or surgery. The area can become very sensitive and may swell or change color, temperature, or sweating. In type I, no major nerve injury is found; type II follows a known nerve injury. Symptoms and recovery vary.

Alternate Names:
CRPS; Reflex Sympathetic Dystrophy; Complex Regional Dystrophy Syndrome

Compliance

The extent to which a person follows a treatment plan. The term is often replaced by adherence, which recognizes that treatment decisions should be discussed and agreed with the patient.

Complicated Bereavement

Alternate name; see *Complicated Grief*.

Complicated Grief

Persistent, intense grief that substantially interferes with daily functioning and lasts longer than expected for the person's cultural and social context.

Complicated Migraine

An older, nonspecific term for migraine accompanied by prolonged or prominent neurologic symptoms; it may refer to several distinct neurologic syndromes.

Alternate Names:
Migraine with Prolonged Aura; Complex Migraine

Complicated Urinary Tract Infection

A urinary infection associated with functional or structural abnormality, obstruction, catheterization, renal impairment, male anatomy, pregnancy, or another factor increasing treatment failure or complication risk. Causative organisms and antibiotic resistance vary by setting.

Complication

A new problem or harmful effect that develops during or after an illness, treatment, or procedure. Examples include infection, bleeding, organ damage, medicine reactions, and blood clots; seriousness de-

pends on the problem and its effect.

Composite Resin

A tooth-colored material used to repair cavities, chipped teeth, or other defects. It is bonded to the tooth and shaped to match it, but may wear or stain sooner than some harder restorations.

Compound Heterozygote

A person who has two different disease-causing changes in the same gene, one inherited in each copy of the gene. Together, the changes can cause an inherited disorder.

Compounding

Preparation, mixing, or altering of a medicine to meet an individual patient's needs when an appropriate approved product is unavailable.

Compounding Pharmacy

A pharmacy that prepares customized formulations for an individual patient when a suitable commercially manufactured product is unavailable or unsuitable.

Alternate Names:
Compounding Pharmacy Practice; Extemporaneous Pharmacy

Compound Muscle Action Potential

The summated electrical voltage recorded over a muscle belly during a motor nerve conduction study, reflecting the near-simultaneous depolarization of all innervated muscle fibers following supramaximal electrical stimulation of its motor nerve.

Alternate Names:
CMAP; Motor Response

Compound Presentation

An abnormal obstetric presentation in which one or more fetal extremities (most commonly a fetal hand or forearm, and rarely a lower extremity) prolapse alongside the primary presenting part (vertex or breech) into the maternal pelvic inlet. Associated with prematurity, polyhydramnios, high multiparity, contracted pelvic dimensions, and unengaged fetal presenting parts. While minor vertex-hand presentations often resolve spontaneously as the head descends and compresses the extremity upward, persistent compound presentation significantly elevates the risks of prolonged second-stage dystocia, cephalopelvic disproportion, umbilical cord prolapse, and maternal-fetal trauma.

Compound Presentations

Plural form; see *Compound Presentation*.

Comprehensive Geriatric Assessment

A detailed review of an older person's illnesses, medicines, movement, daily activities, memory, mood, nutrition, and support at home. The findings are used to create a coordinated care plan based on the person's goals.

Comprehensive Metabolic Panel

A routine 14-substance blood test combining the eight basic metabolic tests (glucose, calcium, electrolytes, BUN, and creatinine) with six liver and protein tests (ALT, AST, ALP, bilirubin, albumin, and total protein). Commonly ordered before surgery and during acute medical care, it evaluates whether the liver and kidneys can safely clear anesthetics and medications, verifies electrolyte stability to prevent irregular heart rhythms during surgery, and checks protein stores necessary for post-surgical wound healing.

Alternate Names:
CMP; Chem-14; Comprehensive Chemistry Screen

Compress

To press together or apply pressure, as with a bandage or device, or to reduce the volume of something.

Compressed Nerve

Alternate name; see *Pinched Nerve*.

Compression

Pressure applied to tissue or a structure, which may reduce swelling or bleeding but can also impair nerves, blood vessels, or organs when excessive.

Compression Bandage

A bandage that applies controlled pressure to a limb or body part. It may reduce swelling, support injured tissue, or help manage venous disease, but improper use can impair circulation or damage skin.

Compression Fracture

Collapse of a vertebra or other bone because of compression, often related to osteoporosis or trauma.

Compression Fractures Of The Back

Collapse of one or more vertebral bodies caused by weakened bone, often from osteoporosis, or by substantial trauma. It can cause sudden back pain, height loss, kyphosis, and rarely nerve or spinal-cord compression.

Compression Stockings

Elastic garments that apply graduated pressure to the legs, supporting venous return and reducing swelling or selected risks of venous pooling; correct fit and arterial circulation matter.

Compression Therapy

Use of external pressure, usually from garments or bandages, to support venous or lymphatic flow and reduce swelling in selected conditions.

Compression Ultrasound

An ultrasound test in which gentle pressure is applied to a vein. A healthy vein usually collapses; failure to collapse may indicate a blood clot, especially in the deep veins of a limb.

Compressive Atelectasis

Collapse of part of a lung because fluid, air, a tumor, or another process presses on it from outside. The lung may re-expand when the pressure is relieved.

Compton Scattering

A change in the direction and energy of an X-ray or other high-energy photon after it strikes an electron. It creates scattered radiation that can reduce image quality and add unnecessary exposure during imaging.

Compulsions

Repeated actions or mental rituals that a person feels unable to resist, often to reduce distress caused by unwanted thoughts. They take up time or interfere with daily life and may not realistically prevent the feared event.

Compulsive Behavior

Repetitive physical actions or mental rituals that an individual feels strongly driven to perform to neutralize anxiety or prevent a feared event; see *Compulsions* and *Obsessive-Compulsive Disorder*.

Compulsive Gambling

Alternate, nonpreferred label; see *Gambling Disorder*.

Compulsive Obsessive Disorder

Alternate name; see *Obsessive-Compulsive Disorder*.

Compulsive Overeating

Alternate name; see *Binge-Eating Disorder*.

Compulsive Sexual Behavior

Recurrent sexual thoughts or behaviors that are difficult to control and cause significant distress or impairment.

Alternate Names:
Compulsive Sexual Behavior Disorder

Compulsive Sexual Behavior Disorder

A persistent pattern of failure to control intense, repetitive sexual impulses or behaviors, resulting in marked distress or significant impairment and continuing despite adverse consequences. It is not defined simply by a high sex drive or moral disapproval; assessment considers control, distress, consent, and coexisting mental-health or substance-use conditions.

Alternate Names:
Compulsive Sexual Behavior; Problematic Sexual Behavior

Compulsive Stealing

Alternate index label; see *Kleptomania*.

Computational Biology

The use and development of computational, mathematical, and statistical methods to study biological systems and data. It includes analyzing genomic and other molecular data, modeling biological processes, and generating predictions about biological function or disease. It overlaps with bioinformatics, with boundaries that vary by context.

Computational Medicine

An interdisciplinary field that uses mathematical models, computer simulations, and analysis of biological and patient data to understand disease, predict its course, and evaluate diagnostic or treatment strategies. Models can represent processes from molecules to whole organs or patients. Their predictions can inform research and clinical decisions but do not by themselves establish a diagnosis or determine treatment.

Alternate Names:
In Silico Medicine

Computed Tomography

An imaging test that uses rotating X-rays and computer processing to create detailed cross-sectional pictures. It is fast and can show bones, bleeding, organs, blood vessels, tumors, infection, and internal injury.

Computed Tomography Pulmonary Angiography

A CT scan performed after injected contrast highlights the lung arteries. It is commonly used to look for a pulmonary embolism and may also show strain on the heart or other chest abnormalities.

Alternate Names:
CT Pulmonary Angiogram; Pulmonary CT Angiography

Computed Tomography Scan

An X-ray scan processed by a computer to produce cross-sectional images of the body. It can rapidly detect bleeding, fractures, infection, blocked bowel, blood clots, tumors, and many other urgent conditions.

Computed Tomography Urography

A CT scan of the kidneys, ureters, and bladder, usually using contrast material to show the urinary tract. It can show stones, blockage, bleeding, tumors, or structural changes.

Computerized Axial Tomography

Alternate name; see *Computed Tomography*.

Concato's Disease

An old name for progressive polyserositis, inflammation of several serous membranes, such as the pleura, pericardium, and peritoneum, often with fluid accumulating in the chest or abdomen. It may complicate tuberculosis, cancer, or connective-tissue disease and can cause shortness of breath, fatigue, and abdominal swelling.

Concealed Conduction

A heart rhythm event in which an electrical impulse enters part of the heart's conduction system but stops before producing a visible heartbeat. The affected tissue may then delay or block the next impulse and alter the heartbeat pattern.

Concealed Pregnancy

A pregnancy that is deliberately hidden or not recognized until late in pregnancy or childbirth. It may occur because symptoms are mild, pregnancy tests are misleading, or the person is unable or unwilling to recognize the pregnancy; medical assessment is still important.

Concentration

The amount of a substance in a given volume, such as the level of glucose or medicine in blood. It is reported in units such as milligrams per deciliter or millimoles per liter.

Concentric Muscle Action

Muscle action in which a muscle produces force while becoming shorter, such as when lifting an

object.

Conception

The joining of a sperm and egg, usually in a fallopian tube, to form the first cell of an embryo. The resulting cells divide as they travel toward the uterus, where implantation may occur several days later.

Alternate Names:
Fertilization

Conceptus

The product of conception at any stage from fertilization to birth, including the embryo or fetus and supporting tissues such as the placenta, umbilical cord, and fetal membranes.

Conceptuses

Plural form; see *Conceptus*.

Conchae

Curved bony structures covered by mucosa inside the nasal cavity that warm, humidify, and filter inhaled air.

Conclusion

The part of a report that summarizes the main findings and their clinical significance or recommended next steps.

Concomitant

Existing or occurring at the same time as another condition, treatment, or event. Concomitant medicines or illnesses may change diagnosis, treatment choices, expected effects, side effects, or monitoring needs.

Concordance

The frequency with which two people, especially twins, show the same trait or diagnosis. Higher agreement in identical than fraternal twins may suggest a genetic contribution, but shared environment also matters.

Concrescence

A dental abnormality in which two neighboring teeth become joined by the hard tissue covering their roots, while their crowns remain separate. It most often affects back teeth and may complicate extraction.

Concretio Cordis

An abnormal joining or fusion of tissues involving the heart or its surrounding sac. It may result from inflammation, scarring, or a birth defect and can restrict heart movement or interfere with normal function.

Concussion

A mild traumatic brain injury caused by a blow, jolt, or force that changes how the brain works. It may cause headache, dizziness, confusion, memory trouble, nausea, or sensitivity to light. Symptoms often improve but can last for days, weeks, or longer; routine scans may be normal.

Conditioning

Learning in which repeated association or reinforcement changes a behavior or response; in medicine, conditioning can also mean preparing a patient or tissue for a treatment.

Conditions Caused By Deletion Mutations

Deletion mutations remove DNA segments and can disrupt one gene or several neighboring genes. The clinical effect depends on size, location, inheritance, and whether the remaining copy compensates; genetic counseling and testing may clarify diagnosis and recurrence risk.

Condom

A thin barrier sheath worn on the penis or inserted into the vagina that helps prevent pregnancy and reduces transmission of sexually transmitted infections when used correctly.

Alternate Names:
Male Condom; Barrier Contraception; External Condom

Conduct Disorder

A childhood or adolescent disorder involving a persistent pattern of behavior that violates the rights of others or major age-appropriate rules. Examples include aggression, property destruction, deceitfulness, theft, and serious rule violations.

Conduction Aphasia

A fluent aphasic syndrome resulting from a lesion disrupting the arcuate fasciculus connecting Broca area and Wernicke area, characterized by intact auditory comprehension and fluent spontaneous speech, but profound impairment in verbal repetition and prominent phonemic paraphasias.

Conduction Deafness

Hearing loss caused by a problem in the outer or middle ear that prevents sound from reaching the inner ear normally. Earwax, fluid, a damaged eardrum, or changes in the small ear bones may be responsible.

Conduction System

Specialized cardiac cells and pathways that generate and transmit electrical impulses through the atria, atrioventricular node, His bundle, bundle branches, and ventricles to coordinate the heartbeat.

Conductive Deafness

Hearing loss resulting from a problem in the external auditory canal, tympanic membrane, or middle ear that reduces conduction of sound to the inner ear.

Conductive Hearing Loss

Hearing loss caused by a problem in the outer or middle ear that prevents sound from reaching the inner ear normally. Earwax, fluid, a damaged eardrum, bone changes, or ear-bone disease may be responsible.

Condylar Process

The rounded articular projection of a bone, especially the mandibular process that articulates with the temporal bone to form the temporomandibular joint.

Condyle

A rounded projection at the end of a bone that forms part of a joint and helps guide movement against another bone.

Condyloid Joint

A joint in which an oval surface of one bone fits into an oval depression in another bone. It allows bending, straightening, and side-to-side movement, but little rotation.

Condyloma

A wart-like growth, often in the genital or anal area and commonly caused by human papillomavirus; condyloma lata are lesions of secondary syphilis.

Condyloma Acuminata

Alternate name; see *Genital Warts*.

Condyloma Acuminatum

Alternate singular name; see *Genital Warts*.

Condyloma Lata

Broad, flat, moist, whitish or grayish-pink plaques and papules occurring in warm intertriginous skin and mucosal areas (particularly the perianal, vulvar, and scrotum regions) during secondary syphilis, containing abundant highly infectious Treponema pallidum spirochetes.

Alternate Names:
Condylomata Lata; Syphilitic Condyloma

Condyloma Latum

A broad, flat, moist, highly infectious lesion of secondary syphilis, usually around the genitals or anus. It differs from a genital wart and indicates syphilis requiring testing and antibiotic treatment.

Condylomata Acuminata

Alternate name; see *Genital Warts*.

Condylomata Lata

Broad, flat, moist, grayish-white papules occurring in secondary syphilis, typically found in the anogenital region and other intertriginous areas. They are

highly infectious and contain abundant Treponema pallidum organisms. Diagnosis is by darkfield microscopy or serological testing for syphilis.

Cone-Beam Computed Tomography

A dental or facial scan that uses a cone-shaped X-ray beam to create three-dimensional images of teeth, jawbone, and nearby structures. It is useful when three-dimensional detail affects diagnosis or procedural planning.

Cone Biopsy

A surgical procedure that removes a cone-shaped portion of the cervix for diagnosis or treatment of high-grade cervical precancer and to determine whether invasive cancer is present.

Cones

Light-sensitive retinal cells responsible for color vision and sharp detail, working best in daylight or other relatively bright conditions.

Alternate Names:
Cone Photoreceptors; Cone Cells

Confabulation

Unintentional production of inaccurate memories or stories without an attempt to deceive. It may occur with memory disorders or injury affecting the front part of the brain.

Confidentiality

The duty of healthcare professionals and organizations to protect a person's health information from unauthorized access or disclosure. Information may be shared when the patient agrees or when law permits or requires it.

Confirmatory Test

A test used to verify a preliminary or screening result, often with a different method or greater specificity. The method depends on the condition, specimen, timing, and accepted clinical guidelines.

Confluent and Reticulated Papillomatosis

An uncommon skin disorder causing asymptomatic or mildly itchy brown, papillomatous papules and plaques that merge centrally and form a net-like pattern, usually on the upper trunk, neck, or axillae. Diagnosis is clinical after excluding fungal infection and other causes of hyperpigmentation; treatment may include specialist-prescribed antibiotics.

Conformal Radiation Therapy

Radiation treatment planned so that the high-dose region conforms closely to the tumor's three-dimensional shape while limiting exposure of nearby normal tissue.

Confounding

A distortion that occurs when another factor is related to both an exposure and an outcome, making their relationship appear stronger, weaker, or different from reality. For example, age may affect both an exposure and disease risk. Study design and statistical adjustment can reduce confounding.

Confusion

Impaired ability to think clearly, orient, attend, remember, or respond appropriately; sudden confusion is delirium and may indicate infection, medication effect, metabolic illness, stroke, or another emergency.

Confusion Assessment Method

A bedside assessment for delirium. It checks for a sudden or fluctuating change, poor attention, disorganized thinking, and an altered level of alertness; the pattern helps identify delirium but does not replace finding its cause.

Congenital

Present at birth, whether inherited, caused by an early developmental difference, or acquired before birth through infection, exposure, or another condition.

Congenital Adrenal Hyperplasia

A group of usually autosomal recessive disorders in which the adrenal glands cannot make hormones normally. The most common form can cause salt loss, excess androgen effects, early puberty, or genital

differences and may be life-threatening in newborns.

Congenital Anomaly

A structural, functional, or biochemical abnormality present at birth; see *Birth Defect*.

Congenital Anomaly Reconstruction

Reconstructive surgery to restore form and function in a congenital anomaly affecting the face, skull, limbs, hands, trunk, or other body region. Treatment may use local tissue rearrangement, grafts, flaps, implants, staged operations, or microsurgery depending on the defect and the structures involved.

Congenital Antithrombin III Deficiency

An inherited condition in which the blood lacks enough working antithrombin, a natural substance that limits clotting. It increases the risk of clots in deep veins or the lungs, sometimes from a young age.

Congenital Biliary Atresia

Alternate name; see *Biliary Atresia*.

Congenital Birth Defect

A structural or functional abnormality present before or at birth. Causes may include genetic changes, infections, nutritional deficiencies, medicines, environmental exposures, or unknown factors.

Congenital Cataract

Clouding of the eye lens present at birth or developing soon afterward. It can interfere with visual development and may require early eye assessment and treatment to prevent lasting reduced vision.

Congenital CMV

Cytomegalovirus infection acquired before birth. Some babies have small head size, hearing or vision loss, seizures, jaundice, an enlarged liver or spleen, or developmental problems; others appear well initially but develop later hearing loss.

Congenital CNS Malformation

A difference in the structure of the brain, spinal cord, or related tissues that develops before birth. Effects range from none to problems with movement, learning, seizures, breathing, or other functions, depending on the area involved.

Congenital Contractural Arachnodactyly

An inherited condition causing unusually long, slender fingers and toes, stiff or bent joints from birth, thin muscles, and sometimes a curved spine. Joint stiffness often improves with age, but movement and heart or aortic findings may need monitoring.

Congenital Cytomegalovirus

Cytomegalovirus infection present at birth after transmission during pregnancy. Some infants have hearing loss, vision problems, small head size, seizures, or developmental disability; others have no symptoms initially.

Congenital Cytomegalovirus Infection

Cytomegalovirus infection acquired before birth. It may cause hearing loss, developmental problems, microcephaly, or no symptoms.

Congenital Diaphragmatic Hernia

A hole in the muscle separating the chest and abdomen that allows abdominal organs to move into the chest before birth. The crowded lungs may be underdeveloped, causing severe breathing problems after delivery.

Congenital Diaphragmatic Hernia Repair

Surgery to return abdominal organs to the abdomen and close the opening in the diaphragm. It is performed after the newborn is stable enough for surgery; breathing support may be needed before and afterward.

Congenital Disorder

A medical condition or structural abnormality present in an individual from birth, which may be caused by genetic factors or environmental influences in the womb.

Congenital Fibrinogen Deficiency

An inherited absence or abnormality of fibrinogen that can cause bleeding, thrombosis, or both depending on the specific molecular defect.

Congenital Glaucoma

Glaucoma present at birth or developing in early infancy, usually because the anterior-chamber angle (the eye's fluid-drainage area) formed abnormally. Elevated intraocular pressure can enlarge the eye and cause excessive tearing, photophobia (sensitivity to light), or corneal clouding (clouding of the clear front surface of the eye).

Congenital Heart Defect

A structural abnormality of the heart or major vessels present at birth. It may alter blood flow and range from a small defect with little effect to a serious condition requiring treatment or surgery.

Congenital Heart Defect Corrective Surgery

Surgical or transcatheter interventions designed to anatomically or physiologically correct congenital cardiovascular anomalies (such as atrial/ventricular septal defects, tetralogy of Fallot, or transposition of the great arteries).

Alternate Names:
Congenital Heart Surgery; Pediatric Cardiac Surgery; Corrective Cardiac Repair

Congenital Heart Defects

Alternate form; see *Congenital Heart Defect*.

Congenital Heart Defects In Children

Alternate index label; see *Congenital Heart Defect*.

Congenital Heart Disease

A heart or major blood-vessel problem present from birth. It may change blood flow, cause no symptoms, or lead to breathing difficulty, blue color, poor growth, heart failure, or abnormal rhythms. Treatment ranges from monitoring and medicines to catheter procedures or surgery.

Congenital Heart Disease In Adults

A heart defect present from birth that continues into adulthood; see *Congenital Heart Defect*.

Congenital Heart Murmur

A heart murmur heard in a newborn or infant. It may be innocent or may indicate a structural heart defect; assessment considers the murmur's characteristics and associated symptoms or examination findings.

Congenital Hemolytic Jaundice

Jaundice present from or caused by an inherited condition that increases red-blood-cell destruction, producing excess unconjugated bilirubin; examples include hereditary spherocytosis and some enzymatic defects.

Congenital Hip Dislocation

An older term for a hip whose femoral head is dislocated at birth. Developmental dysplasia of the hip is the broader current term, covering abnormalities from a shallow socket or instability through dislocation; see *Developmental Dysplasia Of The Hip*.

Congenital Hydrocephalus

Hydrocephalus present at birth or caused by a developmental abnormality, genetic condition, or congenital infection; see *Hydrocephalus*.

Congenital Hyperinsulinism

An inherited or developmental disorder in which a baby's pancreas releases too much insulin. This can cause dangerously low blood sugar, poor feeding, seizures, brain injury, or death unless recognized and treated promptly.

Congenital Hyperthyroidism

Excess thyroid hormone in a newborn, most often caused by thyroid-stimulating antibodies passing from a mother with Graves disease. It may cause a fast heartbeat, irritability, poor feeding, poor weight gain, or an enlarged thyroid.

Congenital Hypertrichosis Lanuginosa

A very rare form of congenital hypertrichosis in which fine, soft lanugo-like hair covers much of the body from birth or early infancy. It may occur alone or as part of a genetic syndrome; examination looks for associated dental, skeletal, neurologic, or developmental findings.

Congenital Hypothyroidism

Too little thyroid hormone from birth, most often because the thyroid is missing, misplaced, or underdeveloped, or cannot make hormone normally. Newborn screening and early treatment are essential because untreated deficiency can impair growth and brain development.

Congenital Malaria

The transmission of Plasmodium parasites (predominantly Plasmodium falciparum or Plasmodium vivax) from an infected mother to the fetus across the placenta or during delivery. Although relatively uncommon due to the protective barrier of maternal antibodies and placental syncytiotrophoblast, affected newborns can present in the neonatal period with fever, irritability, severe hemolytic anemia, jaundice, hepatosplenomegaly, thrombocytopenia, and poor feeding.

Alternate Names:
Congenital Plasmodium Infection; Neonatal Malaria

Congenital Malformation

A structural abnormality that develops before birth and is present at birth, caused by genetic, environmental, developmental, or unknown factors.

Congenital Megacolon

A birth condition in which part of the intestine lacks the nerve cells needed to move stool. It causes blockage and enlargement of the bowel above it, with delayed first stool, swelling, vomiting, or severe constipation.

Congenital Melanocytic Nevus

A dark mole present at birth or appearing soon afterward, caused by a collection of pigment-producing cells. Most remain harmless, but larger lesions have a higher melanoma risk and need specialist monitoring.

Congenital Mitral Valve Anomalies

Birth differences in the mitral valve, which controls blood flow from the upper to the lower left heart chamber. The valve may leak or be narrowed, causing no symptoms or leading to breathlessness, poor growth, or heart failure.

Congenital Muscular Dystrophy

A group of inherited muscle disorders causing weakness or low muscle tone at birth or during early infancy. Some types also affect the brain, eyes, breathing, heart, or joints; severity varies widely.

Alternate Names:
CMD; Congenital Dystrophy

Congenital Myasthenic Syndromes

A group of inherited disorders that disrupt communication between nerves and muscles. They cause weakness that worsens with activity and may affect the eyes, swallowing, breathing, or limb movement.

Congenital Myopathies

A group of inherited muscle disorders whose weakness or low muscle tone is present at birth or begins in infancy or childhood. They differ in their genetic cause and biopsy features and may affect movement, breathing, swallowing, the spine, or the heart.

Congenital Nasolacrimal Duct Obstruction

Blockage of the tear-drainage channel present at birth, commonly causing persistent watering or discharge from one or both eyes. Most cases occur because a membrane at the lower end of the duct has not opened normally.

Congenital Nephrotic Syndrome

Severe kidney disease beginning before birth or during the first three months of life, causing large amounts of protein loss in urine, swelling, low blood protein, poor growth, infections, and increased clotting risk.

Congenital Nevi

Multiple melanocytic nevi present at birth or appearing soon afterward. Most are benign, but melanoma risk rises with larger or numerous lesions; changes in colour, size, surface, or symptoms can occur in melanoma.

Congenital Nevus

A dark or raised mole present at birth or soon after. Most are harmless, but larger or unusual moles have a higher risk of melanoma. Imaging or removal is used for selected high-risk moles.

Alternate Names:
Congenital Melanocytic Nevus; Congenital Melanocytic Naevus; CMN; Congenital Pigmented Nevus; Bathing Trunk Nevus

Congenital Penile Curvature

Curvature of the penis present from birth, usually caused by unequal development of the erectile tissues. Mild curvature may need no treatment; significant curvature causing functional difficulty may require specialist assessment.

Congenital Plagiocephaly

A difference in the shape of a baby's head that is present at birth or develops soon afterward. It may result from position before or after birth and differs from craniosynostosis, in which skull bones join too early.

Congenital Platelet Function Defects

Inherited disorders in which platelets do not work normally even though their number may be normal. They can cause easy bruising, nosebleeds, heavy menstrual bleeding, or excessive bleeding after injury or surgery.

Congenital Pneumonia

A lung infection present at birth, acquired before or during delivery. A newborn may have rapid or difficult breathing, temperature instability, poor feeding, or sepsis.

Congenital Protein C Or S Deficiency

An inherited lack or abnormality of protein C or protein S, natural substances that limit clotting. It increases the risk of blood clots in veins, sometimes beginning in infancy or childhood.

Congenital Pyloric Stenosis

Older name for a condition in which the muscle at a baby's stomach outlet thickens and narrows the opening; see *Hypertrophic Pyloric Stenosis*.

Congenital Rubella

Fetal infection with rubella virus acquired during pregnancy, potentially causing hearing loss, cataracts, congenital heart disease, developmental impairment, and other findings.

Congenital Rubella Syndrome

Birth defects caused by rubella infection during pregnancy, especially early pregnancy. Affected babies may have hearing loss, cataracts, heart defects, small head size, developmental problems, enlarged organs, or a low platelet count.

Congenital Scoliosis

A sideways curve of the spine caused by vertebrae that formed abnormally before birth. The curve may worsen as the child grows, so its pattern and progression require regular assessment.

Congenital Syphilis

Syphilis infection passed from a pregnant person to the fetus. It can cause miscarriage, stillbirth, premature birth, rash, liver or bone disease, hearing loss, or problems that appear later.

Congenital Toxoplasmosis

Infection with the parasite Toxoplasma gondii passed to a fetus during pregnancy. It may cause eye inflammation, brain changes, enlarged fluid spaces, seizures, hearing or vision problems, or developmental difficulties; some babies have no signs at birth.

Congenital Tracheomalacia

Congenital tracheomalacia is weakness of the infant

tracheal cartilage causing dynamic airway collapse, noisy breathing, cough, or recurrent respiratory symptoms.

Congenital Uterine Anomalies

Structural malformations of the uterus and upper reproductive tract resulting from abnormal development, fusion, or resorption of the embryonic Müllerian ducts; see *Mullerian Duct Anomalies*.

Congenital Vaginal Obstruction

A blockage of the vaginal canal due to a developmental anomaly, such as an imperforate hymen, transverse vaginal septum, or vaginal atresia. The specific anatomy determines whether menstrual flow is obstructed and whether blood accumulates in the vagina or uterus. Vaginal agenesis and OEIS complex are distinct congenital conditions.

Congenital Varicella Syndrome

A rare congenital disorder occurring in infants born to mothers who contracted primary varicella zoster virus infection (chickenpox) during the first or early second trimester of pregnancy (typically 8 to 20 weeks gestation). Clinical hallmarks include zig-zag cicatricial skin scarring in a dermatomal distribution, unilateral limb hypoplasia, chorioretinitis, optic atrophy, microcephaly, and autonomic or central nervous system dysfunction.

Alternate Names:
Fetal Varicella Syndrome; Congenital Varicella Embryopathy

Congenital Zika Syndrome

A group of birth problems caused by Zika virus infection during pregnancy. Babies may have a small head, abnormal brain development, eye or hearing problems, stiff joints, or developmental difficulties; care focuses on the child's specific needs because there is no single cure.

Congestion

An excess of blood within vessels or fluid within tissue. Venous congestion occurs when blood cannot drain normally, as in heart failure; pulmonary congestion refers to fluid buildup in the lungs from increased pressure in pulmonary veins. Nasal congestion instead means swelling of the nasal lining.

Congestive Heart Failure

Heart failure with fluid buildup in the lungs or body; see *Heart Failure*.

Congestive Hepatopathy

Liver injury caused by chronically elevated venous pressure, usually from right-sided heart failure or constrictive pericardial disease. It may cause liver enlargement, abnormal liver tests, ascites, and eventually cardiac cirrhosis.

Alternate Names:
Nutmeg Liver; Cardiac Hepatopathy

Congo Red

A histologic dye used to detect amyloid deposits in tissue. Under polarized light, stained amyloid shows characteristic birefringence, often described as apple-green, although the observed colours can vary.

Conization

Surgical removal of a cone-shaped portion of the cervix for diagnosis or treatment of cervical dysplasia or selected early cervical cancers.

Conjoined Twins

Identical twins who are physically joined because the early embryo did not completely separate. They may share organs or body structures, so detailed imaging and care by specialists are needed; the outlook depends on what is shared.

Conjugated Equine Estrogens

A mixture of estrogenic compounds historically derived from the urine of pregnant mares and used in some hormone-therapy formulations.

Alternate Names:
CEE; Conjugated Estrogens

Conjugated Hyperbilirubinemia

An elevation of direct, water-soluble bilirubin in the blood, usually caused by impaired bile formation or

excretion, bile-duct obstruction, or hepatocellular injury. Jaundice, dark urine, pale stools, or itching may occur.

Conjugated Linoleic Acid

A group of related fats found mainly in meat and dairy products and sold as supplements. Claims about weight loss or muscle improvement are inconsistent, and supplements may adversely affect blood sugar or liver function.

Conjunctiva

The thin, clear tissue lining the inside of the eyelids and covering the white part of the eye. It protects and lubricates the eye and helps the eyelids move smoothly across its surface.

Conjunctival

Relating to the conjunctiva, the thin mucous membrane covering the front of the eye and lining the inner eyelids.

Conjunctival Melanoma

A rare malignant melanoma of the conjunctiva, often appearing as a pigmented or occasionally amelanotic lesion on the eye surface. It can recur locally or spread to lymph nodes and distant organs, so ophthalmic examination, biopsy, and surveillance are important.

Conjunctival Squamous-Cell Carcinoma

A cancer arising from the surface cells of the conjunctiva, often near the border of the cornea. It may appear as a persistent growth, redness, or irritation and can invade nearby eye tissue if not treated.

Conjunctivitis

Inflammation of the conjunctiva, the membrane lining the inside of the eyelids and covering the white of the eye. It can cause redness, itching or irritation, watering, and discharge, and may result from infection, allergy, or irritants.

Conjunctivoplasty

Plastic or reconstructive surgery of the conjunctiva, performed to repair defects, scarring, adhesions, or other abnormalities of the ocular surface.

Connective Tissue

A diverse type of tissue that supports, binds, protects, and insulates organs and structures throughout the body.

Connective Tissue Disease

A disorder affecting tissues that support and connect organs, often because the immune system attacks the body's own tissues. It may involve skin, joints, muscles, blood vessels, lungs, kidneys, or other organs. Examples include lupus, systemic sclerosis, rheumatoid arthritis, and Sjögren syndrome.

Connexin 26 Deficiency

An inherited change in the *GJB2* gene that can cause hearing loss present from birth. The severity and whether one or both ears are affected can vary.

Alternate Names:
GJB2-Related Deafness; DFNB1 Hearing Loss

Conn's Syndrome

Historical eponym for primary aldosteronism; see *Primary Aldosteronism*.

Conn Syndrome

Alternate spelling; see *Primary Aldosteronism*.

Consanguinity

A biological relationship between people who share a recent common ancestor; it can increase the chance that both parents carry the same recessive disease variant.

Conscious Sedation For Surgical Procedures

Medicines given during a procedure to make a person relaxed and sleepy while allowing them to respond to voice or touch and usually breathe independently. Continuous monitoring is needed because breathing, blood pressure, and alertness can become dangerously reduced.

Consolidation

An imaging finding in which air in part of the lung's air spaces is replaced by fluid, pus, blood, or cells, making that area appear denser. It may occur with pneumonia, fluid buildup, bleeding, or a tumor; consolidation describes an appearance, not a specific disease.

Consolidation Therapy

Additional treatment given after an initial response or remission to destroy remaining disease and lower the chance of relapse. It may include medicines, radiation, surgery, or a transplant depending on the illness.

Constipation

A condition involving fewer than three bowel movements per week, hard or lumpy stools, difficult or painful passage, straining, or a feeling that the bowel has not emptied completely. Causes include diet, medicines, dehydration, functional bowel disorders, and structural or systemic disease.

Constitutional Delay In Puberty

A common pattern in which puberty starts later than average but eventually progresses normally. Growth and bone development may also be delayed, often with a family history of late puberty.

Constitutional Growth Delay

A normal variant in which height growth and bone maturation are temporarily behind average, often with a family history of late puberty. Most affected children continue growing and enter puberty later than peers but reach a typical adult height.

Alternate Names:
Constitutional Delay of Growth and Puberty; CGD

Constraint-Induced Movement Therapy

Rehabilitation that limits use of a less-affected limb while providing structured practice with an affected limb to improve functional use in selected people.

Constrictive Pericarditis

A chronic condition in which a thickened or scarred, noncompliant sac around the heart restricts diastolic filling. It can cause breathlessness, fatigue, leg or abdominal swelling, enlarged neck veins, and liver congestion; causes include infection, surgery, radiation, or unknown disease.

Consultation-Liaison Psychiatry

Psychiatric care for people who are being treated for a physical illness. The psychiatrist helps assess and treat problems such as confusion, depression, anxiety, substance withdrawal, or difficulty coping during medical care.

Contac Overdose

Overdose of a combination cold medicine that may cause acetaminophen toxicity, antihistamine or decongestant effects, sedation, seizures, or cardiac complications depending on ingredients.

Contact Allergen Testing

Patch testing checks whether a substance causes allergic skin inflammation. Small amounts of suspected allergens are placed on the skin, usually the back, and the area is examined after one or more days for a delayed reaction.

Contact Dermatitis

Skin inflammation caused by direct irritation from a substance or by an allergic immune reaction to a substance touching the skin. Irritant contact dermatitis results from direct skin damage; allergic contact dermatitis is a delayed immune reaction. It can cause redness, itching, dryness, soreness, or blisters.

Contact Lenses

Thin lenses placed directly on the eye to correct vision or deliver selected treatment. Proper fitting, handwashing, cleaning, and replacement are essential because misuse can cause corneal infection, inflammation, or vision-threatening injury.

Contact Precautions

Steps used to prevent spread of germs by touch. They may include gloves and a gown, hand hygiene, a private room, and equipment kept for one patient,

depending on the infection and local policy.

Contact Tracing

Identifying and monitoring persons exposed to infectious disease. Critical for outbreak control. Examples: COVID-19, Ebola, TB.

Contact Urticaria

Hives, itching, or swelling that develop within minutes to about an hour after a substance touches the skin or mucosa. It may be immunoglobulin-E-mediated, such as with latex or foods, or caused by direct irritation; widespread symptoms, wheezing, throat swelling, or faintness suggest anaphylaxis.

Contagious Disease

An infectious disease that can be transmitted directly or indirectly from one person, animal, or source to another.

Contamination

Unwanted microorganisms or other material entering a specimen, surface, medicine, or normally sterile area without causing infection in the person. It can produce misleading test results and must be distinguished from true disease.

Continuing Medical Education

Education after professional training that updates a healthcare worker's knowledge, skills, judgment, and ability to provide safe, effective patient care.

Continuity Of Care

Consistent and coordinated care over time and across clinicians or settings, integrating the patient's history, current needs, treatment plan, and preferences. It supports safety, adherence, prevention, and chronic-disease outcomes.

Continuous Bladder Irrigation

Continuous flow of sterile fluid through a urinary catheter into and out of the bladder. It helps prevent blockage and wash out blood clots or debris, often after urinary-tract surgery.

Continuous Combined Hormone Therapy

A hormone treatment regimen taking estrogen and progestogen continuously, often to manage menopausal symptoms while reducing regular withdrawal bleeding.

Alternate Names:
Continuous Combined HRT; Continuous Estrogen-Progestogen Therapy

Continuous Electronic Fetal Monitoring

Continuous recording of the baby's heart rate and the pregnant person's contractions during labor. It may identify patterns associated with fetal distress or changes in fetal oxygenation.

Continuous Glucose Monitoring

A wearable sensor that measures glucose in fluid beneath the skin at regular intervals and shows current levels, trends, and alerts. It helps manage diabetes but may need confirmation with a blood-glucose test when readings do not fit symptoms.

Continuous Kidney Replacement Therapy

Alternate name; see *Continuous Renal Replacement Therapy*.

Continuous Murmurs

Heart sounds heard during both the heart's contraction and relaxation because blood flows continuously through an abnormal opening or connection. Causes include patent ductus arteriosus and arteriovenous fistula.

Continuous Passive Motion Machine

A device that gently moves a limb through a set range of motion while the person relaxes. It may be used after selected operations, especially knee surgery, but does not replace active rehabilitation.

Continuous Positive Airway Pressure

Noninvasive respiratory support that delivers a constant positive pressure throughout the breathing cycle to keep the upper airway or alveoli open.

Continuous Renal Replacement Therapy

A slow form of dialysis used in intensive care for people with severe kidney failure who are too ill for standard dialysis sessions. It filters the blood and removes extra fluid over many hours, often around the clock.

Alternate Names:
CRRT; CKRT

Continuous Subcutaneous Insulin Infusion

Delivery of rapid-acting insulin through a pump and a subcutaneous infusion set to provide basal insulin and mealtime doses.

Contraception

Any method used to prevent pregnancy, including intrauterine devices, implants, pills, injections, condoms, fertility-awareness methods, and sterilization. Methods differ in effectiveness, duration, side effects, cost, and protection against sexually transmitted infections. The best choice depends on health, preferences, reproductive plans, and access to care.

Contraception And Birth Control

Contraception encompasses methods used to prevent pregnancy, including hormonal options like oral contraceptives, patches, rings, injections, and implants, as well as non-hormonal methods like copper IUDs, barrier methods, diaphragms, and permanent sterilization.

Contraception For Adolescents

Methods to prevent unintended pregnancy. Options: combined oral contraceptives, progestin-only pills, depot medroxyprogesterone acetate, contraceptive implant (Nexplanon), intrauterine devices (IUDs), condoms, and abstinence.

Contraceptive Implant

A small medicine-releasing device placed under the skin, usually in the upper arm, to prevent pregnancy for an extended period. It releases a progestogen and can cause irregular bleeding or other hormone-related effects.

Contraceptives

Methods used to prevent pregnancy, including hormonal medicines, implants, intrauterine devices, condoms, and permanent procedures. Methods differ in effectiveness, duration, and risks; most do not protect against sexually transmitted infections, while condoms reduce but do not eliminate that risk.

Contracted Pelvis

A pelvis whose size or shape is reduced or abnormal enough to interfere with passage of the fetus during labor.

Contractile Proteins

Proteins, especially actin and myosin, that interact inside muscle cells to generate force, shorten fibers, and produce body movement.

Alternate Names:
Muscle Contractile Proteins; Actomyosin Proteins

Contraction

The generation of tension and active mechanical shortening of muscle fibers through actin and myosin cross-bridge cycling. In obstetrics, coordinated, rhythmic contractions of the myometrium driven by oxytocin and locally synthesized prostaglandins promote cervical effacement and dilatation, facilitating the descent and delivery of the fetus. True labor contractions occur at regular, progressively shortening intervals with increasing intensity and cervical change, distinguishing them from Braxton Hicks contractions, which are irregular, low-intensity uterine contractions that do not produce progressive cervical effacement or dilatation.

Contractions

Plural form; see *Contraction*.

Contraction Stress Test

A pregnancy test that records the baby's heart rate while contractions occur, sometimes after gentle stimulation or medicine. Repeated slowing of the heart rate may suggest that the placenta cannot supply enough oxygen during labor.

Contracture

A lasting inability to fully move a joint because nearby muscles, tendons, ligaments, skin, or other tissues have shortened or stiffened. It may follow injury, burns, paralysis, inflammation, or prolonged immobility.

Contracture Deformity

A fixed limitation of movement caused by shortening or tightening of muscle, tendon, ligament, joint capsule, skin, or other soft tissue. It may follow neurologic disease, prolonged immobility, injury, burns, or inflammation.

Contracture Prevention

Measures such as positioning, stretching, exercise, splinting, orthoses, and serial casting that help preserve joint movement in people at risk of fixed shortening.

Contraindication

A condition or circumstance in which a treatment, procedure, or medication should not be used because the potential harm outweighs the expected benefit.

Alternate Names:
Contraindications

Contralateral

On or affecting the side opposite a stated body part or injury. For example, a stroke on the left side of the brain may cause weakness on the right side of the body.

Contrast

A difference that makes structures distinguishable; in imaging, contrast material is administered to improve visualization of organs, vessels, or tissues.

Contrast Agent

A substance given or placed in the body to make organs, tissues, blood vessels, or body spaces easier to see during imaging. Different agents are used for X-ray, CT, MRI, ultrasound, or digestive-tract studies.

Contrast-Associated Acute Kidney Injury

Acute worsening of kidney function occurring after administration of contrast, whether or not contrast is causal. Risk assessment includes baseline kidney function, hemodynamic status, diabetes, nephrotoxins, urgency, and the need to avoid unnecessary contrast exposure.

Contrast Echocardiography

An ultrasound examination of the heart using tiny gas-filled bubbles in the bloodstream to make heart chambers, blood flow, or selected areas of heart muscle easier to see.

Contrast-Enhanced Computed Tomography

A CT scan performed after contrast material makes selected organs, blood vessels, or abnormal areas easier to see.

Contrast-Enhanced Magnetic Resonance Imaging

An MRI scan performed after contrast material makes selected tissues, blood vessels, or abnormal areas easier to see.

Contrast-Enhanced Ultrasound

An ultrasound examination using tiny gas-filled bubbles in the bloodstream to improve pictures of blood flow and help characterize selected liver, heart, blood-vessel, or other lesions.

Contrast-Induced Nephropathy

A sudden decline in kidney function after an imaging test using iodinated contrast, although the contrast is not always the cause. Risk is higher with severe kidney disease, dehydration, low blood pressure, or other kidney stresses.

Contrast Medium

A substance administered or placed in the body to make tissues, organs, or body spaces more visible during imaging.

Alternate Names:
Contrast Agent; Radiographic Contrast Material

Contrast Radiology

Imaging of the gastrointestinal tract using contrast material, such as barium, to outline the esophagus, stomach, intestine, or colon on radiographs or fluoroscopy.

Contrast Reaction

An unwanted response after an imaging contrast agent, ranging from nausea, itching, or a rash to breathing difficulty, low blood pressure, or a severe allergic-like reaction. Previous contrast reactions are relevant to risk assessment.

Contrecoup

An injury occurring on the side of an organ opposite the site of impact, especially a brain injury produced when the brain moves within the skull after trauma.

Control Group

The comparison group in a study, which may receive usual care, a placebo, or no intervention according to the study design.

Controlled Cord Traction

Gentle pulling on the umbilical cord after the placenta has separated, while supporting the uterus. A trained birth attendant may use it to help deliver the placenta and reduce blood loss.

Controlled Ovarian Hyperstimulation

Use of hormone medicines to make several ovarian follicles mature at the same time for fertility treatment. Ultrasound and blood tests guide dosing and help reduce the risk of ovarian hyperstimulation, a potentially serious complication.

Alternate Names:
COH; Ovarian Stimulation

Controlled-Substance Schedule I

A United States controlled-substance category for drugs with high misuse potential and no accepted medical use under federal law.

Controlled-Substance Schedule II

A United States legal category for medicines with accepted medical uses but high misuse, dependence, or overdose potential. Prescribing, dispensing, refills, and storage are subject to strict rules.

Controlled-Substance Schedule III

A United States legal category for medicines with accepted medical uses and less misuse potential than Schedule II substances, although dependence and misuse remain possible. Rules vary by medicine and jurisdiction.

Controlled-Substance Schedule IV

A United States controlled-substance category for drugs with accepted medical uses and lower misuse potential than Schedule III drugs.

Controlled-Substance Schedule V

A United States controlled-substance category for drugs with the lowest level of misuse potential among the federal schedules.

Controllers

Long-term asthma medicines taken regularly to reduce airway inflammation, prevent symptoms and attacks, and lower the need for quick-relief inhalers.

Alternate Names:
Controller Medicines; Maintenance Asthma Therapy

Contusion

A bruise caused by a blunt blow that damages small blood vessels without breaking the skin. It may cause pain, swelling, and discoloration; severe injuries can damage muscle, organs, or deeper tissues.

Alternate Names:
Contusions

Conus Medullaris Syndrome

A group of symptoms caused by damage to the lower end of the spinal cord. It may cause back pain, weakness or numbness in the legs and pelvic area, and loss of bladder, bowel, or sexual function.

Convergence

The inward movement of both eyes so that they are

directed toward the same nearby object.

Convergence Insufficiency

Difficulty turning both eyes inward together to focus on something nearby. It can cause eyestrain, headaches, blurred or double vision, and reading difficulty, especially in children and young adults.

Conversion Disorder

A condition causing genuine problems such as weakness, abnormal movements, loss of sensation, or seizure-like episodes because of altered nervous-system functioning. The symptoms are not intentionally produced and can interfere with daily life.

Convulsion

A sudden episode of involuntary, often rhythmic muscle contractions that may occur with a seizure or other disturbance of brain function. It describes the motor activity, and not all seizures cause convulsions; some produce staring, unusual sensations, altered awareness, or other non-motor symptoms.

Alternate Names:
Convulsive Episode; Seizure-Related Motor Activity

Cooking Without Salt

Preparing food with little or no added sodium to reduce dietary sodium intake, often useful in blood-pressure or fluid-retention management when combined with an individualized eating plan.

Cooley's Anemia

Alternate index label; see *Thalassemia*.

Coombs Test

A blood test that detects antibodies affecting red blood cells. It helps investigate immune-related destruction of red cells and checks compatibility before some blood transfusions.

Cooper's Ligament

Fibrous connective-tissue septa extending from the deep surface of the breast toward the skin and pectoral fascia. Tumor invasion or fibrosis may cause skin retraction.

Coordination

The ability to control movements smoothly, accurately, and in the correct order. It depends on the brain, nerves, muscles, vision, and balance and may be tested with simple hand or leg movements.

COPD

See *Chronic Obstructive Pulmonary Disease*.

COPD And Other Health Problems

The interaction between chronic obstructive pulmonary disease and conditions such as cardiovascular disease, osteoporosis, depression, diabetes, and lung cancer, which can complicate symptoms and care.

COPD Exacerbation

Acute worsening of respiratory symptoms beyond normal day-to-day variation in a patient with COPD that leads to additional therapy. Common triggers include viral or bacterial infection, air pollution, and cardiopulmonary comorbidity.

COPD Flare-Ups

Acute worsening of breathlessness, cough, or sputum beyond usual daily variation in chronic obstructive pulmonary disease, often triggered by infection, pollution, or other irritants.

COPD Maintenance Medications

Pharmacologic agents administered on a daily, scheduled regimen to prevent exacerbations, reduce symptoms, and slow airflow limitation in chronic obstructive pulmonary disease, including long-acting muscarinic antagonists (LAMAs), long-acting beta-2 agonists (LABAs), and inhaled corticosteroids (ICS).

Alternate Names:
COPD Controller Medications; Long-Acting COPD Bronchodilators; COPD Maintenance Therapy

COPD Rehabilitation

A supervised program combining exercise, breathing strategies, education, nutrition, and support to help people with COPD breathe and function better,

remain active, and reduce the effects of flare-ups.

COPD Rescue Medications

Short-acting inhaled bronchodilators administered on an as-needed basis to rapidly relieve acute dyspnea and bronchoconstriction during COPD symptom flares, encompassing short-acting beta-2 agonists (SABAs) and short-acting muscarinic antagonists (SAMAs).

Alternate Names:
COPD Quick-Relief Drugs; COPD Reliever Inhalers; Fast-Acting COPD Bronchodilators

CO Poisoning

Illness caused by breathing carbon monoxide, an odorless gas that prevents blood from carrying oxygen normally. It may cause headache, dizziness, nausea, confusion, fainting, seizures, or death.

Copper

An essential trace element required for iron transport, connective-tissue cross-linking, energy metabolism, neurotransmitter synthesis, and antioxidant enzymes. Deficiency can cause anemia, neutropenia, impaired neurologic function, and bone abnormalities; excess is toxic and accumulates in Wilson disease.

Copper Deficiency

A lack of copper, a trace element needed for iron transport, connective tissue, nerve function, and pigment production. It may follow malnutrition, malabsorption, gastrointestinal surgery, excess zinc, or an inherited disorder such as Menkes disease, and can cause anemia, low white-cell count, bone changes, and nerve or spinal-cord damage. Copper replacement treats deficiency when intake or absorption is inadequate.

Copper In Diet

Copper obtained from foods such as shellfish, nuts, seeds, beans, whole grains, and organ meats. The body needs small amounts, while excessive supplements or exposure can be harmful; requirements vary with deficiency or disease.

Copper Poisoning

Toxic exposure to copper or copper salts that may cause vomiting, abdominal pain, hemolysis, liver injury, kidney injury, or shock.

Coprolalia

Saying obscene or socially inappropriate words without meaning to. It is an uncommon vocal tic and can occur in Tourette syndrome.

Copy Number Variant

A genetic change in which a section of DNA is missing or present in extra copies. Whether it affects health depends on its size, location, genes, inheritance, and available evidence.

Copy Number Variation

A deletion or duplication of a section of DNA that changes how many copies are present. Some variations are harmless, while others alter gene activity and cause developmental, neurologic, or other disorders.

CoQ10

A fat-soluble substance made by the body that helps mitochondria produce energy and also acts as an antioxidant. It is sold as a supplement, but benefit varies by condition and it can interact with medicines.

Cor

A Latin anatomical word meaning heart, appearing in medical terms that describe the heart, heart-related structures, or diseases affecting circulation.

Coracoid Process

A hook-shaped bony projection from the shoulder blade that points forward. Several muscles and ligaments attach to it, and injury may occur with a direct blow or shoulder dislocation.

Cord

A long, narrow structure such as the spinal cord, which contains the central nervous tissue, or the umbilical cord, which connects a fetus to the pla-

centa.

Cord Blood Stem Cells

Blood-forming stem cells collected from the umbilical cord and placenta after birth. They can make different types of blood and immune cells and may be used for stem-cell transplantation.

Cord Blood Testing

Laboratory testing of blood collected from the umbilical cord at birth, which may include blood type, complete blood count, blood gases, glucose, or tests for infection or inherited disease when clinically indicated.

Cord Prolapse

An obstetric emergency in which the umbilical cord descends through the cervix ahead of the presenting fetal part; see *Umbilical Cord Prolapse*.

Cordocentesis

A prenatal procedure using ultrasound guidance to take a small blood sample from the umbilical cord. It can assess fetal anemia, infection, or selected genetic conditions but carries risks including bleeding and pregnancy loss.

Cordotomy

A procedure that cuts selected pain-sensing pathways in the spinal cord to relieve severe pain when other treatments have failed. It may cause numbness, weakness, breathing problems, or other lasting nerve complications.

Cord Presentation

A position in which the umbilical cord lies between the baby's presenting part and the cervix while the membranes are intact. If the membranes break, the cord may slip down and become compressed, threatening the baby's oxygen supply.

Core Biopsy

Removal of one or more cylindrical tissue samples with a hollow cutting needle for microscopic examination. It preserves more tissue architecture than fine-needle aspiration and is used for breast, liver, prostate, and other lesions.

Core Needle Biopsy

Removal of small cylinders of tissue with a hollow cutting needle for laboratory examination. Imaging may guide the needle, and the samples preserve tissue structure better than fluid or cell aspiration alone.

Cori Cycle

A process in which muscles send lactate to the liver, where it is changed into glucose. The glucose returns to the blood and can be used again by muscles for energy.

Cori Disease

A rare inherited disorder in which the body cannot break down stored glycogen normally. It can cause low blood sugar, an enlarged liver, muscle weakness, and sometimes heart disease.

Alternate Names:
Glycogen Storage Disease Type III (GSD III); Forbes Disease; Debrancher Deficiency

Corn

A sharply demarcated, conical hyperkeratotic lesion of the stratum corneum that develops over bony prominences subject to repetitive mechanical friction and localized compression. The inverted apex points inward toward the dermis, provoking focal sharp pain when direct perpendicular pressure is applied. Categorized into hard corns (heloma durum), classically located over the dorsolateral aspect of the fifth digit or interphalangeal joints, and soft corns (heloma molle), found within interdigital web spaces where maceration softens the keratin core. Distinguished from plantar verrucae by the preservation of normal skin dermatoglyphic skin lines and the absence of pinpoint thrombosed capillary petechiae upon paring.

Alternate Names:
Clavus; Heloma; Corns

Corn-Cockle Poisoning

Poisoning caused by ingestion of corn cockle

(*Agrostemma githago*) seeds, which may contaminate grain and cause stomach upset, weakness, or other toxic effects.

Alternate Names:
Githism (obsolete historical term); Agrostemma Githago Intoxication

Cornea

The transparent, curved front surface of the eye, covering the iris and pupil. It protects the eye and provides much of its focusing power by bending incoming light toward the retina. Its layered structure includes an outer epithelium, a strong central stroma, and an inner endothelium that helps maintain corneal clarity.

Corneal Abrasion

A scratch or loss of the outer layer of the cornea, often from a fingernail, foreign body, contact lens, makeup tool, or other injury. It can cause pain, tearing, redness, light sensitivity, and blurred vision.

Corneal Cross-Linking

A treatment that uses riboflavin and ultraviolet light to strengthen the cornea. It can slow or stop worsening thinning and bulging, especially in keratoconus, but may cause pain during healing.

Corneal Degeneration

A group of acquired corneal changes that may involve deposits, thinning, blood-vessel growth, or tissue irregularity. Unlike corneal dystrophies, degenerations are not usually inherited and may be asymmetric or develop with age or other eye disease. Effects on vision vary with the type and location.

Corneal Disease

Corneal disease affects the transparent front surface of the eye through infection, inflammation, trauma, dystrophy, degeneration, dryness, or abnormal shape. Pain, redness, light sensitivity, discharge, or reduced vision can occur in sight-threatening disease because scarring may impair vision.

Corneal Dystrophy

A group of usually inherited disorders in which abnormal material builds up in one or more layers of the cornea. They may cause blurred vision, glare, pain, or recurrent corneal erosions and often affect both eyes.

Corneal Edema

Swelling of the cornea from excess fluid, making it cloudy and causing blurred vision, glare, halos, or pain. Causes include damage to its inner cells, glaucoma, inflammation, injury, or eye surgery.

Corneal Endothelium

The innermost layer of cells in the cornea. It moves extra fluid out of the cornea and helps keep it clear.

Corneal Epithelium

The thin outer layer of the cornea that protects the eye and helps keep its surface smooth.

Corneal Implant

A device or tissue substitute placed in or on the cornea, the clear front surface of the eye, to change its shape, replace damaged tissue, or improve vision. Benefits and risks depend on the implant and eye condition.

Corneal Inflammation

Alternate name; see *Keratitis*.

Corneal Injury

Damage to the clear front surface of the eye, including scratches, foreign bodies, chemical burns, infections, or cuts that may threaten vision.

Corneal Laceration

A cut through part or all of the cornea, usually caused by sharp trauma or a foreign object. It can cause pain, tearing, light sensitivity, reduced vision, and leakage of aqueous humor.

Corneal Reflex

An involuntary protective reflex resulting in bilateral blinking upon mechanical or tactile stimulation of either cornea. The sensory afferent limb is mediated by the ophthalmic division of the trigeminal

nerve (cranial nerve V1) and the motor efferent limb is carried by the facial nerve (cranial nerve VII) supplying the orbicularis oculi muscles.

Alternate Names:
Blink Reflex; Corneal Blink Reflex

Corneal Stroma

The thick middle layer of the cornea. It gives the cornea much of its strength and helps keep it clear.

Corneal Surgery

Surgery on the cornea, the clear front surface of the eye, to treat disease or injury, restore its integrity, or change its shape. Procedures include corneal transplantation, wound repair, and laser reshaping.

Corneal Transplant

Surgery that replaces part or all of a damaged or diseased cornea with healthy donor tissue. It may restore vision or relieve pain; risks include rejection, infection, increased eye pressure, and need for further treatment.

Corneal Transplantation

Surgical replacement of part or all of a diseased or damaged cornea with donor corneal tissue to restore vision or relieve pain.

Alternate Names:
Corneal Transplant

Corneal Ulcer

A loss of tissue forming an open sore on the cornea, the clear front surface of the eye. It is most often caused by infection with bacteria, viruses, fungi, or parasites, but may also follow an injury, severe dryness, poor eyelid closure, or contact-lens problems. It may cause eye pain, redness, tearing, discharge, sensitivity to light, or blurred vision. Healing can leave a corneal scar, and a deep or central ulcer can seriously damage vision or perforate the eye.

Corneal Ulcers And Infections

Infection or inflammation of the cornea that may produce an epithelial defect or ulcer, pain, redness, tearing, discharge, and light sensitivity. Bacterial, fungal, protozoal, and viral causes can threaten vision.

Corneitis

Inflammation of the cornea, the clear front surface of the eye. It may cause pain, redness, watering, light sensitivity, or blurred vision and can result from infection, injury, immune disease, or chemical exposure.

Cornelia De Lange Syndrome

A genetic developmental disorder that can cause distinctive facial features, slow growth, intellectual disability, limb differences, feeding problems, hearing loss, and heart or other organ abnormalities. Severity varies widely.

Corns

Plural form; see *Corn*.

Corns And Calluses

Corns are small, localized areas of thickened skin caused by repeated pressure or friction, usually on the toes. Calluses are broader areas of thickened, hardened skin, usually on the soles of the feet or palms of the hands. Both are usually harmless but may become painful.

Cornual Pregnancy

An imprecise term historically used for an interstitial ectopic pregnancy, implanted in the portion of the fallopian tube that traverses the uterine wall. It has also been used for pregnancy in a rudimentary uterine horn; the intended anatomy should therefore be specified.

Coronal

Relating to a plane that divides the body into front and back portions, or to the crown or top of a structure.

Coronal Caries

Tooth decay affecting the crown, the visible part of a tooth above the gum. It can begin in pits, grooves, or smooth surfaces when bacterial acids

dissolve enamel and dentin.

Coronal Plane

A vertical plane that divides the body or an organ into front (anterior) and back (posterior) portions.

Coronary

Relating to the arteries and blood flow that supply the heart muscle. Narrowing or blockage of these arteries can reduce oxygen to the heart and cause chest pain or a heart attack.

Alternate Names:
Cardiac Blood-Vessel-Related; Heart-Coronary

Coronary Aneurysm

An abnormal widening or ballooning of a coronary artery. It may result from atherosclerosis, inflammation, infection, injury, or a congenital condition and can cause clotting, blockage, or rarely rupture.

Coronary Angiography

An X-ray examination of the heart arteries after contrast is injected through a thin catheter. It shows narrowed or blocked areas and can guide treatment, but the procedure can cause bleeding, stroke, kidney injury, or other complications.

Coronary Angioplasty

A procedure that opens a narrowed or blocked artery supplying the heart. A thin tube with a small balloon is guided to the blockage. The balloon is inflated to widen the artery, and a small mesh tube called a stent is often left in place to help keep it open.

Alternate Names:
Percutaneous Coronary Intervention; PCI; Coronary Balloon Angioplasty; PTCA

Coronary Arteries

The blood vessels that arise from the aorta and supply oxygen to the heart muscle. The right and left arteries divide into branches, and blockage in one can cause angina or a heart attack.

Coronary Artery

One of the blood vessels branching from the aorta that supplies oxygen-rich blood directly to the heart muscle.

Coronary Artery Aneurysm

A weakened section of an artery supplying the heart that has become abnormally widened. It may form a blood clot, reduce blood flow, or rarely rupture; causes include artery disease, inflammation, infection, or injury.

Coronary Artery Anomaly

A birth difference in where a heart artery begins, how it travels, or how it ends. Some cause no problems, while others reduce blood flow or increase the risk of chest pain, dangerous rhythms, or sudden cardiac arrest.

Coronary Artery Bypass

A surgical procedure that creates a new route for blood flow around a narrowed or blocked coronary artery using a vascular graft.

Coronary Artery Bypass Grafting

Surgery that uses a blood-vessel graft to create a route around severely narrowed or blocked heart arteries. It can improve blood flow and symptoms and may improve survival in selected people with extensive disease.

Coronary Artery Bypass Surgery

Alternate name; see *Coronary Artery Bypass Grafting*.

Coronary Artery Calcium Score

A CT scan measurement of calcium in the arteries that supply the heart. It can help estimate future heart disease risk in some people who have no symptoms, but it does not show every type of artery disease.

Alternate Names:
Agatston Score; CAC Score

Coronary Artery Disease

A condition in which fatty plaque builds up in the arteries that supply blood to the heart muscle, narrowing them and reducing blood flow. It may cause no symptoms, chest discomfort (angina), or a heart attack, and can lead to heart failure or abnormal heart rhythms.

Alternate Names:
Coronary Heart Disease

Coronary Artery Fistula

An unusual connection between an artery supplying the heart and a heart chamber or another blood vessel. It may cause no symptoms or lead to breathlessness, chest pain, abnormal rhythms, heart failure, or infection of the heart lining.

Coronary Artery Spasm

Temporary tightening of a heart artery that reduces blood flow and may cause chest pain, often at rest. Smoking, stimulant drugs, stress, or other vessel problems can trigger it.

Coronary Calcium Score

A CT measurement of calcium in the arteries supplying the heart. More calcium usually means more plaque and higher future cardiovascular risk, but a zero score does not exclude soft plaque or eliminate all risk.

Coronary Calcium Scoring

A computed tomography scan measuring calcium-containing plaque in heart arteries. The score helps estimate future cardiovascular risk in selected people but does not show all plaque or replace clinical assessment.

Coronary Care Unit

A hospital unit for people with serious or unstable heart conditions. Staff continuously monitor heart rhythm, blood pressure, oxygen, and other vital functions and provide urgent treatment for problems such as heart attack, dangerous rhythms, or heart failure.

Alternate Names:
CCU

Coronary Circulation

The network of arteries and veins that supplies the heart muscle with oxygen and removes waste. Blood flow increases when the heart works harder and falls when an artery is narrowed or blocked.

Coronary Computed Tomography Angiography

A noninvasive CT scan performed after injected contrast highlights the heart arteries. It can show plaque, narrowing, or blockage and is useful for selected people with suspected coronary artery disease.

Alternate Names:
Coronary CT Angiography; Cardiac CTA

Coronary Dominance

The pattern describing which heart artery gives rise to the vessel supplying the back part of the heart. Most people have right dominance; left or shared patterns are normal variations.

Coronary Endarterectomy

Surgery removing hardened plaque from the inner lining of a heart artery. It may improve blood flow in selected complex blockages but is uncommon and carries risks of heart attack, bleeding, or vessel injury.

Alternate Names:
Coronary Plaque Endarterectomy; Coronary Endarterectomy Procedure

Coronary Flow Reserve

The ratio of coronary blood flow during maximal vasodilation to flow at rest. It measures how much the coronary circulation can increase blood flow; a low value may reflect obstructive coronary artery disease, microvascular dysfunction, or both.

Alternate Names:
CFR

Coronary Insufficiency

Blood flow through the heart arteries is not enough to meet the heart muscle's need for oxygen, usually because the arteries are narrowed. It may cause

chest pain, especially during exertion, or a heart attack.

Coronary Microvascular Angina

Chest pain caused by poor blood-flow regulation in the heart's smallest blood vessels. The main heart arteries may look open on testing, but the small vessels do not deliver enough oxygen during stress or sometimes at rest.

Coronary Microvascular Disease

Alternate name; see *Small Vessel Disease*.

Coronary Microvascular Dysfunction

Abnormal function of the small heart vessels that limits blood flow even when the major arteries are not severely narrowed. It may cause chest pain, especially in women and people with diabetes or high blood pressure.

Coronary Occlusion

Obstruction of a coronary artery, commonly by atherosclerotic plaque and thrombus, that can cause myocardial ischemia or infarction.

Coronary Perfusion Pressure

The physiological net pressure gradient driving myocardial blood flow through coronary capillary beds, calculated as the difference between aortic diastolic pressure and left ventricular end-diastolic pressure.

Alternate Names:
CPP

Coronary Revascularization

Restoration of blood flow through the coronary arteries, usually by percutaneous coronary intervention (angioplasty with or without stenting) or coronary artery bypass grafting. It is used to treat selected obstructive coronary artery disease and acute coronary syndromes.

Coronary Sinus

A large vein on the back of the heart that collects deoxygenated blood from the heart muscle and drains it into the right atrium.

Coronary Slow Flow Phenomenon

Delayed passage of contrast through the epicardial coronary arteries during angiography despite no obstructive coronary disease. It may be associated with impaired microvascular function and ischemic chest discomfort; microvascular dysfunction is not itself the definition of the angiographic slow-flow phenomenon.

Alternate Names:
CSFP; Slow Coronary Flow; Primary Coronary Slow Flow

Coronary Spasm

Alternate name; see *Coronary Artery Spasm*.

Coronary Steal Phenomenon

A situation in which blood is diverted toward healthier heart muscle and away from an area already receiving too little blood. It can worsen chest pain during certain medicines or stress tests.

Alternate Names:
Coronary Steal Syndrome; Myocardial Steal

Coronary Steal Syndrome

A hemodynamic phenomenon in which pharmacologically induced vasodilation (such as with dipyridamole or adenosine) diverts blood flow away from an already maximally dilated, stenotic coronary vascular bed toward well-perfused non-stenotic vessels, worsening regional myocardial ischemia.

Coronary Stent

A small mesh tube placed in a narrowed heart artery to help keep it open after angioplasty. Medicines are usually needed afterward to reduce the risk of clotting.

Coronary Thrombosis

Formation of a blood clot in a coronary artery, potentially obstructing blood flow and causing myocardial infarction.

Coronavirus

A family (*Coronaviridae*) of enveloped, positive-sense single-stranded RNA viruses possessing the

largest genomes among RNA viruses (≈ 27–32 kb). Characteristic surface spike (S) glycoprotein projections create a crown-like halo appearance on transmission electron microscopy and mediate viral entry by binding to host receptors (such as ACE2 for SARS-CoV and SARS-CoV-2, or DPP4 for MERS-CoV). Four endemic human coronaviruses (HCoV-229E, NL63, OC43, HKU1) cause mild-to-moderate upper respiratory infections (common cold), while zoonotic spillovers have produced virulent pandemic pathogens causing acute respiratory distress syndrome (ARDS), systemic hyperinflammation, and multiorgan failure, notably SARS-CoV, MERS-CoV, and SARS-CoV-2.

Alternate Names:
Coronaviruses; Coronaviridae

Coronavirus (COVID-19) and Asthma

COVID-19 in a person with asthma may worsen breathing symptoms or trigger an exacerbation, although risk varies with asthma control and severity.

Coronavirus (COVID-19) and High Blood Pressure

COVID-19 in a person with hypertension may carry higher risk when other cardiovascular or age-related risk factors are present. Prescribed blood-pressure medicines should generally be continued unless the treating clinician advises otherwise.

Coronavirus (COVID-19) and Pregnancy

SARS-CoV-2 infection during pregnancy can increase the risk of severe maternal illness, hospitalization, preterm birth, and other complications. Vaccination and individualized treatment can reduce some risks.

Coronavirus Disease 2019

Alternate index label; see *COVID-19*.

Coronavirus Disease COVID-19

Alternate index label; see *COVID-19*.

Coronaviruses

Plural form; see *Coronavirus*.

Corporeal

Relating to the physical body rather than thoughts, feelings, or the spirit. In medical writing, the word may describe a bodily symptom, physical examination, or treatment directed at the body.

Cor Pulmonale

Enlargement and weakening of the right side of the heart caused by high pressure in the lung arteries, usually from long-term lung disease. It may cause breathlessness, leg swelling, enlarged neck veins, or liver congestion.

Corpus

Latin for body; in anatomy it refers to the main body of an organ or structure, such as the corpus callosum or corpus uteri.

Corpus Albicans

A dense, white fibrous scar tissue mass within the ovary formed by the regression and involution of an unfertilized corpus luteum, consisting of hyalinized collagen and degenerated luteal cells.

Alternate Names:
White Body

Corpus Callosum

A broad band of nerve fibers connecting the brain's left and right halves. It allows the two sides to share information needed for movement, sensation, language, vision, and thinking.

Corpus Cavernosum

One of two columns of erectile tissue in the penis that fill with blood during erection.

Alternate Names:
Cavernous Body; Penile Corpus Cavernosum

Corpus Luteum

The temporary endocrine structure formed from an ovarian follicle after ovulation; it produces progesterone during the luteal phase and early pregnancy.

Alternate Names:
Yellow Body; Luteal Body

Corpus Luteum Cyst

A usually harmless ovarian cyst that forms after ovulation when the normal hormone-producing structure fills with fluid or blood. It often disappears within a few menstrual cycles but may cause pelvic pain, delayed menstruation, or bleeding if it ruptures.

Corpus Luteum Cysts

Plural form; see *Corpus Luteum Cyst*.

Corpus Spongiosum

A column of erectile tissue surrounding the penile urethra and expanding distally to form the glans.

Alternate Names:
Spongy Body; Corpus Spongiosum Penis

Corrected Age

The developmental age of a premature baby after allowing for the weeks born before 40 weeks of pregnancy. It helps interpret growth and milestones, usually during the first two years.

Corrigan Pulse

A strong pulse that rises quickly and then collapses rapidly. It is classically associated with aortic-valve leakage but can occur with other high-flow states.

Corrosive

A chemical that destroys tissue on contact, such as a strong acid or alkali. Exposure can burn skin, eyes, airways, or the digestive tract; effects depend on the substance and duration of contact.

Corrosive Ingestion

Swallowing an acid, alkali, or other substance that can burn or destroy the mouth, throat, esophagus, or stomach. It may cause pain, drooling, vomiting, difficulty swallowing, or breathing problems and can lead to perforation.

Corrugator Muscle

A small facial muscle that pulls the eyebrows downward and inward, helping create frowning and other concentrated facial expressions.

Alternate Names:
Corrugator Supercilii; Glabellar Muscle

Cortex

The outer layer of an organ or structure. Examples include the brain's cerebral cortex, the outer part of the adrenal gland, and the outer layer of a hair.

Alternate Names:
Cortical Layer; Outer Cortex

Cortical

Relating to the cortex, the outer layer of an organ such as the brain, kidney, or adrenal gland.

Cortical Bone

Dense bone forming the outer shell of most bones and providing much of the skeleton's mechanical strength.

Alternate Names:
Compact Bone; Cortical Tissue

Cortical Cataract

A cataract that begins in the outer part of the eye's lens and forms spoke-like cloudy areas extending inward. It can cause glare, halos, and blurred vision, especially in bright light.

Corticobasal Degeneration

A rare, progressive disease that damages brain cells involved in movement and thinking. It may cause stiffness or slow movement, often worse on one side, poor coordination, speech trouble, or difficulty using a hand or arm. These symptoms are called corticobasal syndrome, which can also result from other brain diseases.

Corticospinal Tract

The primary descending somatic motor pathway originating from pyramidal neurons in layer V of the cerebral motor cortex, descending through the internal capsule, brainstem, and medullary pyramids (where 85 to 90 percent decussate) to synapse on spinal lower motor neurons for voluntary fine motor control.

Alternate Names:

Pyramidal Tract

Corticosteroid

A class of steroid hormones synthesized from cholesterol within the adrenal cortex, or their synthetic pharmacological analogues. Divided into glucocorticoids (primarily cortisol/hydrocortisone, synthesized in the zona fasciculata under ACTH regulation) and mineralocorticoids (primarily aldosterone, synthesized in the zona glomerulosa under renin-angiotensin-aldosterone system control). Glucocorticoids cross the plasma membrane, bind intracellular glucocorticoid receptors, and translocate to the nucleus to downregulate pro-inflammatory cytokines (via NF-κB and AP-1 inhibition) and upregulate anti-inflammatory proteins (lipocortin-1). Clinically utilized for immunosuppression, rheumatologic disorders, asthma, allergic reactions, and adrenal insufficiency; chronic therapy carries risks of secondary adrenal suppression, iatrogenic Cushing syndrome, osteopenia, hyperglycemia, and opportunistic infection.

Corticosteroids

Plural form; see *Corticosteroid*.

Corticosteroids Mechanism

Corticosteroids enter cells and switch genes that control inflammation and immune activity. They reduce the release of inflammatory chemicals and limit the movement and activation of several immune cells, easing swelling, pain, and tissue damage.

Corticosteroids Overdose

Overdose of corticosteroids that may cause gastrointestinal symptoms, mood changes, hyperglycemia, fluid retention, infection risk, or adrenal suppression.

Corticotropin-Releasing Factor

A hypothalamic hormone that stimulates the pituitary gland to release adrenocorticotropic hormone and helps coordinate the stress response.

Alternate Names:
Corticotropin-Releasing Hormone; CRH

Corti's Ganglion

A group of nerve-cell bodies inside the cochlea that carries hearing signals from the inner ear toward the brain. Damage to this pathway can contribute to sensorineural hearing loss.

Cortisol

The principal glucocorticoid steroid hormone produced by the adrenal cortex, the outer part of the adrenal glands above the kidneys. It helps regulate metabolism and blood glucose, maintain blood pressure, modulate immune and inflammatory responses, and support the body's response to stress. Its secretion follows a daily rhythm, rising before waking and generally peaking around waking before declining to low levels at night.

Cortisol Blood Test

A blood test measuring cortisol, a hormone produced by the adrenal cortex. Results help evaluate adrenal insufficiency or cortisol excess, but vary substantially with time of day, stress, illness, medicines, and the assay used.

Cortisol Urine Test

A test measuring cortisol excreted in a timed urine collection, commonly 24-hour urine free cortisol, used to evaluate suspected excess cortisol production such as Cushing syndrome.

Cortisone

A corticosteroid that is converted in the body to cortisol and can be used to reduce inflammation or replace glucocorticoid activity.

Cor Triatriatum

A rare birth defect in which a membrane divides the upper left heart chamber into two spaces. If the membrane blocks blood returning from the lungs, it can cause breathlessness, poor growth, or heart failure; some people have no symptoms.

Coryza

Acute inflammation of the nasal mucous membranes with nasal discharge and obstruction, commonly occurring in the common cold or other upper-

respiratory infection.

Cosmeceutical

A cosmetic product marketed as having biologically active, drug-like benefits; the term has no uniform formal regulatory category in many jurisdictions.

Cosmetic Allergies

Cosmetic products can cause irritant dermatitis or allergic contact dermatitis, producing itching, redness, swelling, scaling, or blistering where applied. Stopping the suspected product and medical assessment, sometimes with patch testing, help identify the responsible ingredient.

Cosmetic Dermatology

Dermatologic care intended to change appearance rather than treat disease, including procedures for wrinkles, scars, pigmentation, hair, or facial volume. Risks include infection, scarring, pigment changes, allergic reactions, and injury from improperly performed treatment.

Cosmetic Ear Surgery

Surgery to change the size, shape, or position of the outer ear, often to correct prominent ears or a structural difference. Risks include bleeding, infection, scarring, altered sensation, and an unsatisfactory result.

Cosmetic Surgery

Surgery intended primarily to change or improve appearance rather than treat disease or restore function. It still carries risks such as infection, bleeding, anesthesia complications, scarring, and unsatisfactory results.

Costal Cartilage

Flexible cartilage that connects the front ends of the ribs to the sternum or to the cartilage of the rib above. It gives the chest wall flexibility during breathing.

Costal Groove

A shallow groove along the lower inner border of a rib that contains an intercostal nerve and blood vessels.

Costal Margin

The lower curved edge of the rib cage, formed mainly by the cartilage of the lower ribs.

Costello Syndrome

A rare genetic condition, usually caused by an HRAS gene change, affecting growth, development, skin, heart, and muscles. It may cause feeding difficulty, short stature, distinctive facial features, heart disease, and increased risk of certain tumors.

Costochondritis

Inflammation of the cartilage where one or more ribs join the breastbone (sternum), causing localized chest-wall pain and tenderness that may worsen with movement, deep breathing, coughing, or pressing the area. Similar pain can also result from heart or lung disease.

Alternate Names:
Costosternal Inflammation

Costochondritis And Tietze Syndrome

Costochondritis is inflammation or irritation at the junction of ribs and the breastbone, causing reproducible chest-wall pain. Tietze syndrome is a less common related condition with visible swelling at one or a few joints; heart and lung emergencies must still be excluded.

Alternate Names:
Anterior Chest Wall Syndrome

Costosternal Chondrodynia

Alternate index label; see *Costochondritis*.

Costosternal Syndrome

Alternate index label; see *Costochondritis*.

Costotransverse Joint

A joint where the tubercle of a rib meets the transverse process of a thoracic vertebra. It helps guide rib movement during breathing.

Costovertebral-Angle Tenderness

Pain elicited by percussion over the angle between the lower ribs and spine. It may occur with kidney infection or other renal and surrounding conditions, and is interpreted with the rest of the examination and clinical findings.

Costovertebral Joint

A joint where a rib meets a vertebra in the spine. It helps the ribs move during breathing.

Cotard Syndrome

A rare syndrome involving a fixed belief that one is dead, missing body parts, or no longer exists, sometimes accompanied by severe depression, psychosis, or other psychiatric or neurologic illness. It is a descriptive syndrome rather than a standalone diagnosis.

Cot Death

Alternate name; see *Sudden Infant Death Syndrome*.

Cotton-Wool Spots

Small, fluffy, whitish-yellow retinal lesions representing localized micro-infarcts of the retinal nerve fiber layer caused by occlusion of precapillary arterioles and subsequent axoplasmic stasis. They are commonly observed on funduscopic examination in diabetic retinopathy, severe hypertension, and retinal vein occlusion.

Alternate Names:
Cytoid Bodies; Retinal Nerve Fiber Layer Infarcts

Cough

A protective reflex that clears mucus, irritants, or foreign material from the airways. Coughs may be short-lived or persistent and can result from infection, allergy, asthma, reflux, medicines, heart disease, or other conditions.

Cough Augmentation

Techniques that help a person with weak breathing muscles clear mucus. They may include assisted coughing, taking several stacked breaths, or using a device that pushes air in and then rapidly pulls it out.

Cough Headaches

Head pain triggered by coughing, sneezing, straining, laughing, or another sudden pressure increase. Some are caused by a structural brain problem, while others occur without an identified structural cause.

Cough In Adults

A cough in an adult may be acute, subacute, or chronic and may result from infection, asthma, chronic obstructive pulmonary disease, reflux, upper-airway cough syndrome, medication, or other disease. Coughing blood, breathing difficulty, chest pain, low oxygen, or persistent unexplained cough can accompany serious illness.

Coughing Up Blood

Expectoration of blood or blood-streaked sputum from the lower respiratory tract, called hemoptysis; heavy bleeding or breathing difficulty is an emergency.

Cough Suppressant

An antitussive medicine or measure that reduces the urge or reflex to cough. Suppressing a productive cough can interfere with airway clearance.

Cough Syncope

A brief faint caused by coughing, which raises chest pressure, reduces venous return and cardiac output, and transiently lowers cerebral blood flow.

Councilman Body

A rounded, intensely eosinophilic apoptotic hepatocyte globule with condensed pyknotic or fragmented nuclear material seen on microscopic examination of liver biopsies, characteristic of acute viral hepatitis, yellow fever, and severe toxic hepatitis.

Alternate Names:
Councilman-Rocha Lima Body; Apoptotic Hepatocyte

Countercurrent Multiplication

A kidney process that creates a concentrated salt

gradient deep in the kidney. This gradient allows the collecting ducts to reclaim more water when antidiuretic hormone is present.

Counterfeit Drug

A product falsely labeled as an approved medicine or made to imitate one. It may contain the wrong ingredient, too little or too much active drug, contaminants, or no active drug and can cause treatment failure or poisoning.

Counterpulsation

Timed inflation and deflation of a balloon or pressure cuffs with each heartbeat to improve blood flow to the heart or reduce the heart's workload. It is used only in selected serious cardiac conditions.

Countertransference

A healthcare professional's emotional responses to a patient, influenced by the professional's experiences or by the interaction. Recognizing these responses helps maintain safe, objective, and effective care.

Counting Carbohydrates

Estimating the grams of carbohydrate in foods and drinks to help plan meals, match insulin, and manage blood glucose, especially in diabetes.

Count Rate

The number of detected events each second during measurement. In medical imaging, very high rates can cause missed events because equipment needs recovery time, reducing accuracy unless corrected.

Coup-Contrecoup Injury

Brain injury in which the brain is damaged both beneath the point of impact and on the opposite side as it moves inside the skull. Falls and vehicle crashes are common causes.

Courvoisier Sign

A painless, enlarged gallbladder in a person with jaundice, traditionally suggesting blockage of the bile duct by a tumor rather than a gallstone. It is a clue, not a diagnosis.

Covered Vascular Stent

A vascular stent lined with a graft material that supports the vessel and excludes a leak or aneurysm from the bloodstream.

Alternate Names:
Stent Graft; Endovascular Graft; Endoprosthesis

Cover Test

An objective ocular alignment test used to identify and measure manifest strabismus (tropia). While the patient fixes their gaze on a target, one eye is covered and the uncovered eye is observed for any compensatory refixation movement.

COVID-19

Coronavirus disease caused by infection with SARS-CoV-2. Illness ranges from asymptomatic or mild disease to pneumonia, respiratory failure, thrombosis, or death; common symptoms include fever, cough, shortness of breath, fatigue, muscle aches, and altered taste or smell. Some people develop persistent symptoms after the acute infection.

COVID-19 Antibody Test

A blood test that detects antibodies produced in response to SARS-CoV-2 infection or vaccination; it does not reliably diagnose current infection or establish complete immunity.

COVID-19-Associated Anosmia and Ageusia

COVID-19 can temporarily impair smell and taste through infection or inflammation of nasal and olfactory pathways. Most people improve, but persistent loss, distortion, poor nutrition, or neurologic symptoms warrants follow-up and smell-retraining advice.

COVID-19 Complications

Complications of SARS-CoV-2 infection can include pneumonia, hypoxemic respiratory failure, blood clots, myocarditis, acute kidney injury, neurologic disease, multisystem inflammatory syndrome, and persistent post-COVID symptoms.

COVID-19 in Infants and Children

COVID-19 in children and infants is often mild but can cause pneumonia, dehydration, croup-like illness, or multisystem inflammatory syndrome in children. Breathing difficulty, poor feeding, unusual sleepiness, or dehydration may occur in severe illness.

COVID-19 In Pregnancy

COVID-19 during pregnancy can be more severe than in nonpregnant adults and increases risks such as hospitalization, preterm birth, and stillbirth. Fetal infection before birth is uncommon but possible; vaccination can reduce the risk of severe disease.

COVID-19 Recovery

Recovery after COVID-19 varies from days to months. Persistent fatigue, breathlessness, cognitive symptoms, loss of smell or taste, and post-exertional worsening may represent post-COVID condition and warrant appropriate evaluation.

COVID-19 Symptoms

Symptoms of SARS-CoV-2 infection, which may include fever, cough, sore throat, congestion, fatigue, muscle aches, headache, loss of smell or taste, vomiting, or diarrhea.

COVID-19 Test

A test for current SARS-CoV-2 infection using a respiratory sample. Molecular tests detect viral genetic material and antigen tests detect viral proteins; results depend on timing, sample quality, and the amount of virus present.

COVID-19 Testing

Testing for SARS-CoV-2 uses antigen or nucleic-acid methods on respiratory samples. Test timing, symptoms, exposure, and the purpose of testing affect interpretation and the need for repeat testing.

COVID-19 Vaccines

Vaccines that prime immune responses against SARS-CoV-2 and reduce severe disease, hospitalization, and death; products, schedules, effectiveness, and recommendations vary by age and risk.

COVID-19 Virus Test

Alternate name; see *COVID-19 Test*.

COVID Toe

A chilblain-like skin lesion reported in association with COVID-19, usually affecting the toes or fingers and appearing red, purple, or swollen.

Cowden Disease (Multiple Hamartoma Syndrome)

Alternate names; see *Cowden Syndrome*.

Cowden Syndrome

An inherited PTEN-hamartoma tumour syndrome, usually caused by a pathogenic *PTEN* variant. It may cause multiple hamartomas, characteristic mucocutaneous lesions, and increased risks of breast, thyroid, endometrial, kidney, and colorectal cancers; lifelong organ-specific surveillance is important.

Cowper's Gland

One of a pair of small male accessory sex glands below the prostate. Its secretion contributes mucus and fluid to the urethra before ejaculation.

Cowpox

A zoonotic viral infection caused by cowpox virus or related orthopoxviruses, producing localized pustular or ulcerative skin lesions and sometimes systemic illness.

Cow's Milk Allergy

Alternate name for cow's milk protein allergy; see *Milk Allergy*.

Cow's Milk And Children

Nutritional guidance on cow's milk for children, balancing protein, calcium, vitamin D, fat, iron, allergy, and total intake so milk does not displace a varied diet.

Cow's Milk Introduction in Infancy

Pediatric nutritional guidance establishing that unmodified whole cow's milk should be withheld as a primary beverage until 12 months of age due to its

high renal solute load, low iron bioavailability, risk of occult gastrointestinal blood loss, and inadequate micronutrient profile.

Alternate Names:
Cow's Milk in Infancy; Infant Milk Guidelines; Whole Milk Introduction

Cox-2

Cyclooxygenase-2, an inducible enzyme that produces inflammatory prostaglandins; selective COX-2 inhibitors reduce pain and inflammation but may have cardiovascular, renal, and gastrointestinal risks.

COX-2 Inhibitors

Medicines that reduce the action of an enzyme involved in pain and inflammation. They may cause less stomach irritation than some older anti-inflammatory medicines, but can still cause bleeding, kidney problems, high blood pressure, or heart risks.

Alternate Names:
Cyclooxygenase-2 Inhibitors; Selective COX-2 Inhibitors

Coxalgia

Pain arising from the hip or nearby tissues, often felt in the groin and sometimes spreading to the thigh or knee. Causes vary with age and include infection, injury, growth problems, arthritis, cartilage damage, stress fractures, and reduced blood supply.

Coxa Vara

A hip deformity in which the upper thigh bone has an unusually narrow angle, making the leg shorter or changing how the hip bears weight. It may cause a limp, pain, or limited movement.

Coxiella Burnetii

A bacterium that causes Q fever, usually spread by breathing dust contaminated by infected farm animals. It can cause fever, headache, hepatitis, or pneumonia and may persist as a serious infection of heart valves.

Coxsackie

Alternate name; see *Coxsackievirus*.

Coxsackievirus

A group of viruses that can cause fever, sore throat, mouth sores, rashes, or hand, foot, and mouth disease. Some types can also inflame the heart, its surrounding sac, the muscles, or the coverings of the brain.

Coxsackie Virus Type A16

A virus that commonly causes hand, foot, and mouth disease, especially in children. Fever, painful mouth sores, and a rash or blisters on the hands and feet usually resolve without serious complications.

Cozen Test

A physical examination manoeuvre used to assess for lateral epicondylitis (tennis elbow). The patient extends and radially deviates the wrist against examiner resistance while the elbow is stabilized in flexion; sharp pain at the lateral epicondyle constitutes a positive finding.

Alternate Names:
Cozen's Test; Tennis Elbow Test

CP

A commonly used abbreviation for cerebral palsy, a group of permanent disorders of movement and posture caused by injury or abnormal development of the developing brain. Associated problems may involve sensation, communication, cognition, seizures, or feeding.

CPAP

Continuous positive airway pressure delivered through a mask to splint open the upper airway during sleep. It is commonly used for obstructive sleep apnea and can reduce apneas and related symptoms when used consistently.

CPAP Machine

A device that sends a steady stream of air through a mask to keep the upper airway open during sleep. It is commonly used for obstructive sleep apnea;

benefit depends on correct mask fit and regular use.

C-Peptide

A small protein fragment released when the pancreas makes insulin. Measuring it helps show how much insulin a person's body is making, rather than how much injected insulin is present. Kidney function and blood-glucose levels can affect the result.

CpG

A DNA sequence in which cytosine is followed by guanine on the same strand, often occurring in regions whose methylation helps regulate gene expression.

CPK Isoenzymes Test

A blood test that separates forms of creatine kinase to help identify whether an increased level comes mainly from skeletal muscle, heart muscle, or brain. Troponin testing is usually preferred when a heart attack is suspected.

CPR

Alternate index label; see *Cardiopulmonary Resuscitation*.

CPVT

Alternate name; see *Catecholaminergic Polymorphic Ventricular Tachycardia*.

Crabs

Alternate colloquial name; see *Pubic Lice*.

Crabs (Pubic Lice)

Infestation of coarse body hair by pubic lice, causing itching and visible nits or lice. It is usually sexually transmitted but can spread through close contact; other sexually transmitted infections may coexist.

Cracked Heels

Dry, thickened skin at the heel that develops fissures, sometimes deep enough to bleed or become infected. Moisturizers, gentle filing, and treatment of contributing skin disease can help; painful or infected cracks may have complications.

Cracked Tooth Syndrome

A partial crack in a tooth that may cause sharp pain when biting or when pressure is released, and sensitivity to hot or cold. The crack can be difficult to locate and may worsen over time. Dental treatment depends on its depth and whether the inner pulp is involved.

Crackles

Brief popping or bubbling sounds heard in the lungs, usually while breathing in. They may occur when small airways reopen or when air moves through fluid, as in pneumonia, heart failure, or scarring.

Alternate Names:
Rales

Cradle Cap

A common form of seborrheic dermatitis in infants, causing greasy or flaky scales on the scalp with mild redness. It is usually harmless and often resolves spontaneously; persistent inflammation or signs of infection may indicate another condition.

Cramp

A sudden, involuntary, often painful muscle contraction. Cramps may result from exertion, dehydration, electrolyte changes, pregnancy, medicines, nerve disease, or reduced blood flow.

Cramping Leg Pain

Pain caused by involuntary, often painful muscle contraction in the leg; contributors include exertion, dehydration, electrolyte abnormalities, medications, nerve disease, and impaired circulation.

Cramps But No Period

Pelvic cramps without menstruation can result from ovulation, pregnancy, implantation, constipation, urinary disease, infection, endometriosis, cysts, or other pelvic conditions. Severe one-sided pain, faintness, fever, or vomiting may accompany serious causes, including ectopic pregnancy.

Cranberries

Red fruits containing fiber and plant compounds.

Cranberry products may modestly reduce recurrent urinary infections in some people but do not treat an established infection; they can interact with warfarin and other medicines.

Cranial

Relating to the skull or toward the head, as opposed to caudal or toward the lower end of the body.

Cranial Arteritis

Inflammation of arteries, usually in the scalp and head, that can cause a new headache, scalp tenderness, jaw pain while chewing, fever, or vision loss. Sudden visual symptoms require emergency treatment.

Cranial Cavity

The hollow space inside the skull that contains and protects the brain, its coverings, blood vessels, and cerebrospinal fluid. A rise in pressure inside this space can compress the brain and become life-threatening.

Cranial Fasciitis

A usually harmless but rapidly growing lump in the scalp or nearby soft tissue, most often in infants and young children. It can look like cancer on examination or scans, so a tissue sample may be needed to confirm the diagnosis.

Cranial Implant

An artificial material or device placed in or on the skull to repair a defect, protect the brain, drain fluid, stimulate nerves, or support treatment. Risks include infection, bleeding, and implant failure.

Cranial Mononeuropathy III

Damage to the third cranial nerve, which controls several eye muscles, the eyelid, and the pupil. It can cause double vision, a drooping eyelid, abnormal eye position, or an enlarged pupil.

Cranial Nerve

One of twelve pairs of peripheral nerves that arise directly from the brain and brainstem (rather than the spinal cord) and traverse dedicated cranial foramina of the skull base to provide sensory, motor, and autonomic parasympathetic innervation to the head, neck, and thoracoabdominal viscera. Numbered sequentially with Roman numerals I through XII: I (olfactory; special sensory), II (optic; special sensory), III (oculomotor; somatic motor/parasympathetic), IV (trochlear; somatic motor), V (trigeminal; branchial motor/somatic sensory), VI (abducens; somatic motor), VII (facial; mixed/parasympathetic), VIII (vestibulocochlear; special sensory), IX (glossopharyngeal; mixed/parasympathetic), X (vagus; mixed/parasympathetic), XI (accessory; branchial motor), and XII (hypoglossal; somatic motor).

Cranial Nerve Palsy

Weakness or loss of function caused by injury or dysfunction of one or more cranial nerves or their nuclei in the brain. It may cause double vision, facial weakness, hearing loss, trouble swallowing, or tongue weakness, depending on the nerve involved.

Alternate Names:
Cranial Nerve Paralysis

Cranial Nerves

Plural form; see *Cranial Nerve*.

Cranial Nerve X

The vagus nerve, the tenth cranial nerve, which carries parasympathetic and sensory fibers and contributes to swallowing, voice, and regulation of thoracic and abdominal organs.

Cranial Sutures

Fibrous joints between skull bones that permit molding in infancy and accommodate brain growth before progressively fusing; premature fusion causes craniosynostosis.

Craniectomy

An operation in which part of the skull is removed and left off temporarily, often to give a swollen brain more room. It may be done after a serious head injury, stroke, or brain bleed. The skull opening is usually repaired later with the saved bone or an artificial piece.

Alternate Names:
Decompressive Craniectomy; Hemicraniectomy; Suboccipital Craniectomy

Craniocerebral Injury

An injury involving the scalp, skull, brain, or several of these structures, ranging from minor wounds to life-threatening traumatic brain injury.

Craniofacial

Relating to the skull and face. Craniofacial conditions may involve bones, soft tissues, teeth, eyes, ears, or airway and may be congenital, traumatic, developmental, or acquired.

Craniofacial Abnormalities

Abnormalities of the skull, face, or related tissues that may be present at birth or develop later. Causes include genetic conditions, disrupted development, trauma, infection, and tumors.

Craniofacial Disorder

A condition that affects the skull, face, jaw, or nearby soft tissues. It may be present at birth or develop later. Examples include cleft lip and palate and early joining of skull bones. Depending on the condition, it can affect breathing, feeding, hearing, vision, teeth, or speech.

Alternate Names:
Craniofacial Anomaly; Craniofacial Malformation; Craniofacial Condition

Craniofacial Dysostosis

A birth disorder in which some skull bones join too early and the face develops unusually. It can change head shape, affect the eyes or airway, and sometimes increase pressure around the brain; severity varies.

Craniofacial Microsomia

A birth condition in which one side of the face develops less fully than the other. It may affect the jaw, ear, eye, facial muscles, and nearby tissues, with severity ranging from mild to complex.

Craniofacial Surgery

Surgery to correct congenital, traumatic, developmental, or acquired conditions of the skull, face, jaws, and associated soft tissues. Care often involves collaboration among plastic, oral and maxillofacial, neurosurgical, and other specialties.

Craniopharyngioma

A usually slow-growing tumor near the pituitary gland and hypothalamus. It may cause headache, vision loss, excessive thirst or urination, hormone problems, growth changes, or increased pressure in the skull.

Cranioplasty

Surgery to repair a missing or damaged part of the skull, often after a head injury or earlier brain surgery. A stored piece of bone or an artificial material may be used. It protects the brain and may improve skull shape or symptoms, but results and risks vary.

Alternate Names:
Skull Reconstruction; Cranial Reconstruction; Skull Defect Repair

Craniorachischisis

A severe neural tube defect in which the skull and spine fail to close along an extensive portion of their length, leaving the brain and spinal cord exposed to varying degrees. It combines features of anencephaly and open spina bifida and is usually incompatible with long-term survival. The condition is diagnosed by prenatal imaging or examination after birth.

Craniosynostosis

Craniosynostosis is premature fusion of one or more skull sutures, altering head shape and sometimes increasing pressure on the developing brain.

Alternate Names:
Craniostenosis

Craniosynostosis Repair

Surgery to separate prematurely fused skull bones and reshape the skull when needed. It aims to improve head shape and make room for brain growth; timing and technique depend on the child's age and

anatomy.

Craniotabes

Soft areas of an infant's skull that bend or indent more easily than expected. They can be part of normal newborn molding but may also result from rickets or another bone disorder; significance varies with the baby's examination and growth.

Craniotomy

An operation in which a surgeon temporarily removes a piece of the skull to reach the brain or its coverings. It may be used to remove a tumor, stop bleeding, repair an aneurysm, or treat another brain problem. The bone is usually put back and secured at the end of the operation.

Alternate Names:
Open Brain Surgery; Bone Flap Surgery; Craniotomy Bone Flap

Cranium

The part of the skull that encloses and protects the brain, consisting of the cranial bones and their joints.

Crapulence

An unpleasant state of sickness or discomfort caused by excessive eating or drinking, especially excessive alcohol use.

Craving

A strong, often difficult-to-control desire for a substance, behavior, or experience, commonly seen in substance-use disorders.

Alternate Names:
Strong Urge; Compulsive Desire

Crazy Paving Pattern

A lung-imaging pattern of hazy areas crossed by thick lines, resembling paving stones. It can occur with several conditions, including infection, bleeding, inflammation, or protein buildup, so it is not a diagnosis by itself.

CRC

Colorectal cancer, malignant disease arising in the colon or rectum; screening and evaluation depend on age, risk, symptoms, and test results.

CRE

Enterobacterales bacteria resistant to carbapenem antibiotics, important medicines for serious infections. They may colonize without illness or cause difficult-to-treat urinary, wound, abdominal, lung, or bloodstream infections.

C-Reactive Protein

A protein made by the liver that rises when there is inflammation or infection. It can help monitor inflammatory diseases and possible infection, but it does not identify the cause by itself. A high-sensitivity CRP test may be used with other information to assess heart-disease risk.

C-Reactive Protein Test

A blood test that measures C-reactive protein. The level may rise with inflammation or infection, but the test cannot identify the cause by itself; levels are considered with symptoms and other findings.

Cream

A spreadable semisolid preparation applied to the skin, often containing a medicine. Creams are usually less greasy than ointments and may be useful on moist or broad areas, but the correct product depends on the skin condition.

Creatine

A nitrogen-containing compound stored mainly in skeletal muscle that helps supply energy for short, high-intensity activity.

Creatine Kinase

An enzyme found mainly in muscle and released into blood when muscle cells are damaged. Levels may rise after strenuous exercise, injury, seizures, muscle disease, or some medicines; other tests help identify the source.

Creatine Kinase Test

A blood test measuring creatine kinase, an enzyme released into circulation following injury to muscle tissues, the myocardium, or the brain; see *Creatine Kinase*.

Creatine Phosphokinase Test

A blood test measuring creatine kinase, an enzyme released with muscle injury; elevated levels may occur in skeletal-muscle disease, strenuous exercise, rhabdomyolysis, or myocardial injury.

Creating A Family Health History

Collecting a record of relatives' diseases, ages at diagnosis, ancestry, and causes of death to identify inherited risk and guide screening, prevention, and genetic counseling.

Creatinine

A breakdown product of muscle creatine phosphate produced at a constant rate, filtered by the glomerulus and minimally reabsorbed; serum creatinine is the most used marker of kidney function.

Creatinine Blood Test

A blood test measuring serum creatinine, a waste product generated largely by skeletal muscle. It is used with age, body size, and other factors to estimate kidney filtration, but interpretation is affected by muscle mass, diet, medicines, and acute illness.

Creatinine Clearance Test

A test estimating kidney filtration from creatinine in a timed urine collection and blood sample. It can be affected by incomplete urine collection and creatinine secretion, so estimated glomerular filtration rate is often preferred for routine assessment.

Creatinine Test

A blood or urine test measuring creatinine to help assess kidney filtration and muscle-related creatinine production.

Alternate Names:
Creatinine Measurement; Renal Function Creatinine Test

Creatinine Urine Test

A urine test measuring creatinine concentration or excretion, used to assess kidney handling, interpret other urine measurements, or judge the completeness of a timed collection. Results depend on muscle mass, diet, collection quality, and kidney function.

Creeping Eruption

An intensely itchy winding skin track caused by larvae, usually hookworms from contaminated soil or sand, migrating within the superficial skin.

Alternate Names:
Cutaneous Larva Migrans

CRE Infection

An infection caused by carbapenem-resistant Enterobacterales, bacteria resistant to carbapenem antibiotics. Infection may involve the urinary tract, blood, abdomen, wounds, or lungs. Detection of CRE without attributable illness is colonization, not infection.

Cremasteric Reflex

A superficial neurological reflex elicited by lightly stroking or scratching the superior and medial aspect of the inner thigh, causing prompt contraction of the cremaster muscle and upward retraction of the ipsilateral testis, mediated through spinal cord segments L1 and L2 via the genitofemoral and ilioinguinal nerves.

Alternate Names:
Cremaster Reflex; Genitofemoral Reflex

Crepitation

Alternate name; see *Crepitus*.

Crepitus

A crackling, grating, or popping sensation or sound caused by movement of tissue, bone, joint surfaces, or air in soft tissue.

Alternate Names:
Crackling Sensation

Crescentic Glomerulonephritis

A rapidly worsening inflammation of the kidney's

filtering units. It can cause blood or protein in urine, swelling, high blood pressure, and kidney failure.

CREST Syndrome

A limited cutaneous form of systemic sclerosis named for Calcinosis, Raynaud phenomenon, Esophageal dysfunction, Sclerodactyly, and Telangiectasia. It may also affect the lungs, heart, kidneys, or digestive tract; monitoring for pulmonary hypertension and other organ involvement is important.

Creutzfeld-Jakob Disease

Alternate spelling; see *Creutzfeldt-Jakob Disease*.

Creutzfeldt Jakob Disease

Alternate spelling; see *Creutzfeldt-Jakob Disease*.

Creutzfeldt-Jakob Disease

A rare brain disease caused by abnormal proteins called prions that damage brain cells. It usually worsens quickly and can affect memory, thinking, movement, balance, and coordination. It is fatal. It causes worsening cognitive impairment and may produce myoclonus, ataxia, visual changes, or other neurologic signs. Most cases are sporadic; others are genetic or rarely acquired. Variant CJD, linked to bovine spongiform encephalopathy, is a distinct form.

CRIA Syndrome

A rare inherited inflammatory disorder caused by a change in the RIPK1 gene. Repeated attacks of fever, swollen lymph nodes, muscle or joint pain, and inflammation often begin during childhood.

Crib Death

Alternate name; see *Sudden Infant Death Syndrome*.

Cribriform

Having multiple small openings in a sieve-like arrangement. In pathology, the term describes a tissue or tumour growth pattern; its significance depends on the organ and tumour type.

Cribriform Carcinoma

A carcinoma with a sieve-like microscopic growth pattern. The term may describe several tumors, including adenoid cystic carcinoma or cribriform breast carcinoma, so the organ of origin and pathology report determine its meaning.

Cribriform Plate

The horizontal, sieve-like bony lamina of the ethmoid bone situated in the floor of the anterior cranial fossa, perforated by numerous small foramina transmitting the olfactory nerve (CN I) fascicles from the nasal olfactory mucosa into the anterior cranial cavity.

Cricoid Cartilage

A complete ring of firm tissue at the lower part of the voice box, just above the windpipe. It supports the airway and connects with other structures involved in breathing and voice.

Cricoid Pressure

Pressure applied to the cricoid cartilage during some emergency airway procedures. Its use is intended to reduce stomach contents entering the airway, but it can make ventilation or intubation more difficult and is clinician-dependent.

Cricothyroid Membrane

A tough fibroelastic ligament located in the anterior neck between the inferior border of the thyroid cartilage and the superior border of the cricoid cartilage; the target anatomical landmark for emergency airway cricothyroidotomy.

Alternate Names:
Cricothyroid Ligament; Conus Elasticus

Cricothyroidotomy

An emergency surgical airway procedure in which an incisional opening is made through the skin and cricothyroid membrane to introduce an endotracheal or tracheostomy tube, indicated in catastrophic "cannot intubate, cannot ventilate" scenarios.

Alternate Names:
Cricothyroidectomy; Emergency Surgical Airway

Cricothyrotomy

An emergency operation creating an opening through the front of the neck into the airway when a person cannot be intubated or oxygenated by other means. It provides temporary access for breathing and has serious risks.

Cri Du Chat Syndrome

Alternate spelling; see *Cri-Du-Chat Syndrome*.

Cri-Du-Chat Syndrome

A chromosomal condition caused by deletion of part of the short arm of chromosome 5 (5p-). The size of the deletion varies and contributes to the range of features. Infants often have a high-pitched, cat-like cry, low muscle tone, low birth weight, and a small head; affected people may have distinctive facial features, intellectual disability, and developmental delay. Some have congenital heart defects. Most cases arise spontaneously; a minority result from an inherited chromosome rearrangement.

Alternate Names:
Cat Cry Syndrome; 5p Deletion Syndrome; 5p- Syndrome; Monosomy 5p; Chromosome 5p Deletion Syndrome

Crigler-Najjar Syndrome

A rare inherited disorder in which the liver cannot properly process bilirubin. It causes persistent yellowing of the skin and eyes; severe forms can damage the brain unless treated urgently.

Crimean-Congo Hemorrhagic Fever

A serious viral illness usually spread by infected ticks or contact with infected animal blood. It can also spread through the blood or body fluids of an infected person. Symptoms may include sudden fever, headache, muscle pain, vomiting, or diarrhea. Severe illness can cause bleeding, organ failure, or shock.

Crime Scene Investigation

The systematic documentation, collection, preservation, and analysis of physical evidence from a suspected crime scene, often supporting forensic medical and legal conclusions.

Criminal Abortion

Abortion performed illegally, outside permitted legal indications and procedures (e.g., unsafe methods, unqualified practitioners, or non-medical settings), carrying high maternal risk.

CRISPR

A gene-editing method that uses a guide molecule and an enzyme to find and change a chosen DNA sequence. It is used in research and some treatments but can make unintended changes and requires careful monitoring.

CRISPR-Cas9

A laboratory gene-editing tool that uses a guide molecule to direct an enzyme to a chosen DNA sequence. The enzyme cuts the DNA so the cell can remove, disable, or replace genetic material.

CRISPR Therapy

A treatment that uses CRISPR-based genome-editing tools to make a targeted change to DNA in a patient's cells. Cells may be edited outside the body and returned to the patient, or edited directly inside the body. It is used or studied for selected genetic and other diseases; possible concerns include unintended genetic changes, immune reactions, and effects that require long-term monitoring.

Crisscross Heart

A rare congenital heart malformation in which the inflow streams to the right and left ventricles cross because the ventricular mass is abnormally rotated around its long axis. The atrioventricular connections themselves may be structurally normal, but other heart defects can coexist. Echocardiography and other cardiac imaging define the anatomy and its relationship to the other cardiac abnormalities.

Crista Galli

A vertical, crest-like bony projection of the ethmoid bone rising upward from the cribriform plate into the anterior cranial fossa, serving as the anterior intracranial attachment site for the falx cerebri.

Critical Care

Specialized care for people with life-threatening illness or injury who need close monitoring and support for failing organs.

Critical Care Nursing

Specialized nursing care for critically ill patients requiring close monitoring, organ support, rapid assessment, complex therapies, and coordination with multidisciplinary intensive-care teams.

Critical Findings

Test or examination findings that may indicate a life-threatening problem. Examples include a collapsed lung, brain pressure, or a tear in the aorta.

Critical Illness Myopathy

A muscle weakness disorder that develops during severe illness, especially sepsis, organ failure, prolonged intensive-care treatment, or use of certain medicines. It can affect arms, legs, and breathing muscles, making movement and removal from a ventilator difficult. Rehabilitation supports recovery.

Alternate Names:
CIM; Acute Quadriplegic Myopathy; Critical Care Myopathy

Critical Illness Polyneuropathy

Damage to many peripheral nerves that can develop during severe critical illness, especially sepsis or multiorgan failure. It causes weakness, reduced reflexes, and difficulty coming off a ventilator and may occur together with critical illness myopathy.

Critical Illness-Related Corticosteroid Insufficiency

Inadequate corticosteroid activity during critical illness, caused by impaired adrenal production, altered hormone metabolism, or reduced tissue response. It may contribute to low blood pressure, shock, inflammation, or poor response to usual supportive care.

Critical Limb Ischemia

Older term; see *Chronic Limb-Threatening Ischemia*.

Critical Results

Test findings suggesting a potentially life-threatening problem that are communicated promptly to the responsible healthcare team.

Critical Value

A laboratory result indicating a potentially life-threatening condition that requires communication to a responsible clinician or care team. The threshold is test- and laboratory-specific and defined by institutional policy.

Crohn Disease

Alternate spelling; see *Crohn's Disease*.

Crohn Disease Cobblestoning

A bumpy appearance of the bowel lining seen during an internal examination in some people with Crohn disease. Deep ulcers surround areas of less-inflamed tissue, creating a pattern resembling cobblestones.

Crohn Disease Pathology

Patchy, chronic, often transmural intestinal inflammation with architectural distortion, fissures, creeping fat, and possible noncaseating granulomas. The disease may involve any part of the gastrointestinal tract and commonly produces skip lesions.

Crohn Ileitis

Crohn disease involving the ileum, the final part of the small intestine, causing chronic or relapsing inflammation that may produce abdominal pain, diarrhea, weight loss, strictures, or fistulas.

Crohn Ileocolitis

Crohn disease affecting both the ileum and colon, causing patchy chronic inflammation that may lead to abdominal pain, diarrhea, weight loss, strictures, fistulas, or perianal disease.

Crohn's Disease

A chronic inflammatory bowel disease that causes ongoing inflammation deep in the digestive tract

lining. It can affect any part of the digestive system from the mouth to the anus, but most commonly involves the lower part of the small intestine (ileum) and the colon. The inflammation often penetrates all layers of the bowel wall in scattered patches ('skip lesions'), causing abdominal pain, persistent diarrhea, cramping, weight loss, and potentially narrowing the bowel or creating abnormal tunnels called fistulas.

Alternate Names:
Regional Enteritis; Granulomatous Enteritis; Crohn's; Crohn Disease

Cronkhite-Canada Syndrome

A rare, non-familial gastrointestinal polyposis syndrome characterized by multiple juvenile-like hamartomatous polyps throughout the stomach, small bowel, and colon, accompanied by distinctive ectodermal changes including generalized alopecia, cutaneous hyperpigmentation, and dystrophic onycholysis.

Alternate Names:
CCS; Gastrointestinal Polyposis with Ectodermal Changes

Crossed Extensor Reflex

A contralateral polysynaptic spinal reflex in which noxious or painful stimulation causing flexion and withdrawal of an injured limb simultaneously triggers contraction of extensor muscles and inhibition of flexor muscles in the opposite limb to maintain upright balance and posture.

Alternate Names:
Crossed Extension Reflex; Contralateral Extensor Reflex

Cross-Eyes (Strabismus)

Misalignment of the eyes so they do not point in the same direction. Persistent strabismus in a child can impair visual development and cause amblyopia; sudden adult onset may indicate neurologic or ocular disease.

Crossmatch

Laboratory test mixing donor and recipient blood to detect preformed antibodies that could cause transfusion or transplant reactions.

Cross-Matching

Laboratory testing that checks whether donor blood is compatible with a recipient before transfusion. It helps prevent dangerous immune reactions by detecting antibodies that could attack transfused red cells.

Cross-Section

A slice or plane made through a structure, or an image showing that slice, such as a cross-sectional CT image.

Cross-Sectional Study

A study that measures possible causes and health outcomes at one point in time. It can show how common a condition is and whether factors are linked, but it usually cannot show which came first or prove cause and effect.

Cross-Tolerance

Reduced response to one substance because the body has adapted to another substance with a similar effect. It can increase overdose risk when a person changes substances or combines them.

Crosti-Gianotti Syndrome

A self-limited papular rash of childhood, also called papular acrodermatitis of childhood. It may follow viral infection or vaccination and causes symmetric papules on the face, buttocks, and limbs, usually resolving over weeks.

Crotch

The region where the inner thighs meet the trunk, including the groin and nearby perineal structures.

Croup

A usually viral illness in babies and young children that swells the voice box and windpipe. The swelling can narrow the airway, causing a barking cough, a hoarse voice, and sometimes a harsh, high-pitched sound when breathing in.

Alternate Names:

Acute Laryngotracheitis

Crouzon Syndrome

A craniosynostosis syndrome, usually caused by a pathogenic *FGFR2* variant, in which skull sutures fuse too early. It changes the shape of the skull and face and may cause shallow eye sockets, vision problems, airway obstruction, dental abnormalities, hearing loss, or raised pressure around the brain.

Crowe Sign

Small freckles in the armpits or groin. They are one finding that can support neurofibromatosis type 1, but they are not enough to make the diagnosis alone.

Alternate Names:
Crowe's Sign; Axillary Freckling Sign

Crow-Fukase Syndrome

Another name for POEMS syndrome, a rare plasma-cell disorder associated with polyneuropathy, organ enlargement, endocrinopathy, monoclonal protein, and characteristic skin changes.

Crown

The visible part of a tooth above the gum line, or a dental restoration that covers and protects a damaged tooth.

Alternate Names:
Dental Crown; Anatomic Tooth Crown

Crowning

The stage of childbirth when the baby's head remains visible at the vaginal opening between contractions because it has stretched the surrounding tissues. It occurs shortly before the head is born.

Crown Lengthening

A dental procedure that removes or reshapes gum tissue, and sometimes a small amount of bone, to expose more tooth. It may allow a damaged tooth to be restored or change a gummy smile.

Crown-Rump Length

The ultrasound measurement from the top of an embryo's head to its bottom. It is the most accurate way to estimate pregnancy age during early pregnancy and helps monitor early growth.

CRP

C-reactive protein, a substance made by the liver that rises during inflammation or infection. A CRP test can help assess inflammation and response to treatment, but it does not identify the cause by itself.

Cruciate Ligament

One of two strong bands crossing inside the knee that stabilize forward, backward, and twisting movement. The anterior cruciate ligament is commonly torn during sports or a sudden change in direction.

Crushing Injury

Damage caused when a body part is compressed between heavy objects. It can produce fractures, nerve and blood-vessel injury, tissue death, and rhabdomyolysis. Severe limb compression or sudden release after prolonged entrapment requires emergency treatment.

Crush Injury

Damage caused when a body part is squeezed or trapped under pressure. It can cause broken bones, muscle death, nerve and vessel injury, dangerous chemical changes in blood, shock, or kidney failure.

Crush Syndrome

A life-threatening illness after prolonged muscle compression, often when someone is trapped. Damaged muscle releases substances that can cause shock, dangerous heart rhythms, and sudden kidney failure, especially after pressure is removed.

Crust

Dried serum, blood, pus, or other exudate on the skin surface, often covering an erosion, ulcer, vesicle, pustule, or inflamed lesion.

Crusted Scabies

A severe form of scabies causing thick crusts full

of very large numbers of mites. It is extremely contagious and occurs mainly in people with weakened immunity, older adults, or people with reduced sensation.

Cruveilhier-Baumgarten Sign

A continuous epigastric or periumbilical vascular venous hum and palpable thrill resulting from turbulent collaterals in recanalized umbilical or paraumbilical veins in patients with severe portal hypertension and cirrhosis.

Alternate Names:
Cruveilhier-Baumgarten Murmur; Cruveilhier-Baumgarten Syndrome

Cry For Help

A verbal or behavioral expression of distress or need for assistance; in a mental-health setting it may reflect immediate safety concerns.

Crying In Childhood

Vocal expression of distress or emotion in a child; persistent, inconsolable, unusual, or pain-associated crying may indicate illness, injury, abuse, or unmet developmental needs.

Crying In Infancy

Crying is an infant's normal communication of hunger, discomfort, fatigue, or need for contact; sudden inconsolable crying with lethargy, fever, vomiting, or injury may indicate illness or injury.

Cryoablation

A treatment that uses controlled freezing to destroy selected abnormal tissue, such as a tumor or abnormal heart pathway. Imaging or specialized equipment guides the treatment, which may cause bleeding, injury, or recurrence.

Cryobiopsy

A biopsy method that uses a freezing instrument to remove a larger tissue sample, often from the lung. It can improve diagnosis in selected cases but carries risks such as bleeding and a collapsed lung.

Cryoglobulinemia

A condition in which abnormal blood proteins thicken or clump when cold. They can inflame small blood vessels and cause purplish skin spots, joint pain, nerve problems, kidney injury, or poor circulation.

Cryoglobulinemic Vasculitis

Inflammation and injury of small blood vessels caused by abnormal blood proteins that become active in the cold. It may cause purple spots, joint pain, nerve problems, kidney disease, or poor circulation.

Cryoglobulins

Immunoglobulins that precipitate at low temperatures and dissolve on warming; circulating cryoglobulins can cause vasculitis, purpura, neuropathy, kidney disease, or hyperviscosity.

Cryopexy

A procedure that uses controlled freezing to destroy or seal abnormal tissue, especially retinal breaks or small retinal detachments.

Cryoprecipitate

A blood-product concentrate containing mainly fibrinogen and some clotting proteins. It is given in selected serious bleeding disorders when a person's fibrinogen level is too low.

Cryopreservation

Preserving cells, tissues, sperm, eggs, or embryos by cooling them to very low temperatures with protective chemicals. The material can later be thawed for treatment, research, or reproduction.

Cryopyrin-Associated Autoinflammatory Syndromes

Alternate index label; see *Cryopyrin-Associated Periodic Syndromes*; the group is also called CAPS.

Cryopyrin-Associated Periodic Syndromes

A group of inherited inflammatory disorders causing

repeated fever, rash, joint symptoms, eye inflammation, or hearing loss because immune activity is overactive.

Cryostat

An instrument that maintains very low temperatures and cuts thin frozen sections of tissue for rapid microscopic examination.

Cryosurgery

Surgery that destroys abnormal tissue by controlled freezing, used in selected skin lesions, tumors, and other conditions.

Cryotherapy

Treatment using controlled cold to destroy or reduce abnormal tissue. It may treat selected skin lesions, tumors, eye problems, or prostate disease; pain, blistering, scarring, and damage to nearby tissue are possible.

Cryotherapy For Prostate Cancer

A treatment that destroys prostate tissue by repeated freezing and thawing, used selectively for localized or recurrent prostate cancer.

Cryotherapy For The Skin

Destruction of selected skin lesions by controlled freezing, usually with liquid nitrogen, for conditions such as warts, actinic keratoses, or some superficial tumors.

Crypt

A small cavity, gland, or recessed space in body tissue, such as an intestinal crypt or tonsillar crypt.

Cryptitis

Inflammation of a small gland or recessed space in body tissue, most often the tiny glands and spaces lining the anal canal. It may cause pain, bleeding, or discharge.

Crypto

Informal shorthand that can mean cryptococcosis, a fungal infection caused by *Cryptococcus*, or cryptosporidiosis, an intestinal infection caused by *Cryptosporidium*. The two infections are unrelated, so the shorthand is ambiguous.

Cryptococcal Infection

Alternate name; see *Cryptococcosis*.

Cryptococcal Meningitis

A fungal infection of the coverings and fluid around the brain, usually in people with weakened immunity. It often develops gradually with headache, fever, nausea, confusion, vision changes, or unusual sleepiness.

Alternate Names:
Cryptococcic Meningitis

Cryptococcic Meningitis

Meningitis caused by *Cryptococcus* fungi, especially in people with advanced HIV or other immune suppression. Headache, fever, confusion, nausea, and visual symptoms may develop gradually.

Cryptococcosis

Cryptococcosis is fungal infection caused by Cryptococcus, often affecting the lungs or brain in people with immune suppression.

Alternate Names:
Torulosis

Cryptococcus Neoformans

A yeast found in soil and bird droppings that can cause lung or brain infection after it is inhaled. Serious disease is most likely in people with weakened immunity and may require prolonged antifungal treatment.

Cryptogenic Organizing Pneumonia

Organizing pneumonia with no identified cause. Small plugs of healing tissue block air sacs and nearby airways, causing cough, fever, or shortness of breath. It is one form of organizing pneumonia, which can also occur after infection or with medicines and immune diseases.

Cryptomenorrhea

Menstrual bleeding that occurs but cannot leave the body because a blockage prevents flow through the vagina. It may cause monthly pelvic pain and a buildup of menstrual blood.

Cryptorchid

Describing a testis that has not descended into the scrotum. See also: *Cryptorchidism*.

Cryptorchidism

One or both testicles fail to move into or remain in the scrotum, the pouch of skin below the penis. Some move down on their own in early infancy; others remain in the groin or abdomen, or move back up after descending. The condition can reduce fertility and raises the risk of testicular cancer. Surgery to move a testicle into the scrotum is called orchiopexy and may reduce some risks.

Alternate Names:
Cryptorchism; Maldescended Testis

Cryptosporidiosis

An intestinal infection caused by microscopic Cryptosporidium parasites. It spreads when contaminated water, food, surfaces, or material from infected people or animals is swallowed. It may cause watery diarrhea, stomach cramps, nausea, and loss of fluids. Some people have no symptoms, while illness may be prolonged or severe in people with weakened immune systems.

Cryptosporidium Enteritis

Diarrheal intestinal infection caused by Cryptosporidium parasites, transmitted through contaminated water, food, or contact; illness can be prolonged or severe in immunocompromised people.

Crystal Arthropathy

Joint inflammation caused by crystals collecting in or around a joint. Uric-acid crystals cause gout, while calcium-pyrophosphate crystals cause pseudogout; sudden pain, swelling, warmth, and redness are common, and joint-fluid testing can confirm the cause.

Crystal-Induced Synovitis

Acute or chronic joint inflammation caused by deposition of crystals such as monosodium urate, calcium pyrophosphate, or basic calcium phosphate in or around the joint.

Crystalline Lens

The clear, flexible structure inside the eye that focuses light onto the retina. It changes shape for near vision and becomes cloudy in cataracts, causing blurred or reduced vision.

Crystalloids

Sterile fluids containing water and small dissolved substances such as salts or sugar. They can be given through a vein to replace lost fluid, but the choice and amount depend on the person's condition.

Crystalluria

The presence of crystals in urine, which may reflect precipitation of salts, medication effects, metabolic disease, or a tendency to form urinary stones.

C-Section

Alternate index label; see *Cesarean Section*.

CSF Analysis

Alternate name; see *Cerebrospinal Fluid Analysis*.

CSF Cell Count

Laboratory measurement of red and white blood cells in cerebrospinal fluid, used to evaluate meningitis, encephalitis, subarachnoid hemorrhage, inflammation, malignancy, and other central nervous system disorders.

CSF Coccidioides Complement Fixation Test

A cerebrospinal-fluid test for complement-fixing antibodies to Coccidioides, used with other findings to evaluate suspected coccidioidal meningitis.

CSF Glucose Test

A laboratory measurement of glucose in cerebrospinal fluid, usually interpreted with a simulta-

neous blood-glucose value. Low cerebrospinal-fluid glucose may occur in bacterial, fungal, or tuberculous meningitis and other disorders, but results require the complete clinical and cerebrospinal-fluid profile.

CSF Leak

Escape of cerebrospinal fluid through a defect in the skull base or spinal dura, causing positional headache, clear nasal or ear drainage, wound leakage, meningitis risk, or intracranial hypotension.

CSF Myelin Basic Protein

A test measuring a protein released when the insulating covering of nerve fibers is damaged. An increased level may support evaluation of multiple sclerosis or other nervous-system injury but is not specific by itself.

CSF Oligoclonal Banding

A laboratory test looking for immune-protein bands in the fluid around the brain and spinal cord and comparing them with blood. The pattern may support multiple sclerosis or another inflammatory nervous-system disorder but is not diagnostic by itself.

CSF Rhinorrhea

Leakage of the fluid surrounding the brain and spinal cord through a skull-base defect into the nose. It may cause a persistent clear, watery drip, often worse when bending forward, and can increase the risk of meningitis.

CSF Smear

Microscopic examination of cerebrospinal fluid for cells, organisms, or abnormal material, supporting evaluation of meningitis, hemorrhage, malignancy, or inflammation.

CSF Total Protein

A measurement of protein in cerebrospinal fluid, usually obtained by lumbar puncture. High or low levels may support evaluation of infection, bleeding, inflammation, nerve disorders, or other brain and spinal-cord disease.

CSF-VDRL Test

A test of the fluid around the brain and spinal cord for antibodies associated with syphilis. A positive result strongly supports neurosyphilis, but a negative result does not completely exclude it; symptoms and other tests contribute to interpretation.

CT

Computed tomography, an imaging method that uses multiple X-ray measurements and computer reconstruction to produce cross-sectional images.

Alternate Names:
Computed Tomography

CT Angiography

A CT scan performed after injected contrast highlights blood vessels. It can show narrowing, blockage, aneurysm, dissection, bleeding, or abnormal vessel connections in areas such as the brain, heart, chest, abdomen, or limbs.

CT Angiography – Chest

Computed tomography angiography of the chest uses intravenous contrast and computed tomography to visualize the thoracic aorta, pulmonary arteries, or other chest vessels. It can evaluate embolism, aneurysm, dissection, bleeding, and vascular malformation.

CT Angiography of Abdomen and Pelvis

High-resolution contrast-enhanced computed tomography optimized for vascular visualization of the abdominal aorta, visceral branches, renal arteries, and iliac vessels to diagnose aneurysms, dissections, mesenteric ischemia, and hemorrhage.

Alternate Names:
CTA Abdomen and Pelvis; Abdominal CT Angiography; Mesenteric CTA

CT Angiography of Head and Neck

Rapid contrast-enhanced computed tomographic angiography evaluating the extracranial carotid/vertebral arteries and intracranial cerebral arterial circulation in acute ischemic stroke, intracranial aneurysms, and vascular dissections.

Alternate Names:
CTA Head and Neck; Carotid CTA; Cerebral CT Angiography; Intracranial CTA

CT Angiography of the Extremities

Non-invasive contrast-enhanced computed tomographic imaging of upper or lower extremity arterial vasculature to assess peripheral arterial disease, traumatic vascular disruption, arterial emboli, or bypass graft patency.

Alternate Names:
CTA Extremities; Peripheral CTA; Runoff CTA; Lower Extremity CTA

CT Chest

A CT scan of the chest that shows the lungs, heart, blood vessels, mediastinum, pleura, ribs, and chest wall. It can evaluate infection, tumors, injury, fluid, blood clots, and other abnormalities.

CT Colonography

A CT scan of the colon after bowel cleansing and gentle inflation with air or carbon dioxide. It can look for polyps or cancer when colonoscopy is incomplete or unsuitable, but an abnormal result usually requires colonoscopy for tissue removal or biopsy.

Alternate Names:
Virtual Colonoscopy

CT Contrast

A substance administered during computed tomography to make selected tissues, vessels, or body spaces more visible.

CT Coronary Angiography

A CT scan taken after injected contrast outlines the arteries supplying the heart. It can show plaque or narrowing and is a non-invasive option for selected people with possible coronary artery disease.

CTD-Associated Interstitial Lung Disease

Interstitial lung disease occurring with autoimmune connective-tissue disease such as systemic sclerosis, rheumatoid arthritis, myositis, or Sjögren disease. Symptoms, lung function, high-resolution CT, antibodies, and disease activity guide monitoring and immunomodulatory or antifibrotic treatment.

CT Dose-Length Product

A measure of the radiation output from a CT scan that combines the scan settings with the length of the body examined. It helps imaging teams compare and improve protocols but does not directly predict one person's cancer risk.

Ctenocephalides Flea Bite

Alternate name; see *Flea Bites In Humans*.

CT Enterography

A CT scan of the small intestine after drinking contrast to expand the bowel and receiving injected contrast. It helps evaluate Crohn disease, inflammation, tumors, obstruction, and unexplained intestinal bleeding.

CTL

Cytotoxic T lymphocyte, an immune cell that recognizes and kills infected, abnormal, or target cells through antigen-specific mechanisms.

CTLA-4

A protein on some immune cells that acts as a brake on T-cell activity. Blocking this brake can strengthen an immune attack against cancer but may also cause inflammation in healthy organs.

CTPA

Alternate name; see *Computed Tomography Pulmonary Angiography*.

CT Perfusion

A CT technique that estimates blood flow and related perfusion parameters in tissue, commonly to assess selected cases of acute stroke or tumors.

CT Pulmonary Angiography

CT imaging performed after intravenous contrast to show the pulmonary arteries and evaluate suspected pulmonary embolism or other vascular abnormalities.

CTS

Commonly, carpal tunnel syndrome: compression of the median nerve at the wrist causing numbness, tingling, pain, or weakness in the hand.

CT Scan

An imaging test that uses rotating X-rays and a computer to create detailed cross-sectional pictures (slices) of the body. By taking pictures from multiple angles, it provides far more detail than a standard flat X-ray, quickly showing bones, internal bleeding, blood clots, organ injuries, and tumors. Scans can be done plain or with a contrast dye swallowed or injected into a vein to highlight blood vessels and internal organs.

Alternate Names:
Computed Tomography

Cubital

Relating to the elbow or nearby forearm. Cubital structures include the joint, bones, muscles, nerves, and blood vessels, and problems there may cause pain, restricted movement, numbness, or weakness.

Cubital Tunnel Syndrome

Pressure or stretching of the ulnar nerve at the elbow, causing tingling or numbness in the little and ring fingers, hand weakness, or pain. Symptoms often worsen when the elbow stays bent.

Cubitus

The elbow or the forearm; the term is also used in names of structures and conditions around the elbow.

Cubitus Valgus

An outward angle of the forearm at the elbow that is larger than usual when the arm is straight. It may be present from birth or develop after an elbow injury. In some people, it can put pressure on the ulnar nerve and cause tingling, numbness, or weakness in the ring and little fingers.

Cubitus Varus

An abnormal inward angulation of the forearm relative to the upper arm when the elbow is extended, often developing after a childhood elbow fracture.

Cuboid

A cube-shaped bone on the outer side of the midfoot. It helps form the foot arch and connects several foot bones; injury or displacement can cause outer-foot pain, especially during walking.

Cul-De-Sac

A space or pouch that ends without an opening on the other side. In the pelvis, it may refer to the space behind the uterus or between the bladder and rectum.

Culdocentesis

A procedure that places a needle through the back of the vagina to sample or drain fluid from the lowest part of the pelvis. Ultrasound and less-invasive tests have replaced it in many situations.

Cullen Sign

Bluish bruising in the skin around the belly button, which suggests bleeding inside the abdomen or severe inflammation of the pancreas.

Cullen's Sign

Blue or purple discoloration around the navel caused by blood leaking into tissues inside the abdomen and tracking to the skin. It can signal serious internal bleeding, including bleeding from severe pancreatitis or pregnancy-related emergencies.

Cultural Psychiatry

The study and clinical practice of how cultural factors influence mental health, illness expression, diagnosis, and treatment. Cultural concepts of distress, idioms of distress, and cultural syndromes must be considered. The DSM-5 includes a Cultural Formulation Interview.

Culture

A laboratory test in which a clinical specimen is placed in conditions that allow microorganisms to grow and be identified; susceptibility testing may

help guide treatment.

Culture And Sensitivity

A laboratory test that grows microorganisms from a sample and checks which medicines can stop them. It helps identify the cause of an infection and select effective treatment.

Culture Media

Nutrient materials prepared to grow microorganisms in a laboratory, with different formulas chosen for specific organisms, tests, or identification purposes.

Culture-Negative Endocarditis

Infective endocarditis in which routine blood cultures do not identify an organism, often because of prior antibiotics, fastidious bacteria, fungi, or noninfectious mimics; diagnosis requires integrated clinical, imaging, and laboratory assessment.

Culture Swab

A sterile swab used to collect material from skin, wounds, the throat, genital tract, or another site for laboratory culture. The test may identify bacteria or fungi and guide antibiotic choice; viral testing usually uses separate molecular or antigen tests.

Cumulative Dose

The total amount of a substance or radiation received over time. Cumulative exposure matters for medicines, toxins, radiation, carcinogens, and pregnancy-related risks because effects may build gradually.

Cumulative Trauma Disorder

Pain or injury that develops after repeated forceful, awkward, or prolonged movements. It may affect muscles, tendons, nerves, or other soft tissues in the hands, arms, neck, shoulders, or back.

Cupping

Enlargement or deepening of the central depression in the optic disc, assessed during glaucoma evaluation and interpreted with eye pressure and other findings.

Alternate Names:
Optic-Disc Cupping; Glaucomatous Cupping

Cupping Therapy

A complementary practice that places cups on the skin to create suction, sometimes after small skin cuts. It may leave bruises or marks and can cause burns, infection, or blood loss; evidence of benefit varies by condition.

Cup-To-Disc Ratio

A comparison between the central hollow of the optic nerve and the whole visible optic nerve head. An enlarged or changing ratio may suggest glaucoma; eye pressure and other findings affect its significance.

CURB-65 Score

A five-point tool estimating the severity of community-acquired pneumonia using confusion, blood urea, breathing rate, blood pressure, and age 65 or older. It helps guide hospital decisions but does not replace clinical judgment.

Curcumin

A yellow compound in turmeric that has anti-inflammatory effects in laboratory studies. Evidence that supplements treat disease is limited or variable, and concentrated products can interact with medicines or cause stomach or liver problems.

Cure

Complete elimination or permanent resolution of a disease. The meaning of cure varies by condition; remission or no detectable disease does not always mean that a disease has been cured.

Curettage

Removal or sampling of tissue by scraping with a curette, a spoon-shaped or ring-shaped instrument. It is used in procedures involving the uterus, skin lesions, bone lesions, and gum pockets.

Curettage Specimen

Tissue scraped or scooped from a body surface, cavity, or bone lesion for laboratory examination.

Because the pieces are often small and fragmented, they may not show the full structure or depth of disease.

Curette

A spoon-shaped or ring-shaped surgical instrument used to scrape, remove, or clean tissue from a cavity, bone, skin lesion, or tooth-supporting area. Its use and risks depend on the procedure and body site.

Curie

A unit of radioactivity equal to 3.7 billion nuclear disintegrations per second; the SI unit is the becquerel.

Curling's Ulcer

An acute peptic ulcer associated with severe burns, often occurring in the duodenum or stomach during physiologic stress.

Curling Ulcer

An acute ulcer in the stomach or duodenum that can develop after severe burns. Reduced blood flow and major physical stress weaken the digestive lining and may cause dangerous bleeding.

Currant Jelly Sputum

A distinctive thick, viscous, dark-red, blood-tinged mucoid sputum characteristic of acute destructive lobar pneumonia caused by Klebsiella pneumoniae, produced by extensive alveolar necrosis, hemorrhage, and abundant capsular polysaccharide secretion.

Alternate Names:
Klebsiella Sputum; Red Currant Jelly Sputum

Curschmann Spirals

Microscopic corkscrew-shaped casts of condensed mucus and desquamated bronchial epithelial cells found in sputum or bronchoalveolar lavage fluid, representing plugs formed in small distal bronchioles in patients with bronchial asthma and chronic bronchitis.

Alternate Names:
Curschmann's Spirals; Bronchial Mucus Casts

Curvature Of The Penis

A bend of the erect or flaccid penis caused by congenital tissue asymmetry, scar tissue such as Peyronie disease, trauma, or other conditions; it may impair intercourse or cause pain.

Alternate Names:
Penile Curvature

Curvature of the Spine (Scoliosis)

Abnormal sideways curvature and rotation of the spine. It may be idiopathic, congenital, neuromuscular, or degenerative and can cause asymmetry, pain, reduced function, or impaired breathing when severe.

Curvularia Alcornii

A dark-pigmented environmental fungus that rarely causes infection. It may affect the skin, sinuses, or brain, mainly in people with weakened immunity, and requires specialist laboratory identification and treatment.

Cushing Disease

Cushing syndrome caused by an adrenocorticotropic hormone-secreting pituitary tumor. Excess cortisol can cause central weight gain, rounded facial features, skin changes, muscle weakness, high blood pressure, high blood glucose, and menstrual or mood changes.

Cushingoid

Resembling the physical features of excess glucocorticoid exposure, such as a round face, central weight gain, thin skin, easy bruising, and muscle weakness.

Cushing's Disease

A pituitary tumor that makes too much adrenocorticotropic hormone (ACTH), causing the adrenal glands to produce too much cortisol. Features may include weight gain around the trunk, a round face, easy bruising, purple stretch marks, muscle weakness, high blood pressure, high blood glucose, and menstrual or mood changes.

Cushing Syndrome

A hormonal disorder caused by prolonged, abnormally high levels of cortisol (the body's primary stress hormone) in the bloodstream. It most commonly results from long-term use of oral steroid medications, or less commonly from a tumor in the pituitary or adrenal glands that produces excess hormones. Classic signs include a round 'moon' face, a fatty hump between the shoulders, easy bruising, purple stretch marks on the abdomen, high blood pressure, and muscle weakness.

Alternate Names:
Cortisol Excess Syndrome; Cushing's Syndrome; Cushing's Syndrome

Cushing Syndrome Complications

Long-term excess cortisol can cause high blood pressure, diabetes, infections, blood clots, weak bones, muscle weakness, and heart or blood-vessel disease. Treating the cause and monitoring these problems can reduce complications.

Cushing Syndrome Due To Adrenal Tumor

Excess cortisol caused by an adrenal tumor, producing Cushing syndrome with features such as central weight gain, hypertension, diabetes, muscle weakness, and skin changes.

Cushing Triad

A classic constellation of physiological responses indicating life-threateningly elevated intracranial pressure and impending transtentorial or tonsillar brainstem herniation, consisting of systolic hypertension with widened pulse pressure, bradycardia, and irregular respirations.

Alternate Names:
Cushing's Triad; Cushing Reflex

Cushing Ulcer

An acute stomach or duodenal ulcer associated with severe brain disease, head injury, or neurosurgery. Excess nerve stimulation can increase acid production and cause abdominal pain or gastrointestinal bleeding.

Cusp

A pointed projection, such as a projection of a tooth or one of the leaflets of a heart valve.

Cusp Fracture

A break in one of the raised points of a tooth, often around a large filling or weakened tooth. It may cause pain when biting or sensitivity and may require a bonded repair, crown, or other dental treatment.

Cut

A break or incision made in tissue, usually by a sharp object; the depth, contamination, and location determine the required care.

Cutaneous

Relating to the skin. The skin forms a protective barrier, helps control temperature, senses touch and pain, and supports vitamin D production. Skin findings can provide clues to infections, immune diseases, hormone disorders, and skin cancers.

Cutaneous Abscess

A collection of pus in the skin or tissues beneath it, usually caused by bacterial infection. It may be painful, red, warm, and swollen; treatment commonly involves drainage and sometimes antibiotics.

Cutaneous and Oral Melanocytic Nevi

Usually benign moles composed of melanocytes in the skin or oral mucosa. Most remain stable; changes in size, colour, border, surface, or symptoms can occur with atypia or melanoma.

Cutaneous Angiosarcoma

A fast-growing cancer of blood-vessel cells in the skin, usually on the scalp or face of older adults. It may look like a bruise, ulcerate, and spread.

Cutaneous Anthrax

A skin infection caused by Bacillus anthracis, usually producing a painless black sore surrounded by swelling.

Cutaneous B-Cell Lymphoma

A group of non-Hodgkin lymphomas in which clonal B lymphocytes primarily involve the skin. Primary cutaneous follicle-centre and marginal-zone lymphomas often behave indolently, whereas diffuse large B-cell lymphoma, leg type, is more aggressive; biopsy, staging, and immunophenotyping guide treatment.

Cutaneous Bleeding

Leakage of blood into the skin or the tissue just beneath it. It may appear as tiny red or purple spots called petechiae, larger areas called purpura, or bruises called ecchymoses. Causes include injury, low platelet levels, clotting disorders, fragile blood vessels, and medicines such as anticoagulants.

Cutaneous Candidiasis

A Candida yeast infection of the skin, often affecting warm, moist folds such as the groin, armpits, or under the breasts. It causes red, itchy, moist plaques with small satellite spots; diabetes, antibiotics, occlusion, and immune suppression increase risk.

Cutaneous Diphtheria

A skin infection caused by Corynebacterium diphtheriae bacteria. It usually produces a long-lasting ulcer or sore that may have a gray membrane and can spread toxin or infection to other people.

Cutaneous Drug Reaction

A skin reaction caused by a medicine taken by mouth, given by injection, or applied to the skin. It may be allergic or nonallergic and can cause a rash, itching, hives, blisters, peeling, or pain; widespread blistering, mouth sores, fever, facial swelling, or breathing difficulty may indicate a severe reaction.

Cutaneous Horn

A cone-shaped, hard projection of compacted keratin arising from the skin. The underlying lesion may be benign, precancerous, or cancerous, especially when the base is broad, indurated, painful, or inflamed, so removal or biopsy is usually needed.

Cutaneous Langerhans Cell Histiocytosis

An uncommon disorder in which abnormal immune cells build up in the skin. It may cause scaly or crusted spots, rash, or purple marks; testing checks whether other organs are involved.

Cutaneous Larva Migrans

An intensely itchy, winding skin rash caused by hookworm larvae from contaminated soil or sand entering bare skin. The larvae move beneath the skin and usually die without reaching internal organs.

Cutaneous Leiomyoma

A usually benign smooth-muscle tumour of the skin, often presenting as firm, painful papules or nodules that may be triggered by cold or pressure. Multiple lesions can be associated with hereditary leiomyomatosis and renal-cell cancer, so extensive or familial disease needs genetic and renal-risk assessment.

Cutaneous Leishmaniasis

Infection of the skin by *Leishmania* parasites, usually transmitted by the bite of an infected female sand fly. One or more lesions often begin as bumps or nodules and may develop into long-lasting ulcers, usually on exposed skin; they are often painless and can heal with scars. Some parasite species can later affect the mucous membranes of the nose, mouth, or throat.

Cutaneous Lipomas

Multiple benign tumors of mature fat cells arising in or beneath the skin, usually soft, mobile, and painless. A rapidly growing, painful, fixed, or deep mass needs imaging or biopsy because not every fatty-appearing lump is a simple lipoma.

Cutaneous Lupus

A form of lupus erythematosus limited to the skin, manifesting as discoid lesions, subacute cutaneous plaques, or acute malar erythema. It may occur in isolation or as a feature of systemic lupus erythematosus.

Cutaneous Lupus Erythematosus

An immune disorder causing inflamed skin patches

or sores that may worsen with sunlight, scar, or change skin color. It may remain limited to skin or occur with systemic lupus and requires appropriate evaluation.

Cutaneous Lymphoma

A cancer of immune cells that mainly affects the skin. It may cause persistent patches, plaques, lumps, or widespread redness. The exact type determines whether it behaves slowly or aggressively and how it is treated.

Cutaneous Manifestations of HIV

Skin findings associated with HIV infection may reflect acute HIV, opportunistic infections, inflammatory disease, medicine reactions, or cancers such as Kaposi sarcoma. Conditions including herpes zoster, molluscum contagiosum, candidiasis, and extensive or recurrent eruptions may become more severe as immune function declines; effective antiretroviral therapy often improves HIV-related skin disease.

Cutaneous Melanoma

A malignant tumor of melanocytes, the pigment-producing cells of skin. It may arise in a new lesion or a changing mole and can spread; ABCDE features include asymmetry, border irregularity, colour variation, diameter, and evolution, while bleeding or a nonhealing pigmented spot can also occur.

Cutaneous Metastases

Secondary deposits of cancer in the skin, originating from a primary tumor elsewhere in the body. They may present as nodules, plaques, or ulcers, and often indicate advanced or recurrent disease.

Cutaneous Metastasis

A deposit of malignant cells in the skin from a primary tumor elsewhere or, less often, another cutaneous site; it may present as a firm nodule, plaque, or inflammatory-appearing lesion.

Cutaneous Penile Lesions

Abnormal skin findings on the penis, including papules, plaques, blisters, ulcers, or growths. Causes range from normal variants and irritation to infection, inflammatory skin disease, and precancerous or cancerous lesions. Assessment depends on appearance and history; persistent, changing, bleeding, or ulcerated lesions need clinical evaluation, and some require biopsy.

Alternate Names:
Penile Lesions; Penile Skin Lesions

Cutaneous Polyarteritis Nodosa

Inflammation of small and medium blood vessels limited mainly to the skin. It may cause painful lumps, a net-like purple pattern, or ulcers, usually on the legs, without the internal-organ disease seen in systemic forms.

Cutaneous Pseudolymphoma

A benign reactive lymphoid proliferation in the skin that can resemble cutaneous lymphoma clinically or under the microscope. It may follow an insect bite, tattoo, medicine, infection, or other stimulus; biopsy and sometimes additional studies are needed to distinguish it from true lymphoma.

Cutaneous Sarcoidosis

Sarcoidosis affecting the skin. It may cause firm bumps, plaques, or nodules, or thickening around old scars; some lesions are red-brown, purple, or skin-colored. Skin disease may occur alone or with sarcoidosis in other organs. Erythema nodosum can occur with sarcoidosis but is a separate, nonspecific skin reaction.

Cutaneous Skin Tag

A small, soft, usually harmless growth of extra skin, often on a narrow stalk in the neck, armpit, groin, or another skin fold. It may catch on clothing or become irritated.

Cutaneous Small-Vessel Vasculitis

Inflammation of tiny blood vessels in the skin, often causing groups of raised purple spots, especially on the lower legs. Medicines, infections, and immune diseases can trigger it; tests may check whether other organs are involved.

Cutaneous Squamous Cell Carcinoma

An invasive malignant tumor arising from keratinocytes in the epidermis, often on chronically sun-damaged skin. It may appear as a firm, rough, scaly, crusted, tender, or ulcerated growth. It can invade nearby tissue and sometimes metastasize, especially when high-risk features are present.

Alternate Names:
Squamous Cell Carcinoma Of The Skin; Squamous Cell Skin Cancer; cSCC

Cutaneous T-Cell Lymphoma

A cancer of immune cells that mainly affects the skin. It may begin as itchy, scaly patches or thicker plaques and later form lumps or widespread redness; some types also involve the blood, lymph nodes, or other organs.

Cutaneous Vasculitis

Inflammation of small blood vessels in the skin, causing red or purple spots, raised purpura, blisters, sores, or pain. Medicines, infections, autoimmune disease, or inflammation elsewhere in the body may be responsible.

Cuticle

The thin outermost layer of a hair shaft formed by overlapping cells that protect the inner cortex.

Alternate Names:
Hair Cuticle; Cuticular Layer

Cuticle Remover Poisoning

Exposure to cuticle-remover products, which may contain alkaline or acidic chemicals that can injure the skin, eyes, mouth, or gastrointestinal tract.

Cutis Anserina

Gooseflesh or piloerection, in which contraction of tiny muscles around hair follicles makes the skin appear rough or dimpled.

Cutis Laxa

A group of inherited or acquired connective-tissue disorders characterized by loose, inelastic skin caused by abnormal elastic fibers. Some forms also affect the lungs, blood vessels, heart, gastrointestinal tract, or skeleton.

Cutis Marmorata

A usually temporary, net-like mottling of the skin, often seen in infants or after cold exposure. It reflects a vascular response to temperature and generally fades with warming. Persistent congenital reticulated lesions may represent a distinct vascular malformation.

Alternate Names:
Mottled Skin; Physiologic Cutis Marmorata

Cutis Verticis Gyrata

A rare condition in which thickened scalp skin forms deep folds and furrows resembling the surface of the brain. It may be primary or associated with neurologic, endocrine, inflammatory, or genetic conditions.

Cuts And Puncture Wounds

Breaks in the skin caused by sharp, blunt, or penetrating trauma; evaluation considers depth, contamination, retained foreign bodies, tendon or nerve injury, vascular damage, and tetanus protection.

Alternate Names:
Lacerations; Minor Open Traumatic Wounds

Cuts and Wounds

Alternate name; see *Wound Care*.

Cutting Balloon Catheter

A balloon catheter with tiny blades or scoring surfaces that make controlled cuts in hardened plaque while the balloon widens a narrowed blood vessel. It is used in selected vascular procedures.

Alternate Names:
Cutting Balloon Angioplasty

CVC

Central venous catheter, a catheter whose tip lies in a large central vein and provides intravenous access for medications, fluids, nutrition, or monitoring.

Cyanide

A highly poisonous chemical that prevents cells from using oxygen. Exposure can rapidly cause headache, confusion, seizures, breathing failure, cardiovascular collapse, and death.

Cyanide Poisoning

A medical emergency in which cyanide stops cells from using oxygen. It may follow smoke inhalation or industrial, accidental, or intentional exposure and can cause headache, confusion, seizures, collapse, and death within minutes.

Cyanide Toxicity

Cellular asphyxiation caused by inhibition of mitochondrial oxidative phosphorylation. Rapid agitation or confusion, seizures, cardiovascular collapse, severe lactic acidosis, and coma may develop after smoke inhalation or ingestion; treatment must not await confirmatory testing when suspicion is high, and hydroxocobalamin is the preferred antidote in many settings.

Cyanoacrylates Poisoning

Exposure to cyanoacrylate adhesives, commonly known as instant glue. Contact may bond tissues or irritate the skin, eyes, or airways; ingestion usually causes local adhesion or irritation.

Cyanosis

A bluish or gray discoloration of the skin or mucous membranes associated with increased deoxygenated haemoglobin or abnormal haemoglobin. Central cyanosis affects the lips and tongue and usually reflects reduced arterial oxygenation; peripheral cyanosis mainly affects the extremities and may occur when blood flow is slow.

Cyanotic

Having a bluish or slate-gray discoloration of skin or mucous membranes, usually reflecting increased deoxygenated hemoglobin or abnormal blood flow.

Cyanotic Congenital Heart Disease

A group of congenital structural heart defects that cause low oxygen levels in systemic blood, usually through right-to-left shunting, mixing of oxygen-poor and oxygen-rich blood, or reduced blood flow to the lungs. Examples include tetralogy of Fallot, transposition of the great arteries, tricuspid atresia, and truncus arteriosus. Cyanosis may be subtle or absent initially.

Alternate Names:
Cyanotic Congenital Heart Defects

Cyanotic Heart Disease

A congenital or acquired heart disorder that reduces systemic oxygen saturation and causes cyanosis, often through right-to-left shunting or inadequate pulmonary blood flow.

CyberKnife Radiosurgery

CyberKnife is a robotic system that delivers many precisely aimed radiation beams to a tumor or other target without an open operation.

Cycle Time

The time needed to complete one cycle of a medical process, such as collecting an image or recording a repeating body signal. The length depends on the test, equipment, and purpose.

Cyclic Citrullinated Peptide

A substance used in a blood test for antibodies associated with rheumatoid arthritis. A positive result supports the diagnosis but is not diagnostic by itself.

Cyclic Edema

Recurrent swelling, often of the legs or hands, that changes with the menstrual cycle or other regular hormonal pattern. The diagnosis requires exclusion of heart, kidney, liver, venous, lymphatic, medication-related, and other causes of edema.

Cyclic Guanosine Monophosphate

A chemical messenger inside cells that helps relax smooth muscle, widen blood vessels, process visual signals, and control other body functions. Some medicines work partly by increasing or preserving its effects.

Alternate Names:
CGMP; Cyclic GMP

Cyclic Hormone Therapy

Hormone therapy in which estrogen is given continuously or for part of a cycle and progestogen is added for a defined number of days.

Alternate Names:
Sequential Hormone Therapy; Cyclic Estrogen-Progestogen Therapy

Cyclic Migraines

Migraine attacks that recur in a predictable pattern, sometimes around menstruation or at regular intervals. They may include headache, nausea, light or sound sensitivity, and aura; preventive treatment may be considered when attacks are frequent or disabling.

Cyclic Neutropenia

Repeated episodes of low neutrophils, the white blood cells that fight many infections. Episodes often recur at regular intervals and may cause fever, mouth ulcers, sore throat, or infections.

Cyclic Vomiting Syndrome

Repeated, similar attacks of severe nausea and vomiting separated by periods of normal health. It is often related to migraine biology; dehydration and other causes must be considered during evaluation.

Alternate Names:
Cyclic Vomiting

Cyclin-Dependent Kinase

An enzyme that helps control cell growth and division by working with a cyclin protein. Abnormal activity can contribute to cancer, and some targeted medicines block these enzymes.

Cyclist's Syndrome

Pain, numbness, tingling, or altered sensation in the perineum caused by prolonged pressure on the pudendal nerve during cycling. It is a form of pudendal nerve irritation or entrapment and may improve with changes in saddle fit, riding position, activity, and specialist treatment.

Alternate Names:
Cyclist Syndrome; Pudendal Neuralgia Associated With Cycling

Cyclocryotherapy

A cyclodestructive glaucoma procedure that freezes part of the ciliary body to reduce aqueous-humor production and intraocular pressure. It has been used mainly in severe or treatment-resistant glaucoma.

Cyclooxygenase

An enzyme family that helps convert arachidonic acid into prostaglandins and related mediators involved in pain, inflammation, and platelet function.

Alternate Names:
COX Enzyme; Prostaglandin-Endoperoxide Synthase

Cyclooxygenase-2

An inducible cyclooxygenase enzyme that generates prostaglandins involved in inflammation, pain, and fever and is inhibited by COX-2-selective medicines.

Cyclops

An informal term with two medical uses: cyclopia, a severe congenital malformation with a single central eye, and a cyclops lesion, a fibrous nodule in the knee joint, usually after anterior cruciate ligament injury or reconstruction, that can block full knee extension.

Cyclospora Infection

An intestinal infection caused by Cyclospora parasites, usually acquired from contaminated food or water. It can cause prolonged or recurring watery diarrhea, cramps, nausea, tiredness, and weight loss.

Cyclosporiasis

An intestinal infection caused by the parasite Cyclospora cayetanensis. It is usually spread through contaminated food or water and may cause prolonged or repeated watery diarrhea, abdominal cramps, nausea, tiredness, loss of appetite, and

weight loss.

Alternate Names:
Cyclospora Cayetanensis Enteritis; Cyclospora Infection

Cyclothymia

Alternate name for *Cyclothymic Disorder*; see that entry.

Cyclothymic Disorder

A chronic mood disorder marked by numerous periods of hypomanic symptoms and depressive symptoms that do not meet full criteria for manic, hypomanic, or major depressive episodes. In adults, symptoms persist for at least two years; in children and adolescents, at least one year. They occur for at least half that time, with no symptom-free interval longer than two months.

Cylindroma

A usually benign adnexal tumor composed of basaloid cells, often presenting as a firm pink or skin-coloured nodule on the scalp or face; multiple lesions may occur in Brooke-Spiegler syndrome.

Cylindroma and Spiradenoma

Usually benign skin appendage tumors arising from sweat-gland-related structures. Cylindromas are often firm scalp or facial nodules, while spiradenomas are characteristically painful; multiple lesions may occur in Brooke-Spiegler syndrome and a rapidly enlarging or ulcerated lesion needs review.

CYP2C19 Polymorphism

An inherited difference in a liver enzyme that breaks down some medicines. It can make a medicine act too weakly or too strongly, so genetic or medicine review may guide treatment for selected drugs.

CYP2C9 Polymorphism

An inherited variation in the CYP2C9 drug-metabolizing enzyme that can make some medicines, especially warfarin, break down more slowly or quickly. Genotype may help inform dosing in selected settings, alongside clinical factors and monitoring.

CYP2D6 Polymorphism

An inherited difference in a liver enzyme that breaks down many medicines. Some people process certain drugs slowly or quickly, which can change their benefits and side effects.

CYP450 System

A family of enzymes, found mainly in the liver, that breaks down many medicines and foreign chemicals. Genetic differences and other medicines can speed up or slow down this process and alter drug effects.

Cyproheptadine Overdose

Overdose of cyproheptadine, an antihistamine, that may cause sedation, agitation, anticholinergic effects, seizures, respiratory depression, or cardiac effects.

Cyprus Fever

An older regional name for brucellosis, a bacterial infection acquired from infected animals or unpasteurised animal products. It may cause prolonged or recurring fever, sweats, fatigue, joint pain, and involvement of other organs.

Alternate Names:
Brucellosis; Malta Fever; Mediterranean Fever

Cyst

A closed sac containing fluid, air, cells, or semisolid material. Cysts can occur in the skin, organs, glands, or other tissues and may be harmless, infected, or related to another disease.

Cystadenoma

A usually noncancerous gland-forming tumor containing fluid-filled spaces or cyst-like structures. It can occur in several organs, may enlarge or cause symptoms, and sometimes requires removal or monitoring.

Cystectomy

Surgery to remove part or all of the urinary bladder. Partial cystectomy is used for selected localized disease; complete or radical cystectomy removes the bladder and requires another route for urine to leave

the body.

Cystic Acne

Severe acne with deep, painful lumps that can leave permanent scars. It often needs clinician-directed treatment; squeezing or picking the lesions increases scarring and infection risk.

Cystic Diseases of the Kidney

Disorders in which fluid-filled cysts develop in one or both kidneys. They may be inherited or acquired and can cause enlargement, pain, infection, bleeding, stones, high blood pressure, or progressive loss of kidney function.

Cystic Echinococcosis

A parasitic infection in which slowly growing cysts form, most often in the liver or lungs, after swallowing Echinococcus eggs from infected dogs or contaminated food, water, or soil. Cysts may cause pain, cough, blockage, or serious allergic reactions if they rupture.

Cysticercosis

Infection caused by the larval form of the pork tapeworm, *Taenia solium*, after a person swallows its eggs from contaminated food, water, or hands. Cysts may form in muscle, skin, the eyes, or the brain. Brain infection, called neurocysticercosis, may cause seizures, headaches, or other nervous-system problems. Cysticercosis is different from intestinal taeniasis and is not caused by eating undercooked pork.

Cystic Fibrosis

An inherited genetic disorder caused by a faulty gene that controls the movement of salt and water into and out of cells. This defect causes the body to produce unusually thick, sticky mucus that clogs the airways in the lungs, leading to chronic infections and progressive breathing problems. The thick mucus also blocks the ducts in the pancreas, preventing digestive enzymes from reaching the intestines and causing digestive problems and poor growth.

Cystic Fibrosis Carrier Screening

Genetic testing to identify a person who carries one disease-causing CFTR variant and usually has no cystic-fibrosis symptoms. Results help estimate reproductive risk and guide partner testing or genetic counseling.

Cystic Hygroma

A fluid-filled growth made of enlarged lymph vessels, usually in the neck or upper chest. It is present from birth or develops in early childhood. A large one can cause swelling or make breathing or feeding difficult.

Alternate Names:
Cystic Lymphangioma

Cystic Kidney Disease

A group of disorders in which fluid-filled cysts develop in one or both kidneys. Some forms are inherited, while others develop later; cysts may enlarge the kidneys or reduce their function.

Cystic Lung Disease

A group of disorders in which multiple air- or fluid-filled cysts develop in the lungs. Causes include lymphangioleiomyomatosis, pulmonary Langerhans-cell histiocytosis, Birt-Hogg-Dubé syndrome, lymphoid interstitial pneumonia, congenital abnormalities, infection, and smoking-related disease; high-resolution CT helps classify the pattern.

Alternate Names:
Multiple Cystic Lung Disease; Pulmonary Cystic Disease

Cystic Medial Necrosis

An older term for weakening of the middle layer of the aortic wall. The weakened aorta may stretch into an aneurysm or tear, especially in people with inherited connective-tissue disorders, high blood pressure, or aging-related disease.

Cystic Teratoma

A germ-cell tumor containing tissues derived from more than one embryonic layer, commonly occurring in the ovary as a mature cystic teratoma or dermoid cyst. Most are benign, but torsion, rup-

ture, infection, or rare malignant transformation can occur.

Cystine and Struvite Urinary Crystals

Two types of crystals that may appear in urine. Cystine crystals can indicate an inherited tendency to form stones, while struvite crystals may occur with some urinary infections; results need clinical interpretation.

Alternate Names:
Hexagonal Cystine and Magnesium Ammonium Phosphate Crystals; Urinary Calculi Crystals

Cystine Stones

Kidney stones formed when inherited cystinuria causes excess cystine in urine. They often recur and may be difficult to dissolve; abundant fluids, medical treatment, and sometimes procedures help prevent or remove them.

Cystinosis

A rare inherited disorder in which cystine, a building block of proteins, builds up inside cells and damages organs. It often affects the kidneys and eyes and may also impair growth, the thyroid, muscles, or other tissues.

Cystinuria

An inherited disorder in which the kidneys release too much cystine into urine, allowing recurrent cystine kidney stones to form. It requires long-term fluid intake, monitoring, and sometimes medicines to prevent stones.

Cystitis

Inflammation of the bladder that may be caused by infection, irritation, medicines, radiation, or other conditions. It can cause burning or discomfort with urination, frequent or urgent urination, lower-abdominal pressure, or blood in the urine; some forms cause bladder or pelvic pain without infection.

Cystitis Pathology

Inflammatory injury of the urinary bladder mucosa and wall. Acute cases may show edema, congestion, and neutrophils, while chronic or specialized forms show lymphocytes, fibrosis, ulceration, or characteristic epithelial changes.

Cystocele

Bulging of the bladder into the front wall of the vagina because the supporting pelvic tissues have weakened. It may cause pelvic pressure, a vaginal bulge, urinary leakage, difficulty emptying the bladder, or no symptoms.

Cystography

X-ray or other imaging of the urinary bladder after contrast is placed in it. It can show bladder injury, leaks, fistulas, structural abnormalities, or urine flowing backward toward the kidneys.

Cystoid Macular Edema

Swelling at the center of the retina caused by fluid collecting in small cyst-like spaces. It can blur or distort central vision and may follow eye surgery, inflammation, diabetes, or retinal blood-vessel disease.

Cystoisosporiasis

An intestinal infection caused by the parasite Cystoisospora belli. It is usually spread by swallowing contaminated food or water and may cause watery diarrhea, abdominal cramps, nausea, vomiting, loss of appetite, and fever. The illness may be prolonged or severe in people with weakened immune systems.

Cystometric Study

A bladder test that measures pressure, sensation, and urine storage while the bladder fills and empties. It helps investigate urgency, leakage, difficulty emptying, weak bladder muscles, or nerve-related urinary problems.

Cystometrogram

A recording of bladder pressure and sensation during filling and emptying. It is part of urodynamic testing used to investigate leakage, urgency, blockage, weak contractions, or nerve-related bladder problems.

Cystometry

A bladder-function test measuring pressure and sensation while the bladder fills and empties. It helps assess urgency, leakage, obstruction, weak contractions, nerve problems, or other urinary difficulties.

Cystoscope

A thin, lighted instrument used to examine the urethra and bladder and, when needed, perform procedures.

Cystoscopy

Cystoscopy uses a camera passed through the urethra to inspect the bladder and urethra and may allow biopsy or treatment.

Cystostomy

A procedure that creates an opening from the bladder to the skin or another passage so urine can drain when it cannot leave normally through the urethra. It may be temporary or long term.

Cystotome

A small surgical instrument used to cut the thin covering of the eye's lens during selected cataract procedures. Modern instruments and techniques vary according to the operation.

Cystourethrography

An X-ray examination of the bladder and urethra after contrast material is placed in the bladder. Images during filling and urination can show leaks, narrowing, structural problems, or urine flowing backward toward the kidneys.

Cysts

Closed sacs or tissue cavities containing fluid, air, pus, blood, cells, or semisolid material. They can occur in the skin, organs, glands, or other tissues; many are harmless, but some result from infection, developmental or inherited disease, or a tumor. Cysts may be new, growing, painful, changing, or infected.

Cytochrome B5 Reductase

An enzyme that keeps hemoglobin in the chemical form needed to carry oxygen. An inherited deficiency can cause methemoglobinemia, in which the skin looks blue and blood cannot deliver oxygen normally.

Cytochrome C

A protein inside mitochondria that carries electrons during energy production. When released from damaged mitochondria, it can also help start the controlled death of a cell.

Cytochrome P450

A family of enzymes, found mainly in liver cells, that chemically changes many medicines, toxins, and hormones so the body can remove them. Genetic differences and drug interactions can alter their activity.

Cytogenetic Karyotyping

Alternate name; see *Karyotyping*.

Cytogenetics

The study of chromosomes, including their number, structure, and arrangement. Laboratory tests can help identify inherited conditions, developmental differences, some pregnancy problems, leukemia, and other cancers.

Cytokine

A diverse group of small signaling proteins produced by immune cells and other tissues that act as chemical messengers. They help coordinate the body's immune defenses, inflammation, and cellular communication by instructing other cells to grow, move toward an infection, or fight off pathogens.

Alternate Names:
Immune Signaling Proteins; Cytokine Mediators; Cytokines

Cytokine Release Syndrome

A potentially serious whole-body inflammatory reaction caused by a sudden release of immune signaling proteins, sometimes after immune-based cancer

treatment or infection. Fever, low blood pressure, breathing difficulty, and organ problems may occur.

Cytokines

Plural form; see *Cytokine*.

Cytokine Signaling

Communication between cells through cytokines binding to specific receptors and activating intracellular pathways. It regulates immune responses, inflammation, blood-cell production, tissue repair, and interactions between organs.

Cytokine Storm

A dangerous overreaction of the immune system in which large amounts of inflammatory messenger proteins are released. It can cause widespread tissue injury, low blood pressure, breathing failure, organ damage, and shock.

Cytologic Evaluation

Microscopic examination of individual cells or small cell groups from a fluid, brushing, scraping, or fine-needle sample to detect infection, inflammation, or malignancy.

Cytology

The study of individual cells under a microscope. Cells may come from a body fluid, scraping, brushing, or needle sample and can be examined for cancer, infection, inflammation, or other disease.

Cytology Exam Of Pleural Fluid

Microscopic examination of fluid around the lung for malignant cells and other cellular changes, performed with chemical and microbiologic testing when evaluating an effusion.

Cytology Exam Of Urine

Microscopic examination of shed urinary-tract cells, used mainly to detect high-grade urothelial malignancy and selected abnormal cells; a negative result does not exclude cancer.

Cytomegalovirus

A common herpesvirus that often causes no symptoms or a mild illness in healthy people. It can cause serious disease in unborn babies and people with weakened immunity, affecting organs such as the lungs, eyes, brain, or digestive tract.

Alternate Names:
CMV; Human Betaherpesvirus 5; Human Cytomegalovirus (HCMV)

Cytomegalovirus Colitis

Alternate name; see *CMV Colitis* and *Cytomegalovirus Gastroenteritis and Colitis*.

Cytomegalovirus Gastroenteritis and Colitis

An opportunistic viral gastrointestinal infection caused by cytomegalovirus (CMV) reactivation in severely immunocompromised individuals (e.g., advanced HIV/AIDS, solid-organ transplantation), characterized by mucosal ulceration, hematochezia, abdominal pain, and potential bowel perforation.

Alternate Names:
CMV Colitis; CMV Enteritis; Gastrointestinal Cytomegalovirus

Cytomegalovirus Infection

Infection with cytomegalovirus, which may cause no symptoms or a fever-and-fatigue illness in healthy people. Infection during pregnancy or in someone with weakened immunity can cause hearing loss, organ disease, or other serious complications.

Cytomegalovirus Retinitis

An infection of the retina caused by cytomegalovirus, usually in people with severe immune suppression, such as advanced HIV or after an organ transplant. It can cause floaters, blind spots, or blurred vision; examination may show yellow-white areas of retinal damage, sometimes with bleeding. Without treatment, it can cause permanent vision loss or retinal detachment.

Alternate Names:
CMV Retinitis; Cytomegaloviral Chorioretinitis

Cytopathology

The examination of individual cells under a microscope to help diagnose cancer, infection, inflammation, or other disease. Cells may come from fluid, a brushing, a smear, or a needle sample.

Cytopenia

A lower-than-normal number of one or more blood-cell types: red blood cells, white blood cells, or platelets. The effects depend on which cells are low and how severe the reduction is.

Cytoplasm

The jelly-like material inside a cell outside its nucleus. It contains the cell's working structures and is where many chemical reactions, transport processes, and energy-producing activities occur.

Cytoreductive Surgery

Surgery that removes as much visible cancer as can be taken safely. It may not remove every cancer cell and is often combined with chemotherapy, radiation, or other treatment; its value depends on the cancer's type, site, and spread.

Cytoskeleton

A network of protein fibers inside a cell that maintains its shape, moves materials, enables movement, and helps the cell divide. It constantly changes in response to the cell's needs.

Cytotoxic

Toxic to cells or capable of killing cells, as with some chemotherapy drugs, toxins, or cytotoxic immune cells.

Cytotoxic Alopecia

Hair loss caused by exposure to a cytotoxic treatment or other toxic injury to actively growing hair follicles.

Alternate Names:
Drug-Induced Alopecia; Chemotherapy-Related Hair Loss

Cytotoxicity

The ability of a substance or cell to damage or kill another cell. This may be part of normal immune defense or may result from medicines, toxins, radiation, or other harmful exposures.

Cytotoxic T Cell

An immune cell that recognizes and kills infected, abnormal, or cancerous cells. It identifies small protein signals displayed on the target cell and can trigger that cell to die.

D

D2 Receptor

A protein on cells that responds to dopamine, a brain chemical involved in movement, motivation, and reward. Some medicines work partly by blocking or stimulating this receptor.

Dacarbazine

A chemotherapy medicine used for Hodgkin lymphoma, melanoma, and some other cancers. It may cause severe nausea, low blood counts, or liver injury.

Daclizumab

A monoclonal antibody that blocks the interleukin-2 receptor on activated T cells. Daclizumab was used to prevent kidney-transplant rejection, and a modified form was used for relapsing multiple sclerosis; the latter was withdrawn in 2018 after serious, sometimes fatal immune reactions affecting the brain, liver, and other organs.

Dacomitinib

A targeted medicine that blocks several members of the epidermal-growth-factor receptor family and is used for selected EGFR-mutated lung cancers. Diarrhea, skin reactions, mouth sores, and lung or liver problems may occur.

Da Costa's Syndrome

Historical term for a syndrome of breathlessness, palpitations, chest discomfort, dizziness, and fatigue, once called effort syndrome or neurocirculatory asthenia. It is now a nonspecific label rather than a precise modern diagnosis.

Dacrocytes

Teardrop-shaped red blood cells seen on a blood smear. They may occur when red blood cells pass through scarred or crowded bone marrow, and can be seen in myelofibrosis, bone-marrow cancers, and severe thalassemia.

Alternate Names:
Teardrop Cells

Dacryoadenitis

Inflammation of a tear-producing gland, causing painful swelling near the outer upper eyelid. It may be caused by infection, inflammation, or a condition affecting the whole body.

Dacryocystitis

Infection or inflammation of the tear sac near the inner corner of the eye, usually because the tear-drainage passage is blocked. It can cause pain, redness, swelling, and pus.

Dacryocystocele

A fluid-filled swelling near the inner corner of the eye caused by blockage and widening of the tear-drainage system. In a newborn it may interfere with breathing if it extends into the nose.

Dacryocystography

An imaging test in which contrast material is put into the tear-drainage passages to show narrowing, blockage, abnormal connections, or leakage. It may help plan treatment for persistent tearing or repeated tear-sac infection.

Dacryocystorhinostomy

Surgery creating a new passage from the tear sac into the nose to bypass a blocked tear duct. It is used for persistent tearing or repeated tear-sac infections.

Dacryocyte Analysis

Examination or counting of teardrop-shaped red blood cells on a blood smear; numerous dacryocytes may occur with marrow fibrosis, infiltration, severe anemia, or splenic disease.

Dacryolithiasis

Formation of a stone or concretion within the lacrimal drainage system, which may cause excessive tearing, discharge, recurrent dacryocystitis, or obstruction.

Dacryostenosis

Narrowing or blockage of the passages that drain tears from the eye into the nose. It can cause constant tearing, sticky discharge, or repeated infection of the tear sac.

Dactinomycin

An anticancer medicine that binds DNA and interferes with gene activity and cell growth. It is used for selected cancers and can cause bone-marrow suppression, mouth sores, nausea, and tissue injury if it leaks outside a vein.

Dactylitis

Swelling and inflammation of an entire finger or toe, producing a sausage-like appearance. It can occur with sickle-cell disease, psoriatic arthritis, infection, or other inflammatory conditions.

Dactylomegaly

Abnormal enlargement of a finger or toe, which may occur as an isolated finding or as part of an endocrine, skeletal, vascular, or inflammatory disorder.

Dactylosymphysis

Another name for syndactyly, the congenital joining of adjacent fingers or toes by skin, bone, or both; see *Syndactyly*.

Daidzein

A naturally occurring isoflavone found in soy and other legumes that can be converted by intestinal bacteria into related compounds.

Daily Bowel Care Program

A planned routine for preventing and treating constipation or fecal incontinence, often including timing, fluids, diet, activity, medication, and rectal measures when prescribed.

Dakin Solution

A dilute sodium hypochlorite solution used as a topical antiseptic for selected contaminated or infected wounds. Higher concentrations or prolonged exposure can damage viable tissue as well as microorganisms.

Dalrymple Sign

A clinical ophthalmologic sign characterized by abnormal widening of the palpebral fissure and retraction of the upper eyelid, revealing a strip of white sclera above the superior corneal limbus in primary gaze, classically seen in Graves ophthalmopathy and thyrotoxicosis.

Alternate Names:
Dalrymple's Sign; Thyrotoxic Eyelid Retraction

Dalteparin

An injectable blood thinner used to prevent or treat clots in veins and the lungs. It reduces clotting through the body's natural anticoagulant system; bleeding is the main risk, and kidney disease may require dose adjustment.

Dalteparin Sodium

Salt name; see *Dalteparin*.

Daltonism

Color-vision deficiency, especially difficulty distinguishing certain colors because of abnormal or absent retinal cone function.

DALY

Disability-adjusted life year, a measure combining years of healthy life lost because of premature death and disability.

DAMA

Abbreviation for discharge against medical advice: a patient's decision to leave the hospital before the care team recommends discharge.

Damage-Control Resuscitation

Emergency treatment for severe injury that quickly controls bleeding, gives appropriate blood products, prevents dangerous cooling, and corrects clotting problems while avoiding harmful excess fluid.

Damage-Control Surgery

A planned series of operations for a critically ill or severely injured person who cannot safely tolerate a long repair. The first operation controls bleeding or contamination; after stabilization, a later operation completes the repair.

Damage To The Amygdala

Damage to the amygdala can affect fear processing, emotional learning, memory, threat recognition, and social behavior. Causes include trauma, stroke, infection, tumor, epilepsy, or degenerative disease, and effects depend on the side and extent of injury.

Damus-Kaye-Stansel Procedure

A heart operation for selected children with a single working ventricle and a blocked or narrowed route from the ventricle to the aorta. It connects the pulmonary artery to the aorta to create a wider route for blood leaving the heart.

Alternate Names:
DKS Procedure; Damus-Stansel-Kaye Operation

Danazol

A synthetic androgen that suppresses pituitary gonadotropins. It is used to treat endometriosis and to prevent attacks of hereditary angioedema. Adverse effects include androgenic changes, abnormal blood lipids, liver injury, and blood clots.

Dance Sign

A clinical physical examination finding in pediatric intussusception characterized by a palpable emptiness or flattening in the right lower quadrant (ileocecal fossa), resulting from the invagination and distal displacement of the cecum and terminal ileum into the ascending colon.

Alternate Names:
Dance's Sign; Signe de Dance

D And C

Alternate name; see *D & C*.

D And E

Abbreviation; see *Dilation And Evacuation*.

Dander

Tiny flakes of skin shed by animals with fur or feathers. Dander can carry proteins that trigger allergy symptoms in some people. The flakes can float in the air and be breathed in, sometimes causing sneezing, itchy eyes, or asthma symptoms in people with an animal allergy.

Dandruff

A common scalp condition causing small white or yellow flakes and sometimes itching. It is often related to oily skin, seborrheic dermatitis, or the scalp's reaction to the normal yeast *Malassezia*; it is not usually contagious. Persistent severe flaking, redness, sores, or hair loss may indicate another scalp disorder.

Dandy Fever

Older name; see *Dengue*.

Dandy-Walker Malformation

A congenital malformation of the back of the brain, marked by an underdeveloped or partly absent cerebellar vermis, cyst-like enlargement of the fourth ventricle, and an enlarged posterior fossa. It may cause hydrocephalus, developmental delay, or problems with balance and coordination; symptoms vary.

Dandy-Walker Syndrome

Alternate name; see *Dandy-Walker Malformation*.

Dane Particle

The complete infectious form of hepatitis B virus. It contains the virus's genetic material inside a protein shell and outer envelope, allowing it to enter liver cells and reproduce.

Dangerous Abbreviations

Abbreviations that can be misread and cause medication or clinical errors; safer practice is to write the complete term when an abbreviation is ambiguous.

Danon Disease

A rare inherited disorder, usually caused by an LAMP2 gene change, in which cells cannot properly recycle materials. It may cause heart-muscle disease, muscle weakness, intellectual disability, or eye problems.

Dantrolene

A muscle relaxant that reduces the release of calcium inside muscle cells. It is the main treatment for malignant hyperthermia and may cause weakness or liver injury.

Dapsone

A sulfone antimicrobial used for leprosy, selected dermatitis, and other infections; haemolysis, especially with G6PD deficiency, methaemoglobinaemia, agranulocytosis, and severe skin reactions are important risks.

Daptomycin

An antibiotic used for selected serious infections caused by gram-positive bacteria, including resistant strains. It can damage muscles and kidneys, so treatment requires appropriate testing and monitoring.

Daptomycin Resistance

Reduced or absent response of bacteria to daptomycin, often because changes in the bacterial membrane prevent the antibiotic from working. It can develop during treatment and limits options for serious infections.

Darbepoetin Alfa

A long-acting medicine that stimulates the bone marrow to make more red blood cells. It is used for selected anemia related to kidney disease or cancer treatment, but can raise blood pressure and the risk of blood clots.

Darier's Disease

An inherited skin disorder that causes persistent, firm, often greasy or crusted bumps, usually on the chest, back, scalp, or skin folds. It may also change the nails or affect the mouth. Heat, sweating, friction, and sunlight can trigger flares.

Alternate Names:
Darier Disease; Darier-White Disease

Darier Sign

A raised, red, itchy swelling that appears within minutes when a skin lesion containing mast cells is rubbed. It supports a diagnosis of cutaneous mastocytosis, but its absence does not rule it out.

Alternate Names:
Darier's Sign; Mastocytoma Stroking Sign

Dark Adaptation

The gradual adjustment that allows the eyes to see better after moving from bright light into darkness. Poor dark adaptation may result from retinal disease, vitamin A deficiency, aging, or some medicines.

Dartos

A thin muscle layer beneath the skin of the scrotum. It tightens or relaxes the scrotal skin in response to temperature and other signals, helping regulate the position of the testicles.

Darunavir

An antiretroviral medicine that blocks HIV protease, an enzyme needed to make new viruses. It is used with other HIV medicines and has important interactions and possible liver or skin reactions.

Darwin's Tubercle

A harmless small bump on the upper rim of the outer ear. It is a common normal variation in ear shape and usually needs no treatment.

Dasatinib

A targeted cancer medicine that blocks abnormal tyrosine-kinase signals, especially those caused by BCR::ABL1. It treats selected blood cancers and may cause low blood counts, fluid around the lungs, bleeding, or abnormal heart rhythms.

DASH Diet

An eating pattern designed to lower blood pressure by emphasizing vegetables, fruits, whole grains, beans, nuts, and low-fat dairy while limiting salt, saturated fat, and sugary foods. Individual needs may require adjustment.

Dating Ultrasound

An ultrasound examination, usually performed in early pregnancy, used to estimate gestational age and calculate the expected date of delivery. First-trimester crown–rump length is generally the most accurate ultrasound measurement for dating.

Alternate Names:
Pregnancy Dating Scan; Gestational-Age Ultrasound

Daubenton's Plane

A craniometric reference plane passing through the opisthion, the midpoint of the posterior margin of the foramen magnum, and the lower margins of the orbits. It is used in describing skull orientation.

Daunorubicin

An anthracycline chemotherapy medicine that interferes with DNA and is used mainly for selected leukemias. It can suppress bone-marrow function and, especially after repeated exposure, damage the heart.

Alternate Names:
Daunorubicin Hydrochloride

Daunorubicin Hydrochloride

Alternate name for the hydrochloride salt of daunorubicin; see *Daunorubicin*.

David Procedure

An operation that replaces an enlarged or weakened aortic root while keeping the person's own aortic valve. The valve is supported inside a graft and the coronary arteries are reattached; bleeding, stroke, valve leakage, or recurrent aortic disease are possible.

Alternate Names:
David Operation; Valve-Sparing Root Replacement; Reimplantation of Aortic Valve

Dav Regimen

An abbreviation used for more than one cancer-treatment combination. In older leukemia reports, DAV meant daunorubicin, cytarabine, and etoposide; in newer reports, it may mean daunorubicin, cytarabine, and venetoclax. The source must identify the drugs and cancer before the regimen is used.

Daw

An abbreviation meaning dispense as written, indicating that the pharmacist should dispense the prescribed product rather than automatically substitute a generic equivalent when permitted by law.

Dawn Phenomenon

A rise in blood glucose during the early morning caused by normal hormone changes that help the body wake up. It may be more noticeable in people with diabetes whose insulin supply cannot match the rise.

Dawson Fingers

Long, finger-like areas seen on some brain MRI scans in multiple sclerosis. They form around small veins near the brain's fluid spaces and support, but do not by themselves prove, the diagnosis.

Alternate Names:
Dawson's Fingers; Perivenular MS Plaques

Day-Blindness

Poor vision in bright light, also called hemeralopia. It can result from retinal disease, cone dysfunction, or other eye disorders.

Day Hospital

A facility that provides multidisciplinary medical, psychiatric, rehabilitative, or diagnostic care during the day without overnight admission. It can support intensive treatment while allowing the patient to return home.

Daytime Sleepiness

A tendency to feel sleepy or fall asleep during waking hours. It may follow insufficient or disrupted sleep, or occur with sleep disorders, medicines, or other illnesses; persistent excessive sleepiness is a symptom rather than a diagnosis by itself.

DBA

Abbreviation for Diamond-Blackfan anemia, an inherited bone-marrow failure syndrome that usually causes anemia in infancy or early childhood and may be associated with characteristic physical differences or other congenital abnormalities.

D & C

Dilation and curettage, a procedure in which the cervix is widened and tissue is removed from the uterine cavity for treatment or diagnosis.

Dcc Gene

A gene that helps guide developing nerve fibers and may also help control cell growth. Harmful changes in this gene can cause some developmental nerve disorders and may contribute to certain cancers.

D&C Instruments

Instruments used to dilate the cervix and remove tissue from the uterus during dilation and curettage.

DCIS

Alternate name; see *Ductal Carcinoma In Situ*.

DDH

Alternate name; see *Hip Dysplasia*.

D-Dimer

A substance released into the blood when a blood clot breaks down. A high level can occur with a blood clot, but also with infection, pregnancy, recent surgery, cancer, or other conditions. A normal result can help rule out a clot in carefully selected patients whose initial risk is low or moderate.

D-Dimer Test

A blood test measuring a substance released when blood clots are broken down. A normal result can help rule out a clot in carefully selected low-risk people; a high result has many possible causes and does not prove a clot.

Alternate Names:
D-Dimer Assay; Fibrin Degradation Fragment Test

Deacetylase Inhibitor

A medicine or research compound that blocks enzymes removing chemical groups called acetyl groups from proteins. Some alter gene activity and are used for selected cancers; effects and risks depend on the specific medicine.

Dead Space

The part of a breath that does not exchange oxygen and carbon dioxide with the blood, including the nose, throat, and larger airways. It increases when air reaches lung areas with too little blood flow.

Dead Space Ventilation

Breathing that moves air through areas of the lungs where little or no blood is available for gas exchange. It may increase with a pulmonary embolism, low blood flow, or emphysema and can make breathing less effective.

Dead Time

The brief period after an event during which a detector or recording system cannot register another event, limiting the measured count rate.

Deafblindness

Combined hearing and vision loss that significantly affects communication, access to information, or moving around independently. The degree of hearing and sight loss varies; support is tailored to each person's remaining senses and communication needs.

Alternate Names:
Deaf-Blindness; Dual Sensory Loss

Deafferentation

Loss or interruption of nerve signals carrying sensation from a body area to the brain or spinal cord. It may cause numbness, unusual sensations, poor awareness of position, or persistent nerve pain.

Deafness

Complete or severe loss of hearing in one or both ears. The problem may involve sound passing through the outer or middle ear, the inner ear or hearing nerve, or more than one of these areas.

Death

The permanent end of life. It may be confirmed when the heart and breathing stop permanently or when all brain function has permanently stopped, according to medical and legal standards.

Death Rate

The number of deaths in a population during a stated period. It is often shown per 1,000 or 100,000 people and may be adjusted for age when comparing populations.

Death Rattle

Noisy, rattling breathing caused by secretions accumulating in the throat or upper airways, often occurring near the end of life when swallowing and coughing weaken.

Deauville Criteria

A five-point scale used on fluorodeoxyglucose PET scans to assess treatment response in lymphomas that take up the tracer. It compares uptake in suspected lymphoma with uptake in the blood pool in the middle of the chest and in the liver. Scores range from no abnormal uptake (1) to markedly greater uptake than the liver or new likely lymphoma sites (5); scores 2–4 fall between these levels.

Deaver Retractor

A hand-held surgical instrument with a broad, curved blade used to gently move organs or tissues aside. It is often used during chest or abdominal surgery to improve the surgeon's view.

Debility

General physical weakness or reduced ability to function, often caused by illness, aging, poor nutrition, prolonged inactivity, or recovery from major stress. Persistent weakness may have an underlying medical cause.

Alternate Names:
Weakness

Debride

To remove dead, damaged, infected, or contaminated tissue from a wound or body site to support healing and control infection.

Debridement

Removal of dead, damaged, infected, or contaminated tissue from a wound. It may be done with instruments, irrigation, or other methods to reduce infection, reveal healthy tissue, and support healing.

Debulk

To reduce the size or amount of a tumor or other abnormal tissue, usually by surgery or another treatment, without necessarily removing every abnormal cell.

Debulking

Removal of as much of a tumor as possible when removing all of it is unsafe or impossible. The aim is to reduce symptoms or improve the effect of later treatment; benefit depends on the cancer and situation.

Decalcification

Loss of calcium salts from bone, teeth, or other mineralized tissue. In teeth it may weaken enamel; in bone it can contribute to reduced strength.

Decannulation

Removal of a tube, especially a tracheostomy tube, after a person can breathe safely, protect the airway, and clear secretions without it. The site is monitored for bleeding, narrowing, or breathing difficulty.

Decanoic Acid

A ten-carbon saturated fatty acid, also called capric acid, found in some fats and studied for antimicrobial, metabolic, and antiseizure effects.

Decapitation

Separation of the head from the body, seen in severe trauma (vehicle accidents, train injuries, explosions), industrial accidents, hanging with judicial execution, or homicide. Complete decapitation is almost always rapidly fatal due to exsanguination and brain ischemia.

Decay Correction

A calculation that adjusts a radioactive measurement for the gradual loss of activity over time. It allows imaging or laboratory results obtained at different times to be compared accurately.

Deceased Donor

Individual who has died (usually from brain death or cardiac death) and donated organs, tissues, or both for transplantation.

Decenoic Acid

An unsaturated ten-carbon fatty acid; its biologic effects depend on the position and geometry of its double bond and on tissue and dietary context.

Decerebrate Posture

Abnormal straightening of the arms and legs caused by severe injury to the brainstem or nearby brain structures. It is a sign of serious neurologic injury and may occur after head injury, bleeding, or increased pressure in the skull.

Decerebrate Posturing

Alternate name; see *Decerebrate Posture*.

Decerebrate Rigidity

Alternate name; see *Decerebrate Posture*.

Decerebrate State

Alternate name; see *Decerebrate Posture*.

Decerebration

Severe brain dysfunction that causes abnormal straightening of the arms and legs. It usually results from major brain or brainstem injury or increased pressure inside the skull and is a medical emergency.

Decibel

A unit used to describe sound intensity. Higher values mean louder sound; repeated or very loud exposure can damage hearing, depending on the level and duration.

Decidua

The specialized lining of the uterus during pregnancy. It is shed after delivery and helps support the pregnancy and placenta.

Decidua Basalis

The pregnancy-modified endometrium beneath the implantation site, between the chorion and uterine muscle. It interfaces with chorionic villi and forms the maternal component of the placenta, including its basal plate. Maternal vessels in this tissue supply blood to the placental intervillous space.

Alternate Names:
Basal Decidua

Deciduitis

Inflammation of the specialized uterine lining that forms during pregnancy. It may be associated with infection or other pregnancy complications and may occur with pain, fever, or bleeding.

Deciduosis

Pregnancy-related tissue from the uterine lining growing in an unusually large area or outside the uterus, such as on the cervix or pelvic surfaces. It can look like a tumor during examination or surgery but is usually benign.

Deciduous Teeth

The 20 primary teeth that erupt during childhood and are gradually replaced by permanent teeth. Caries, infection, trauma, or premature loss can affect nutrition, speech, space for permanent teeth, and oral development.

Deciduous Tooth

A primary or baby tooth that is eventually shed and replaced by a permanent tooth. Early decay or loss can affect chewing, speech, and the space needed for permanent teeth.

Decision Making

The process of comparing information, options, benefits, risks, and preferences to choose an action or plan, including shared decision-making in healthcare.

Decision-Making Capacity

The ability to understand information about a medical decision, consider the possible results, compare choices, and communicate a choice. It applies to a specific decision, may change over time, and is different from legal competence.

Decitabine

A cancer medicine that changes abnormal gene activity and interferes with growth of blood-forming cancer cells. It is used for selected blood cancers and may cause low blood counts, infection, bleeding, or fatigue.

Declarative Memory

Memory for facts, information, and personal events that a person can consciously remember and describe.

Decoction

A preparation made by simmering plant material in water to extract soluble substances. The strength and safety depend on the plant, preparation, dose, contamination, and interactions with medicines.

Decompensated Cirrhosis

Cirrhosis with complications such as fluid buildup in the abdomen (ascites), bleeding from enlarged veins in the esophagus or stomach, jaundice, or hepatic encephalopathy, which can impair thinking and alertness.

Decomposition

The natural breakdown of a dead body after death. Cells and tissues first break down themselves, followed by the action of microorganisms; the speed and appearance depend on temperature, moisture, and other conditions.

Decompression

Reduction of pressure on a tissue or body compartment, such as removing pressure from a spinal nerve, draining an obstructed organ, or treating pressure changes after diving.

Decompression Sickness

Illness caused by nitrogen bubbles forming in the body when pressure falls too quickly, usually after diving. It may cause joint pain, skin changes, breathing problems, weakness, confusion, or paralysis.

Deconditioning

Loss of strength, fitness, balance, and function after inactivity, illness, or prolonged bed rest. It increases fall risk but can often improve gradually with safe movement, exercise, nutrition, and rehabilitation.

Decongestant

A medicine that reduces swelling inside the nose and relieves nasal congestion. Some oral decongestants can raise blood pressure or speed the heartbeat; prolonged use of some nasal sprays can cause rebound congestion.

Alternate Names:
Decongestants; Nasal Decongestants

Decontamination

Steps that remove or reduce a harmful substance from the skin, eyes, clothing, or digestive tract and prevent further absorption. The correct method depends on the substance; some exposures require washing, irrigation, or specialist treatment.

Decorin

A small protein-sugar molecule found around cells. It helps organize collagen, influences tissue growth and repair, and may affect scar formation.

Decorticate Posture

Abnormal bending of the arms with straightening of the legs, caused by severe injury to the brain. It is a sign of serious brain damage and reduced consciousness.

Decorticate Posturing

Alternate name; see *Decorticate Posture*.

Decorticate Rigidity

Alternate name; see *Decorticate Posture*.

Alternate Names:
Decorticate Posturing; Flexor Posturing

Decreased Alertness

Decreased alertness is reduced awareness or responsiveness that may result from metabolic illness, intoxication, infection, seizure, stroke, trauma, or sleep-related causes.

Decreased Appetite

A pathological or temporary reduction in the desire to ingest food, commonly caused by systemic illness, chronic infection, malignancy, psychological stress, depression, or medications.

Alternate Names:
Anorexia; Hyporexia; Loss of Appetite; Poor Appetite

Decreased Breath Sounds

Softer-than-normal sounds heard when listening to the lungs, suggesting reduced air movement. Causes include fluid or air around the lung, partial lung collapse, blockage, or shallow breathing; sudden one-sided loss can be an emergency.

Decreased Concentration

Reduced ability to sustain attention or mental focus; causes include sleep loss, stress, medications, mood disorders, substance use, and neurologic or medical illness.

Decreased Dentin

Reduced thickness or formation of dentin, the mineralized tissue beneath tooth enamel; causes include developmental defects, wear, erosion, caries, or dental treatment.

Decreased Libido

Reduced sexual desire that may be related to relationships, mood, stress, medications, hormones, chronic illness, pain, or other health factors.

Decreased Tear Production

Lower-than-normal production of the watery part of tears. It can contribute to dry-eye disease, although dry eye can also result from poor tear quality or excessive evaporation.

Decubitus

A lying or reclining position; the term also appears in decubitus ulcer, a pressure injury caused by prolonged pressure and shear.

Decubitus Ulcer

Older term for a pressure injury: damage to skin or underlying tissue caused by sustained pressure, often with shear, usually over a bony area or beneath a medical device. Injury can range from persistent discoloration to an open wound or deeper tissue damage.

Deep

Located farther inside the body or a structure, away

from its surface. For example, deep muscles lie beneath muscles closer to the skin.

Deep Brain Stimulation

A treatment in which implanted electrodes deliver electrical pulses to specific brain targets to reduce symptoms. Common targets include the subthalamic nucleus or globus pallidus for Parkinson disease and dystonia, and the ventral intermediate nucleus of the thalamus for essential tremor.

Deep Femoral Artery

The profunda femoris artery, a major branch of the femoral artery that supplies the deep muscles of the thigh and gives rise to perforating branches.

Deep Infiltrating Endometriosis

Endometriosis that grows deeply into tissues around the uterus, bowel, bladder, or other pelvic structures. It may cause severe period pain, pain with sex or bowel movements, urinary symptoms, infertility, and sometimes requires complex specialist treatment.

Alternate Names:
DIE; Deep Endometriosis

Deep Neck Space Infection

A bacterial infection in one or more of the tissue spaces deep in the neck. It may cause neck swelling, severe throat pain, fever, difficulty swallowing, or breathing problems and can spread to the chest or threaten the airway.

Deep Sleep

The deepest stage of normal non-REM sleep, when a person is difficult to awaken and the body carries out important physical restoration. Too little may contribute to daytime sleepiness and poor function.

Deep Tendon Reflex

An involuntary monosynaptic muscle stretch reflex elicited by briskly tapping a tendon with a reflex hammer. The tap stretches muscle spindles, sending afferent impulses via Ia sensory fibers directly to alpha motor neurons in the spinal cord, producing rapid efferent contraction of the homonymous muscle. Evaluates specific spinal cord segments and peripheral nerve roots: biceps reflex (C5–C6, musculocutaneous nerve), brachioradialis reflex (C6, radial nerve), triceps reflex (C7, radial nerve), patellar reflex (L4, femoral nerve), and Achilles reflex (S1, tibial nerve). Graded clinically on a scale from 0 to 4+ (0: absent; 1+: hypoactive; 2+: normal; 3+: hyperactive without clonus; 4+: hyperactive with sustained clonus). Hypoactive or absent reflexes denote lower motor neuron lesions or peripheral neuropathies; hyperactive reflexes and clonus indicate upper motor neuron lesions with loss of descending cortical inhibition.

Alternate Names:
Deep Tendon Reflexes; Muscle Stretch Reflex; Myotatic Reflex

Deep Tendon Reflexes

Plural form; see *Deep Tendon Reflex*.

Deep Vein Thrombosis

The formation of a blood clot (thrombus) within a deep vein, most commonly deep inside the legs, thighs, or pelvis. It usually develops when blood flow slows down (such as during prolonged bed rest, surgery, or long travel), when the vein wall is damaged, or when a medical condition makes blood clot more easily. Symptoms often include swelling, tenderness, warmth, and aching pain in the affected leg, though some clots cause no symptoms. The primary danger is that a piece of the clot can break loose and travel to the lungs, causing a life-threatening pulmonary embolism.

Alternate Names:
DVT; Deep Venous Thrombosis; Deep Venous Thrombosis (DVT); Phlebothrombosis

Deep Vein Thrombosis Ultrasound

An ultrasound examination that checks whether deep veins compress normally and whether blood flows through them. A vein that does not compress may contain a clot; results are interpreted with symptoms and other tests.

Deep Venous Reflux

Backward flow of blood through weakened valves in

deep veins. It can cause long-term leg swelling, heaviness, skin changes, pain, and ulcers from increased pressure in the veins.

Deerfly Fever

An older name for tularemia, an infection caused by *Francisella tularensis*. It can spread through tick or deerfly bites, infected animals, contaminated water, or inhalation and may cause fever, ulcers, swollen lymph nodes, pneumonia, or severe systemic illness.

De-Escalation

A set of verbal and nonverbal techniques used to reduce agitation and prevent violence while preserving dignity and safety. It includes calm communication, appropriate personal space, clear limits, environmental modification, and offering choices.

Defaecation

The expulsion of stool from the rectum through the anus. Difficulty, pain, urgency, incontinence, bleeding, or a sustained change in bowel habit may indicate constipation, anorectal disease, neurologic dysfunction, or another condition.

Defecation

The process of passing stool from the rectum through the anus. It involves signals from a full rectum, contraction of the bowel, and relaxation of the anal muscles, followed by voluntary control of timing.

Defecation Syncope

Fainting during or immediately after defecation, usually a situational reflex involving straining, reduced venous return, and a temporary fall in blood pressure.

Defecography

An imaging test that records the rectum and pelvic floor while a person passes a soft contrast material. It can show prolapse, a bulge, inward telescoping, or poor coordination causing difficult stool passage.

Defective Virus

A virus missing genetic information needed to reproduce independently. It can multiply only with help from another virus or host system and may influence infection without always causing disease on its own.

Defence Mechanisms

Mental processes that help a person manage conflict, anxiety, or distress, often without conscious awareness. They may be helpful or harmful depending on how rigidly they are used and how they affect daily life.

Defense Mechanism

An automatic, involuntary psychological process operating largely outside conscious awareness to mediate between internal instinctual drives (id), external reality, and moral conscience (superego), shielding the individual from severe anxiety, guilt, or psychic distress. Categorized systematically by George Vaillant into four developmental levels: pathological/psychotic defenses (delusional projection, denial, psychotic distortion); immature defenses (acting out, passive-aggressive behavior, projection, splitting, fantasy); neurotic defenses (displacement, dissociation, intellectualization, isolation of affect, rationalization, reaction formation, repression); and mature defenses (altruism, anticipation, humor, sublimation, suppression), which are associated with healthy psychosocial adaptation.

Alternate Names:
Defense Mechanisms; Ego Defenses

Defense Mechanisms

Plural form; see *Defense Mechanism*.

Defenses

The body's protective mechanisms against infection, injury, and other threats, including physical barriers and immune responses.

Alternate Names:
Host Defenses; Immune Defenses

Defense Wounds

Injuries to the hands, wrists, arms, or other ar-

eas that may occur when a person tries to protect against an attack. Their appearance and location can support a forensic interpretation but cannot prove how an injury happened by themselves.

Defensin

A small protective protein made by skin, lining tissues, and immune cells. It can damage microbes and is part of the body's early defense against infection.

Deferasirox

An oral iron-chelating medicine used to reduce chronic iron overload when clinically indicated; kidney, liver, hearing, and gastrointestinal toxicity require monitoring.

Deferiprone

An oral iron chelator used for transfusional iron overload; neutropenia or agranulocytosis is an important adverse effect requiring blood-count monitoring.

Deferoxamine

A parenteral iron chelator used for severe or chronic iron overload and sometimes aluminum toxicity; treatment requires monitoring for ocular, auditory, renal, and infectious complications.

Defibrillation

Delivery of an electrical shock to stop ventricular fibrillation or pulseless ventricular tachycardia during cardiac arrest. The shock can restore an organized rhythm and is used with cardiopulmonary resuscitation.

Defibrillator

A device that delivers an electrical shock to treat certain life-threatening abnormal heart rhythms. External defibrillators are used during cardiac arrest; implanted devices can detect and treat dangerous rhythms automatically.

Defibrillator Implant

An implanted device that continuously monitors heart rhythm and can use pacing or an electrical shock to stop dangerous fast rhythms. It may be recommended for selected people at high risk of sudden cardiac arrest.

Deficiency Diseases

Illnesses caused by too little of a needed nutrient or other substance, such as iron, iodine, vitamin D, or vitamin B12. Symptoms depend on the missing substance.

Deficient Color Vision

Alternate name; see *Color Blindness*.

Deformation

An alteration in the shape or structure of a body part, tissue, or material caused by developmental forces, injury, disease, pressure, or mechanical stress.

Deformity

An abnormal shape, alignment, or structure of a body part caused by development, injury, disease, pressure, or unusual growth. It may affect appearance, movement, comfort, or organ function.

Degarelix

An injected hormone-blocking medicine that rapidly lowers testosterone. It is used for advanced prostate cancer; injection-site reactions, hot flushes, bone loss, and other hormone-related effects may occur.

Degeneration

Progressive structural or functional deterioration of cells, tissues, or organs caused by aging, disease, injury, inherited factors, or other processes.

Degenerative

Describing gradual deterioration or loss of structure or function in a tissue or organ. The term does not by itself specify the cause, rate of change, or whether the damage is reversible.

Degenerative Arthritis

Alternate index label; see *Osteoarthritis*.

Degenerative Cervical Myelopathy

Spinal-cord dysfunction caused by age-related

changes in the neck that narrow the spinal canal and compress the cord. It may cause hand numbness or clumsiness, limb weakness, balance or walking problems, and sometimes bladder or bowel changes; worsening symptoms can reflect progressive cord compression.

Alternate Names:
Cervical Spondylotic Myelopathy; DCM

Degenerative Chorea

Progressive involuntary, dance-like movements caused by degeneration of brain circuits that control movement. The term is most often used for chorea associated with Huntington disease, which can also affect thinking, mood, behavior, speech, and swallowing.

Degenerative Disc

Age-related or other structural changes in a spinal disc, such as drying or loss of height. These changes may occur without symptoms or contribute to back or neck pain and nerve compression.

Alternate Names:
DDD; Degenerative Disc Disease

Degenerative Disc Disease

Wear, drying, or cracking of the cushioning discs between spinal bones, often related to aging or injury. It may cause back or neck pain, stiffness, or nerve pressure; imaging changes can occur without symptoms.

Degenerative Disease

A broad term for a condition in which tissue or organ structure or function progressively worsens. Causes differ by disease and include aging, inherited changes, and ongoing injury; examples include osteoarthritis and some disorders of the brain and nerves. It is not one specific diagnosis.

Degenerative Disk Disease

Alternate spelling; see *Degenerative Disc*.

Degenerative Disorder

A disease in which progressive cellular or tissue deterioration causes loss of structure or function, as in neurodegenerative, joint, retinal, or muscle disorders.

Degenerative Joint Disease

Gradual loss of joint cartilage with changes in nearby bone and tissues, commonly meaning osteoarthritis. It can cause pain, stiffness, swelling, reduced movement, and difficulty with daily activities.

Alternate Names:
Osteoarthritis

Degenerative Rotator-Cuff Disorders

A group of shoulder problems that develop from gradual degeneration of the rotator-cuff tendons, often associated with aging or repeated use. They include tendon degeneration and partial or complete tears. They may cause shoulder pain or weakness, but some degenerative tears cause no symptoms.

Degenerative Spine Disease

Wear-related changes in the spinal discs, joints, or bones that can cause back or neck pain, stiffness, reduced movement, or pressure on nerves. Symptoms may include leg or arm pain, numbness, weakness, or walking difficulty.

Degenerative Spondylolisthesis

Forward slipping of one spinal bone over another because joints and disks have worn down, sometimes causing back pain, leg pain, or nerve compression.

Deglutition

The coordinated process of moving food, liquid, or saliva from the mouth through the throat and esophagus into the stomach. Problems can cause choking, coughing, or food entering the airway.

Alternate Names:
Swallowing

Degos Disease (Malignant Atrophic Papulosis)

A rare occlusive small-vessel disease causing multiple porcelain-white, atrophic skin papules with a surrounding pink or violaceous rim. It may remain

limited to the skin or involve the intestine, brain, or other organs; systemic involvement may cause abdominal pain, headache, or neurologic symptoms.

Degranulation

Release of stored chemicals from cells such as mast cells, white blood cells, and platelets. The chemicals help respond to injury or infection but can also cause allergy, inflammation, blood-vessel changes, or clotting.

Degrees Fahrenheit

A unit on the Fahrenheit temperature scale. In clinical care, body temperature may be reported in Fahrenheit; 98.6 degrees Fahrenheit is an approximate average normal oral temperature, not a universal threshold.

Dehiscence

Partial or complete separation of a healing wound or surgical closure. It may involve only the skin or deeper tissues; increasing pain, drainage, or exposed tissue can indicate wound complications.

DEHP

Di(2-ethylhexyl) phthalate, a chemical added to some plastics to make them flexible. Repeated or high exposure may affect reproduction, development, or hormone function, so medical exposure is limited when possible.

Dehydration

Loss of more water and electrolytes than are replaced, often from vomiting, diarrhea, fever, sweating, or poor fluid intake. It can cause thirst, dry mouth, reduced urination, dizziness, fast heartbeat, abnormal electrolyte levels, or shock.

Dehydroascorbic Acid

The oxidized form of vitamin C. Cells can take it up and convert it back to active vitamin C, allowing it to participate in antioxidant and other chemical reactions.

Dehydroepiandrosterone

A hormone made mainly by the adrenal glands that the body can convert into other sex hormones. Levels change with age and illness; supplements may cause acne, unwanted hair, mood changes, or medicine interactions.

Deinstitutionalize

To help a person leave long-term institutional care and live in the community with suitable housing, healthcare, and support. The plan should protect safety, treatment needs, and independence.

Deiodinase

An enzyme that removes iodine from thyroid hormones and changes how active they are. Different tissues use these enzymes to help control metabolism, growth, brain development, and responses to thyroid hormone.

Deja Vu

Alternate spelling; see *Déjà Vu*.

DILE

Autoimmune reaction resembling systemic lupus that is triggered by specific prescription medications. See *Drug-Induced Lupus Erythematosus*.

Déjà Vu

A brief feeling that a new situation has happened before. Occasional episodes are common. Repeated episodes with loss of awareness or unusual movements may occur with seizures.

Dejerine-Roussy Syndrome

Persistent burning, aching, or painful abnormal sensation on one side of the body after a stroke damages a deep brain sensory area. Normally harmless touch or temperature may become painful.

De Lange Syndrome

A congenital developmental disorder, also called Cornelia de Lange syndrome, involving characteristic facial features, growth and developmental delay, limb abnormalities of variable severity, and intellec-

tual disability.

Alternate Names:
Cornelia De Lange Syndrome

Delavirdine

An older HIV medicine that blocks reverse transcriptase, an enzyme HIV needs to copy its genetic material. It was used with other HIV medicines, but resistance and drug interactions limit its use.

Delayed Cord Clamping

Waiting, commonly 30–60 seconds or longer, before clamping the umbilical cord after birth. This allows extra blood to reach the newborn and may improve early circulation and iron stores; timing depends on both patients' condition.

Delayed Ejaculation

Persistent difficulty or inability to ejaculate despite adequate sexual stimulation, causing distress. Medicines, nerve or hormone problems, chronic illness, psychological factors, and relationship circumstances may contribute.

Delayed Emergence

Failure to wake and respond as expected after anesthesia. Causes include lingering anesthetic medicines, low body temperature, abnormal blood sugar or salts, breathing problems, stroke, or other complications.

Delayed Gastric Emptying

Alternate index label; see *Gastroparesis*.

Delayed Graft Function

Poor early function of a transplanted kidney, usually related to ischemia-reperfusion injury. In studies it is often defined as needing dialysis within the first seven days after transplant, although definitions vary.

Alternate Names:
DGF

Delayed Growth

Slower-than-expected increase in a child's height, weight, or head size. Nutrition, chronic disease, hormone problems, genetic conditions, and family growth pattern can contribute; growth patterns are evaluated over time.

Delayed Hemolytic Transfusion Reaction

Immune destruction of transfused red blood cells that develops more than 24 hours and up to 28 days after transfusion. It usually occurs when a recipient's antibody response to a red-cell antigen rises again and may cause jaundice or an unexpected fall in hemoglobin.

Alternate Names:
DHTR

Delayed Hypersensitivity

An immune reaction that develops hours or days after exposure rather than immediately. It can cause contact dermatitis, some medicine rashes, or a reaction to a tuberculosis skin test.

Delayed or Absent Tooth Formation

Delayed or absent tooth formation means teeth develop or erupt later than expected or fail to form, due to local, genetic, endocrine, nutritional, or systemic causes.

Delayed Orgasm

Persistent difficulty or inability to reach orgasm despite adequate stimulation, causing distress. Medicines, illness, hormonal or nerve problems, anxiety, trauma, and relationship factors may contribute.

Delayed Puberty

Puberty that has not begun by the expected age or is progressing unusually slowly. Common thresholds are no breast development by age 13 in girls or no testicular enlargement by age 14 in boys. Primary amenorrhea is defined by absent menstruation by age 15 or more than three years after breast development. Causes include constitutional delay, chronic illness, undernutrition, and gonadal or hypothalamic-pituitary disorders.

Delayed Puberty In Boys

Failure of testicular enlargement, the first usual sign of puberty in boys, by age 14. Causes include constitutional delay, chronic illness, undernutrition, primary testicular disorders, or impaired hypothalamic-pituitary signaling. Slowed or arrested pubertal progression is also abnormal.

Delayed Puberty In Girls

Failure of breast development by age 13, or absent menstruation by age 15 or more than three years after breast development. Causes include constitutional delay, low energy availability, chronic illness, ovarian insufficiency, or impaired hypothalamic-pituitary signaling. Puberty that stops progressing may also indicate an underlying disorder.

Delayed Sleep Phase

A body-clock pattern in which a person naturally falls asleep and wakes much later than desired. Sleep may be normal at the preferred times but interfere with school, work, or social activities.

Alternate Names:
Delayed Sleep-Wake Phase Disorder (DSWPD); Delayed Sleep Phase Syndrome (DSPS)

Delayed Sleep Phase Syndrome

Alternate name; see *Delayed Sleep Phase*.

Delayed Sleep-Wake Phase Sleep Disorder

Alternate name; see *Delayed Sleep Phase*.

Deletion

Loss of a section of DNA or part of a chromosome. The effects depend on the size, location, and genes involved; deletions may cause no problems or lead to inherited, developmental, or medical disorders.

Deletion Mutation

A genetic change in which one or more DNA building blocks are missing. Its effect depends on the location and size of the deletion and whether it changes a gene or its control region.

Delftia

A group of oxygen-using bacteria found mainly in soil and water. Human infection is uncommon but can occur as an opportunistic infection, especially in people with weakened immunity or medical devices.

Delirium

A sudden, temporary state of severe mental confusion and fluctuating awareness. Unlike dementia, which develops slowly over months or years, delirium comes on quickly—over hours or days—and symptoms often worsen at night. It is caused by an underlying medical problem such as an acute infection, medication reaction or withdrawal, dehydration, surgery, or organ failure. Common signs include trouble paying attention, disorientation, disordered thinking, memory loss, and hallucinations or agitation.

Delirium In Anesthesia

Sudden confusion, poor attention, and changing awareness during recovery from anesthesia or surgery. Possible causes include medicines, infection, pain, low oxygen, dehydration, or abnormal body chemistry.

Delirium Superimposed On Dementia

Delirium occurring in a person who already has dementia. The sudden, fluctuating worsening in attention and awareness differs from the person's usual cognitive impairment and may be triggered by illness, medicines, dehydration, or hospitalization.

Delirium Tremens

A severe, life-threatening form of alcohol withdrawal that occurs in people with long-standing heavy alcohol dependence when they abruptly stop drinking, usually developing two to four days after the last drink. Because the nervous system has adapted to constant alcohol exposure, sudden withdrawal triggers extreme nervous system overactivity. Symptoms include severe mental confusion, shaking (tremors), high fever, heavy sweating, elevated heart rate and blood pressure, extreme agitation, and vivid hallucinations.

Delirium Tremens (DTs)

A severe, potentially fatal form of alcohol withdrawal characterized by delirium, agitation, tremor, autonomic overactivity, hallucinations, and sometimes seizures, usually beginning several days after reduction or cessation of heavy drinking.

Delivery

Childbirth, ending with birth of the baby and delivery of the placenta. It may occur through the vagina, sometimes with forceps or vacuum assistance, or through cesarean surgery.

Delivery Of Posterior Arm

A maneuver for shoulder dystocia in which the clinician brings the baby's back arm through the birth canal. This reduces the width of the shoulders and may help complete delivery.

Delivery Presentations

The fetal body part positioned to enter the birth canal first. Common presentations are head-first, breech, and shoulder; the presentation affects delivery planning and risks.

Delta Agent

An older name for hepatitis D virus, which can reproduce only when hepatitis B virus is present. Infection may cause severe acute hepatitis or worsen long-term liver disease.

Delta-ALA Urine Test

A urine test measuring a substance used to make hemoglobin. Increased levels may occur with acute porphyria or lead poisoning and are interpreted with symptoms and other tests.

Deltacoronavirus

A group of coronaviruses identified by their genetic features. Some infect birds or mammals, and their ability to infect people or cause disease depends on the specific virus and host.

Deltaretrovirus

A group of viruses that includes human T-cell leukemia viruses. They copy their RNA into DNA inside infected cells; some can persist for years and cause blood-cell disorders or cancer.

Delta-Tocopherol

One form of vitamin E found in foods and supplements. It has antioxidant activity, but alpha-tocopherol is the main form maintained in human blood and used to assess vitamin E status.

Delta Waves

Very slow electrical brain waves that are normal during deep non-REM sleep. Excessive delta activity while awake may indicate brain dysfunction; significance depends on symptoms and other tests.

Alternate Names:
Delta Rhythm

Deltoid

The large, triangular muscle covering the shoulder. It helps lift the arm and stabilize the shoulder joint; injury or nerve damage can cause pain and weakness.

Deltoid Ligament

A strong, fan-shaped triangular ligament complex on the medial aspect of the ankle joint, composed of superficial and deep components originating from the medial malleolus and attaching to the talus, calcaneus, and navicular bones to resist excessive eversion.

Alternate Names:
Medial Collateral Ligament of the Ankle

Deltoid Muscle

A triangular shoulder muscle attached to the collarbone, shoulder blade, and upper arm. Its front, middle, and back fibers move the arm forward, outward, and backward; the axillary nerve supplies it.

Delusion

A firmly held false belief that remains despite clear evidence to the contrary and is not explained by the person's cultural background. It may involve

persecution, grandiosity, illness, or other themes.

Delusional Disorder

A mental disorder with one or more persistent delusions lasting at least one month, while overall functioning is relatively preserved. Hallucinations, if present, relate closely to the delusional belief.

Delusional Infestation

A fixed belief that the body is infested by a living agent, such as a parasite, or by nonliving material, such as fibers, despite lack of objective evidence of infestation. It may occur as a primary delusional disorder or secondary to a psychiatric, neurologic, medical, medication-related, or substance-related condition.

Demarcation

A clear boundary between two areas or conditions, such as the line separating healthy tissue from tissue that has died. It may guide diagnosis or treatment.

Demeclocycline

A tetracycline antibiotic that blocks bacterial protein production. It was also used to reduce excess water retention in some patients with inappropriate antidiuretic hormone secretion; adverse effects include sun sensitivity and kidney or liver problems.

Demecolcine

A colchicine-related substance that disrupts microtubules, structures needed for cell division. It has limited medical use and can be highly toxic, causing gastrointestinal, blood-cell, nerve, or organ injury.

Dementia

A lasting decline in memory, thinking, language, judgment, or other mental abilities that interferes with independent daily life. Causes include brain diseases, blood-vessel disease, infections, medicines, and some treatable medical problems.

Alternate Names:
Major Neurocognitive Disorder

Dementia And Driving

The effect of cognitive impairment on driving safety. Assessment considers memory, judgment, visuospatial skills, reaction time, medications, and local licensing requirements.

Dementia Behavioral and Sleep Changes

Changes in behavior or sleep that can occur with dementia, including agitation, wandering, altered sleep timing, or increased confusion later in the day. Causes and patterns vary; these changes are not unique to dementia.

Dementia Due To Metabolic Causes

Cognitive impairment caused or worsened by metabolic problems such as thyroid disease, vitamin deficiency, organ failure, electrolyte disturbance, or medication toxicity; some causes are treatable.

Dementia with Lewy Bodies

Alternate name; see *Lewy Body Dementia*.

Alternate Names:
DLB; Lewy Body Dementia

Demethylation

Removal of a small chemical group called a methyl group from a molecule such as DNA or a protein. In DNA, this change can alter which genes are active and affect cell development or disease.

Demineralization

Loss of minerals from a tissue such as tooth enamel or bone. It can weaken the tissue, causing early tooth decay or contributing to fragile bones, depending on the cause.

Demulcent

A substance that coats and soothes irritated moist body linings, temporarily reducing discomfort from dryness, inflammation, or minor injury.

De Musset Sign

Repeated head nodding that matches the heartbeat. It can occur when the aortic valve leaks severely, but it is uncommon and cannot confirm the diagnosis

without examination and heart tests.

Demyelinating CNS Disease

A disorder in which the protective covering of nerves in the brain, spinal cord, or vision pathways is damaged. Causes include immune disease, infection, inherited conditions, toxins, and metabolic problems.

Demyelinating Disease

A disease in which the protective covering around nerve fibers is damaged. Nerve signals then slow or fail, causing problems such as weakness, numbness, vision changes, or poor coordination.

Demyelination

Loss or damage of myelin, the protective coating that helps nerve fibers send signals quickly. It can disrupt movement, sensation, vision, balance, or thinking and may result from immune, infectious, inherited, or toxic disorders.

Denaturant

A substance added to another product to change its taste, smell, or properties, often to make it unsuitable for drinking. Some denaturants are poisonous or irritating, so health effects depend on the product and amount swallowed or contacted.

Dendrite

A branching extension of a nerve cell that receives signals from other nerve cells or sensory receptors and carries those signals toward the cell body.

Dendrites

Plural form; see *Dendrite*.

Dendritic Cell

An immune cell that captures foreign material and shows pieces of it to other immune cells. This helps start a targeted immune response against infections and abnormal cells.

Dendritic Cells

Plural form; see *Dendritic Cell*.

Dendritic Spine

A tiny branch on a nerve cell that receives signals from other nerve cells. Its shape and number can change with learning, development, and some brain diseases.

Dendritic Ulcer

A branching epithelial ulcer of the cornea, classically caused by herpes simplex virus. It may cause a red eye, pain, light sensitivity, tearing, or reduced vision and requires ophthalmic assessment.

Denervate

To remove or interrupt the nerve supply to a tissue or organ, either deliberately during treatment or because of injury or disease. The change may reduce movement, sensation, pain, or automatic organ function.

Denervation

Denervation is loss of nerve supply to a muscle or tissue, causing weakness, atrophy, altered sensation, or autonomic dysfunction.

Dengue

A viral infection spread mainly by infected *Aedes* mosquitoes. It commonly causes sudden fever, severe headache, pain behind the eyes, muscle and joint aches, nausea, and sometimes a rash. Severe dengue can cause plasma leakage, bleeding, shock, or organ injury. NS1 antigen, nucleic-acid, or antibody tests support diagnosis depending on illness timing; aspirin and other nonsteroidal anti-inflammatory drugs increase bleeding risk.

Alternate Names:
Breakbone Fever; DENV Infection

Dengue Fever

Alternate name; see *Dengue*.

Dengue Hemorrhagic Fever

An older dengue classification for illness with plasma leakage and hemorrhagic manifestations, which could progress to shock. Current World Health Organization classification groups clinically severe

cases as severe dengue and separately identifies warning signs.

Dengue Shock Syndrome

An older classification term for shock caused by severe dengue, usually from plasma leakage and reduced circulating blood volume. Current World Health Organization classification uses the category severe dengue.

Dengue Virus

The virus that causes dengue fever and is spread mainly by infected Aedes mosquitoes. Four major types exist; protection after infection is strongest against the same type and does not reliably prevent later infection by other types.

Denial

A psychological response in which a person cannot or will not accept a distressing fact, diagnosis, or situation. It may briefly reduce distress but can delay needed decisions or treatment when persistent.

Denileukin Diftitox

A laboratory-made protein combining part of interleukin-2 with diphtheria toxin. It was used for selected cutaneous T-cell lymphomas by delivering the toxin to cells bearing the interleukin-2 receptor; toxicity limits use.

Dennie-Morgan Fold

A prominent, symmetrical single or double skin crease or infraorbital fold immediately below the margin of the lower eyelid, recognized as a characteristic cutaneous hallmark of atopic dermatitis and allergic diathesis.

Alternate Names:
Dennie-Morgan Line; Dennie Fold

Denominator

The number below the line in a fraction. In a medical rate or proportion, it represents the total population or group being compared with the number above it.

Denosumab

A medicine that blocks a protein needed to activate bone-destroying cells. It is used for osteoporosis and some cancer-related bone problems; stopping it without follow-up can cause rapid bone loss and spine fractures.

Denosumab For Osteoporosis

An injection given every six months that blocks a signal activating bone-destroying cells. It lowers fracture risk, including at the spine and hip; low calcium and rapid bone loss after stopping are recognized risks.

De Novo

Newly arising in an individual rather than inherited from either parent; the term is commonly used for genetic variants or disease presentations.

De Novo Variant

A genetic change found in a person that was not found in either biological parent. It usually begins in an egg, sperm, or very early embryo and may cause disease; testing parents can help estimate the chance in future pregnancies.

Dens

The tooth-shaped projection of the second neck vertebra. It fits into the first neck vertebra and acts as a pivot that allows the head to turn.

Dens Evaginatus

An extra bump or cusp on a tooth, most often a premolar. It may contain an extension of the tooth's nerve and can wear, break, or develop decay and pain.

Dens Invaginatus

An inward folding of a tooth's enamel and dentin that may reach the nerve. The pocket can trap bacteria and food, increasing the risk of early decay, nerve infection, and tooth loss.

Densitometry

Measurement of how dense a tissue is, most often

the mineral content of bone. A bone-density scan helps diagnose osteoporosis, estimate fracture risk, and monitor treatment.

Density

The amount of mass in a given volume. In medicine, density measurements help describe bone mineral content, tissue composition, fluid collections, or findings on imaging.

Dental Abscess

A pocket of pus caused by infection in a tooth or nearby gum. It may cause toothache, swelling, fever, or trouble opening the mouth. The infection can spread to the face or neck and, rarely, block breathing.

Dental Age

An estimate of a child's developmental age based on tooth formation, hardening, and eruption. It can help assess growth but does not exactly determine the child's actual age.

Dental Alloy

A mixture of metals used to make dental fillings, crowns, bridges, dentures, orthodontic appliances, or other restorations. Its strength, appearance, corrosion resistance, and possible allergies depend on its composition.

Dental Alveolus

The part of the upper or lower jawbone that forms a tooth socket and holds the tooth root. It can shrink after tooth loss or severe gum disease.

Dental Amalgam

A durable filling material made by mixing liquid mercury with powdered metals, mainly silver, tin, and copper. It is strong but has a silver color and may be unsuitable in some situations.

Dental Anesthesia

Use of local anesthetic, sedation, or occasionally general anesthesia to prevent pain or reduce anxiety during dental treatment. The method depends on the procedure, health, age, and patient preference.

Dental Anxiety

Fear or distress about dental treatment that may cause avoidance, delayed care, or difficulty during appointments. Reassurance, communication, pain control, and behavioral or medicine-based support may help.

Dental Arch

The curved arrangement of teeth and the bone supporting them in the upper or lower jaw. Its shape affects tooth alignment, bite, speech, chewing, and space for dental restorations.

Dental Articulator

A device that holds models of the upper and lower teeth and imitates jaw movements. It helps dental professionals design and adjust crowns, bridges, dentures, and other restorations so they fit the bite.

Dental Avulsion

Complete displacement of a tooth from its socket, usually caused by trauma. Avulsion of a permanent tooth is a time-sensitive dental emergency because prolonged drying damages the periodontal ligament; primary teeth are not replanted.

Dental Bone Graft

Surgery that adds bone or a bone-like material to the jaw. It may rebuild a thin area of jawbone or prepare the jaw for a dental implant.

Alternate Names:
Alveolar Ridge Augmentation; Maxillofacial Bone Grafting

Dental Braces

Fixed or removable appliances that apply gentle, controlled force to move teeth and improve their alignment or bite. Cleaning and periodic adjustment are part of treatment; possible problems include soreness, decay, gum disease, and root shortening.

Alternate Names:
Orthodontic Braces; Orthodontic Appliances

Dental Bridge

A fixed dental appliance that replaces one or more missing teeth by attaching artificial teeth to nearby teeth or implants. It can improve chewing and appearance and depends on healthy supporting teeth or implants.

Dental Calculus

Hardened plaque formed when minerals in saliva or gum fluid collect on teeth. It cannot be removed reliably by brushing alone and can contribute to gum inflammation and disease.

Dental Caries

Tooth decay that happens when bacteria in plaque use sugars to make acids that weaken and wear away a tooth. It can cause holes, sensitivity, pain, infection, or tooth loss.

Alternate Names:
Tooth Decay

Dental Cavities

Permanent holes or weakened areas caused when plaque bacteria use sugars and make acids that dissolve a tooth. Decay can spread from enamel into the deeper tooth, causing sensitivity, pain, infection, or tooth loss.

Dental Cement

A dental material used to attach crowns, bridges, or orthodontic bands, fill small spaces, or protect exposed tooth tissue. Its strength and use depend on the material and treatment.

Dental Ceramic

A tooth-colored material used for crowns, veneers, bridges, fillings, and implant restorations. It provides good appearance and resistance to wear, but its strength and suitability vary by type and location.

Dental Clasp

A part of a removable partial denture that rests against or around supporting teeth to help keep the denture in place. Poor fit or excessive pressure can irritate teeth or gums.

Dental Crown

A custom-fabricated, full-coverage prosthetic dental restoration cemented over the prepared coronal portion of a damaged, decayed, fractured, or endodontically treated tooth. It encases the visible tooth structure down to the gingival margin, restoring natural anatomical contour, occlusal masticatory function, structural durability, and aesthetics. Fabricated from diverse materials, including all-ceramic/porcelain (e.g., lithium disilicate, zirconia), porcelain-fused-to-metal (PFM), and cast metal alloys (gold or base metals).

Dental Crowns

Plural form; see *Dental Crown*.

Dental Deposit

Material that collects on a tooth, such as plaque, hardened tartar, food debris, or stain. Some deposits irritate the gums or support decay and may require professional cleaning.

Dental Disease

A disorder of the teeth, gums, jaw, or supporting tissues, including decay, gum disease, infection, and tooth loss. Fluoride, daily cleaning, limited frequent sugar exposure, and dental visits reduce risk.

Dental Drill

A powered dental handpiece with a rotating bur, driven by air or an electric motor, used to remove decayed tooth structure, shape teeth, prepare teeth for fillings or crowns, and perform other dental procedures. Different burs and speeds are selected for the material and procedure.

Alternate Names:
Dental Handpiece

Dental Dysplasia

Abnormal development of a tooth or its supporting tissue. It may change the tooth's shape, color, strength, position, or eruption and can increase the risk of wear, decay, or infection.

Dental Erosion

Gradual loss of tooth enamel caused by acid rather than bacteria. Acidic foods or drinks, reflux, vomiting, and some medicines may contribute, causing sensitivity or worn teeth; reducing acid exposure helps prevent progression.

Dental Extraction

Removal of a tooth from its jaw socket because of severe decay, infection, gum disease, impaction, crowding, trauma, or treatment planning. Risks include bleeding, infection, nerve injury, fracture, and dry socket.

Dental Fillings

Materials placed in a tooth after decay or damage is removed to restore its shape and function. Resin, glass ionomer, metal amalgam, or other materials may be used depending on the tooth and clinical situation.

Dental Fissure

A narrow natural groove or developmental defect in a tooth, especially on a chewing surface. Food and bacteria can collect there, increasing the risk of decay.

Dental Floss

A thin thread used to remove plaque and food between teeth and just below the gumline. Daily cleaning between teeth helps prevent gum inflammation but does not replace brushing or dental care.

Dental Fluorosis

Changes in tooth enamel caused by too much fluoride while the teeth are developing. It may appear as white lines or patches and, in more severe cases, brown discoloration or pits.

Dental Hygiene

Daily care of the teeth, gums, tongue, and mouth, including brushing with fluoride toothpaste and cleaning between teeth. It removes plaque and helps prevent decay, gum disease, and bad breath.

Dental Implant

A small biocompatible fixture placed in the jawbone to support a replacement tooth, bridge, or denture. Bone may grow around it for stability; risks include infection, poor healing, nerve injury, and implant failure.

Dental Implantation

The surgical insertion of an artificial titanium screw or post into the jawbone to serve as a sturdy anchor for a replacement tooth or crown; see *Dental Implant*.

Dental Impression Material

A material placed in a tray to make an accurate mold of the teeth and mouth tissues. The mold helps make crowns, dentures, orthodontic appliances, restorations, or study models.

Dental Injuries

Damage to teeth, gums, jawbone, or mouth tissues caused by a fall, blow, sports injury, accident, or biting force. Prompt assessment may save displaced or knocked-out teeth; severe bleeding or head injury is an emergency.

Alternate Names:
Traumatic Dental Injury

Dental Inlay

A custom-made filling fitted inside the grooves of a damaged tooth and bonded in place. It restores areas too large for a simple filling but does not cover the tooth's cusps like an onlay or crown.

Dental Material

A substance used in dental care, such as composite, amalgam, ceramic, metal, cement, bonding material, impression material, or implant material. Choice depends on the treatment, location, strength, appearance, and patient factors.

Dental Occlusion

The way the upper and lower teeth meet when the mouth closes or the jaw moves. An abnormal bite may contribute to difficulty chewing, tooth wear,

jaw pain, or muscle strain.

Dental Overjet

The horizontal distance between the upper and lower front teeth when the teeth are closed. A large overjet may increase the risk of trauma to the upper front teeth and affect biting.

Dental Papilla

Soft embryonic tissue beneath a developing tooth. Its cells form the dentin and living pulp, which contains the tooth's nerves and blood vessels.

Dental Pellicle

A thin protective film of salivary proteins that forms on tooth enamel soon after cleaning. Bacteria can attach to it and build dental plaque.

Dental Plaque

A sticky film of bacteria, saliva, and food material on teeth and along the gums. If not removed by brushing and cleaning between teeth, it can cause decay, gum inflammation, and gum disease.

Dental Polishing

Cleaning and smoothing tooth surfaces, often after tartar has been removed. It can remove some surface stains but does not repair tooth decay or gum disease.

Alternate Names:
Coronal Polish

Dental Porcelain

A tooth-colored ceramic used for crowns, veneers, bridges, and other restorations. It provides a natural appearance but may chip or fracture under heavy force.

Dental Precision Attachment

A precision mechanical or magnetic interlocking device used to secure, stabilize, and retain a removable partial denture or overdenture to retained tooth roots, natural abutments, or dental implants.

Alternate Names:
Precision Attachment

Dental Procedure

An examination, preventive service, or treatment involving the teeth, gums, jaw, or mouth, such as cleaning, filling, extraction, root-canal treatment, or restoration. Benefits and risks depend on the procedure.

Dental Prosthesis

An artificial replacement for one or more missing teeth or nearby mouth tissues, such as a denture, bridge, crown, or implant-supported restoration. It restores appearance, speech, and chewing.

Dental Public Health

Efforts to prevent and control oral disease in communities. They include fluoride programs, oral-health education, screening, disease monitoring, access to dental care, and policies that reduce differences in oral health.

Dental Pulp

The living soft tissue at the center of a tooth. It contains nerves, blood vessels, and connective tissue and can become inflamed or infected when decay or injury reaches it.

Dental Pulpitis

Inflammation of the soft tissue inside a tooth, commonly caused by decay, trauma, a crack, or dental treatment. Brief pain may be reversible; spontaneous or lingering pain may require root-canal treatment or extraction.

Dental Pulp Necrosis

Death of the soft tissue inside a tooth, usually after untreated inflammation, deep decay, trauma, or loss of blood supply. The tooth may become discolored and develop infection around its root.

Dental Radiographs

X-ray images of the teeth and jaws used to find decay, bone loss, infection, impacted teeth, fractures, and developmental problems. Types include

bitewing, periapical, occlusal, and panoramic views.

Dental Radiography

Use of X-rays to examine teeth and jaws. Bitewing, periapical, panoramic, and three-dimensional scans answer different questions; exposure is kept as low as reasonably achievable while obtaining useful images.

Dental Restorative Materials

Materials used to repair teeth, including composite resin, glass ionomer, amalgam, ceramic, and metal alloys. Selection depends on tooth location, size of damage, strength, appearance, moisture control, cost, and patient needs.

Dental Root

The part of a tooth below the gum that anchors it in the jawbone. It contains a canal with nerves and blood vessels and is covered by cementum and supported by a ligament. Infection, decay, cracks, or loss of bone around the root can cause pain and tooth loosening.

Dental Sac

A layer of tissue surrounding a developing tooth. It forms the tissues that support the tooth, including the periodontal ligament, cementum, and part of the surrounding jawbone.

Dental Screening

A check of the teeth, gums, and mouth to look for decay, gum disease, oral lesions, or risk factors before serious symptoms develop. Screening does not replace a complete dental examination.

Dental Sealant

A thin protective coating placed in the grooves of teeth, especially molars. It blocks food and bacteria from collecting in deep pits and lowers the risk of decay.

Dental Sealants

Plural form; see *Dental Sealant*.

Dental Sleep Apnea Therapy

Alternate name; see *Oral Appliance Therapy*.

Dental Splint

A dental device used to support, protect, or immobilize loose, replanted, fractured, or injured teeth while they heal. The term can also refer to removable appliances used to protect teeth from grinding or to support treatment of jaw disorders.

Alternate Names:
Trauma Splint; Tooth Splint

Dental Trauma

Alternate name; see *Dental Injuries*.

Dental Traumatology

The prevention, assessment, and treatment of injuries to teeth and surrounding mouth tissues. Injuries may involve cracks, fractures, displacement, root damage, or complete tooth loss.

Dental X-Ray

Radiographic imaging of the teeth, gums, and jawbones; see *Dental X-Rays*.

Dental X-Rays

X-ray images of teeth and jaws used to detect decay, bone loss, infection, impacted teeth, fractures, developmental problems, and other disease not visible during an examination.

Dentate Gyrus

A curved region of the hippocampus that helps process incoming information and form memories. Studies suggest that new neurons may form there in adulthood, including in humans, but the extent and functional importance of adult human hippocampal neurogenesis remain debated.

Dentate Line

A zigzag transverse anatomical boundary in the anal canal separating the upper two-thirds (endodermal origin, simple columnar epithelium, autonomic visceral innervation) from the lower one-third (ectodermal origin, stratified squamous epithelium, somatic

pudendal innervation).

Alternate Names:
Pectinate Line

Dentatorubral-Pallidoluysian Atrophy

A rare inherited brain disorder caused by an extra-long repeated section of the ATN1 gene. Symptoms vary with age and may include seizures, poor coordination, involuntary movements, behavior changes, and worsening thinking ability.

Alternate Names:
DRPLA; Haw River Syndrome; Naito-Oyanagi Disease

Dent Disease

An inherited disorder of the kidney's filtering tubes, usually affecting boys. It causes loss of small proteins in urine, excess urinary calcium, kidney stones or calcium deposits, and sometimes progressive kidney failure.

Dentifrice

A preparation, such as toothpaste or tooth powder, used to clean teeth. Fluoride dentifrice strengthens enamel and helps prevent tooth decay when used regularly.

Dentigerous Cyst

A fluid-filled sac that forms around the crown of an unerupted tooth, usually in the jaw. It may cause swelling, move nearby teeth, or damage bone if it becomes large or infected.

Dentin

The hard tissue beneath tooth enamel that forms most of the tooth. Tiny channels within it can transmit sensitivity, especially when dentin is exposed by decay, wear, gum recession, or injury.

Dentin Hypersensitivity

Alternate term; see *Dentin Sensitivity*.

Dentinogenesis

Formation of dentin by specialized cells during tooth development and repair. Abnormal dentin formation may produce weak, discolored, sensitive teeth that wear or fracture easily.

Dentinogenesis Imperfecta

An inherited disorder in which dentin forms abnormally, causing teeth that may look blue-gray or amber and break, wear, or discolor easily. Some forms occur with fragile bones.

Dentin Sensitivity

Brief, sharp tooth pain caused by cold, heat, sweet foods, touch, or air reaching exposed dentin. Decay, worn enamel, gum recession, cracks, or aggressive brushing can expose it.

Dentist

A licensed healthcare professional who examines, prevents, diagnoses, and treats diseases and injuries of the teeth, gums, jaw, and mouth.

Dentistry

The healthcare field concerned with preventing, diagnosing, and treating disorders and injuries of the teeth, gums, jaw, and mouth, including restoration, replacement, and oral health education.

Dentition

The teeth present in the mouth, including their number, arrangement, development, and eruption. Children usually have primary teeth that are replaced by permanent teeth; disease, injury, or development can alter either set.

Denture

A removable prosthetic appliance designed to replace missing teeth and their surrounding alveolar ridge and mucosal tissues, restoring mastication, speech articulation, lip and facial contour support, and dentofacial aesthetics. Categorized into complete dentures (indicated in edentulous dental arches, relying on mucosal seal and saliva adhesion) and removable partial dentures (RPDs, indicated in partially dentate arches, utilizing cast clasps or precision attachments anchored to remaining natural abutment teeth).

Denture Base

The part of a denture that rests on the gums and mouth tissues and supports the artificial teeth. Its shape and fit distribute chewing pressure and help prevent soreness.

Denture Problems

Difficulties caused by a removable denture, including poor fit, looseness, pain, sores, breakage, difficulty chewing or speaking, or infection. A dental review may correct the cause or determine whether replacement is needed.

Dentures

Plural form; see *Denture*.

Denturist

A dental professional authorized in some regions to make, fit, adjust, and repair removable dentures within the local scope of practice. Dentists may also assess oral disease and provide related treatment.

Denver Developmental Screening Test

A screening questionnaire and task-based assessment for young children that checks personal-social, fine-motor, language, and gross-motor skills. It identifies possible developmental delay but does not diagnose its cause.

Denys-Drash Syndrome

A rare genetic disorder caused by changes in the *WT1* gene. It can cause severe kidney disease, differences in sex development, and a high risk of Wilms kidney tumor in childhood.

Deoxycoformycin

An anticancer medicine that blocks an enzyme needed by some cells to make DNA. It was used for selected blood cancers and can suppress bone marrow, weaken immunity, and increase the risk of serious infections.

Deoxycytidine

A DNA building block made of the base cytosine joined to the sugar deoxyribose. Cells use it to make and repair DNA.

Deoxycytidine Kinase

An enzyme that chemically activates deoxycytidine and some similar medicines. The activated medicines can interfere with the DNA of cancer cells or viruses and stop them from multiplying.

Deoxyglucose

A molecule resembling glucose that is used mainly in research and PET imaging. When labeled with a radioactive form of fluorine, it can show tissues using unusually large amounts of glucose, including many tumors and areas of inflammation.

Deoxyguanosine

A DNA building block made of the base guanine joined to the sugar deoxyribose. Cells use it to make and repair DNA.

Deoxyhemoglobin

Hemoglobin that is not carrying oxygen. A high amount in blood near the skin can make the lips, skin, or nail beds appear blue, a finding called cyanosis.

Deoxyribonuclease

An enzyme that breaks DNA into smaller pieces. An inhaled laboratory-made form can thin thick mucus in some people with cystic fibrosis by breaking down DNA released from damaged cells.

Deoxyribonucleic Acid

Full name; see *DNA*.

Deoxyribonucleosides

Molecules made of one of the four DNA bases joined to the sugar deoxyribose. Cells use them as starting materials when making or repairing DNA.

Deoxyribonucleotides

DNA building blocks made of a base, deoxyribose sugar, and phosphate groups. The four forms—dATP, dGTP, dCTP, and dTTP—are assembled into DNA strands.

Dependence

Physical adaptation to repeated exposure to a medicine or substance, so that reducing or stopping it can cause withdrawal symptoms. Dependence can occur with or without addiction.

Dependent Personality Disorder

A long-term pattern of excessive need to be cared for, difficulty making decisions independently, fear of separation, and submissive behavior that causes distress or impairs relationships and daily life.

Dependovirus

A group of small viruses that usually need another virus, such as an adenovirus or herpesvirus, to reproduce. They are generally not known to cause serious disease in healthy people.

Depersonalization

A feeling of being detached from or observing one's own body, thoughts, or emotions as if from outside. It can occur with anxiety, trauma, panic, substance use, or other mental health conditions.

Depersonalization-Derealization Disorder

A disorder causing repeated or persistent feelings that one's body, thoughts, emotions, or surroundings are unreal or distant, while the person knows these feelings are not literally true. Symptoms cause significant distress or impairment.

Depersonalization/Derealization Disorder

Alternate name; see *Depersonalization-Derealization Disorder*.

Dephosphorylation

Removal of a phosphate group from a molecule. This can switch proteins and other cell components on or off and change how cells communicate, use energy, grow, or respond to signals.

Depigmentation

Loss or reduction of normal pigment, especially melanin in the skin, hair, or mucous membranes. It may result from vitiligo, inflammation, injury, infection, chemical exposure, or treatment.

Depilation

Removal of hair at or near the skin surface by shaving, cutting, waxing, or a chemical product. It differs from epilation, which removes hair together with its root.

Depilatory Poisoning

Harmful exposure to a hair-removal product, usually by swallowing or contact with the eyes, skin, or airways. Ingredients may cause irritation, chemical burns, vomiting, or breathing problems.

Depolarization

A change that makes the inside of a cell less electrically negative. In nerve and muscle cells, it can start or transmit an electrical signal that produces movement or sensation.

Depolarizing Neuromuscular Blocker

A paralytic agent, exemplified exclusively by succinylcholine, that acts as an acetylcholine receptor agonist at the neuromuscular junction, inducing persistent membrane depolarization, transient muscle fasciculations, and subsequent flaccid motor paralysis.

Alternate Names:
Depolarizing Muscle Relaxant

Depot Implant

A small device placed in the body that releases medicine slowly over an extended period. It can provide steady treatment but may require a procedure for insertion and removal.

Deprescribing

A planned, supervised reduction or stopping of a medicine when its harms, burden, or limited benefit outweigh expected benefit. The plan considers withdrawal, return of illness, safer alternatives, and patient goals.

Depressed Fracture

A break in which bone is pushed inward, most often

in the skull. It can injure the brain or other underlying tissue, especially with neurologic symptoms.

Depression

Persistent low mood, loss of interest or pleasure, or both; it may occur as a symptom or as part of a depressive disorder. A major depressive episode involves at least five symptoms over the same two-week period, including low mood or loss of interest, and causes significant distress or impairment. Other symptoms may include changes in sleep, appetite, energy, concentration, movement, or self-worth.

Depression Screening

Use of questions or a validated questionnaire to identify possible depression. A positive screen is not a diagnosis; a clinician must assess symptoms, duration, impairment, medical causes, treatment needs, and safety.

Depressive Disorder

One of a group of mental disorders involving clinically significant depressive symptoms, such as low or irritable mood, reduced interest or pleasure, and changes in sleep, appetite, energy, or concentration. The symptom pattern and duration vary by diagnosis.

Depressive Illness

Broad, non-diagnostic term; see *Depressive Disorder*.

Depth Perception

The ability to judge how far away objects are and where they are in three-dimensional space. It depends mainly on using both eyes together and also on movement, size, shading, and perspective cues.

Depurination

Loss of the DNA bases adenine or guanine, leaving a gap in the DNA strand. If the gap is not repaired correctly, it can cause a genetic mutation.

De Quervain's Tendonitis

Alternate spelling; see *De Quervain Tenosynovitis*.

De Quervain's Tenosynovitis

Alternate spelling; see *De Quervain Tenosynovitis*.

De Quervain Tendinitis

Alternate name; see *De Quervain Tenosynovitis*.

De Quervain Tenosynovitis

Painful swelling and narrowing around the tendons on the thumb side of the wrist. It causes pain with thumb movement, gripping, or lifting and may cause tenderness or swelling near the base of the thumb.

Alternate Names:
Radial Styloid Tenosynovitis; De Quervain Tendinopathy

De Quervain Thyroiditis

A painful, temporary inflammation of the thyroid, often following a viral illness. It can cause neck tenderness and fever, with a temporary rise in thyroid hormone followed by a period of low levels before recovery.

Alternate Names:
Subacute Granulomatous Thyroiditis; Giant Cell Thyroiditis

Derbyshire Neck

Older term; see *Goiter*.

Dercum Disease (Adiposis Dolorosa)

Alternate names; see *Dercum's Disease*.

Dercum's Disease

A rare disorder characterized by multiple painful fatty growths, often with obesity, fatigue, and widespread tenderness. The cause is uncertain, and diagnosis is based on symptoms and examination after other causes are excluded.

Derealization

A feeling that the outside world is unreal, distant, dreamlike, or visually changed, while the person knows it is not literally unreal. It may occur with anxiety, panic, trauma, dissociation, or substance use.

Dermabrasion

A procedure that uses a rapidly rotating instrument to remove outer skin layers. It may improve selected scars, wrinkles, sun damage, or lesions but can cause pain, pigment changes, infection, or scarring.

Dermal

Relating to the dermis, the skin layer beneath the epidermis. The dermis contains connective tissue, blood vessels, nerves, hair follicles, and sweat glands that support and nourish the skin.

Dermal Fillers

Injectable materials placed under or within the skin to restore volume or reduce wrinkles or scars. Common effects include swelling and bruising; infection, lumps, skin damage, or rare blockage of a blood vessel can be serious.

Dermal Melanocytosis

A usually harmless blue-gray or slate-colored skin patch caused by pigment-producing cells located deep in the skin. It is often present at birth and commonly affects the lower back or buttocks.

Dermal Papilla

A small structure at the base of a hair follicle that supplies signals and nutrients to developing hair cells. Its activity helps control hair growth and the hair-growth cycle.

Dermal Structure

The dermis has a thin superficial layer and a deeper supportive layer. It contains collagen, elastic fibers, blood and lymph vessels, nerves, hair follicles, sweat glands, and oil glands.

Dermatan Sulfate

A long chain of sugar molecules found in skin, connective tissue, blood vessels, and heart valves. It helps organize tissues and can influence wound healing and blood clotting.

Dermatitis

Inflammation of the skin causing some combination of itching, redness, swelling, scaling, dryness, or blisters. It may result from irritation, allergy, infection, medicines, genetics, or another disease.

Dermatitis Herpetiformis

A chronic, intensely itchy autoimmune blistering rash associated with gluten-sensitive celiac disease. Groups of small bumps and blisters often occur symmetrically on the elbows, knees, buttocks, back, or scalp; scratching may leave erosions and crusts. The rash is linked to IgA antibody deposits in the skin.

Alternate Names:
Duhring-Brocq Disease

Dermatofibroma

A common harmless, firm skin nodule, often on the legs. It may be brown or pink and often dimples when pinched. It usually needs no treatment; changing or bleeding lesions can have other causes.

Dermatofibrosarcoma

A rare, slow-growing cancer of connective tissue in the skin. It usually begins as a firm plaque or nodule and can grow into nearby tissue, but it rarely spreads to distant organs.

Dermatofibrosarcoma Protuberans

A rare cancer arising from connective tissue in the skin. It often appears as a slowly enlarging firm plaque or nodule, commonly on the trunk; it can recur locally but rarely spreads. Complete surgical removal is the usual treatment.

Dermatofibrosarcoma Protuberans Of The Breast

A rare, usually slow-growing skin cancer involving the breast skin or nearby superficial tissue. It can extend into surrounding tissue and recur if incompletely removed; treatment aims for complete surgical removal.

Dermatoglyphics

The study of ridge patterns on the fingers, palms, toes, and soles. Patterns help with identification and may differ in some genetic or developmental

conditions, but they cannot diagnose a condition by themselves.

Dermatographia

Alternate name; see *Dermatographism*.

Dermatographic Urticaria

Alternate name; see *Dermatographism*.

Dermatographism

Hives that appear as raised linear welts within minutes after the skin is stroked or scratched. They result from an exaggerated release of histamine and may occur with other allergic or hive disorders.

Dermatologic

Relating to the skin, hair, nails, or medical care for these structures. Dermatologic problems include rashes, infections, wounds, hair loss, nail changes, acne, and skin cancers.

Dermatologic Disorder

A disease affecting the skin, hair, nails, or skin glands. It may cause rash, scaling, pigment change, lumps, ulcers, pain, itching, hair loss, or abnormal nail growth.

Dermatologic Manifestations of Hematologic Disease

Skin, hair, nail, or mucosal findings caused by a blood or bone-marrow disorder, its treatment, or an associated infection. Examples include pallor, petechiae, purpura, bruising, pruritus, ulcers, nodules, and infiltrative lesions; new or unexplained findings may require blood tests and biopsy.

Dermatologist

A physician who specializes in diagnosing and treating disorders of the skin, hair, nails, and related mucous membranes, including infections, inflammatory diseases, tumors, and cosmetic concerns.

Dermatology

The medical specialty concerned with health and disease of the skin, hair, nails, and related mucous membranes. Dermatologists diagnose and manage inflammatory, infectious, immune-mediated, neoplastic, and other disorders, including skin signs of systemic disease; the specialty also includes medical and surgical skin care.

Dermatomal

Following or relating to a dermatome—a strip of skin supplied by sensory fibers from a single spinal nerve root. Dermatomal patterns can help localize nerve-root disease and are characteristic of some conditions, such as herpes zoster.

Dermatome

Either a surgical tool that removes a thin layer of skin for a graft or a strip of skin supplied by one spinal nerve. The meaning depends on whether the term is being used in surgery or nerve anatomy.

Dermatomycosis

A fungal infection of the skin, hair, or nails. It may cause scaling, itching, discoloration, cracking, or hair loss; treatment depends on the site and may require a topical or oral antifungal medicine.

Dermatomyositis

An autoimmune inflammatory myopathy affecting the skin and skeletal muscles. It often causes symmetric weakness of shoulder and hip muscles and a violaceous rash around the eyes or scaly papules over the knuckles. Skin disease can occur without obvious muscle weakness; adult-onset disease is associated with increased risk of some cancers.

Dermatopathology

The study of skin disease by examining tissue samples with a microscope and related laboratory methods. It helps distinguish inflammatory, infectious, harmless, and cancerous skin disorders.

Dermatophyte

A fungus that grows in keratin, the tough protein in skin, hair, and nails. It causes tinea infections such as athlete's foot, ringworm, and fungal nail disease.

Dermatophytosis

A superficial fungal infection of keratinized tissue, including the skin, hair, or nails, caused by dermatophytes. Also called tinea or ringworm, it includes infections of the body, scalp, groin, feet, and nails. Findings vary by site and may include scaly rashes, itching, cracked skin, or thickened, discolored nails.

Alternate Names:
Dermatophyte Infection; Dermatophyte Infections; Tinea

Dermatoplasty

Surgical repair or reconstruction of damaged skin, often using tissue rearrangement or a skin graft. It may restore coverage after injury, burns, removal of a lesion, or another operation.

Dermatoscope

A handheld optical instrument that magnifies and illuminates skin lesions, often with polarized or nonpolarized light. It reveals structures below the skin surface and supports clinical assessment of pigmented and other lesions.

Dermatosis

Any disease or disorder of the skin, including inflammatory, infectious, allergic, inherited, or tumor-related conditions. It may cause rash, itching, scaling, pigment changes, lumps, ulcers, or pain.

Dermis

The strong, flexible skin layer beneath the epidermis. It contains collagen and elastic fibers, blood vessels, nerves, hair follicles, and sweat and oil glands that support and nourish the skin.

Dermoid

A usually benign cyst or tumor containing tissues such as skin, hair, oil glands, fat, or teeth. It may occur in the ovary or other sites and can cause pressure, rupture, infection, or twisting of an organ.

Dermoid Cyst

A benign cyst or choristoma containing mature skin structures, such as hair follicles and oil or sweat glands. It is often developmental and may occur in the skin, around the eye, or elsewhere. An ovarian dermoid is a mature cystic teratoma; epidermoid cysts are a distinct type.

Dermoid Cyst Of The Ovary

A usually benign ovarian cyst that can contain skin, hair, fat, glands, or teeth. It may cause pain, pressure, rupture, or twisting of the ovary and is assessed with examination and imaging.

Dermoscopy

Examination of a skin lesion with magnification and special lighting that reveals structures not visible to the unaided eye. It helps assess pigmented and other lesions but does not replace biopsy when cancer is suspected.

Descemet Membrane Endothelial Keratoplasty

An advanced partial-thickness corneal transplantation procedure in which only the diseased recipient corneal endothelium and Descemet membrane are stripped and replaced by an isolated donor Descemet membrane-endothelium sheet. It offers rapid visual recovery and very low allograft rejection rates in corneal endothelial disorders such as Fuchs endothelial dystrophy.

Alternate Names:
DMEK

Descending Colon

The left-sided part of the large intestine, extending downward from the transverse colon toward the sigmoid colon. It absorbs water and salts and helps compact stool before it moves toward the rectum.

Descending Thoracic Aorta

The part of the body's main artery that runs from the aortic arch through the chest to the diaphragm. It gives branches to the chest wall and organs and continues as the abdominal aorta.

Desensitization

A treatment that gradually exposes a person to increasing or controlled amounts of a specific aller-

gen or medicine. It can reduce immune reactions; serious reactions may occur during the process.

Desferrioxamine

A medicine that binds excess iron and helps remove it from the body. It is used for serious iron overload and selected aluminum toxicity; prolonged treatment can affect hearing, vision, kidneys, or growth.

Desflurane

An inhaled medicine used to maintain general anesthesia. It acts quickly but may irritate the airway, lower blood pressure, cause nausea, or rarely trigger malignant hyperthermia in susceptible people.

Desiccate

To dry out or remove moisture from a tissue, substance, surface, or specimen. Excessive drying can damage skin or wounds and can alter medicines or laboratory samples.

Desiccated Thyroid

A thyroid-hormone medicine made from dried animal thyroid tissue. It contains mainly thyroxine and triiodothyronine; excess treatment can cause palpitations, bone loss, or other effects, so blood tests and monitoring are needed.

Alternate Names:
Desiccated Thyroid Extract; Natural Desiccated Thyroid

Desipramine

A tricyclic antidepressant that increases norepinephrine activity. It is used for selected mental health or pain conditions but may cause dry mouth, constipation, drowsiness, abnormal heart rhythms, or dangerous overdose.

Desipramine Hydrochloride Overdose

Taking too much desipramine hydrochloride can cause severe drowsiness, confusion, seizures, low blood pressure, coma, and life-threatening heart-rhythm or conduction problems. It requires emergency assessment, even if symptoms are initially mild.

Desmin

A structural protein that links parts of muscle cells and helps maintain their alignment. Changes in the desmin gene or abnormal desmin buildup can cause muscle weakness and heart-muscle disease.

Desmoid Tumor

A locally aggressive growth of fibrous tissue that usually does not spread to distant organs but can invade nearby structures and recur. It may be associated with familial adenomatous polyposis; treatment depends on location and symptoms.

Desmoid Tumors

Plural form; see *Desmoid Tumor*.

Desmoid Tumour

Alternate spelling; see *Desmoid Tumor*.

Desmoplasia

A dense, scar-like tissue response rich in collagen and fibroblast-like cells. It commonly forms around invasive cancers, especially carcinomas, and can also occur with some benign tumors or tissue injury. It may make an area firm but does not by itself show whether a tumor is benign or malignant.

Desmoplastic

Describing the formation of dense, scar-like fibrous tissue, often around a tumor or in response to chronic inflammation or injury.

Desmoplastic Fibroblastoma

A rare, usually harmless tumor made of collagen-producing cells. It is typically a slow-growing, painless lump in superficial or deep soft tissue and is treated according to its size, site, and symptoms.

Desmoplastic Fibroma

A rare noncancerous but locally aggressive fibrous growth in bone. It can cause pain, swelling, or fracture and may return after treatment.

Desmoplastic Infantile Ganglioglioma

A rare, usually slow-growing brain tumor of infancy

containing both nerve-cell and support-cell components. It may cause seizures, increasing head size, vomiting, or other signs of pressure in the brain.

Desmoplastic Melanoma

A rare form of skin melanoma with abundant scar-like tissue. It often develops on sun-damaged skin, may have little or no pigment, and can grow deeply or recur locally.

Desmoplastic Reaction

Formation of dense, scar-like fibrous tissue in response to injury, chronic inflammation, or invasion by a cancer. It may make affected tissue firm and can complicate interpretation of imaging or biopsy.

Desmoplastic Small Round Cell Tumor

A rare and aggressive soft-tissue sarcoma that usually develops in the abdomen or pelvis of children, adolescents, or young adults, especially males. It often forms several masses on the lining of the abdomen and can spread within the abdomen or to other sites. Symptoms may include abdominal swelling or pain, nausea, vomiting, diarrhea, or constipation. Tumor cells typically have an *EWSR1-WT1* gene fusion, which helps confirm the diagnosis.

Desmoplastic Small Round Cell Tumors

Plural form; see *Desmoplastic Small Round Cell Tumor*.

Desmoplastic Trichoepithelioma

A rare harmless tumor arising from a hair follicle, usually appearing as a small firm facial bump or ring-shaped lesion. It can resemble a skin cancer and may require biopsy for confirmation.

Desmopressin

A medicine that mimics vasopressin, a hormone that reduces urine production and helps control bleeding. It is used for central diabetes insipidus, some bleeding disorders, and selected nighttime urination problems; excess fluid can dangerously lower blood sodium.

Desmosome

A strong junction that fastens neighboring cells together, especially in the skin and heart muscle. It links internal support fibers and helps tissues resist stretching and friction.

Desogestrel

A progestin used in some hormonal contraceptives. It prevents pregnancy mainly by suppressing ovulation and thickening cervical mucus; irregular bleeding, mood changes, breast tenderness, or other hormonal effects may occur.

Desonide

A low-strength corticosteroid applied to the skin to reduce redness, itching, and inflammation from conditions such as eczema or dermatitis. Excessive or prolonged use can thin the skin or cause other local effects.

Desoximetasone

A corticosteroid applied to the skin to reduce inflammation and itching in responsive rashes. Strength, body site, amount, and duration affect the risk of skin thinning and absorption into the body.

Desoxycorticosterone

A steroid hormone with mineralocorticoid effects. It makes the kidneys retain sodium and water and lose potassium, thereby influencing blood volume and blood pressure.

Desquamation

Shedding or peeling of the outer layer of skin or another body lining. It may be normal or result from dryness, irritation, infection, inflammation, burns, medicines, or another skin disorder.

Desquamative Interstitial Pneumonia

A rare inflammatory lung disease strongly associated with smoking. Immune cells collect in the air sacs, causing cough and breathlessness; treatment may include smoking cessation and anti-inflammatory medicines.

Desquamative Inflammatory Vaginitis

Long-lasting inflammation of the vagina that can cause irritation, pain, and discharge. Its cause is not fully known; it can overlap with severe aerobic vaginitis but is not usually linked to a common vaginal infection.

Desulfovibrio

A group of bacteria that can live without oxygen and use sulfate during metabolism. They occur in the environment and intestine; invasive human infection is uncommon and must fit the patient's symptoms and specimen findings.

Desvenlafaxine Succinate

A form of desvenlafaxine, an antidepressant that increases serotonin and norepinephrine signaling. It is used for major depressive disorder and may cause nausea, insomnia, increased blood pressure, or withdrawal symptoms if stopped suddenly.

Desynchronosis

Alternate name; see *Jet Lag*.

Detached

Describes tissue separated from its normal attachment or position, as when the retina lifts from the back of the eye or the placenta separates from the uterine wall before birth. The specific structure and type of separation are named in the full term.

Detached Retina

Separation of the light-sensitive retina from the tissue beneath it. Flashes, new floaters, or a curtain-like shadow may occur; it is an emergency because delayed treatment can cause permanent vision loss.

Detergent

A cleaning substance that helps remove oils and dirt from surfaces. Some detergents can irritate or burn the skin, eyes, airways, or digestive tract, especially when concentrated or swallowed.

Deterministic Effects

Tissue injuries from radiation that usually occur only after exposure exceeds a threshold. Higher exposure generally causes more severe injury, such as skin damage, cataracts, or tissue death.

Detoxification

Medical treatment that reduces the effects of a poison or helps the body remove it. Care may include supportive treatment, an antidote, activated charcoal, or dialysis; stomach washing is rarely appropriate.

Detritic Synovitis

Inflammation of the lining of a joint caused by loose particles from damaged cartilage, bone, blood, crystals, or a worn implant. It can cause swelling, pain, stiffness, and reduced movement.

Detrusor Instability

Involuntary contractions of the bladder muscle while the bladder is filling. They can cause sudden urinary urgency, frequent urination, nighttime urination, or urge leakage.

Detrusor Muscle

The muscle forming the bladder wall. It relaxes while urine collects and contracts to empty the bladder; abnormal activity can cause urgency or leakage, while weak activity can make emptying difficult.

Detrusor Sphincter Dyssynergia

A neurological voiding disorder occurring in patients with suprasacral spinal cord lesions, characterized by involuntary, simultaneous contraction of the urinary bladder detrusor muscle and the external urethral sphincter during micturition, producing functional bladder outlet obstruction.

Alternate Names:
DSD

Detumescence

Return of erectile tissue to its non-erect state after sexual stimulation or an erection ends. It occurs when blood leaves the erectile tissue and pressure falls.

Deubiquitinating Enzymes

Enzymes that remove a small regulatory tag from other proteins. This can change whether a protein is broken down, where it works, and how cells control signals, repair DNA, and respond to infection.

Deubiquitination

Removal of the ubiquitin tag from a protein. This process can prevent the protein from being broken down or can change its activity, location, or role in cell signaling.

Deuteranopia

An inherited red-green color-vision deficiency caused by missing green-sensitive pigment in the retina. People may have difficulty distinguishing some shades of green, red, brown, and orange.

Deuterium

A naturally occurring form of hydrogen whose nucleus contains one proton and one neutron. Small amounts occur in water; very high exposure to heavy water can disrupt cell function.

Development

The progressive growth and change by which a person, organ, or ability acquires its structure and function. It includes physical, brain, language, emotional, social, and adaptive changes.

Developmental Coordination Disorder

A childhood condition in which movement skills develop more slowly or less accurately than expected and interfere with dressing, writing, sports, school, or daily activities. It is not explained only by another medical or neurologic condition.

Developmental Delay

A child's acquisition of movement, language, thinking, social, or self-care skills is slower than expected for age. Delay may affect one or several areas and can result from genetic, neurologic, sensory, medical, or environmental causes.

Developmental Disabilities

Lifelong conditions that begin during childhood and affect movement, learning, thinking, language, behavior, or ability to manage daily activities. Support needs vary and may include medical, educational, communication, and social services.

Developmental Disorder

A broad, heterogeneous group of neurodevelopmental conditions originating during early embryonic, fetal, or childhood development that cause chronic impairment across motor, cognitive, communicative, learning, behavioral, or adaptive domains. Typically exhibits an early childhood onset and lifelong course, including autism spectrum disorder, attention-deficit/hyperactivity disorder (ADHD), intellectual disability, specific learning disorders, and cerebral palsy, arising from complex multifactorial interactions between genetic susceptibility and environmental perinatal insults.

Developmental Disorders

Plural form; see *Developmental Disorder*.

Developmental Dysplasia Of The Hip

A developmental abnormality of the hip joint in which the femoral head is unstable within or improperly aligned with the acetabulum. The spectrum ranges from a shallow socket to subluxation or dislocation. It is usually present at birth but may become apparent during infancy.

Developmental Expressive Language Disorder

A childhood disorder causing persistent difficulty expressing ideas with spoken words, sentences, or grammar. Hearing differences, developmental conditions, autism, and other factors can contribute to or resemble it.

Developmental Genital Tract Anomalies

Differences in the formation or structure of the uterus, cervix, vagina, fallopian tubes, or external genitalia that arise before birth. Effects range from none to infertility, pain, menstrual problems, or pregnancy complications.

Developmental History

A record of a child's developmental milestones and abilities, including motor, language, cognitive, social, and adaptive skills, used to identify possible delays or regression.

Developmental Milestone

Alternate name; see *Developmental Milestones*.

Developmental Milestones

Skills that most children learn as they grow, such as sitting, walking, talking, and interacting with others. The timing varies from child to child. Health professionals use milestones to follow development and identify children who may need further assessment.

Alternate Names:
Child Development Milestones; Pediatric Milestones

Developmental Milestones Record

Alternate name; see *Developmental Milestones*.

Developmental Process

The physical, brain, emotional, social, and functional changes through which a person or organ grows and acquires abilities. Development is influenced by genes, health, nutrition, relationships, learning, and environment.

Developmental Psychology

The study of how thinking, emotions, relationships, behavior, and abilities change from infancy through old age. It examines the effects of genes, health, learning, experience, relationships, and environment.

Developmental Reading Disorder

A learning disorder causing persistent difficulty learning accurate, fluent reading. Problems may include recognizing words, linking letters to sounds, spelling, or understanding written language despite appropriate teaching.

Developmental Regression

Loss of skills a child previously acquired, such as speech, movement, social interaction, or self-care. Regression is a warning sign requiring prompt evaluation for neurologic, genetic, metabolic, infectious, or other causes.

Developmental Stage

A period of growth characterized by typical physical, thinking, emotional, social, language, or self-care changes. Children vary, so stages describe broad patterns rather than exact deadlines.

Developmental Surveillance

Ongoing monitoring of a child's development through caregiver concerns, observation, history, and milestone review during routine care. It can identify concerns early but differs from formal screening with a standardized tool.

Deviated Nasal Septum

Alternate name for deviated septum, in which the wall dividing the nasal passages is displaced from the midline.

Alternate Names:
Deviated Septum; Nasal Septal Deviation

Deviated Septum

A nasal partition displaced away from the center, often from normal development or injury. A marked deviation can block one side, causing difficulty breathing through the nose, congestion, nosebleeds, sinus problems, or sleep symptoms.

Deviation

A departure from an expected position, direction, value, or pattern, such as a bone shifted from its normal alignment or a laboratory result outside its reference range. The term describes a finding; it does not identify its cause.

Devic Disease

An older name associated with neuromyelitis optica spectrum disorder (NMOSD), an antibody-mediated inflammatory disorder of the central nervous system. NMOSD can affect the optic nerves, spinal cord, area postrema, brainstem, or other regions; the classic presentation combines optic neuritis and longitudinally extensive transverse myelitis. AQP4-

IgG is common but not present in every case.

Alternate Names:
Neuromyelitis Optica; NMO

Device Embolisation

Movement of a medical device or broken piece of one through the bloodstream until it lodges in and blocks a blood vessel. It can reduce blood flow and may cause pain, organ injury, or an emergency requiring removal.

Devices For Hearing Loss

Equipment that improves access to sound, including hearing aids, cochlear implants, bone-conduction devices, alerting systems, and communication accessories. Choice depends on the type and severity of hearing loss and personal needs.

De Winter ECG Pattern

Alternate name; see *De Winter T-Wave Pattern*.

De Winter T-Wave Pattern

An electrocardiographic pattern associated with acute occlusion of the left anterior descending coronary artery, even without typical ST-segment elevation. It features upsloping ST depression at the J points across the anterior chest leads, followed by tall, symmetric T waves; slight ST elevation may appear in lead aVR. It is a high-risk acute coronary occlusion pattern.

Alternate Names:
De Winter ECG Sign; De Winter ECG Pattern; De Winter Pattern; De Winter Sign; De Winter T Waves

DEXA Scan

Dual-energy X-ray absorptiometry; a low-dose radiological test measuring bone mineral density to diagnose osteopenia and osteoporosis. See *Dual-Energy X-Ray Absorptiometry*.

Dexamethasone

A strong, long-acting corticosteroid that reduces inflammation and immune activity. It is used for selected allergic, brain-swelling, cancer-related, endocrine, and other conditions; risks include infection, high blood sugar, mood changes, and adrenal suppression.

Dexamethasone Suppression Test

A test that checks whether dexamethasone lowers cortisol production. Cortisol is measured after a dose of dexamethasone; failure to suppress can suggest Cushing syndrome. Oral estrogen, acute illness, major depression, alcohol use disorder, and medicines that alter dexamethasone breakdown can affect the result.

Dexamphetamine

Alternate name; see *Dextroamphetamine*.

Dexibuprofen

A nonsteroidal anti-inflammatory medicine used for short-term pain and inflammation. It can irritate the stomach and may cause ulcers, bleeding, kidney injury, fluid retention, or cardiovascular problems.

Dexketoprofen

A nonsteroidal anti-inflammatory medicine used for short-term pain. It reduces substances that cause pain and inflammation but can cause stomach bleeding, kidney injury, fluid retention, heart problems, or allergic reactions.

Dexlansoprazole

A proton-pump inhibitor that reduces stomach-acid production. It is used for acid reflux and related esophageal injury; prolonged use may contribute to infections, low magnesium or vitamin B12, fractures, or kidney inflammation.

Dexmedetomidine

A sedative that activates alpha-2 receptors and is given by injection during monitored care or intensive care. It usually depresses breathing less than many sedatives but can slow the heart or lower blood pressure.

Dexmethylphenidate

A stimulant used to treat attention-

deficit/hyperactivity disorder. It increases dopamine and norepinephrine activity and may cause reduced appetite, insomnia, headache, increased heart rate or blood pressure, or misuse.

Dexrazoxane

A medicine used in selected cancer treatments to reduce heart damage from anthracyclines or tissue injury after leakage of an anthracycline from a vein. It can suppress bone marrow and increase infection risk.

Dexrazoxane Hydrochloride

A salt form of dexrazoxane used in selected settings to reduce anthracycline-related heart damage or tissue injury after medicine leakage from a vein. Its use requires specialist dosing and monitoring.

Dextrin

A group of shorter carbohydrate chains formed when starch breaks down. Dextrins are used in foods, laboratory products, and medicines and are generally digested as carbohydrates.

Dextroamphetamine

A stimulant medicine used for attention-deficit/hyperactivity disorder and narcolepsy. It can reduce appetite, disturb sleep, raise heart rate or blood pressure, and cause dependence.

Dextrocardia

A congenital condition in which the heart points or lies mainly on the right side of the chest. It may occur alone or with reversed organs and structural heart defects.

Dextromethorphan

A cough suppressant that reduces activity in brain pathways controlling the cough reflex. Excessive amounts can cause drowsiness, agitation, hallucinations, seizures, breathing depression, or serotonin toxicity.

Dextromethorphan Overdose

Taking too much dextromethorphan can cause drowsiness, confusion, agitation, hallucinations, fast heartbeat, seizures, breathing depression, or serotonin toxicity.

Dextroposition Of The Heart

The heart is pushed toward the right side of the chest by nearby organs, the diaphragm, lung disease, or another space-occupying problem. The heart itself may be normally formed and is not necessarily reversed as in dextrocardia.

Dextrose

D-glucose, a simple sugar used for energy. Oral or intravenous dextrose can treat or prevent low blood glucose, but excessive amounts can raise blood sugar and disturb body fluids.

DFSP

Alternate name; see *Dermatofibrosarcoma Protuberans*.

DH

Abbreviation commonly used for dermatitis herpetiformis, an intensely itchy blistering skin disorder associated with gluten-sensitive enteropathy and celiac disease. The abbreviation can have other meanings depending on context.

DHA

Docosahexaenoic acid, an omega-3 fatty acid that is an important part of brain and retinal cell membranes. It is obtained mainly from oily fish, some algae, and supplements.

DHEA

Dehydroepiandrosterone, a hormone precursor made mainly by the adrenal glands. The body can convert it into male and female sex hormones; levels vary with age, illness, and some hormone disorders.

DHEA-Sulfate Test

A blood test measuring a hormone made mainly by the adrenal glands. It can help investigate early puberty, excess body hair, some hormone disorders, congenital adrenal hyperplasia, or an adrenal tumor;

results vary with age and sex.

Diabetes And Alcohol

Alcohol can cause delayed low blood glucose, interact with medicines, and make glucose control harder. Risk depends on amount, timing, food intake, diabetes type, liver health, and treatment.

Diabetes And Exercise

Physical activity can improve glucose control, fitness, and heart health. People using insulin or medicines that lower glucose may need to check levels and adjust food or treatment with professional guidance to prevent low glucose.

Diabetes And Eye Disease

Diabetes can damage retinal blood vessels, causing retinopathy and macular swelling that may reduce vision. Good glucose and blood-pressure control and regular dilated eye examinations help prevent or limit sight loss.

Diabetes And Eye Problems

Diabetes may cause retinopathy, macular swelling, cataracts, glaucoma, and vision loss. Glucose and blood-pressure control, regular dilated eye examinations, and timely laser, injection, or surgical treatment reduce the risk of severe loss.

Diabetes And Kidney Disease

Kidney damage caused by diabetes. It may begin with albumin leaking into urine and progress to reduced kidney function or kidney failure; glucose, blood-pressure, and kidney monitoring can slow progression.

Diabetes And Metabolic Health

Diabetes is linked with insulin resistance, excess body fat, abnormal cholesterol, and high blood pressure. Together these problems increase the risk of heart disease and can worsen blood-glucose control.

Diabetes And Nerve Damage

Long-term diabetes can injure nerves, causing burning pain, tingling, numbness, weakness, digestive or bladder problems, sexual difficulties, or loss of protective feeling in the feet.

Diabetes Complications

Problems caused by diabetes, including low or high glucose emergencies and long-term damage to the eyes, kidneys, nerves, heart, blood vessels, teeth, and feet. Regular monitoring and risk-factor control reduce risk.

Diabetes Eye Exams

Eye examinations that look for diabetic retinopathy, macular swelling, cataracts, glaucoma, and other sight-threatening problems. Dilated examination or retinal photography may detect changes before vision is affected.

Diabetes in Children: Dealing with Low Blood Sugar

Recognition and treatment of hypoglycemia in a child with diabetes. Symptoms may include sweating, trembling, hunger, irritability, confusion, seizure, or loss of consciousness; fast-acting glucose is used when the child is awake and able to swallow, with emergency glucagon for severe episodes.

Diabetes in Children: Preventing Low Blood Sugar

Measures to reduce hypoglycemia in children with diabetes, including individualized insulin dosing, regular meals and snacks, glucose monitoring, planning around activity, and education about symptoms and emergency glucagon.

Diabetes in Pregnancy

Alternate name; see *Diabetes Mellitus and Pregnancy*.

Diabetes in Pregnancy (Gestational Diabetes)

Alternate name; see *Gestational Diabetes*.

Diabetes Insipidus

A rare disorder of water balance that causes the body to produce unusually large amounts of dilute,

watery urine and triggers constant, intense thirst. It occurs either when the brain fails to produce enough antidiuretic hormone (vasopressin)—which tells the kidneys to retain water—or when the kidneys fail to respond to this hormone. Despite sharing part of its name with diabetes mellitus, it does not involve insulin or high blood sugar levels.

Diabetes Medications

Medicines that lower blood glucose or replace insulin. They work in different ways, and the choice depends on the type of diabetes, kidney and heart health, other medicines, cost, and treatment goals.

Diabetes Mellitus

A chronic metabolic condition characterized by persistently high levels of sugar (glucose) in the bloodstream, resulting from problems with the hormone insulin. In extbftype 1 diabetes, the immune system mistakenly destroys the insulin-producing cells of the pancreas, causing an absolute lack of insulin. In extbftype 2 diabetes, the body's cells become resistant to insulin, and the pancreas eventually cannot produce enough to keep up. Over time, high blood sugar damages blood vessels and nerves throughout the body, raising the risk of heart disease, kidney damage, vision loss, and foot complications.

Alternate Names:
Diabetes

Diabetes Mellitus and Pregnancy

Diabetes before or first recognized during pregnancy can increase risks of miscarriage, fetal overgrowth or growth restriction, congenital anomalies, hypertensive disease, stillbirth, and neonatal metabolic problems. Glucose control, retinal and kidney assessment, medication review, and fetal surveillance are important.

Diabetes Mellitus Type 1

An autoimmune disorder in which the immune system destroys insulin-producing pancreatic cells, causing little or no insulin. It can begin at any age and requires insulin; untreated deficiency can cause ketoacidosis.

Diabetes Mellitus Type 2

A disorder in which the body resists insulin and, over time, may not make enough of it. Risk is increased by family history, excess body weight, and inactivity; it can occur at any age and may have no early symptoms.

Diabetes Prevention

The risk of type 2 diabetes can often be reduced through regular physical activity, nutritious meals, avoiding tobacco, adequate sleep, and weight loss when appropriate. People at increased risk may benefit from structured prevention programs and regular testing.

Diabetes-Related Foot Disease

Infection, ulceration, or tissue destruction of the foot in a person with current or previous diabetes, usually associated with peripheral neuropathy or peripheral artery disease. Neuropathy, poor blood flow, deformity, and pressure can contribute to tissue injury and impaired healing.

Alternate Names:
Diabetic Foot Disease

Diabetes Treatment

Diabetes treatment combines nutrition, physical activity, glucose monitoring, education, and medicines chosen for the type of diabetes and individual risks. Care also addresses blood pressure, lipids, kidneys, eyes, nerves, feet, vaccines, and cardiovascular health.

Diabetic Amyotrophy

A painful diabetic lumbosacral radiculoplexus neuropathy, usually beginning with sudden pain in one hip or thigh followed by proximal leg weakness and muscle wasting. It can spread to the other leg and is distinct from the more common distal symmetric diabetic polyneuropathy.

Diabetic Angiopathy

Damage to small or large blood vessels caused by diabetes. It can reduce circulation, injure the eyes, kidneys, heart, brain, or feet, and increase the risk of wounds, heart attack, or stroke.

Diabetic Autonomic Neuropathy

Diabetes-related damage to nerves that control automatic body functions. It may cause dizziness on standing, fast heartbeat, sweating changes, delayed stomach emptying, bladder problems, sexual dysfunction, or reduced awareness of low glucose.

Diabetic Cardiomyopathies

Heart-muscle disease associated with diabetes that is not fully explained by blocked heart arteries or high blood pressure. It can make the heart relax or pump poorly and may lead to heart failure.

Diabetic Cardiomyopathy

Heart-muscle damage associated with diabetes, after other causes such as blocked arteries and high blood pressure are considered. It may cause poor relaxation, weak pumping, heart failure, or rhythm problems.

Diabetic Coma

Profound unconsciousness caused by a severe diabetes-related problem, such as extremely low or high blood glucose, ketoacidosis, severe dehydration, or abnormal body chemistry. It is a medical emergency.

Diabetic Complications

Alternate name; see *Diabetes Complications*.

Diabetic Diet

An individualized eating pattern for diabetes that balances carbohydrate portions, fiber, protein, and healthy fats with medicines, activity, culture, and health goals. It supports glucose control without requiring the same foods or schedule for everyone.

Alternate Names:
Diabetic Meal Plan; Medical Nutrition Therapy for Diabetes

Diabetic Eye Disease

Eye damage caused by diabetes, including diabetic retinopathy, diabetic macular edema, cataract, glaucoma, and cranial-nerve or optic-nerve complications. Regular dilated eye examinations can detect treatable disease before vision is lost.

Diabetic Focal Neuropathy

Alternate name; see *Diabetic Neuropathy*.

Diabetic Foot

Alternate name; see *Diabetes-Related Foot Disease*.

Diabetic Foot Infections

Infection involving the skin, soft tissue, or bone of a diabetic foot. Neuropathy, ischemia, ulceration, and impaired immunity can conceal severity or delay healing, so assessment includes depth, perfusion, systemic illness, and need for antimicrobial therapy or source control.

Diabetic Foot Ulcer

A chronic non-healing sore on the foot in a person with diabetes, usually caused by a combination of peripheral neuropathy, poor blood circulation, and localized pressure or minor trauma.

Alternate Names:
Diabetic Ulcer; Neuropathic Foot Ulcer; Diabetic Foot Sore

Diabetic Gastroparesis

A complication of diabetes in which damage to the stomach's nerves slows the movement of food from the stomach into the small intestine. It may cause early fullness, nausea, vomiting, bloating, abdominal pain, and difficult-to-control blood sugar levels.

Diabetic Hyperglycemic Hyperosmolar Syndrome

Alternate name; see *Hyperosmolar Hyperglycemic State*.

Diabetic Hyperosmolar Hyperglycemic State

Alternate name; see *Hyperosmolar Hyperglycemic State*.

Diabetic Hypoglycemia

Blood glucose that is too low in a person with diabetes, often because of insulin, certain medicines,

missed food, alcohol, or unusual exercise. Shaking, sweating, confusion, seizures, or unconsciousness may occur.

Diabetic Ketoacidosis

A life-threatening complication of diabetes—most commonly type 1 diabetes—that occurs when the body lacks sufficient insulin to move sugar from the blood into cells for energy. In response, the body rapidly breaks down fat for fuel, generating high levels of toxic blood acids called ketones. This causes the blood to become dangerously acidic while blood sugar climbs to high levels. Symptoms include extreme thirst, frequent urination, nausea and vomiting, rapid deep breathing, abdominal pain, a fruity breath odor, and severe dehydration or confusion.

Alternate Names:
DKA

Diabetic Ketoacidosis Monitoring

Monitoring during treatment includes frequent glucose checks, blood salts, kidney function, ketones, acidity, fluid balance, urine output, and mental status. Close monitoring helps guide fluids, insulin, and electrolyte replacement safely.

Diabetic Kidney Disease

Kidney disease occurring in a person with diabetes, often attributed to diabetes when no other cause is evident. It may involve albumin in the urine, reduced kidney filtering, or both, and can progress to kidney failure. Other causes of chronic kidney disease should also be considered.

Diabetic Macular Edema

Swelling of the macula caused by fluid leaking from retinal blood vessels damaged by diabetes. It may occur at any stage of diabetic retinopathy and can blur or distort central vision.

Diabetic Mastopathy

A benign fibroinflammatory breast lesion associated mainly with long-standing type 1 diabetes, but also reported with type 2 diabetes and autoimmune disease. It usually presents as a firm, often painless mass that can mimic breast cancer on examination and imaging; tissue examination shows fibrosis with lymphocytic inflammation.

Alternate Names:
Diabetic Fibrous Mastopathy

Diabetic Microvascular Complications

Diabetes-related damage to small blood vessels, mainly affecting the eyes, kidneys, and nerves. Good glucose, blood-pressure, and cholesterol control, along with regular screening, lowers the risk of progression.

Diabetic Nephropathy

Alternate name; see *Diabetic Kidney Disease*.

Diabetic Neuropathy

Nerve damage associated with diabetes, including distal symmetric polyneuropathy, autonomic neuropathy, and focal or radiculoplexus neuropathies. Symptoms vary with the nerves affected and may include pain, numbness, weakness, loss of protective sensation, or impaired autonomic function.

Alternate Names:
Diabetic Nerve Damage

Diabetic Peripheral Neuropathy

Diabetes-related damage to nerves, usually beginning in the toes and feet and later affecting the hands. It can cause numbness, burning pain, weakness, and loss of protective sensation that increases injury risk.

Diabetic Proximal Neuropathy

Alternate name; see *Diabetic Amyotrophy*.

Diabetic Retinopathy

Damage to retinal blood vessels caused by diabetes. It ranges from nonproliferative changes, such as microaneurysms and hemorrhages, to proliferative disease with abnormal new blood vessels. Leakage can cause macular edema, while bleeding or scar tissue can lead to vision loss or tractional retinal detachment. Early disease may have no symptoms.

Alternate Names:
Diabetic Microangiopathy of Retina

Diabetic Third Nerve Palsy

An oculomotor nerve palsy associated with diabetes, usually attributed to microvascular ischemia after other causes are considered. It may cause double vision, eyelid drooping, and impaired eye movement; the pupil is often spared but can be involved, so pupil status alone does not establish the cause.

Alternate Names:
Diabetic Oculomotor Neuropathy; Diabetic Cranial Neuropathy III

Diabetogenic

Able to cause or promote diabetes or high blood glucose. The term may describe a disease, hormone, medicine, genetic change, or other factor that reduces insulin action or increases glucose production.

Diabetologist

A physician specializing in diabetes prevention, diagnosis, and treatment, including glucose management and complications involving the heart, kidneys, nerves, eyes, and feet.

Diabrosis

An old medical term for erosion or corrosion that eats through tissue and may cause an ulcer or perforation, especially in a blood-vessel or organ wall. Modern reports usually name the specific cause and injury.

Diacetoxyscirpenol

A toxin produced by some Fusarium molds that can contaminate food or animal feed. Exposure may irritate the digestive tract, suppress blood-cell production, and impair immune function.

Diacylglycerol

A fat-like molecule made from cell membranes that acts as an internal chemical signal. It helps control cell growth, movement, secretion, metabolism, and responses to hormones or other signals.

Diagnosis

Identification of a disease or health condition using symptoms, medical history, examination, and appropriate tests. A clinician may compare several possible causes before reaching the most likely diagnosis.

Diagnostic

Pertaining to, assisting in, or serving as the basis for a clinical diagnosis—the precise identification and characterization of a disease, disorder, or injury from its signs, symptoms, history, examination, imaging, and laboratory findings.

Diagnostic Imaging

Use of images to detect, locate, or monitor disease or injury. Methods include X-ray, ultrasound, computed tomography, magnetic resonance imaging, and nuclear imaging; findings vary with the clinical situation.

Diagnostic Laparoscopy

A minimally invasive procedure in which a camera is inserted through small abdominal incisions to inspect pelvic or abdominal organs. The clinician may take tissue samples or perform treatment during the same procedure.

Diagnostic Microbiology

Laboratory testing used to identify microorganisms that may cause disease. Methods include microscopy, culture, antigen or antibody tests, and genetic tests; results depend on symptoms and the specimen site.

Diagnostic Peritoneal Lavage

An older emergency test for serious internal bleeding or injury after major abdominal trauma. A small tube is placed into the abdomen and fluid is put in and then removed for testing. Ultrasound and CT scans are now used more often, but this test may still be used when those scans are not available.

Alternate Names:
DPL; Peritoneal Lavage; Abdominal Lavage

Diagnostic Procedure

An examination or procedure used to identify, exclude, locate, or monitor a disease or injury. The purpose, preparation, risks, accuracy, and follow-up

depend on the specific procedure and patient.

Diagnostic Radiology

The medical specialty that uses imaging to diagnose and characterize disease or injury. It includes X-ray, ultrasound, computed tomography, magnetic resonance imaging, and selected nuclear-medicine studies.

Diagnostics

Plural form; see *Diagnostic*.

Diagnostic Service

A healthcare service that collects or interprets information to detect, identify, characterize, or monitor a disease or health condition, such as laboratory testing, imaging, or specialist assessment.

Diagnostic Test

A test used to evaluate symptoms, signs, or an abnormal screening result and help confirm, exclude, or characterize a disease. Its value depends on accuracy, timing, the patient's condition, and how the result will guide care.

Diagnostic Trial

A clinical study that evaluates how accurately a test detects, rules out, or predicts a disease or important health outcome. Researchers may compare it with an established test or another accepted way of determining the diagnosis.

Diagnostic Uncertainty

A state in which the available symptoms, examination findings, and test results do not establish one diagnosis with sufficient confidence. It may occur when different diseases cause similar symptoms or when evidence is incomplete or inconclusive.

Diakinesis

The final stage before the first division that produces eggs or sperm. Paired chromosomes become tightly packed and remain connected at points where they exchanged genetic material.

Dialectical Behavior Therapy

A structured talking treatment that combines behavior-change skills with mindfulness and acceptance. It teaches ways to manage intense emotions, tolerate distress, improve relationships, and reduce harmful behaviors.

Dialister Pneumosintes

A bacterium found in the mouth and respiratory tract that grows without oxygen. It may contribute to mixed infections; significance of a positive sample depends on symptoms and collection site.

Dialysis

Treatment that replaces part of the kidneys' work by removing waste, excess water, and some chemicals from the blood. The main types are hemodialysis and peritoneal dialysis.

Dialysis Access

A route used to connect a person's blood circulation to a hemodialysis machine. Options include an arteriovenous fistula, graft, or central venous catheter; each has different risks of infection, clotting, and inadequate flow.

Dialysis Adequacy

How well dialysis removes waste and extra fluid and keeps body salts and acid levels within a safe range. Blood tests, treatment records, symptoms, nutrition, and weight help determine whether dialysis is sufficient.

Dialysis Complications of Chronic Renal Failure

Acute and chronic problems related to hemodialysis or peritoneal dialysis, including hypotension, disequilibrium, access infection or thrombosis, bleeding, electrolyte shifts, peritonitis, and amyloidosis.

Dialysis Disequilibrium Syndrome

A rare brain reaction during or soon after starting or intensifying hemodialysis, caused by rapid changes in dissolved substances. Headache, nausea, confusion, seizures, or coma may occur; gradual treatment reduces risk.

Dialysis Machine

Equipment that moves blood or dialysis fluid across a filter to remove waste, excess water, and selected salts when the kidneys cannot do so adequately.

Dialysis-Related Beta-2m Amyloidosis

Amyloid deposition caused by accumulation of beta-2 microglobulin in people receiving long-term dialysis, especially with inadequate clearance. It can cause shoulder or joint pain, carpal tunnel syndrome, bone cysts, and destructive arthropathy.

Dialysis Solutions

Specially prepared fluids used during hemodialysis or peritoneal dialysis. They allow waste and excess water to move out of the blood; their salt, glucose, and other contents are adjusted to the patient's needs.

Dialysis Therapy

Use of hemodialysis or peritoneal dialysis to replace part of kidney function by removing waste and excess fluid and correcting some salt and acid imbalances. Treatment is individualized according to kidney function, symptoms, health, and goals.

Diamine

A molecule containing two amino groups. Diamines occur naturally in metabolism and are used in laboratory, pharmaceutical, and industrial chemistry; health effects depend on the specific compound and exposure.

Diamond-Blackfan Anemia

A rare inherited disorder in which the bone marrow makes too few red blood cells, usually beginning in infancy. It may also cause short stature, thumb or facial differences, or heart defects.

Alternate Names:
Diamond-Blackfan Syndrome; Congenital Hypoplastic Anemia

Diamond-Gardner Syndrome

A rare condition in which painful bruises appear repeatedly without a clear injury, most often in women. It is a diagnosis made after other bleeding causes are excluded; old skin tests are not reliable confirmation.

Alternate Names:
Autoerythrocyte Sensitization Syndrome; Painful Bruising Syndrome

Diamorphine

A strong opioid medicine used in selected settings for severe pain or during medical procedures. It can cause sleepiness, nausea, constipation, dependence, and dangerous breathing depression, especially in overdose or with other sedatives.

Dianisidine

An industrial chemical used in some dyes and laboratory reagents. Significant or repeated exposure can irritate tissues and may damage blood or increase cancer risk; workplace protection is important.

Diapedesis

Movement of blood cells, especially infection-fighting white cells, through the walls of tiny blood vessels into nearby tissue. This allows them to reach and respond to infection, injury, or inflammation.

Diaper Rash

Inflammation of skin covered by a diaper, most often irritant contact dermatitis caused by prolonged moisture, urine, stool, occlusion, or friction. Redness usually affects exposed skin and spares the folds; Candida and other skin conditions can also cause rashes in the diaper area.

Alternate Names:
Diaper Dermatitis; Napkin Dermatitis

Diaphoresis

Excessive sweating. It may be a normal response to heat or exercise, or a sign of fever, pain, low blood glucose, anxiety, infection, heart problems, or another condition.

Diaphoretic

Describing heavy sweating or something that causes sweating. Sudden cold sweating with chest pain,

faintness, breathlessness, confusion, or weakness may occur with serious illness.

Diaphragm

The dome-shaped muscle separating the chest from the abdomen and the main muscle used for breathing. When it contracts, it flattens and draws air into the lungs; when it relaxes, air leaves.

Diaphragmatic Crus

One of two musculotendinous bundles (right and left crura) originating from the anterior aspects of the upper lumbar vertebral bodies and fibrocartilaginous discs, ascending to insert into the central tendon of the diaphragm and encircling the esophageal hiatus.

Diaphragmatic Eventration

Abnormal thinning or weakness of part or all of the diaphragm, causing it to sit higher than usual. It may cause no symptoms or lead to breathlessness, especially if severe or present from birth.

Diaphragmatic Hernia

Movement of abdominal organs through a hole or weak area in the diaphragm into the chest. It may be present from birth or follow injury and can impair breathing or cause bowel obstruction.

Diaphragmatic Paralysis

Loss of normal diaphragmatic movement from phrenic-nerve injury, neuromuscular disease, surgery, trauma, or idiopathic causes. Symptoms range from none to breathlessness when lying flat and sleep-related hypoventilation; bilateral disease is more likely to cause respiratory failure.

Diaphragmatic Rupture

A tear in the diaphragm, usually caused by a severe blunt or penetrating injury to the chest or abdomen. Abdominal organs may move into the chest, causing breathing difficulty, obstruction, or strangulation.

Diaphysis

The long central shaft of a bone such as the femur, humerus, or tibia. It contains a hollow marrow cavity and is surrounded by strong compact bone; fractures there may require prolonged healing.

Diarrhea

Passing loose or watery stools more often than usual. Causes include infections, medicines, food intolerance, inflammation, malabsorption, or other illnesses. Diarrhea can lead to dehydration and, when prolonged, malabsorption.

Diarrheal Disease

A group of illnesses that cause repeated loose or watery stools, often because of intestinal infection by viruses, bacteria, or parasites. Severe or persistent episodes can cause dehydration and loss of body salts.

Diarrhea-Predominant IBS

Alternate name; see *IBS-D*.

Diarrhoea

Alternate spelling; see *Diarrhea*.

Diarthrosis

A freely movable joint in which the bones are separated by a space containing lubricating fluid. The knee, hip, shoulder, and elbow are examples.

Diascopy

A clinical examination technique in which a transparent glass slide or plastic lens is pressed firmly against a skin lesion to assess whether it blanches, allowing differentiation between intravascular blood (erythema, telangiectasias, spider naevi) and extravasated red blood cells (purpura, petechiae, ecchymoses).

Diastase

An older name for enzymes that break starch into smaller sugars. Modern medical writing usually uses the term amylase for the related digestive enzyme activity.

Diastasis

Separation or widening between structures that normally lie together. It commonly describes separation of the abdominal muscles after pregnancy and is not itself a true hernia, although both can occur together.

Diastasis Recti

Widening and thinning of the tissue between the two front abdominal muscles, commonly during or after pregnancy or major weight change. It can cause a midline bulge when the abdomen is strained and is not a true hernia.

Diastematomyelia

A birth defect in which the spinal cord is divided into two parts, often by bone or fibrous tissue. It may occur with abnormal vertebrae, a skin mark, weakness, altered sensation, or bladder problems.

Diastole

The part of each heartbeat when the heart muscle relaxes and its chambers fill with blood. The lower blood-pressure number is the pressure in the arteries during this phase.

Diastolic

Relating to diastole, when the heart relaxes and fills. Diastolic blood pressure is the lower number in a blood-pressure reading.

Diastolic Blood Pressure

The pressure in the arteries while the heart relaxes between beats. It is the lower number in a blood-pressure reading and is interpreted with the upper number, symptoms, age, and other health conditions.

Diastolic Dysfunction

Impaired relaxation or filling of a heart ventricle between beats. It may occur with a normal or reduced ejection fraction and does not by itself mean that a person has heart failure; symptoms and evidence of raised filling pressure are also needed to diagnose heart failure.

Diastolic Heart Failure

An older term usually referring to heart failure caused by a stiff heart that does not fill easily, often with preserved pumping percentage. Diagnosis also requires symptoms, signs, and evidence of raised filling pressure.

Diastolic Murmur

An abnormal extra sound heard with a stethoscope between heartbeats, during the resting phase (diastole) when the heart muscle relaxes and fills with blood. Unlike systolic murmurs (which are sometimes harmless), diastolic murmurs almost always indicate an underlying heart valve problem, such as a leaky valve that allows blood to flow backward (regurgitation) or a stiff, narrowed valve that restricts blood flow (stenosis).

Diastolic Murmurs

Plural form; see *Diastolic Murmur*.

Diathermy

Use of high-frequency electrical or electromagnetic energy to produce heat in tissue. It may be used during surgery to cut tissue or stop bleeding, or in selected treatments to warm deeper tissues.

Diathesis

A tendency to develop a particular disease, symptom, or body response. For example, a bleeding diathesis means a person is more likely to bleed than usual.

Diatomaceous Earth

A powder made from the fossilized remains of microscopic algae. Inhalation of fine particles can irritate the lungs, and some forms containing crystalline silica can cause serious lung disease with repeated exposure.

Diatom Test

A forensic test that looks for microscopic algae in tissues after suspected drowning. It may support an investigation but cannot prove drowning by itself because algae can enter the body from other sources.

Diatrizoate Meglumine

An iodinated contrast substance used for selected X-ray or imaging studies. It improves visibility of body structures but may cause allergic-like reactions, kidney injury, aspiration problems, or thyroid effects.

Diazepam

A benzodiazepine that calms brain activity and is used for selected anxiety, muscle-spasm, seizure, and alcohol-withdrawal conditions. It can cause drowsiness, falls, dependence, withdrawal, and dangerous breathing depression with opioids or alcohol.

Diazepam Overdose

Taking too much diazepam can cause extreme sleepiness, confusion, poor coordination, low blood pressure, slowed breathing, coma, or death, especially when combined with alcohol, opioids, or other sedatives.

Diazinon

An organophosphate insecticide that blocks acetylcholinesterase, causing excess nerve signals. Exposure can lead to sweating, salivation, vomiting, diarrhea, breathing difficulty, muscle weakness, seizures, or respiratory failure.

Diazinon Poisoning

Poisoning by diazinon, causing excess cholinergic activity with sweating, salivation, vomiting, diarrhea, wheezing, slow heartbeat, muscle weakness, seizures, or breathing failure. It requires emergency treatment and decontamination.

Diazonium Compounds

Chemicals containing a diazonium group, used in dyes, synthesis, and laboratory reactions. Some are unstable or toxic and may irritate tissues or release hazardous products.

Diazoxide

A medicine that opens potassium channels and can reduce insulin release or relax blood vessels. It is used in selected cases of low blood sugar from excess insulin and severe high blood pressure; fluid retention and high glucose may occur.

Dibekacin

An aminoglycoside antibiotic used in some regions for serious bacterial infections. It blocks bacterial protein production but can damage the kidneys, hearing, or balance, especially with prolonged or high-dose treatment.

Dibenzepin

A tricyclic antidepressant used in some countries for depressive disorders. It can cause drowsiness, dry mouth, constipation, blurred vision, abnormal heart rhythms, and dangerous toxicity in overdose.

Dibucaine

A long-acting local anesthetic applied to skin or mucous membranes to reduce pain or itching. Excessive use or absorption can cause numbness beyond the treatment area, seizures, heart problems, or other toxicity.

Dicarboxylic Acid

An organic molecule containing two acid groups. These molecules take part in metabolism and may accumulate in some inherited or acquired metabolic disorders.

Dichlorophen

A chemical formerly used in some disinfectants and medicines. Exposure can irritate the skin, eyes, or digestive tract; serious effects depend on the amount, route, and duration of exposure.

Dichlorvos

An organophosphate insecticide that can block acetylcholinesterase. Poisoning may cause sweating, salivation, vomiting, diarrhea, muscle weakness, breathing difficulty, seizures, or respiratory failure.

Dichorionic Diamniotic Twin Placenta

A twin pregnancy in which each fetus has its own outer membrane and amniotic sac, usually with a separate placenta. It generally has fewer shared-placenta complications, but routine maternal and

fetal monitoring remains important.

Dichorionic Twins

Twins that each have a separate outer membrane and amniotic sac. Most fraternal twins and some identical twins are dichorionic; risks still include premature birth, growth problems, and pregnancy complications.

Diclofenac

A nonsteroidal anti-inflammatory medicine used for pain and inflammation. It can cause stomach irritation or bleeding, kidney or liver injury, fluid retention, and increased cardiovascular risk.

Diclofenac Sodium

A salt form of diclofenac used for pain and inflammation. It can irritate or bleed the stomach and may affect the kidneys, blood pressure, liver, or heart.

Diclofenac Sodium Overdose

Taking too much diclofenac sodium can cause nausea, vomiting, stomach bleeding, kidney injury, drowsiness, seizures, breathing problems, or abnormal body chemistry.

Dicloxacillin

A penicillin-type antibiotic that blocks bacterial cell-wall production. It is used for susceptible infections, especially some staphylococcal infections; allergy, diarrhea, and liver injury can occur.

DICOM

An international format and communication standard for storing, sending, and viewing medical images and related information. It allows images from X-ray, CT, MRI, ultrasound, and other systems to be shared.

Dicoumarol

An older oral anticoagulant that blocks vitamin K recycling and reduces production of several clotting factors. It has largely been replaced by medicines with more predictable effects and remains important mainly historically.

Dicrotic

Describing a second small wave or notch in an artery's pressure pulse, usually produced when the aortic valve closes. It may be visible on a monitor or arterial pressure tracing.

Dicrotophos

An organophosphate insecticide that can inhibit acetylcholinesterase. Poisoning may cause sweating, salivation, vomiting, diarrhea, muscle weakness, breathing difficulty, seizures, or respiratory failure.

Dicyclomine

An anticholinergic medicine that relaxes intestinal muscle and may reduce cramping in selected bowel disorders. It can cause dry mouth, blurred vision, constipation, fast heartbeat, confusion, or difficulty urinating.

Dieffenbachia Poisoning

Poisoning after chewing or swallowing parts of the Dieffenbachia plant. Needle-like calcium oxalate crystals can cause immediate burning, pain, drooling, and swelling of the mouth and throat; airway swelling requires emergency care.

Diencephalon

A central part of the brain containing the thalamus and hypothalamus. It helps process sensory information and regulate hormones, temperature, appetite, sleep, movement, and other automatic functions.

Dientamoebiasis

Infection of the large intestine with *Dientamoeba fragilis*, a protozoan related to trichomonads. Many people carrying the organism have no symptoms; others have abdominal pain or diarrhea. Its role in symptoms can be uncertain because it is also found in healthy people.

Alternate Names:
Dientamoeba Fragilis Infection

DIEP Flap

A reconstructive surgery using skin and fat from the lower abdomen, supplied by small blood vessels, to rebuild a breast or another body area while preserving most abdominal muscle.

Diesel Oil

A petroleum fuel whose fumes or liquid can irritate the skin, eyes, and lungs. Swallowing or aspiration into the lungs can cause severe chemical pneumonia.

Diestrus

A phase of the reproductive cycle in many mammals between periods of sexual receptivity. It is characterized by activity and later regression of the corpus luteum.

Dietary Assessment

Systematic review of a person's food, drink, nutrient, and supplement intake using methods such as a food diary, recall, or questionnaire. It helps identify deficiencies, excesses, patterns, and changes needed for health.

Dietary Calcium

Calcium obtained from food or drinks, needed for bones, teeth, muscles, nerves, and blood clotting. Requirements vary with age and health; excess supplements may cause kidney stones or other problems.

Dietary Carbohydrate

Carbohydrate in foods and drinks, including sugars, starches, and fiber. Digestible carbohydrate provides energy and affects blood glucose; fiber is only partly or not digested and supports bowel function.

Dietary Fat

An essential nutrient that serves as a concentrated source of energy and is necessary for cellular structure and hormone production. Dietary fats help the body absorb essential fat-soluble vitamins (vitamins A, D, E, and K) and protect vital organs. They are categorized into unsaturated fats (healthy fats commonly found in plant oils, nuts, and fish) and saturated or trans fats, which when consumed in excess can raise cholesterol levels and increase the risk of cardiovascular disease.

Dietary Fats

Plural form; see *Dietary Fat*.

Dietary Fats and Oils

Edible fats and oils, including butter, margarine, and cooking oils, provide energy and essential fatty acids and help the body absorb vitamins A, D, E, and K. Their health effects depend on the type and amount consumed and the overall eating pattern.

Dietary Fiber

Plant material that is not fully digested. It helps form stool, supports regular bowel movements, may improve cholesterol and glucose control, and can increase fullness.

Dietary Fibre

Plant-derived carbohydrate that is not fully digested in the small intestine. Soluble and insoluble fiber support bowel function and may improve cholesterol, glucose control, and fullness; increase intake gradually with adequate fluids unless medically restricted.

Dietary Inflammation

Inflammatory activity that may be influenced by long-term eating patterns, excess body fat, and overall health. Diets rich in vegetables, legumes, whole grains, and unsaturated fats generally support lower inflammation than diets high in heavily processed foods.

Alternate Names:
Diet-Induced Inflammation; Diet-Associated Systemic Inflammation

Dietary Iron

Iron from food or supplements, needed to make hemoglobin, muscle proteins, and enzymes. Too little can cause iron-deficiency anemia; too much can be toxic, especially in children or people with iron-storage disorders.

Dietary Phospholipid

A food-derived fat containing phosphate that helps form cell membranes and transports fats in the blood. Its digestion and handling depend on food intake, absorption, and liver function.

Dietary Phosphorus

Phosphorus from food, needed for bones, teeth, cell membranes, and energy use. People with reduced kidney function may need to limit highly absorbable sources to prevent high blood phosphorus.

Dietary Protein

Protein from food that is digested into amino acids and small peptides. These support muscle and tissue repair, enzymes, hormones, immunity, and energy when needed.

Dietary Reference Intakes

A set of nutrient-intake reference values used to plan and assess diets. They include the recommended allowance, adequate intake, estimated average requirement, and tolerable upper intake level, which vary with age, sex, and life stage.

Dietary Sterol

A cholesterol-like substance found in foods, including cholesterol and plant sterols. Absorption and metabolism affect blood cholesterol; plant sterols can reduce intestinal cholesterol absorption in some people.

Dietary Sugars

Sugars are simple carbohydrates that provide energy but can raise blood glucose and contribute to dental decay or excess calories when consumed in excess.

Dietary Supplement

A manufactured orally ingested product intended to augment the nutritional content of the diet, containing one or more dietary ingredients such as vitamins, essential minerals, amino acids, botanicals/herbal extracts, enzymes, or metabolites. Regulated in many jurisdictions under distinct regulatory frameworks from prescription pharmaceutical drugs, dietary supplements are indicated to correct documented nutritional deficiencies (e.g., vitamin B_{12} in pernicious anemia or vegan diets, vitamin D/calcium in osteopenia, folic acid in preconception), though excessive or unmonitored intake carries risks of toxicities and pharmacodynamic/pharmacokinetic drug-nutrient interactions.

Dietary Supplementation

Deliberate addition of nutrients or other substances to the diet to correct a deficiency, meet increased needs, or support a health goal. Excess amounts can be harmful.

Dietary Supplements

Plural form; see *Dietary Supplement*.

Dietetics

The science and professional practice of using food and nutrition to promote health, prevent disease, and manage medical conditions through individualized dietary advice.

Diethylcarbamazine

An antiparasitic medicine used mainly for lymphatic filariasis and some other filarial infections. Fever, rash, swelling, or inflammation may occur as the immune system reacts to dying parasites.

Diethylhexylphthalate

Another name for DEHP, a chemical added to some plastics to make them flexible. Repeated or high exposure may affect reproduction, development, or hormone function.

Diethylpropion

A stimulant appetite suppressant used short term in selected weight-management plans. It can cause insomnia, anxiety, fast heartbeat, high blood pressure, misuse, and dependence; medical supervision is required.

Diethylstilbestrol

A synthetic estrogen formerly given to some pregnant people. Exposure before birth can increase the risk of reproductive-tract abnormalities, fertility

problems, and certain rare cancers later in life.

Alternate Names:
DES

Dietitian

A nutrition professional who assesses food and nutrient needs and provides individualized advice for health, disease prevention, and medical conditions. Professional titles and licensing rules vary by region.

Dietl Crisis

Severe, episodic, colicky flank or abdominal pain accompanied by nausea, vomiting, and oliguria, caused by transient kinking or obstruction of the ureter when a mobile or ptotic kidney shifts position into the pelvis upon standing (nephroptosis), relieved upon lying supine.

Alternate Names:
Renal Ptosis Crisis; Dietl Syndrome

Diet Therapy

Use of an individualized eating plan to prevent, manage, or treat a health problem. It may address diabetes, kidney disease, food allergy, malnutrition, digestive disorders, or other needs and is tailored to the person's health and goals.

Dieulafoy Lesion

An unusually large artery close to the surface of the stomach or another digestive organ that can suddenly cause severe bleeding, sometimes without a visible ulcer. It may produce vomiting of blood or black stools.

Diff Dx

An abbreviation for differential diagnosis, the structured comparison of possible causes of a person's symptoms, signs, or test results.

Differences Of Sex Development

Variations present from birth in chromosomes, gonads, hormones, or internal or external genital anatomy. Medical evaluation explains the variation, addresses health needs, and supports informed decisions and well-being.

Differential Blood Count

A blood test measuring the numbers or percentages of different white blood cells, including neutrophils, lymphocytes, monocytes, eosinophils, and basophils. Results help assess infection, inflammation, allergy, and blood disorders.

Differential Diagnosis

The process of comparing possible diseases or conditions that could explain the same symptoms or findings. Clinicians consider serious causes first, use examination and targeted tests, and revise the possibilities as new information appears.

Differentiated Cancer

A cancer whose cells still resemble the normal tissue from which they arose. The degree of resemblance, called differentiation, helps pathologists describe tumor grade and may provide information about behavior.

Differentiation

The process by which cells develop specialized structures and functions. In cancer pathology, it describes how closely abnormal cells resemble the normal tissue from which they originated.

Differentiation Antigens

Molecules on a cell's surface that indicate its tissue type or stage of development. Laboratory tests for them help identify blood-cell disorders, classify cancers, and guide selected treatments.

Difficult Airway

A situation in which a clinician may have trouble keeping a person breathing or placing a device into the airway. Causes include unusual anatomy, swelling, injury, illness, or limited neck movement and require careful planning.

Difficult Intubation

Difficulty placing a breathing tube in the windpipe despite appropriate technique and equipment. Limited mouth or neck movement, unusual anatomy, swelling, injury, obesity, or a previous difficult intubation may increase risk.

Difficult-to-Control Asthma

Asthma that remains poorly controlled despite appropriate treatment. Possible reasons include ongoing triggers, incorrect inhaler use, another illness, an incorrect diagnosis, severe airway inflammation, or a different response to medicines.

Difficult Urination

Trouble starting or maintaining urine flow, a weak stream, pain, straining, or a feeling of incomplete emptying. Causes include infection, blockage, prostate or pelvic disorders, medicines, and nerve or bladder problems.

Difficulty Speaking

Trouble producing or coordinating speech. It may result from a language problem, weakness or poor coordination of the speech muscles, or a voice disorder; the specific diagnosis depends on the cause.

Difficulty Swallowing

Alternate name; see *Dysphagia*.

Difficulty Swallowing (Dysphagia)

Trouble moving food, liquid, or saliva safely from the mouth to the stomach. Causes may involve the throat, esophagus, nerves, muscles, or obstruction; choking, aspiration, weight loss, or progressive symptoms may indicate significant disease.

Difficulty Walking

Trouble walking safely or normally because of pain, weakness, poor balance, numbness, joint disease, neurologic illness, or heart or lung limitations. Sudden onset may occur with acute neurologic or musculoskeletal disease.

Diffuse

Spread broadly or throughout an area rather than limited to one small, clearly defined focus. The term may describe a disease, pain, swelling, imaging finding, or other process.

Diffuse Aches and Pains

Pain or aching felt in several parts of the body. It can occur with infections, inflammation, some medicines, or other illnesses. The cause depends on the person's other symptoms and health history.

Diffuse Alopecia

Alternate name; see *Diffuse Hair Loss*.

Diffuse Alveolar Hemorrhage

A serious condition in which blood leaks into many of the lung's air sacs. It may cause coughing up blood, breathlessness, low oxygen, falling blood counts, and widespread shadows on a chest scan. Bronchoscopy with increasingly bloody samples can support the diagnosis; clinical findings help identify the cause.

Alternate Names:
DAH; Pulmonary Alveolar Hemorrhage

Diffuse Astrocytoma

An older name for an infiltrating brain tumor made of astrocyte-like cells. Modern classification depends on molecular findings, including IDH status, which help determine diagnosis, outlook, and treatment.

Diffuse Axonal Injury

Widespread damage to brain nerve fibers caused by rapid acceleration, deceleration, or rotation of the head. It can cause prolonged unconsciousness or severe brain dysfunction, and MRI may show the injury.

Diffuse Esophageal Spasm

A disorder in which the esophagus contracts too early or unevenly, causing intermittent chest pain and difficulty swallowing liquids or solids. Testing helps distinguish it from blockage, reflux, and heart disease.

Diffuse Hair Loss

A generalized, non-scarring reduction in hair density or widespread shedding affecting the entire scalp, distinguishing it from focal or patchy alopecia. Major causes include telogen effluvium following physiologic stress or childbirth, anagen effluvium induced by cytotoxic chemotherapy, diffuse androgenetic alopecia, systemic endocrinopathies such as

hypothyroidism, and nutritional deficiencies in iron or zinc.

Alternate Names:
Generalized Alopecia; Diffuse Effluvium

Diffuse Idiopathic Skeletal Hyperostosis

A condition in which extra bone forms along spinal ligaments and where tendons attach to bone. It can cause stiffness, pain, swallowing difficulty, or fractures after minor injury.

Alternate Names:
DISH; Forestier Disease

Diffuse Large B-Cell Lymphoma

A fast-growing cancer of B lymphocytes, a type of white blood cell. It may cause painless swollen lymph nodes, fever, night sweats, or weight loss.

Diffuse Midline Glioma

An aggressive brain or spinal-cord cancer arising in a midline structure, often in children. Symptoms depend on location and may include weakness, movement problems, vision changes, vomiting, or seizures.

Diffuse Parenchymal Lung Disease

Alternate name; see *Interstitial Lung Disease*.

Diffuse Parenchymal Lung Diseases

Alternate index label; see *Interstitial Lung Disease*.

Diffuse Proliferative Glomerulonephritis

A pattern of glomerular inflammation in which many glomeruli show increased cellularity and tissue injury. It often produces hematuria, proteinuria, hypertension, and reduced kidney function and may result from immune-complex disease such as lupus or infection.

Diffuse Scleroderma

A form of systemic sclerosis in which skin thickening extends beyond the hands and face onto the trunk or limbs. It carries a higher risk of lung, kidney, heart, blood-vessel, and digestive complications.

Diffusing Capacity

The ability of the lungs to move oxygen and other gases from the air sacs into the blood. It may be reduced by emphysema, interstitial lung disease, pulmonary vascular disease, or anemia.

Diffusing Capacity Of The Lung

A measure of how efficiently gas crosses from the lung air sacs into nearby blood vessels. It is commonly measured as DLCO and helps evaluate lung tissue, blood vessels, and hemoglobin-related problems.

Diffusion

Movement of molecules from an area where they are more concentrated to an area where they are less concentrated, caused by their random motion. It helps exchange gases and substances in the body.

Diffusion Anisotropy

A difference in the direction water moves through tissue, especially along nerve fibers in the brain. MRI can use this pattern to study nerve-fiber structure and injury.

Diffusion Capacity

A measure of how efficiently gases pass from lung air sacs into blood. It is commonly reported as DLCO and may be reduced in interstitial lung disease, emphysema, pulmonary vascular disease, or anemia.

Diffusion Restriction

An area where water movement appears reduced on a special MRI sequence. It can occur with an acute stroke, abscess, densely packed tumor, seizure, or other problem; significance depends on the full examination.

Diffusion Tensor Imaging

An MRI technique that maps the direction of water movement along nerve fibers. It helps show the paths and condition of important nerve connections in the brain.

Diffusion-Weighted Imaging

An MRI technique that shows how water molecules move within tissue. Areas with restricted movement may occur in acute stroke, abscess, densely packed tumors, seizures, or other conditions.

Diflunisal

A salicylate nonsteroidal anti-inflammatory medicine used for pain and inflammation. It can cause stomach irritation or bleeding, kidney injury, fluid retention, allergic reactions, or cardiovascular problems.

Digastric Muscle

A two-part muscle beneath the jaw that helps open the mouth, lower the jaw, and raise the hyoid bone during swallowing and speech.

DiGeorge Syndrome

A genetic disorder usually caused by loss of a small part of chromosome 22. It can affect the heart, immune system, calcium regulation, palate, hearing, learning, and development.

Alternate Names:
22q11.2 Deletion Syndrome

Digestion

The process of breaking food into smaller substances that the body can absorb and use. It begins in the mouth and continues through the stomach and intestines with movement, acid, bile, and digestive enzymes.

Digestive Diseases

Disorders affecting the digestive tract, liver, gallbladder, or pancreas. Examples include reflux, ulcers, infections, inflammatory bowel disease, blockage, malabsorption, and cancer.

Digestive Disorder

A disease affecting the digestive tract or the process of digestion. It may cause abdominal pain, nausea, reflux, diarrhea, constipation, bleeding, vomiting, or poor nutrient absorption.

Digestive Health

Healthy function of the digestive tract in breaking down food, absorbing nutrients and water, and removing waste. It is influenced by diet, fluids, medicines, movement, illness, and the gut lining and microbiome.

Alternate Names:
Gut Health

Digestive System

The gastrointestinal tract and accessory organs that mechanically and chemically process food, absorb nutrients and water, and eliminate solid waste. It includes the mouth, pharynx, esophagus, stomach, small and large intestines, rectum, anus, liver, gallbladder, and pancreas.

Digestive Tract

The continuous hollow passage through which food travels from the mouth to the anus. It includes the throat, esophagus, stomach, small intestine, large intestine, rectum, and anus.

Alternate Names:
Gastrointestinal Tract; Alimentary Canal

Digit

A finger or toe. Most fingers and toes contain three small bones, while the thumb and great toe usually contain two; muscles, tendons, nerves, and blood vessels allow movement and sensation.

Digital Anorectal Examination

A physical examination in which a clinician uses a lubricated, gloved finger to evaluate the anal canal, distal rectum, sphincter muscle tone, and adjacent structures such as the prostate.

Alternate Names:
DARE; Digital Rectal Examination; DRE; Rectal Exam

Digital Breast Tomosynthesis

A breast X-ray test that takes pictures from several angles and combines them into thin, layered images. It can show some breast findings more clearly than a single flat image.

Digital Clubbing

Enlargement and rounding of the fingertips with curved nails and loss of the normal angle at the nail base. It may be associated with lung, heart, digestive, liver, or other diseases.

Digital Fibrokeratoma

A rare, harmless, firm skin growth usually found on a finger or toe. It may resemble a wart; removal or microscopic examination may be needed when its appearance is unusual or it causes pain or interference.

Digitalis

A group of cardiac glycosides, including digoxin, that can increase cardiac contractility and slow atrioventricular conduction; toxicity may cause gastrointestinal, neurologic, visual, or cardiac-rhythm effects.

Digital Ischemia

Too little blood flow to a finger or toe, causing pain, pallor, coolness, numbness, or tissue death. It may result from arterial blockage, severe Raynaud phenomenon, inflammation, or an embolus and can be an emergency.

Digitalis Preparation

A preparation containing a cardiac glycoside such as digoxin or digitoxin. It can strengthen heart contraction and slow electrical conduction, but the dose range is narrow and toxicity can cause digestive, visual, or rhythm problems.

Digitalis Toxicity

Harmful effects from digitalis or related cardiac glycosides, including nausea, vomiting, visual changes, confusion, slow or fast abnormal heart rhythms, and high potassium. Kidney disease and drug interactions increase risk.

Digital Mammography

Breast imaging that records X-ray pictures electronically. It helps detect masses, distortions, and calcium deposits and allows images to be enlarged, adjusted, stored, and compared.

Digital Mucous Cyst

A usually harmless fluid-filled lump near the last joint of a finger, often linked to osteoarthritis. It may press on the nail, cause pain, or occasionally become infected.

Digital Papillary Adenocarcinoma

A rare cancer of a sweat gland, usually on a finger, hand, or foot. It often appears as a slow-growing lump but can return locally or spread to other organs.

Digital Radiography

X-ray imaging in which the picture is captured electronically instead of on film. The image can be viewed, stored, adjusted, and shared on a computer.

Digital Rectal Exam

A physical examination using a lubricated, gloved finger to feel the anal canal and rectum and, when relevant, the prostate. It may detect tenderness, bleeding, lumps, hemorrhoids, or muscle problems.

Digital Rectal Examination

An examination in which a clinician gently feels inside the rectum with a lubricated, gloved finger. It may check for pain, bleeding, lumps, hemorrhoids, prostate changes, or muscle problems after explanation and consent.

Digital Subtraction Angiography

An X-ray study in which computer processing removes background structures from contrast images so blood vessels are clearer. It can diagnose narrowing or blockage and guide selected vascular procedures.

Digitate Warts

Finger-like or thread-like warts, usually on the face or neck, caused by human papillomavirus infection. They are generally harmless but can spread or recur.

Alternate Names:
Verruca Digitata

Digitoxin

A cardiac glycoside that can strengthen heart contraction and slow electrical conduction. Its safe and toxic doses are close together, so abnormal rhythms, digestive symptoms, visual changes, and drug interactions are important concerns.

Digoxin

A cardiac medicine used in selected people with heart failure or atrial fibrillation. It can strengthen contraction and slow the heart rate, but kidney function, electrolytes, other medicines, and blood levels affect toxicity risk.

Digoxin Immune Fab

Antibody fragments given by injection that bind digoxin and related cardiac glycosides, reducing their effects. They are used for life-threatening abnormal rhythms, severe toxicity, or a potentially very large ingestion.

Digoxin Test

A blood test measuring digoxin concentration to help guide dosing or assess possible toxicity. Timing, symptoms, kidney function, electrolytes, and interacting medicines affect interpretation; the number alone does not prove toxicity.

Digoxin Toxicity

Poisoning from digoxin or related heart medicines. It may cause nausea, vomiting, confusion, vision changes, or a slow, fast, or irregular heartbeat. Severe toxicity can be life-threatening.

Dihydrocodeine

An opioid medicine used for selected pain or cough conditions. It can cause constipation, nausea, drowsiness, dependence, dangerous breathing depression, and overdose, especially with alcohol or other sedatives.

Dihydroergotamine

An ergot medicine used for selected acute migraine attacks. It narrows certain blood vessels and is contraindicated in several vascular, heart, liver, kidney, and pregnancy-related conditions.

Dihydropyrimidine Dehydrogenase Deficiency (DPYD-Related)

Reduced activity of dihydropyrimidine dehydrogenase, usually caused by harmful variants in the DPYD gene. It can impair breakdown of fluorouracil and related medicines and greatly increase the risk of severe or life-threatening toxicity.

Dihydrotestosterone

A potent androgen made from testosterone. It contributes to development of male external genitalia, facial and body hair, prostate growth, and other androgen effects.

Dihydroxyacetone

A three-carbon sugar involved in metabolism. Its phosphate form is an intermediate used when cells break down glucose or make glucose.

Dilantin Overdose

Taking too much phenytoin can cause involuntary eye movements, poor coordination, slurred speech, drowsiness, confusion, low blood pressure, abnormal heart rhythms, seizures, or coma.

Dilatation

Alternate spelling; see *Dilation*.

Dilate

To become wider or make a passage, blood vessel, opening, or body structure wider. Dilation may occur naturally, result from medicines or disease, or be created during a procedure.

Alternate Names:
Expand; Enlarge

Dilated Cardiomyopathy

A heart-muscle disease in which one or more chambers enlarge and pump weakly. Causes include inherited disease, infection, toxins, medicines, pregnancy, blocked arteries, and inflammation; it can lead to heart failure or abnormal rhythms.

Alternate Names:
DCM; Congestive Cardiomyopathy

Dilated Cardiomyopathy Prognosis

Outlook varies with heart-pumping strength, symptoms, cause, abnormal rhythms, other illnesses, and response to treatment. Medicines and devices can improve function for some people; severe disease may require advanced heart-failure care.

Dilated Pore of Winer

A benign, enlarged opening of a hair follicle that appears as a solitary black or dark keratin-filled pore, usually on the face, neck, or trunk of an adult. It may resemble a skin tumour; complete removal is diagnostic and usually curative.

Dilation

Widening or expansion of a hollow organ, blood vessel, duct, pupil, opening, or other body structure. It may be normal, caused by disease, or deliberately produced during a procedure.

Dilation and Curettage

A procedure that opens the cervix and removes tissue from inside the uterus using suction or an instrument. It may treat miscarriage or retained pregnancy tissue, investigate bleeding, or remove abnormal tissue; risks include bleeding, infection, and perforation.

Dilation And Evacuation

A procedure that opens the cervix and removes pregnancy tissue from the uterus using suction and instruments. It is performed by trained clinicians for selected pregnancy-related indications, with risks including bleeding, infection, and uterine injury.

Dilator

An instrument or device used to widen a body opening or passage gradually or temporarily. It may be used during examinations, surgery, childbirth care, dental treatment, or treatment of a narrowing.

Diltiazem

A calcium-channel blocker used for high blood pressure, angina, and heart-rate control in some abnormal rhythms. It can slow the heart, lower blood pressure, cause constipation, or worsen heart failure in susceptible people.

Dilute Russell Viper Venom Time

A blood-clotting test used mainly to detect lupus anticoagulant, an antibody associated with antiphospholipid syndrome. Anticoagulant medicines and other clotting problems can affect the result, so confirmatory testing is needed.

Dilution

Lowering the concentration of a substance by adding solvent or another fluid. Accurate dilution is important when preparing medicines, laboratory reagents, standards, or specimens.

Dilution Anemia

A pseudoanemia caused by an expansion of plasma volume out of proportion to red blood cell mass, resulting in reduced hemoglobin concentration and hematocrit despite normal total circulating erythrocyte volume, typically seen during pregnancy and aggressive intravenous fluid administration.

Alternate Names:
Hypervolemic Anemia; Hemodilution

Dimenhydrinate

An antihistamine used to prevent or treat motion sickness and nausea. It can cause drowsiness, dry mouth, blurred vision, constipation, confusion, or difficulty urinating.

Dimenhydrinate Overdose

Taking too much dimenhydrinate can cause severe drowsiness or agitation, confusion, hallucinations, seizures, abnormal heart rhythms, breathing depression, or coma.

Dimercaprol

An injected medicine that binds certain toxic metals, including arsenic, mercury, and gold, so the body can remove them. It can cause high blood pressure, fast heartbeat, nausea, pain, and other adverse effects.

Dimesna

A sulfur-containing compound studied as a protective or detoxifying medicine, including in some chemotherapy-related settings. Its clinical role depends on the specific treatment and available evidence.

Dimethoate

An organophosphate insecticide that blocks acetylcholinesterase. Poisoning can cause sweating, excess saliva, vomiting, diarrhea, small pupils, muscle weakness, breathing problems, seizures, or coma.

Dimethoxon

A poisonous breakdown product of some organophosphate pesticides. It can cause sweating, excess saliva, vomiting, diarrhea, small pupils, muscle twitching, weakness, breathing difficulty, or seizures.

Dimethyl Fumarate

An oral medicine used for multiple sclerosis and selected skin conditions. It can cause flushing, digestive symptoms, low white-cell counts, liver injury, allergic reactions, or rare serious infections.

Dimethyl Fumarate Allergy

An allergic or hypersensitivity reaction to dimethyl fumarate, a medicine used for some forms of multiple sclerosis. It may cause rash, itching, swelling, breathing difficulty, or other immune symptoms.

Dimethylhydrazines

A group of highly toxic chemicals formerly used mainly in rocket fuel. Exposure can irritate or burn tissues and damage the nervous system, liver, blood, or other organs.

Dimethyl Sulfoxide

An organic solvent used in laboratories and some specialized medical or investigational applications. Contact or ingestion can irritate tissues, and it may carry other substances through the skin.

Dimethyl Sulphoxide

Another spelling of dimethyl sulfoxide, an organic solvent used in laboratories and selected medical or investigational applications. Exposure may cause irritation, a characteristic odor, or other adverse effects.

Dimetilan

A poisonous carbamate insecticide that disrupts nerve signals by blocking acetylcholinesterase. Exposure can cause sweating, vomiting, diarrhea, small pupils, weakness, breathing difficulty, seizures, or coma.

Diminished Ovarian Reserve

Fewer remaining eggs than expected for a person's age, which may reduce response to fertility treatment and shorten the time available for conception. Tests estimate reserve but cannot precisely predict natural fertility.

Alternate Names:
Decreased Ovarian Reserve; DOR

Dimocillin

A penicillin-type antibiotic used historically or in selected settings for susceptible bacterial infections. Choice depends on the organism, resistance testing, infection site, allergies, and local treatment guidance.

Dimorphic

Existing in two distinct forms. Some fungi are dimorphic, growing as a mold in the environment and as a yeast in body tissues; this ability can contribute to infection.

Dinophyceae

A group of aquatic microorganisms, including dinoflagellates. Some produce toxins during harmful algal blooms that can contaminate seafood or water and cause neurologic, digestive, or liver illness.

Dinoprost

A prostaglandin medicine that stimulates uterine contraction and other smooth-muscle effects. It is

used mainly in veterinary medicine and selected reproductive-health settings; pain, diarrhea, breathing difficulty, and blood-pressure changes may occur.

Dinoprostone

A prostaglandin medicine used to soften the cervix and help start labor or manage selected pregnancy-related conditions. It requires obstetric monitoring because it can cause contractions that are too frequent, pain, fever, nausea, or fetal heart-rate changes.

Dinucleoside Phosphates

Molecules containing two nucleosides joined by phosphate groups. They occur in nucleotide metabolism and may take part in cellular signaling, energy transfer, or DNA and RNA-related reactions.

Dinutuximab

An antibody-based cancer medicine that attaches to a marker found on many neuroblastoma cells and helps the immune system destroy them. It can cause severe nerve pain, allergic reactions, fever, and fluid leakage from blood vessels.

Dioctyl Sodium Sulphosuccinate

A surfactant and stool-softening medicine also called docusate sodium. It helps water mix with stool and is used in selected constipation settings, although evidence of benefit is limited.

Diopter

A unit of optical power equal to the reciprocal of focal length in meters. Eyeglass and contact-lens prescriptions use diopters to state the strength needed to focus light clearly.

Dioxin

A group of long-lasting environmental chemicals produced by some industrial processes and burning. They can build up in body fat; long-term exposure may affect development, reproduction, immunity, hormones, and cancer risk.

Dipeptide

A molecule made of two amino acids joined together. Dipeptides are produced during protein digestion and metabolism and can be absorbed or used in further chemical reactions.

Dipeptidyl Peptidase-4 Inhibitors

Oral diabetes medicines that prolong the action of natural gut hormones. They help the body release insulin after meals and reduce glucagon, usually without causing weight gain or low blood glucose when used alone.

Dipetalonema Infection

Infection with a Dipetalonema parasitic worm, usually acquired through an arthropod bite. It may affect skin or tissue beneath the skin; diagnosis and treatment depend on the species and clinical findings.

Didelphys Uterus

Alternate name; see *Uterus Didelphys*.

Diphallia

A rare birth condition in which the penis is partly or completely duplicated. Abnormalities of the urinary tract, anus, spine, or other organs may also occur and require specialist assessment.

Diphenhydramine

An antihistamine with sedating and anticholinergic effects used in some allergy or sleep products. It can impair alertness and cause dry mouth, confusion, urinary retention, abnormal rhythms, or toxicity in overdose.

Diphenhydramine Overdose

Taking too much diphenhydramine can cause severe drowsiness or agitation, confusion, hallucinations, seizures, abnormal heart rhythms, breathing depression, coma, or death.

Diphenoxylate

An opioid-related medicine that slows intestinal movement to reduce diarrhea, usually combined

with atropine. Excessive use can cause drowsiness, constipation, dependence, breathing depression, or poisoning.

Diphosphate

A chemical group containing two linked phosphate units. Diphosphate is involved in energy use, nucleotide formation, and other chemical reactions in cells.

Diphosphonate

A chemical group found in compounds that can bind strongly to bone mineral. Some related medicines are used or studied for disorders of bone breakdown and calcium balance.

Diphtheria

An infection caused by certain types of *Corynebacterium diphtheriae* bacteria that make a toxin. Infection of the throat or nose can form a thick gray coating that makes breathing or swallowing difficult. The toxin can also damage the heart, nerves, or other organs; skin infection may cause sores.

Diphtheria Toxin

A poisonous protein made by some Corynebacterium bacteria. It blocks protein production inside cells, causing local tissue injury and potentially severe heart, nerve, and airway complications.

Diphtheroid Bacillus

A rod-shaped bacterium resembling Corynebacterium under the microscope. Many are normal skin bacteria or contaminants, but some can cause opportunistic infection in people with serious illness or medical devices.

Diphyllobothriasis

An intestinal infection caused by a fish tapeworm acquired from raw or undercooked freshwater fish. It may cause abdominal symptoms and, rarely, vitamin B12 deficiency and anemia.

Diphyllobothrium Latum

A fish tapeworm acquired by eating raw or undercooked freshwater fish. It lives in the intestine and may cause abdominal symptoms or compete for vitamin B12, occasionally leading to anemia.

Diplacusis

Hearing one sound as two different pitches or qualities. It often reflects unequal hearing between the ears or inner-ear dysfunction and may follow infection, noise injury, or other ear disease.

Diplegia

Severe weakness or paralysis affecting matching parts on both sides of the body. In spastic diplegia, the legs are affected more than the arms, often because of early brain injury.

Diplococcus

A bacterium that appears as pairs of round cells under a microscope. The term describes shape, not one species; some diplococci cause infections in people.

Diploid Cell

A cell containing two complete sets of chromosomes, one inherited from each parent. Most human body cells are diploid; eggs and sperm normally contain only one set.

Diploidy

Having two complete sets of chromosomes, usually one from each parent. This is the normal chromosome state of most human body cells.

Diplopia

Seeing two images instead of one. It may affect one eye or happen only when both eyes are open. Causes include eye problems, misaligned eye muscles, nerve or muscle conditions, and brain disorders.

Alternate Names:
Double Vision

Dipole

A pair of equal and opposite electrical or magnetic charges separated by a distance. The concept is used in physiology, medical imaging, and physics to

describe electrical or magnetic fields.

Dipper

A person whose blood pressure falls during sleep, usually by about 10 percent or more compared with daytime readings. The pattern is measured with a portable 24-hour monitor and may help assess cardiovascular risk.

Diprosopus

A rare birth defect in which part or all of the face is duplicated. It usually occurs with severe abnormalities of the brain, heart, or other organs and often causes major developmental problems.

Dipsosis

Excessive thirst or a persistent urge to drink. Causes include dehydration, high blood glucose, high blood concentration, medicines, dry mouth, or disorders affecting thirst regulation.

Dipstick Device

A strip or small device containing chemical pads that change color when placed in a specimen, commonly urine. It provides a rapid screen for substances such as blood, protein, glucose, or infection markers.

Diptera

The insect order containing flies and mosquitoes. Some species spread infections through bites or contamination, while others can cause infestations such as myiasis.

Dipylidium Caninum

A tapeworm of dogs and cats that can occasionally infect people, especially children, after an infected flea is swallowed. Infection may cause mild digestive symptoms or visible worm segments in stool.

Dipyridamole

A medicine that reduces platelet clumping and widens blood vessels. It is used in selected stroke-prevention plans and heart stress testing; headache, dizziness, low blood pressure, and bleeding may occur.

Direct Acting Antivirals

Medicines that directly block steps in a virus's life cycle. The term is often used for combination treatments for hepatitis C that target viral proteins and can cure most infections.

Alternate Names:
DAAs

Direct Action

An effect produced through an intervention's immediate target, without requiring an intermediate pathway or mediator. The term may describe a medicine, hormone, nerve signal, or other biological process.

Direct Antiglobulin Test

A blood test that detects antibodies or complement attached to a person's red blood cells. A positive result may occur with autoimmune hemolysis, a transfusion reaction, or hemolysis affecting a newborn.

Direct Coombs Test

Another name for the direct antiglobulin test, which detects antibodies or complement attached to red blood cells. It can help investigate autoimmune hemolysis, transfusion reactions, medicine-related hemolysis, or newborn hemolysis.

Direct Hernia

An inguinal hernia in which abdominal tissue pushes through a weak area in the back wall of the groin canal. It may cause a groin lump or discomfort and can occasionally become trapped.

Direct Inguinal Hernia

An abdominal wall hernia in which peritoneal sac contents protrude directly forward through a weakened transversalis fascia within Hesselbach triangle, situated medial to the inferior epigastric vessels.

Directly Observed Therapy

A healthcare worker or trained supporter watches a person take each dose of medicine. It can support completion of complex treatment, especially

for tuberculosis, and helps detect adverse effects or missed doses.

Direct Oral Anticoagulants

Oral blood thinners that directly block a clotting protein, such as thrombin or factor Xa. They prevent and treat clots but can cause bleeding and require attention to kidney function, interactions, and procedures.

Direct Transmission

Spread of an infectious organism through immediate contact or short-range respiratory droplets from an infected person or animal, without an intermediate object, food, water source, or vector.

Direct Veneer

A tooth-colored composite layer shaped and hardened directly on a tooth to improve appearance or repair minor damage. It usually preserves more tooth than some alternatives but may stain, chip, or need replacement.

Alternate Names:
Direct Composite Veneer; Composite Dental Veneer

Dirofilaria Repens

A mosquito-transmitted parasitic worm that rarely infects people. It usually causes a single lump beneath the skin or near the eye because humans are an accidental host; it does not usually mature or spread in the body.

Dirt-Eating

Repeatedly eating soil or other nonfood substances, a form of pica. It may be associated with iron deficiency, pregnancy, nutritional problems, or mental health conditions and can expose a person to infection or toxins.

Dirty Necrosis

Dead tumor tissue mixed with broken cell material and many white blood cells. It is often seen in rapidly growing cancers and is interpreted by a pathologist with the rest of the tissue sample.

Disability

A difficulty with body function, activity, or participation caused by a health condition and influenced by the person's environment. Disability may be temporary or lifelong and varies in severity and support needs.

Disability-Adjusted Life Year

A population-health measure combining years lost from early death with years lived in less than full health. One DALY represents one lost year of healthy life under the method used.

Disability Evaluation

An assessment of how a health condition affects physical, mental, or daily functioning. History, examination, records, and appropriate tests may inform decisions about work, benefits, insurance, rehabilitation, or support.

Disaccharidase

An intestinal enzyme that breaks a double sugar into simple sugars that can be absorbed. Lactase, for example, breaks lactose in milk into glucose and galactose.

Disaccharide

A carbohydrate made of two linked simple sugars, such as lactose, sucrose, or maltose. It must be split by digestive enzymes before the intestine can absorb its component sugars.

Disarticulation

Amputation performed through a joint rather than by cutting through the shaft of a bone. The level is chosen according to the injury, disease, circulation, function, and possibility of healing.

Disc

A thin, round structure. In the spine, an intervertebral disc is a tough, flexible cushion between neighboring vertebrae that absorbs load and allows movement.

Discectomy

Surgery to remove part of a damaged spinal disc that is pressing on a nerve. It may relieve leg or arm pain and weakness, but risks include infection, bleeding, nerve injury, and recurrent disc problems.

Discitis

Inflammation or infection of a spinal disc, often involving the nearby vertebral bones. It may cause severe localized back or neck pain, stiffness, fever, or reduced movement and usually requires imaging and medical evaluation.

Discography

An imaging procedure in which contrast is injected into a spinal disc to examine it and see whether the injection reproduces pain. Because it has limitations and risks, it is used selectively.

Discoid

Coin-shaped or round. In medicine, it often describes a skin lesion or rash, such as the round plaques of discoid lupus; the associated condition must be identified separately.

Discoid Eczema

A long-lasting type of eczema that causes itchy, round or oval patches of inflamed skin, which may blister, ooze, crust, or become dry and cracked. It can affect different parts of the body and sometimes becomes infected.

Alternate Names:
Nummular Eczema; Discoid Dermatitis; Nummular Dermatitis

Discoid Lupus

Alternate name; see *Discoid Lupus Erythematosus*.

Discoid Lupus Erythematosus

A chronic scarring form of cutaneous lupus that causes persistent, scaly plaques, commonly on the scalp, face, and ears. Lesions may heal with skin atrophy, pigment change, and permanent hair loss in affected areas. Some people also have or later develop systemic lupus erythematosus.

Discoloration

An unusual change in the color of skin, mucous membranes, nails, or another tissue. Causes include bruising, low oxygen, jaundice, inflammation, infection, or altered pigment; changes may be sudden, painful, widespread, or unexplained.

Discolored Teeth

Alternate name; see *Tooth Discoloration*.

Discoloured Teeth

Alternate spelling; see *Tooth Discoloration*.

Discomfort

An unpleasant physical or emotional sensation that may be milder or less clearly located than pain. Its importance depends on the site, duration, associated symptoms, and underlying cause.

Discordance

Lack of agreement between findings, measurements, genetic results, or the medical conditions of two related people. The significance depends on what is being compared and the clinical setting.

Discordant

Not agreeing, matching, or corresponding. In medicine it may describe conflicting test results or different medical findings in related people, twins, or paired organs.

Discordant Couple

A couple whose partners have different results or medical statuses relevant to their care, such as one partner having HIV and the other not. Counseling can reduce transmission risk and support reproductive decisions.

Disease

An abnormal condition that affects the body or mind and changes normal structure or function. Diseases may be infectious, inflammatory, inherited, degenerative, metabolic, immune-related, or cancerous.

Disease-Free Survival

The length of time after treatment during which a person remains alive without detectable evidence of the disease. The exact definition and assessment method depend on the disease and study.

Disease Progression

Change in a disease over time, often meaning worsening. It is assessed through symptoms, examination, laboratory results, imaging, function, complications, and response to treatment.

Disease Reporting

Notification of specified diseases, infections, or health events to public-health authorities. Reports help detect outbreaks, protect contacts, arrange follow-up, and monitor health patterns; requirements vary by location.

Disease Reservoir

A person, animal, environment, or material in which an infectious organism normally lives and from which it can spread to a susceptible host.

Disease Response

The body's biological or clinical reaction to a disease or its treatment. It is assessed using symptoms, signs, laboratory results, imaging, physical function, or survival.

Disease Surveillance

Ongoing collection, analysis, interpretation, and reporting of health information to detect, monitor, and respond to disease patterns, outbreaks, and changes in population health.

Disease Susceptibility

Increased likelihood of developing a disease because of genes, age, immune status, exposures, behavior, other illnesses, or environmental factors. Susceptibility raises risk but does not mean disease is certain.

Disease Vector

A living carrier, commonly a mosquito, tick, flea, or other arthropod, that transfers an infectious organism between hosts. The vector may transmit infection without becoming ill itself.

Disfigurement

A visible change that substantially alters appearance, caused by injury, disease, surgery, a birth difference, or scarring. Its physical, emotional, and social effects vary between people.

Disinfectant

A chemical or physical agent used on nonliving surfaces to destroy or inactivate many microorganisms. Disinfectants are not necessarily safe for skin, wounds, food, or internal use.

Disinfection

A process that inactivates many or most disease-causing microorganisms on nonliving objects. Unlike cleaning, it does not primarily remove soil and germs; cleaning is usually needed first. Disinfection may not destroy bacterial spores, and its effectiveness depends on the agent, organism, surface, and exposure conditions.

Disk

A flat, round structure. In the spine, an intervertebral disk lies between neighboring vertebrae, absorbs shock, and helps the back move.

Alternate Names:
Disc

Disk Battery Ingestion

Ingestion of a button or coin battery, which can cause rapid electrical and chemical tissue injury, especially when lodged in the esophagus. It is a medical emergency requiring urgent localization and removal.

Disk Diffusion Susceptibility Test

A laboratory test of bacterial antibiotic sensitivity. Drug-containing disks are placed on growing bacteria, and the clear areas around them are measured and compared with standards to guide treatment.

Diskectomy

Surgery to remove part or all of a damaged spinal disk pressing on a nerve or the spinal cord. It may relieve pain or weakness caused by disk herniation; risks include infection, bleeding, nerve injury, and recurrence.

Diskitis

Inflammation or infection of a spinal disk and nearby vertebral bone. It commonly causes severe localized back pain, stiffness, fever, or reluctance to move; imaging can show the affected area.

Dislocated Ankle

Alternate name; see *Ankle Dislocation*.

Dislocated Elbow

Loss of normal alignment of the elbow joint, usually after a fall or collision. It causes severe pain, deformity, and limited movement and may occur with fractures, nerve injury, or impaired circulation.

Dislocated Hip

Displacement of the upper thighbone from its hip socket, usually after major trauma or around an artificial joint. It is an emergency because nearby nerves and the blood supply to the bone may be damaged.

Dislocated Knee

Loss of alignment between the thighbone and shinbone, usually after severe injury. Major artery or nerve damage may be hidden, so urgent reduction and circulation checks are needed even if the knee returns to position.

Dislocated Shoulder

Displacement of the upper arm bone from the shoulder socket. It causes pain, deformity, and inability to move normally and requires reduction with assessment of nerves, blood vessels, and fractures.

Dislocation

Complete loss of normal contact between the surfaces of a joint, usually from injury or disease. It can cause severe pain and deformity and may occur with fractures or nerve and blood-vessel injury.

Dislocation Of The Lens

Partial or complete movement of the eye's natural lens away from its normal position because its supporting fibers are weak or torn. It may cause blurred or double vision, eye pain, or glaucoma.

Disofenin Scan

A nuclear-imaging test that follows bile production and flow through the liver, gallbladder, and bile ducts. It can help detect blockage, leakage, inflammation, or selected causes of abdominal pain.

Disopyramide

An antiarrhythmic medicine used selectively for certain abnormal heart rhythms. It can slow electrical conduction and weaken heart contraction and may cause dry mouth, urinary retention, low blood pressure, or new arrhythmias.

Disorder

A disturbance of normal body or mind structure or function that causes symptoms, impairment, or important health risk. The term does not by itself indicate how severe the problem is.

Disordered Thinking

A disturbance in the organization, clarity, logic, or flow of thoughts. It may occur with mental illness, brain disease, delirium, substance use, medicines, or other medical conditions.

Disorders of Fluid, Electrolyte, and Acid-Base Balance

Disorders that disturb body-fluid balance, electrolyte concentrations, or blood acidity. They may arise from kidney, heart, endocrine, gastrointestinal, medication, or critical-illness problems and can affect the brain, muscles, and heart.

Disorders of Oral Pigmentation

Conditions causing focal or diffuse dark, brown, blue, or black discoloration of the mouth lining. Causes

include normal variation, trauma, inflammation, medicines, smoking, endocrine or systemic disease, and melanocytic or other tumors; new, changing, solitary, or symptomatic lesions need oral examination.

Disorganized Symptoms in Schizophrenia

Markedly disorganized speech, behavior, or emotional expression occurring in schizophrenia. Modern classifications describe these features within schizophrenia-spectrum disorders rather than as a separate subtype.

Alternate Names:
Disorganized Schizophrenia (deprecated historical subtype label)

Disorientation

Difficulty knowing the time, place, situation, or one's identity. It may occur with delirium, infection, abnormal body chemistry, intoxication or withdrawal, brain injury, or dementia; sudden onset can accompany acute illness.

Dispensary

A place or service that stores, prepares, and supplies medicines and may provide basic medication advice. Safe dispensing includes checking the prescription, labeling the medicine, and explaining how to use it.

Dispensed Amount

The quantity of medicine supplied to a patient. It is determined by the prescribed dose, treatment duration, formulation, refill rules, and applicable safety or legal requirements.

Dispensing

The professional process of checking a prescription, selecting and preparing the medicine, labeling it, and supplying it with instructions for safe use.

Displacement

Movement of an anatomical structure away from its normal position, as in a displaced fracture, joint injury, organ shift, or device migration. Effects depend on the structure involved and the amount of movement.

Disruption

An interruption or breakdown of normal structure, function, continuity, or process. In medicine, it may describe damaged tissue, a broken barrier, disturbed development, or an interruption in the usual work of an organ or system.

Disruptive Mood Dysregulation Disorder

A childhood mental disorder characterized by persistent, severe irritability and frequent, developmentally inappropriate temper outbursts occurring several times per week.

Disruptive, Impulse-Control, and Conduct Disorders

A group of disorders involving persistent problems with emotional or behavioral self-control that violate the rights of others, major age-appropriate rules, or social norms. Examples include oppositional defiant disorder, conduct disorder, intermittent explosive disorder, kleptomania, and pyromania.

Dissect

To separate tissue layers or structures by cutting or careful blunt separation for surgery, examination, or anatomical study.

Dissecting Aneurysm

Alternate name; see *Aortic Dissection*.

Dissection

Separation of tissue layers, either during surgery or because of disease. In an artery, a tear in the inner lining lets blood split the wall layers and can block blood flow or cause the artery to rupture.

Disseminate

To spread widely through the body, a tissue, or a population. Infection, cancer, inflammation, or another process may disseminate rather than remain in one limited area.

Disseminated Bartonellosis

Bartonella infection that spreads through the bloodstream and affects multiple tissues or organs. It

may cause fever and weight loss, with manifestations such as vascular skin lesions, bacillary peliosis of the liver or spleen, bone infection, eye disease, or endocarditis. Severe forms, including bacillary angiomatosis and peliosis, occur mainly in people with weakened immune systems.

Disseminated Coccidioidomycosis

A fungal infection in which Coccidioides spreads beyond the lungs to skin, bones, joints, brain coverings, or other organs. It can be severe and is more likely in people with impaired immunity.

Disseminated Cutaneous Blastomycosis

A Blastomyces infection that spreads from the lungs or another site to multiple areas of skin. It may also involve bones or other organs and requires antifungal treatment.

Disseminated Gonococcal Infection

A systemic complication of Neisseria gonorrhoeae infection resulting from bacteremic dissemination from mucosal surfaces. It classically manifests as an arthritis-dermatitis syndrome (migratory polyarthralgias, tenosynovitis, and painless pustular or hemorrhagic skin lesions) or as acute purulent septic monoarthritis.

Alternate Names:
DGI

Disseminated Intravascular Coagulation

A severe, life-threatening disorder of blood clotting triggered by major medical emergencies such as widespread infection (sepsis), severe trauma, burns, or pregnancy complications. The condition causes tiny blood clots to form throughout small blood vessels across the body, blocking blood flow to vital organs. As the body exhausts its clotting proteins and platelets, dangerous, uncontrollable bleeding can occur from puncture sites, gums, or internal organs.

Alternate Names:
DIC

Disseminated Mycobacterium Avium–Intracellulare Infection

A widespread infection with Mycobacterium avium complex, usually in people with severe immune suppression. It may involve blood, bone marrow, lymph nodes, liver, spleen, or other organs.

Disseminated Neuroblastoma

Neuroblastoma that has spread from its original site to distant organs, bone marrow, bones, liver, or lymph nodes. Treatment and outlook depend on age, spread, tumor biology, and response to specialist care.

Disseminated Sclerosis

An older name for multiple sclerosis, an immune-mediated disease in which areas of damage develop in the brain, spinal cord, or optic nerves and cause symptoms that vary over time.

Disseminated Tuberculosis

Tuberculosis that has spread through the bloodstream or lymphatic system to multiple organs. It may cause fever, weight loss, fatigue, organ damage, meningitis, or widespread small lesions.

Disseminated Varicella Infection

Chickenpox infection that spreads beyond the skin and may involve the lungs, brain, liver, or other organs. It is more likely and more severe in adults, pregnant people, and those with weakened immunity.

Disseminated Zoster

A severe, widespread reactivation of varicella-zoster virus characterized by greater than 20 cutaneous vesicles outside the primary and adjacent dermatomes, occurring predominantly in immunocompromised individuals and carrying a high risk of visceral organ dissemination (pneumonitis, encephalitis, hepatitis).

Dissociation

A disruption in the usual connection between consciousness, memory, identity, emotions, perceptions, behavior, or sense of self. Mild forms may occur during daydreaming; severe or persistent forms can

impair daily life.

Dissociative Amnesia

Inability to recall important autobiographical information, often related to trauma or severe stress, beyond ordinary forgetfulness. Memory loss may involve a specific event, period, or broader part of a person's life and is not better explained by ordinary forgetting, substances, a neurologic disorder, or another medical condition.

Dissociative Disorder

A psychiatric disorder characterized by a disruption in the normal, integrated functioning of consciousness, memory, identity, emotion, perception, body representation, motor control, or behavior. Typically developing as a profound psychological defense mechanism in response to overwhelming, severe childhood trauma or chronic abuse. Major DSM-5 categories include dissociative identity disorder (DID, presence of two or more distinct personality states or experiences of possession), dissociative amnesia (inability to recall important autobiographical information, usually of a traumatic or stressful nature, with or without dissociative fugue), and depersonalization/derealization disorder (persistent or recurrent experiences of unreality or detachment from one's mind/body or surroundings, with intact reality testing).

Alternate Names:
Dissociative Disorders

Dissociative Disorders

Plural form; see *Dissociative Disorder*.

Dissociative Identity Disorder

A mental health disorder involving two or more distinct identity states and repeated gaps in memory for everyday events or personal information. It can cause changes in behavior, emotions, perception, and daily functioning.

Distal

Farther from the point where a body part attaches or begins, or farther from the center of the body. For example, the hand is distal to the elbow.

Distal Convoluted Tubule

The segment of the renal nephron located between the macula densa and the cortical collecting duct, responsible for calcium reabsorption under parathyroid hormone regulation and thiazide-sensitive sodium-chloride cotransport.

Alternate Names:
DCT

Distal Median Nerve Dysfunction

Abnormal function of the median nerve near the forearm, wrist, or hand, causing numbness, tingling, pain, or weakness in its area of supply. Compression at the wrist is a common cause.

Distal Pancreatectomy

Surgery removing the body or tail of the pancreas, usually while leaving the head. It may be used for selected tumors, cysts, injury, or inflammation; diabetes and leakage from the pancreas are possible risks.

Distal Radius Fractures

Breaks near the wrist end of the forearm bone, often after a fall. They may cause pain, swelling, deformity, or numbness; treatment depends on alignment, joint involvement, bone quality, and nerve or blood-vessel injury.

Distal Renal Tubular Acidosis

A kidney disorder in which the kidneys cannot remove enough acid into the urine. Acid builds up in the blood and may cause low potassium, kidney stones, weak bones, muscle weakness, or poor growth in children.

Distal Splenorenal Shunt

Surgery connecting the splenic vein to the left kidney vein to lower pressure in veins around the esophagus. It may reduce bleeding from varices while preserving some blood flow through the liver.

Distal Tubule

A small kidney tube that adjusts the amount of salt, calcium, and water left in forming urine. Its activity

helps regulate blood pressure and body chemistry and can be affected by some diuretic medicines.

Distamycins

A group of antibiotic-like compounds that bind to DNA and have been studied for antimicrobial or anticancer effects. Their clinical use is limited and depends on the specific compound and evidence.

Distant

Far from a reference point or original site. In cancer, distant disease means that cancer has spread to remote organs or lymph nodes rather than remaining near the primary tumor.

Distended

Abnormally stretched, swollen, or enlarged by gas, fluid, blood, tissue, or pressure. The term may describe the abdomen, bladder, stomach, bowel, veins, or another body structure.

Distension

Enlargement or stretching of a body part or hollow organ, often from gas, fluid, urine, stool, blood, pressure, or blockage. Abdominal distension may occur with severe pain, vomiting, fever, or inability to pass stool or gas.

Distention

Enlargement or stretching of an organ, cavity, or body part, such as abdominal distention from gas, fluid, swelling, or blockage.

Distichia

Growth of an extra row of eyelashes, usually from openings of glands along the eyelid. Misguided lashes may rub the eye and cause irritation, tearing, corneal scratches, or ulcers.

Distortion

An abnormal change in the shape, structure, appearance, or representation of tissue or an image. New breast, facial, or visual distortion may indicate disease.

Distraction Osteogenesis

A surgical method for growing new bone by slowly separating two bone sections after a controlled cut. A device gradually widens the gap to lengthen or reshape the jaw, limbs, or other bones.

Distress

Significant physical or emotional suffering, discomfort, or strain related to illness, injury, treatment, or difficult circumstances. Severe distress may affect sleep, functioning, decisions, or safety and may need support.

Distributive Shock

Shock caused by marked vasodilation and abnormal distribution of blood flow, producing low systemic vascular resistance and inadequate effective tissue perfusion despite normal or high cardiac output early in the course. Sepsis, anaphylaxis, neurogenic shock, and some toxins are causes; skin may be warm initially, with hypotension, tachycardia or bradycardia, altered mentation, oliguria, and rising lactate.

District Nurse

A community nurse who provides care in homes, clinics, or other local settings. Duties may include wound care, chronic-disease support, health education, medicine monitoring, prevention, and coordination with other services.

Disulfiram-Like Reaction

An unpleasant reaction after alcohol is taken with disulfiram or another interacting substance. Flushing, headache, nausea, vomiting, palpitations, chest discomfort, or low blood pressure may occur.

Disulfiram Toxicity

Poisoning from excessive disulfiram, which may cause nausea, vomiting, abdominal pain, drowsiness, confusion, hypotension, seizures, coma, peripheral neuropathy, or liver injury. A separate disulfiram–alcohol reaction causes flushing, throbbing headache, vomiting, tachycardia, and hypotension.

Disulfoton

A highly toxic organophosphate insecticide that inhibits acetylcholinesterase. Exposure can cause sweating, excess saliva, vomiting, diarrhea, muscle weakness, breathing failure, seizures, or coma.

Dithiolethione

A sulfur-containing compound studied for activating cellular defense and detoxification pathways. It may influence inflammation and protection from chemical injury, but clinical uses depend on evidence for the specific compound.

Ditiocarb

A term for dithiocarbamate compounds, some of which are used as pesticides or metal-binding chemicals. Toxic effects vary by compound and may involve the nervous system, liver, kidneys, or skin.

Diuresis

Increased production of urine. It may result from excess fluid, high blood glucose, diabetes insipidus, medicines called diuretics, or other causes; excessive loss can lead to dehydration and electrolyte problems.

Diuretic

A medicine that makes the kidneys remove more salt and water in urine. It is used to treat high blood pressure, heart failure, or swelling caused by extra fluid in the body. Some types can change the body's salt levels and cause other side effects.

Diuretic Drug

A medicine that makes the kidneys remove more sodium and water in urine. It is used for high blood pressure, heart failure, and swelling but can cause dehydration, low blood pressure, electrolyte changes, or kidney problems.

Diuretic Resistance

A clinical failure to achieve expected therapeutic natriuresis, fluid excretion, and decongestion despite escalating doses of loop diuretics, commonly encountered in decompensated heart failure, nephrotic syndrome, and cirrhosis with refractory ascites.

Diurnal

Relating to daytime or occurring during a daily 24-hour cycle. The term may describe symptoms, hormone levels, body functions, or patterns of activity and sleep.

Diverticula

Alternate name; see *Diverticulosis*.

Diverticular Bleeding

Sudden, typically painless bleeding from the lower digestive tract caused by the bursting or erosion of a small blood vessel inside a diverticulum (a small pouch in the colon wall). It is one of the most common causes of significant bright red or dark maroon blood in the stool in older adults, often stopping on its own but occasionally causing significant blood loss.

Alternate Names:
Diverticular Hemorrhage

Diverticular Disease

A condition involving small pouches in the wall of the colon. Diverticulosis means the pouches are present, while diverticular disease generally refers to symptoms or complications such as abdominal pain, altered bowel habits, bleeding, inflammation, infection, blockage, or perforation. Diverticulitis is inflammation or infection of one or more pouches and commonly causes lower-abdominal pain and fever.

Diverticulitis

Inflammation or infection of one or more small pouches (diverticula) that bulge outward from the wall of the large intestine (colon). It occurs when a pouch becomes obstructed, leading to swelling, bacterial infection, or a tiny perforation in the intestinal wall. Symptoms typically include sudden, persistent pain in the lower left side of the abdomen, fever, nausea, vomiting, and changes in bowel habits.

Diverticulosis

The presence of small pouches in the wall of the colon. Most people have no symptoms. The pouches can sometimes bleed; inflammation of one or more

pouches is called diverticulitis.

Alternate Names:
Colonic Diverticulosis; Diverticular Pouching

Diverticulosis And Diverticulitis

Diverticulosis means small pouches have formed in the colon wall. Diverticulitis occurs when one or more pouches become inflamed or infected, causing abdominal pain, fever, and bowel changes.

Diverticulum

A pouch-like projection from the wall of a hollow organ, especially the intestine. It may cause no symptoms or become inflamed, infected, blocked, bleed, or rarely perforate.

Dix-Hallpike Maneuver

A bedside test for a common inner-ear cause of brief positional vertigo. The clinician moves the head and body into a specific position and watches for dizziness and characteristic eye movements.

Dizygotic Twin

One of a pair of non-identical (fraternal) twins resulting from the fertilization of two independent ova by two separate spermatozoa during the same ovulatory cycle. Dizygotic twins are genetically equivalent to full siblings, sharing on average 50% of their segregating genes, and can be of the same or different chromosomal sex. Characterized placentally by separate chorionic and amniotic sacs (dichorionic-diamniotic), although their placentas may fuse anatomically if implantation sites are adjacent. Influenced strongly by maternal age, family history, race, and assisted reproductive technologies.

Dizygotic Twins

Plural form; see *Dizygotic Twin*.

Dizziness

A sensation of spinning, lightheadedness, imbalance, faintness, or being unsteady. Causes include inner-ear, heart, blood-pressure, vision, medicine, blood, metabolic, or neurologic problems.

Dizzy

Alternate name; see *Dizziness*.

DKD

Abbreviation for diabetic kidney disease; see *Diabetic Kidney Disease*.

D-Lactic Acidosis

A rare metabolic encephalopathy and high anion gap metabolic acidosis occurring in patients with short bowel syndrome, resulting from colonic bacterial fermentation of unabsorbed carbohydrates into the D-isomer of lactic acid, which humans metabolize slowly.

Alternate Names:
D-Lactate Encephalopathy

DLB

Progressive neurodegenerative dementia marked by visual hallucinations, parkinsonian movement problems, and cognitive fluctuations. See *Lewy Body Dementia*.

DLCO

A lung-function test that measures how well a small amount of carbon monoxide passes from the lungs into the blood. A low result may occur in lung or blood-vessel disease and is interpreted with other test results.

Alternate Names:
Transfer Factor for Carbon Monoxide; TLCO

DLI

Donor lymphocyte infusion, in which immune cells from a stem-cell donor are given after transplantation to strengthen an immune attack against returning cancer. It can cause graft-versus-host disease and other complications.

DM

An abbreviation most commonly meaning diabetes mellitus, a group of disorders with persistently high blood glucose. Because DM can have other meanings, the surrounding clinical context is important.

DM2

An abbreviation for type 2 diabetes mellitus, in which the body resists insulin and may gradually produce too little of it. It can cause long-term damage to the eyes, kidneys, nerves, heart, and blood vessels.

DMD

Abbreviation for Duchenne muscular dystrophy, an X-linked muscle disease caused by deficient dystrophin. It usually begins in childhood with progressive proximal weakness, difficulty running or climbing, calf enlargement, and later heart and respiratory complications.

DMFT Index

A dental measure counting permanent teeth that are decayed, missing because of decay, or filled. It estimates a person's lifetime experience of tooth decay but does not show whether a current problem is active.

DMG

Alternate name; see *Diffuse Midline Glioma*.

DMSA Scan

A nuclear-imaging test using a small amount of labeled dimercaptosuccinic acid to show kidney tissue. It can identify differences in kidney function, scars, or injury, especially in children with repeated urinary infections.

DNA

Deoxyribonucleic acid, the molecule that stores hereditary information in humans and most organisms. Its sequence helps control cell function and protein production; changes may be inherited or acquired during life.

DNA Adduct

A chemical group attached to DNA after exposure to a reactive substance. If not repaired, it can alter DNA copying, cause mutations, and potentially contribute to cancer.

DNA Alkylation

Attachment of an alkyl group to DNA. This can change base pairing, block copying or repair, cause mutations, or kill a cell; some anticancer medicines work partly this way.

DNA Amplification

Production of many copies of a selected DNA sequence, naturally in cells or in the laboratory by methods such as polymerase chain reaction. It helps detect, identify, or study genes and microorganisms.

DNA Binding

Attachment of a protein or other molecule to a DNA sequence. This can control gene activity, DNA copying, repair, chromosome organization, or the action of some medicines.

DNA Damage

A chemical or structural change in DNA that can interfere with gene function or copying. Cells usually repair such damage, but persistent or incorrectly repaired damage can cause mutations, cell death, or cancer.

DNA Demethylation

Removal or loss of small chemical groups called methyl groups from DNA. It can change how accessible a gene is and alter gene activity during development, cell reprogramming, or disease.

DNA Double Helix

The twisted ladder-like structure of DNA, formed by two strands running in opposite directions. Sugar and phosphate form the outside rails, while paired bases join the strands inside.

DNA Fragmentation

Breaking DNA strands into smaller pieces. It occurs normally during programmed cell death and can also result from injury, radiation, chemicals, disease, or laboratory processing.

DNA Gyrase

A bacterial enzyme that twists and untwists DNA

so it can be copied and separated. Fluoroquinolone antibiotics block this enzyme, stopping bacterial growth and survival.

DNA Helicase

An essential adenosine triphosphate-dependent motor enzyme that unwinds and separates double-stranded DNA into single strands ahead of the replication fork, enabling DNA polymerases access for replication, transcription, and recombination.

DNA Integration

Insertion of foreign or copied DNA into a cell's genome. It occurs in some viral infections, evolution, and gene therapy and can alter nearby gene activity if the insertion affects a control region.

DNA Ligases

Enzymes that join breaks in DNA strands during copying, repair, and genetic recombination. They help preserve the continuous structure of chromosomes.

DNA Ligation

Joining DNA fragments by forming a chemical bond between them. Cells use it during DNA copying and repair, and laboratories use it in genetic testing and cloning.

DNA Methylation

Addition of small chemical groups called methyl groups to DNA, usually at cytosine bases. It can change how strongly a gene is expressed without changing the DNA sequence.

DNA Packaging

Arrangement of long DNA molecules around histone proteins and into compact structures called chromosomes. Packaging allows DNA to fit inside the nucleus and helps control access to genes.

DNA Polymerase

A family of cellular enzymes that synthesize new DNA strands by polymerizing deoxynucleotides complementary to a single-stranded template in a 5-prime to 3-prime direction, with many isoforms possessing 3-prime to 5-prime exonucleolytic proofreading activity.

DNA Primase

An enzyme that makes short RNA starting pieces so other enzymes can begin copying DNA. It is required during cell division and DNA repair.

DNA Primers

Short nucleic-acid sequences that provide a starting point for copying DNA. Cells make them during replication, and laboratories use designed primers to amplify selected genetic sequences.

DNA Probe

A labeled single-stranded DNA sequence designed to bind a matching target. It can help detect a gene, mutation, chromosome region, or microorganism in a laboratory sample.

DNA Profiling

A laboratory test that compares selected parts of a person's DNA. It can help identify a person, assess biological relationships, identify remains, or check whether cells came from a donor or another person. Results depend on sample quality, testing method, and legal or medical setting.

Alternate Names:
Fingerprinting; Genetic Fingerprinting; DNA Typing; STR Analysis

DNA Repair

Cellular processes that detect and correct damage or copying errors in DNA. Repair pathways address small base changes, bulky chemical damage, mismatched bases, and breaks in one or both DNA strands.

DNA Repair Mechanisms

Cellular systems that correct DNA damage caused by copying errors, chemicals, radiation, or reactive oxygen. Failure of some pathways increases mutation risk and can contribute to inherited cancer syndromes.

DNA Replication

The process by which DNA copies itself before cell division. Each new DNA molecule contains one original strand and one newly made strand, allowing genetic information to pass to daughter cells.

DNA Sequencing

Determination of the order of DNA building blocks in a sample. It can examine a single gene, selected genes, all coding regions, or the whole genome to identify genetic changes.

DNA Virus

A virus whose genetic material is DNA. DNA viruses vary widely in transmission, tissues affected, and disease; some cause persistent infection, while others cause short-term illness.

D.O.

Doctor of Osteopathic Medicine, a physician degree whose graduates are licensed to practice medicine and surgery like MD graduates in the United States.

DOAC Monotherapy

Use of a direct oral anticoagulant (DOAC) without concomitant antiplatelet therapy, such as aspirin or clopidogrel.

Alternate Names:
NOAC Monotherapy

DOACs

Direct oral anticoagulants are oral blood thinners that directly block thrombin or factor Xa. They prevent and treat blood clots but can cause bleeding and require attention to kidney function, interactions, and planned procedures.

DOB

An abbreviation for date of birth, the day, month, and year a person was born. It helps confirm identity and calculate age for records, screening, medicine doses, and treatment decisions.

Dobutamine

An intravenous medicine that increases heart contraction and, sometimes, heart rate. It is used short term for selected cases of severe low-output heart failure or shock and requires close monitoring.

Dobutamine Stress Echocardiography

An ultrasound heart test using dobutamine to increase heart workload when a person cannot exercise adequately. New areas of poor wall movement may suggest reduced blood flow; findings are considered with other clinical information.

Doc

Informal shorthand for doctor, a person qualified to practice medicine or another health profession. The exact role depends on the person's training and professional license.

Docetaxel

An anticancer medicine that interferes with microtubules, structures needed for cell division. It is used for several cancers and can cause low blood counts, infection, hair loss, nerve problems, or allergic reactions.

Alternate Names:
Taxotere

Doconexent

A pharmaceutical name for docosahexaenoic acid, an omega-3 fatty acid found in oily fish, algae, and cell membranes. Its effects depend on the product, dose, and reason for use.

Docosadienoic Acid

A 22-carbon fatty acid with two double bonds, present in small amounts in body and dietary lipids. It is studied mainly for possible effects on cell membranes and metabolism.

Docosahexaenoic Acid

An omega-3 fatty acid that is an important structural part of brain and retinal cell membranes. It comes mainly from oily fish, algae, or supplements and is especially important during brain development.

Docosapentaenoic Acid

A 22-carbon polyunsaturated fatty acid with five double bonds. It occurs as omega-3 and omega-6 forms in foods and tissues; its health effects depend on the form and amount.

Docosatrienoic Acid

A 22-carbon fatty acid with three double bonds, found in small amounts in body and dietary lipids. It is studied mainly for its possible roles in cell membranes and metabolism.

Docusate

A stool-softening medicine that helps water mix with stool. It may be used when avoiding straining is important, but evidence for treating ordinary constipation is limited; diarrhea and abdominal cramps can occur.

Dog Allergy

An immune reaction to proteins from a dog's skin flakes, saliva, urine, or other secretions. It can cause sneezing, blocked or itchy nose, watery eyes, hives, cough, or asthma symptoms.

Dog Bite

An injury caused by a dog's teeth. It can cause puncture wounds, tissue damage, infection, and exposure to rabies or tetanus, especially when deep or involving the face or hand.

Alternate Names:
Canine Bite Trauma; Dog Bite Wound

Dolasetron

A medicine that blocks serotonin 5-HT3 receptors and helps prevent nausea and vomiting in selected settings. It can cause headache, constipation, or dangerous heart-rhythm changes.

Dolasetron Mesylate

Alternate name; see *Dolasetron*.

Dolichocephalic

Having a relatively long, narrow skull. It may be a normal family or positional variation, but marked or worsening skull narrowing in an infant may indicate early fusion of a skull suture.

Dolichol

A long-chain fatty alcohol used inside cells to assemble sugar chains attached to proteins. This process is important for protein folding, transport, and function.

Dolichostenomelia

Abnormally long, slender limbs, often used to describe a marfanoid body habitus. It may occur in connective-tissue disorders such as Marfan syndrome and can occur with other skeletal and cardiovascular features.

Doll Eye Reflex

The oculocephalic reflex in which rapid passive rotation or flexion and extension of the head in an unconscious or comatose patient produces conjugately opposed compensatory eye movements when the brainstem pathways linking cranial nerves III, VI, and VIII through the medial longitudinal fasciculus are functionally intact.

Alternate Names:
Oculocephalic Reflex; Doll's Eyes Phenomenon

Doll's Eye Sign

A physical examination finding of the oculocephalic reflex in comatose patients, in which rapid horizontal or vertical rotation of the head produces conjugate eye deviation in the direction opposite to head movement, demonstrating intact midbrain and pontine brainstem pathways.

Alternate Names:
Oculocephalic Reflex

Dolor

The Latin word for pain, one of the classic signs of inflammation. Pain may result from irritated nerves, swelling, injury, infection, or another cause and is interpreted with other findings.

Domain

A defined region or area. In biology, a protein

domain is a part with a particular structure or function; in genetics, a domain may be a genomic or regulatory region.

Domestic Violence

A pattern of physical, sexual, emotional, psychological, or financial abuse or coercive control by an intimate partner or household member. It can cause injury, fear, isolation, and serious health effects; confidential support is available.

Dominant

Describing a genetic variant whose effect can appear when only one copy is present. An affected parent with an autosomal dominant condition may pass the variant to each child with a one-in-two chance.

Domperidone

A medicine that blocks dopamine receptors outside the brain and is used in some countries for nausea or slow stomach movement. It can prolong the heart rhythm and cause dangerous arrhythmias.

Donath-Landsteiner Antibody

An antibody that can attach to red blood cells in cold conditions and destroy them when the blood warms. It is associated with paroxysmal cold hemoglobinuria, a rare cause of red-cell breakdown.

Alternate Names:
Donath-Landsteiner Hemolysin; Biphasic Hemolysin

Donath-Landsteiner Test

A blood test that detects an antibody associated with paroxysmal cold hemoglobinuria. The antibody binds red cells in the cold and destroys them when the blood warms.

Donepezil

A medicine that increases acetylcholine activity in the brain and may temporarily improve symptoms of Alzheimer disease. It does not cure the disease and can cause nausea, diarrhea, slow heartbeat, fainting, or sleep problems.

Donnan Equilibrium

The distribution of charged particles across a partly permeable membrane when large charged particles cannot cross. It helps explain cell volume, membrane electrical charge, and movement of salts and water.

Donohue Syndrome

A rare inherited disorder in which the body cannot respond normally to insulin. It causes severe growth and feeding problems, very little body fat, unusual facial features, and serious metabolic complications beginning in infancy.

Donor

A person who provides blood, cells, tissue, an organ, sperm, eggs, or another biological material for another person or for research. Screening, informed consent, compatibility, and traceability support safety.

Donor Insemination

A fertility treatment in which sperm from a screened donor is placed in the reproductive tract to attempt pregnancy. The donor may be known or anonymous, and counseling and legal requirements vary by location.

Donor Suitability Assessment

Evaluation of a potential donor's medical history, examination, laboratory tests, infection risks, organ function, and compatibility to determine whether donation is safe and suitable for transplantation.

Donor Testing

Laboratory and clinical evaluation of a potential donor for infections, cancer, organ function, blood type, and other factors that affect donation safety and recipient compatibility.

Do Not Resuscitate

Alternate name; see *Do-Not-Resuscitate Order*.

Do-Not-Resuscitate Order

A medical order instructing clinicians not to perform

cardiopulmonary resuscitation if a person's breathing or heartbeat stops. It does not automatically refuse other treatments or comfort care.

Alternate Names:
DNR Order; DNAR Order; Allow Natural Death (AND)

Donovan Bodies

Intracellular clusters of deeply staining, encapsulated, pleomorphic gram-negative rod bacteria (Klebsiella granulomatis) located within the cytoplasm of large mononuclear histiocytes, identified on Giemsa or Wright-stained tissue smears from lesions of granuloma inguinale (donovanosis).

Alternate Names:
Donovan Body; Leishmanoid Granules

Donovanosis

A sexually transmitted infection caused by Klebsiella granulomatis. It produces slowly enlarging, usually painless genital ulcers that may bleed easily; diagnosis uses laboratory testing and treatment uses antibiotics.

Alternate Names:
Granuloma Inguinale; Calymmatobacterium Infection

Dopa

A chemical precursor that the body can convert into dopamine. Levodopa, a form that reaches the brain, is used with another medicine to improve movement problems in Parkinson disease.

Dopamine

A chemical messenger made by nerve cells and some hormone-producing cells. In the brain, it helps control movement, attention, motivation, and learning. It also affects blood-vessel width and limits the release of prolactin, a hormone that helps the body make breast milk.

Dopamine Agonist

A medication that stimulates dopamine receptors in the brain by mimicking the actions of dopamine, a natural chemical messenger that regulates movement and emotions. These medications are used to help control tremors, stiffness, and slow movement in conditions such as Parkinson disease, to reduce the urge to move the legs in restless legs syndrome, or to shrink certain pituitary tumors.

Dopamine Agonists

Plural form; see *Dopamine Agonist*.

Dopamine Antagonist

A medicine or compound that blocks dopamine receptors. It is used in selected psychiatric, nausea, or digestive treatments but can cause movement problems, drowsiness, hormone changes, or other adverse effects.

Dopamine Receptor

A protein on or inside a cell that responds to dopamine. Different receptor types affect movement, mood, hormone release, blood vessels, and other functions and are targets of some medicines.

Dopaminergic Neuron

A nerve cell that makes and releases dopamine. These cells help control movement, motivation, reward, attention, and hormone regulation; loss of some contributes to Parkinson disease.

Dopaminergic Pathways

Four main nerve pathways that use dopamine to send signals. They help control movement, reward, thinking, emotions, and the release of some hormones.

Dopamine Transporter

A protein that clears dopamine from the space between nerve cells by moving it back into the releasing nerve cell. Stimulants and some imaging tracers affect or measure its activity.

Dopa-Responsive Dystonia

An inherited movement disorder causing sustained muscle contractions and abnormal postures, sometimes with Parkinson-like symptoms. It often improves markedly with a small dose of levodopa.

Doppler Echocardiography

A heart ultrasound technique that measures the direction and speed of blood flow through the heart and major vessels. It helps assess valves, chambers, pressure, and abnormal flow.

Doppler Ultrasound

An ultrasound technique that measures moving blood to assess its direction and speed. It can identify narrowed or blocked vessels, abnormal flow, blood clots, and circulation problems without ionizing radiation.

Doppler Ultrasound of a Limb

An ultrasound examination measuring blood flow through the arteries and veins of an arm or leg. It can help identify narrowing, blockage, a clot, aneurysm, or other circulation problem without ionizing radiation.

Doppler Velocimetry

Ultrasound measurement of blood-flow speed and resistance in fetal or placental vessels. It helps assess circulation and fetal well-being when poor growth, placental problems, or other pregnancy risks are suspected.

Doravirine

An HIV medicine that blocks reverse transcriptase, an enzyme HIV needs to copy its genetic material. It is used with other medicines for HIV-1 infection; interactions and resistance affect its choice.

Dorea

A group of bacteria commonly found in the human intestine and able to grow without oxygen. Finding it usually reflects normal gut organisms unless it comes from a normally sterile site with compatible illness.

Doripenem

An intravenous antibiotic that damages bacterial cell walls and is used for selected serious infections. It can cause allergy, diarrhea, or seizures; bacterial resistance can affect its activity.

Dormant

Inactive or not multiplying. The term may describe a latent infection, quiet tumor cell, inactive disease process, or other biological state that can become active under certain conditions.

Dor Procedure

A heart operation that removes or excludes a scarred, bulging part of the left ventricle after a large heart attack. It reshapes the chamber in selected people with severe ischemic heart-muscle disease.

Alternate Names:
Endoventricular Circular Patch Plasty (EVCPP); Surgical Ventricular Restoration

Dorsal

Relating to the back of the body or the back-facing surface of a body part. On the hand, dorsal means the side opposite the palm; on the foot, it means the top surface opposite the sole. In other parts of the body, it usually means toward the back.

Dorsal Blocking Splint

A hand splint that limits wrist and finger extension to protect healing tendons, commonly after flexor-tendon repair. Position and duration are set by the treating surgical and therapy team.

Dorsal Body Cavity

The body cavity toward the back. It includes the cranial cavity, which contains the brain, and the spinal cavity, which contains the spinal cord.

Dorsal Column-Medial Lemniscal Pathway

The major ascending sensory pathway conveying conscious proprioception, discriminative fine touch, and vibratory sensation from peripheral mechanoreceptors through the spinal cord fasciculus gracilis and cuneatus to the medulla, where fibers decussate in the medial lemniscus to ascend to the thalamus.

Alternate Names:
DCML Pathway; Dorsal Column System

Dorsal Funiculus

A back column of the spinal cord containing nerve fibers that carry vibration, fine touch, and awareness of body position to the brain.

Dorsalis Pedis Artery

An artery running across the top of the foot as a continuation of the anterior tibial artery. Its pulse helps assess blood flow to the foot.

Dorsal Kyphosis

Excessive forward curvature of the upper spine, causing a rounded upper back. It may result from posture, spinal wear, osteoporosis, or vertebral fractures and can cause pain, height loss, or breathing difficulty.

Dorsal Root

The back root of a spinal nerve. It carries sensory signals from the body into the spinal cord.

Dorsal Root Ganglion

A swelling on the back root of a spinal nerve containing the cell bodies of sensory nerve cells. It relays information about touch, pain, temperature, and body position to the spinal cord.

Dorsiflexion

Upward movement of the foot at the ankle, bringing the toes toward the shin. It helps clear the foot during walking; weakness can cause foot drop and tripping.

Dorsocervical Fat Pad

A visible accumulation of fat at the back of the neck and upper shoulders, associated with obesity, corticosteroid excess, some medicines, or lipodystrophy; it differs from spinal kyphosis.

Dorsolateral

Describing a position toward the back and side of a body structure. For example, a dorsolateral area is behind and to one side rather than toward the front or middle.

Dorsum

The back or upper surface of a body part, such as the back of the hand, top of the foot, or upper surface of the tongue.

Dorzolamide

An eye medicine that lowers pressure inside the eye by reducing fluid production. It is used for glaucoma or raised eye pressure and may cause stinging, blurred vision, or a bitter taste.

Dosage

The amount, frequency, route, and duration of a medicine given to achieve benefit while limiting harm. It may need adjustment for age, weight, kidney or liver function, interactions, and the condition treated.

Dosage Forms

The physical form in which a medicine is supplied, such as a tablet, capsule, liquid, cream, inhaler, injection, patch, suppository, or implant. The form affects how and how quickly it is given.

Dose

The amount of a medicine, radiation, or other substance given or received at one time. The appropriate dose depends on the substance, purpose, age, weight, organ function, interactions, and individual risk.

Dose-Limiting Toxicity

A treatment-related adverse effect severe enough to prevent increasing the dose or require reducing it. The term is used especially in early cancer trials to estimate a tolerable dose.

Dose Rate

The amount of a medicine, radiation, or other exposure delivered during a specified time, such as milligrams per hour or grays per minute. It affects both benefit and toxicity.

Dose-Response Curve

A graph showing how the size of a biological effect

changes as the dose of a medicine or substance increases. It helps describe potency, maximum effect, and the dose range that produces benefit or harm.

Dose-Response Relationship

The relationship between the amount of a medicine or substance and the size of its effect. Increasing the dose may increase benefit, toxicity, or both, but the pattern depends on the substance and person.

Dose Titration

Gradual adjustment of a medicine dose according to its effects, treatment goals, blood tests, or side effects. The dose may be increased, decreased, or kept the same as the person's response is assessed.

Dosimeter

An instrument worn or placed near a person or object to measure or record exposure to ionizing radiation. It helps monitor occupational or treatment-related radiation.

Dosimetry

Measurement and calculation of radiation dose received by a person, tissue, or object. In treatment, it helps plan and verify that the intended dose reaches the target while limiting exposure elsewhere.

DOTATATE

A substance that binds somatostatin receptors found on many neuroendocrine tumors. When linked to a radioactive tracer, it is used in PET imaging to locate and stage tumors and assess possible targeted treatment.

DOTS

A tuberculosis-control strategy involving reliable diagnosis, standardized combination treatment, medicine-supply support, monitoring, and sometimes directly observed doses. It aims to cure infection and limit drug resistance and transmission.

Double Aortic Arch

A birth defect in which two aortic arches form a ring around the windpipe and esophagus. It may cause noisy breathing, cough, feeding difficulty, vomiting, or trouble swallowing.

Double-Balloon Enteroscopy

An endoscopic procedure using two balloons to move a flexible camera through much of the small intestine. It can locate bleeding or lesions, take biopsies, and perform selected treatments.

Double Blind

Alternate name; see *Double-Blind Study*.

Double-Blind Method

Alternate name; see *Double-Blind Study*.

Double-Blind Study

A clinical study in which participants and the investigators assessing outcomes do not know the assigned treatment group during the blinded phase. This masking reduces bias from expectations and assessment; the term does not specify who else may know the assignments.

Alternate Names:
Double-Masked Study; Double-Blind Protocol

Double Blind Trial

Alternate name; see *Double-Blind Study*.

Double Bubble Sign

An imaging finding in a newborn showing two enlarged, air- or fluid-filled areas representing the stomach and first part of the small intestine. It strongly suggests a blockage near the start of the small intestine, such as duodenal atresia, but other causes are possible.

Alternate Names:
Duodenal Atresia Sign; Double Bubble Radiographic Appearance

Double-Contrast Barium Enema

An X-ray examination in which barium coats the inside of the colon and air expands it. It can show polyps, masses, narrowing, or changes in the bowel lining.

Alternate Names:

Air-Contrast Barium Enema

Double Inlet Left Ventricle

A rare birth defect in which both upper heart chambers connect mainly to one lower chamber. It produces single-ventricle circulation and mixing of oxygen-rich and oxygen-poor blood and usually needs staged specialist treatment.

Double Outlet Right Ventricle

A birth defect in which both major arteries arise mainly from the right lower heart chamber. An opening between the lower chambers allows blood from the left chamber to reach the arteries; anatomy and symptoms vary.

Double-Outlet Right Ventricle

Alternate spelling; see *Double Outlet Right Ventricle*.

Double Uterus

A birth difference in which the uterus develops as two separate cavities or two uteruses. Some people have no symptoms; others may have menstrual problems, infertility, miscarriage, or pregnancy complications.

Double Vision

Seeing two images of one object. Causes include eye-surface or lens disease, eye misalignment, muscle or nerve problems, medicines, migraine, or brain disease; sudden onset with neurologic symptoms or eye pain is an emergency.

Douche

A stream of water or solution directed into a body cavity, most often the vagina. Vaginal douching can irritate tissue, disturb normal bacteria, and increase infection risk.

Dowager Hump

An exaggerated posterior thoracic hyperkyphosis causing an abnormal dorsal hump at the base of the neck, caused by multiple anterior wedge compression fractures of osteoporotic thoracic vertebral bodies in elderly patients.

Alternate Names:
Senile Kyphosis; Postmenopausal Thoracic Hyperkyphosis

Dowager's Hump

Alternate name; see *Dowager Hump*.

Dowling-Meara Syndrome

A severe inherited form of epidermolysis bullosa simplex, usually caused by variants in the *KRT5* or *KRT14* gene. Widespread grouped blisters may begin at birth or in infancy and can affect the skin, mouth, nails, and airway.

Alternate Names:
Epidermolysis Bullosa Simplex, Dowling-Meara Type; EBS-DM

Downregulation

A decrease in the number, sensitivity, or activity of receptors, genes, or signaling pathways. It may occur after prolonged stimulation, medicine exposure, inflammation, or another regulatory change.

Down Syndrome

A genetic condition caused by the presence of an extra copy of chromosome 21 (trisomy 21). This extra genetic material alters the course of physical and mental development. Common characteristics include distinct facial features (such as upward slanting eyes and a flattened facial profile), mild to moderate intellectual disability, low muscle tone in infancy, and higher risks of congenital heart defects, hearing loss, and thyroid disorders.

Alternate Names:
Trisomy 21; Down's Syndrome

Doxapram

A medicine that stimulates breathing and is used rarely in selected situations. It can cause agitation, high blood pressure, fast or abnormal heart rhythms, seizures, or other serious effects.

Doxazosin

An alpha-1 blocker that relaxes blood vessels and

prostate or bladder-neck muscle. It is used for high blood pressure or urinary symptoms from an enlarged prostate and can cause dizziness or fainting.

Doxazosin Mesylate

A salt form of doxazosin, an alpha-1 blocker used for high blood pressure and urinary symptoms from an enlarged prostate. It can cause dizziness, low blood pressure, fainting, or falls, especially after the first dose.

Doxepin

A tricyclic antidepressant also used in low doses for insomnia or skin itching. It can cause drowsiness, dry mouth, constipation, blurred vision, abnormal heart rhythms, and dangerous toxicity in overdose.

Doxepin Overdose

Taking too much doxepin can cause severe drowsiness, confusion, seizures, low blood pressure, coma, and life-threatening heart-rhythm or conduction problems, especially with alcohol or other medicines.

Doxercalciferol

A vitamin D-like medicine used in selected people with chronic kidney disease to reduce excess parathyroid hormone. It can raise calcium and phosphate levels.

Doxorubicin

An anthracycline cancer medicine that damages DNA and blocks cell division. It treats many cancers but can cause low blood counts, infection, nausea, hair loss, tissue injury after leakage, and dose-related heart damage.

Doxorubicin Hydrochloride

A salt form of doxorubicin, an anthracycline cancer medicine used for many cancers. Important risks include low blood counts, infection, tissue injury after leakage, and dose-related heart damage.

Doxycycline

A tetracycline antibiotic that blocks bacterial protein production. It treats many bacterial and tick-borne infections and can cause nausea, sun sensitivity, esophageal irritation, diarrhea, or tooth and bone effects in developing children.

Doxycycline Hyclate

A salt form of doxycycline, a tetracycline antibiotic that blocks bacterial protein production. It is used for susceptible infections; nausea, sun sensitivity, esophageal irritation, diarrhea, and allergic reactions may occur.

Doxylamine

A sedating antihistamine used in some sleep aids and pregnancy-related nausea treatments. It can cause drowsiness, dry mouth, blurred vision, constipation, urinary retention, confusion, or impaired driving.

DPP-4 Inhibitor

An oral antihyperglycemic medication (e.g., sitagliptin, linagliptin, saxagliptin, alogliptin) that competitively inhibits the dipeptidyl peptidase-4 (DPP-4) enzyme. By preventing the rapid enzymatic degradation of endogenous incretin hormones—specifically glucagon-like peptide-1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP)—it potentiates glucose-dependent insulin secretion from pancreatic β-cells and suppresses inappropriate postprandial glucagon secretion from α-cells. Characterized by weight neutrality, once-daily oral dosing, and a negligible intrinsic risk of hypoglycemia in monotherapy.

DPP-4 Inhibitors

Plural form; see *DPP-4 Inhibitor*.

DPT Immunization

Older term for vaccination against diphtheria, pertussis (whooping cough), and tetanus. Current vaccines use formulations such as DTaP for young children and Tdap for older children and adults.

DR

Alternate name; see *Diabetic Retinopathy*.

Dracunculiasis

Guinea-worm disease caused by a parasite acquired from unsafe drinking water containing infected tiny water fleas. About a year later, a painful blister usually forms on a leg as the adult worm emerges through the skin.

Dracunculosis

Infection with the Guinea-worm parasite after drinking unsafe water containing infected water fleas. It causes a painful blister, usually on a leg, followed by emergence of a long adult worm through the skin.

Dracunculus Medinensis

The parasitic worm that causes Guinea-worm disease. People become infected by drinking water containing tiny infected water fleas; roughly a year later, an adult female worm emerges through the skin.

Draf Procedure

One of several endoscopic operations that widen the drainage pathway of the frontal sinuses. Draf types I, IIa, IIb, and III differ in how much tissue is removed; type III, also called the modified Lothrop procedure, creates a shared opening between the two frontal sinuses.

Drain

A tube or other device used to remove blood, pus, fluid, or air from a wound, body cavity, or organ. Drainage may prevent pressure, infection, or impaired healing after injury or surgery.

Drainage

Removal of blood, pus, fluid, or air from a body site, wound, or abnormal collection. It may occur naturally or use a needle, catheter, tube, or surgical opening to relieve pressure and aid healing.

Drainage Procedures

Treatments that remove pus, blood, or other collected fluid, sometimes with ultrasound or CT guidance. They may use a needle, catheter, tube, or surgery to treat abscesses and other fluid collections.

Drain Opener Poisoning

Exposure to a caustic drain-cleaning product that can cause severe burns of the skin, eyes, airway, or gastrointestinal tract.

Drainpipe Cleaners

Strong chemical products used to clear blocked pipes, commonly containing caustic alkalis or acids. Swallowing, inhaling, or splashing these products can cause severe burns to the mouth, throat, eyes, skin, or lungs.

Drawer Test

An orthopedic manual examination of the flexed knee joint assessing the integrity of the cruciate ligaments; forward tibial translation tests the anterior cruciate ligament (anterior drawer test) and backward tibial translation tests the posterior cruciate ligament (posterior drawer test).

Alternate Names:
Knee Drawer Sign; Anterior and Posterior Drawer Tests

Dream

A succession of subjective cognitive, sensory, perceptual, and affective experiences occurring involuntarily in the mind during sleep states. While mentation can occur during non-rapid-eye-movement (NREM) sleep (typically more fragmented and thought-like), vivid, narratively structured, emotionally intense, and sensorially rich dreams occur predominantly during rapid-eye-movement (REM) sleep, corresponding neurophysiologically with limbic and paralimbic activation, forebrain cholinergic tone, and visual association cortex activity coupled with dorsolateral prefrontal cortical deactivation and somatic muscle atonia.

Dreams

Plural form; see *Dream*.

Drepanocytosis

Sickle-cell disease or a related condition in which an abnormal form of hemoglobin makes red blood cells become rigid and sickle-shaped. This can cause anemia, painful blockages of blood flow, and damage

to organs.

Dressing

Material placed over a wound to protect it from contamination, absorb drainage, control minor bleeding, maintain moisture, or deliver local treatment. Change frequency and monitoring depend on the wound and dressing.

Dressler's Syndrome

Alternate spelling; see *Dressler Syndrome*.

Dressler Syndrome

An immune-related inflammation of the sac around the heart that occurs weeks after a heart attack, heart surgery, or other heart injury. It can cause fever, sharp chest pain, and fluid around the heart or lungs.

DRESS Syndrome

A serious delayed allergic reaction to a medicine, usually beginning two to eight weeks after exposure. It may cause fever, widespread rash, facial swelling, abnormal blood counts, hepatitis, kidney injury, or other organ inflammation.

DRI

Dietary reference values used to estimate the amounts of vitamins, minerals, protein, and other nutrients needed by healthy people. They help assess diets but are not individualized treatment targets for every illness.

Alternate Names:
Dietary Reference Intakes

Dried Specimen

A biological sample collected and dried on a prepared card or other surface for transport and laboratory testing. Dried blood spots are commonly used for screening, but correct collection and handling are essential.

Drinking Water

Water safe for human consumption, with levels of disease-causing organisms and harmful chemicals low enough to avoid significant health risk. Boiling, filtration, chlorination, and bottled water are methods used to reduce contamination.

Drip

A drop-by-drop flow of liquid, or fluid given slowly into a vein through tubing and a catheter. The infusion rate is controlled to deliver medicines, fluids, blood products, or nutrients safely.

Driving And Older Adults

Evaluation of whether an older person can drive safely, considering vision, attention, memory, hearing, movement, health conditions, and medicines. Age alone does not determine driving ability.

Driving Evaluation

An assessment of driving ability after illness, injury, or a health change. It may examine vision, attention, memory, reaction time, strength, and vehicle control in a clinic and on the road; adaptive equipment may help.

Driving Rehabilitation

Assessment and training to help a person resume driving safely or use adaptive vehicle controls after illness or injury. It may address vision, attention, reaction time, strength, vehicle operation, and road safety.

Dronabinol

A medicine related to the active substance in cannabis, used for selected cases of chemotherapy-related nausea or severe appetite loss. It may cause dizziness, sleepiness, confusion, mood changes, or impaired coordination.

Drool

Saliva that unintentionally escapes from the mouth. It may result from excess saliva, difficulty swallowing, poor lip closure, dental problems, or a neurologic condition affecting mouth control.

Drooling

Unintentional loss of saliva from the mouth caused

by excess saliva, difficulty swallowing, poor lip closure, or reduced control of the mouth. Persistent drooling may be associated with dental, medication, or neurologic causes.

Drooping Eyelids

Ptosis, or abnormal lowering of one or both upper eyelids. Causes include age-related tendon stretching, nerve or muscle disease, congenital weakness, trauma, or a mass; sudden ptosis with double vision, headache, or unequal pupils is urgent.

Drop Arm Test

A shoulder examination that helps assess for a substantial rotator-cuff tear, especially of the supraspinatus. The examiner passively raises the arm to about 90 degrees and asks the person to lower it slowly. Inability to hold the arm up or lower it smoothly is a positive result; a negative test does not rule out a tear.

Alternate Names:
Dropped Arm Test

Drop Attack

A descriptive term for a sudden fall or collapse, often without warning. It may happen with or without loss of consciousness and can result from fainting, a seizure, or a balance problem. The cause must be assessed because the event may not be a simple trip or slip.

Drop Attacks

Alternate plural name; see *Drop Attack*.

Droperidol

A medicine used in selected clinical settings to treat severe nausea or agitation. It can prolong the heart's electrical recovery time and rarely cause dangerous arrhythmias, so heart-risk factors and monitoring may be important.

Drop Foot

Alternate name; see *Foot Drop*.

Drop Hand Syndrome

Weakness or paralysis of the muscles that straighten the wrist and fingers, usually from injury or pressure on the radial nerve. The wrist hangs downward and gripping or releasing objects becomes difficult.

Droplet Precautions

Infection-control measures for infections spread by respiratory droplets released during coughing, sneezing, or talking. They may include a medical mask, hand hygiene, patient separation, and limiting transport according to the infection.

Dropper Bottle

A bottle with a device that releases liquid one drop at a time. Drop size varies with the liquid and device, affecting the amount delivered.

Drowning

Breathing impairment caused by submersion or immersion in liquid. It may be fatal or nonfatal. Lack of oxygen can injure the brain and other organs; complications include aspiration, lung injury, and respiratory failure.

Drowning Signs

Findings after respiratory impairment caused by submersion or immersion in liquid. They may include coughing, difficulty breathing, low blood oxygen, confusion, unconsciousness, or cardiac arrest; the findings depend on the severity and duration of oxygen deprivation. "Dry drowning," "wet drowning," and "secondary drowning" are nonstandard terms, not distinct diagnoses.

Drowsiness

An increased tendency to fall asleep or reduced alertness. It may result from too little sleep, medicines, alcohol or other substances, metabolic illness, sleep disorders, infection, or neurologic disease; sudden severe drowsiness can occur with acute illness.

Drug

A substance that changes body function or is used to prevent, diagnose, or treat disease. Drugs include prescription medicines, nonprescription medicines,

biological products, and substances used recreationally or illegally.

Drug- and Nephrotoxin-Associated Kidney Disorders

Kidney injury caused by medicines, contrast agents, industrial chemicals, supplements, or other toxins. Patterns include acute tubular injury, interstitial nephritis, glomerular disease, crystals, obstruction, and chronic fibrosis; medication review and prompt withdrawal of a culprit may limit damage.

Drug Caution Code

A code used in a medicine record or labeling system to flag a risk such as allergy, drug interaction, dose restriction, or required monitoring. There is no universal drug-caution code; each code is defined by the system that uses it.

Drug Delivery

The way a medicine is prepared and given so its active ingredient reaches the intended body site at an effective dose. Routes include swallowing, inhalation, skin application, injection, implantation, and targeted systems.

Drug Desensitization

A supervised process that gives gradually increasing doses of a medicine to temporarily reduce an allergic reaction when that medicine is essential and no suitable alternative exists. The tolerance usually ends when doses are interrupted.

Drug Discovery

The process of finding and developing substances that may prevent, diagnose, or treat disease. It includes laboratory research, safety testing, dose studies, clinical trials, manufacturing, and review by a regulatory authority.

Drug-Eluting Stent

A vascular stent coated with a medicine that reduces tissue growth and helps keep the treated vessel open. It is used in selected narrowed or blocked arteries and requires appropriate antiplatelet management.

Drug Eruptions

Alternate plural form; see *Drug Eruption*.

Drug-Food Interaction

A change in a medicine's effect, absorption, or safety caused by food or drink. Food may increase or decrease absorption, while some foods can alter medicine metabolism or raise the risk of adverse effects.

Drug Hypersensitivity

An unusual reaction to a medicine that resembles an allergy. Some reactions involve the immune system, while others have different causes. Symptoms may include a rash, swelling, breathing problems, or fever. Reactions can begin soon after taking a medicine or days later.

Alternate Names:
Drug Hypersensitivity Reaction

Drug Implant

A solid drug-containing pellet, container, or delivery device placed under the skin or in another tissue to release medicine continuously or slowly over an extended period. It may provide local or whole-body treatment; the product determines whether it biodegrades or requires removal and how it is monitored.

Drug-Induced Bullous Disorders

Medication-triggered blistering diseases, including bullous pemphigoid, pemphigus, linear IgA disease, bullous fixed drug eruption, and severe reactions such as Stevens–Johnson syndrome or toxic epidermal necrolysis. New widespread blisters, skin tenderness, peeling, fever, or mouth, eye, or genital involvement is an emergency.

Drug-Induced Gingival Hyperplasia

Enlargement or overgrowth of gum tissue associated especially with phenytoin, cyclosporine or tacrolimus, and calcium-channel blockers such as nifedipine or amlodipine. It can impair brushing, trap plaque, and promote bleeding or periodontal disease; management may include dental care or changing the causative medicine.

Drug-Induced Glaucoma

Glaucoma or raised intraocular pressure caused or worsened by a medicine, commonly corticosteroids and less often agents that produce pupillary block or secondary inflammation. Treatment involves removing the trigger when possible and controlling pressure.

Drug-Induced Hepatotoxicity

Liver injury caused by a medicine, supplement, or other therapeutic exposure. Patterns include hepatocellular injury, cholestasis, or a mixed picture; diagnosis requires exposure review and exclusion of competing causes.

Drug-Induced Liver Injury

Liver damage caused by a medicine, herbal product, or dietary supplement. It may injure liver cells, slow the flow of bile, or do both. The reaction may be predictable from the amount taken or may occur rarely in a person who is unusually sensitive to the substance.

Alternate Names:
DILI; Toxic Hepatitis

Drug-Induced Lupus

A lupus-like autoimmune reaction caused by certain medicines, often producing joint pain, muscle pain, fever, and inflammation around the lungs or heart. Symptoms and abnormal antibodies usually improve after the causative medicine is stopped under medical supervision.

Alternate Names:
DILE

Drug-Induced Lupus Erythematosus

Alternate name; see *Drug-Induced Lupus*.

Alternate Names:
DILE; Drug-Induced Lupus

Drug-Induced Pemphigus

An autoimmune blistering disorder triggered by a medicine, with antibodies disrupting adhesion between epidermal cells and causing fragile blisters or erosions on skin or mucous membranes. Diagnosis uses biopsy and immunofluorescence; the suspected medicine is stopped only with medical guidance, and the eruption may improve after withdrawal.

Drug-Induced Photosensitivity

An exaggerated skin reaction after exposure to sunlight or other ultraviolet light while taking or applying a photosensitizing medicine. Phototoxic reactions resemble an intense sunburn and may occur quickly, whereas photoallergic reactions are delayed and eczematous; sun protection and clinician-guided review of the medicine are important.

Drug-Induced Pigmentation

Darkening or altered colour of the skin, nails, teeth, or mucous membranes caused by a medicine or its metabolites. Causes include increased melanin, drug or metabolite deposition, and iron deposition; examples include minocycline, amiodarone, clofazimine, antimalarials, and some chemotherapy medicines.

Drug-Induced Pulmonary Toxicity

Respiratory injury caused by a medicine, radiation, or treatment-related immune reaction. It may appear as pneumonitis, organizing pneumonia, fibrosis, edema, hemorrhage, bronchospasm, or pulmonary vascular disease; diagnosis requires temporal review and exclusion of infection and other causes.

Drug Repurposing

Studying or using a medicine developed for one condition to treat a different condition. Earlier safety information may help, but the new use still needs evidence about effectiveness, dose, interactions, and risks.

Drug Safety

The prevention, detection, and management of harmful effects, interactions, errors, and misuse involving medicines. It includes choosing the right medicine and dose, checking allergies and interactions, following instructions, monitoring effects, and reporting suspected problems.

Drug Screening

Testing a sample such as urine, blood, saliva, or

hair for selected drugs or their breakdown products. Initial results can be falsely positive or negative and may require confirmation with a more specific test.

Drugs That May Cause Erection Problems

Some medicines can contribute to difficulty getting or keeping an erection by affecting blood flow, hormones, nerves, or mood. A clinician should review the timing and all medicines before changing treatment.

Drug Testing

Laboratory analysis of blood, urine, saliva, hair, or another sample to detect medicines, recreational drugs, their breakdown products, or poisons. The test's purpose, detection limits, timing, and medicines taken affect interpretation.

Drusen

Yellow-white deposits that form beneath the retina, often with aging. Small deposits may cause no symptoms; many or larger deposits can be associated with age-related macular degeneration and need eye examination.

Dry Age-Related Macular Degeneration

Alternate name; see *Dry Macular Degeneration*.

Dry AMD

Alternate name; see *Dry Macular Degeneration*.

Dry Beriberi

The predominantly neurologic form of severe thiamine deficiency. It can cause symmetric peripheral neuropathy, burning or numb feet, muscle weakness, wasting, impaired reflexes, and difficulty walking.

Dry Cell Battery Poisoning

Injury caused by swallowing or contact with the contents of a dry-cell battery. A swallowed button battery can rapidly burn and perforate the esophagus and is a time-critical medical emergency.

Dry Cough

A cough that produces little or no mucus. Common causes include viral infection, asthma, acid reflux, allergies, smoking, certain medicines, and other airway or lung conditions.

Dry Cupping

A complementary treatment in which cups create suction on intact skin without making cuts. It may temporarily relieve some muscle pain, but evidence is limited; bruising, burns, skin injury, infection, and worsening of skin disease can occur.

Dry Drowning

Obsolete, nonstandard term that has no accepted diagnostic definition; see *Drowning*.

Dry Eye

A disorder in which tears are insufficient or evaporate too quickly, causing burning, grittiness, redness, watering, light sensitivity, or blurred vision. Long-lasting disease can damage the eye surface.

Alternate Names:
Keratoconjunctivitis Sicca; Dry Eyes

Dry Eye Disease

Alternate name; see *Dry Eye*.

Dry Eye Syndrome

Alternate name; see *Dry Eye*.

Dry Gangrene

Tissue death caused by a severe loss of blood flow, often in a toe, foot, or finger. The area may become cold, dry, shrunken, and dark. Infection can develop, and the affected tissue may progress to wet gangrene.

Alternate Names:
Mummification; Senile Gangrene; Arterial Gangrene

Dry Hair

Hair that feels rough, brittle, dull, or frizzy because its outer layer is damaged or lacks moisture. Heat, chemical treatments, weather, frequent washing, nutritional problems, and thyroid disease may

contribute.

Dry Ice

Solid carbon dioxide that changes directly into a cold gas. Contact can cause severe cold burns, and gas in an enclosed space can displace oxygen and cause unconsciousness or suffocation; never seal it in a container.

Dry Macular Degeneration

The more common form of age-related macular degeneration, in which light-sensing cells in the macula gradually deteriorate without bleeding from new abnormal vessels. It can cause slow loss of detailed central vision.

Alternate Names:
Nonexudative AMD; Non-Neovascular AMD

Dry Mouth

A feeling that the mouth does not have enough saliva, also called xerostomia. It may be caused by medicines, dehydration, mouth breathing, anxiety, disease of the saliva-making glands, radiation, or other illness. It can make speaking, swallowing, and tasting harder and harm teeth.

Alternate Names:
Cottonmouth

Dry Mouth Xerostomia

Alternate name; see *Xerostomia*.

Alternate Names:
Oral Dryness

Dry Powder Inhaler

A breath-powered device that delivers powdered medicine into the lungs. It does not require pressing and breathing at the same time; dose delivery depends on the strength and timing of inhalation.

Dry-Powder Inhaler

Alternate spelling; see *Dry Powder Inhaler*.

Dry Skin

Skin that is rough, scaly, tight, or itchy because it has lost moisture or its protective barrier is damaged. Aging, cold or dry air, frequent washing, eczema, medicines, and some illnesses can contribute.

Dry Skin and Itching

Xerosis with pruritus, often caused by low humidity, irritating products, eczema, medicines, or systemic disease. Persistent, widespread, severe, or sleep-disrupting itch may be associated with dermatologic, liver, kidney, thyroid, blood, or neurologic causes.

Dry Socket

Painful inflammation after tooth extraction when the protective blood clot is lost or breaks down too early. Severe pain may begin a few days later and spread to the ear or jaw.

DSM

The Diagnostic and Statistical Manual of Mental Disorders, a reference that describes recognized mental-health diagnoses and their criteria. Clinicians use it with history and examination; it does not replace individual clinical judgment.

DSPS

Alternate name; see *Delayed Sleep Phase*.

DSRCT

Alternate name; see *Desmoplastic Small Round Cell Tumor*.

DSWPD

Alternate name; see *Delayed Sleep Phase*.

DTaP

A vaccine for infants and young children that protects against diphtheria, tetanus, and pertussis (whooping cough). It is given as a series, with later booster vaccines used as children grow older.

D Trisomy Syndrome

Older name for trisomy 13; see *Patau Syndrome*.

Dual Antiplatelet Therapy

Use of two antiplatelet medicines, commonly aspirin with a P2Y12 inhibitor such as clopidogrel, tica-

grelor, or prasugrel. It is used for selected periods in conditions including acute coronary syndrome, after coronary stenting, and after some minor ischemic strokes or high-risk transient ischemic attacks; indications and duration depend on the clinical setting.

Alternate Names:
DAPT

Dual-Energy CT

A CT scan that uses two X-ray energy levels to help distinguish materials in the body. It can improve evaluation of kidney stones, gout, blood vessels, bleeding, and some tissues while using the usual CT principles and risks.

Dual Energy X-Ray Absorptiometry

See *Bone Mineral Density Test*.

Alternate Names:
DXA; DEXA

Dual-Energy X-Ray Absorptiometry

Alternate spelling; see *Bone Mineral Density Test*.

Dual-Photon Absorptiometry

An older test that used two photon energy levels to estimate bone mineral content. It has largely been replaced by dual-energy X-ray absorptiometry for measuring bone density and fracture risk.

Duane Retraction Syndrome

A birth-related eye-movement disorder caused by abnormal nerve control of an eye muscle. Turning the eye inward or outward may be limited, and the eyeball may pull backward and the eyelids narrow.

Alternate Names:
DR Syndrome; Duane Syndrome; Stilling-Turk-Duane Syndrome

Dubin-Johnson Syndrome

An inherited liver-transport disorder in which conjugated bilirubin is not moved normally into bile. It causes intermittent mild jaundice, often triggered by illness or stress, but usually does not cause serious liver damage.

Dubowitz Syndrome

A rare developmental condition associated with poor growth, a small head, characteristic facial features, developmental or learning difficulties, and variable immune, skin, or behavioral problems. Features differ among affected people.

Duchenne Muscular Dystrophy

A severe, inherited genetic muscle disorder that predominantly affects boys, caused by mutations in the gene responsible for producing dystrophin, a protein that protects and strengthens muscle fibers. Without dystrophin, muscle cells gradually break down and weaken over time. Symptoms usually appear in early childhood as difficulty walking, frequent falls, and trouble climbing stairs, progressing to widespread muscle wasting that eventually affects the heart and breathing muscles.

Alternate Names:
Duchenne Dystrophy

Duck Embryo Vaccine

An older rabies vaccine made by growing inactivated rabies virus in duck embryos. It has largely been replaced by safer, more consistent cell-culture vaccines and is not commonly used today.

Duct

A tube or channel that carries fluid within the body, such as bile, pancreatic juice, saliva, tears, or secretions from a gland. Blockage or injury can cause pain, swelling, infection, or impaired organ function.

Ductal Carcinoma

A cancer that begins in cells lining a duct. The term most often describes breast cancer or pancreatic cancer; its behavior and treatment depend on the organ, spread, and tumor features.

Ductal Carcinoma In Situ

A noninvasive breast cancer in which abnormal cells remain inside the milk ducts and have not invaded surrounding breast tissue. It is classified as stage 0 breast cancer; some cases may progress to invasive cancer.

Alternate Names:

Stage 0 Breast Cancer

Ductal-Dependent Lesions

Serious congenital heart defects in which blood flow to the lungs or body depends on the fetal ductus arteriosus remaining open after birth. Affected newborns may rapidly become blue, breathless, pale, or shocked.

Duct Ectasia

Alternate name; see *Mammary Duct Ectasia*.

Ductless Glands

Glands that release hormones directly into the bloodstream rather than through a tube. Examples include the pituitary, thyroid, adrenal glands, and pancreatic islets; their hormones regulate growth, metabolism, stress, and reproduction.

Ductus Arteriosus

A blood vessel in the fetus connecting the pulmonary artery to the aorta, allowing blood to bypass the lungs before birth. It normally closes soon after birth; failure to close can strain the heart and lungs.

Ductus Venosus

A fetal blood vessel that directs oxygen-rich blood from the umbilical vein toward the heart while partly bypassing the liver. It normally closes after birth; abnormal fetal flow can indicate circulatory or placental problems.

Duffy-Null Associated Neutrophil Count

A lower neutrophil count associated with the Duffy-null red-cell blood-group phenotype, which is more common in some ancestral populations. It is not generally associated with increased infection risk and, by itself, does not indicate impaired immune defense.

Dugas Sign

A shoulder examination sign in which a person cannot touch the opposite shoulder with the injured arm while keeping the elbow against the chest. It may occur with a shoulder dislocation.

Alternate Names:
Dugas' Sign; Anterior Shoulder Dislocation Test

Duke Criteria

A set of clinical, blood-culture, and heart-imaging findings used to classify suspected infective endocarditis. The criteria combine major and minor findings; the result supports diagnosis alongside the patient's history and examination.

Alternate Names:
Modified Duke Criteria; Duke Endocarditis Criteria

Dukes Classification

An older system for describing how far colorectal cancer has spread through the bowel wall, into nearby lymph nodes, or to distant organs. Modern staging systems are more detailed and are generally preferred.

Dull Pain

Aching, heavy, or pressure-like pain that is not sharp or stabbing. It can arise from muscles, organs, inflammation, or other tissues, and its significance depends on location, duration, associated symptoms, and examination findings.

Duloxetine

A medicine that increases serotonin and norepinephrine signaling in the brain. It treats depression, anxiety, some nerve pain, fibromyalgia, and chronic muscle or bone pain; nausea, sleep changes, sweating, and withdrawal symptoms may occur.

Duloxetine Hydrochloride

The salt form of duloxetine, a medicine used for depression, anxiety, some nerve pain, fibromyalgia, and chronic muscle or bone pain. It may cause nausea, sleep changes, sweating, blood-pressure changes, or withdrawal symptoms.

Dumbbell Ossification

Bone formation or a bone lesion shaped like a dumbbell, often extending through an opening between the spinal canal and surrounding tissues. Imaging is needed to identify its cause and relationship to nerves or other structures.

Dumdum Fever

An older name for visceral leishmaniasis, a parasitic infection transmitted by sandflies. It can cause prolonged fever, weight loss, enlarged spleen or liver, anemia, low blood counts, and life-threatening illness without treatment.

Dumping Syndrome

Symptoms caused by food moving too quickly from the stomach into the small intestine, often after stomach surgery. Early symptoms include cramps, diarrhea, flushing, sweating, dizziness, and a fast heartbeat; later low blood sugar may occur.

Dunbar Syndrome

Alternate name; see *Median Arcuate Ligament Syndrome*.

Dunphy Sign

A clinical sign of acute appendicitis and localized peritoneal inflammation characterized by a sharp exacerbation of right lower quadrant abdominal pain triggered by coughing.

Alternate Names:
Dunphy's Sign; Cough Sign of Appendicitis

Duodenal

Relating to the duodenum, the first part of the small intestine immediately beyond the stomach. This segment receives bile and pancreatic juice and begins digestion and absorption of nutrients.

Duodenal Adenocarcinoma

A cancer arising from gland-forming cells in the duodenum. It may cause abdominal pain, vomiting, bleeding, anemia, jaundice, or blockage; diagnosis usually requires imaging, endoscopy, and tissue sampling.

Duodenal Atresia

A birth defect in which the duodenum is completely blocked, preventing food and digestive fluid from passing. Newborns usually develop green vomiting and feeding difficulty; it is often associated with other birth defects and requires surgery.

Duodenal Bulb

The widened first part of the duodenum just beyond the stomach outlet. It receives partly digested food and is a common site for peptic ulcers; inflammation or scarring can narrow it and delay passage.

Duodenal Disease

Any disorder affecting the duodenum, such as inflammation, ulcer, infection, bleeding, blockage, poor nutrient absorption, or a growth. Symptoms may include upper-abdominal pain, vomiting, anemia, or weight loss.

Duodenal Diverticulum

A pouch that bulges outward from the duodenal wall, often near the openings of the bile and pancreatic ducts. It commonly causes no symptoms but can rarely lead to bleeding, inflammation, blockage, pancreatitis, or bile-duct infection.

Duodenal Fistula

An abnormal connection between the duodenum and another organ, bowel segment, or skin. Digestive fluid may leak through it, causing infection, skin damage, dehydration, electrolyte loss, or poor nutrition.

Duodenal Hemorrhage

Bleeding from the duodenum, often caused by a peptic ulcer, inflammation, abnormal blood vessel, injury, or cancer. It may cause black stools, vomiting blood, weakness, dizziness, anemia, or shock.

Duodenal Infection

Infection affecting the duodenum, caused by bacteria, parasites, viruses, or spread from nearby digestive disease. Symptoms can include upper-abdominal pain, nausea, vomiting, diarrhea, fever, or bleeding.

Duodenal Neoplasm

An abnormal growth in the duodenum that may be benign or cancerous. It can cause pain, bleeding, vomiting, blockage, anemia, or jaundice; evaluation depends on its size, location, appearance, and tissue type.

Duodenal Obstruction

A partial or complete blockage that prevents food and digestive fluid from passing through the duodenum. It can cause repeated vomiting, abdominal swelling, pain, and dehydration.

Duodenal Papilla

A small raised opening in the duodenal wall where bile and pancreatic juice enter the intestine. Narrowing, blockage, or inflammation at this site can cause jaundice, pancreatitis, or digestive symptoms.

Duodenal Perforation

A hole through the full thickness of the duodenal wall, usually caused by a severe ulcer, injury, or a medical procedure. Sudden severe abdominal pain, rigid muscles, and infection of the abdominal lining require emergency treatment.

Duodenal Stenosis

Narrowing of the duodenum that partly blocks passage of food and digestive fluid. It may cause vomiting, abdominal swelling, pain, early fullness, poor feeding, or dehydration; treatment depends on the cause and severity.

Duodenal Tissue Culture

Microbiologic culture of endoscopic mucosal biopsy specimens obtained from the duodenum to diagnose atypical bacterial, mycobacterial, or fungal infections of the proximal small intestine.

Alternate Names:
Duodenal Biopsy Culture; Small Intestine Mucosal Culture

Duodenal Ulcer

An open sore in the duodenal lining, commonly related to Helicobacter pylori infection or anti-inflammatory medicines. It may cause upper-abdominal pain and can bleed, perforate the bowel, or obstruct food passage.

Duodenitis

Inflammation of the duodenal lining, which may result from Helicobacter pylori, excess acid, anti-inflammatory medicines, infection, celiac disease, or inflammatory bowel disease. It can cause upper-abdominal pain, nausea, vomiting, or bleeding.

Duodenoscope

A flexible, side-viewing endoscope passed through the mouth into the duodenum. Its movable tip elevator helps guide instruments into the bile and pancreatic ducts during endoscopic retrograde cholangiopancreatography (ERCP), which can be used to remove stones or place stents.

Duodenostomy

A surgically created opening from the duodenum to the skin or another part of the intestine. It may be used in selected cases for feeding, drainage, or bypassing a blockage.

Duodenum

The first part of the small intestine, between the stomach and jejunum. It receives bile and pancreatic juice, mixes them with stomach contents, and begins much of the digestion and absorption of nutrients.

Duplex Doppler Ultrasound Scanning

An ultrasound test that shows the structure of blood vessels and measures the direction and speed of blood flow. It can detect narrowing, blockage, clots, aneurysms, or abnormal connections without radiation.

Alternate Names:
Duplex Ultrasound

Duplex Surveillance

Planned examinations and ultrasound checks of a blood vessel, graft, stent, aneurysm, or dialysis access. Monitoring can detect recurrent narrowing, clotting, leakage, or failure before serious symptoms develop.

Duplex Ultrasound

An ultrasound examination that combines pictures of body structures with Doppler measurement of blood flow. It is commonly used to assess blood vessels and can identify narrowing, blockage, clots, or abnormal flow.

Duplication

A genetic change in which a section of DNA or a chromosome is copied one or more extra times. The additional genetic material can alter how much of a gene is active and may cause a health condition, although some duplications have little or no effect.

Dupuytren Contracture

Progressive thickening and shortening of tissue in the palm that pulls one or more fingers toward the palm and can limit hand function.

Alternate Names:
Dupuytren Disease; Palmar Fibromatosis

Dupuytren's Disease

A condition in which tissue under the skin of the palm thickens and tightens. It can form cords that gradually bend one or more fingers toward the palm, making them hard to straighten. The ring and little fingers are often affected.

Dupuytren's Disease

Alternate spelling; see *Dupuytren's Disease*.

Dura

Alternate name; see *Dura Mater*.

Durable Power Of Attorney

A legal authorization allowing a designated person to act or make decisions for another person when specified conditions are met. In healthcare, it may appoint a healthcare proxy.

Dural Arteriovenous Fistula

An abnormal direct connection between an artery and a vein in the tough covering around the brain or spinal cord. It may cause a pulsing sound in the ear, headache, seizures, vision or other nerve problems, or bleeding.

Alternate Names:
DAVF

Dural Arteriovenous Fistulas

Plural form; see *Dural Arteriovenous Fistula*.

Dural Sac

The tough, tubular covering around the spinal cord, its surrounding fluid, and the spinal nerve roots inside the spinal canal. A tear can allow spinal-fluid leakage and cause positional headaches.

Dural Venous Sinuses

Channels between layers of the brain's tough covering that collect blood and cerebrospinal fluid and drain them toward the neck veins. A clot in these channels can cause headache, seizures, vision problems, or stroke-like symptoms.

Dura Mater

The tough outer layer of tissue surrounding and protecting the brain and spinal cord. It helps support blood vessels and contains the fluid-filled coverings around the central nervous system.

Durapatite

Another name for hydroxyapatite, the calcium-phosphate mineral that gives bones and teeth much of their hardness. Its amount and arrangement contribute to bone strength and can change in metabolic bone disease.

Duroziez Sign

An auscultatory vascular sign of severe aortic regurgitation consisting of a double murmur heard over the femoral artery—a systolic murmur generated by proximal compression and a diastolic murmur generated by distal compression with the stethoscope diaphragm.

Alternate Names:
Duroziez's Sign; Duroziez Double Murmur

Durules

A formulation designed to release a medicine slowly over an extended period. Crushing or chewing some such tablets or pellets may release too much medicine at once.

Dust

Small solid particles suspended in air or settled on surfaces. Inhaled dust can irritate the nose and

lungs; some types can cause allergy, asthma, infection, poisoning, or long-term lung disease.

Dust Disease

A broad term for lung disease caused by inhaling dust, especially at work. Mineral-dust diseases include silicosis, asbestosis, and coal workers' pneumoconiosis; some organic dusts can cause occupational asthma or hypersensitivity pneumonitis.

Dust Mite Allergy

An immune reaction to proteins from tiny mites living in household dust. It can cause sneezing, blocked or itchy nose, watery eyes, cough, wheezing, eczema flares, or asthma symptoms.

Alternate Names:
House Dust Mite Hypersensitivity; Dust Mite Sensitization

Dutasteride

A medicine that lowers the hormone dihydrotestosterone and gradually shrinks an enlarged prostate. It improves urinary symptoms and lowers retention risk but may reduce sexual function and lowers the blood-test level used to screen for prostate cancer.

DVT

A blood clot in a deep vein, usually in the leg. It can cause swelling, pain, warmth, or redness and may travel to the lungs, causing a life-threatening pulmonary embolism.

DVT Prevention

Steps to reduce the risk of a deep-vein blood clot, including early movement, leg exercises, compression devices, and preventive anticoagulant medicine when appropriate. The choice depends on clot risk and bleeding risk.

Dwarfism

A group of genetic or medical conditions that cause marked short stature. Adult height of 4 feet 10 inches (147 cm) or less is commonly used as a threshold, although some people with a dwarfing condition are taller. Causes include skeletal dysplasias such as achondroplasia, growth-hormone deficiency, and other genetic or medical conditions. In children, short stature is assessed against age- and sex-specific growth standards.

DWI FLAIR Mismatch

A pattern on brain MRI in which an area is abnormal on diffusion images but not yet clearly abnormal on FLAIR images. In selected people with an unknown stroke onset time, it may help identify potentially treatable recent stroke.

Dx

A medical abbreviation for diagnosis or diagnostic assessment. Abbreviations can be misunderstood, especially in patient instructions and other documents.

DXA Scan

Alternate name; see *Bone Mineral Density Test*.

D-Xylose Absorption

An older test of how well the small intestine absorbs a simple sugar after it is swallowed. Low amounts in blood or urine may suggest intestinal lining disease, but kidney function and collection quality affect results.

Dyad

A pair of related people, structures, cells, or measurements considered together. Medical examples include two linked findings or two parts of a cellular or body structure that function together.

Dye

A colored substance used to stain tissue, identify cells, make structures visible, or provide contrast during a medical test. Some dyes can cause allergic reactions or affect the kidneys, especially when injected.

Dye Lasers

Lasers that use a liquid organic dye to produce adjustable wavelengths of light. In medicine, selected wavelengths can treat blood-vessel or pigmented skin lesions; eye and skin protection is essential.

Dye Remover Poisoning

Harm from swallowing, inhaling, or getting dye-removing chemicals on the skin or eyes. Depending on the ingredients, exposure can cause burns, breathing problems, vomiting, poisoning, or organ injury and needs poison-control advice.

Dying

The physical process of approaching death, often involving increasing weakness, sleepiness, reduced appetite and drinking, changes in breathing, and less responsiveness. Emotional, social, cultural, and spiritual support may help the person and family.

Dynamin Gtpase

A family of GTP-binding proteins that constrict membranes during vesicle budding, endocytosis, and other cell-membrane processes.

Dynamometer

An instrument that measures force, commonly handgrip or muscle strength. Clinicians use the result to compare sides, identify weakness, monitor recovery, and assess physical function during rehabilitation or neurologic examination.

Dynein Atpase

The energy-using activity of dynein, a motor protein that moves materials inside cells along microtubules. Dynein also powers the movement of cilia and flagella, which help move fluid or cells.

Dynorphin

A naturally occurring opioid peptide that mainly activates kappa-opioid receptors in the nervous system. It influences pain, stress, mood, movement, and hormone regulation.

Dyphylline

A bronchodilator used in some countries to relax airway muscles in asthma or chronic obstructive lung disease. It may cause nausea, tremor, headache, nervousness, or a fast heartbeat.

Dysaesthesia

An unpleasant abnormal sensation, such as burning, electric-shock pain, pins and needles, or excessive sensitivity to light touch. It commonly results from nerve injury, diabetes, medicines, or other nerve disease.

Dysania

An informal term for persistent difficulty waking or getting out of bed. It is not a formal medical diagnosis; similar difficulty can occur with sleep deprivation, circadian-rhythm sleep disorders, depression, or sedating medicines.

Dysarthria

Slurred, weak, slow, or poorly coordinated speech caused by a problem in the brain, nerves, or muscles used for speaking. Sudden dysarthria can be a sign of stroke.

Dysautonomia

A disorder of the automatic nervous system that controls blood pressure, heart rate, sweating, temperature, digestion, bladder function, and sexual function. Causes include nerve disease, diabetes, medicines, and inherited conditions.

Dysbarism

Illness caused by a change in surrounding pressure, usually during diving, flying, or hyperbaric treatment. It includes decompression sickness and pressure injury to the ears, sinuses, lungs, or other tissues.

Dysbiosis

An imbalance or change in the community of microorganisms living in the body, especially the intestine. Antibiotics, infection, diet, and illness may contribute; dysbiosis is associated with some digestive and inflammatory disorders, but it is not always a proven cause.

Alternate Names:
Gut Microbiome Imbalance

Dyscalculia

A persistent difficulty understanding numbers, quantities, or arithmetic that is not explained by inadequate teaching or general intellectual disability. It may begin during development or follow brain injury and can affect school or daily tasks.

Dyschezia

Difficult or painful passage of stool, often with excessive straining or a feeling of incomplete emptying. Causes include constipation, pelvic-floor coordination problems, anal disorders, and other bowel disease.

Dyschromatosis

A pattern of skin pigmentation with intermixed hyperpigmented and hypopigmented macules, often small and irregular. The term describes a group of pigmentary disorders rather than one specific disease; inherited and acquired forms occur.

Dyscrasia

An abnormal, diseased, or disordered state of the blood or bone marrow, derived historically from the humoral theory of medicine. In modern hematology, the term is applied to specific hematologic pathologies, such as blood dyscrasias (e.g., severe cytopenias, coagulopathies, aplastic anemia) and plasma cell dyscrasias (clonal neoplastic expansions of immunoglobulin-producing plasma cells, including multiple myeloma, monoclonal gammopathy of undetermined significance [MGUS], and AL amyloidosis).

Dyscrasias

Plural form; see *Dyscrasia*.

Dysdiadochokinesia

Difficulty making quick, repeated movements in opposite directions, such as rapidly turning the hands over and back. It can occur with problems in the cerebellum or its nerve pathways.

Alternate Names:
Adiadochokinesia

Dysdiadochokinesis

Alternate name; see *Dysdiadochokinesia*.

Dysembryoplastic Neuroepithelial Tumor

A usually slow-growing, low-grade brain tumor that develops most often in the outer part of the brain in children or young adults. It commonly causes long-standing focal seizures and is often treatable with surgery.

Dysentery

Diarrhea with visible blood, often with cramps, fever, mucus, and an urgent need to pass stool. Several bacteria and parasites can cause it.

Dysesthesia

An unpleasant abnormal sensation, such as burning, electric-shock pain, or painful sensitivity to light touch. It may result from injury or disease of nerves in the brain, spinal cord, or limbs.

Dysferlinopathy

A group of inherited muscle diseases caused by changes in both copies of the DYSF gene, which makes a muscle-membrane repair protein. Weakness often begins in adolescence or early adulthood, affecting the hips, shoulders, or calves.

Alternate Names:
DYSF-Related Muscular Dystrophy; Dysferlin Deficiency

Dysfibrinogenemia

An inherited or acquired condition in which fibrinogen, a blood-clotting protein, has abnormal structure or function. It may cause unusual bleeding, excessive clotting, or no symptoms and is diagnosed with clotting and specialized blood tests.

Dysfunction

Abnormal, reduced, or poorly controlled function of an organ, tissue, body system, or process. It may be temporary or permanent and can result from disease, injury, medicines, inherited conditions, stress, or aging.

Dysfunctional Uterine Bleeding

Older term; see *Abnormal Uterine Bleeding*.

Dysfunctional Voiding

Abnormal coordination between the bladder muscle and the muscles around the urethra during urination. It may cause a weak or interrupted stream, straining, incomplete emptying, urinary infections, wetting, or constipation, especially in children.

Dysgammaglobulinemia

An abnormal level or pattern of antibodies in the blood, with some antibody types low or absent and others normal or increased. It may cause repeated infections, autoimmune problems, or no symptoms and is identified by blood tests.

Dysgerminoma

A cancer of the ovary arising from germ cells, the cells that can develop into eggs. It occurs most often in adolescents and young adults and may cause pelvic pain, swelling, or an abdominal mass.

Dysgeusia

An altered sense of taste, including reduced, distorted, or unpleasant taste. Causes include viral infection, mouth or nose disease, nerve injury, nutritional deficiency, dry mouth, medicines, and other illnesses.

Dysgraphia

A persistent difficulty with handwriting, spelling, or expressing ideas in writing despite appropriate learning opportunities. It may reflect problems with motor skills, language, attention, or brain function and can occur with other learning disorders.

Dyshidrosis

Alternate name; see *Dyshidrotic Eczema*.

Dyshidrotic Eczema

A recurrent, intensely itchy eruption of small, deep-seated fluid-filled blisters on the palms, sides of the fingers, and sometimes the soles. The blisters often occur symmetrically and may be followed by peeling or fissures. Its cause is not fully understood; the condition is also known as pompholyx.

Alternate Names:
Dyshidrotic Dermatitis

Dyskeratosis Congenita

A rare hereditary telomere biology disorder caused by mutations in telomere maintenance genes, characterized by the classic triad of reticulated reticular skin hyperpigmentation, dystrophic nails, and oral mucosal leukoplakia, associated with a high risk of progressive bone marrow failure and pulmonary fibrosis.

Alternate Names:
Zinsser-Cole-Engman Syndrome; Telomere Biology Disorder

Dyskinesia

Abnormal movement that is often involuntary, excessive, repetitive, twisting, or irregular. It may result from neurologic disease or medicines, including long-term treatment for movement disorders, and can interfere with walking, speaking, or daily activities.

Dyslexia

A learning disorder involving persistent difficulty recognizing words accurately or fluently, decoding them, spelling, or linking letters with speech sounds. It is not caused by low intelligence or poor motivation and may continue into adulthood.

Alternate Names:
Specific Reading Disorder; Developmental Dyslexia

Dyslipidemia

An abnormal level or pattern of blood lipids or lipoproteins, such as elevated LDL cholesterol or triglycerides, low HDL cholesterol, or a combination. It is associated with increased cardiovascular risk; severe hypertriglyceridemia can cause acute pancreatitis.

Alternate Names:
Dyslipidaemia; Dyslipidaemias

Dyslipidemias

Alternate plural; see *Dyslipidemia*.

Dysmenorrhea

Painful menstrual periods, usually causing cramping in the lower abdomen and sometimes back pain, nausea, diarrhea, headache, or dizziness. Severe, new, or worsening pain may indicate an underlying pelvic disorder.

Dysmenorrhea (Painful Menstruation)

Alternate name; see *Dysmenorrhea*.

Dysmenorrhoea

Painful menstrual periods. Primary pain occurs without another pelvic disease, while secondary pain results from a condition such as endometriosis, fibroids, adenomyosis, pelvic infection, or an intrauterine device.

Dysmetria

Inability to judge or control the distance, force, or speed of a voluntary movement. A person may overshoot or undershoot a target; it commonly reflects dysfunction of the cerebellum or its connecting pathways.

Dysmyelogenic Leukodystrophy

An older or nonspecific term for a leukodystrophy in which myelin develops abnormally. Modern diagnosis generally identifies the specific genetic or acquired disorder and its pattern of hypomyelination, dysmyelination, or demyelination.

Alternate Names:
Dysmyelinating Leukodystrophy

Dysorexia

An abnormal appetite, including little desire to eat, excessive hunger, or disordered eating. It may result from illness, medicines, emotional distress, metabolic disease, or an eating disorder and can affect nutrition and weight.

Dysostoses

Inherited or developmental conditions in which one or more bones form or grow abnormally. They may affect the skull, face, spine, ribs, arms, or legs and can alter body shape, movement, growth, hearing, breathing, or other functions.

Dyspareunia

Recurrent or persistent genital or pelvic pain before, during, or after sexual activity, especially attempted vaginal penetration. Pain may be at the vaginal opening or deeper in the pelvis and can result from dryness, infection, skin disease, pelvic-floor muscle spasm, endometriosis, inflammation, injury, or emotional factors.

Dyspepsia

Recurring discomfort in the upper abdomen, often called indigestion. It may feel like pain or burning, uncomfortable fullness after a meal, or getting full too soon. Causes include ulcers, reflux, some medicines, or no visible cause.

Alternate Names:
Indigestion; Upset Stomach

Dyspeptic

Describing indigestion symptoms such as upper-abdominal discomfort or burning, early fullness, bloating, belching, or nausea, especially after eating.

Dysphagia

Trouble swallowing food, liquid, or saliva. It may be hard to start a swallow, move food through the throat, or pass it down the food pipe; coughing, choking, or food sticking may occur. Causes include problems with the shape or movement of the throat or food pipe, nerves, or muscles.

Alternate Names:
Deglutition Disorder

Dysphagia Diet

Foods with modified texture or drinks with modified thickness, selected to accommodate a person's swallowing difficulty. A swallowing assessment guides the consistency; these changes may improve swallowing safety but do not eliminate aspiration risk and can affect fluid or food intake.

Dysphagia Lusoria

Difficulty swallowing caused by compression of the esophagus by a congenital abnormality of the aortic arch or its branches. The usual cause is an aberrant right subclavian artery that arises from the left side of the aortic arch and passes behind the esophagus to reach the right arm; less common causes include a double aortic arch or a right aortic arch with an aberrant left subclavian artery. These vascular abnormalities may be present without causing symptoms; the term refers to cases in which they cause swallowing difficulty.

Dysphagia Rehabilitation

Therapy to improve safe swallowing, nutrition, and hydration. It may include swallowing exercises, posture or pacing strategies, food-texture changes, and caregiver education based on the cause and assessment.

Dysphasia

Difficulty using or understanding language because of a problem in the brain's language areas. It may affect speaking, understanding, reading, or writing; many clinicians use the clearer term aphasia.

Dysphonia

An abnormal voice, such as hoarseness, breathiness, roughness, strain, weakness, or loss of voice. Causes include infection, vocal-cord swelling or growths, nerve problems, voice overuse, reflux, and cancer.

Dysphonia Spastica

Alternate name; see *Spasmodic Dysphonia*.

Dysphoria

A state of marked emotional distress, unease, or dissatisfaction. Gender dysphoria specifically means distress related to a difference between experienced gender and sex assigned at birth; it is not itself a mental illness.

Dysplasia

Abnormal size, shape, or arrangement of cells in a tissue. It is not cancer, but some forms—especially when severe or persistent—can increase the chance of cancer and may need monitoring or treatment.

Dysplasia Epiphysealis Hemimelica (Trevor Disease)

A rare developmental overgrowth of cartilage in one side of an epiphysis, usually affecting a lower-limb joint in childhood. It can cause asymmetric bony masses, pain, stiffness, deformity, or restricted movement and is evaluated with radiographs or MRI.

Dysplastic Melanocytic Nevi Pathology

Melanocytic nevi with architectural disorder and variable cytologic atypia, often showing bridging of rete ridges, lamellar fibroplasia, and atypical melanocytes. The degree of atypia is graded and must be distinguished from melanoma.

Dysplastic Nevi

Plural form; see *Dysplastic Nevus*.

Dysplastic Nevus

An atypical melanocytic mole with clinical or microscopic features such as asymmetry, irregular borders, uneven color, or disordered cell growth. Most do not become melanoma, but multiple dysplastic nevi are associated with increased melanoma risk and can resemble early melanoma.

Dyspnea

A person's uncomfortable feeling of difficult breathing, breathlessness, or not getting enough air. It may occur with lung, heart, blood, muscle, or anxiety-related conditions.

Alternate Names:
Breathing Difficulty; Breathlessness; Dyspnoea

Dyspnea On Exertion

Shortness of breath that occurs or worsens with physical activity. It may result from heart or lung disease, anemia, poor fitness, or other conditions; symptoms may be new, severe, or rapidly worsening.

Dyspnoea

Alternate name; see *Dyspnea*.

Dyspraxia

A developmental difficulty planning and coordinating movements that interferes with daily activities, learning, or motor skills. It is not explained by muscle weakness, loss of sensation, or inadequate opportunity to learn.

Alternate Names:
Developmental Coordination Disorder

Dysraphism

A birth defect caused by incomplete joining of developing body structures, especially the spinal cord or spinal bones. Effects range from a small skin mark to weakness, loss of sensation, or bladder and bowel problems.

Dysrhythmia

An abnormal heart rhythm that may be too fast, too slow, or irregular. Some cause no symptoms; others cause palpitations, dizziness, fainting, chest pain, stroke, or inadequate blood flow.

Dyssomnia

A primary category of sleep disorders characterized by abnormalities in the amount, quality, or timing of sleep, leading to difficulty initiating, maintaining, or achieving restful sleep, or to excessive daytime sleepiness. Classified into intrinsic sleep disorders (e.g., psychophysiological insomnia, obstructive sleep apnea, central sleep apnea, narcolepsy, idiopathic hypersomnia), extrinsic sleep disorders (e.g., inadequate sleep hygiene, environmental sleep disorder, altitude insomnia), and circadian rhythm sleep-wake disorders (e.g., delayed sleep phase, advanced sleep phase, shift work disorder, jet lag). Distinguished nosologically from parasomnias, which involve abnormal behavioral or physiological events during sleep or sleep-wake transitions.

Alternate Names:
Dyssomnias

Dyssomnias

Plural form; see *Dyssomnia*.

Dysthymic Disorder

Alternate name; see *Persistent Depressive Disorder*.

Dysthyroid Eye Disease

Inflammation and swelling of tissues around the eyes, usually linked to Graves disease. It may cause dry or gritty eyes, puffy lids, bulging eyes, or double vision. Rarely, pressure can damage vision. Smoking increases the risk of severe disease.

Alternate Names:
Graves' Ophthalmopathy; Graves' Orbitopathy; Dysthyroid Ophthalmopathy; TED

Dystocia

Difficult or unusually slow labor caused by ineffective contractions, the baby's size or position, or the mother's pelvis or soft tissues. It can increase risks for both parent and baby and may require assisted delivery or cesarean birth.

Dystonia

A movement disorder marked by involuntary, often sustained or intermittent muscle contractions that cause twisting movements or abnormal postures. It may be painful and affect one or several body regions; dystonia can occur on its own or with genetic conditions, brain disorders, or certain medicines.

Dystonia Disorder

Alternate name; see *Dystonia*.

Dystonin

A protein made from the DST gene that helps attach the internal framework of cells to other cell structures. Harmful gene changes can cause inherited nerve disease, muscle weakness, and fragile or blistering skin.

Dystrophia Unguium

Abnormal nail growth, shape, color, or texture. Causes include injury, fungal infection, inflammation, poor nutrition, medicines, reduced blood flow, and inherited disorders; treatment depends on the cause.

Dystrophic Calcification

Buildup of calcium salts in damaged, dead, or chronically inflamed tissue even though the blood calcium

level is normal. It can occur in scars, diseased valves, tumors, or injured muscles and may impair function.

Dystrophin

A large sub-sarcolemmal cytoskeletal structural protein that anchors the internal actin cytoskeleton of skeletal and cardiac muscle fibers to the extracellular matrix through the dystrophin-associated glycoprotein complex; mutations in the *DMD* gene lead to Duchenne and Becker muscular dystrophies.

Dystrophin-Glycoprotein Complex

A group of proteins that connects the internal framework of muscle cells to their surrounding support tissue and protects the cell membrane during contraction. Changes in its components can cause several inherited muscular dystrophies.

Alternate Names:
DGC; Dystrophin-Associated Glycoprotein Complex (DAGC)

Dystrophy

Abnormal development or progressive deterioration of a tissue or organ. The term is used in the names of distinct disorders, such as muscular, retinal, and corneal dystrophies; the cause and effects differ among them.

Dysuria

Pain, burning, or discomfort during urination. Common causes include bladder or urethral infection, vaginal or penile inflammation, stones, irritation, and sexually transmitted infections; fever, flank pain, pregnancy, or blood in urine may accompany more serious causes.

Alternate Names:
Painful Urination

E

Eagle Syndrome

A rare cause of throat, face, jaw, or neck pain related to an unusually long bony projection near the skull base or a hardened nearby ligament. Pain may worsen with swallowing or turning the head.

Eales Disease

An uncommon inflammatory disorder of small retinal veins, usually affecting otherwise healthy young adults. Blocked vessels can cause abnormal new vessels and bleeding inside the eye, leading to floaters or reduced vision.

Ear

The organ for hearing and balance. The outer ear collects sound, the middle ear transmits vibrations through the eardrum and tiny bones, and the inner ear converts sound and movement into signals sent to the brain.

Earache

Pain in or perceived to come from the ear. It may arise from the ear canal or middle ear, or be referred from nearby structures such as the teeth, jaw joint, throat, or neck.

Alternate Names:
Otalgia

Ear Barotrauma

Ear injury caused by unequal pressure between the middle ear and surrounding air or water, often during flying or diving. It may cause pain, fullness, blocked hearing, ringing, dizziness, bleeding, or a torn eardrum.

Ear Canal

The passage between the outer ear and eardrum. Its skin and earwax protect the middle ear, but infection, injury, foreign objects, or wax buildup can cause pain, discharge, or reduced hearing.

Ear Cartilage

Flexible connective tissue that forms much of the outer ear and gives it shape. Injury or infection can cause pain, swelling, deformity, or damage that permanently changes the ear.

Ear Disease

Alternate name; see *Ear Disorders*.

Ear Disorders

Conditions affecting the outer, middle, or inner ear, including infection, injury, blockage, inflammation, hearing loss, and growths. Symptoms depend on the affected part and may include pain, discharge, ringing, dizziness, or reduced hearing or balance.

Ear Drainage Culture

A laboratory test of fluid draining from the ear to identify bacteria or fungi. Results can guide treatment; normal organisms, contamination, or colonization can affect the findings.

Eardrum

A thin membrane separating the ear canal from the middle ear. Sound makes it vibrate, and the vibration moves the tiny middle-ear bones; infection, pressure, or injury can tear it or reduce hearing.

Eardrum Repair

Treatment to close a hole or repair damage in the eardrum, often using a tissue graft or other surgical technique. It may improve hearing and prevent infection, but healing is not always complete.

Ear Examination

Inspection of the outer ear and ear canal and viewing of the eardrum, usually with an otoscope. Hearing, balance, or additional tests may be added when symptoms suggest middle- or inner-ear disease.

Ear Foreign Body

An object lodged in the ear canal, most often in a child. It may cause pain, reduced hearing, bleeding, discharge, or injury. Button batteries can rapidly damage tissue; two magnets or a magnet and another metal object can pinch tissue between them.

Alternate Names:
Auditory Canal Foreign Body; Aural Foreign Body

Ear Infection

Infection or inflammation affecting part of the ear, including the outer ear, ear canal, middle ear, or inner ear. It may cause ear pain, fever, discharge, reduced hearing, dizziness, or irritability in children.

Earliest Signs Of Increased Intracranial Pressure

Early signs may include worsening headache, vomiting, blurred or double vision, drowsiness, slowed thinking, or behavior change. Causes include bleeding, swelling, infection, a growth, or excess brain fluid.

Earlobes

The soft lower parts of the outer ears, made mainly of skin and fatty or connective tissue without cartilage. They may be affected by piercing injury, infection, cysts, allergic reactions, or tears.

Early Afterdepolarization

An extra abnormal electrical signal during the heart's recovery phase after each beat. It is more likely when the QT interval is prolonged and can trigger dangerous abnormal rhythms.

Alternate Names:
EAD; Early After-Depolarization

Early Childhood Caries

Dental caries affecting one or more primary teeth in a child younger than 6 years. It is a multifactorial disease involving oral bacteria, fermentable carbohydrates, tooth susceptibility, behavior, and social conditions; frequent sugar exposure and enamel defects can increase risk.

Alternate Names:
Early Childhood Tooth Decay

Early Decelerations

A gradual temporary slowing of the fetal heart rate that begins and ends with a uterine contraction, usually from pressure on the baby's head. When isolated, it is generally reassuring, but the complete tracing and clinical situation matter.

Early Detection

Finding a disease at an early stage, before it causes major complications or spreads. It may result from screening or prompt evaluation of symptoms and can improve treatment options for some conditions.

Early Diagnosis

Identifying a disease before it has progressed or caused major complications. Earlier diagnosis may provide more treatment choices, but its benefit depends on the disease and the accuracy and usefulness of available tests.

Early Endosome

A small membrane-bound compartment inside a cell that receives material brought in from the cell surface. It sorts that material for return to the surface, delivery elsewhere in the cell, or breakdown.

Early Gastric Cancer

Stomach cancer limited to the inner lining or the layer just beneath it, whether or not nearby lymph nodes are involved. It may be found early because of screening or testing for digestive symptoms.

Alternate Names:
EGC

Early-Infantile Developmental and Epileptic Encephalopathy

A severe epilepsy syndrome beginning in neonates or infants, characterized by frequent seizures, markedly abnormal brain activity on electroencephalography, and impaired development. Causes may be genetic, structural, metabolic, or unknown; the current International League Against Epilepsy classification includes cases formerly described as Ohtahara syndrome or early myoclonic encephalopathy.

Alternate Names:
Early Infantile Epileptic Encephalopathy; EIDEE

Early Intervention

Support provided to infants and young children with developmental delays or disabilities. It may include physical, occupational, speech, behavioral, educational, and family services to improve development, function, and participation.

Early-Onset Dementia

Dementia beginning unusually early in life. Modern assessment identifies the specific cause, such as Alzheimer disease, frontotemporal dementia, vascular disease, or an inherited disorder, while also documenting the age at onset.

Alternate Names:
Premature Senility Syndrome (deprecated historical term)

Early-Onset Tremor

Tremor beginning before older adulthood. Causes include essential tremor, medication effects, dystonia, Parkinson disease, metabolic disease, or another neurologic disorder.

Alternate Names:
Presenile Tremor Syndrome (deprecated historical term)

Early Pregnancy Loss

Loss of a pregnancy in the first trimester, most often because of chromosomal abnormalities in the embryo. Evaluation and treatment depend on symptoms, ultrasound, bleeding, infection risk, pregnancy location, and the person's preferences.

Early Puberty

Alternate name; see *Precocious Puberty*.

Early Repolarization Pattern

An electrocardiogram finding of at least 1 mm of elevation at the junction between the QRS complex and ST segment in two or more neighboring inferior or lateral leads, often with notching or slurring at the end of the QRS complex. It is common and usually benign; the pattern alone does not mean a person has an arrhythmic syndrome.

Alternate Names:
Early Repolarization ECG Pattern; BER

Early Repolarization Syndrome

A rare arrhythmic disorder diagnosed when an early-repolarization pattern on an electrocardiogram is present in a person who has survived otherwise unexplained ventricular fibrillation or polymorphic ventricular tachycardia, after other causes are excluded. Most people with the ECG pattern do not have this syndrome.

Alternate Names:
ERS; Malignant Early Repolarization

Early Satiety

Feeling full sooner than expected while eating, sometimes after only a small amount of food. It may result from stomach or digestive disease and may be persistent or associated with weight loss.

Early-Stage Prostate Cancer

Prostate cancer that remains confined to the prostate or nearby tissues and has not spread to distant organs. The term includes cancers with different grades and risks of progression.

Alternate Names:
Early Prostatic Carcinoma; Localized Prostate Cancer

Ear Microbiome

The community of microorganisms living on or in

the ear, especially the ear canal. They interact with skin and earwax and may influence infection risk; moisture, cleaning, hearing devices, inflammation, and illness can change the community.

Ear Neoplasm

An abnormal growth in the outer, middle, or inner ear that may be benign or cancerous. It can cause a persistent lump, pain, discharge, hearing loss, dizziness, or facial weakness; imaging or biopsy can help characterize it.

Ear Speculum

A small cone-shaped tip fitted to an otoscope to direct light into the external ear canal and permit examination of the canal and tympanic membrane. Disposable and reusable types are available in different sizes.

Ear Tag

A small, skin-covered projection on or near the outer ear, usually present from birth. It is generally harmless, but examination may be appropriate if it causes problems or occurs with other birth findings.

Ear Thermometer

A device that estimates body temperature by measuring heat in the ear canal near the eardrum. Correct positioning is important; earwax, a small ear canal, or an ear infection can affect the reading.

Ear Tube Insertion

A procedure placing a small ventilation tube through the eardrum to allow air into the middle ear and fluid to drain. It may help repeated infections or persistent fluid but can cause drainage, blockage, scarring, or a persistent opening.

Ear Wax

A waxy mixture of gland secretions and shed skin that protects and cleans the ear canal. A buildup can cause reduced hearing, fullness, ringing, itching, or discomfort; inserted objects can push wax deeper or injure the ear.

Alternate Names:
Cerumen

Earwax

Alternate spelling; see *Ear Wax*.

Earwax Blockage

A buildup of wax that partly or completely blocks the ear canal. It may cause reduced hearing, fullness, ringing, itching, pain, or cough; removal methods vary with the person and ear condition.

Earwax Removal

Removal of excess or impacted earwax by a clinician after examining the ear. Instruments, gentle suction, or irrigation may be used when safe; inserting objects at home can cause injury or push wax deeper.

Eating Disorder

A group of mental-health conditions involving harmful eating patterns that cause distress, medical risk, or impaired functioning. Some involve intense concern about food, weight, or body shape, but avoidant/restrictive food intake disorder (ARFID) does not require body-image concerns. Examples include anorexia nervosa, bulimia nervosa, binge-eating disorder, and ARFID.

Eating Disorders

Alternate name; see *Eating Disorder*.

Eaton-Lambert Syndrome

An uncommon condition in which the immune system interferes with nerve signals to muscles. It causes weakness, often in the hips and shoulders, reduced reflexes, dry mouth, and other automatic-body problems. It can be linked to small-cell lung cancer.

Alternate Names:
Lambert-Eaton Myasthenic Syndrome; LEMS

EB

Alternate name; see *Epidermolysis Bullosa*.

EBCT

Electron-beam computed tomography, an older rapid CT method that was used especially to mea-

sure calcium in the coronary arteries. Newer CT technology is now more commonly used for heart and vessel imaging.

Alternate Names:
Electron-Beam Computed Tomography; Ultrafast CT

Ebola

Alternate name; see *Ebola Virus Disease*.

Ebola Hemorrhagic Fever

Older name; see *Ebola Virus Disease*.

Ebola Virus

A virus that causes Ebola disease. It spreads mainly through direct contact with infected blood or body fluids, usually after symptoms begin; illness may include fever, vomiting, diarrhea, bleeding, shock, and organ failure.

Ebolavirus

Older genus name; see *Orthoebolavirus*.

Ebola Virus Disease

A serious infection caused by Ebola viruses. Symptoms usually begin 2–21 days after exposure and may include fever, weakness, muscle pain, headache, vomiting, or diarrhea; severe illness can cause bleeding, shock, or organ failure. It spreads through contact with an infected person's or animal's blood or body fluids, or with objects contaminated by them. People generally spread the virus after symptoms begin.

Ebola Virus Infection

Alternate name; see *Ebola Virus Disease*.

Ebstein Anomaly

A birth defect in which the tricuspid valve is positioned too low in the right ventricle and does not close normally. It can cause leakage of blood, enlargement of the right heart, blue coloring, heart failure, or abnormal rhythms.

Ebstein's Anomaly

Alternate spelling; see *Ebstein Anomaly*.

EBUS-TBNA

A procedure that uses a flexible breathing-tube camera and ultrasound to locate lymph nodes or masses beside the airways, then obtains tissue with a needle. It helps diagnose and stage lung cancer, sarcoidosis, lymphoma, and tuberculosis.

Alternate Names:
Endobronchial Ultrasound Transbronchial Needle Aspiration; Convex Probe EBUS

Ecbolics

Medicines that stimulate contractions of the uterus. They may be used to start or strengthen labor or control heavy bleeding after birth; excessive contractions can harm the parent or baby.

EC Cells

Specialized neuroendocrine cells in the digestive tract lining that produce and store serotonin. See *Enterochromaffin Cells*.

Eccentric

Positioned away from the center. In exercise, an eccentric muscle action occurs when a muscle produces force while lengthening, such as lowering a weight; it can improve strength but may cause soreness or injury.

Eccentric Action

Muscle contraction that produces force while the muscle lengthens, such as the controlled lowering of an object. It helps control movement and build strength but may cause muscle soreness when new or intense.

Alternate Names:
Eccentric Contraction

Eccentrocyte Count

The number or proportion of eccentrocytes in a blood smear. These red blood cells have hemoglobin displaced to one side because oxidative damage makes part of the cell membrane stick together;

they can be seen in oxidative hemolysis.

Ecchymosis

A flat purple, blue, or brown skin mark caused by blood leaking into tissues, commonly after an injury. Easy or unexplained bruising can also result from medicines, low platelets, clotting disorders, fragile vessels, or illness.

Eccrine Carcinoma

A rare malignant tumor arising from eccrine sweat-gland structures. It often presents as a slowly growing plaque or nodule, but may invade nearby tissue or recur; biopsy is required and treatment usually involves complete surgical removal.

Eccrine Gland

A small sweat gland found throughout the skin that releases watery sweat onto the surface. It helps cool the body and is especially numerous on the palms, soles, and forehead.

Eccrine Glands

Plural form; see *Eccrine Gland*.

Eccrine Porocarcinoma

A rare skin cancer arising from cells of sweat-gland ducts. It may appear as a slowly enlarging lump or patch and can recur or spread; biopsy and complete removal are often needed.

Eccrine Poroma

A usually harmless growth arising from a sweat-gland duct, often appearing as a flesh-colored, pink, or reddish lump on a hand or foot. It may bleed or be tender and can be removed if needed.

Eccyesis

Alternate name; see *Ectopic Pregnancy*.

ECG

Abbreviation; see *Electrocardiogram*.

ECG/EKG Machine

A device that records the heart's electrical activity through electrodes placed on the skin. A standard 12-lead recording helps assess rhythm, conduction, heart strain, reduced blood flow, and prior heart injury.

Echinacea

A group of plants used in some herbal products for colds or claimed immune support. Evidence of benefit is inconsistent; allergic reactions and interactions with medicines can occur, especially in people with plant allergies.

Echinocandins

A group of antifungal medicines that stop fungi building their protective cell wall. They are given mainly by injection for serious Candida infections and selected Aspergillus infections; liver reactions and infusion effects can occur.

Echinococcal Cysts

Fluid-filled cysts caused by the larval stage of Echinococcus tapeworms, most often in the liver or lungs. They may remain silent or cause pressure, pain, breathing symptoms, or a severe allergic reaction if they rupture.

Echinococcosis

A parasitic infection caused by larval Echinococcus tapeworms. Cystic disease usually forms cysts in the liver or lungs; alveolar disease grows invasively in the liver and may spread, requiring specialist treatment.

Echinococcus

A group of tapeworms that can cause disease when people swallow eggs from contaminated soil, food, water, or contact with infected animals. Larvae can form cysts or invasive lesions, especially in the liver or lungs.

Echinococcus Granulosus

A tapeworm whose larvae cause cystic echinococcosis. Dogs commonly carry the adult worm, and people become infected by swallowing eggs from contaminated material; cysts most often develop in the liver or lungs.

Echinococcus Multilocularis

A tapeworm species whose larvae cause alveolar echinococcosis. The infection mainly affects the liver, where it grows slowly and invasively and may spread to other organs.

Echinococcus Vogeli

A tapeworm species that causes polycystic echinococcosis, a disease producing multiple parasitic cysts mainly in the liver and sometimes other abdominal organs.

Echinocytes

Red blood cells with many small, evenly spaced projections around their edges. They may reflect kidney disease or an inherited blood disorder, but can also be created by improper storage or preparation of the blood sample.

Alternate Names:
Burr Cells

Echo

A common abbreviation for echocardiography, an ultrasound test that examines the heart's chambers, valves, pumping action, and blood flow. The full term is preferable in patient instructions.

Echocardiogram

An ultrasound picture of the heart that shows its chambers, valves, pumping movement, and blood flow without ionizing radiation. It helps evaluate heart failure, valve disease, congenital defects, clots, and other heart problems.

Echocardiography

Ultrasound imaging of the heart. It shows the chambers, valves, pumping action, and blood flow; the probe usually scans through the chest and may be passed into the esophagus for closer views.

Echoencephalography

Ultrasound imaging of the brain, historically used mainly in infants to look for enlarged fluid spaces or displacement of brain structures. CT or MRI is now usually preferred for detailed brain imaging.

Echogenic Bowel

An ultrasound finding in which a fetus's bowel appears unusually bright, sometimes as bright as bone. It may be a normal variation or may be associated with infection, chromosome conditions, cystic fibrosis, bleeding, or other fetal problems.

Echogenic Intracardiac Focus

A small bright spot, usually in a muscle inside the fetal heart, seen on ultrasound. When isolated and all other findings and screening are reassuring, it is commonly a harmless variation; its significance depends on the full evaluation.

Echography

Medical ultrasonography, which uses high-frequency sound waves to create images of tissues, organs, blood flow, or a developing fetus.

Echolalia

Repeating words or phrases spoken by someone else, either immediately or after a delay. It can occur in autism, developmental conditions, brain disorders, or some psychiatric illnesses; other symptoms vary.

Echophenomena

Automatic, non-purposeful imitation or repetition of actions, words, or sounds observed in others without explicit awareness or intent. Subtypes include echolalia (vocal repetition) and echopraxia (imitation of movements), commonly observed in Tourette syndrome, catatonia, and certain neurodevelopmental or neurodegenerative disorders.

Echopraxia

Involuntary imitation or repetition of another person's movements. It may occur in some neurologic, developmental, or psychiatric conditions and is interpreted with other symptoms.

Echovirus

A group of enteroviruses spread mainly by the fecal-oral route and sometimes by respiratory secretions. Infection is often mild or silent but can cause rash, respiratory illness, meningitis, encephalitis, heart inflammation, or severe newborn infection.

E-Cigarettes And E-Hookahs

Electronic devices that heat a liquid to produce an inhaled aerosol. Many contain nicotine, which can cause dependence; the aerosol may contain irritants and toxic substances and is not harmless water vapor.

Eclampsia

New-onset seizures during pregnancy or after delivery that are not explained by another cause and are usually associated with preeclampsia. It can cause maternal brain injury, stroke, aspiration, or fetal compromise and is a life-threatening obstetric emergency.

Eclampsia in Pregnancy

Alternate name; see *Eclampsia*.

ECMO

Alternate name; see *Extracorporeal Membrane Oxygenation*.

ECOG Performance Status

A scale from 0 to 5 describing how much a person's illness limits daily activity. It is used to estimate prognosis and decide whether someone may tolerate certain cancer treatments; 0 means fully active and 5 means death.

E. Coli

A group of bacteria commonly found in the intestines of people and animals. Most are harmless, but some strains cause diarrhea, urinary infection, or serious illness such as bloodstream infection or kidney injury.

E Coli Enteritis

Infection and inflammation of the intestine caused by disease-producing strains of Escherichia coli. It may cause watery or bloody diarrhea, cramps, vomiting, and dehydration; some strains can injure the kidneys.

E Coli Infection

Infection caused by Escherichia coli bacteria. Depending on the strain and site, it may cause diarrhea, urinary infection, wound or abdominal infection, newborn meningitis, or bloodstream infection; some strains cause kidney injury.

E. coli Infection

Alternate spelling; see *E Coli Infection*.

E. Coli O157:H7

A Shiga toxin-producing strain of Escherichia coli that can cause severe abdominal cramps and bloody diarrhea. In some people, especially young children, infection leads to hemolytic uremic syndrome, a serious complication that can cause kidney failure.

Econazole

A topical antifungal that damages the fungal cell membrane and treats ringworm, athlete's foot, jock itch, and some yeast skin infections. It may cause local irritation, burning, itching, or allergic contact dermatitis.

Economy Class Syndrome

Informal term for venous thromboembolism associated with prolonged sitting during travel, especially deep-vein thrombosis and sometimes pulmonary embolism. It can occur during any long journey, not only air travel.

Ecstasy

A street name for MDMA, an illegal stimulant and hallucinogenic drug. It can cause overheating, dehydration or dangerously low sodium, fast heartbeat, seizures, confusion, liver injury, and death.

Ectasia

Abnormal widening of a blood vessel, duct, tube, or organ. Its importance depends on the structure involved; it may cause pressure, poor flow, bleeding, blockage, or rupture.

Ecthyma

A bacterial skin infection that extends deeper than a superficial sore and causes painful, punched-out ulcers covered by thick crusts. It commonly affects

the legs and may need wound care and antibiotic treatment.

Ecthyma Gangrenosum

A serious skin infection causing rapidly developing dark or black ulcers from tissue death, often due to Pseudomonas bloodstream infection. It occurs mainly in people with severely weakened immunity or very low white-cell counts.

Ectoderm

The outer layer of cells in an early embryo. It develops into the skin, hair, nails, nervous system, eyes, ears, and other sense-related structures.

Ectodermal Dysplasia

A group of inherited disorders affecting tissues such as hair, teeth, nails, skin, and sweat glands. Features may include sparse hair, abnormal teeth, reduced sweating, overheating, dry skin, and repeated infections.

Ectodermal Dysplasias

Plural form; see *Ectodermal Dysplasia*.

Ectodermosis Erosiva Pluriorificialis

Historical name; see *Stevens-Johnson Syndrome*.

Ectomesenchymoma

A rare cancer containing both nerve-related and connective-tissue parts, usually occurring in children. It may appear as a growing mass or cause pain; diagnosis uses tissue examination.

Ectoparasite

A parasite that lives on the outer surface of a host, such as a louse, flea, tick, or mite. It may cause itching, bites, skin disease, anemia, or transmission of infections.

Ectopia Cordis

A rare birth defect in which the heart lies partly or completely outside the chest because the chest wall did not form normally. It is usually life-threatening and associated with major structural abnormalities.

Ectopia Lentis

Displacement of the eye's natural lens from its normal position. Injury or inherited connective-tissue disorders may cause it, leading to blurred or double vision, unequal focusing, or increased eye pressure.

Ectopic

Located or occurring in an abnormal position. For example, an ectopic pregnancy implants outside the main cavity of the uterus, most often in a fallopian tube.

Ectopic ACTH Syndrome

Excess cortisol production caused by a tumor outside the pituitary making adrenocorticotropic hormone (ACTH). It can cause weight gain, muscle weakness, high blood pressure, diabetes, low potassium, infections, and other features of cortisol excess.

Ectopic Beat

An extra or early heartbeat that starts outside the heart's usual pacemaker. It may feel like a skipped beat, flutter, or thump and can occur in healthy people or with heart disease.

Ectopic Cushing Syndrome

Excess cortisol caused by a tumor outside the pituitary producing ACTH or, rarely, a related hormone. It may cause high blood pressure, diabetes, low potassium, muscle weakness, infections, and rapid physical changes.

Ectopic Heartbeat

Alternate name; see *Ectopic Beat*.

Ectopic Heartbeats

Plural form; see *Ectopic Beat*.

Ectopic Kidney

A kidney located somewhere other than its usual position in the upper back of the abdomen. It may work normally or be associated with abnormal drainage, urine reflux, stones, or infection.

Ectopic Pacemaker

A site outside the sinoatrial node that can initiate a heartbeat. Normally, subsidiary pacemakers can take over if the sinus node fails; an abnormal ectopic focus may produce premature beats or tachycardia.

Alternate Names:
Ectopic Focus

Ectopic Pregnancy

A pregnancy complication in which a fertilized egg implants and begins to grow outside the main cavity of the uterus, most commonly in one of the fallopian tubes. Because structures outside the uterus cannot stretch to accommodate a growing pregnancy, the expanding tissue risks rupturing the fallopian tube, causing severe internal bleeding, sharp abdominal or pelvic pain, dizziness, and fainting. An ectopic pregnancy cannot develop normally into a live birth and requires prompt medical attention.

Alternate Names:
Extrauterine Gestation; Tubal Pregnancy

Ectopic Thyroid

Thyroid tissue located outside its usual position in the lower front of the neck, most often at the base of the tongue. It may be the only functioning thyroid tissue and can cause swallowing, voice, or breathing problems.

Ectopic Thyroid Tissue

Alternate name; see *Ectopic Thyroid*.

Ectopic Tissue

Tissue found outside its usual anatomical location because it developed there, did not move to its usual site during growth, or became implanted there. Examples include thyroid tissue at the base of the tongue and endometrial-like tissue outside the uterus. It may function normally or cause local pain, bleeding, or blockage.

Ectopic Ureter

A ureter that does not enter the bladder in its normal position. It may drain into the urethra, vagina, or another abnormal site and can cause urine leakage, infection, blockage, or kidney damage.

Ectopion

A general term for outward turning of a body structure. In eyelid ectropion, the lid turns away from the eye; in cervical ectropion, glandular cells from the cervical canal are present on the outer surface of the cervix. These are distinct findings.

Ectrodactyly

A birth difference in which one or more central fingers or toes are missing, leaving a deep cleft in the hand or foot. It may occur alone or with other limb or genetic differences and can affect function.

Ectromelia

A birth defect in which one or more limbs are absent or severely underdeveloped. In laboratory medicine, the same word names a mouse poxvirus infection; these are separate uses and should not be confused.

Ectropion

Outward turning of an eyelid, usually the lower lid, so the eye may not close or drain tears normally. It can cause tearing, dryness, irritation, and corneal injury; aging, weakness, scarring, or paralysis may contribute.

Ectropion (Drooping Eyelids)

Misleading label: drooping of the upper eyelid is ptosis, whereas ectropion is outward turning of the eyelid. See *Ptosis*.

Eculizumab

An antibody medicine that blocks part of the immune system called complement. It treats selected blood, kidney, and nerve disorders but greatly increases the risk of meningococcal and other serious infections, so vaccination and monitoring are essential.

Eczema

An umbrella term for inflammatory skin conditions that commonly cause itchy, dry, red, or scaly skin. Some forms also cause blisters, oozing, or cracks. Atopic dermatitis and contact dermatitis are common types; eczema is not contagious.

Eczema Herpeticum

A rapidly spreading herpes simplex infection in skin affected by eczema or another barrier disorder. It causes many similar painful blisters or punched-out sores, often with fever, and can affect the eyes or other organs.

Eczematous Dermatitis

A pattern of inflammatory skin disease characterized by itching, redness, scaling, dryness, oozing, or vesicles. Causes include atopic, allergic contact, irritant contact, and other forms of dermatitis.

ED

Erectile dysfunction, difficulty getting or keeping an erection sufficient for sexual activity. It may reflect blood-vessel, nerve, hormone, medicine, psychological, or relationship factors and can signal broader health problems.

Alternate Names:
Erectile Dysfunction; Impotence

Edema

Swelling caused by extra fluid in body tissues. It may leave a dent when pressed or feel firm. Common causes include heart, kidney, or liver disease, poor vein drainage, blocked lymph flow, and some medicines.

Edema Trunk

Abnormal accumulation of fluid in the soft tissues of the chest or abdomen, producing swelling from heart, kidney, liver, lymphatic, venous, inflammatory, or medication-related causes.

Edentulism

Complete or partial absence of natural teeth. It can impair mastication, speech, nutrition, facial support, and quality of life and may be managed with removable, fixed, or implant-supported prostheses.

Edentulous

Having some or all natural teeth missing. Tooth loss may result from decay, gum disease, injury, extraction, or a developmental condition and can affect chewing, speech, nutrition, jawbone support, and appearance; dentures or implants may restore function.

Edentulousness

Alternate name; see *Edentulism*.

Edetic Acid

Alternate name; see *EDTA*.

EDMD

Abbreviation; see *Emery-Dreifuss Muscular Dystrophy*.

E-D Syndrome

Alternate name; see *Ehlers-Danlos Syndrome*.

EDTA

Ethylenediaminetetraacetic acid, a chemical that binds metal ions and is used in laboratory testing and some medicines. Calcium disodium edetate is used under specialist supervision to treat lead poisoning; other EDTA salts are not interchangeable and can cause serious harm.

Edwardsiella

A group of bacteria associated with water and animals. Some species, especially E. tarda, can rarely cause diarrhea, wound infection, bloodstream infection, or other illness in people.

Edwardsiella Tarda

A bacterium found in fish, reptiles, and water that can rarely infect people. It may cause diarrhea, wound infection, gallbladder or abdominal infection, or bloodstream infection.

Edward's Syndrome

Alternate spelling; see *Edwards Syndrome*.

Alternate Names:
Trisomy 18; Trisomy E

Edwards Syndrome

A chromosome condition caused by an extra chromosome 18 in some or all cells. It commonly causes

poor growth, developmental impairment, feeding difficulty, heart defects, and other birth abnormalities; medical needs and survival vary widely.

Edwards Syndrome (Trisomy 18)

Alternate name; see *Edwards Syndrome*.

EEG

A test that records the brain's electrical activity through sensors placed on the scalp. It helps evaluate seizures, unexplained episodes, altered awareness, certain sleep disorders, and some brain illnesses.

Alternate Names:
Electroencephalogram

EFAST Examination

A rapid bedside ultrasound used after serious injury to look for internal bleeding, fluid around the heart, and air or blood around the lungs. A normal scan does not exclude every internal injury, so repeat assessment or CT may be needed.

Efavirenz

An antiretroviral medicine that blocks HIV reverse transcriptase and is used in combination treatment for HIV infection. It can cause vivid dreams, dizziness, mood or nervous-system effects, rash, and important medicine interactions.

Effacement

Thinning and shortening of the cervix during labor, measured as a percentage from 0 to 100. Effacement helps the cervix open and usually occurs along with dilation as contractions progress.

Effective Dose

An estimate that combines radiation exposure to different organs into one number. It helps compare the approximate risk of imaging procedures but cannot predict an individual person's exact risk.

Effective Half-Life

The time needed for the amount of a radioactive substance in the body or a tissue to fall by half through both natural decay and removal by the body. It helps estimate how long radiation exposure lasts.

Effectiveness

How well a treatment, test, or public-health intervention achieves its intended result in usual real-world practice. It differs from efficacy, which describes performance under ideal, controlled study conditions.

Effective Reproduction Number

The average number of people one infected person infects at a particular time, taking account of immunity, behavior, and control measures. Continued spread generally occurs when the number is above 1.

Alternate Names:
Rt

Effector

A cell, molecule, organ, or mechanism that carries out a response after receiving a signal. For example, an immune cell may destroy an infected cell after activation.

Efferent

Carrying signals away from a central structure. In the nervous system, efferent pathways carry movement or automatic-control signals from the brain or spinal cord to muscles, glands, or organs.

Efferent Arteriole

The small blood vessel that carries blood away from the kidney's filtering unit. It helps control pressure in the filter and leads to the small vessels around the kidney tubules.

Efferent Ductules

A series of 10 to 20 delicate, ciliated convoluted tubules that penetrate the tunica albuginea of the testis to transport spermatozoa from the rete testis into the head (caput) of the epididymis, reabsorbing the majority of testicular luminal fluid.

Alternate Names:

Ductuli Efferentes

Efferent Lymphatic Vessel

A lymphatic vessel that carries lymph out of a lymph node.

Efferent Nerve

A nerve pathway carrying signals away from the brain or spinal cord to muscles, glands, or organs. Damage can cause weakness, impaired automatic function, or loss of control in the affected area.

Efferent Neuron

A nerve cell that carries movement or automatic-control signals from the brain or spinal cord to muscles, glands, or organs. Damage can cause weakness or impaired control of body functions.

Efferent Pathway

A nerve route carrying signals away from the brain or spinal cord to muscles, glands, or organs. It controls movement and automatic functions such as heart rate, digestion, sweating, and bladder activity.

Effervescent Tablets

Tablets dissolved in water before use, releasing bubbles as they form a drinkable solution. Some contain substantial sodium or other ingredients that may affect people with heart, kidney, or blood-pressure conditions.

Efficacy

How well a treatment produces its intended result under ideal, carefully controlled study conditions. It differs from effectiveness, which describes how well the treatment works in ordinary clinical practice.

Effort Angina

A classic presentation of stable ischemic heart disease characterized by substernal chest discomfort, tightness, or pressure predictably provoked by physical exertion, emotional stress, or cold exposure, and consistently relieved within minutes by rest or sublingual nitroglycerin.

Alternate Names:

Classic Angina; Exertional Angina

Effort Syncope

Transient loss of consciousness occurring abruptly during or immediately following physical exertion, serving as a cardinal red-flag symptom of severe cardiac outflow obstruction (such as critical aortic stenosis or hypertrophic obstructive cardiomyopathy) or exertion-induced ventricular arrhythmia.

Effusion

Abnormal buildup of fluid in a body space, such as around a joint, lung, or heart. It may cause swelling, pain, stiffness, or breathing difficulty; the cause may be injury, infection, inflammation, heart failure, or cancer.

Effusive-Constrictive Pericarditis

A form of pericardial disease in which fluid around the heart coexists with constrictive physiology. Signs that the heart remains restricted after the fluid is drained support the diagnosis.

EGD

An examination of the esophagus, stomach, and duodenum using a flexible camera passed through the mouth. It can investigate pain, swallowing problems, bleeding, or anemia and can obtain samples or treat selected lesions.

EGFR

A protein on the cell surface that receives growth signals. Changes that overactivate EGFR can help some cancers grow; testing the tumor may guide use of treatments that block this pathway.

EGFR Inhibition

Cancer treatment that blocks growth signals sent through the epidermal growth factor receptor. It may slow selected colorectal, lung, or head-and-neck cancers when the tumor has suitable features; rash, diarrhea, and other effects may occur.

Egg

A nutrient-rich food containing protein, fat, vita-

mins, and minerals, but also a common allergen. Raw or undercooked eggs can transmit Salmonella; allergy and dietary needs vary.

Egg Allergy

An immune reaction to egg proteins that may cause hives, swelling, vomiting, stomach pain, wheezing, or anaphylaxis. It is more common in children; reactions vary in severity.

Alternate Names:
Egg Hypersensitivity; Hen's Egg Allergy

Egg-Cell

A mature female reproductive cell, also called an oocyte, that can unite with sperm during fertilization. It contains half the usual genetic material and can develop into an embryo after fertilization.

Eggerthella

A group of bacteria that can live in the human intestine without causing disease. Rarely, especially in people with serious illness, they can cause bloodstream infection, abscesses, or other opportunistic infections.

Egg Shell

The hard calcium-containing outer covering of an egg. In medical imaging, "eggshell calcification" describes a thin rim of calcium around a lesion or lymph node.

Eggshell Nail

A nail that becomes unusually thin, soft, flexible, and sometimes pale or concave. Possible causes include nutritional deficiency, chronic illness, aging, or repeated trauma.

Egophony

A change in voice sounds heard through a stethoscope in which a spoken "E" sounds like an "A." It may occur when lung tissue becomes dense or filled with fluid, such as in pneumonia.

EHBA

Abbreviation for extrahepatic biliary atresia, a serious infant disorder in which the bile ducts outside the liver are absent, scarred, or blocked, causing persistent jaundice and progressive liver injury.

Ehlers-Danlos Syndrome

A group of inherited connective-tissue disorders that can cause unusually flexible joints, stretchy or fragile skin, easy bruising, and poor wound healing. Some types also weaken blood vessels or internal organs.

Alternate Names:
EDS

EHR

Electronic health record: a digital collection of a person's health information, such as diagnoses, medicines, allergies, test results, and clinical notes, that can be shared among authorized healthcare professionals.

Ehrlichia

A group of bacteria spread mainly by ticks that infect certain white blood cells and cause ehrlichiosis. Infection may produce fever, headache, muscle aches, low blood counts, and serious illness if untreated.

Ehrlichia And Anaplasma

Tick-borne bacteria that infect white blood cells. They can cause fever, headache, muscle aches, weakness, low blood counts, and abnormal liver tests; severe disease is more likely in older or immunocompromised people.

Ehrlichiosis

A tick-borne infection caused by Ehrlichia bacteria. It commonly causes fever, headache, muscle aches, weakness, low white-cell or platelet counts, and raised liver enzymes; untreated infection can damage the brain, lungs, or other organs.

Ehrlichiosis And Anaplasmosis

Tick-borne bacterial infections that may cause fever, headache, muscle aches, weakness, low blood counts, and abnormal liver tests. Prompt medical assessment and appropriate antibiotics reduce the risk of severe complications.

Eicosanoid

A signaling substance made from certain fats that helps regulate inflammation, blood-vessel width, platelet activity, pain, and muscle contraction. Prostaglandins, leukotrienes, and thromboxanes are examples.

Eicosanoid Degradation

Breakdown and inactivation of eicosanoids, the body's short-lived fatty-acid signals. This limits how long and how strongly they affect inflammation, blood vessels, platelets, airways, and other muscles.

Eicosanoid Metabolism

The body's production, modification, and breakdown of prostaglandins, leukotrienes, thromboxanes, and related fatty-acid signals that influence inflammation, blood vessels, platelets, pain, and airway function.

Eicosanoid Receptor

A protein on or inside a cell that responds to prostaglandins, leukotrienes, thromboxanes, or related lipid signals. Activation can change inflammation, blood-vessel tone, platelet activity, pain, or smooth-muscle contraction.

Eicosapentaenoic Acid

The omega-3 fat EPA, found in oily fish and some supplements. It forms part of cell membranes and can be changed into signaling substances involved in inflammation and blood clotting.

Eicosatetraenoic Acid

A 20-carbon fatty acid with four double bonds. Arachidonic acid is the best-known form and is used by cells to make prostaglandins, leukotrienes, thromboxanes, and other signaling substances.

Eighth Cranial Nerve

The vestibulocochlear nerve, which carries hearing and balance signals from the inner ear to the brain. Its cochlear division carries hearing information, while its vestibular division carries balance information. Damage can affect hearing, balance, or both.

Alternate Names:
Vestibulocochlear Nerve; Auditory Nerve

Eikenella

A group of bacteria found in the mouth. Some species can cause deep wound, bone, joint, or bloodstream infection, especially after human bites or injuries involving a person's teeth.

Eikenella Corrodens

A slow-growing bacterium normally found in the mouth that can cause infection after human bites or clenched-fist injuries. It may produce abscesses, bone or joint infection, or rarely bloodstream infection.

Eisenmenger Complex

Alternate form; see *Eisenmenger Syndrome*.

Eisenmenger's Syndrome

Alternate form; see *Eisenmenger Syndrome*.

Eisenmenger Syndrome

A serious heart condition that develops when a congenital heart defect (such as a large hole between the heart chambers) is left uncorrected. Over time, high blood flow through the lungs causes permanent scarring and high blood pressure in the pulmonary arteries. Eventually, the direction of blood flow across the defect reverses, causing oxygen-poor blood to be pumped out to the body. This leads to chronic cyanosis (a bluish tint to the skin and lips), fatigue, shortness of breath, and clubbing of the fingers.

Alternate Names:
Eisenmenger Complex; Eisenmenger's Syndrome

Ejaculation

The release of semen through the penis, usually during sexual climax. It involves coordinated contractions of reproductive ducts, glands, pelvic muscles, and nerves; pain, blood, or major changes may occur with disorders of the reproductive or urinary tract.

Ejaculatory Duct

One of paired muscular conduits of the male reproductive system formed by the confluence of the ampulla of the vas deferens and the duct of the seminal vesicle near the base of the prostate gland. Measuring approximately 2 cm in length, each ejaculatory duct traverses anteroinferiorly through the substance of the prostate gland and terminates within the prostatic urethra at the verumontanum (seminal colliculus) flanking the prostatic utricle. During emission and ejaculation, coordinated sympathetic contraction delivers spermatozoa and fructose-rich seminal fluid into the urethral lumen; congenital or acquired obstruction of the ducts precipitates obstructive azoospermia, male subfertility, and painful ejaculation, treatable by transurethral resection of the ejaculatory ducts (TURED).

Ejaculatory Ducts

Plural form; see *Ejaculatory Duct*.

Ejaculatory Dysfunction

Difficulty ejaculating, such as delayed ejaculation, absent ejaculation, painful ejaculation, or ejaculation into the bladder instead of out through the penis. Causes include medicines, nerve or pelvic disorders, diabetes, prostate procedures, and psychological factors.

Ejection Click

A sharp heart sound heard just after the heart begins to contract, caused by opening of an abnormal aortic or pulmonary valve. It may occur with a bicuspid valve or valve narrowing and is assessed with other findings.

Ejection Fraction

The percentage of blood pumped out of a heart chamber with each beat. It is used to describe the heart's pumping strength, but a normal value does not rule out heart failure.

Ejection Murmur

A midsystolic crescendo-decrescendo heart murmur that begins shortly after the first heart sound (S1), peaks in midsystole, and ends before the second heart sound (S2), produced by turbulent blood flow across an obstructed or narrowed ventricular outflow tract or semilunar valve, as seen in aortic stenosis and pulmonic stenosis.

Alternate Names:
Systolic Ejection Murmur; Midsystolic Murmur

EKG

Alternate abbreviation; see *Electrocardiogram*.

Ekman-Lobstein Disease

Alternate name; see *Osteogenesis Imperfecta*.

Elastance

A physical and physiological measure of the stiffness and tendency of a hollow organ or vascular structure to recoil toward its original resting dimensions after being distended by pressure, defined mathematically as the change in pressure divided by the change in volume (the inverse of compliance).

Elastic Cartilage

Flexible supporting tissue containing many elastic fibers. It helps structures such as the outer ear, epiglottis, and pressure-equalizing ear tube keep their shape while bending.

Elastic Fiber

A thin connective-tissue fiber that allows skin, lungs, blood vessels, and other structures to stretch and recoil. Damage or loss of elastic fibers can reduce flexibility or weaken tissues.

Elasticity

The ability of a tissue or material to return toward its original shape after stretching or compression. It contributes to the function of skin, lungs, blood vessels, muscles, and ligaments.

Elastics

Elastic bands used in medical or dental care, such as orthodontic bands, compression supports, wound devices, or surgical ties. Their purpose and safe use depend on the specific treatment.

Elastic Skin

Unusually stretchable skin, also called skin hyperextensibility. It can occur in connective-tissue disorders such as some Ehlers-Danlos syndromes, but is not itself a diagnosis of Ehlers-Danlos syndrome.

Elastic Tissue

Connective tissue containing fibers that let structures stretch and return toward their original shape. It helps arteries pulse, lungs expand, skin recoil, and some ligaments support movement.

Elastin

A flexible protein in connective tissue that lets skin, lungs, blood vessels, and other structures stretch and recoil. Aging, inflammation, and chronic sun exposure can damage elastin.

Elastofibroma

A harmless, slowly growing mass made of fatty and elastic tissue, most often beneath the lower shoulder blade in older adults. It may cause swelling or movement-related discomfort but often needs no treatment.

Elastography

An imaging method that estimates how stiff tissue is. It is commonly used to assess liver scarring and may help evaluate breast, thyroid, prostate, or other abnormal areas without tissue removal.

Elastomer

A flexible rubber-like material that can stretch and return toward its original shape. It is used in some medical tubing, seals, gloves, devices, and implants; biocompatibility depends on the material.

Elastosis

Abnormal buildup, breakdown, or alteration of elastic fibers in tissue. It is commonly associated with long-term sun exposure and can occur in some degenerative, inherited, or lung disorders.

Elastosis Perforans Serpiginosa

A rare perforating dermatosis characterized by transepidermal elimination of abnormal elastic fibers, presenting clinically as small, keratotic, umbilicated papules arranged in a serpiginous or annular configuration on the neck, face, or upper extremities, often associated with systemic disorders such as Down syndrome, Ehlers-Danlos syndrome, and pseudoxanthoma elasticum.

Alternate Names:
Lutz Disease

Elbow

The joint connecting the upper arm and forearm, formed by the humerus, radius, and ulna. It allows bending and straightening and works with nearby joints to rotate the forearm.

Elbow Dislocation

Displacement of the radius and ulna from their normal alignment with the humerus, usually after a fall or forceful injury. It causes severe pain, deformity, and loss of motion and may involve nerve, blood-vessel, or bone injury.

Elbow Extensor

A muscle that straightens the elbow, mainly the triceps and anconeus. These muscles help push, reach, lift, throw, and control lowering of the arm.

Elbow Flexors

Muscles that bend the elbow, mainly the biceps, brachialis, and brachioradialis. They help lift the forearm and turn the palm upward; injury, pain, nerve problems, or tendon damage can weaken movement.

Elbow Joint

A joint complex between the humerus, radius, and ulna that allows the arm to bend and straighten and the forearm to rotate. Cartilage, ligaments, muscles, and fluid-filled coverings provide stability and movement.

Elbow Pain

Pain in or around the elbow caused by tendon injury, arthritis, bursitis, nerve pressure, fracture, instability, infection, or referred pain from the neck or

shoulder. Swelling, deformity, weakness, or injury may accompany serious causes.

Alternate Names:
Elbow Arthralgia; Cubital Pain

Elbow (Radial Head or Neck) Fracture

A break in the radial head or neck, the upper end of the radius at the elbow, usually after a fall onto the hand or a direct blow. It can cause pain, swelling, tenderness, and difficulty bending, straightening, or rotating the forearm. Assessment may include X-rays; treatment depends on the fracture and any associated injury, and stable fractures often benefit from early, gentle movement to reduce stiffness.

Alternate Names:
Radial Head or Neck Fracture; Radial Head/Neck Fracture; Radial Neck Fracture

Elbow Replacement

Surgery that removes damaged parts of the elbow and replaces them with artificial components to relieve pain and improve movement. It may be used for severe arthritis or injury; infection, loosening, and nerve or bone problems can occur.

Elder Abuse

An intentional act or failure to provide care that harms an older person. It includes physical, emotional, sexual, or financial abuse and neglect; recognition and safeguarding are shaped by local law.

Elective

Planned in advance rather than performed immediately for an emergency. An elective procedure may still be medically necessary; its timing follows assessment of benefits, risks, alternatives, and the person's preferences.

Elective Abortion

A planned ending of a pregnancy using medicines or a procedure, usually before an immediate medical emergency develops. The method depends on pregnancy duration, health, personal choice, and local clinical and legal requirements.

Elective Surgery

Surgery scheduled in advance because it is not needed immediately to prevent serious harm. It may still be important or medically necessary, and timing follows discussion of benefits, risks, alternatives, and preferences.

Electrical Alternans

A beat-to-beat change in the size or direction of ECG complexes. It can occur when the heart moves within a large fluid collection around it and may indicate cardiac tamponade, an emergency.

Electrical Cardioversion

A controlled electrical shock delivered at a specific point in the heartbeat to restore a normal rhythm, often for atrial fibrillation or flutter. Sedation, clot risk, heart stability, and follow-up treatment must be considered.

Electrical Conductance

The ability of a material or tissue to carry electrical current. It depends on how easily charged particles move and is important in nerve, muscle, heart, and medical-device measurements.

Electrical Injury

Damage caused by electrical current passing through the body. Severity depends on voltage, current, duration, pathway, and skin resistance; effects may include burns, heart-rhythm problems, muscle breakdown, nerve injury, falls, or breathing failure.

Electrical Stimulation

Use of controlled electrical currents to activate nerves or muscles. It may help selected pain, weakness, movement, or rehabilitation problems; benefits and risks depend on the device, body site, and underlying condition.

Electrical Storm

Recurrent sustained ventricular tachycardia or ventricular fibrillation, commonly defined as at least three episodes requiring intervention within 24 hours, including appropriate implantable cardioverter-defibrillator therapies. It is a pattern

of acute cardiac electrical instability.

Alternate Names:
VT/VF Storm; Arrhythmic Storm

Electrical Synapse

A direct connection between cells through tiny channels that let charged particles and electrical signals pass rapidly from one cell to another. It helps coordinate some brain, heart, and other tissue activity.

Electric Axis of the Heart

The net average direction and magnitude of the electrical electromotive forces traveling through the ventricular myocardium during ventricular depolarization, represented on the frontal plane electrocardiogram and normally oriented between -30 degrees and +90 degrees.

Alternate Names:
Mean QRS Axis

Electric Impedance

The opposition a material or tissue offers to alternating electrical current, measured in ohms. Medical devices use impedance changes to assess body composition, monitor signals, or detect contact and function.

Electric Shock

Injury caused when electrical current passes through the body. It can cause burns, muscle damage, falls, abnormal heart rhythms, breathing failure, nerve injury, or internal damage even when skin burns are small.

Electrocardiogram

A test that records the heart's electrical activity through skin electrodes. It helps assess heart rate and rhythm and can show conduction problems or patterns associated with heart disease, a heart attack, or medicine and electrolyte effects.

Alternate Names:
ECG; EKG

Electrocardiographic Gating

An imaging synchronization technique used in cardiac computed tomography, magnetic resonance imaging, and nuclear cardiology that synchronizes image acquisition with specific phases of the patient's cardiac cycle (prospective or retrospective gating) to eliminate cardiac motion artifacts.

Alternate Names:
ECG Gating

Electrocardiography

The process of recording the heart's electrical activity through skin electrodes, usually as a 12-lead ECG. It assesses rate, rhythm, conduction, chamber strain, reduced blood flow, prior injury, and some medicine or electrolyte effects.

Electrocauterization

The use of a heated instrument to destroy tissue or control bleeding. Electricity heats the instrument, but current does not pass through the patient's tissue; this distinguishes electrocauterization from electrosurgery.

Electrocautery

A technique that applies heat from an electrically heated instrument to tissue, usually to destroy a small area or stop bleeding. The current heats the instrument rather than passing through the patient's tissue; the term is often loosely used for electrosurgery.

Electrocoagulation

Coagulation of tissue by heat generated when electrical current passes through it, generally as a mode of electrosurgery. It can seal small blood vessels and control bleeding; it describes a tissue effect rather than one specific instrument.

Electroconvulsive Therapy

A treatment that causes a brief controlled seizure while the person is under general anesthesia. It can rapidly treat severe depression, catatonia, or mania; temporary confusion and memory problems are common risks.

Electrocution

Serious injury or death caused by electrical current

passing through the body. It may produce burns, abnormal heart rhythms, muscle or nerve damage, breathing failure, falls, or hidden internal injury.

Electrode

A conductive contact that carries electrical signals or current to or from the body, a device, or a laboratory sample. Electrodes are used in tests such as ECG and EEG and in selected treatments.

Electrodessication

A procedure using electrical energy to dry and destroy selected superficial tissue or control bleeding. It may treat some skin lesions, often with scraping, and can cause pain, scarring, infection, or pigment change.

Electroencephalogram

A recording of brain electrical activity through scalp electrodes. It helps evaluate seizures, prolonged altered awareness, encephalopathy, selected sleep disorders, and some intensive-care conditions; a normal result does not exclude epilepsy.

Electroencephalography

The process of recording brain electrical activity with electrodes on the scalp. It can help identify abnormal patterns associated with seizures, sleep disorders, or diffuse brain dysfunction.

Electrogastrogram

A recording of the stomach's electrical activity, usually through electrodes on the abdominal skin. It measures stomach rhythm and is used mainly in specialist assessment of suspected motility disorders.

Electrolysis

Hair removal using electrical energy delivered through a fine probe into individual hair follicles. Repeated treatment may permanently reduce hair growth, but pain, irritation, pigment changes, scarring, or infection can occur.

Electrolyte

An essential mineral—such as sodium, potassium, calcium, magnesium, or chloride—that carries an electric charge when dissolved in body fluids like blood. Electrolytes are vital for transmitting nerve impulses, contracting muscles, maintaining proper fluid balance, and regulating the body's acid-base balance.

Alternate Names:
Electrolytes; Serum Electrolytes

Electrolyte Balance

Maintenance of appropriate levels of minerals such as sodium, potassium, calcium, magnesium, chloride, and phosphate in body fluids. The kidneys, hormones, intestines, and lungs regulate them; imbalance can affect nerves, muscles, heart rhythm, and hydration.

Electrolyte Disorders

Disorders involving abnormal concentrations or distribution of sodium, potassium, calcium, magnesium, chloride, phosphate, or bicarbonate in body fluids. They may result from kidney, endocrine, gastrointestinal, cardiac, or critical-illness conditions and can affect neuromuscular function, consciousness, and cardiac rhythm.

Electrolyte Imbalance

An abnormal level of minerals such as sodium, potassium, calcium, magnesium, chloride, or phosphate in the blood. It may cause weakness, cramps, confusion, seizures, or abnormal heart rhythms; causes include fluid loss, kidney disease, medicines, and hormone disorders.

Electrolyte Panel

A blood test measuring selected electrolytes, commonly sodium, potassium, chloride, and bicarbonate, and sometimes related minerals. It helps assess fluid balance, kidney function, acid-base disorders, and causes of weakness or confusion.

Electrolytes

Plural form; see *Electrolyte*.

Electromagnetic Navigation

Bronchoscopy

A computer-guided form of bronchoscopy that helps a flexible camera reach small areas near the outer lung. It can guide a biopsy of a lesion not visible with ordinary bronchoscopy, but bleeding, infection, or a collapsed lung can occur.

Electromechanical Dissociation

A cardiac arrest in which the monitor shows electrical activity but the heart does not pump enough blood to produce a pulse. Resuscitation and treatment of the underlying cause may restore circulation.

Alternate Names:
EMD; Pulseless Electrical Activity; PEA

Electromyography

A test (EMG) that records electrical activity in skeletal muscles at rest and during contraction, usually with a needle electrode. It helps assess muscle disorders and problems affecting the nerves that control muscles, including nerves near the spine and the connection between nerves and muscles. It is often done with nerve-conduction studies, which measure how signals travel along nerves.

Electron-Beam Computed Tomography

A rapid CT technique that uses an electronically steered X-ray beam to image the heart and measure calcium deposits in coronary arteries. It has largely been replaced by newer CT methods.

Alternate Names:
EBCT

Electronic Cigarette

A battery-powered device that heats liquid into an inhaled aerosol, often containing nicotine and other chemicals. It can cause dependence, airway irritation, lung injury, or poisoning from liquid nicotine and is not harmless.

Electronic Fetal Monitoring

Continuous or intermittent recording of the fetal heart rate and uterine contractions during pregnancy or labor. The heart-rate pattern provides an indirect measure of fetal well-being and can signal possible oxygen-related stress; it does not measure fetal oxygen directly.

Electron Microscope

A microscope that uses electrons rather than visible light to produce highly magnified images of cells, tissues, microorganisms, or materials.

Electron Transport Chain

A series of protein systems inside mitochondria that transfer energy from nutrients to oxygen and use it to make ATP, the cell's main energy source. Problems in this process can impair organs that need substantial energy, such as the brain and muscles.

Electronystagmography

A test that records eye movements with sensors around the eyes, often while the balance system is stimulated. It helps evaluate involuntary eye movements and inner-ear or balance-nerve disorders; video testing is now often preferred.

Electrophoresis

A laboratory method that separates charged molecules by how they move through a gel or liquid in an electric field. It can analyze proteins, hemoglobin, DNA, and other substances.

Electrophysiological Study

An invasive cardiac test in which catheters record and stimulate electrical activity inside the heart to diagnose arrhythmias and assess their origin and response to selected interventions.

Electrophysiologic Testing

Testing that records or deliberately stimulates the heart's electrical system, usually with catheters, to investigate abnormal rhythms and guide treatment. It is invasive and carries risks such as bleeding, infection, or rhythm disturbance.

Electrophysiology

The study of electrical activity in living cells and tissues. Clinical electrophysiology includes tests and treatments involving heart rhythm, nerves, muscles,

and the connections between them.

Electrophysiology Study

An invasive test in which thin electrode catheters are placed in the heart to map electrical pathways and trigger or measure abnormal rhythms. It can guide ablation or other treatment; bleeding, infection, and rhythm complications are possible.

Electroretinography

A test that records the retina's electrical response to flashes or patterned light. It helps evaluate inherited or acquired retinal disorders when examination and imaging do not fully explain visual loss.

Electrosurgery

Use of electrical energy during a procedure to cut tissue, destroy tissue, or control bleeding. Risks include burns, scarring, smoke exposure, unintended tissue injury, and interference with implanted electronic devices.

Electrosurgical Unit

A generator that delivers high-frequency electrical energy through an electrode to cut tissue or stop bleeding. Safe use requires attention to current pathways, burns, nearby structures, and possible interference with implanted electronic devices.

Elejalde Syndrome

A very rare autosomal-recessive neurocutaneous disorder characterized by silvery or gray hair, abnormal melanin distribution, and severe neurologic disease such as seizures, hypotonia, and developmental impairment. It requires specialist genetic and neurologic evaluation.

Element

A pure substance made of atoms with the same number of protons. Some elements, such as iron and iodine, are essential nutrients; others can be toxic, and health effects depend on dose and exposure.

Elephant Ear Poisoning

Irritation or poisoning after eating or handling elephant-ear or taro plants, which contain sharp calcium-oxalate crystals. It can cause intense burning and swelling of the mouth and throat and may obstruct breathing.

Elephantiasic Pretibial Myxedema

A rare, severe form of Graves dermopathy (pretibial myxedema) with marked lymphedema and multiple nodular, polypoid, or warty lesions, usually on the lower legs and feet. It can cause pronounced limb enlargement and may occur despite normal or low thyroid hormone levels.

Alternate Names:
Elephantiasic Pretibial Myxoedema

Elephantiasis

Severe, long-lasting swelling and thickening of skin, usually in a limb or the scrotum, caused by blocked lymph drainage. Lymphatic filariasis is one cause; other causes include repeated infection, surgery, cancer, or injury.

Elevated Blood Pressure

Blood pressure readings that are repeatedly above the healthy range. Persistent elevation increases the risk of heart disease, stroke, kidney disease, and blood-vessel problems, although a single high reading does not establish a diagnosis.

Elevated Hemidiaphragm

An imaging finding in which one side of the diaphragm sits higher than usual. Causes include reduced lung volume, nerve or muscle weakness, abdominal disease, or a normal variation; significance depends on symptoms and other findings.

Elevated Liver Enzymes

Abnormal blood levels of enzymes measured in liver tests, including ALT, AST, alkaline phosphatase, or GGT. ALT and AST elevations often reflect hepatocellular injury, while alkaline phosphatase and GGT may suggest cholestasis. AST and alkaline phosphatase can also rise from nonhepatic sources.

Elevation

Upward movement or position of a body part, such

as raising the arm, shoulder, jaw, or foot. The term can also describe raising an injured limb to reduce swelling.

Elevator

A surgical or dental instrument used to lift, separate, or loosen tissue, bone, or a tooth from nearby structures. The exact design and use depend on the procedure.

Eligible

Meeting the requirements for a treatment, clinical trial, screening program, benefit, or healthcare service. Eligibility does not guarantee that an intervention is appropriate or that it will be available.

Elimination

Removal of waste products or medicines from the body, mainly through the kidneys, liver, lungs, skin, or intestines. Reduced elimination can make a medicine remain longer in the body and increase its effects or toxicity.

Elimination Diets

Short-term eating plans that remove suspected foods and later reintroduce them in a planned way to identify food-related symptoms. They should be supervised when many foods are excluded or nutrition could be compromised.

Alternate Names:
Exclusion Diet; Diagnostic Elimination Diet

Elimination Disorders

A group of childhood-onset disorders involving inappropriate urination or defecation, including enuresis and encopresis. These disorders are diagnosed in a developmentally inappropriate context and are distinguished from incontinence caused by a known medical, neurologic, structural, infectious, or substance-related condition.

Elimination Half-Life

The time required for the amount of a medicine in the blood to fall by half. It helps guide dosing intervals and predicts accumulation and clearance; kidney or liver disease, age, and interactions can change it.

Elimination Patterns

The timing, frequency, amount, and appearance of urination and bowel movements. Changes can provide clues about hydration, kidney or bowel function, continence, infection, bleeding, or other illness.

ELISA Blood Test

A blood test that uses an enzyme-linked reaction to detect or measure an antibody, antigen, hormone, protein, or other substance. Results depend on the test design, timing, sample, and likelihood of disease before testing.

Elixir

A sweetened liquid preparation, historically sometimes containing alcohol, used to carry a medicine. The exact ingredients and strength determine its medical effects, interactions, and poisoning risk.

Elizabethkingia

A group of environmental bacteria that can rarely cause severe infection, especially in newborns, older adults, or people with weakened immunity. Illness may involve the blood, lungs, brain, or other organs.

Elliptocyte Count

The number or proportion of oval or elongated red blood cells on a blood smear. A high proportion can occur in hereditary elliptocytosis; elliptocytes may also appear in iron-deficiency anemia.

Elliptocytosis

A condition in which many red blood cells are oval or elongated rather than round. Inherited forms may cause red cells to break down early and produce anemia, while some people have no symptoms.

Alternate Names:
Ovalocytosis

Ellis-Van Creveld Syndrome

An inherited skeletal condition causing short limbs, extra fingers or toes, a narrow chest, and abnormal teeth or nails. Congenital heart disease is com-

mon and may affect breathing, growth, or physical function.

Ellsworth-Howard Test

A specialized test of how the kidneys respond to parathyroid hormone. It measures changes in urine after the hormone is given and may help distinguish pseudohypoparathyroidism from other causes of low parathyroid hormone effects.

Alternate Names:
PTH Responsiveness Test; Parathyroid Hormone Infusion Test

Elongin

A protein complex that helps RNA polymerase II continue copying genetic information into RNA. It contributes to gene regulation and cell function and is mainly a molecular-biology term.

Elotuzumab

An antibody medicine that helps the immune system recognize and attack myeloma cells. It is used with other medicines for selected multiple-myeloma patients and can cause infusion reactions, infection, fatigue, or low blood counts.

Eltrombopag

An oral medicine that stimulates the thrombopoietin receptor in bone marrow and increases platelet production. It is used for selected low-platelet conditions and can affect the liver, clotting risk, or blood counts.

Eltrombopag Olamine

The salt form of eltrombopag, an oral medicine that increases platelet production in selected blood disorders. Liver tests, blood counts, medicine interactions, and clotting risk may require monitoring.

Emaciation

Extreme loss of body weight, muscle, and fat caused by severe malnutrition, chronic disease, cancer, infection, or other illness. It can weaken immunity and function; causes and nutritional needs vary.

Embolectomy

Removal of a traveling blood clot or other blockage from a blood vessel with surgery or a catheter procedure to restore blood flow. It may be urgent when a limb or organ is threatened.

Alternate Names:
Arterial Embolectomy; Surgical Embolectomy

Emboli

Plural form of embolus; see *Embolus*.

Embolic Stroke

A stroke caused by a clot or other material traveling to and blocking an artery that supplies the brain. Emergency treatment may restore blood flow and limit permanent brain injury.

Alternate Names:
Brain Embolism Cerebral Embolism

Embolic Stroke of Undetermined Source
