A non-lacunar ischemic stroke detected on neuroimaging without proximal arterial stenosis exceeding 50 percent, a major cardioembolic source (such as atrial fibrillation), or other established specific cause despite comprehensive diagnostic evaluation.

Alternate Names:
ESUS

Embolism

Blockage of a blood vessel by material that traveled through the bloodstream from another site. The material is most often a clot but may be fat, air, infected material, or rarely tumor tissue.

Embolization

Deliberate blockage of a blood vessel or abnormal vessel connection using a catheter and materials such as coils, particles, or plugs. It can control bleeding, reduce tumor blood flow, or treat selected aneurysms and malformations.

Embolization Therapy

An image-guided procedure that blocks selected blood vessels with coils, particles, plugs, or other materials. It can control bleeding, reduce blood sup-

ply to a tumor, treat aneurysms, or close abnormal vessel connections.

Embolus

Material traveling through the bloodstream that may lodge in a smaller vessel and block it. It may be a blood clot, fat, air bubble, infected material, or rarely tumor tissue.

Embryo

A developing human from fertilization through the end of the eighth week after fertilization. From the ninth week until birth, the developing human is called a fetus.

Embryogenesis

The process by which an embryo develops after fertilization through cell division, movement, specialization, and formation of organs and body structures.

Embryo Grading

A visual assessment of an embryo created during in vitro fertilization, based on features such as cell number and appearance or, at the blastocyst stage, its expansion and the appearance of its inner cell mass and outer cell layer. The grade helps compare embryos, but it does not test chromosomes or guarantee implantation or pregnancy.

Embryology

The study of development from fertilization through the embryonic and fetal stages, including how organs and body structures form, grow, and become specialized.

Embryoma

A rare tumor made of primitive cells resembling early embryonic tissue. The term can refer to different tumor types, so diagnosis depends on the organ involved and microscopic examination.

Embryonal Carcinoma

An aggressive germ-cell tumor composed of primitive malignant cells, occurring in the testis, ovary, or other sites and often treated with chemotherapy and surgery.

Embryonal CNS Tumor

A highly cellular malignant pediatric CNS tumor with primitive or embryonal morphology. Diagnosis depends on integrated histologic and molecular classification, and treatment usually combines surgery, radiation when appropriate, and chemotherapy.

Embryonal Rhabdomyosarcoma

A malignant skeletal-muscle-lineage tumor that commonly affects young children and may arise in the head and neck, urinary tract, or reproductive tract.

Embryonal Tumors

Cancers that arise from cells resembling developing embryonic tissue, often occurring in children and commonly affecting the nervous system.

Embryo Neoplasm

A tumor arising from primitive cells resembling developing embryonic tissue, usually in a child. Diagnosis and treatment depend on the tissue of origin, microscopic and molecular features, location, and spread.

Embryonic

Relating to an embryo, the developing human or animal during the early period after fertilization. In humans, the embryonic period ends at about eight weeks after fertilization, followed by the fetal period.

Embryonic Cell

A cell of an early embryo capable of division and differentiation into specialized tissues; embryonic stem cells have broad developmental potential.

Embryonic Development

The biological process of cellular proliferation, organogenesis, and morphogenesis occurring from fertilization through the eighth gestational week; see *Embryogenesis*.

Embryonic Induction

A developmental process in which one group of embryonic cells signals nearby cells to develop into a particular tissue or structure.

Embryonic Mosaic

A developing embryo containing two or more groups of cells with different genetic makeups, produced by a change after fertilization. Effects depend on the cells involved and the proportion of each cell group.

Embryonic Stage

The early developmental period after fertilization during which the basic body plan and major organs begin to form. In human pregnancy it lasts through about eight weeks after fertilization.

Embryo Transfer

A fertility procedure in which one or more laboratory-grown embryos are placed into the uterus through a thin catheter. It may be done soon after fertilization or after freezing and thawing; implantation and pregnancy are not guaranteed.

Alternate Names:
ET; Intrauterine Embryo Transfer

Emergence Agitation

Temporary confusion, restlessness, fear, or inconsolable crying while waking from anesthesia. It is more common in children and usually resolves with reassurance and monitoring, but pain, low oxygen, or another complication must be excluded.

Emergency Airway Puncture

An emergency procedure that creates an airway through the neck when severe upper-airway blockage prevents breathing and a breathing tube cannot be placed. It is a temporary, high-risk lifesaving measure performed only by trained professionals.

Emergency Care

Immediate assessment and treatment for a serious or time-sensitive illness or injury. Clinicians first protect breathing, circulation, brain function, and control of bleeding, pain, or infection, then arrange continued treatment or transfer.

Emergency Code

A hospital alert that summons a designated response to an urgent event, such as cardiac arrest, fire, or security threat. The meaning of each code varies by institution.

Emergency Contraception

Birth control used after unprotected sex or contraceptive failure to reduce the chance of pregnancy. Options include an oral medicine or copper intrauterine device; effectiveness depends mainly on the method and how soon it is used.

Emergency Department

The hospital service that evaluates and treats sudden illness and injury. Staff prioritize people by seriousness, stabilize life-threatening problems, diagnose causes, provide initial treatment, and arrange discharge, admission, or transfer.

Emergency Medicine

The medical specialty for rapid assessment and initial treatment of sudden illness and injury at any age. It includes resuscitation, stabilization, diagnostic evaluation, urgent procedures, and coordination of disposition or transfer across emergency and hospital settings.

Alternate Names:
A&E Medicine

Emergency Procedures

Planned actions for responding safely to urgent events such as cardiac arrest, airway blockage, contamination, equipment failure, or radiation exposure while protecting patients, staff, and the public.

Emerging Infectious Disease

An infection that is newly recognized, has recently increased, or is spreading into a new population or region. Causes may include animal-to-human transmission, genetic change, travel, climate, or loss of effective control.

Emery-Dreifuss Muscular Dystrophy

A rare inherited muscle disease causing early tightness around the elbows, ankles, and neck followed by slowly progressive weakness. Heart conduction problems, abnormal rhythms, and cardiomyopathy may occur, so regular heart monitoring is essential.

Emesis

Forceful emptying of stomach contents through the mouth, commonly called vomiting. It may result from infection, medicines, poisoning, pregnancy, blockage, brain disease, or other illness and can cause dehydration.

Emetic

A pharmacological or chemical agent that stimulates vomiting (emesis) by acting either locally on gastric mucosal sensory receptors (e.g., syrup of ipecac) or centrally on the chemoreceptor trigger zone (CTZ) within the area postrema of the medulla oblongata via dopamine D_2, serotonin 5-HT_3, or neurokinin-1 (NK_1) receptors (e.g., apomorphine). Once widely utilized in initial toxicological management, the clinical use of emetics has been almost entirely abandoned in contemporary emergency medicine because emesis fails to reliably reduce toxin absorption, delays the administration of activated charcoal, and markedly increases the risks of aspiration pneumonia, esophageal rupture (Boerhaave syndrome), and chemical pneumonitis.

Alternate Names:
Emetics; Vomiting Inducer

Emetics

Plural form; see *Emetic*.

EMG

A test that records electrical activity in muscles, usually with nerve-conduction testing. It helps investigate weakness, numbness, nerve injury, trapped nerves, muscle disease, and disorders of the nerve-muscle connection.

Alternate Names:
Electromyography

Eminentia

An anatomical term for a raised or prominent part of a body structure. It may provide attachment for a muscle or ligament, form part of a joint, or serve as a landmark during examination or surgery.

Emission

The discharge or release of a substance, usually a fluid. In male reproduction, emission is the movement of semen into the urethra before ejaculation.

Emmenagogue

A substance traditionally claimed to start or increase menstrual bleeding. Evidence and safety vary, and some products can cause poisoning, miscarriage, or interactions; missed or abnormal periods can have many causes.

Emmetropia

The usual focusing state of the eye in which incoming parallel light focuses on the retina without extra effort. Nearsightedness, farsightedness, or astigmatism causes light to focus away from the retina.

Emodin

A plant chemical studied for laxative, anti-inflammatory, and anticancer effects. Evidence and safety are not established for routine treatment, and concentrated products may cause diarrhea, dehydration, or medicine interactions.

Emollient

A substance applied to skin to soften and moisturize it, reduce water loss, and strengthen the protective barrier. Emollients are commonly used for dry skin and eczema; greasy products can make floors or clothing slippery.

Emotion

A feeling state involving subjective experience, brain and body responses, behavior, and interpretation of events. Emotions are normal, but persistent or extreme changes may occur with mental or physical illness.

Emotional Adjustment

The process of adapting thoughts, feelings, and behavior to illness, loss, stress, or a major life change. Difficulty adjusting may cause persistent distress or impaired functioning and may benefit from support or treatment.

Emotional Blunting

A reduced capacity to experience and express subjective emotions, characterized by diminished feelings of joy, sadness, affection, or enthusiasm; commonly encountered in major depression, schizophrenia, or as a medication side effect.

Emotional Dependency

Reliance on another person for reassurance, self-worth, or emotional stability to a degree that limits independence or causes distress. It is not a diagnosis by itself and may reflect anxiety, low self-esteem, trauma, or relationship difficulties.

Emotional Disorders

Mental-health conditions involving persistent or severe changes in mood or emotional responses that cause distress or interfere with daily life, relationships, school, or work. Examples include depressive, anxiety, and trauma-related disorders.

Emotional Dysregulation

Impaired ability to modulate, manage, or tolerate emotional responses, leading to exaggerated mood fluctuations, emotional instability, or impulsive reactions out of proportion to situational triggers; see *Emotional Dysregulation Disorder*.

Emotional Dysregulation Disorder

A nonstandard term for persistent difficulty regulating emotional responses. Emotional dysregulation can occur in several mental-health and neurologic conditions, including borderline personality disorder, but is not itself a specific diagnosis.

Emotional Eating

Eating in response to stress, boredom, sadness, anger, or other feelings rather than mainly physical hunger. Occasional emotional eating is common, but frequent episodes can affect health and may benefit from behavioral or psychological support.

Emotional Lability

Rapid, exaggerated, and unpredictable shifts in mood or emotional expression (such as sudden unprovoked crying or laughing) out of proportion to the circumstances; see *Pseudobulbar Affect*.

Empathy

The ability to understand another person's feelings and point of view. It supports respectful communication and compassionate care but does not require agreeing with the person or experiencing the same feelings.

Emphysema

A type of chronic obstructive pulmonary disease in which air sacs are permanently damaged and enlarged, reducing air exchange. Smoking is a common cause; breathlessness, cough, and reduced exercise capacity may develop gradually.

Emphysematous Aortitis

A rare, life-threatening infection of the aortic wall that produces gas within the artery, usually caused by organisms such as *Clostridium septicum*. It may cause severe back or abdominal pain, sepsis, bleeding, or an abnormal connection with the intestine.

Emphysematous Cholecystitis

A severe gallbladder infection in which gas-forming bacteria produce gas in the gallbladder wall or cavity. It is more common in people with diabetes and can rapidly cause tissue death, perforation, or sepsis.

Emphysematous Gastritis

A rare, severe infection in which gas-forming germs invade the stomach wall. It can cause sudden abdominal pain, fever, bleeding, or sepsis and is a dangerous form of gas in the stomach wall, unlike some milder causes of gastric pneumatosis.

Emphysematous Hepatitis

A rare, life-threatening gas-forming infection of liver

tissue, usually caused by bacteria in people with diabetes or weakened immunity. It can cause fever, abdominal pain, sepsis, and liver failure.

Emphysematous Prostatitis

A rare, severe prostate infection in which gas-forming bacteria produce gas within prostate tissue. It may cause fever, pelvic or perineal pain, difficulty urinating, urinary retention, and sepsis.

Emphysematous Pyelonephritis

A severe kidney infection in which gas-forming bacteria destroy kidney tissue. It occurs mainly in people with diabetes and can cause fever, flank pain, shock, and sepsis; urgent drainage, antibiotics, and sometimes surgery are needed.

Empirical

Based on observation, measurement, or experience rather than theory alone. Empirical treatment begins before the exact cause is confirmed and is revised when test results or the clinical course provide more information.

Empirical Treatment

Treatment started on the basis of symptoms and likely causes before a diagnosis is confirmed. It may be revised when test results or the response to treatment becomes available.

Empiric Antibiotic Therapy

Starting an antibiotic before the exact germ and its medicine sensitivity are known. The first choice is based on the symptoms, likely source of infection, local resistance patterns, and the person's health; it may be changed when test results return.

Empiric Risk

An estimate of the probability of a specified outcome, calculated from observed rates in a defined population. The estimate applies to the outcome and population studied; it may not predict an individual's risk if that person differs in relevant ways.

Employee

A person who works for an employer under an agreement. In occupational health, assessment may consider workplace exposures, safety, physical or mental function, and ability to perform duties safely.

Empty Calories

A nontechnical term for foods or drinks that provide energy but little protein, fiber, vitamins, or minerals, such as many sugary drinks and highly processed snacks. Frequent intake can displace more nutritious foods.

Empty Can Test

A shoulder examination maneuver that assesses the supraspinatus muscle and tendon. With the arm raised in the scapular plane and the thumb pointing down, the examiner applies downward pressure as the person resists. Pain or weakness may suggest rotator-cuff disease but does not establish a diagnosis by itself.

Alternate Names:
Jobe Test; Supraspinatus Test

Empty Nose Syndrome

A poorly understood condition that can follow surgery on the nasal turbinates, the structures that warm and moisten air. The nose may feel blocked or too open despite a clear airway; dryness, crusting, and a reduced sense of airflow may also occur. Examination may not show a physical blockage.

Empty Sella Syndrome

A condition in which fluid presses the pituitary gland flat within its bony space. It is often found incidentally and causes no symptoms, but some people have headaches, vision problems, or reduced pituitary-hormone production.

Empyema

The presence of pus in a body cavity or hollow organ. In common clinical use, it most often refers to pleural empyema: pus in the space between the lung and chest wall, usually associated with pneumonia or another infection. Empyema can also occur in other spaces, including the gallbladder or subdural

space.

Empyema Necessitans

Alternate spelling; see *Empyema Necessitatis*.

Empyema Necessitatis

Spread of a pleural empyema through the parietal pleura and chest wall into nearby soft tissues, where it can form an abscess or draining sinus. It is an uncommon complication of pleural infection, classically associated with tuberculosis or actinomycosis, but other bacteria and fungi can also cause it.

Alternate Names:
Empyema Necessitans

EMR

Electronic medical record: a digital record of health information maintained within a particular healthcare organization or practice. It may include diagnoses, notes, medicines, allergies, test results, and treatment plans.

Emtricitabine

An antiretroviral medicine that blocks HIV reverse transcriptase and is used with other medicines to treat or prevent HIV infection. Kidney function and hepatitis B status are important because stopping it can worsen hepatitis B.

Emulsion

A mixture of two liquids that normally do not blend, such as oil and water, with one dispersed in the other. Emulsions are used in some medicines, nutrition products, cosmetics, and laboratory preparations.

Enalapril

A medicine that blocks formation of angiotensin II, relaxing blood vessels and reducing strain on the heart. It treats high blood pressure and heart failure but can cause cough, high potassium, kidney problems, or rarely facial swelling.

Enalaprilat

The active injectable form related to enalapril that blocks angiotensin II formation and lowers blood pressure. It is used in selected settings and can cause low blood pressure, high potassium, kidney problems, or facial swelling.

Enamel

The hard, mineral-rich outer covering of a tooth crown. It protects the sensitive inner tooth but cannot repair itself after major damage; acids and bacteria can cause erosion and decay.

Enamel Hypoplasia

Incomplete formation of tooth enamel while a tooth is developing, leaving it thin, grooved, pitted, or discolored. Affected teeth are more vulnerable to sensitivity, wear, and decay.

Enamel Organ

The developing tissue of a tooth that produces enamel and helps shape the crown. It is present during tooth formation and later contributes to the protective covering around the developing tooth.

Enamel Pearl

A small lump of enamel on a tooth root, often near where the roots divide. It can make cleaning difficult and interfere with gum attachment, increasing the risk of localized gum disease.

Enanthem

A rash, spot, ulcer, or other lesion on a mucous membrane, especially inside the mouth. It may occur with infection, inflammation, an allergic or medicine reaction, or a systemic illness.

Enanthema

A rash or lesion on a moist membrane lining the mouth, throat, genitals, or another body surface. Infection, inflammation, medicines, or systemic disease may cause it.

Enarthrosis

A ball-and-socket joint that allows movement in many directions, including bending, straightening, rotation, and movement away from or toward the body. The hip and shoulder are examples.

Encapsulated

Enclosed by a capsule or clearly defined layer of tissue. This may describe a cyst, growth, infection, or organ; being encapsulated does not by itself prove that a lesion is harmless or cancerous.

Encapsulated Peritoneal Sclerosis

Alternate name; see *Encapsulating Peritoneal Sclerosis*.

Alternate Names:
Sclerosing Encapsulating Peritonitis; EPS

Encapsulating Peritoneal Sclerosis

A rare condition in which thick scar tissue surrounds the intestines and can cause repeated blockage, pain, vomiting, and poor nutrition. It is most associated with long-term peritoneal dialysis but can have other causes.

En Caul Birth

A delivery in which the baby is born completely enclosed within the intact amniotic sac. It can occur during vaginal or cesarean delivery and differs from a caul birth, in which only part of the membrane remains over the newborn.

Encephalitis

Inflammation of brain tissue, often caused by an infection or an abnormal immune reaction. It may cause fever, headache, confusion, seizures, behavior change, weakness, or movement problems and can progress rapidly.

Encephalitis Lethargica

A rare inflammatory brain disorder described mainly during the early twentieth century, causing sleepiness, abnormal movements, eye-movement problems, and other neurologic symptoms. Its cause remains uncertain.

Encephalitis Virus

A virus capable of infecting the brain and causing encephalitis. It may spread through mosquitoes, ticks, animals, respiratory secretions, food, or other routes depending on the virus.

Encephalitozoon

A group of tiny spore-forming parasites that can infect the intestine, eyes, kidneys, or several organs. Serious disease occurs mainly in people with weakened immunity.

Encephalocele

A birth defect in which the coverings of the brain and sometimes brain tissue protrude through an opening in the skull. It may cause a visible head swelling and can be associated with seizures, fluid buildup, developmental problems, or other brain abnormalities.

Encephalofacial Angiomatosis

Sturge-Weber syndrome, a congenital neurocutaneous disorder involving capillary malformations of the face and leptomeninges. It may cause seizures, glaucoma, stroke-like episodes, headaches, and developmental or visual problems.

Encephalomalacia

Softening or loss of brain tissue after injury, stroke, bleeding, infection, or reduced blood flow. The resulting permanent damage may cause seizures, weakness, movement problems, memory changes, or other neurologic effects.

Encephalomyelitis

Inflammation affecting both the brain and spinal cord, caused by infection or an abnormal immune response. It may cause confusion, seizures, weakness, numbness, balance problems, or bladder changes and requires urgent neurologic assessment.

Encephalopathy

A disorder that broadly affects brain function, causing confusion, drowsiness, personality change, difficulty thinking, or coma. Causes include infection, toxins, organ failure, medicines, metabolic problems, seizures, and reduced oxygen.

Encephalotrigeminal Angiomatosis

A birth condition involving abnormal blood vessels in the skin of the face and the coverings of the brain. It may cause a port-wine stain, seizures, weakness,

learning problems, or glaucoma, but symptoms vary.

Alternate Names:
Sturge-Weber Syndrome; SWS

Enchondroma

A usually harmless cartilage growth inside a bone, often in the hands or long bones and found by chance. Pain, enlargement, fracture, or unusual imaging features can overlap with a more serious tumor.

Enchondromatosis

A disorder in which multiple cartilage growths develop inside bones. It can cause uneven growth, limb deformity, pain, or fractures; a small number of lesions may become cancerous and require monitoring.

Encoding

The process by which sensory or other information is changed into a form the brain can store in memory. Attention, sleep, stress, illness, and brain injury can affect encoding.

Encopresis

Repeated passage of stool in inappropriate places by a child at an age or developmental level when bowel control is expected. It is often related to long-term constipation and retained stool but may have other medical, developmental, or emotional contributors.

Endangiitis

Inflammation of the inner lining of a blood vessel. Swelling or scarring can thicken the lining, narrow the vessel, and reduce blood flow.

Endarterectomy

Surgery that removes fatty plaque and diseased inner lining from an artery to improve blood flow, most often a carotid artery in the neck. Possible complications include bleeding, stroke, heart attack, or nerve injury.

Endarteritis

Inflammation of the inner lining of an artery that can narrow the vessel and reduce blood flow. Causes include infection, autoimmune disease, injury, and other vascular disorders.

Endemic

Regular presence of a disease or infectious agent in a particular population or region at an expected baseline level. Endemic does not mean that every person is infected or that cases cannot increase.

Endemic Diseases

Diseases that remain present at a predictable level in a particular population or region. Their frequency is shaped by local environment, immunity, behavior, exposures, healthcare access, and prevention measures.

Endemic Fungi

Fungi naturally found in particular geographic regions whose spores can cause infection when inhaled. Disease may affect the lungs and sometimes spread to other organs, especially in people with weakened immunity.

Endemic Goiter

Thyroid enlargement occurring commonly in a population, traditionally because of insufficient iodine intake. It may occur with normal, low, or high thyroid function depending on the cause.

Endergonic

Describing a chemical reaction that requires an input of energy. In cells, energy from food or another reaction drives processes such as building proteins, DNA, or other complex molecules.

Ending Pregnancy With Medicines

Ending a pregnancy with prescribed medicines that cause the uterus to empty. The appropriate method depends on pregnancy duration, health, symptoms, and local clinical requirements; follow-up confirms completion and checks for complications.

Endobronchial Foreign Body

An object lodged in a bronchus, partly or completely

blocking an airway. It may cause sudden coughing, one-sided wheezing, collapse of part of the lung, or pneumonia and often requires urgent bronchoscopy for removal.

Endobronchial Tumor

A growth inside a bronchus that can narrow the airway and cause cough, wheezing, coughing blood, lung collapse, or repeated pneumonia. It may be benign or cancerous; diagnosis usually requires imaging and tissue sampling.

Endobronchial Ultrasound

A procedure combining bronchoscopy with ultrasound to examine structures beside the airways and guide needle sampling of lymph nodes or masses. It is commonly used to diagnose and stage lung cancer and other chest diseases.

Endobronchial Valve

A one-way valve placed through a bronchoscope into a selected airway to reduce air trapping in severe emphysema. It lets air and mucus leave but limits new air entering; pneumothorax and infection are possible complications.

Endocannabinoid

A signaling molecule made naturally by the body that activates cannabinoid receptors. Endocannabinoids help regulate pain, appetite, mood, memory, movement, and immune activity.

Endocardial Cushion Defect

Alternate name; see *Atrioventricular Septal Defect*.

Endocardial Fibroelastosis

Thickening of the inner lining of the heart from excess fibrous and elastic tissue, usually in infants or children. It can stiffen the heart or weaken its pumping and may lead to heart failure.

Endocarditis

An infection or inflammation of the endocardium, the smooth inner lining of the heart's chambers and valves. It most often occurs when bacteria or other germs from elsewhere in the body (such as the mouth or skin) enter the bloodstream and attach to damaged or artificial heart valves. Symptoms may include fever, chills, fatigue, heart murmurs, shortness of breath, and small spots or bleeding under the nails or skin.

Alternate Names:
Infective Endocarditis; Bacterial Endocarditis

Endocarditis Prophylaxis

Preventive antibiotics given before selected dental procedures to people at highest risk of serious infective endocarditis complications. They are not needed for everyone; eligibility depends on the heart condition and procedure.

Endocarditis Surgical Indications

Reasons surgery may be needed for endocarditis include heart failure from valve damage, uncontrolled infection or abscess, infection of a prosthetic valve, fungal infection, or a high risk of emboli. Decisions require a specialist heart team.

Endocardium

The thin inner lining of the heart chambers and valves. It provides a smooth surface for blood flow and continues into the inner lining of blood vessels; inflammation or infection can damage it.

Endocervical

Relating to the inner canal or lining of the cervix, the lower part of the uterus that connects the uterine cavity with the vagina.

Endocervical Culture

A laboratory test that attempts to grow bacteria or fungi from a sample collected from the inner cervix. It may help investigate cervicitis or selected infections, although molecular tests are preferred for many sexually transmitted infections.

Endocervical Gram Stain

A microscope test that stains cells and organisms from the inner cervix. It may show inflammation or some bacteria but cannot by itself reliably diagnose every sexually transmitted infection.

Endocrine

Relating to hormones released into the bloodstream by glands or specialized cells. Endocrine organs include the thyroid, pituitary, adrenal glands, pancreas, and reproductive glands.

Endocrine Disease

A disorder of a hormone-producing gland or hormone action. It may affect growth, metabolism, reproduction, stress responses, blood pressure, or fluid and electrolyte balance.

Endocrine Disorders

Diseases in which hormone-producing glands make too much or too little hormone, or the body does not respond to hormones properly. They may affect growth, metabolism, reproduction, mood, blood pressure, and fluid balance. Examples include thyrotoxicosis, hypothyroidism, hypogonadism, Cushing syndrome, and Addison's disease.

Endocrine Disrupting Chemicals

Chemicals that can interfere with hormone production, transport, breakdown, or action. Some exposures are associated with reproductive, developmental, thyroid, metabolic, or cancer outcomes, but risk depends on the substance, dose, and timing.

Endocrine Disruptor

A chemical that interferes with hormone systems. Possible effects include altered development, reproduction, thyroid function, or metabolism; health risk depends on the chemical, exposure level, duration, and timing.

Endocrine Finding

A symptom, examination result, imaging result, or laboratory result that may suggest abnormal hormone production, hormone action, or an endocrine-gland disorder.

Endocrine Function

The production, release, transport, and action of hormones that regulate metabolism, growth, reproduction, stress responses, blood pressure, and fluid or electrolyte balance.

Endocrine Gland

An organ or group of cells that releases hormones into the bloodstream, without using ducts to carry those hormones. They travel to target cells and regulate functions such as metabolism, growth, reproduction, stress responses, and fluid balance. Examples include the pituitary, thyroid, parathyroid, adrenal, and pineal glands, and hormone-secreting tissue in the pancreas and gonads.

Endocrine Glands

Plural form; see *Endocrine Gland*.

Endocrine Hypertension

High blood pressure caused by excess or abnormal hormone activity. Causes include primary aldosteronism, excess cortisol, or excess adrenaline-like hormones from an adrenal or related tumor.

Endocrine Myopathies

Muscle disorders caused by hormonal disease, such as thyroid, adrenal, parathyroid, or pituitary dysfunction. Weakness, exercise intolerance, cramps, or muscle pain may improve when the underlying endocrine disorder is treated.

Endocrine Neoplasm

A benign or cancerous growth arising in a hormone-producing gland or cell. It may release too much hormone or cause symptoms by pressing on nearby structures; evaluation depends on its location and behavior.

Endocrine Pancreas

The hormone-producing part of the pancreas, made mainly of pancreatic islets. Its cells release insulin, glucagon, somatostatin, and other hormones that help regulate blood glucose and digestion.

Endocrine System

The network of glands and hormone-producing cells and tissues that release chemical messengers into the blood. It includes structures such as the hypothalamus, pituitary, thyroid, parathyroids, adrenal glands, pancreatic islets, and gonads; its hormones regulate growth, metabolism, reproduction, stress

responses, sleep, blood pressure, fluid balance, and other aspects of homeostasis.

Endocrine Testing

Blood, urine, saliva, stimulation, suppression, and sometimes imaging tests used to assess hormone production and action. Results depend on timing, medicines, age, sex, illness, and the test method.

Endocrine Therapy

Treatment that lowers, blocks, or changes hormone signals to control hormone-sensitive cancer. It may be used for breast, prostate, or other cancers; effects depend on the medicine and can include hot flashes, sexual changes, or bone loss.

Endocrine Tissues

Cells or groups of cells that produce and release hormones into the bloodstream or nearby tissues. They are found in glands and in organs such as the pancreas, ovaries, testes, kidneys, and intestine.

Endocrinologist

A physician who diagnoses and treats disorders of hormones, endocrine glands, and metabolism, including diabetes, thyroid disease, adrenal disease, osteoporosis, and reproductive hormone problems.

Endocrinologists

Plural form; see *Endocrinologist*.

Endocrinology

The medical specialty concerned with hormones, endocrine glands, and metabolism. It includes diabetes and disorders of the pituitary, thyroid, and adrenal glands, as well as problems involving growth, reproduction, bone, and fluid or electrolyte balance.

Endocrinopathy

A disorder of an endocrine gland or hormone system that causes too much, too little, or abnormal hormone action. Effects depend on the hormone and may involve growth, metabolism, reproduction, mood, or fluid balance.

Endocytosis

The process by which a cell folds its outer membrane around material and brings it inside in a small sac. Cells use it to absorb nutrients, remove particles, and control surface signals.

Endoderm

The innermost of the three early embryonic cell layers. It develops into the linings of the digestive and respiratory systems and contributes to organs such as the liver, pancreas, thyroid, and bladder.

Endodontics

The dental specialty concerned with the soft tissue inside teeth, root canals, and tissues around tooth roots. Endodontists diagnose and treat tooth infection, inflammation, injury, and related pain.

Endodontist

A dentist with advanced training in diagnosing and treating disease or injury of the tooth's inner tissue, root canals, and tissues around tooth roots. They commonly perform complex root-canal treatment.

End-Of-Life Care

Care for a person nearing death that focuses on comfort, symptom relief, dignity, communication, and personal goals. It also supports family and caregivers and may include hospice or palliative services.

Endogenous

Originating within the body or produced by its own cells or tissues, rather than introduced from outside. Endogenous hormones, chemicals, infections, or substances may be contrasted with external sources.

Endogenous Biomarker

A measurable characteristic produced within the body that indicates a normal biological process, disease process, exposure, or response to an intervention. Examples include naturally occurring metabolites or proteins measured in blood or urine; results may also be affected by factors unrelated to the process being assessed.

Alternate Names:
Endogenous Biomarkers

Endogenous Cushing Syndrome

Hypercortisolism caused by internal overproduction of cortisol or its stimulatory hormones, including pituitary, adrenal, or ectopic sources. Features may include central weight gain, hypertension, diabetes, proximal weakness, bruising, and bone loss.

Endogenous Opiates

Older term for endogenous opioids; see *Endogenous Opioids*.

Endogenous Opioids

Opioid-like peptides made naturally by the body, including endorphins, enkephalins, and dynorphins. They activate opioid receptors to influence pain, stress, mood, reward, movement, and hormone regulation.

Alternate Names:
Endogenous Opioid Peptides

Endogenous Retrovirus

A piece of viral DNA inherited in the human genome from an ancient virus that infected a reproductive cell. Most such sequences are inactive, although some can influence gene control or normal development.

Endoleak

Continued blood flow into the weakened part of an artery after endovascular aneurysm repair. Some types indicate an inadequate seal or device problem and may require repair; others are monitored according to sac growth and risk.

Endolimax

A group of amoebas that can live in the intestine. They are usually harmless colonizers rather than causes of disease; significance of a stool finding depends on symptoms and other test results.

Endolimax Nana

An amoeba that can live harmlessly in the intestine and appear in stool tests. It usually does not cause illness; its presence may indicate exposure to contaminated food or water and should not alone explain digestive symptoms.

Endolymph

Fluid inside the membranous part of the inner ear that helps sensory organs detect sound and head movement. Abnormal pressure or composition can contribute to dizziness, hearing changes, or ringing.

Endolymphatic Hydrops

Abnormal buildup or expansion of endolymph-filled spaces in the inner ear. It is associated with Ménière disease but does not by itself establish the diagnosis or fully explain its cause.

Alternate Names:
Meniere Hydrops; Inner Ear Hydrops

Endometrial

Relating to the endometrium, the inner lining of the uterus. This lining changes during the menstrual cycle and can support implantation of a pregnancy; abnormal growth may cause bleeding or affect fertility.

Endometrial Ablation

A procedure that destroys much of the uterine lining to reduce heavy menstrual bleeding. It is not contraception, pregnancy afterward can be dangerous, and it is generally intended for people who do not plan future pregnancy.

Endometrial Adenocarcinoma

A gland-forming cancer of the uterine lining. It often causes abnormal bleeding, especially after menopause; treatment depends on the cancer's type, grade, stage, molecular features, and overall health.

Endometrial Atrophy

Thinning of the uterine lining, often after menopause when estrogen levels fall. The lining may become fragile and cause light vaginal bleeding or spotting. It is one possible cause of bleeding after menopause, but that bleeding can also have other causes, including endometrial cancer.

Endometrial Biopsy

Removal of a small sample of the uterine lining for laboratory examination, often to investigate abnormal bleeding or suspected overgrowth or cancer. Cramping and light bleeding are common; occasionally the sample is insufficient for diagnosis.

Endometrial Cancer

Cancer arising from the inner lining of the uterus. Abnormal bleeding—especially after menopause—is a common warning sign; evaluation usually includes examination, imaging, and a sample of the uterine lining.

Alternate Names:
Uterine Endometrial Neoplasm; Endometrial Carcinoma

Endometrial Carcinoma

Cancer arising from the uterine lining, often causing abnormal bleeding, particularly after menopause. Diagnosis requires examination of uterine-lining tissue, and treatment depends on type and spread.

Endometrial Disorder

Any condition affecting the uterine lining, including inflammation, polyps, abnormal overgrowth, endometriosis-related changes, or cancer. It may cause heavy or irregular bleeding, pelvic pain, infertility, or no symptoms.

Endometrial Hyperplasia

Overgrowth of glands in the uterine lining, often after prolonged estrogen exposure without enough progesterone. It may cause heavy, irregular, or postmenopausal bleeding. It is classified as hyperplasia without atypia or atypical hyperplasia, also called endometrial intraepithelial neoplasia (EIN). Hyperplasia without atypia is not precancer; atypical hyperplasia/EIN is precancerous and can sometimes be found alongside endometrial cancer, so it needs prompt evaluation.

Endometrial Implants

Lesions of tissue resembling the uterine lining that grow outside the uterus in endometriosis. They may cause local inflammation, scarring, or adhesions; see *Endometriosis*.

Endometrial Intraepithelial Neoplasia

A precancerous overgrowth of abnormal glands in the uterine lining. It can exist with or progress to endometrial cancer, so treatment may involve removal of the uterus or hormone treatment when preserving fertility is important.

Alternate Names:
EIN; Atypical Endometrial Hyperplasia

Endometrial Intraepithelial Neoplasia (EIN)

Alternate name; see *Endometrial Intraepithelial Neoplasia*.

Endometrial Neoplasm

An abnormal growth of the uterine lining that may be benign, precancerous, or cancerous. Symptoms, tissue examination, imaging, and—if cancer is present—stage determine treatment.

Endometrial Polyp

Alternate name; see *Uterine Polyp*.

Endometrial Polyps

Alternate name; see *Uterine Polyp*.

Endometrial Receptivity Analysis

A test that examines activity of genes in a sample of the uterine lining to estimate when it may best support embryo implantation. Its ability to improve pregnancy rates is uncertain, so results need specialist interpretation.

Alternate Names:
ERA; Endometrial Receptivity Assay

Endometrial Stromal Nodule

A rare, usually harmless, well-defined growth of connective-tissue cells in the uterus. It differs from cancer by not invading nearby tissue or blood vessels, but microscopic examination is needed for reliable classification.

Endometrial Stromal Sarcoma

A rare cancer arising from connective-tissue cells of the uterine lining. Some forms grow slowly and others aggressively; abnormal bleeding or pelvic symptoms may occur, and treatment depends on grade, spread, hormone receptors, and molecular findings.

Alternate Names:
ESS

Endometrioid Carcinoma Of The Vulva

A rare gland-forming cancer of the vulvar skin or nearby tissue that resembles cancer of the uterine lining. Diagnosis requires tissue examination and confirmation that it did not spread from the uterus or ovary.

Endometrioid Ovarian Carcinoma

A type of ovarian cancer whose cells resemble glands of the uterine lining. It may be associated with endometriosis; symptoms, treatment, and outlook depend on stage, grade, and tumor features.

Endometrioma

An ovarian cyst caused by endometriosis in which old blood collects. It may cause pelvic pain, painful periods, pain during sex, or infertility, although some people have no symptoms.

Endometriosis

A chronic gynecological condition in which tissue similar to the lining of the uterus (endometrium) grows outside the uterus, most commonly on the ovaries, fallopian tubes, and pelvic surfaces. Like normal uterine tissue, these misplaced patches thicken, break down, and bleed with each menstrual cycle, but because the blood has no way to exit the body, it causes chronic inflammation, scarring, pelvic pain (especially during periods), and potential fertility challenges.

Alternate Names:
Pelvic Endometriosis

Endometritis

Inflammation or infection of the uterine lining, often after childbirth, miscarriage, abortion, or a procedure entering the uterus. It may cause fever, pelvic pain, tenderness, abnormal discharge, or bleeding and needs treatment.

Endometrium

The inner lining of the uterus. It thickens each month under hormone control to prepare for pregnancy and sheds during menstruation; abnormal thickening, inflammation, polyps, or cancer can cause bleeding or fertility problems.

Endomyocardial Biopsy

A procedure that removes tiny samples from the heart muscle through a catheter in a vein. The samples can help check for rejection after a heart transplant or investigate some heart-muscle diseases.

Alternate Names:
EMB

Endomyocardial Fibrosis

Scarring and thickening of the inner heart lining and nearby muscle that makes the heart stiff and reduces filling. It can cause breathlessness, swelling, abnormal rhythms, or heart failure.

Endomysium

A delicate layer of reticular connective tissue that individually invests each single skeletal muscle fiber, containing an intricate network of capillaries and nerve terminals essential for metabolic exchange and muscle contraction.

Endoneurium

A delicate layer of loose connective tissue and collagen fibrils that directly surrounds each individual myelinated or unmyelinated axon and its accompanying Schwann cell sheath within a peripheral nerve fascicle.

Endoparasite

A parasite that lives inside its host, such as a worm in the intestine or a microscopic parasite in blood or tissue. It may cause no symptoms or lead to inflammation, anemia, organ damage, or infection.

Endopeptidase

An enzyme that cuts proteins or peptides at internal points rather than removing amino acids only from an end. Digestive enzymes such as pepsin and trypsin are examples.

Endophthalmitis

A severe infection inside the eye involving its tissues or fluids, most often after surgery, an injection, or an injury; infection can also spread from elsewhere in the body. It can rapidly damage vision.

Endoplasmic Reticulum

A network of tiny membrane-lined spaces inside cells. It helps make and transport proteins and fats, stores calcium, and processes substances needed for cell structure and function.

Endoprosthesis

An artificial device placed inside the body to replace, support, or restore a body structure. Examples include joint replacements, vascular grafts or stents, and some devices used to keep an airway open.

Endoribonuclease

An enzyme that cuts RNA at internal chemical bonds. It helps process RNA into usable forms or break down RNA that is damaged, unnecessary, or produced by viruses.

Endorphin

A natural chemical made by the body that acts on opioid receptors in the brain and other tissues. It can reduce the feeling of pain and influence stress, mood, and other body responses.

Endorphins

Plural form; see *Endorphin*.

Endoscope

A flexible or rigid instrument with a light and camera used to view an internal body passage or cavity. It can sometimes collect tissue, stop bleeding, remove growths, or perform other treatments.

Endoscopic Endonasal Surgery

A minimally invasive operation performed through the nostrils and nasal passages using an endoscope, commonly to reach selected skull-base, pituitary, sinus, or nearby lesions. Risks include bleeding, infection, cerebrospinal-fluid leak, and injury to nearby structures.

Endoscopic Mucosal Resection

An endoscopic procedure that removes a superficial growth from the digestive tract after lifting it away from deeper tissue. The removed tissue is examined to determine whether it was completely removed and whether cancer is present.

Endoscopic Retrograde Cholangiopancreatography

A procedure combining an endoscope and X-ray imaging to examine and treat the bile and pancreatic ducts. It can remove stones, open narrowed ducts, place stents, or obtain samples; pancreatitis, bleeding, and infection are possible risks.

Endoscopic Submucosal Dissection

An endoscopic procedure that removes a larger or flatter superficial growth from the digestive tract in one piece by dissecting beneath it. It allows detailed tissue examination but carries risks of bleeding and perforation.

Endoscopic Third Ventriculostomy

A brain procedure used to treat some types of hydrocephalus, in which fluid builds up because its normal path is blocked. A small camera is used to make an opening in one of the brain's fluid spaces so the fluid can drain. It may reduce the need for a shunt, but not everyone is a suitable candidate and the opening can close later.

Alternate Names:
ETV; Third Ventriculostomy; Endoscopic Ventriculostomy

Endoscopic Thoracic Sympathectomy

A minimally invasive operation that interrupts selected nerves in the chest, usually for severe sweating of the hands. Possible complications include

increased sweating elsewhere, drooping eyelid, collapsed lung, nerve injury, and heart or blood-pressure changes.

Endoscopic Ultrasound

A procedure combining an endoscope with ultrasound to view the digestive-tract wall and nearby organs. It can guide needle sampling of lymph nodes, pancreas, or other masses and help assess the depth or spread of disease.

Endoscopy

Examination of an internal body passage or cavity with a camera-equipped instrument. Depending on the site, it can directly inspect tissue, collect samples, remove growths, widen narrow areas, or stop bleeding.

Endosome

A small membrane-bound compartment inside a cell that receives material taken in from the cell surface and sorts it for recycling, transport, or breakdown.

Endosteum

A thin membrane lining the inner surfaces of bones, including the marrow cavity and small internal channels. It contains cells involved in bone formation, remodeling, and repair.

Endostosis

Abnormal formation of bone on or within an existing bone. It may be a localized developmental finding or part of a broader bone disorder; the significance depends on its location, extent, and symptoms.

Endothelial

Relating to the thin layer of cells lining blood and lymphatic vessels and some internal surfaces. These cells help control blood flow, vessel leakiness, inflammation, clotting, and new-vessel growth.

Endothelial Cell

A cell lining a blood or lymphatic vessel. It regulates movement between blood and tissues and helps control vessel widening, inflammation, clotting, and formation of new blood vessels.

Endothelial Nitric Oxide Synthase

A calcium- and calmodulin-dependent enzyme constitutively expressed in vascular endothelial cells that synthesizes nitric oxide from L-arginine, mediating basal vasodilation, inhibition of leukocyte adhesion, and suppression of platelet aggregation.

Alternate Names:
eNOS; NOS3

Endothelin

A small protein made mainly by cells lining blood vessels that strongly narrows vessels and affects blood pressure, circulation, inflammation, and tissue growth. Excess signaling contributes to some cases of pulmonary arterial hypertension.

Endothelin Receptor Antagonists

Medicines that block signals that narrow blood vessels, especially in the lungs. They are used for selected pulmonary arterial hypertension; liver injury, anemia, swelling, and serious fetal harm are important risks.

Endothelium

The thin layer of specialized cells lining blood and lymphatic vessels. It controls exchange between blood and tissues and helps regulate vessel diameter, inflammation, clotting, and new-vessel growth.

Endothelium-Derived Relaxing Factor

A substance released by vessel-lining cells that relaxes blood vessels. It is largely identified with nitric oxide, which also helps reduce platelet sticking and vessel-wall inflammation.

Alternate Names:
EDRF

Endotoxin

A component of the outer membrane of certain bacteria, especially Gram-negative bacteria. When released into the body, it can trigger fever, inflammation, low blood pressure, organ injury, and life-threatening sepsis.

Endotracheal Intubation

Placement of a breathing tube through the mouth or nose into the windpipe to keep the airway open, deliver ventilator support, give anesthetic gases, or protect the lungs. Incorrect placement can cause severe harm and must be confirmed.

Endotracheal Tube

A breathing tube passed through the mouth or nose into the windpipe to maintain an airway and support ventilation. An inflatable cuff may seal the airway; irritation, injury, infection, or incorrect placement can occur.

Endourologist

A urologist specializing in minimally invasive procedures performed through the urinary tract or small access sites. Common work includes treating urinary stones, narrowing, blockage, and selected tumors.

Endovaginal Ultrasound

Ultrasound imaging performed with a covered probe placed gently in the vagina to examine the uterus, uterine lining, ovaries, cervix, and early pregnancy. It uses sound waves rather than radiation and may cause temporary discomfort.

Endovascular

Located inside a blood vessel or performed from within it, usually with a catheter passed through a small skin puncture. Endovascular procedures can treat aneurysms, clots, narrowing, bleeding, or abnormal vessels.

Endovascular Aneurysm Repair

Alternate name; see *Endovascular Aortic Aneurysm Repair*.

Endovascular Aortic Aneurysm Repair

Repair of an aortic aneurysm by placing a fabric-covered stent graft inside the aorta through a catheter, usually passed through an artery in the groin. The graft diverts blood flow away from the weakened area and lowers rupture risk. Abdominal and thoracic repairs are commonly called EVAR and TEVAR, respectively.

Alternate Names:
Endovascular Aortic Repair

Endovascular Coiling

A catheter procedure that treats some brain aneurysms from inside the blood vessels, without opening the skull. A clinician guides soft metal coils into the aneurysm, where they promote clotting and reduce blood flow into it. The procedure can lower the risk of bleeding, but the aneurysm may need follow-up imaging or further treatment.

Alternate Names:
Endovascular Aneurysm Coiling; Guglielmi Detachable Coiling; GDC; Aneurysm Embolization Coils

Endovascular Embolization

A catheter procedure that deliberately blocks a selected blood vessel using coils, particles, plugs, or another material. It may control bleeding or treat an aneurysm, malformation, or tumor blood supply; non-target blockage is a possible risk.

Endovascular Graft

A fabric-covered artificial tube placed inside a diseased blood vessel through a catheter. It can reinforce a weak artery or exclude an aneurysm; suitability and follow-up depend on anatomy, symptoms, and imaging.

Endovascular Repair

A minimally invasive procedure that uses a catheter-delivered graft, balloon, stent, or other device to repair a blood vessel from inside. Bleeding, clotting, infection, leakage, or need for further treatment can occur.

Endovenous Laser Ablation

A treatment for some varicose veins in which a thin laser fiber is placed inside the vein through a small needle opening. Heat closes the treated vein, and blood flows through healthier veins. It is usually done with local numbing medicine; bruising, pain, clots, nerve irritation, or return of the vein can occur.

Alternate Names:
EVLA; Endovenous Laser Therapy; EVLT; Endove-

nous Thermal Ablation

End Point

A predefined outcome or measurement used to judge a clinical study, treatment, diagnostic test, or disease process. It may be a symptom, laboratory result, event, survival measure, or patient-reported outcome.

End Stage

The advanced phase of a disease in which normal function is severely impaired. Meaning, criteria, expected course, and treatment options depend on the disease, such as advanced kidney, liver, lung, or heart failure.

End-Stage Kidney Disease

Advanced chronic kidney disease in which the kidneys can no longer adequately remove waste or control fluid, electrolytes, and acid levels. Treatment options include dialysis, kidney transplantation, or supportive care based on health and preferences.

End-Stage Renal Disease

The most advanced stage of chronic kidney disease, usually when kidney filtration is below 15 or dialysis is needed. Waste and fluid can accumulate, causing nausea, itching, confusion, swelling, anemia, or heart complications.

Alternate Names:
ESRD

Endurance

The ability to continue physical or mental activity without becoming tired quickly. It depends on heart and lung function, muscle conditioning, energy, sleep, and overall health and can be assessed with activity or exercise tests.

Enema

Introduction of liquid into the rectum through the anus to soften stool, stimulate bowel emptying, deliver selected treatment, or assist a test. Overuse can cause irritation, dehydration, or electrolyte problems.

Energy

The capacity needed for body functions, movement, growth, and temperature control, obtained mainly from food. Persistent low energy may reflect poor sleep, inadequate nutrition, anemia, hormone disease, mood disorder, infection, or another illness.

Energy Conservation

Strategies that reduce unnecessary effort and fatigue during daily activities, such as planning, pacing, prioritizing, resting, sitting for tasks, changing position, and using helpful equipment.

Energy Expenditure

The energy the body uses for basic functions, movement, digestion, growth, pregnancy, and temperature control. It varies with body size, muscle mass, age, activity, illness, and other conditions.

Energy Increased

A noticeable rise in energy or activity. It may be normal, but unusually high energy with little need for sleep, racing thoughts, impulsive behavior, or irritability can occur with stimulant use, thyroid disease, mania, or hypomania.

Energy Intake

The amount of energy obtained from food and drink, usually measured in calories. Appropriate intake depends on age, body size, activity, illness, pregnancy, and nutritional goals.

Energy Metabolism

The chemical processes that convert nutrients into usable energy for cells. They include breaking down carbohydrates, fats, and proteins and storing or using the resulting energy for body functions.

Energy Resolution

The ability of a radiation detector to distinguish radiation particles with different energies. Better resolution allows more accurate identification and separation of radioactive substances during imaging or laboratory measurement.

Energy Window

The range of radiation energies accepted by a detector or gamma camera to create an image. Choosing it appropriately improves image quality by accepting desired signals and reducing scattered radiation.

Enfuvirtide

An injectable HIV medicine that blocks fusion of HIV with human immune cells. It is used with other antiretroviral medicines for resistant infection; injection-site reactions and allergic reactions can occur.

Engagement

Descent of the widest part of the baby's presenting head or body into the parent's pelvis. It may occur before labor or during labor and indicates that the baby has entered the birth passage.

Enhanced Elimination

Medical methods used to remove an absorbed poison more quickly, such as dialysis or changing urine chemistry. They are used only for selected toxins because benefits, timing, and risks depend on the substance and the person's condition.

Enhanced Pause

A calculated breathing index, abbreviated Penh, derived from airflow measurements during whole-body plethysmography, mainly in laboratory animals. It has been used as an indirect indicator of airway narrowing, but it does not directly measure airway resistance and its interpretation is debated.

Enhanced Recovery After Surgery

A coordinated care plan before, during, and after surgery that supports recovery through education, appropriate nutrition and fasting, pain control, early movement, early eating, and prevention of complications.

Enhancement Artifact

An imaging effect in which tissue behind a fluid-filled or low-density structure appears brighter than it really is, especially on ultrasound. It is a technical artifact, not necessarily a sign of increased blood flow or tissue density.

Enhancer

A stretch of DNA that increases activity of a gene when regulatory proteins bind to it. It may be far from the gene and can work in either direction, helping control when and where the gene is active.

Enkephalin

A natural opioid-like peptide made by the body that activates mainly delta and mu opioid receptors. It helps regulate pain, stress, mood, movement, and other nervous-system functions.

Enlarged Adenoids

Overgrowth of immune tissue behind the nose that can block nasal breathing and cause mouth breathing, snoring, repeated ear-fluid problems, or sleep-disordered breathing. Symptoms and age determine whether treatment is needed.

Enlarged Fontanelle

A soft spot on an infant's skull that is significantly larger than normal for age, which may be associated with conditions such as congenital hypothyroidism, rickets, skeletal dysplasias, or increased intracranial pressure.

Alternate Names:
Large Fontanelle

Enlarged Heart

An increase in heart size caused by conditions such as high blood pressure, valve disease, heart-muscle disease, anemia, or athletic adaptation. It may cause no symptoms or lead to breathlessness, swelling, rhythm problems, or heart failure.

Alternate Names:
Cardiomegaly

Enlarged Liver

Alternate name; see *Hepatomegaly*.

Alternate Names:
Hepatomegaly; Hepatic Enlargement

Enlarged Prostate

An increase in prostate size, also called prostatomegaly. Benign prostatic hyperplasia is a common cause, but inflammation and prostate cancer can also enlarge the gland.

Enlarged Spleen

Increase in spleen size caused by infection, liver or blood disease, inflammation, cancer, or congestion. It may cause fullness or pain and can increase rupture risk; evaluation considers symptoms, blood counts, and the underlying cause.

Alternate Names:
Splenomegaly; Splenic Enlargement

Enophthalmos

Abnormal backward sinking of an eyeball within the eye socket. It may follow injury, loss of tissue around the eye, dehydration, aging, or a nerve disorder and can cause unequal eye appearance or double vision.

Enoxaparin

A low-molecular-weight heparin that reduces clotting by enhancing antithrombin activity, especially against factor Xa. It prevents or treats blood clots but can cause bleeding, low platelets, or injection-site bruising.

Enrichment

Adding nutrients to food after processing has removed some of them. Enriched flour, for example, commonly has certain B vitamins and iron added back to help prevent nutritional deficiencies.

Entamoeba

A group of single-celled amoebas that live in the intestine or other tissues. Some species are harmless, while Entamoeba histolytica can cause diarrhea, intestinal ulcers, or liver abscesses.

Entamoeba Coli

A usually harmless amoeba found in the human intestine and spread by fecal contamination. Its presence in stool indicates exposure to contaminated food or water but usually does not cause illness.

Entamoeba Hartmanni

A small, usually harmless intestinal amoeba spread through fecal contamination. It generally causes no disease; identification in stool mainly indicates possible exposure to contaminated food, water, or hands.

Entamoeba Histolytica

A parasite spread when contaminated food, water, or hands are swallowed. It can cause diarrhea, abdominal pain, and bloody stools and may invade the intestine or spread to the liver, causing an abscess.

Entamoeba Polecki

An intestinal amoeba that can infect people after fecal contamination, often through contact with animals or contaminated food and water. It is usually harmless but may occasionally be associated with diarrhea.

Enteral

Relating to or delivered through the digestive tract. Enteral nutrition provides food and fluids by mouth or through a feeding tube into the stomach or intestine.

Enteral Formula

A liquid nutrition preparation given by mouth or feeding tube. It may provide complete nutrition or selected nutrients and is chosen according to digestion, absorption, fluid needs, kidney or liver disease, and metabolic requirements.

Enteral Nutrition

Delivery of food, fluids, and nutrients through the digestive tract, by mouth or feeding tube. It may be used when swallowing or eating is unsafe or inadequate; aspiration, diarrhea, blockage, and tube displacement are possible complications.

Enteric

Relating to the intestine or digestive tract. The term can also describe organisms, infections, medicines, or coatings associated with the intestines.

Enteric Bacteria

Bacteria that live in or affect the intestinal tract. Some are harmless normal residents, while others cause diarrhea or infections outside the intestine, such as urinary, wound, or bloodstream infection.

Enteric-Coated

Covered with a protective layer that resists stomach acid and dissolves in the small intestine. This can protect the stomach or protect a medicine from stomach acid; such tablets should not usually be crushed.

Enteric Duplication Cyst

A birth-related cyst attached to or within the digestive tract, most often the small intestine. It may cause pain, blockage, bleeding, infection, or no symptoms and can require surgery.

Enteric Fever

A systemic infection caused by *Salmonella* enterica serotypes Typhi or Paratyphi, usually spread through food or water contaminated with human feces. It causes prolonged fever and may include headache, abdominal pain, weakness, diarrhea or constipation, and sometimes a rash. Severe disease can cause intestinal bleeding or perforation.

Enteric Nervous System

The network of nerve cells within the digestive tract that helps control movement, secretion, blood flow, and communication with the brain and spinal cord.

Enteritis

Inflammation of the small intestine caused by infection, inflammatory disease, radiation, reduced blood flow, medicines, or other injury. It may cause abdominal pain, diarrhea, vomiting, fever, bleeding, or dehydration.

Enterobacter

A group of Gram-negative bacteria that may live in the intestine but can cause healthcare-associated urinary, bloodstream, wound, respiratory, or abdominal infection, especially in vulnerable people.

Enterobacter Aerogenes

Former taxonomic name; see *Klebsiella Aerogenes*.

Enterobacter Cloacae

A Gram-negative bacterium that can cause healthcare-associated urinary, bloodstream, lung, wound, or abdominal infection. It may resist several antibiotics, so laboratory susceptibility testing guides treatment.

Enterobacter Hormaechei

A bacterium in the Enterobacter cloacae group that can cause opportunistic healthcare-associated infection of blood, urine, lungs, wounds, or devices. Testing for antibiotic resistance is often important.

Enterobacteriaceae

A family of Gram-negative bacteria that includes Escherichia, Klebsiella, Enterobacter, Salmonella, and Shigella. Some normally live in the intestine, while others cause intestinal, urinary, wound, or bloodstream infection.

Enterobacteriaceae Carbapenem Resistance

Resistance in certain Gram-negative bacteria to carbapenem antibiotics, often caused by enzymes that destroy these medicines. Such infections can be difficult to treat and require laboratory testing, infection control, and specialist guidance.

Enterobiasis

Infection with pinworms, small intestinal worms whose eggs spread easily between people. It commonly causes intense itching around the anus at night, disturbed sleep, and sometimes irritation in the genital area.

Enterobius

A group of pinworms that live in the intestine. Enterobius vermicularis causes the common pinworm infection, which spreads when eggs are swallowed and often causes nighttime anal itching.

Enterobius Vermicularis

A small intestinal worm commonly called the pinworm or threadworm. Adult females lay eggs around the anus, usually at night, causing itching and allowing infection to spread through contaminated hands or surfaces.

Alternate Names:
Pinworm; Threadworm; Enterobius

Enterocele

A pelvic organ prolapse in which a pouch of abdominal lining and sometimes small intestine bulges into the space between the vagina and rectum. It may cause pelvic pressure, a vaginal bulge, back or rectal discomfort, or no symptoms.

Alternate Names:
Small Bowel Prolapse; Douglas Pouch Hernia

Enterochromaffin Cells

Specialized enteroendocrine cells located throughout the mucosal epithelium of the gastrointestinal tract that synthesize, store, and release serotonin (5-hydroxytryptamine) and substance P to modulate gastrointestinal motility, secretion, and visceral pain perception.

Alternate Names:
EC Cells; Kultschitzky Cells

Enterochromaffin-Like Cells

Specialized neuroendocrine cells situated within the oxyntic mucosa of the gastric fundus and body that synthesize and secrete histamine in response to gastrin and acetylcholine stimulation, directly stimulating parietal cell H+/K+-ATPase proton pumps.

Alternate Names:
ECL Cells

Enteroclysis

An imaging test in which contrast material is delivered through a tube into the small intestine to look for inflammation, narrowing, tumors, or blockage. CT or MRI enterography is now more commonly used in many settings.

Enterococcaceae

A family of bacteria that includes Enterococcus species. These bacteria may normally live in the intestine but can cause urinary, wound, bloodstream, or heart-valve infections when they enter protected body sites.

Enterococcal Infection

An infection caused by Enterococcus bacteria, which normally live in the intestine but can cause urinary-tract, wound, abdominal, bloodstream, or heart-valve infections. Enterococcal infections are more common after hospitalization, surgery, antibiotic exposure, or use of medical devices. Some strains resist multiple antibiotics, so culture and susceptibility testing guide treatment.

Alternate Names:
Enterococcosis

Enterococcus

A group of bacteria normally found in the intestine that can cause urinary, wound, abdominal, bloodstream, or heart-valve infection. Some strains resist several antibiotics and require laboratory susceptibility testing.

Enterococcus Durans

A bacterium that may live in the bowel but can rarely cause infection in seriously ill or immunocompromised people. It may affect blood, urine, wounds, or other sites, and testing guides antibiotic treatment.

Enterococcus Faecalis

A common intestinal bacterium that can cause urinary, wound, abdominal, bloodstream, or heart-valve infection. Disease is more likely after surgery, hospitalization, medical-device use, or when immunity is weakened.

Enterococcus Faecium

An Enterococcus species that can cause healthcare-associated urinary, wound, abdominal, bloodstream, or heart-valve infection. Some strains resist vancomycin and other antibiotics, making laboratory testing essential.

Enterocolitis

Inflammation of the small intestine and colon caused by infection, immune disease, reduced blood flow, toxins, or other injury. It may cause abdominal pain, diarrhea, fever, vomiting, bleeding, dehydration, or severe illness.

Enterocyte

A cell lining the small intestine that digests and absorbs nutrients, water, and electrolytes. It also helps form the intestinal barrier and participates in immune defense.

Enterocytozoon

A group of tiny spore-forming parasites that can cause persistent diarrhea and intestinal disease, especially in people with weakened immunity. Some species can also affect other organs.

Enteroendocrine Cell

A specialized cell in the intestinal lining that senses food and releases hormones regulating digestion, appetite, gallbladder and pancreatic activity, and blood-glucose control.

Enterohepatic Circulation

Recycling of a substance from the liver into bile and the intestine, then back to the liver through the bloodstream. This can prolong the effects of some medicines and natural body chemicals.

Enteromonas Hominis

A usually harmless microorganism that may live in the intestine and appear in stool samples. It generally does not cause disease; significance depends on symptoms and other test results.

Enteropathic

Relating to intestinal disease or its effects elsewhere in the body. For example, enteropathic arthritis is joint inflammation associated with inflammatory bowel disease; intestinal disease can also be associated with skin or eye inflammation and poor nutrient absorption.

Enteropathic Arthritis

Inflammatory joint disease associated with inflammatory bowel disease such as Crohn disease or ulcerative colitis. It may affect the spine, joints between the spine and pelvis, or joints of the arms and legs.

Alternate Names:
Enteropathic Arthropathy; Enteropathic Arthropathies

Enteropathic Arthropathy

Alternate name; see *Enteropathic Arthritis*.

Enteropathy

Any disease or disorder affecting the intestine. Causes include infection, inflammation, gluten sensitivity, poor blood flow, toxins, medicines, inherited conditions, or impaired absorption.

Enteropathy-Associated T-Cell Lymphoma

A rare, fast-growing cancer of immune cells in the intestine. It can be linked to long-standing celiac disease and may cause severe abdominal pain, weight loss, poor nutrient absorption, blockage, or a hole in the bowel.

Alternate Names:
EATL; Enteropathy-Type Intestinal T-Cell Lymphoma

Enteroscopy

Examination of the small intestine with a camera-equipped instrument. It can identify disease, obtain tissue samples, treat bleeding, or remove selected growths beyond the reach of routine upper endoscopy.

Enterospasm

An involuntary tightening or contraction of the intestine that may cause cramping, abdominal pain, bloating, or altered movement of intestinal contents.

Enterostomy

A surgically created opening that brings part of the intestine to the abdominal surface so stool or intestinal contents can leave the body or a feeding

solution can enter.

Enterostomy Procedure

Surgery that creates an opening from the intestine to the abdominal wall, such as an ileostomy or colostomy. It may divert stool or support feeding; bleeding, infection, blockage, and skin problems can occur.

Enterotoxin

A toxin made by some microorganisms that acts on the intestinal lining and can cause vomiting, cramps, watery diarrhea, dehydration, or other intestinal illness.

Enterovesical Fistula

An abnormal connection between the intestine and urinary bladder. It can cause repeated urinary infections, air or stool in the urine, abdominal pain, or urine leaking into the intestine and may result from inflammation, cancer, or surgery.

Enterovirulent E. Coli

A group of Escherichia coli strains that cause intestinal disease by making toxins, attaching to the bowel, or invading it. Illness may include watery or bloody diarrhea, cramps, vomiting, or dehydration.

Enterovirus

A group of viruses spread mainly by respiratory secretions or contact with infected stool. Many infections are mild or cause no symptoms, but some cause hand-foot-and-mouth disease, rash, meningitis, heart inflammation, or severe illness in newborns.

Enterovirus D68

A virus that usually causes a respiratory illness but can rarely cause severe pneumonia or sudden weakness of the limbs, especially in children. It spreads mainly through respiratory secretions and contaminated surfaces.

Enterovirus Infection

Alternate name; see *Enterovirus*.

Enthesis

The place where a tendon, ligament, or joint capsule attaches to bone. Repeated stress or inflammation there can cause localized pain and stiffness and occurs in several inflammatory joint diseases.

Enthesitis

Inflammation where a tendon, ligament, or joint capsule attaches to bone. It can cause localized pain, tenderness, and stiffness and is common in spondyloarthritis, including psoriatic and inflammatory-bowel-disease-related arthritis.

Enthesitis And Enthesopathy

Enthesitis is inflammation where a tendon, ligament, or fascia attaches to bone. Enthesopathy includes inflammation, wear, injury, or other disease at that site and may cause localized pain and stiffness.

Alternate Names:
Enthesopathy; Insertion Tendinopathy

Enthesitis-Related Arthritis

A type of arthritis that begins in childhood and causes inflammation where tendons or ligaments attach to bone. It often affects the legs, feet, or lower back and may also cause swelling in joints or pain where the heel tendon attaches.

Alternate Names:
ERA; Juvenile Spondyloarthritis

Entorhinal Cortex

A region of the brain that links the hippocampus with other memory and navigation areas. It helps process spatial information and new memories and is affected early in many cases of Alzheimer disease.

ENT Physician

An otolaryngologist, a physician who diagnoses and treats disorders of the ear, nose, throat, and related head and neck structures.

Entrance Wound

The wound where a projectile enters the body. Its appearance may help estimate the direction and distance of the shot, but findings vary with the

weapon, clothing, body site, and circumstances and require forensic examination.

Entropion

Inward turning of an eyelid, usually the lower lid, so the eyelashes rub against the eye. It can cause irritation, tearing, pain, corneal scratches, infection, and reduced vision.

Enucleation

Surgical removal of an organ or a well-defined growth in one piece. In eye surgery, it means removing the eyeball while leaving most surrounding tissues in place; a growth may also be enucleated when it can be separated from nearby tissue.

Alternate Names:
Ocular Enucleation; Eye Enucleation; Surgical Enucleation

Enucleation Procedure

Alternate name; see *Enucleation*.

Enuresis

Repeated involuntary urination, usually during sleep in a child expected to remain dry. It may be primary or begin again after dryness; constipation, infection, diabetes, sleep problems, stress, or urinary disorders may contribute.

Environment

The physical, chemical, biological, and social surroundings in which a person lives or works. Environmental factors such as air, water, housing, noise, climate, and pollutants can influence health.

Environmental Exposure

Contact with a chemical, pollutant, organism, physical hazard, or other factor in the surroundings. Health effects depend on the substance, dose, route, duration, timing, and individual susceptibility.

Environmental Health

The field concerned with how surroundings affect human health. It includes air and water quality, food safety, housing, workplace hazards, climate, radiation, pollution, and prevention of harmful exposures.

Environmental Illness

Illness caused or worsened by an environmental exposure. Evaluation considers the timing, dose, setting, symptoms, other possible causes, and whether symptoms improve when exposure stops.

Enzyme

A protein, or occasionally an RNA molecule, that speeds a specific chemical reaction without being used up. Enzymes are essential for digestion, energy production, DNA processes, and many other cell functions.

Enzyme Activity

The rate at which an enzyme carries out a chemical reaction under specified conditions. It is affected by temperature, acidity, inhibitors, helper molecules, substrate amount, and enzyme concentration.

Enzyme Deficiency

Reduced or absent activity of an enzyme, usually inherited or sometimes acquired. It can cause buildup of substances, lack of needed products, and characteristic metabolic or cellular disease.

Enzyme Induction

Increased production or activity of an enzyme, often after exposure to a medicine or chemical. If liver drug-metabolizing enzymes are induced, some medicines may be broken down faster and become less effective.

Enzyme Inhibition

Reduced activity of an enzyme, sometimes caused by a medicine or chemical. If a drug-metabolizing enzyme is inhibited, another medicine may accumulate and cause stronger effects or toxicity.

Enzyme Kinetics

The study of how quickly enzyme reactions occur and how their rate changes with substrate amount, temperature, acidity, inhibitors, helper molecules,

and enzyme concentration.

Enzyme-Linked Immunosorbent Assay

A laboratory test that uses antibodies and an enzyme-generated color signal to detect or measure a target such as an antibody, antigen, hormone, or infection marker.

Enzyme Markers

Enzymes measured in blood or another body fluid to help assess tissue injury or organ function. Abnormal levels can suggest liver, bile-duct, muscle, heart, bone, or pancreatic disease but are not a diagnosis by themselves.

Enzyme Precursors

Inactive or weakly active proteins that become working enzymes after being cut or chemically changed. This allows the body to activate digestive and other enzymes at the correct place and time.

Enzyme Therapy

Treatment that replaces, supplements, blocks, or uses an enzyme to correct a deficiency or alter a disease process. The purpose, dose, benefits, and risks depend on the specific enzyme and condition.

Eosin

An acidic red dye used in histology, commonly with hematoxylin in H&E staining. It colors many cytoplasmic and extracellular proteins pink to red, helping show tissue structure.

Eosinophil

A specialized type of white blood cell that forms part of the immune system. Eosinophils play key roles in defending the body against parasitic infections (such as worms) and participate in allergic reactions and asthma. Elevated levels in the bloodstream often indicate an allergic response, asthma flare-up, medication reaction, or parasitic disease.

Alternate Names:
Eosinophils; Eosinophilic Granulocyte

Eosinophilia

An abnormally high number of eosinophils in the blood, commonly caused by allergy, parasites, medicines, autoimmune disease, or some blood disorders. Severe or persistent elevation can injure the heart, lungs, skin, nerves, or other organs.

Eosinophilia-Myalgia Syndrome

A potentially severe illness characterized by intense muscle pain and increased eosinophils, historically associated with contaminated L-tryptophan supplements. It may also cause rash, swelling, nerve symptoms, breathing problems, or internal-organ injury.

Eosinophilic Asthma

Asthma in which eosinophils, a type of white blood cell, contribute to airway inflammation. It may cause recurring wheezing, cough, chest tightness, or breathlessness and can be difficult to control in some people.

Eosinophilic Bronchitis

A cause of long-lasting cough in which eosinophils inflame the airways without the variable narrowing typical of asthma. The cough may resemble asthma or reflux.

Eosinophilic Esophagitis

A chronic immune-related disease in which eosinophils inflame the esophagus. It may cause difficulty swallowing, food becoming stuck, chest or upper-abdominal pain, reflux-like symptoms, and narrowing of the esophagus.

Eosinophilic Esophagitis Pathology

Esophageal mucosal disease with increased intraepithelial eosinophils, basal-zone hyperplasia, spongiosis, and sometimes lamina-propria fibrosis. Histologic findings are interpreted with symptoms and endoscopic features.

Eosinophilic Enteritis

A rare inflammatory disorder in which eosinophils, a type of white blood cell, build up in the small intestine. It may cause abdominal pain, nausea,

vomiting, diarrhea, bleeding, or poor nutrient absorption. Diagnosis uses tissue samples and checks for other causes of eosinophils.

Eosinophilic Fasciitis

A rare inflammatory disease causing painful swelling and hardening of the deeper skin and tissue around muscles, usually in the arms or legs. Blood eosinophils may be high, and joint stiffness or limited movement can develop.

Alternate Names:
Shulman Syndrome; Diffuse Fasciitis with Eosinophilia

Eosinophilic Gastroenteritis

A rare immune-related disease in which eosinophils inflame the stomach or intestines. Symptoms may include abdominal pain, nausea, vomiting, diarrhea, bleeding, poor absorption, or weight loss.

Eosinophilic Gastritis

Inflammation of the stomach lining with an unusually large number of eosinophils, a type of white blood cell. It may cause abdominal pain, nausea, vomiting, or feeling full early. Diagnosis uses symptoms and stomach tissue samples while checking for other causes of eosinophils.

Eosinophilic Gastrointestinal Disorders

Conditions in which eosinophils, a type of white blood cell, build up in one or more parts of the digestive tract and cause inflammation. Symptoms may include pain, vomiting, swallowing difficulty, diarrhea, or poor growth; diagnosis usually requires endoscopy and biopsy.

Eosinophilic Granuloma

A localized form of Langerhans-cell disease in which abnormal immune cells collect, often in bone or skin. Bone lesions can cause pain, swelling, or fractures and may require imaging and tissue examination.

Eosinophilic Granuloma (Pulmonary Histiocytosis X)

Historical or imprecise label; see *Pulmonary Langerhans Cell Histiocytosis*.

Eosinophilic Granulomatosis With Polyangiitis

A rare disease in which inflamed blood vessels occur with asthma and high levels of eosinophils, a type of white blood cell. It can damage the lungs, skin, nerves, heart, kidneys, or digestive organs.

Alternate Names:
Allergic Granulomatosis Allergic Granulomatosis and Angiitis

Eosinophilic Pneumonia

A group of lung diseases in which eosinophils, a type of white blood cell, build up in the lungs. It may cause cough, fever, and shortness of breath. Causes include medicines, parasites, and immune disease; sometimes no cause is found.

Eosinophilic Pneumonia Pathology

Lung inflammation rich in eosinophils involving alveolar spaces, interstitium, or both. Additional findings may include organizing pneumonia, edema, and eosinophilic infiltrates around vessels or airways.

Eosinophils

Plural form; see *Eosinophil*.

Ependyma

A specialized layer of cells lining the brain's fluid-filled ventricles and the spinal cord's central canal. It helps separate nervous tissue from cerebrospinal fluid and supports movement of that fluid.

Ependymal Cell

A supporting cell lining the brain ventricles and spinal cord central canal. It helps maintain the cerebrospinal-fluid boundary and, in some areas, helps move or produce the fluid.

Ependymal Tumor

Alternate name; see *Ependymoma*.

Ependymoblastoma

A rare, aggressive brain tumor of childhood made from very immature cells. It may cause headache, vomiting, seizures, or changes in movement or devel-

opment; tissue and genetic testing guide treatment and outlook.

Ependymoma

A tumor arising from cells lining the brain ventricles or spinal canal. It may block fluid flow and cause headache, vomiting, seizures, balance problems, weakness, or hydrocephalus, especially in children.

Ephedrine

A stimulant that activates the sympathetic nervous system and can widen airways and raise blood pressure and heart rate. It has limited medical uses and may cause palpitations, insomnia, anxiety, high blood pressure, or misuse.

Ephedrinum

Another name for ephedrine, a stimulant that can increase heart rate, blood pressure, alertness, and airway diameter. Excessive use may cause dangerous heart-rhythm, blood-pressure, or nervous-system effects.

Ephelides

Small, flat freckles caused by increased pigment production, often inherited. They become darker with sunlight and usually fade when exposure decreases; sun protection helps prevent further pigment change and skin damage.

Ephrins

Proteins on the surface of cells that help guide cell position, nerve growth, blood-vessel development, and tissue organization. Abnormal ephrin signaling can contribute to some diseases and cancers.

Epiblast

A layer of cells in the early embryo that develops into the three main cell layers of the body and ultimately forms most tissues and organs.

Epicanthal Folds

Skin folds of the upper eyelid that partly cover the inner corner of the eye. They are normal in many people but can also occur with some chromosome or developmental conditions.

Alternate Names:
Epicanthus

Epicardium

The thin outer layer of the heart wall and the inner layer of its surrounding protective sac. It contains connective tissue, fat, blood vessels, and nerves and helps reduce friction as the heart beats.

Epichlorohydrin

An industrial chemical used to make resins and other materials. Exposure can irritate or burn the skin, eyes, and airways; swallowing or substantial exposure can cause serious poisoning and requires urgent medical advice.

Epicondyle

A bony projection beside a rounded joint surface where muscles and ligaments attach. Repeated strain or injury around an elbow epicondyle can cause localized pain and weakness.

Epicondylitis

Pain and tenderness where a tendon attaches near an epicondyle, usually from repeated strain rather than infection. At the elbow it can weaken gripping and wrist movement and is commonly called tennis or golfer's elbow.

Epicondylitis (Tennis Elbow)

Overuse-related pain at the outer elbow, usually involving tendons that attach forearm muscles to the lateral epicondyle. Despite the name, it is generally tendinopathy rather than acute inflammation and may cause pain with gripping or wrist extension.

Epidemic

An increase in disease cases above the number normally expected in a population, place, or period. An epidemic may result from infection, environmental exposure, behavior, or another shared cause.

Epidemic Cerebrospinal Meningitis

Historical name; see *Meningococcal Meningitis*.

Epidemic Cholera

Alternate name; see *Cholera*.

Epidemic Keratoconjunctivitis

A very contagious viral infection of the eye. It can cause red eyes, pain, watering, swollen eyelids, light sensitivity, blurred vision, and swollen glands near the ear; symptoms may last for weeks.

Alternate Names:
EKC; Adenoviral Keratoconjunctivitis; Shipyard Eye

Epidemiological Study

A study of health and disease in groups of people. It may measure how often a condition occurs, compare possible causes or exposures, or examine outcomes over time to help guide prevention and healthcare planning.

Alternate Names:
Epidemiologic Study

Epidemiologic Method

A structured way to measure how often a health problem occurs and to study whether exposures, behaviors, or other factors are associated with it in a population. Results guide prevention and policy.

Epidemiologic Studies

Research that examines the distribution, causes, risk factors, prevention, or outcomes of health events in populations.

Epidemiologist

A scientist or public-health professional who studies the distribution, causes, risk factors, and prevention of health conditions in populations.

Epidemiology

The study of how often diseases and other health events occur, who is affected, and which factors influence them. It uses population data to identify causes, guide prevention, investigate outbreaks, and evaluate healthcare.

Epidermal

Relating to the epidermis, the outermost layer of skin. An epidermal problem affects this protective surface layer rather than the deeper skin tissues.

Epidermal Acanthosis

Thickening of the epidermis caused by increased growth of its cells, seen in conditions such as psoriasis, chronic rubbing, and some inflammatory or genetic skin disorders.

Epidermal Cells

Cells forming the outer layer of skin, chiefly keratinocytes, which create a protective barrier; melanocytes, immune cells, and touch-associated cells are also present.

Epidermal Growth Factor

A signaling protein that binds the epidermal-growth-factor receptor and promotes cell growth, survival, and tissue repair; abnormal signaling can contribute to cancer.

Epidermal Inclusion Cyst

A common, usually harmless lump beneath the skin filled with keratin, a protein found in skin. It often has a small central opening and may become swollen, painful, infected, or recur if its wall remains.

Epidermal Layers

The epidermis has several layers of cells that make and protect the skin. From deepest to most superficial they are basal, spinous, granular, clear, and horny layers; the clear layer is mainly in the palms and soles.

Epidermal Nevus

A usually benign, often present-from-birth or childhood skin lesion caused by an overgrowth of epidermal cells. It commonly appears as a localized, linear, or warty thickened patch and may occur with other developmental abnormalities.

Epidermal Nevus Syndrome

A group of mosaic developmental disorders in which extensive or systematized epidermal nevi occur with abnormalities of the brain, eyes, skeleton, limbs, or other organs. Evaluation is guided by the distribution of the nevi and associated neurologic, ocular, or musculoskeletal findings.

Epidermis

The outer layer of skin that forms a protective barrier against injury, germs, and water loss. It contains cells that make keratin and pigment, as well as immune and touch-sensing cells, and it is replaced continuously.

Epidermodysplasia Verruciformis

A rare inherited or acquired disorder of cutaneous immunity in which susceptibility to specific beta-human papillomaviruses causes persistent flat wart-like or pityriasis-versicolor-like lesions. Sun-exposed lesions can develop actinic keratosis and cutaneous squamous-cell carcinoma, so lifelong skin surveillance and sun protection are important.

Epidermoid Cyst

A benign, slow-growing, intradermal or subcutaneous cystic lesion lined by a true, orderly stratified squamous epithelium with a distinct granular cell layer, containing laminated, cheesy, foul-smelling keratinaceous debris. Commonly misnamed "sebaceous cyst," it does not originate from sebaceous glands but arises from follicular infundibular epithelium, traumatic epidermal inclusion, or embryonic sequestration during closure of ectodermal lines. Classically presents as a firm, mobile, non-tender, dome-shaped cutaneous nodule, frequently exhibiting a central punctum (the plugged follicular orifice), most commonly situated on the face, neck, scalp, and upper trunk. Rupture of the cyst wall releases keratin into the surrounding dermis, provoking a vigorous, acutely painful foreign-body inflammatory reaction that mimics secondary bacterial infection. Definitive curative management requires complete surgical excision of the intact cyst wall (capsule); incomplete excision of the lining frequently leads to local recurrence.

Alternate Names:
Epidermoid Cysts; Epidermal Inclusion Cyst; Infundibular Cyst

Epidermoid Cysts

Plural form; see *Epidermoid Cyst*.

Epidermolysis Bullosa

A group of rare disorders causing fragile skin that blisters or tears after minor friction or trauma. Most forms result from inherited defects in proteins that anchor skin layers; epidermolysis bullosa acquisita is an acquired autoimmune form. Blisters may affect mucous membranes and heal with or without scarring, depending on the subtype.

Alternate Names:
Bullosa Hereditaria; Hereditary Epidermolysis Bullosa

Epidermolysis Bullosa Acquisita

An uncommon autoimmune blistering disease in which antibodies target type VII collagen, a protein anchoring the epidermis to the dermis. Tense blisters and erosions develop after minor trauma, often heal with scarring or milia, and may affect mucous membranes.

Epidermolytic Ichthyosis

An inherited keratinization disorder, usually caused by variants in KRT1 or KRT10, in which newborns may have widespread redness and superficial blistering that later evolves into thick, scaling skin and sometimes palmoplantar keratoderma.

Alternate Names:
Epidermolytic Hyperkeratosis; Bullous Congenital Ichthyosiform Erythroderma

Epidermophyton

A group of fungi that grow in keratin, a tough protein in skin, hair, and nails. They can cause ringworm infections, including itchy, scaly skin disease and fungal infection of the nails, but do not usually infect living hair shafts.

Epidermophyton Floccosum

A dermatophyte fungus that commonly causes tinea of the body, groin, and feet and can infect nails.

Epididymal Cyst

A usually benign, fluid-filled cyst arising in the epididymis. It may be painless; larger cysts can cause discomfort or other complications.

Epididymal Neoplasm

A benign or malignant growth arising in the epididymis; most palpable epididymal masses are benign, though persistent or enlarging lesions can have varied causes.

Epididymides

The paired coiled ducts on the posterior surface of the testes where sperm mature and are stored before entering the vasa deferentia.

Alternate Names:
Epididymal Ducts

Epididymis

A tightly coiled tube along the back of each testicle where sperm mature, gain the ability to move, and are stored before passing into the vas deferens. It has a head, body, and tail.

Epididymitis

Inflammation of the epididymis, usually caused by infection. It often causes gradually developing, one-sided scrotal pain and swelling. Causes include sexually transmitted infections, urinary bacteria, urinary obstruction, and less often injury or medicines. Sudden severe pain can occur with testicular torsion.

Epididymitis And Orchitis

Alternate name for epididymo-orchitis, inflammation of the epididymis and testicle.

Epididymo-Orchitis

Inflammation of the epididymis and testicle, usually caused by an infection. It can cause one-sided scrotal pain, swelling, redness, painful urination, and fever. The cause may be a sexually transmitted infection or bacteria from the urinary tract, depending on the person and situation. Sudden severe pain can also occur with testicular torsion; treatment depends on the cause.

Alternate Names:
Epididymo-orchitis; Testicular and Epididymal Inflammation; Orchiepididymitis

Epidural

Regional analgesia or anesthesia produced by injecting medicine into the epidural space outside the dura surrounding the spinal cord. A catheter often allows continuous or repeated dosing. Epidurals provide pain relief during labor, surgery, and postoperative recovery. Unlike spinal anesthesia, the medicine is delivered outside the cerebrospinal fluid.

Epidural Abscess

A pocket of pus between the tough outer covering of the brain or spinal cord and nearby bone. It can compress the brain, spinal cord, or nerves, causing fever, severe pain, weakness, numbness, or loss of bladder control and requires emergency treatment.

Epidural Analgesia

Pain relief produced by delivering numbing medicine, sometimes with an opioid, through a small catheter into the space around the spinal nerves. It may be used during labor or surgery while the person remains awake. Low blood pressure, itching, headache, infection, or incomplete relief can occur.

Epidural Analgesia For Labor

Pain relief during labor provided through a small catheter placed in the lower back. Numbing medicine, sometimes with an opioid, is given gradually to reduce pain while allowing the laboring person to remain awake and participate in birth. Temporary low blood pressure, itching, headache, or incomplete relief can occur.

Epidural Anesthesia

Regional anesthesia produced by injecting numbing medicine, sometimes with an opioid, into the space around the spinal nerves. It blocks pain from part of the body while the person stays awake; low blood

pressure, headache, infection, or nerve injury can rarely occur.

Alternate Names:
Epidural Anaesthesia

Epidural Blood Patch

A procedure that injects a small amount of the person's own blood into the space around the spinal nerves to seal a leak after spinal anesthesia or an accidental puncture. It usually treats a severe positional headache; back pain, infection, or another puncture can occur.

Epidural Hematoma

A serious condition in which blood accumulates between the skull bone and the tough outer membrane covering the brain (the dura mater). It usually results from a traumatic blow to the head that fractures the skull and tears an underlying artery. As bleeding rapidly increases pressure inside the skull, it can compress brain tissue. A classic feature is a brief period of unconsciousness followed by a temporary lucid interval of alertness, before rapid deterioration with severe headache, vomiting, confusion, and loss of consciousness.

Alternate Names:
Extradural Hematoma; EDH

Epidural Neoplasm

A tumor in the space outside the dura surrounding the spinal cord or brain; spinal epidural tumors can compress nerves or the spinal cord and cause pain, weakness, or sensory loss.

Epidural Space

The space between the tough outer covering of the spinal canal and the canal wall. Medicines injected there can reduce pain during childbirth, surgery, or some pain treatments.

Epidural Steroid Injection

An injection of corticosteroid into the space around spinal nerves, usually guided by X-ray. It may reduce pain from an irritated or compressed nerve, such as with a herniated disc, but relief varies and may be temporary. Risks include bleeding, infection, headache, and a temporary rise in blood sugar.

Alternate Names:
ESI; Epidural Corticosteroid Injection

Epigastric

Relating to the upper middle area of the abdomen between the ribs. Pain there may arise from the stomach, esophagus, pancreas, gallbladder, intestine, or other organs.

Epigastric Artery

An artery supplying the front abdominal wall. The superior and inferior epigastric arteries provide blood to abdominal muscles and skin and are important landmarks during some procedures.

Epigastric Pain

Pain or discomfort in the upper middle abdomen, below the ribs and above the navel. Causes include indigestion, ulcer, reflux, gallbladder disease, pancreatitis, and other conditions; pain may be severe or persistent.

Epigastric Region

The upper middle section of the abdomen between the rib margins and above the navel. It overlies parts of the stomach, duodenum, pancreas, and liver; pain there can have several digestive or vascular causes.

Epigastrium

The upper middle part of the abdomen, below the breastbone and between the ribs. It overlies parts of the stomach, liver, pancreas, and small intestine; pain there has many possible causes.

Epigenetics

Changes in how genes are switched on or off without changing the DNA sequence itself. Chemical tags and DNA-packaging changes can be influenced by development, environment, and illness and may sometimes be reversible.

Epigenome

The collection of chemical tags and DNA-packaging features that help control which genes are active in

a cell without changing the DNA sequence.

Epigenomics

The study of chemical and structural changes that control which genes are active across the genome without changing the DNA sequence. These changes can influence development, disease, and treatment response.

Epiglottic Vallecula

A shallow mucosal depression situated in the glossoepiglottic space between the base of the tongue and the anterior surface of the epiglottis, bounded by median and lateral glossoepiglottic folds, serving as the anatomical seat for the tip of a curved Macintosh laryngoscope blade during endotracheal intubation.

Alternate Names:
Vallecula Epiglottica; Vallecular Fossa

Epiglottis

A leaf-shaped flap of flexible tissue at the base of the tongue that helps direct food and liquid into the esophagus during swallowing and away from the airway. Swelling can rapidly obstruct breathing.

Epiglottitis

Rapid swelling of the epiglottis, the flap at the entrance to the windpipe that helps keep food and liquid out during swallowing. It is usually caused by bacteria. The swelling can narrow or block the breathing passage and cause fever, severe sore throat, drooling, trouble swallowing, or noisy breathing.

Alternate Names:
Supraglottitis

Epilepsia Partialis Continua

Repeated or nearly continuous twitching in one part of the body, often an arm, leg, or side of the face. Awareness may remain normal, and the condition can last for hours or longer.

Alternate Names:
EPC; Kojewnikoff Syndrome

Epilepsy

A chronic neurological disorder characterized by recurrent, unprovoked seizures. A seizure occurs when sudden, abnormal surges of electrical activity disrupt normal communication between brain cells. The nature of seizures varies widely, from brief staring spells or muscle twitches to convulsions with loss of consciousness. It can stem from brain injuries, strokes, genetic factors, or infections, though in many cases no specific cause is found.

Alternate Names:
Seizure Disorder

Epilepsy and Seizures

Epilepsy is a brain disorder involving an enduring tendency to have unprovoked seizures. A seizure is a discrete episode of abnormal brain electrical activity and may also result from a temporary provoking cause; one seizure alone does not necessarily mean a person has epilepsy.

Epilepsy Surgery

Surgery or a procedure used for selected people whose seizures continue despite appropriate medicines and arise from an area that can be safely treated. Detailed testing identifies the seizure source and estimates benefits and risks.

Epileptic Spasms

Brief seizures, most common in infancy, in which the head, body, arms, or legs suddenly bend or stiffen. They often occur in clusters and may be associated with developmental impairment, depending on the underlying cause and epilepsy syndrome.

Epileptiform

Resembling a seizure or the electrical pattern associated with seizure activity. It may describe movements or an EEG finding but does not by itself prove that a person has epilepsy.

Epimysium

A substantial sheath of dense irregular collagenous connective tissue that completely envelops the entire exterior surface of a skeletal muscle, continuous with tendons, muscular fascial planes, and the periosteum

of bone.

Epinephrin

Alternate spelling; see *Epinephrine*.

Epinephrine

A hormone and neurotransmitter released during stress that increases heart activity, opens the airways, and narrows many blood vessels. As a medicine, it treats anaphylaxis and selected cardiac or breathing emergencies.

Alternate Names:
Adrenaline

Epineurium

The thick, outermost fibrous connective tissue sheath that encloses an entire peripheral nerve, surrounding multiple nerve fascicles, longitudinal blood vessels (vasa nervorum), and adipose tissue to provide tensile mechanical protection.

Epiphora

Excessive tearing caused by blocked tear drainage or irritation that triggers extra tears. Causes include dry eye, allergy, infection, eyelid position problems, and blockage of the tear duct.

Epiphyseal Plate

The growth plate, a layer of cartilage near the end of a growing bone that allows the bone to lengthen. It gradually closes after puberty; injury can cause pain, deformity, or unequal growth.

Alternate Names:
Growth Plate; Physis

Epiphyseal Plate Disorders

Conditions affecting a growing bone's growth plate, including fractures, inflammation, infection, abnormal blood supply, premature closure, and disorders in which an epiphysis shifts or separates. They may cause pain, swelling, limping, deformity, or unequal limb growth.

Epiphysis

The expanded end of a long bone, usually covered by smooth cartilage where it forms a joint. It contains mostly spongy bone and helps determine the shape and movement of the joint.

Epiphysitis

Inflammation or injury involving a growth plate or the area near the end of a growing bone. It may cause localized pain, swelling, or altered growth, and the cause depends on age and the affected bone.

Epiploic Foramen

The narrow anatomical communication aperture connecting the greater peritoneal sac with the lesser sac (omental bursa), bounded anteriorly by the hepatoduodenal ligament (containing the portal triad), posteriorly by the inferior vena cava, superiorly by the caudate lobe of the liver, and inferiorly by the first part of the duodenum.

Alternate Names:
Foramen of Winslow

Epipodophyllotoxin

A group of cancer medicines derived from a plant compound that damage DNA by blocking an enzyme needed for cell division. They treat selected cancers but may cause low blood counts, nausea, hair loss, infection, or rarely a later blood cancer.

Epiretinal Membrane

A thin layer of cells and connective tissue that forms on the inner surface of the retina, usually over the macula. It may contract, wrinkle the retina, and distort central vision.

Alternate Names:
Macular Pucker

Epirubicin

An anthracycline cancer medicine that damages DNA and blocks cell division. Important risks include low blood counts, infection, nausea, hair loss, tissue injury after leakage, and dose-related heart damage.

Epirubicin Hydrochloride

Drug salt; see *Epirubicin*.

Episcleritis

Usually short-lived inflammation of the thin tissue over the white of the eye, causing a localized red patch and mild tenderness or discomfort. Severe pain, light sensitivity, or vision loss suggests deeper eye disease.

Episiotomy

A cut made in the tissue between the vagina and anus during vaginal birth to enlarge the opening. Routine use is not recommended; selected use may help urgent or assisted delivery but can cause pain, bleeding, infection, or deeper tearing.

Episiotomy Repair

Closing an episiotomy or related tear with stitches after birth. The area is examined to identify deeper injury, and care includes pain relief, hygiene, monitoring for infection, and follow-up of healing and pelvic-floor function.

Episodic Ataxia

An inherited condition causing repeated attacks of poor coordination and balance. Episodes may last seconds to hours and can include dizziness, slurred speech, muscle tightening, or abnormal eye movements, with improvement between attacks.

Epispadias

A birth defect in which the urethral opening is on the upper surface of the penis or in an unusual position in a female. It may affect urine control and is sometimes associated with bladder-exstrophy conditions.

Epistasis

A genetic interaction in which one gene changes or masks the effect of another gene. This can alter inherited traits and complicate how a disease risk or laboratory finding is predicted from genetic testing.

Epistaxis

Medical term; see *Nosebleeds*.

Epithalamic

Relating to the epithalamus, a small region near the center of the brain that includes the pineal gland and structures involved in sleep timing, hormonal rhythms, and responses to reward or stress.

Epithalamus

A dorsal posterior division of the diencephalon comprising the pineal gland (epiphysis cerebri), the habenular nuclei, the stria medullaris thalami, and the posterior commissure, involved in circadian melatonin rhythmicity and limbic-midbrain connections.

Epithelial

Relating to cells that cover the skin, line body passages and organs, or form glands. These cells protect surfaces and may absorb substances, release fluids, or help detect changes.

Epithelial Cells

Cells that cover the skin, line body passages and organs, and form many glands. They create a protective barrier and may absorb substances, release fluids, move material, or sense changes in their surroundings.

Alternate Names:
Epithelial Tissue Cells

Epithelial Cyst

A usually benign, enclosed sac lined by surface-type cells and filled with fluid, mucus, or a skin protein called keratin. It may enlarge, become painful, or become infected and sometimes requires removal.

Epithelial Tissue

Tissue made of closely packed cells that covers the skin, lines internal spaces and tubes, and forms glands. It provides protection and may absorb, secrete, transport, or exchange substances.

Epithelioid Cell

A rounded cell that resembles a surface-lining cell. The term often describes an activated immune cell in a granuloma, but it can also describe the appearance of some tumors.

Epithelioid Histiocyte

An activated macrophage that has undergone structural transformation under the influence of interferon-gamma in chronic granulomatous inflammation, acquiring abundant pale eosinophilic cytoplasm, elongated slipper-shaped nuclei, and indistinct cell borders resembling epithelial cells.

Epithelioid Sarcoma

A rare cancer of connective or soft tissue, often beginning in the skin or deeper tissues of the hands, forearms, feet, or lower limbs. It may recur or spread and requires specialist treatment.

Epithelioid Trophoblastic Tumor

A rare pregnancy-related cancer arising from cells that normally help form the placenta. It may appear months or years after pregnancy, cause abnormal bleeding, and requires specialist cancer treatment.

Epithelioma

An older or broad term for a tumor arising from epithelial cells; the specific diagnosis should identify whether it is benign, precancerous, or malignant.

Epitheliopathy

Disease or damage of epithelial tissue, the cells that cover body surfaces and line organs. The term alone does not specify the affected tissue or the type of damage; these are identified separately, as in corneal epitheliopathy.

Epithelium

A layer or sheet of closely packed cells covering the skin, lining body spaces and tubes, or forming glands. It protects surfaces and may absorb substances, release fluids, transport material, or allow exchange.

Epitope

The small, specific part of an antigen that is recognized by an antibody or immune-cell receptor. Recognition can trigger an immune response; epitopes are important in infections, vaccines, allergies, and antibody-based treatments.

Epitope Mapping

The process of identifying an epitope, the small part of an antigen recognized by an antibody or specific immune-cell receptor. It helps researchers understand immune responses and develop vaccines, diagnostic tests, and antibody-based treatments.

Eplerenone

A medicine that blocks aldosterone, a hormone that promotes salt retention and heart remodeling. It treats high blood pressure and selected heart-failure patients; kidney function and blood potassium require monitoring.

Epley Maneuver

A sequence of head and body movements that returns displaced inner-ear particles to their usual position. It can relieve brief spinning triggered by head movement in posterior-canal positional vertigo.

Epoetin Alfa

A laboratory-made form of erythropoietin that stimulates the bone marrow to produce red blood cells. It treats selected anemias, but can raise blood pressure and the risk of blood clots if hemoglobin rises too high.

Epoetin Beta

A laboratory-made form of erythropoietin used for selected anemias, including some caused by chronic kidney disease. It may cause high blood pressure or blood clots.

Eponym

A medical name derived from a person's name or another proper name, such as the name of a disease, sign, procedure, or body structure. Eponyms may be replaced by descriptive terms to improve clarity.

Epoprostenol

A short-acting medicine that widens blood vessels in the lungs and reduces platelet clumping. Continuous intravenous infusion treats severe pulmonary arterial hypertension; interruption can cause rapid worsening.

EPO Test

Abbreviation; see *Erythropoietin Test*.

Epoxide Hydrolase

An enzyme that changes reactive chemicals called epoxides into less reactive substances. It helps process some medicines, toxins, and natural fats and can influence their effects and the risk of tissue injury.

Epoxy Compounds

Chemicals containing a reactive group used in adhesives, coatings, plastics, and other materials. Uncured components can irritate the skin and eyes, cause allergic skin inflammation, or irritate the airways; workplace exposure may cause asthma.

Epsom Salts

Magnesium sulfate crystals used in some baths and, occasionally, as a laxative. Drinking them can cause diarrhea or magnesium poisoning, especially in people with kidney disease, so medical advice is important.

Epstein-Barr Virus

A common virus spread mainly through saliva. It can cause infectious mononucleosis and remains dormant in the body; it is also linked to some lymphomas, other cancers, and immune disorders.

Epstein-Barr Virus Antibody Test

A blood test that measures antibodies produced against Epstein-Barr virus. The pattern of antibodies, symptoms, and timing can help distinguish recent infection from past infection, but results need clinical interpretation.

Epstein Pearls

Small, white, harmless cysts containing keratin that appear on a newborn's gums or roof of the mouth. They usually disappear within weeks without treatment and should not be squeezed.

Eptifibatide

An injectable antiplatelet medicine used during selected urgent coronary treatments. It prevents platelets from clumping by blocking a platelet-binding receptor, but can cause serious bleeding and requires blood-count and kidney monitoring.

Epulis

A localized growth arising from the gum or tissues around a tooth. Most are reactive and benign, but persistent, painful, bleeding, or enlarging growths need dental examination and sometimes biopsy.

Equilibrium Receptors

Sensory cells in the inner ear that detect head movement and position. Signals from them, the eyes, and muscles help the brain maintain balance and coordinate posture and eye movements.

Equilin

An estrogen hormone found mainly in pregnant mares and included in some mixtures of conjugated estrogens. Estrogen treatment can increase the risk of blood clots and other adverse effects and requires individualized medical advice.

Equine Morbillivirus

A historical name for Hendra virus, a henipavirus in the family *Paramyxoviridae*. It was identified during outbreaks of severe respiratory and neurologic disease in horses and can also infect people and other mammals.

Equinovarus Deformity

A deformity in which the foot points downward and turns inward. It may be present at birth or develop from muscle, nerve, joint, or bone problems, limiting walking and requiring cause-specific treatment.

Equipment Safety

Measures that reduce harm from medical devices by using the correct equipment, checking it before use, cleaning it properly, maintaining it, and training users. Faulty equipment should be removed from service.

Equivalence Trial

A clinical study designed to determine whether a new treatment and an established treatment have effects within a predefined clinically acceptable range of one another. The range must be set before results are analyzed.

Eradication

Complete removal of an infection or disease from a person or population. For an individual infection, eradication may require a full treatment course and a follow-up test to confirm that the organism is gone.

Erbb Receptors

A family of cell-surface proteins that receive growth signals and regulate cell division, survival, and specialization. Abnormal activity in some members can promote cancers and may guide targeted treatment.

Erbium

A chemical element used in specialized lasers and materials. Erbium lasers can precisely remove or remodel selected skin and dental tissue; treatment may cause pain, burns, pigment changes, or scarring.

Erb Palsy

A peripheral obstetric or traumatic traction injury to the upper trunk of the brachial plexus involving spinal nerve roots C5 and C6 (and sometimes C7), causing paralysis of the deltoid, supraspinatus, infraspinatus, and biceps brachii muscles, resulting in an adducted, internally rotated shoulder and extended, pronated forearm ('waiter's tip' posture).

Alternate Names:
Erb-Duchenne Palsy; Upper Trunk Brachial Plexus Palsy

Erb's Palsy

Weakness or paralysis of the shoulder and arm caused by injury to the upper nerves of the brachial plexus, often during difficult birth. The arm may hang inward with the elbow straight and palm facing backward.

ERCP

A procedure using a flexible camera and X-ray guidance to diagnose or treat blocked, narrowed, or leaking bile or pancreatic ducts. It can remove stones or place a stent, but may cause pancreatitis, bleeding, infection, or perforation.

Erdheim-Chester Disease

A rare clonal histiocytic neoplasm associated with mutations in the MAPK signalling pathway, including BRAF V600E. It can affect multiple organs; characteristic findings include symmetric sclerosis of the long bones and infiltrative changes around the aorta or kidneys.

Alternate Names:
ECD; Non-Langerhans Histiocytosis

Erectile Disorder

Alternate name; see *Erectile Dysfunction*.

Erectile Dysfunction

Ongoing difficulty getting or keeping an erection firm enough for sex. It can be linked to blood-flow problems, diabetes, nerve or hormone conditions, medicines, stress, or depression. It may also be an early sign of heart or blood-vessel disease.

Erection

Temporary enlargement and stiffening of the penis when blood fills erectile tissue and drainage through veins decreases. It can occur with sexual stimulation, during sleep, or spontaneously and normally subsides afterward.

Erector Spinae

A group of muscles running along both sides of the spine. They straighten and stabilize the back and help bend the spine sideways during standing, walking, and lifting.

Alternate Names:
Sacrospinalis Muscle; Spinalis and Longissimus Complex

Ergocalciferol

Vitamin D2, a form of vitamin D used to prevent or

treat deficiency. It helps the body absorb calcium and maintain bones, but excessive doses can cause high blood calcium, nausea, confusion, or kidney injury.

Ergolines

A family of compounds related to chemicals made by ergot fungi. Some affect serotonin, dopamine, or adrenaline receptors and are used or studied for migraine, hormone disorders, or neurologic conditions.

Ergometrine

A medicine that contracts the uterus and narrows some blood vessels. It may help control severe bleeding after childbirth, but can dangerously raise blood pressure and is unsuitable for some people with hypertension or heart disease.

Ergonomics

Designing work, tools, furniture, and environments to match the body's abilities and limits. Good ergonomics can reduce strain, awkward posture, repetitive-injury risk, fatigue, and errors.

Ergosterol

A fat-like substance that helps maintain fungal cell membranes. Many antifungal medicines damage fungi by binding ergosterol or blocking its production; human cells use cholesterol instead.

Ergot

The dark, sclerotial resting stage of the parasitic fungus *Claviceps purpurea*, which infects cereal grains, particularly rye. Ergot produces potent pharmacologically active indole alkaloids (including ergotamine, ergometrine/ergonovine, and dihydroergotamine) that act as complex partial agonists and antagonists at adrenergic (α_1), serotonergic (5-HT_1, 5-HT_2), and dopaminergic (D_2) receptors. Therapeutically harnessed for acute abortive migraine treatment (via vasoconstriction of dilated extracranial arteries and inhibition of trigeminal sensory nerve activation) and prevention of postpartum uterine hemorrhage (via sustained myometrial contraction). Ingestion of contaminated flour or overdose of ergot medications produces ergotism ("St. Anthony's fire"), characterized by intense peripheral vasoconstriction leading to acral ischemia, gangrene of extremities, burning pain, and neuroconvulsive symptoms (hallucinations, seizures).

Alternate Names:
Ergots; Claviceps purpurea; Ergot Alkaloids

Ergotamine

A medicine that narrows certain blood vessels and can stop some migraine attacks. It has many interactions and should not be overused because it can cause dangerous loss of blood flow to the limbs or organs.

Ergotism

Poisoning caused by ergot toxins or excessive ergot-derived medicines. Severe blood-vessel narrowing can cause burning pain, numbness, cold or discolored limbs, confusion, seizures, tissue death, or dangerous uterine contractions.

Ergots

Plural form; see *Ergot*.

Eribulin Mesylate

A cancer medicine that interferes with microtubules, structures needed for cell division. It is used for selected advanced breast cancers and liposarcomas; common risks include low blood counts, nerve damage, fatigue, and nausea.

Erlotinib Hydrochloride

A cancer medicine that blocks growth signals from the epidermal growth-factor receptor. It treats selected cancers with suitable molecular changes and may cause rash, diarrhea, liver injury, or lung inflammation.

Erosion

Loss of only the surface layer of skin or a moist lining, without the deeper tissue loss of an ulcer. Friction, inflammation, infection, injury, or chemicals may cause it and may produce pain or bleeding.

Erosion Lesion

A shallow area where the surface layer of skin or a moist lining has been lost. It may result from rubbing, inflammation, infection, injury, or chemicals and usually heals when the cause is removed.

Erosive Esophagitis

Inflammation of the swallowing tube with visible breaks in its lining, usually from repeated stomach-acid reflux. It can cause painful swallowing, heartburn, or bleeding and may lead to narrowing if untreated.

Erosive Gastritis

Inflammation of the stomach lining with shallow breaks in its surface. It may cause pain, vomiting, or bleeding. Medicines, alcohol, infection, or severe illness can contribute; when injury occurs with little inflammation, it is called erosive gastropathy.

Erosive Lichen Planus

A long-lasting immune-mediated inflammation that causes painful raw areas, burning, bleeding, or soreness in the mouth or genital tissues. Scarring and narrowing may develop, so examination and treatment can help protect function.

Alternate Names:
Vulvovaginal Gingival Syndrome; Erosive Vulvovaginal Lichen Planus

Erratic Results

Test results that change unexpectedly or do not agree with repeated measurements. Possible causes include sample problems, device error, normal biological variation, medicines, or a test that does not fit the clinical question.

Ertapenem

A once-daily antibiotic for selected serious infections caused by susceptible bacteria. It does not reliably treat Pseudomonas or enterococcal infections and can cause diarrhea, allergic reactions, seizures, or antibiotic-resistant organisms.

Erucic Acid

A naturally occurring monounsaturated fatty acid found in the seeds of certain plants, particularly unrefined rapeseed and mustard plants. Because high dietary consumption was found to cause fatty deposits in heart muscle in animal studies, food safety standards mandate the use of low-erucic acid varieties (such as canola oil) in commercial food production.

Alternate Names:
Erucic Acids; cis-13-Docosenoic Acid

Erucic Acids

Plural form; see *Erucic Acid*.

Eructation

Release of swallowed air or gas from the stomach through the mouth, commonly called belching. Frequent troublesome belching may be related to swallowed air, reflux, food intolerance, or other digestive problems.

Alternate Names:
Belching; Burping

Eruption Cyst

A soft, fluid-filled swelling over a tooth that is about to come through the gum, often blue or purple. It usually disappears when the tooth erupts, but painful or infected swelling needs dental review.

Eruptive Fever

Fever occurring with a widespread rash. Viral infections are common causes, but bacteria, medicines, allergic reactions, and immune disorders can also be responsible; severe illness or breathing difficulty may occur.

Eruptive Vellus Hair Cysts

Benign follicular cysts containing fine vellus hairs that appear as multiple small, smooth, red-brown or skin-colored papules, often on the chest, abdomen, or limbs. They may be inherited or sporadic and usually need treatment only for symptoms or cosmetic reasons.

Eruptive Xanthomas

Sudden crops of small yellow-red bumps, often on the buttocks, elbows, knees, or trunk, caused by very high blood triglycerides. They signal a serious lipid disorder requiring prompt evaluation and treatment.

Eruptive Xanthomatosis

A sudden outbreak of many small yellow-red skin bumps caused by fat collecting in skin immune cells. It is usually linked to very high triglycerides, sometimes from uncontrolled diabetes or an inherited lipid disorder.

Eryptosis

A controlled process by which aging or damaged red blood cells shrink and are marked for removal from the bloodstream. It helps maintain blood-cell balance but may increase in some diseases or during oxidative stress.

Erysipelas

An acute bacterial infection of the upper dermis and superficial lymphatic vessels, most often caused by group A streptococci. It typically produces a raised, sharply demarcated, warm, tender red patch, commonly on the face or lower leg, and may cause fever and chills.

Alternate Names:
St. Anthony's Fire (historical)

Erysipeloid

A skin infection caused by bacteria acquired through cuts while handling fish, meat, poultry, or animals. It usually causes a slowly expanding painful purple-red patch on a finger or hand and needs antibiotic treatment.

Erysipelothrix

A group of bacteria found in animals and animal products that can enter broken skin and cause a painful localized infection. Rarely, infection spreads to the bloodstream or heart valves.

Erythema

Redness of the skin or a moist body lining caused by increased blood flow near the surface. It may result from inflammation, infection, heat, allergy, or another illness and often fades briefly when pressed.

Erythema Ab Igne

A net-like red-brown skin discoloration caused by repeated exposure to moderate heat, such as heating pads, hot-water bottles, or heaters. Stopping the exposure may allow improvement; persistent lesions need examination.

Erythema Annulare Centrifugum

A reactive gyrate erythema presenting with slowly expanding, polycyclic, annular erythematous plaques characterized by central clearing and a distinctive trailing rim of fine scale along the inner border of the advancing erythematous margin.

Alternate Names:
EAC; Centrifugal Annular Erythema

Erythema Chronicum Migrans

An expanding skin rash that can appear days to weeks after a tick transmits Lyme disease bacteria. It may be evenly red or ring-shaped and does not always look like a classic bull's-eye.

Erythema Dose

The amount of ultraviolet or other radiation needed to produce visible skin redness. The minimal erythema dose is the smallest amount that causes a defined response and varies with skin type, medicines, and exposure conditions.

Erythema Dyschromicum Perstans

An acquired pigmentary disorder causing slowly spreading, sharply defined gray or blue-gray macules and patches, often on the face, neck, and trunk. Early lesions may have a reddish raised border; biopsy may help distinguish it from other causes of dermal hyperpigmentation, and treatment is often difficult.

Erythema Elevatum Diutinum

A rare chronic cutaneous leukocytoclastic vasculitis presenting as persistent, symmetrical, red-violaceous to yellowish-brown papules, nodules, and

plaques over the extensor surfaces of joints, associated with IgA paraproteinemia, hematologic disorders, and chronic infections.

Alternate Names:
EED; Chronic Extensor Leukocytoclastic Vasculitis

Erythema Gyratum Repens

A rapidly spreading, ringed skin rash with a wood-grain pattern. It is often associated with an internal cancer, especially of the lung, so new or persistent cases require prompt medical evaluation.

Erythema Induratum

A form of nodular vasculitis causing recurrent tender, sometimes ulcerating nodules on the backs of the lower legs. Biopsy shows lobular panniculitis with vasculitis; tuberculosis and other infections, inflammatory disease, venous problems, and medicines may be associated, so the cause should be investigated.

Erythema Infectiosum

An infection caused by human parvovirus B19, usually affecting children. Mild fever or cold-like symptoms may come first, followed by bright-red cheeks and a lacy rash on the trunk and limbs; adults may instead have joint pain. The virus can temporarily stop red-cell production, causing an aplastic crisis in people with chronic hemolytic disorders or prolonged anemia in those with weakened immunity. Infection during pregnancy can cause fetal anemia, hydrops, or pregnancy loss.

Erythema Infectiosum (Fifth Disease)

Alternate name; see *Erythema Infectiosum*.

Alternate Names:
Fifth Disease; Slapped Cheek Disease

Erythema Marginatum

A temporary, non-itchy, ring-shaped or wavy red rash that usually appears on the trunk and upper limbs. It is a recognized sign of acute rheumatic fever and may come and go over days or weeks.

Erythema Migrans

An expanding rash that develops days to weeks after a tick transmits Lyme disease bacteria. It may be uniformly red or ring-shaped and is usually diagnosed from its appearance and exposure history.

Erythema Multiforme

An acute skin reaction characterized by distinctive raised spots that resemble targets or bullseyes—with a dark central blister surrounded by a pale ring and an outer red border. Most commonly triggered by an underlying viral infection (particularly the herpes simplex virus) or certain medications, the lesions typically appear symmetrically on the hands, arms, feet, and face, and sometimes involve the lips or mouth.

Erythema Nodosum

An inflammatory skin condition that causes painful, tender, red or purplish bumps (nodules) in the fatty layer beneath the skin, most commonly along the front of the shins. It is an immune-mediated reaction triggered by various underlying causes, such as bacterial infections (like strep throat), inflammatory bowel disease, sarcoidosis, pregnancy, or certain medications.

Erythema Toxicum

A common harmless newborn rash with red spots, small bumps, or tiny pus-filled areas. It often appears during the first days of life and disappears on its own without treatment.

Erythema Toxicum Neonatorum

A harmless newborn rash that usually appears during the first few days as red blotches, bumps, or tiny pustules on the face, trunk, or limbs. It usually spares the palms and soles and clears within one to two weeks.

Alternate Names:
Erythema Neonatorum; Toxic Erythema of the Newborn

Erythrasma

A superficial bacterial infection in warm, moist skin folds that causes well-defined reddish-brown patches,

often in the groin, armpits, or between toes. It usually responds to prescribed antibacterial treatment and keeping folds dry.

Erythroblast

An immature red-blood-cell precursor made in the bone marrow. It develops through several stages before becoming a mature red blood cell; abnormal numbers may indicate altered blood-cell production.

Erythroblastosis Fetalis

Older name; see *Hemolytic Disease Of The Fetus And Newborn*.

Erythroblastosis Foetalis

Older name; see *Hemolytic Disease Of The Fetus And Newborn*.

Erythrocyte

A mature red blood cell that carries oxygen from the lungs to tissues and helps return carbon dioxide to the lungs. Its flexible shape allows it to pass through very small blood vessels.

Erythrocyte Alloimmunization and Pregnancy

Maternal antibodies directed against fetal red-cell antigens, commonly RhD, can cross the placenta and cause fetal or newborn hemolytic anemia. Blood-group screening, antibody testing, fetal surveillance, and preventive anti-D immunoglobulin when indicated reduce risk.

Erythrocyte Casts

Tube-shaped groups of red blood cells seen in urine. They form inside the kidney's small tubes and strongly suggest bleeding or inflammation in the kidney's filtering units, such as glomerulonephritis or vasculitis.

Alternate Names:
Red Blood Cell Casts; RBC Casts

Erythrocyte Enzyme Deficiency

An inherited or acquired lack of a protein that red blood cells need for energy or protection. The cells may break down too early and cause anemia; examples include G6PD and pyruvate-kinase deficiency.

Erythrocyte Membrane

The flexible outer layer of a red blood cell. It maintains the cell's shape, allows it to bend through small vessels, and controls movement of water and substances into and out of the cell.

Erythrocyte Sedimentation Rate

A blood test measuring how quickly red blood cells settle in a tube over one hour. A faster rate can occur with inflammation, but it does not identify the cause and is affected by anemia, age, pregnancy, and other conditions.

Erythrocytosis

An increased red-cell concentration, reflected by elevated hemoglobin or hematocrit. It may be relative, from reduced plasma volume such as dehydration, or absolute, from increased red-cell mass due to a bone-marrow disorder or secondary stimulation such as low oxygen. The distinction affects interpretation and evaluation.

Erythroderma

Intense redness and usually scaling affecting about 90

Alternate Names:
Exfoliative Dermatitis; Exfoliative Erythroderma; Generalized Exfoliative Dermatitis

Erythrodermic Psoriasis

A rare, potentially life-threatening form of psoriasis causing nearly all the skin to become intensely red, painful, and scaly. Fever, chills, dehydration, infection, and unstable blood pressure may occur.

Erythrodysplasia

Abnormal development or maturation of red-blood-cell precursors in the bone marrow. It can produce ineffective blood formation and anemia and may occur with a marrow disorder or other illness.

Erythroid Hyperplasia

An increase in immature red-blood-cell precursors in the bone marrow, usually because the body is responding to anemia, blood loss, red-cell destruction, or low oxygen. The underlying cause needs evaluation.

Erythrokeratodermia Variabilis et Progressiva

A rare inherited keratinization disorder characterized by persistent, often symmetrical red and thickened scaly plaques together with more variable migrating erythematous patches. Onset is usually in infancy or childhood, and treatment aims to reduce scaling and inflammation with emollients, keratolytics, or specialist-directed retinoids.

Erythroleukemia

A rare acute myeloid leukemia characterized by prominent abnormal erythroid precursors in the bone marrow, often with dysplastic or immature myeloid cells. Diagnosis requires blood and marrow evaluation with immunophenotypic and genetic classification.

Erythroleukoplakia

A mouth lesion containing both red and white areas. It has a substantial risk of advanced precancerous change or cancer, so a dentist or specialist should examine it and usually perform a biopsy.

Erythromelalgia

Repeated attacks of burning pain, warmth, and redness in the feet, hands, or sometimes face, often triggered by heat or exercise and eased by cooling. It may be inherited or linked to blood or nerve disorders.

Erythromycin

An antibiotic that blocks bacterial protein production. It treats selected infections and can be used when some other antibiotics are unsuitable; nausea, diarrhea, liver injury, and abnormal heart rhythm are possible.

Erythromycin Estolate

An oral form of the antibiotic erythromycin. It blocks bacterial protein production and treats selected infections; stomach upset, liver inflammation, allergic reactions, and medicine interactions can occur.

Erythromycin Ophthalmic Prophylaxis

Antibiotic ointment placed in a newborn's eyes soon after birth to reduce the risk of severe eye infection from gonorrhea acquired during delivery. It does not replace testing and treatment of infections during pregnancy.

Erythroplakia

A lasting, well-defined red patch inside the mouth that is not explained by another condition. A tissue sample often shows severe precancerous cell changes or cancer.

Erythroplasia

A sharply bordered red patch on skin or a moist lining. Persistent lesions, especially in the mouth or genital area, may represent a serious precancerous change or cancer.

Erythroplasia Of Queyrat

Squamous-cell carcinoma in situ affecting the head of the penis or foreskin. It usually appears as a persistent, well-defined red or velvety patch and can progress to invasive cancer without treatment.

Erythropoiesis

The process of making mature red blood cells, mainly in the bone marrow. It is stimulated by erythropoietin when oxygen is low and requires healthy marrow plus adequate iron, vitamin B12, and folate.

Erythropoiesis-Stimulating Agents

Medicines that signal the bone marrow to make more red blood cells. They are used for selected anemias, including some caused by kidney disease or cancer treatment, but may increase blood pressure and clot risk.

Erythropoietin

A hormone made mainly by the kidneys when body tissues receive too little oxygen. It signals the bone marrow to produce red blood cells; kidney disease can reduce this signal and contribute to anemia.

Erythropoietin Deficiency

An insufficient amount of erythropoietin for the body's need, resulting in reduced stimulation of red-blood-cell production in the bone marrow. It commonly contributes to anemia in chronic kidney disease; reduced response to available erythropoietin is a separate phenomenon.

Erythropoietin Receptor

A protein on immature red-blood-cell precursors that receives the erythropoietin signal. Activation helps these cells survive, multiply, and mature into red blood cells.

Erythropoietin Test

A blood test measuring the kidney-made hormone that stimulates red-blood-cell production. It can help investigate selected anemias or high red-cell counts and is interpreted with the blood count, oxygen status, and kidney function.

Erythrosine

A red dye used in some foods, medicines, and laboratory procedures. Exposure is usually small, but regulations vary and people with a known sensitivity should follow product and medical advice.

ESBL

An enzyme made by some bacteria that destroys many penicillin and cephalosporin antibiotics. Infections caused by these bacteria can be harder to treat and require laboratory testing to select an effective medicine.

ESBL-Producing Organisms

Bacteria that make enzymes capable of breaking down many penicillin and cephalosporin antibiotics. They commonly include certain intestinal bacteria such as E. coli and Klebsiella; treatment depends on susceptibility testing and infection site.

Escape Reaction

A body response that restores an organ's activity after it has been reduced by a medicine, hormone, nerve signal, or feedback system. The response may lessen the effect of continued treatment or stimulation.

Eschar

A firm layer of dead tissue, often black or brown, over a burn, pressure injury, wound, infection, or area with poor blood supply. It can hide deeper damage and may need specialist assessment or removal.

Escharotomy

A surgical cut through stiff dead tissue around a deep burn to release pressure. It may restore circulation to a limb or allow the chest to expand, and is performed urgently when swelling threatens function.

Escherichia

A group of bacteria that includes E. coli and related species found in intestines or the environment. Some strains are harmless, while others cause diarrhea, urinary infection, wound infection, or bloodstream infection.

Escherichia Albertii

An uncommon intestinal bacterium that can cause diarrheal illness. It may be mistaken for certain E. coli strains, so specialized laboratory identification may be needed when infection is suspected.

Escherichia Blattae

A rarely reported Escherichia species associated mainly with insects and the environment. Its significance in a human sample is uncertain and must be judged from symptoms, the specimen source, and other test results.

Escherichia Coli

A bacterium that normally lives in the intestine. Some strains are harmless, while others cause urinary, intestinal, wound, or bloodstream infections, including severe bloody diarrhea and hemolytic ure-

mic syndrome.

Escherichia Coli Infection

Infection caused by a harmful strain of E. coli. It may affect the intestine, urinary tract, wounds, or bloodstream; symptoms, contagiousness, and treatment depend on the strain and site.

Escherichia Coli O157:H7 Infection

Infection with a toxin-producing E. coli strain, usually acquired from contaminated food, water, animals, or people. It commonly causes severe cramps and bloody diarrhea and can lead to kidney failure; urgent medical advice is important.

Escherichia Fergusonii

An uncommon bacterium that can occasionally cause urinary, wound, intestinal, or bloodstream infection, especially in people with serious illness or weakened immunity. Laboratory identification and susceptibility testing guide treatment.

Escherichia Hermannii

An uncommon Escherichia species that rarely causes opportunistic infection, including urinary or bloodstream infection. Its importance depends on the patient's symptoms, immune status, and the specimen in which it is found.

Escherichia Vulneris

An uncommon bacterium rarely linked to wound, urinary, or bloodstream infection, usually in people with other serious illnesses. A laboratory result requires clinical correlation to distinguish infection from contamination.

Escitalopram

An antidepressant that increases available serotonin in the brain. It treats depression and generalized anxiety disorder; nausea, sleep changes, sexual problems, withdrawal symptoms, bleeding risk, and rarely serotonin toxicity may occur.

ESKD

Severe permanent loss of kidney function, usually meaning kidney filtration below about 15 milliliters per minute or a need for dialysis or transplantation. It can cause fluid, electrolyte, anemia, and toxin problems and needs kidney-specialist care.

Esomeprazole

A medicine that reduces stomach-acid production by blocking the acid pump in stomach cells. It treats reflux, ulcers, and acid-related disorders; prolonged or inappropriate use may cause infections, low magnesium, or vitamin deficiencies.

Esomeprazole Magnesium

Drug salt; see *Esomeprazole*.

Esophageal

Relating to the esophagus, the muscular tube that carries swallowed food and liquid from the throat to the stomach.

Esophageal Achalasia

A disorder in which the lower esophageal valve does not relax properly and the esophagus cannot push food normally into the stomach. It causes difficulty swallowing, regurgitation, chest discomfort, and weight loss.

Esophageal Adenocarcinoma

A cancer arising from gland-forming cells, usually in the lower esophagus and often linked to Barrett esophagus. Reflux, obesity, and smoking increase risk; it may cause progressive swallowing difficulty or weight loss and is diagnosed by biopsy.

Esophageal Atresia

A birth defect in which the esophagus ends in a blind pouch instead of connecting normally to the stomach. A connection to the windpipe may also occur, causing drooling, choking, coughing, and breathing problems during feeds.

Esophageal Bleeding

Bleeding from the esophagus, which may result from enlarged veins, inflammation, ulcers, tears, injury, or cancer. Vomiting blood, passing black stools,

dizziness, or fainting requires emergency medical care.

Esophageal Cancer

A malignant tumor of the swallowing tube. The main types are squamous-cell cancer and adenocarcinoma; progressive difficulty swallowing, weight loss, pain, or bleeding may occur, and treatment depends on the stage.

Alternate Names:
Esophageal Carcinoma; Esophagus Malignancy

Esophageal Candidiasis

A yeast infection of the esophagus, more common with weakened immunity, diabetes, or certain medicines. It often causes painful or difficult swallowing and is treated with antifungal medicine, sometimes after endoscopy confirms it.

Esophageal Carcinoma

Alternate name; see *Esophageal Cancer*.

Esophageal Culture

Laboratory growth testing on a sample from the esophagus to identify bacteria or fungi when infection is suspected. Results depend on how the sample was collected, symptoms, and endoscopic findings.

Esophageal Dilation

A procedure that gently stretches a narrowed area of the esophagus with a tube or balloon passed through an endoscope. It can improve swallowing caused by scarring, inflammation, injury, or other narrowing; tearing and bleeding are uncommon but serious risks.

Esophageal Diseases

Disorders affecting the swallowing tube between the throat and stomach. They include reflux, inflammation, narrowing, movement problems, cancer, infection, and birth defects, often causing swallowing difficulty, pain, heartburn, or regurgitation.

Esophageal Diverticulum

A pouch that bulges outward from the wall of the esophagus. It may cause difficulty swallowing, food coming back up, coughing, bad breath, or no symptoms; treatment depends on its size, location, and effects.

Esophageal Duplication

A rare birth defect consisting of a cyst or extra segment beside the esophagus. It may press on the esophagus or airway, causing swallowing difficulty, breathing problems, infection, or no symptoms.

Esophageal Fistula

An abnormal connection between the esophagus and another organ, often the airway. It can allow food or liquid into the lungs, causing coughing during swallowing, repeated pneumonia, poor nutrition, or severe illness.

Esophageal Foreign Body

Food or another object stuck in the esophagus, causing pain, difficulty swallowing, drooling, or breathing problems. A battery, sharp object, complete blockage, or suspected tear requires emergency removal.

Esophageal Infection

Infection of the esophagus caused by a yeast, virus, or bacterium, usually in people with weakened immunity or damaged lining. It may cause painful swallowing, difficulty swallowing, chest pain, or ulcers.

Esophageal Intramural Pseudodiverticulosis

A rare condition in which small drainage ducts of glands within the esophageal wall become widened. It may cause repeated swallowing difficulty, food impaction, or narrowing and is diagnosed with imaging or endoscopy.

Esophageal Leiomyoma

A usually benign smooth-muscle tumor arising in the esophageal wall. It may cause difficulty swallowing, chest discomfort, or no symptoms and is distinguished from other submucosal tumors with imaging, endoscopy, and tissue assessment when

needed.

Esophageal Leukoplakia

A persistent white patch on the esophageal lining caused by thickened surface cells. It is uncommon but may contain precancerous change, so evaluation and biopsy are often needed to determine its significance.

Esophageal Manometry

A test that measures pressure and muscle coordination in the esophagus during swallowing. A thin pressure-sensitive tube passes through the nose into the stomach and helps diagnose achalasia, spasm, and other movement disorders.

Esophageal Motility Disorder

A disorder of the muscle contractions or nerve control that moves food through the esophagus. It may cause difficulty swallowing, chest pain, regurgitation, or food sticking; testing may include esophageal manometry.

Esophageal Necrosis

Death of esophageal lining, sometimes producing a black appearance. It can result from severe low blood flow, shock, acid injury, or caustic substances and may lead to bleeding or perforation.

Esophageal Perforation

A hole through the full thickness of the esophageal wall, caused by forceful vomiting, an instrument, injury, or disease. It can release contents into the chest, causing severe infection and requiring emergency treatment.

Esophageal pH Monitoring

A test that records how much acid enters the esophagus, usually for 24 hours, using a thin tube or a small wireless sensor. It helps determine whether acid reflux explains persistent symptoms when the diagnosis is uncertain.

Esophageal Spasm

A condition affecting the esophagus (the muscular swallowing tube) marked by irregular, uncoordinated, or unusually forceful muscle contractions. Instead of moving food smoothly down toward the stomach, the esophagus contracts spastically, causing sudden severe chest pain that can mimic a heart attack, as well as difficulty or pain when swallowing food or liquids.

Alternate Names:
Esophageal Spasms; Diffuse Esophageal Spasm; DES

Esophageal Spasms

Plural form; see *Esophageal Spasm*.

Esophageal Squamous Cell Carcinoma

A cancer arising from the flat cells lining the esophagus, often in its upper or middle part. Smoking, heavy alcohol use, certain infections, and nutritional factors increase risk; diagnosis requires endoscopic biopsy.

Esophageal Stenosis

Narrowing of the passage through the esophagus caused by scarring, inflammation, a tumor, radiation, or a birth defect. It commonly causes progressively worsening difficulty swallowing, especially solid foods.

Esophageal Stent

A tube placed inside a narrowed or leaking esophagus to keep it open and allow swallowing. It is often used for cancer or injury; movement, blockage, bleeding, pain, or perforation can occur.

Esophageal Stricture

A narrowed area of the esophagus, commonly caused by acid reflux, caustic injury, inflammation, radiation, or procedures. It usually causes gradually worsening difficulty swallowing solids and may require stretching during endoscopy.

Esophageal Surgery

An operation on the esophagus or the area where it meets the stomach. It may treat cancer, severe narrowing, perforation, reflux, or movement disorders; the procedure and risks depend on the disease and

overall health.

Esophageal Ulceration

An open sore in the esophageal lining caused by reflux, infection, medicines, caustic injury, inflammation, or cancer. It may cause painful swallowing, chest pain, or bleeding and often requires endoscopic evaluation.

Esophageal Varices

Abnormally enlarged and swollen veins in the lower lining of the esophagus. They develop when normal blood flow to the liver is blocked—most commonly by advanced liver disease or cirrhosis—causing blood to back up into smaller collateral vessels that are not built to handle high pressure. Because these swollen veins have thin walls, they can rupture and cause sudden, massive, life-threatening vomiting of blood or black, tarry stools.

Alternate Names:
Esophageal Dilated Veins; Bleeding Esophageal Varices

Esophageal Web

A thin shelf of tissue projecting into the upper esophagus. It may cause difficulty swallowing solid food and can be associated with iron-deficiency anemia; persistent symptoms may require endoscopy.

Esophagectomy

Surgery to remove part or all of the esophagus, usually for cancer or severe irreversible damage. The remaining digestive tract is reconstructed, commonly using the stomach or a segment of intestine.

Esophagitis

Inflammation or injury of the esophageal lining. Common causes include acid reflux, infection, medicines that irritate the esophagus, eosinophilic or other immune-mediated disease, swallowed irritants, and radiation. Symptoms may include heartburn, painful or difficult swallowing, chest pain, food sticking, or bleeding; persistent inflammation can cause ulcers or narrowing.

Esophagogastric Bypass

Surgery that creates a new route between the esophagus and stomach to restore passage of food, usually after esophageal removal or severe blockage. The method depends on anatomy, disease, and surgical goals.

Esophagogastric Junction

The area where the esophagus joins the stomach. Its muscular valve and surrounding structures help food enter the stomach while limiting backward flow of stomach contents.

Esophagogastric Tamponade

Temporary control of severe bleeding from esophageal or stomach veins by inflating a balloon device to apply pressure. It is a rescue measure used while definitive treatment is arranged and can obstruct breathing or cause aspiration.

Esophagogastroduodenoscopy

An upper endoscopic diagnostic and therapeutic procedure in which a thin, flexible video endoscope is passed through the mouth to examine the lining of the esophagus, stomach, and duodenum.

Alternate Names:
EGD; Upper Endoscopy; Upper Gastrointestinal Endoscopy

Esophagoscope

A flexible or rigid instrument used to look inside the esophagus. It may allow a clinician to take tissue samples, remove a foreign object, treat bleeding, or perform another procedure.

Esophagoscopy

Examination of the esophagus with a camera-equipped instrument. It may investigate swallowing difficulty, bleeding, reflux damage, narrowing, foreign objects, infection, or suspected cancer and may allow treatment or biopsy.

Esophagram

An X-ray examination performed while a person swallows contrast liquid. It shows the shape and

movement of the esophagus and can reveal narrowing, leaks, pouches, blockage, or abnormal swallowing.

Esophagus

A muscular tube that carries food and liquid from the throat to the stomach. Coordinated muscle contractions move swallowed material downward, while valves at each end help limit reflux and air entry.

Esophagus Disease

A disorder of the esophagus causing swallowing difficulty, pain, reflux, regurgitation, bleeding, obstruction, inflammation, motility disturbance, or cancer.

Esophagus Neoplasm

A benign, precancerous, or malignant growth in the esophagus; evaluation may require endoscopy, biopsy, imaging, and staging.

Esotropia

A type of strabismus in which one or both eyes turn inward toward the nose. It may be constant or intermittent and can occur at any age. Causes include focusing or refractive problems, reduced vision, and disorders affecting eye-movement nerves or brain pathways; evaluation guides treatment.

ESR

The erythrocyte sedimentation rate, a nonspecific blood test measuring how quickly red cells settle in a tube; it can reflect inflammation but cannot identify its cause.

Alternate Names:
SED Rate

ESRD

Alternate index label; see *End-Stage Renal Disease*.

Essential

Necessary or fundamental; in a diagnosis such as essential hypertension, it indicates that no single secondary cause has been identified.

Essential Fats

Fatty acids the body cannot make in sufficient amounts and must obtain from food. They support cell membranes, skin, brain function, and production of signaling molecules involved in inflammation.

Alternate Names:
Essential Fatty Acids

Essential Fatty Acid

A fatty acid the body cannot make in sufficient amounts and therefore must obtain from food; the main human examples are linoleic acid and alpha-linolenic acid.

Essential Hypertension

Long-term high blood pressure with no single identifiable underlying cause. Many genetic, kidney, blood-vessel, metabolic, and lifestyle factors contribute, and untreated disease raises the risk of stroke, heart disease, kidney damage, and vision problems.

Essential Medicines

Medicines considered necessary to meet the most important health needs of a population. They are selected for proven benefit, safety, affordability, and practical availability and should be reliably accessible through healthcare services.

Essential Mixed Cryoglobulinemia

An immune disorder in which abnormal proteins in the blood thicken or clump in the cold and inflame small blood vessels. It may cause purple spots, joint pain, weakness, nerve problems, or kidney disease.

Essential Nutrient

A nutrient the body cannot make in sufficient amounts and must obtain from food or supplements. Essential nutrients include certain amino acids, fatty acids, vitamins, minerals, and water.

Essential Thrombocythemia

A long-term bone-marrow disorder that produces too many platelets. It can cause abnormal clotting or bleeding and may cause headaches, vision

changes, burning pain in fingers or toes, or no symptoms.

Essential Thrombocytosis

A chronic myeloproliferative neoplasm with persistent overproduction of platelets, often driven by JAK2, CALR, or MPL mutations. It can cause thrombosis, bleeding, microvascular symptoms, or splenomegaly.

Essential Tremor

A nervous-system disorder causing rhythmic shaking, usually of both hands during movement or when holding a position. It may also affect the head or voice, gradually worsen, and interfere with writing, eating, or other tasks. It can run in families but also occur without a family history.

Alternate Names:
Benign Essential Tremor; Familial Essential Tremor; Hereditary Essential Tremor

Essiac

A herbal mixture promoted as a treatment for cancer and other illnesses. Reliable evidence has not shown that it cures cancer, and its ingredients may interact with medicines or cause liver, kidney, or other harm.

Estazolam

A sedative medicine sometimes used short-term for insomnia. It slows brain activity but can cause daytime drowsiness, falls, memory problems, slowed breathing, dependence, and withdrawal; alcohol and opioids increase its dangers.

Ester

A chemical formed when an acid combines with an alcohol. Esters occur naturally in fats, medicines, and flavorings; their health effects depend on the specific compound, amount, route of exposure, and duration.

Esterase

An enzyme that breaks ester chemical bonds. Esterases help process fats, medicines, and other substances; abnormal activity or inhibition can alter drug effects and may contribute to poisoning.

Esterified Estrogens

A mixture of estrogen hormones used for selected menopausal symptoms or estrogen deficiency. Treatment can cause bleeding and increase risks of blood clots, stroke, and breast or uterine cancer, so benefits and risks must be individualized.

Esthesia

The ability to sense touch, pain, temperature, movement, or body position. Reduced, increased, or altered sensation may result from nerve injury, brain disease, medicines, or changes in consciousness.

Esthesiometer

An instrument used to measure sensitivity to touch, pressure, or other sensations. Eye clinicians may use one to assess corneal sensation when nerve injury or an eye-surface problem is suspected.

Esthesioneuroblastoma

A rare cancer arising from nerve-related cells high in the nasal cavity. It may cause blocked or bleeding nose, reduced smell, facial pain, or vision symptoms and is diagnosed with imaging and biopsy.

Estimated Average Glucose

An estimate of a person's average blood-glucose level calculated from the hemoglobin A1c result. It is reported in familiar glucose units but does not show daily highs, lows, or sudden changes.

Estimated Date Of Confinement

The approximate date when a pregnancy is expected to reach delivery, calculated from the last menstrual period or an early ultrasound. Only a small proportion of births occur on the estimated date.

Estimated Due Date

The approximate date of delivery, usually calculated as 40 weeks from the first day of the last menstrual period and adjusted when needed using an early ultrasound. Most births occur before or after this date.

Estimated Fetal Weight

An ultrasound-based estimate of a fetus's weight using measurements of the head, abdomen, and thigh bone. It helps assess growth and plan care, but commonly differs from actual birth weight by about 10–15 percent.

Estimated Glomerular Filtration Rate

An estimate of how well the kidneys filter blood, calculated mainly from blood creatinine and other factors. It helps assess kidney disease and adjust medicines but is less reliable during rapidly changing illness or unusual body size.

Estimation of Fetal Weight

An ultrasound-based estimate of fetal size using measurements such as head, abdominal, and femur dimensions. It helps assess growth and delivery planning but has an important margin of error and is interpreted with gestational age and clinical findings.

Estradiol

The main active estrogen hormone during most reproductive years. It helps regulate ovulation and menstruation and supports the vagina, uterus, bones, brain, and other tissues; levels fall after menopause.

Alternate Names:
17β-Estradiol

Estradiol Blood Test

A blood test measuring estradiol. It may help evaluate puberty, menstrual or fertility problems, ovarian or testicular function, menopause, or selected hormone disorders; results vary with age, sex, cycle timing, pregnancy, and medicines.

Estramustine

A cancer medicine combining an estrogen-like component with a compound that interferes with cell division. It has been used for selected advanced prostate cancers; blood clots, fluid retention, nausea, and heart effects may occur.

Estriol

An estrogen produced mainly by the placenta during pregnancy from substances made by the fetus and mother. Maternal blood estriol may be included in prenatal screening, but an abnormal result does not by itself diagnose a problem.

Estrogen

A class of steroid hormones synthesized primarily by the ovaries (granulosa and theca cells under FSH and LH stimulation) in premenopausal females, by the placenta during pregnancy, and to a lesser extent by the adrenal cortex, adipose tissue, and testes via peripheral aromatization of androgens (androstenedione and testosterone) by the enzyme aromatase. The major physiological estrogens are estradiol (E_2, the most potent and predominant estrogen during reproductive years), estrone (E_1, the predominant circulating estrogen post-menopause), estriol (E_3, produced in high concentrations by the feto-placental unit during pregnancy), and estetrol (E_4, produced exclusively by the fetal liver). Functioning by binding nuclear estrogen receptors (ERα and ERβ) to modulate target gene transcription, estrogens regulate the development of female secondary sexual characteristics, stimulate endometrial proliferation during the follicular phase of the menstrual cycle, maintain vaginal mucosal hydration, preserve bone mineral density by inhibiting osteoclast activity, promote favorable lipid profiles (elevating HDL, lowering LDL), and regulate vascular endothelial nitric oxide production. Exogenous estrogens are utilized in hormonal contraception and menopausal hormone therapy; unopposed estrogen exposure carries an increased risk of endometrial hyperplasia and adenocarcinoma.

Alternate Names:
Estrogens; Oestrogen

Estrogen Overdose

Taking or receiving more estrogen than prescribed. It may cause nausea, vomiting, breast tenderness, headache, or abnormal bleeding and can increase the risk of blood clots; urgent advice is needed after a large exposure.

Estrogen Receptor

A cell protein that binds estrogen and changes cell activity. Testing for estrogen receptors helps classify some cancers, especially breast cancer, and can guide hormone-based treatment.

Estrogen Replacement Therapy

Treatment supplying estrogen to relieve selected menopausal symptoms or replace deficient hormone. If the uterus is present, a progestogen is usually added to protect its lining; risks and benefits must be reviewed individually.

Estrogen-Replacement Therapy

Alternate spelling; see *Estrogen Replacement Therapy*.

Alternate Names:
Estrogen Therapy

Estrogens

Plural form; see *Estrogen*.

Estrogen Test

A blood, urine, or saliva test measuring one or more estrogen hormones. It may help evaluate puberty, menstrual problems, fertility, menopause, pregnancy, or hormone disorders; interpretation depends on the test type and timing.

Alternate Names:
Estrogen Levels Test Estrogen Blood Test

Estrone

A naturally occurring estrogen made partly by converting other hormones in body tissues. It is the main estrogen present after menopause, although estradiol is usually more active before menopause.

Estrous Cycle

The recurring reproductive cycle of many female mammals other than humans. It includes hormonal and physical changes that prepare for ovulation, mating, and possible pregnancy.

Eszopiclone

A sleep medicine that enhances inhibitory signaling in the brain. It can help insomnia but may cause drowsiness, impaired coordination, memory problems, dependence, unusual sleep behaviors, or a bitter taste.

Etacrynic Acid

A diuretic that makes the kidneys remove more salt and water, reducing swelling and sometimes blood pressure. It can cause dehydration, abnormal electrolytes, kidney problems, or hearing damage, especially at high doses.

Etanercept

A biologic medicine that blocks tumor-necrosis factor, an inflammation signal. It treats selected arthritis, psoriasis, and other inflammatory diseases but can increase serious infection risk, so tuberculosis and hepatitis screening may be needed.

Ethacrynic Acid

A loop diuretic that increases kidney excretion of salt and water. It can reduce fluid overload but may cause dehydration, low electrolytes, kidney injury, or dose-related hearing damage.

Ethambutol

An antibiotic used with other medicines to treat tuberculosis and selected infections caused by related bacteria. It can damage the optic nerve, causing blurred vision or trouble distinguishing colors, so vision testing is important.

Ethambutol Toxicity

A dose- and duration-dependent adverse pharmacological effect of the first-line antimycobacterial agent ethambutol, characterized by retrobulbar or axial optic neuritis, presenting with bilateral painless reduction in visual acuity, central scotomas, and loss of red-green color discrimination.

Ethane

A colorless, highly flammable gas used mainly to make industrial chemicals. It is not usually poisonous through direct action, but high concentrations can displace oxygen and cause suffocation or fire hazards.

Ethanol

The alcohol in alcoholic drinks and some disinfectants, medicines, and fuels. Drinking too much can impair judgment, suppress breathing, lower blood sugar, cause dependence, and damage the liver and other organs.

Ethanolamine

A chemical used in some industrial products, medicines, and cosmetic ingredients. Concentrated exposure can irritate or burn the skin, eyes, and airways; health effects depend on the product and amount of exposure.

Ethanol Metabolism

The body's breakdown of alcohol, mainly in the liver, into acetaldehyde and then acetate. The process affects blood-alcohol levels, drug interactions, intoxication, hangovers, and long-term alcohol-related organ damage.

Ethanol Poisoning

Harm from drinking a dangerous amount of alcohol, causing confusion, poor coordination, vomiting, slow or irregular breathing, low blood sugar, seizures, coma, or death. An unconscious or poorly breathing person needs emergency care.

Ether

A class of organic chemical compounds, historically represented by diethyl ether, a volatile, sweet-smelling liquid. Diethyl ether was famously introduced in the mid-19th century as one of the very first effective general anesthetics, allowing patients to undergo painless surgery, though it was later replaced by safer, non-flammable modern anesthetic agents.

Alternate Names:
Ethers; Diethyl Ether

Ethers

Plural form; see *Ether*.

Ethics

Principles used to decide what is right, fair, respectful, and responsible in healthcare and research. Medical ethics includes informed choice, privacy, avoiding harm, helping patients, and treating people fairly.

Ethinyl Estradiol

A synthetic estrogen used in many hormonal contraceptives and some other treatments. It can cause nausea or irregular bleeding and increases blood-clot risk, especially with smoking, migraine with aura, or certain medical conditions.

Ethiodized Oil

An iodine-containing oil used as a contrast material in selected imaging or treatment procedures, including some lymphatic and liver procedures. It can affect thyroid function or rarely enter blood vessels and cause an embolism.

Ethion

An organophosphate pesticide that can poison the nervous system by blocking acetylcholinesterase. Exposure may cause sweating, vomiting, pinpoint pupils, muscle twitching, weakness, breathing failure, or death.

Ethionamide

An antibiotic used with other medicines for drug-resistant or difficult-to-treat tuberculosis. It interferes with mycobacterial cell-wall production and may cause nausea, liver injury, nerve symptoms, or thyroid problems.

Ethmocephaly

A severe birth defect in which the eyes are very close together and the nose is replaced or accompanied by a tube-like structure. It usually occurs with major brain-development abnormalities and is often life-limiting.

Ethmoidal Air Cells

Multiple small air-filled spaces within the ethmoid bone between the nose and eye sockets. They are part of the sinus system and can become blocked or infected, causing sinus pressure and discharge.

Ethmoidal Sinus

A group of small, thin-walled air spaces in the ethmoid bone between the eye sockets and above the nasal cavity. They are divided into front and back groups according to where they drain.

Alternate Names:
Ethmoid Air Cells; Paranasal Ethmoid Sinus

Ethmoid Bone

A light, complex bone between the eye sockets that forms part of the nasal septum, nasal roof, and inner eye socket. It contains air cells and openings for smell nerves, so injury can affect smell or the eye.

Ethmoiditis

Alternate name; see *Ethmoid Sinusitis*.

Ethmoid Sinus

One of several small air spaces in the ethmoid bone between the nose and eye sockets. Inflammation or infection can cause nasal blockage, headache, or eye-area pain and may spread to nearby tissues.

Ethmoid Sinusitis

Inflammation or infection of the air spaces between the nose and eyes. It may cause congestion, discharge, fever, headache, or pain around the eyes; eye swelling, vision changes, or severe illness may indicate orbital or intracranial complications.

Ethnicity

A social and cultural identity shaped by shared ancestry, history, language, traditions, or community; it is not a biological diagnosis and should not be used as a substitute for individual risk assessment.

Ethoglucid

An older sclerosing substance used historically to treat selected vascular lesions or hemorrhoids; modern use is limited by tissue-injury risks and alternatives.

Ethosuximide

An anticonvulsant used mainly for absence seizures; common adverse effects include gastrointestinal symptoms, fatigue, and headache, with rare blood or skin reactions.

Ethoxzolamide

A carbonic-anhydrase-inhibiting medicine that reduces formation of certain body fluids. It has been used for selected eye and metabolic conditions; possible effects include tingling, nausea, kidney stones, and electrolyte changes.

Ethyl Chloride

A volatile liquid sprayed on skin to produce brief cooling and numbness before minor procedures, but misuse can cause cold injury or toxicity.

Ethylene

A colorless, flammable gas used in chemical manufacturing and to ripen fruit. High concentrations can displace oxygen and cause headache, dizziness, drowsiness, unconsciousness, or suffocation. Exposure in a poorly ventilated space can be life-threatening.

Ethylene Chlorohydrin

A toxic industrial chemical used in some manufacturing processes. Exposure can irritate the eyes, skin, and airways and may affect the nervous system, liver, or kidneys. It can be absorbed through skin, so contaminated clothing should be removed safely and urgent poison-control advice obtained.

Ethylene Dibromide

A toxic chemical formerly used as a soil fumigant and fuel additive. It can irritate the eyes and lungs and may damage the liver, kidneys, or nervous system; long-term exposure is associated with cancer risk.

Ethylene Glycol

A toxic alcohol found in some antifreeze and industrial products. Ingestion can cause severe metabolic acidosis, neurologic impairment, kidney injury, and death.

Ethylene Glycol Blood Test

A blood test measuring ethylene glycol, a toxic alcohol found in some antifreeze products. Detection supports diagnosis of poisoning, but treatment must not wait for the result when the exposure and metabolic findings are strongly suggestive.

Ethylene Glycol Poisoning

Poisoning after swallowing ethylene glycol, found in some antifreeze products. Early effects may resemble alcohol intoxication, followed by severe acid buildup, seizures, coma, and kidney failure; emergency antidote and sometimes dialysis are needed.

Ethylene Glycol Toxicity

Poisoning by ethylene glycol, a toxic alcohol found in some antifreeze products. It can cause alcohol-like drowsiness, severe acid buildup in the blood, seizures, coma, and kidney injury. Treatment may include the antidote fomepizole and dialysis, depending on the severity.

Ethylene Oxide

A flammable gas used to sterilize heat-sensitive medical equipment and make other chemicals. It can irritate the skin and airways, cause nerve injury, and with repeated exposure increase cancer risk. Sterilized equipment must be adequately aerated before use, and workplace exposure requires strict controls.

Ethyl Ether

A highly flammable liquid formerly used as an anesthetic and still used as a laboratory solvent. Breathing its vapor can cause irritation, dizziness, drowsiness, or loss of consciousness; swallowing it can injure the lungs if it is aspirated. Exposure requires fresh air, fire precautions, and medical assessment when symptoms are severe.

Ethynodiol Diacetate

A synthetic progestogen formerly used in some oral contraceptives. It helps prevent pregnancy mainly by suppressing ovulation and changing cervical mucus and the uterine lining.

Etidronic Acid

A medicine related to bisphosphonates that can slow the breakdown of bone by attaching to bone mineral. It has also been used to bind minerals in some nonmedical products; effects and safety depend on the use and dose.

Etilefrine

A medicine that stimulates some of the body's adrenaline-like receptors and can raise blood pressure. It increases blood-vessel tightening and heart activity, so it may cause fast heartbeat, headache, or other effects and requires medical supervision.

Etiology

The cause or set of causes of a disease or health condition, including genetic, infectious, environmental, immune, traumatic, and behavioural factors.

Etodolac

A nonsteroidal anti-inflammatory drug used for pain and inflammation; gastrointestinal bleeding, kidney injury, cardiovascular events, and hypersensitivity are important risks.

Etomidate

A short-acting intravenous anesthetic used for induction, particularly when cardiovascular stability is desired; it can cause myoclonus, nausea, and transient adrenal suppression.

Etonogestrel

A man-made form of the hormone progesterone used in a small contraceptive implant placed under the skin of the upper arm. It mainly prevents ovulation and also thickens cervical mucus; irregular bleeding and other hormone-related effects can occur.

Etoposide

A chemotherapy medicine that interferes with DNA repair and cell division. It treats several cancers but can cause low blood counts, infection, hair loss, nausea, mouth sores, or a later risk of leukemia.

Etoposide Phosphate

A water-soluble form of etoposide that changes into etoposide inside the body. It provides another method of giving the chemotherapy medicine, with similar cancer treatment effects and potential toxicities.

Etoricoxib

An anti-inflammatory pain medicine that selectively blocks an enzyme involved in pain and swelling. It may help arthritis or acute pain but can raise blood pressure and increase heart, kidney, fluid-retention, and stomach risks.

Eubacterium

A group of bacteria that usually live without oxygen in the mouth and intestine. Most are part of normal microbial communities, but some can rarely cause opportunistic infection in seriously ill people.

Eubacterium Limosum

A bacterium that lives without oxygen in the intestine and helps break down nutrients. It is rarely associated with human infection, and its importance in a sample depends on symptoms and the collection site.

Eubacterium Rectale

A common intestinal bacterium that helps ferment dietary fiber and produce short-chain fatty acids. These products support the colon and contribute to normal gut microbial activity.

Eucalyptus Oil

A concentrated plant oil containing eucalyptol and other chemicals. Swallowing it can poison the nervous system and cause vomiting, drowsiness, seizures, or breathing problems; it should not be taken internally without medical advice.

Eucalyptus Oil Overdose

Poisoning after swallowing eucalyptus oil. It can cause burning, vomiting, drowsiness, confusion, seizures, or breathing problems; severe cases may be life-threatening.

Euchromatin

A relatively open form of DNA packaging inside the cell nucleus. Its structure makes nearby genes more accessible for reading and activity than DNA in tightly packed regions.

Eugenicist

A person who supports eugenics, a discredited belief that society should control reproduction to alter inherited traits in a population. Eugenic policies caused coercion, discrimination, and forced sterilization and have no place in ethical healthcare.

Eugenics

A discredited ideology that seeks to change a population by encouraging some people to reproduce and preventing others from doing so. Its history includes racism, forced sterilization, institutional abuse, and genocide.

Eugenol Oil Overdose

Poisoning after excessive exposure to clove-derived eugenol oil. It may irritate the mouth and stomach and cause liver injury, bleeding, seizures, low blood pressure, slowed breathing, or coma.

Euglycemic Diabetic Ketoacidosis

A form of diabetic ketoacidosis in which the blood glucose is below 200 mg/dL despite high ketone levels and acid buildup in the blood. It may occur with sodium-glucose cotransporter 2 (SGLT2) medicines, reduced food intake, or acute illness.

Alternate Names:
EuDKA; Normal Glycemic Ketoacidosis

Euphoria

An unusually intense feeling of happiness or well-being. It may occur normally, with mania, brain disease, or some medicines and drugs; sudden extreme euphoria with unsafe behavior needs clinical assessment.

Eustachian Tube

A passage connecting the middle ear to the back of the nose. It opens during swallowing or yawning to

equalize pressure, drain fluid, and help protect the middle ear from throat secretions.

Eustachian Tube Dysfunction

A problem with the passage connecting the middle ear to the back of the nose. If it does not open or close properly, pressure or fluid can build up and cause ear fullness, popping, muffled hearing, or pain, often after a cold, allergy, or pressure change.

Eustachian-Tube Dysfunction

Alternate spelling; see *Eustachian Tube Dysfunction*.

Eustachian Tube Patency

The ability of the passage between the middle ear and back of the nose to remain open enough to equalize pressure and drain fluid. Poor patency can cause fullness, muffled hearing, or middle-ear fluid.

Eustachian Tube Problems

Problems with the ear-to-nose passage can cause fullness, popping, pain, muffled hearing, or repeated middle-ear fluid or infection. Colds, allergies, inflammation, and anatomy may contribute; persistent hearing loss needs examination.

Alternate Names:
Eustachian Tube Dysfunction (ETD); Auditory Tube Obstruction

Eustachian Valve

A crescentic embryological flap of tissue at the junction of the inferior vena cava and the inferior right atrium that in fetal life directs oxygenated umbilical venous blood across the foramen ovale into the left atrium; usually persists as a benign vestigial remnant in adults.

Alternate Names:
Valve of the Inferior Vena Cava

Euthanasia

The deliberate ending of a person's life by another person to relieve suffering. It is ethically and legally distinct from allowing a natural death, stopping unwanted treatment, or providing comfort-focused palliative care.

Euthanasia And Assisted Dying

Terms describing legally regulated practices intended to end life or help a person end life to relieve suffering. Laws and safeguards differ widely; they are distinct from palliative care and withdrawal of unwanted treatment.

Euthyroid

Having normal thyroid function, usually shown by thyroid-stimulating hormone and thyroid-hormone levels within the laboratory's reference ranges. A person can be euthyroid even when another illness temporarily changes some thyroid test results.

Euthyroid Goiter

An enlarged thyroid gland with normal thyroid-hormone production. It may result from iodine imbalance, autoimmune disease, nodules, medicines, or inherited factors and may be persistent, enlarging, or cause swallowing or breathing problems.

Euthyroid Hyperthyroxinemia

Elevated circulating thyroxine with an otherwise euthyroid clinical state. Binding-protein changes, inherited transport abnormalities, assay interference, or medication effects can produce the laboratory pattern without true thyroid hormone excess.

Euthyroid Sick Syndrome

Temporary changes in thyroid blood tests during severe illness, starvation, or major surgery without a primary thyroid disorder. Treatment usually focuses on the underlying illness rather than thyroid hormone.

Eutocia

Normal labor and birth progressing without major obstruction or complication. The term describes the course of delivery, not a separate disease or treatment.

Euvolemic Hyponatremia

Low blood sodium with no obvious clinical signs

of excess or deficient body fluid volume. Common mechanisms include inappropriate antidiuretic hormone activity, adrenal insufficiency, hypothyroidism, and excess water intake.

Evacuation

In medicine, removal of material from a body cavity, organ, or wound, such as blood from a body space or retained tissue from the uterus. In general use, it also means moving people away from danger.

Evacuation Of Uterus

Removal of pregnancy tissue or other retained material from the uterus using medicines, suction, or a surgical procedure. It may treat miscarriage, abortion, retained placenta, or bleeding and carries risks of infection, bleeding, or uterine injury.

Evaluation of Fetal Death

Assessment after suspected or confirmed fetal death includes ultrasound confirmation, maternal examination, laboratory testing, review of medical and pregnancy history, and discussion of placental or fetal examination when appropriate. Care also addresses delivery, bleeding or infection risk, grief, and future-pregnancy planning.

Evans Syndrome

An autoimmune disorder characterized by the simultaneous or sequential development of autoimmune hemolytic anemia (positive direct antiglobulin test) and immune thrombocytopenic purpura, occasionally accompanied by autoimmune neutropenia.

Alternate Names:
Evans's Syndrome; AIHA and ITP Syndrome

Event-Free Survival

The length of time after treatment begins or a study starts before a defined event occurs, such as disease progression, relapse, a complication, or death. The exact event must be stated for comparisons to be meaningful.

Event Monitor

A portable device that records the heart's electrical rhythm when symptoms occur or at scheduled intervals over days or weeks. It can help detect intermittent abnormal rhythms that a brief ECG may miss.

Everolimus

A medicine that suppresses a cell-growth pathway and immune activity. It is used for selected cancers, transplant care, and some genetic disorders; mouth sores, infection, high blood sugar, lung inflammation, and low blood counts may occur.

Eversion

Turning the sole of the foot outward, away from the body's midline. The movement uses several ankle and foot joints and can be limited by injury, arthritis, or nerve and muscle disorders.

Evidence-Based Practice

Care that combines the best available research, professional clinical judgment, and the patient's goals, values, and circumstances. It supports informed decisions while recognizing that evidence and individual needs may differ.

Eviscerate

1. To remove internal organs from the body, or the contents of an organ, such as the eye. 2. For internal organs to protrude through an open wound or surgical incision.

Evisceration

Protrusion of internal organs through a surgical abdominal wound that has opened. It is a surgical emergency because exposed organs can be injured, contaminated, or lose blood supply.

Evoked Potential

An electrophysiological neurodiagnostic recording of the electrical potential generated by the central nervous system in response to deliberate, synchronized sensory stimulation. Evaluates the functional integrity and conduction velocity of specific sensory neural pathways through the peripheral nerves, spinal cord tracts, brainstem nuclei, and cerebral cortex. Major clinical modalities include: Visual Evoked Potentials (VEP, recorded over the occipi-

tal cortex following checkerboard pattern-reversal visual stimuli, measuring the P100 wave latency to detect subclinical demyelinating optic neuritis in multiple sclerosis); Brainstem Auditory Evoked Potentials (BAEP, recorded over the scalp following auditory clicks, generating five distinct positive wave peaks representing the auditory nerve to the inferior colliculus to evaluate acoustic neuromas and brainstem lesions); and Somatosensory Evoked Potentials (SSEP, recorded over the spine and sensory cortex following electrical stimulation of the median or tibial nerves, widely utilized for intraoperative neurophysiological monitoring during spinal and cranial surgery).

Alternate Names:
Evoked Potentials; Evoked Response

Evoked Potentials

Plural form; see *Evoked Potential*.

Evolution

Gradual change in inherited traits of a population across generations. In clinical writing, the term can also describe how a disease, symptom, or treatment response changes over time.

Evolutionarily Conserved Gene

A gene whose sequence or function remains similar across different species. This similarity suggests that the gene performs an important biological role, although it does not by itself prove a disease association.

Ewart Sign

A physical-examination finding of a large fluid collection around the heart: dullness, reduced breath sounds, and bronchial breathing over the lower left back. Modern imaging is more reliable for confirming the cause.

Ewing Sarcoma

A rare, aggressive cancer of bone or soft tissue, most often affecting children, teenagers, and young adults. It may cause persistent pain, swelling, fever, or a fracture and requires biopsy and specialist treatment.

Ewing's Family of Tumors

Alternate name; see *Ewing Sarcoma*.

Ewing's Family of Tumors

Alternate name; see *Ewing Sarcoma*.

Ewing's Sarcoma

Alternate name; see *Ewing Sarcoma*.

Ewing's Tumour

Alternate spelling; see *Ewing Sarcoma*.

Exacerbate

To make a disease, symptom, or medical problem worse. Infection, stress, exertion, allergens, medicines, or delayed treatment may exacerbate symptoms, depending on the condition.

Exacerbation

A worsening or flare of a disease or its symptoms after a period of relative stability. Triggers may include infection, allergens, treatment interruption, exertion, or another physical or emotional stress.

Exacerbation Of COPD

A sudden worsening of breathlessness, cough, or sputum beyond usual daily variation in chronic obstructive pulmonary disease. Infections and air pollution are common triggers; severe breathlessness, confusion, or blue lips may occur in severe exacerbations.

Exaggerated Placental Site

A noncancerous increase in placental cells at the place where the placenta attaches to the uterus. It may resemble a pregnancy-related cancer in a tissue sample, so an experienced pathologist must distinguish it from cancer.

Examination

A systematic assessment of health using observation, touch, listening, measurements, and selected tests. It may be general or focused on a complaint and helps identify normal findings, illness, injury, and urgency.

Examination Table

A padded, adjustable surface that supports a person during examination, testing, minor procedures, or treatment. It should be stable, cleanable, accessible, and used with appropriate safety measures.

Exanthem

A widespread skin rash, often caused by an infection or medicine. Its appearance, timing, fever, mucosal involvement, and other symptoms help clinicians determine whether it may be contagious or serious.

Exanthema

A widespread skin eruption associated with an illness affecting the body. Viral infections are common causes, but medicines, bacteria, and immune disorders may also cause it; blisters, skin pain, mouth sores, or severe illness need prompt assessment.

Exanthema Subitum

Alternate spelling; see *Exanthem Subitum*.

Exanthematous Pustulosis

A sudden medicine-related eruption of many small, noninfectious pustules on red skin, often with fever. It usually improves after the responsible medicine is withdrawn; severe reactions may have systemic effects.

Exanthem Subitum

A common viral illness in infants and toddlers, usually caused by human herpesvirus 6 or 7. It often causes three to five days of high fever followed by a pink rash as the fever settles.

Alternate Names:
Roseola Infantum; Sixth Disease

Excavation

A hollow, depression, or removal of tissue or material. In medicine it may describe a normal body feature, a disease-related defect, or the surgical creation or clearing of a space.

Exceptional Release

Permission to use a donated organ that does not meet usual acceptance criteria when clinicians judge it suitable for a particular recipient. The decision requires careful risk assessment, documentation, and informed consent.

Excessive Bruising

Bruises that occur often, are unusually large, appear without clear injury, or last unusually long. Causes include medicines, fragile skin, low platelets, clotting disorders, liver disease, or other illness.

Excessive Daytime Sleepiness

An excessive tendency to feel drowsy or fall asleep during waking hours, despite an opportunity for adequate nighttime sleep. It may occur with insufficient sleep, sleep disorders, medicines, medical or neurologic conditions, or mood disorders.

Excessive Menstrual Bleeding

Alternate name; see *Heavy Menstrual Bleeding*.

Excessive Scarring

Abnormal overgrowth of scar tissue during wound healing. A hypertrophic scar remains within the original wound, while a keloid grows beyond its edges.

Excessive Sweating

Sweating more than needed to cool the body, either all over or in specific areas such as the hands, feet, or armpits. It may result from hyperhidrosis, medicines, infection, hormones, or another illness.

Excessive Tearing

Tears overflowing onto the face because the eyes make too many tears or drainage is blocked. Irritation, allergy, infection, dry eye, eyelid problems, or a blocked tear duct may be responsible.

Excessive Thirst

Polydipsia, an abnormally strong or persistent desire to drink, commonly associated with dehydration, diabetes mellitus, diabetes insipidus, medicines, or psychiatric conditions.

Excessive Yawning

Excessive yawning is unusually frequent or difficult-to-control yawning. It may accompany sleep deprivation, excessive daytime sleepiness, medication effects, vasovagal reactions, or less commonly neurologic or cardiopulmonary disease; persistent unexplained episodes merit clinical evaluation.

Excess Post-Exercise Oxygen Consumption

Increased oxygen use after exercise as the body returns to its usual metabolic and physiologic state.

Exchange Transfusion

A procedure that repeatedly removes small amounts of a baby's blood and replaces them with compatible donor blood. It can rapidly reduce dangerous bilirubin or antibody-related anemia when other treatment is insufficient.

Excise

To remove tissue, a growth, or a lesion by cutting it out. The removed material may be examined in a laboratory to identify the cause and determine whether abnormal cells reach the edges.

Excision

Surgical removal of part or all of a lesion, tissue, or organ. The specimen may be examined to establish a diagnosis, and removal may also treat disease when the affected area can be safely removed.

Excisional Biopsy

Removal of an entire lump or abnormal area, sometimes with a small margin of nearby tissue, so a laboratory can examine it. It may provide a diagnosis and, for selected small lesions, complete treatment.

Excision Biopsy

Alternate name; see *Excisional Biopsy*.

Excitation

Activation or increased responsiveness of a cell, nerve, muscle, molecule, or body system after a stimulus. In nerves and muscles, it can start electrical signals that produce movement or other functions.

Excitation-Contraction Coupling

The chain of events that links an electrical signal in a muscle cell to contraction. The signal causes calcium release inside the cell, allowing muscle proteins to interact and generate force.

Excitatory Neurotransmitter

A chemical messenger that makes a receiving nerve cell more likely to generate an electrical signal. Examples include glutamate and, in some settings, acetylcholine; excessive activity can injure nerve cells.

Excitatory Synapse

A junction between nerve cells where chemical signaling makes the receiving cell more likely to produce an electrical impulse. Balanced excitatory and inhibitory signals are needed for normal brain and nerve function.

Excitotoxicity

The pathological process of neuronal injury and cell death resulting from excessive or prolonged synaptic stimulation by excitatory neurotransmitters, primarily glutamate, triggering massive intracellular calcium influx, mitochondrial dysfunction, reactive oxygen species generation, and apoptotic protease activation.

Excitotoxin

A substance that overstimulates nerve cells and can damage or kill them. Excessive signaling may allow too much calcium into cells, contributing to injury in some brain diseases or poisoning states.

Exclamation Point Hair

A short broken hair that is thinner at its outer end and wider near the scalp. It is a characteristic finding of alopecia areata but can occasionally appear in other hair disorders.

Exclusion Diet

A planned diet that removes a suspected food and later reintroduces it to see whether symptoms recur. It should be supervised when possible and must not replace emergency allergy evaluation when severe reactions or anaphylaxis are possible.

Excoriate

To remove or injure the skin surface by scratching, rubbing, or picking. Repeated excoriation can cause open sores, infection, scarring, and difficulty healing.

Excoriation

A superficial skin injury caused by scratching, rubbing, or picking. It may cause pain, bleeding, crusting, infection, or scarring and usually heals when the irritation or behavior stops.

Excoriation Disorder

An obsessive-compulsive and related disorder involving recurrent skin picking that causes lesions, scarring, infection, or other tissue damage. Repeated attempts to reduce or stop the picking are unsuccessful, and the behavior causes significant distress or impairment; it is not better explained by a skin disease, substance, or another mental disorder.

Alternate Names:
Skin-Picking Disorder

Excoriation Disorder (Skin-Picking Disorder)

Alternate name; see *Excoriation Disorder*.

Excreta

Material expelled from the body, including stool, urine, sweat, vomit, and respiratory secretions. Some excreta carry infectious organisms, so handwashing, protective equipment, cleaning, and safe disposal help prevent spread.

Excretion

Removal of waste, medicines, or other substances from the body, mainly through urine, bile, breath, stool, sweat, or breast milk. Kidney and liver function strongly affect how long many substances remain in the body.

Executive Function

A multidimensional suite of higher-order top-down cognitive neurobehavioral control processes mediated predominantly by the prefrontal cortex (including dorsolateral, ventromedial, orbitofrontal, and anterior cingulate cortices) and its extensive frontostriatal and thalamocortical networks. These integrative operations enable goal-directed, purposeful, adaptive, and flexible behavior in novel or complex situations. Core subcomponents include working memory (mental manipulation and online maintenance of information), cognitive flexibility/set-shifting (the capacity to switch perspectives, attention, or strategies in response to changing environmental demands), and inhibitory control (suppression of prepotent impulsive behaviors, distractions, or inappropriate automatic actions). Higher-level executive functions encompass reasoning, abstract problem-solving, cognitive planning, organized strategy formulation, and error monitoring. Executive dysfunction (dysexecutive syndrome) is a prominent feature of frontotemporal lobar degeneration, traumatic brain injury, stroke affecting the frontal lobes or basal ganglia, Parkinson disease, attention-deficit/hyperactivity disorder (ADHD), and schizophrenia.

Alternate Names:
Executive Functions; Executive Control; Frontal Lobe Function

Executive Function Deficit

Impairment in higher-level cognitive processes governed by the frontal lobes, including working memory, planning, cognitive flexibility, organization, and impulse control; see *Executive Function*.

Executive Functions

Plural form; see *Executive Function*.

Exemestane

A medicine that lowers estrogen production by blocking an enzyme used after menopause. It treats selected hormone-sensitive breast cancers and may cause hot flushes, joint pain, bone loss, fatigue, or

abnormal cholesterol.

Exenatide

An injectable medicine that imitates a gut hormone, increasing insulin release when glucose is high, reducing glucagon, and slowing stomach emptying. It treats type 2 diabetes but may cause nausea, dehydration, or pancreatitis.

Exencephaly

A severe birth defect in which much of the developing brain lies outside the skull because the skull and protective coverings did not form normally. It usually progresses to anencephaly and is not compatible with long-term survival.

Exenteration

Extensive surgery removing organs and tissues from a body compartment, such as the pelvis or eye socket. It is reserved for selected advanced cancers or destructive disease and can cause major functional and emotional effects.

Exercise

Planned physical activity intended to improve or maintain strength, endurance, flexibility, balance, function, or health. Aerobic, resistance, and balance activities should be chosen and increased according to a person's abilities and medical risks.

Alternate Names:
Physical Exercise

Exercise And Age

The way physical activity needs and responses may change with age; safe exercise should match fitness, health, and ability.

Exercise And Immunity

The relationship between physical activity and immune function; regular moderate activity generally supports health, while excessive exertion may increase short-term illness risk.

Exercise Headaches

Headaches occurring during or after strenuous physical activity. Primary exercise headaches are recurrent and usually not caused by an underlying disorder, but a first, abrupt, severe, or atypical exertional headache requires prompt medical assessment to exclude secondary causes such as subarachnoid hemorrhage, arterial dissection, or reversible cerebral vasoconstriction syndrome.

Exercise-Induced Anaphylaxis

A rare form of anaphylaxis triggered by physical exertion, sometimes only when exercise follows ingestion of a specific food or medicine. Symptoms may include flushing, hives, swelling, wheezing, gastrointestinal symptoms, low blood pressure, or collapse.

Exercise-Induced Arrhythmias

Abnormal heart rhythms that begin or worsen during physical exertion. They may result from inherited electrical disorders, heart muscle disease, or reduced blood flow; fainting, chest pain, or palpitations may accompany them.

Exercise-Induced Asthma

An older, imprecise name for exercise-induced bronchoconstriction, which is temporary airway narrowing during or after exercise and can occur with or without chronic asthma.

Exercise-Induced Bronchoconstriction

Temporary narrowing of the lower airways during or shortly after exercise, with or without underlying asthma. It may cause cough, wheezing, chest tightness, or breathlessness, and is more likely in cold, dry air. Diagnosis is confirmed by an objective fall in lung function after exercise or a surrogate bronchoprovocation challenge.

Alternate Names:
Exercise-Induced Asthma (legacy term)

Exercise Intolerance

An inability to do as much physical activity as expected because of unusual tiredness, breathlessness, chest discomfort, leg pain, weakness, or dizziness. Heart, lung, blood-vessel, muscle, nerve, blood, metabolic, and conditioning problems can cause it.

Exercise Prescription

An individualized physical-activity plan specifying the type, frequency, intensity, duration, and progression of exercise. It is adapted to a person's goals, fitness, medical conditions, symptoms, and safety needs.

Exercises To Help Prevent Falls

Activities that improve leg strength, balance, flexibility, walking, and confidence. A program should match ability and medical conditions; supervised practice may be safest for people with previous falls or severe weakness.

Exercise Stress Test

A test that records heart rate, rhythm, blood pressure, and symptoms while a person walks on a treadmill or pedals a stationary bicycle. It assesses exercise capacity and may suggest reduced heart blood flow or an abnormal rhythm.

Exercise Tolerance

The ability to perform physical activity before symptoms such as breathlessness, fatigue, chest discomfort, or pain limit activity.

Exfoliation Syndrome

An age-related eye disorder in which abnormal material collects on the lens and other front-eye structures. It increases the risk of glaucoma and can make cataract surgery more complicated, so regular eye checks are important.

Exfoliative Cytology

Examination of cells that naturally shed from a body surface or are gently collected. It may help investigate infection, inflammation, or cancer, but abnormal or uncertain results may require tissue biopsy.

Exfoliative Dermatitis

Alternate name; see *Erythroderma*.

Exhalation

Breathing air out of the lungs. It is usually passive at rest as the lungs recoil, but muscles actively assist exhalation during exercise, coughing, or breathing difficulty.

Exhaled Nitric Oxide

A breath test that estimates one type of airway inflammation. A raised result can support asthma assessment and suggest likely benefit from inhaled steroids, but smoking, infection, allergies, and current treatment can affect the result.

Exhaustion

Extreme physical or mental tiredness that reduces the ability to function. It may follow exertion, poor sleep, illness, dehydration, anemia, hormone disorders, medicines, or stress; severe or persistent symptoms need evaluation.

Exhibitionism

Sexual arousal from exposing one's genitals to an unsuspecting person. Repeated nonconsensual exposure can harm others and becomes a diagnosable disorder when urges or actions cause significant distress, impairment, or risk.

Exhibitionistic Disorder

A mental-health disorder involving repeated sexual arousal from exposing the genitals to an unsuspecting person, with action on the urges or clinically significant distress or impairment.

Exhumation

Lawful removal of a buried body or remains for identification, further testing, investigation, or repatriation. It requires legal authorization and respectful handling; testing may include toxicology, DNA analysis, or examination of injuries.

Existential Distress

Emotional suffering related to meaning, identity, purpose, freedom, mortality, or loss of control. It can occur during serious illness and may improve with empathetic communication, counseling, spiritual care, and symptom relief.

Exit Wound

The wound where a projectile leaves the body. Its size and shape vary with the projectile, tissue, clothing, and bone, so appearance alone cannot prove the direction or identify every injury; complete examination is required.

Exocervix

The part of the cervix that projects into the vagina and is covered mainly by flat squamous cells. It is examined during pelvic examination and cervical screening.

Exocrine

Relating to glands that release substances through ducts onto a body surface or into a cavity. Examples include sweat, salivary, tear, and digestive glands.

Exocrine Gland

A specialized glandular organ or cluster of epithelial secretory cells that discharges its non-hormonal secretions into an anatomical duct or directly onto an internal or external epithelial surface (in contrast to endocrine glands, which secrete hormones directly into the bloodstream without ducts). Classified morphologically by duct branching (simple vs compound) and secretory unit architecture (tubular, acinar/alveolar, or tubuloacinar). Classified physiologically by mechanism of secretion: merocrine (eccrine) secretion (secretory products released via exocytosis from membrane-bound vesicles without cell loss, as in salivary glands, eccrine sweat glands, and pancreatic acini); apocrine secretion (secretory products released along with the apical portion of the secretory cell cytoplasm, as in apocrine sweat glands and lactating mammary glands); and holocrine secretion (the entire secretory cell disintegrates and is shed to release its contents, as in cutaneous sebaceous glands).

Alternate Names:
Exocrine Glands

Exocrine Glands

Plural form; see *Exocrine Gland*.

Exocrine Pancreas

The part of the pancreas that releases digestive enzymes and bicarbonate into the small intestine. These secretions help break down fats, proteins, and carbohydrates and neutralize stomach acid.

Exocrine Pancreatic Insufficiency

Failure of the pancreas to release enough digestive enzymes, causing poor digestion and absorption. It may lead to greasy stools, bloating, diarrhea, weight loss, and vitamin deficiency.

Exocrine Pancreatic Insufficiency EPI

Alternate index label; see *Exocrine Pancreatic Insufficiency*.

Alternate Names:
EPI; Pancreatic Exocrine Insufficiency

Exocytosis

The process by which a cell releases substances outside itself. Small sacs inside the cell join its outer membrane and release hormones, nerve signals, digestive enzymes, or other proteins.

Exogenous

Coming from outside the body rather than being produced within it. An exogenous substance may be a medicine, hormone, nutrient, toxin, infection, or other externally introduced material.

Exogenous Cushing Syndrome

A condition caused by prolonged or excessive corticosteroid treatment, producing effects similar to too much natural cortisol. Features may include weight gain, easy bruising, high blood pressure, diabetes, weakness, and bone loss.

Exomphalos

A birth defect in which abdominal organs protrude through the belly button into the base of the umbilical cord and are covered by a membrane. Newborns need protection of the sac and specialist surgical care.

Exon

A segment of a gene that remains in the mature messenger RNA after unused sections are removed. It may contain instructions for making part of a protein or, in some genes, help regulate gene activity.

Exopeptidase

An enzyme that removes amino acids from the end of a protein. Digestive exopeptidases help break dietary proteins into smaller units that the intestine can absorb.

Exophiala

A group of darkly pigmented environmental fungi that can rarely cause skin, lung, eye, or widespread infection. Disease is more likely in people with weakened immunity or implanted medical devices.

Exophthalmic Goitre

An enlarged thyroid associated with Graves disease, in which immune stimulation causes excess thyroid hormone. Graves disease may also cause eye dryness, pain, swelling, or bulging.

Exophthalmos

The abnormal forward protrusion or displacement of one or both eyeballs from the orbit, most frequently caused by Graves disease (thyroid eye disease), orbital tumors, or inflammation.

Alternate Names:
Bulging Eyes; Proptosis; Ocular Proptosis

Exosomes

Very small membrane-covered particles released by cells that carry proteins, fats, and genetic material to other cells. They help cells communicate and are being studied for diagnosis and drug delivery, but many medical uses remain experimental.

Exostosis

A benign growth of bone. It may be harmless, but location can cause pain, pressure, restricted movement, or blockage; repeated cold-water exposure can produce bony growths in the ear canal.

Exotoxins

Poisonous proteins released by some bacteria that damage particular cells or disrupt body functions. They cause diseases such as botulism, tetanus, diphtheria, or cholera, some of which can progress rapidly.

Exotropia

A type of strabismus in which one or both eyes turn outward, away from the nose. It may be intermittent or constant and can occur at any age. It can impair binocular vision or depth perception; in children, persistent misalignment may interfere with visual development. Treatment depends on the cause and may include glasses or surgery.

Expanded Rubella Syndrome

Alternate name; see *Congenital Rubella Syndrome*.

Expectant Treatment

Careful observation with regular review instead of immediate medicine or surgery when immediate intervention is not necessary. It includes clear follow-up and warning signs because treatment may be needed if symptoms worsen or tests change.

Expectorants

Medicines intended to loosen or increase airway mucus so it can be coughed up more easily. Benefits vary, and fluids, humidification, and treatment of the underlying illness may be more important than an expectorant.

Expectoration

Coughing up and bringing mucus or phlegm out of the respiratory tract. Changes in amount, color, smell, blood, fever, or breathlessness may indicate infection or another lung problem.

Experience

A person's direct knowledge, perception, or emotional response to an event. In healthcare, patient experience includes how care is accessed, communicated, coordinated, and received.

Alternate Names:

Subjective Experience; Patient-Reported Experience

Expiration

Movement of air out of the lungs, usually caused by relaxation of the breathing muscles and natural recoil of the lungs. During forceful breathing, abdominal and chest muscles actively push air out.

Expiratory Grunting

A grunting sound made during breathing out, caused by partially closing the voice box. It can briefly help keep small air spaces open but, especially in a baby or child, often signals respiratory distress.

Expiratory Reserve Volume

The maximum additional volume of air that can be actively and forcefully exhaled from the lungs at the end of a normal, quiet tidal expiration, normally measuring approximately 1.0 to 1.2 liters in healthy adults.

Alternate Names:
ERV

Explant

To remove an implanted device, prosthesis, or tissue. The term can also mean tissue removed from an organism and maintained in laboratory culture for study.

Explantation

Surgical removal of an implanted device or prosthesis. It may be needed because of infection, malfunction, migration, breakage, tissue injury, intolerance, or completion of temporary treatment.

Exploratory Laparotomy

Open surgery to enter the abdomen and directly find or treat a serious problem such as bleeding, perforation, blocked bowel, or loss of blood flow when less-invasive tests or treatment are insufficient.

Exploratory Operation

Surgery performed to inspect an area directly when scans, tests, or less-invasive procedures cannot establish the cause or extent of disease. Tissue may be sampled and treatment may be performed during the operation.

Exposure

Contact with a physical, chemical, biological, or psychological agent. Health risk depends on what the agent is, how much contact occurred, how it entered the body, and how long exposure lasted.

Exposure Route

The way a substance enters the body, such as by breathing, swallowing, skin contact, injection, or the eyes. The route affects how quickly and how much of the substance is absorbed and how toxic it may be.

Expression

In genetics, the process by which a gene's information is used to make RNA or protein. In clinical examination, expression can also mean the outward display of emotion or symptoms; altered gene activity can contribute to disease.

Expression Hopping

A shift from one form of addictive behavior to another, such as replacing substance use with compulsive gambling. The underlying loss of control and harm may persist even when the specific behavior changes.

Expressivity

The degree to which a genetic variant's effects appear in a person. Variable expressivity means that people with the same variant may have different features or different severity of the associated condition.

Exsanguinate

To lose or remove a life-threatening amount of blood. It can refer to bleeding from an injury or deliberate removal of blood from a body or body part. Severe blood loss can cause hemorrhagic shock and death. The related noun is exsanguination.

Exsanguination

Life-threatening loss of blood from severe internal or external bleeding. It can rapidly cause shock, organ failure, and death; immediate pressure or bleeding control, emergency care, and blood replacement may be needed.

Exserohilum

A group of darkly pigmented molds that can rarely cause sinus, eye, skin, or invasive infection. Serious disease is more likely in people with weakened immunity and requires specialist testing and treatment.

Extend

To straighten a joint or increase the angle between two bones. For example, extending the elbow moves the forearm away from the upper arm toward a straight position.

Alternate Names:
Extension

Extension

Movement that straightens a joint or increases the angle between bones, such as straightening the knee or elbow. Excessive or forced extension can strain or tear muscles, tendons, ligaments, cartilage, or the joint.

Extensively Drug-Resistant Tuberculosis

Tuberculosis caused by bacteria resistant to several key medicines, including isoniazid, rifampin, a fluoroquinolone, and at least one other important medicine. It is difficult to treat and requires specialist, susceptibility-guided therapy.

Alternate Names:
XDR-TB; XDR Tuberculosis

Extensor

A muscle or other structure that straightens a joint or increases the angle between bones. Extensor muscles commonly act opposite flexor muscles and help position limbs and fingers.

Extensor Digitorum

A forearm muscle whose tendons straighten the fingers and help extend the wrist. Overuse near its origin can contribute to outer-elbow pain commonly called tennis elbow.

Extensor Tendinitis

Irritation or inflammation of a tendon that straightens a joint in the foot or toes. It can cause pain or tenderness over the top of the foot or ankle, especially with repeated movement.

Extensor Plantar Response

An abnormal neurological reflex in which firm tactile stroking of the lateral plantar border of the foot produces slow extension (dorsiflexion) of the great toe accompanied by fanning of the other toes, indicating corticospinal (pyramidal) tract impairment.

Alternate Names:
Positive Babinski Sign; Babinski Reflex

Extent

The size, severity, range, or spread of a disease, injury, symptom, or treatment effect. Describing extent helps determine prognosis, further testing, and treatment.

External

Relating to the outside of a structure or body, or situated farther from the center of an organ or cavity. It contrasts with internal.

External Auditory Canal

The passage from the outer ear to the eardrum. It is lined with skin, hair, and wax-producing glands that help protect the ear, but it can become blocked, irritated, or infected.

External Auditory Canal Exostosis

Benign bony growths that narrow the ear canal, often after repeated exposure to cold water. They may trap water or earwax and cause blockage, infection, or reduced hearing. Also called surfer's ear.

External Beam Partial Breast Irradiation

An accelerated conformal radiation therapy technique delivered via external beam linac that targets

exclusively the lumpectomy cavity margin following breast-conserving surgery, sparing the remainder of the ipsilateral breast tissue in selected early-stage breast cancer patients.

Alternate Names:
EB-APBI; Accelerated Partial Breast Irradiation; Targeted Breast Radiotherapy

External Beam Radiation Therapy

Cancer treatment delivered from a machine outside the body to a carefully planned area. It can damage cancer cells while limiting nearby tissue exposure; fatigue, skin changes, and organ-specific effects may occur.

External Capsule

A thin bundle of nerve fibers in the brain near the basal ganglia. It carries signals between the cerebral cortex and deeper brain regions involved in movement, attention, and other functions.

External Carotid Artery

A major branch of the neck artery that supplies blood to much of the face, scalp, neck, and parts of the brain coverings through several branches.

External Cephalic Version

A procedure in which a clinician applies gentle pressure through the maternal abdomen to turn a fetus from a breech or transverse presentation into a head-down (cephalic) position for vaginal delivery. It is typically performed near term with continuous ultrasound and fetal heart rate monitoring.

Alternate Names:
ECV; Cephalic version.

External Ear

The visible part of the ear and the ear canal leading to the eardrum. It collects sound, directs it inward, and helps protect the middle and inner ear.

External Fixation

Stabilization of a broken bone or injured limb with pins or wires connected to a frame outside the body. It may be temporary or definitive, especially when swelling, wounds, or contamination prevent internal fixation.

External Iliac Artery

A major artery carrying blood from the pelvis toward the leg. It becomes the femoral artery below the groin and gives branches to the lower abdominal wall and pelvic region.

External Iliac Vein

A continuation of the femoral vein above the inguinal ligament that joins the internal iliac vein to form the common iliac vein.

External Incontinence Devices

Products worn or placed outside the body to collect urine or stool or protect clothing from leakage. Examples include urinary sheaths, absorbent products, and fecal collection systems; skin care and correct fitting help prevent injury.

External Jugular Vein

A visible vein running along the side of the neck that drains blood from the scalp and face toward the chest. Its fullness can provide clues about pressure in the right side of the heart.

External Nose

The visible nose formed by bone, cartilage, skin, and soft tissue. It shapes the nasal passages, helps warm and filter inhaled air, supports smell, and contributes to facial structure.

External Oblique Muscle

The broad, superficial muscle on each side of the abdomen. It compresses abdominal contents and helps bend and rotate the trunk; its lower border contributes to the groin ligament and canal.

External Otitis

Inflammation or infection of the ear canal outside the eardrum, often called swimmer's ear. Moisture, scratching, or skin disease may contribute, causing pain, itching, discharge, swelling, or reduced hearing.

Alternate Names:
Otitis Externa; Swimmer's Ear

External Resorption

Loss of tooth root or other tooth structure caused by a process starting outside the tooth. Injury, pressure, inflammation, or replacement by bone may contribute; treatment depends on location and severity.

External Ventricular Drain

A temporary tube placed through the skull into a fluid-filled space in the brain. It measures pressure and drains excess cerebrospinal fluid or blood, for example in some cases of hydrocephalus, bleeding, or serious brain injury.

Alternate Names:
EVD

Extinction

In learning, the fading of a learned response when reinforcement stops. In neurology, it can mean failing to notice one side of the body or space when both sides are stimulated, suggesting an attention disorder.

Extirpation

Complete surgical removal of a tissue, organ, growth, or foreign body. The term describes the extent of removal rather than a particular disease or surgical technique.

Extraamniotic

Located outside the amniotic sac surrounding a fetus. The term may describe a procedure, device, or fluid placed between the amnion and nearby tissues during pregnancy care.

Extracapsular Cataract Surgery

Cataract surgery that removes the cloudy lens while leaving most of its surrounding capsule in place. An artificial lens is usually inserted into the remaining capsule to restore focusing ability.

Extracellular

Located outside cells. Extracellular fluid, proteins, ions, and signals surround cells and help provide nutrients, remove waste, support tissues, and coordinate cell activity.

Extracellular Exosome

A tiny membrane-covered vesicle released by a cell that can carry proteins, fats, and genetic material to other cells. Exosomes help cells communicate and are being studied as disease markers and treatment vehicles.

Extracellular Fluid

Fluid outside cells, including blood plasma and the fluid between cells. It carries nutrients, hormones, and waste and is regulated mainly by the kidneys, circulation, and hormones.

Extracellular Matrix

A network of proteins and other substances outside cells that supports tissues and helps cells attach, communicate, grow, and repair injury. Its composition differs among bone, skin, muscle, and other organs.

Extracellular Pathogens

Microorganisms that live and multiply outside human cells. Examples include Streptococcus, Staphylococcus, and some Escherichia coli. They can damage tissues directly or through toxins, and the immune system usually fights them with antibodies and other defenses.

Extracellular Region

The area outside cells. It contains fluid, minerals, proteins, and signals that support tissues and influence how nearby cells grow, move, and function.

Extracellular Space

The fluid- and matrix-filled area outside cells. Nutrients, waste products, hormones, and signaling molecules move through it, and its composition helps control cell survival, movement, and function.

Extracellular Vesicle

A membrane-bound particle released by a cell that transfers molecular cargo between cells and is studied in physiology, disease, biomarkers, and drug delivery.

Extracellular Volume Fraction

A cardiac MRI measure estimating the proportion of heart muscle tissue occupied by extracellular space. It is calculated from pre- and post-contrast T1 measurements and hematocrit; an increased value can reflect diffuse fibrosis or infiltrative disease, including cardiac amyloidosis.

Extracorporeal

Occurring or performed outside the body; extracorporeal circulation and hemodialysis route blood through an external machine.

Extracorporeal Circulation

Movement of a person's blood through equipment outside the body and back again. Heart-lung machines, dialysis, and some life-support systems use it to add oxygen, remove waste, or support circulation; bleeding, clotting, infection, and organ injury are possible.

Extracorporeal Membrane Oxygenation

A temporary life-support treatment in which blood passes through a machine that adds oxygen and removes carbon dioxide, then returns to the body. It may support the lungs, or both the heart and lungs, during severe illness. Risks include bleeding, blood clots, infection, and damage to blood cells or nearby blood vessels.

Alternate Names:
ECMO; Extracorporeal Life Support; ECLS

Extracorporeal Shock Wave Lithotripsy

A treatment that uses focused shock waves from outside the body to break kidney or ureter stones into smaller pieces that can pass in urine. Bruising, bleeding, pain, blockage, or incomplete stone removal can occur.

Extracranial

Located or occurring outside the skull or cranial cavity. For example, extracranial arteries supply the scalp and face, while extracranial injury affects tissues outside the skull and brain.

Extracranial Hematoma

A collection of blood outside the skull or cranial cavity, usually caused by bleeding into soft tissues after injury.

Extract

A concentrated preparation made by separating active substances from a plant, herb, food, or other source. Strength, purity, interactions, and safety vary widely, especially in unregulated supplements.

Alternate Names:
Botanical Extract; Pharmacological Extract

Extraction

Removal of a tooth, tissue, foreign object, or other material from the body using a procedure. The method and risks depend on what is removed, where it is located, and the person's health.

Extra-Dural

Located outside the dura mater, the tough protective membrane around the brain and spinal cord. The term may describe a space, collection of blood, injection, or other structure outside this membrane.

Extra-Gastrointestinal Stromal Tumor

A tumor with features of a gastrointestinal stromal tumor that begins outside the digestive tract, often in abdominal supporting tissues. Diagnosis uses imaging, tissue examination, and molecular tests to guide cancer treatment.

Extragonadal Germ Cell Tumors

Germ-cell tumors arising outside the ovaries or testes, commonly in the mediastinum, retroperitoneum, or central nervous system. They may be seminomatous or nonseminomatous and are evaluated with imaging, tumor markers, pathology, and assessment for a gonadal primary.

Extrahepatic Biliary Atresia

Alternate name; see *Biliary Atresia*.

Extrahepatic Cholestasis

Reduced or blocked bile flow in the ducts outside the liver. Gallstones, scarring, inflammation, or a tumor may cause yellow skin, dark urine, pale stools, itching, pain, or infection.

Extramammary Paget Disease

A rare skin cancer usually affecting the vulva, anus, scrotum, or nearby skin. It often appears as a persistent itchy, sore, red, or scaly patch and requires biopsy to confirm diagnosis and assess for related cancer.

Extramammary Paget's Disease

Alternate spelling; see *Extramammary Paget Disease*.

Extramedullary Hematopoiesis

Blood-cell production outside the bone marrow, most often in the liver or spleen. It is normal during fetal development but, after birth, usually occurs when bone-marrow production is inadequate, as in myelofibrosis or severe chronic anemia such as thalassemia.

Alternate Names:
EMH; Extramedullary Blood Formation

Extranodal

Located outside the lymph nodes. An extranodal disease or lymphoma affects an organ or other tissue, such as the stomach, skin, lung, bone, or brain.

Extranodal Marginal Zone Lymphoma

A usually slow-growing cancer of B lymphocytes arising in tissues such as the stomach, salivary glands, thyroid, lungs, or eye. Symptoms depend on the organ involved and treatment may include observation, infection treatment, or cancer therapy.

Alternate Names:
MALT Lymphoma Mucosa-Associated Lymphoid Tissue Lymphoma

Extranodal Natural Killer T-Cell Lymphoma

An aggressive lymphoma arising from immune cells, often affecting the nose and upper throat. It is strongly associated with Epstein-Barr virus and may cause blockage, bleeding, swelling, fever, or tissue destruction.

Extraocular

Outside the eyeball or involving the muscles, nerves, and tissues around it. Extraocular structures move the eye, protect it, support vision, and connect it with the brain and face.

Extraocular Muscle

One of the muscles outside the eyeball that moves the eye in different directions. Weakness or nerve injury can cause double vision, eye misalignment, or difficulty looking in a particular direction.

Extraocular Muscle Function Testing

Examination of eye movements to assess the muscles and nerves that move the eyes. The person follows targets in different directions; abnormal movement can indicate muscle, nerve, brain, or eye-socket disease.

Extraocular Muscles

Plural form; see *Extraocular Muscle*.

Extrapulmonary Manifestation Of Tuberculosis

Tuberculosis affecting tissues outside the lungs, such as lymph nodes, bones, kidneys, the brain coverings, abdomen, or reproductive organs. Symptoms vary by site and treatment requires multiple antibiotics.

Extrapyramidal Disorder

A disorder of brain circuits that regulate movement, posture, and muscle tone. It may cause stiffness, slowness, tremor, abnormal movements, or restlessness and can result from disease or medicines.

Extrapyramidal Symptoms

Movement problems caused by medicines or dis-

eases affecting movement circuits. They include stiffness, tremor, slowed movement, restlessness, sudden spasms, or involuntary movements, commonly after dopamine-blocking medicines.

Extrapyramidal System

Interconnected brain structures and pathways, including the basal ganglia, that help control automatic movement, posture, muscle tone, and coordination. Damage or medicine effects can produce abnormal movements.

Extrapyramidal Tracts

Nerve pathways outside the main voluntary movement tract that influence posture, muscle tone, automatic movements, and coordination. Disturbance can cause stiffness, tremor, slowness, or involuntary movements.

Extraskeletal Chondroma

A benign cartilage-forming lump arising in soft tissue rather than from bone, often in the hands or feet. It may calcify, cause pain or pressure, and sometimes needs removal to confirm the diagnosis.

Extraskeletal Mesenchymal Chondrosarcoma

A rare aggressive cancer of soft tissue that contains malignant cartilage. It may arise outside bone and requires specialist biopsy, staging, and combined cancer treatment.

Extraskeletal Osteosarcoma

A rare aggressive cancer that produces bone-like material in soft tissue rather than beginning inside bone. It usually affects adults and requires imaging, biopsy, staging, and specialist treatment.

Extrasystole

A premature heartbeat caused by an ectopic electrical impulse arising in the atria, atrioventricular junction, or ventricles. Premature atrial contractions and premature ventricular contractions are common types; the term does not refer only to ventricular beats.

Extrauterine Pregnancy

A pregnancy implanted outside the normal uterine cavity, most often in a fallopian tube. It can rupture and cause life-threatening internal bleeding; one-sided pain, fainting, or bleeding may occur.

Extravasation

Leakage of blood, medicine, urine, or another body fluid from a vessel or duct into nearby tissues. It can cause swelling, pain, inflammation, infection, or tissue death; treatment depends on the substance, location, and severity.

Extravascular Hemolysis

The early removal and breakdown of red blood cells mainly in the spleen and liver. It can cause anemia, yellowing of the skin or eyes, and an enlarged spleen.

Alternate Names:
Reticuloendothelial Hemolysis; Splenic Erythrocyte Clearance

Extraventricular Drain

Alternate name; see *External Ventricular Drain*.

Extremities

The arms and legs, including their bones, joints, muscles, nerves, blood vessels, and skin. Problems in an extremity may affect movement, sensation, circulation, or function.

Extremity

A limb of the body. The upper extremity includes the shoulder, arm, forearm, wrist, and hand; the lower extremity includes the hip, thigh, leg, ankle, and foot.

Extremity Angiography

Imaging of blood vessels in an arm or leg, usually after contrast is introduced. It can show narrowing, blockage, aneurysm, abnormal connections, or injury and may sometimes be combined with treatment.

Extremity Hardware Removal

Surgical extraction of orthopedic implants such as

plates, screws, intramedullary rods, or wires from an arm or leg. Typically indicated for persistent localized pain, implant infection, mechanical irritation, soft-tissue impingement, nonunion, or planned subsequent procedures.

Alternate Names:
Orthopedic Hardware Removal; Implant Removal; Plate and Screw Removal

Extremity X-Ray

An X-ray image of an arm or leg used to look for fractures, joint alignment problems, arthritis, infection, tumors, foreign objects, or other bone abnormalities.

Extrinsic

Coming from outside a structure, organ, or person. An extrinsic cause may be an external injury, medicine, infection, toxin, environmental exposure, or other outside influence.

Extrinsic Allergic Alveolitis

An immune-mediated lung disease caused by repeated inhalation of organic dusts, molds, bird proteins, or other environmental substances. It can cause cough, breathlessness, fever, and, with ongoing exposure, permanent lung scarring.

Alternate Names:
Hypersensitivity Pneumonitis

Extrinsic Factor

An influence from outside a person, tissue, or body process. Examples include medicines, infections, toxins, temperature, nutrition, stress, and environmental exposure; effects depend on the type and amount.

Extrinsic Ureteral Obstruction

Blockage of a ureter caused by pressure from outside the ureter, such as a tumor, scar tissue, enlarged lymph nodes, blood-vessel abnormality, or nearby inflammation. It can reduce urine drainage and cause kidney swelling or loss of kidney function.

Alternate Names:
Extrinsic Ureteral Compression; Secondary Ureteral Obstruction

Extubate

To remove a breathing tube after a person can breathe adequately, protect the airway, clear secretions, and maintain safe oxygen levels without the ventilator.

Extubation

Removal of a breathing tube from the windpipe after a person can breathe independently, keep the airway open, clear secretions, and maintain adequate oxygen and carbon-dioxide levels.

Extubation Criteria

Findings used to judge whether a person can safely have a breathing tube removed. They include adequate breathing and oxygenation, stable circulation, alertness, airway protection, effective cough, and recovery from muscle-paralyzing medicines.

Exudate

Protein-rich fluid that leaks from inflamed or injured blood vessels into tissues or a body cavity. Its presence usually indicates inflammation, infection, or tissue injury rather than pressure alone.

Exudative Pleural Effusion

A protein-rich collection of fluid between the lung and chest wall caused by local inflammation or injury. Pneumonia, cancer, tuberculosis, and blood clots are possible causes; testing the fluid helps guide treatment.

Eye

The organ that detects light and forms vision. It includes the cornea, lens, iris, retina, optic nerve, and supporting tissues within the eye socket; disease can affect sight, movement, comfort, or appearance.

Eye Allergies

An allergic reaction affecting the eyes and often the inner eyelids. It usually causes itching, redness, watering, burning, or swollen eyelids and is commonly called allergic conjunctivitis.

Alternate Names:
Eye Allergy Ocular Allergy

Eye And Orbit Ultrasound

An ultrasound scan of the eye and surrounding socket. It can assess the retina, optic nerve, eye muscles, masses, bleeding, or other structures when the view through the front of the eye is obscured.

Eyeball

The roughly spherical organ of vision containing the cornea, sclera, iris, lens, retina, internal fluids, and other tissues. It focuses light onto the retina, which sends visual signals through the optic nerve.

Alternate Names:
Globe

Eye Bank

An organization that recovers, evaluates, stores, and distributes donated corneas or other eye tissue for transplantation, research, or education. Donor screening and tissue testing help protect recipients.

Eye Bleed

Bleeding on, inside, or around the eye. A bright-red painless patch on the white of the eye is often superficial, but bleeding inside the eye, pain, injury, or vision change requires prompt assessment.

Eyebrow

A strip of hair above the eye socket that helps divert sweat, water, and particles away from the eye and contributes to facial expression.

Eye Cancer

A cancer that begins in the eyelid, surface of the eye, uvea, retina, or tissues around the eye. Warning signs can include a growing or changing spot, persistent redness, vision changes, eye pain, bulging, or a new pupil abnormality; diagnosis usually requires specialist examination and imaging or biopsy.

Eye Color

The visible color of the iris, determined mainly by pigment and light scattering. A new, one-sided, uneven, or painful color change may indicate injury, inflammation, medicine effects, or another eye disorder.

Eye Development

Formation and maturation of the eyes, optic nerves, and visual pathways before and after birth. Disruption can cause structural abnormalities, reduced vision, misalignment, or delayed development of visual skills.

Eye Disease

Any disorder affecting the eye or visual pathways, including refractive errors, cataract, glaucoma, retinal disease, infection, inflammation, and tumors. Symptoms such as sudden vision loss, severe pain, flashes, or a curtain-like shadow can occur with sight-threatening disease.

Eye Disorder

Any pathological, functional, inflammatory, or structural abnormality affecting the eye, its ocular adnexa (eyelids, lacrimal apparatus, conjunctiva, orbit), extraocular muscles, or visual neural pathways (optic nerve, optic chiasm, optic radiations, visual cortex). Manifests with visual impairment (blurred vision, metamorphopsia, scotomas, visual field defects, blindness), ocular pain, redness (ciliary or conjunctival injection), photophobia, diplopia, or discharge. Encompasses major global categories: refractive errors (myopia, hyperopia, astigmatism, presbyopia); lens opacification (cataracts, the leading cause of reversible blindness worldwide); optic neuropathies characterized by progressive retinal ganglion cell axon loss (glaucoma, open-angle and angle-closure); retinal vascular and degenerative diseases (age-related macular degeneration, diabetic retinopathy, retinal vein/artery occlusion, retinal detachment); infectious/inflammatory conditions (keratitis, uveitis, endophthalmitis); and neuro-ophthalmic disorders (optic neuritis, papilledema).

Alternate Names:
Eye Disorders; Ophthalmic Disorder; Ocular Disease

Eye Disorders

Plural form; see *Eye Disorder*.

Eye Drops

Liquid medicines, lubricants, or diagnostic preparations placed on the eye surface. They may re-

lieve dryness or treat disease; contaminated bottles, shared drops, or incorrect use can cause injury or infection.

Eye Emergencies

Conditions requiring immediate assessment include sudden vision loss, chemical exposure, penetrating injury, severe pain, new neurologic symptoms, or rapidly spreading infection. Pressure on an injured eye can worsen damage.

Eye Floaters

Alternate name; see *Floaters*.

Eyeglass

A lens mounted in a frame to correct focusing problems such as nearsightedness, farsightedness, astigmatism, or presbyopia. The prescription is selected after measuring vision and the eyes.

Eye Health

Maintaining vision and preventing avoidable eye disease through appropriate examinations, injury and ultraviolet protection, control of diabetes and blood pressure, safe contact-lens care, and prompt attention to new symptoms.

Eye Hemorrhage

Bleeding on, inside, or around the eye. A small surface bleed may be painless, while bleeding in the retina, vitreous, or eye socket can impair vision or cause pressure.

Eye Infection

Infection of the eyelid, conjunctiva, cornea, internal eye, or surrounding tissues caused by bacteria, viruses, fungi, or parasites. Pain, light sensitivity, reduced vision, or swelling around the eye needs prompt care.

Eye Injury

Damage to the eye or nearby tissues from blunt or penetrating trauma, chemicals, foreign objects, radiation, or heat. Vision change, severe pain, bleeding, or an embedded object may indicate serious injury.

Eye Irritation

Burning, itching, redness, or watering caused by dryness, allergy, smoke, chemicals, infection, or a foreign particle. Chemical exposure can damage the eye and may cause lasting vision loss.

Eyelash

One of the short, curved protective hairs growing in rows along the edges of the upper and lower eyelids. Eyelashes protect the eyes by sweeping away dust, sweat, and debris, and their sensitive root nerves trigger an involuntary blinking reflex when touched by foreign particles.

Alternate Names:
Eyelashes; Cilia (Eyelashes)

Eyelashes

Plural form; see *Eyelash*.

Eyelid

A movable, specialized bi-lamellar musculo-fibro-mucous fold that covers and protects the anterior surface of the globe (eyeball). Structurally organized into an anterior lamella (composed of thin, delicate skin without subcutaneous adipose tissue and the concentric striated fibers of the orbicularis oculi muscle, innervated by the facial nerve [CN VII] and responsible for eyelid closure) and a posterior lamella (composed of the dense fibrous tarsal plate, which provides structural rigidity, modified sebaceous meibomian glands that secrete the lipid tear film layer, and the palpebral conjunctiva). Upper eyelid elevation is mediated by the levator palpebrae superioris muscle (innervated by the oculomotor nerve [CN III]) and the superior tarsal (Müller) muscle (innervated by sympathetics). The eyelids protect the ocular surface from mechanical trauma and light, maintain corneal hydration by sweeping the tear film across the ocular surface during blinking, and facilitate tear drainage into the lacrimal puncta. Clinical conditions include ptosis (drooping upper lid from CN III palsy, Horner syndrome, or aponeurotic dehiscence), ectropion (outward eversion of the lid margin), entropion (inward inversion), blepharitis, chalazion, and hordeolum.

Alternate Names:

Eyelids; Palpebra

Eyelid Bump

A localized eyelid swelling, often a painful infected gland called a stye or a firmer blocked oil gland called a chalazion. Warm compresses may help; persistent, recurrent, or vision-affecting bumps need examination.

Eyelid Cancer

Cancer arising in the skin or other tissues of the eyelid, most commonly basal cell carcinoma. A persistent or changing lump, sore, bleeding area, loss of eyelashes, or eyelid distortion needs ophthalmic or dermatologic evaluation.

Eyelid Coloboma

A birth defect causing a notch or missing section of the eyelid. It may leave the eye exposed, impair closure, and occur with other eye or facial abnormalities requiring specialist assessment.

Eyelid Disorder

A disease or structural problem of the eyelid, such as infection, inflammation, a blocked gland, malposition, weakness, or tumor. It may cause pain, swelling, poor eye protection, irritation, or visual problems.

Eyelid Drooping

Alternate name; see *Ptosis*.

Eyelid Inflammation

Alternate name; see *Blepharitis*.

Eyelid Lift

Alternate name; see *Blepharoplasty*.

Eyelid Neoplasm

A benign, precancerous, or cancerous growth of the eyelid. A persistent, enlarging, changing, bleeding, crusted, or ulcerated lesion needs examination by an eye or skin specialist.

Eyelid Problems

Disorders affecting eyelid skin, glands, muscles, nerves, position, or movement, including blepharitis, styes, chalazia, ptosis, entropion, ectropion, and tumors. Pain, vision change, severe swelling, or sudden onset requires prompt assessment.

Eyelids

Plural form; see *Eyelid*.

Eyelid Swelling

Puffiness of one or both eyelids caused by allergy, infection, inflammation, injury, a blocked gland, or fluid accumulation. Fever, severe pain, impaired eye movement, bulging eye, or vision change may indicate an emergency.

Eyelid Twitch

Alternate name; see *Eye Twitching*.

Eye Melanoma

A cancer arising from pigment-producing cells in the eye, most often in the uvea. It may cause blurred vision, flashes, a dark spot, or no symptoms; treatment depends on size, location, spread, and vision potential.

Alternate Names:
Uveal Melanoma; Ocular Melanoma; Choroidal Melanoma

Eye Movement

Coordinated movement of the eyes that directs gaze and keeps images aligned. It depends on the eye muscles, their nerves, and brain control; abnormal movement may cause double vision or imbalance.

Eye Muscle Repair

Treatment to correct a damaged or misaligned eye muscle or its attachment, usually by eye-muscle surgery. It may improve alignment or double vision but does not always restore normal movement and carries surgical risks.

Eye Neoplasm

A benign or malignant growth arising in the eye

or surrounding tissues. Symptoms and treatment depend on the tissue involved, size, location, effect on vision, and whether the growth has spread.

Eye Pain

Pain in or around the eye caused by surface irritation, infection, injury, inflammation, glaucoma, or disease behind the eye. Severe pain with vision loss, light sensitivity, nausea, or trauma can occur with serious eye disease.

Eye Prosthesis

An artificial eye or implant used to restore appearance after an eye is lost or severely damaged. It generally does not restore sight; fitting, cleaning, and periodic specialist care are needed.

Eye Redness

Redness caused by enlarged or inflamed blood vessels on or inside the eye. Irritation and conjunctivitis are common causes, but pain, light sensitivity, discharge, injury, or vision change may indicate serious disease.

Eye Retraction Syndrome

Alternate name; see *Duane Retraction Syndrome*.

Eyesight

Alternate name; see *Vision*.

Eyestrain

Tired, dry, sore, or uncomfortable eyes, sometimes with blurred vision or headache, after prolonged visual effort. Screen use, glare, poor lighting, dry eye, or an uncorrected focusing problem may contribute; rest often helps.

Eye Trauma

Injury ranging from a surface scratch to a penetrating wound or ruptured eyeball. Chemical exposure can cause progressive injury; pressure, rubbing, vision change, or severe pain may worsen or indicate serious damage.

Eye Twitching

Repeated involuntary eyelid or eye-area spasms, commonly linked to fatigue, stress, caffeine, irritation, or eye strain. Persistent spasms, facial weakness, eye closure, or other neurologic symptoms may indicate another condition.

Ezetimibe

An oral medicine that reduces absorption of cholesterol from the intestine. It lowers blood cholesterol alone or with another medicine and may cause diarrhea, abdominal discomfort, or rarely liver or muscle problems.

F

Fab Immunoglobulins

Antibody fragments containing one antigen-binding site, formed by one light chain and part of one heavy chain. Fab fragments bind a specific target but lack the antibody Fc region that mediates many immune functions.

Fabry Disease

An inherited lysosomal storage disorder caused by reduced activity of alpha-galactosidase A because of a disease-causing variant in the *GLA* gene. Globotriaosylceramide and related substances accumulate in cells, especially in blood vessels, the kidneys, heart, nerves, and skin. Features may include burning pain in the hands and feet, reduced sweating, small dark-red skin spots, kidney disease, heart disease, or stroke. The condition is usually X-linked and can affect people of any sex.

Fabry's Disease

Alternate spelling; see *Fabry Disease*.

Face

The front part of the head, including the eyes, nose, mouth, cheeks, and jaw. Its muscles produce facial expression, its nerves provide movement and sensation, and its structures support breathing, eating, speech, and vision.

Face and Brow Presentation

Fetal presentations in which the head is extended so the face or forehead leads into the birth canal. Face presentation involves full extension and is assessed by the direction the chin faces; brow presentation involves partial extension and has a different likelihood of vaginal birth.

Facelift

Cosmetic surgery that removes or repositions selected facial and neck skin and deeper tissues to reduce sagging. It does not stop aging and may cause bleeding, infection, nerve injury, scarring, or temporary swelling and numbness.

Alternate Names:
Rhytidectomy

Face Pain

Alternate name; see *Facial Pain*.

Face Powder Poisoning

Illness after swallowing or inhaling face powder or its ingredients. Effects depend on the product and amount and may include coughing, choking, vomiting, drowsiness, or breathing problems.

Face Presentation

A birth position in which the baby's neck is extended so the face, rather than the top of the head, leads through the birth canal. The baby's chin direction helps determine whether vaginal birth is safe.

Facet Joint

A small joint at the back of the spine connecting neighboring vertebrae and guiding movement. Arthritis, injury, or inflammation can cause localized neck or back pain and stiffness.

Facet Joint Syndrome

Back or neck pain thought to come from the small joints linking the bones of the spine. Pain may

worsen with bending backward or twisting, but these symptoms are not specific to the facet joints. The term describes a suspected source of pain rather than one test-confirmed disease.

Facet Joints

Plural form; see *Facet Joint*.

Facet Rhizotomy

A procedure that uses heat or another method to interrupt small nerves carrying pain signals from joints at the back of the spine. It may reduce selected chronic neck or back pain, but relief may be temporary.

Facial Anatomy in Cutaneous Surgery

The layered arrangement of facial skin, fat, muscles, nerves, vessels, glands, and connective tissue that guides safe dermatologic and reconstructive procedures. Knowledge of relaxed skin tension lines and danger zones helps preserve function and appearance.

Facial Asymmetry

A difference in the size, position, movement, or shape of the two sides of the face. It may be present from birth or result from injury, nerve weakness, muscle disease, swelling, or a growth.

Facial Cleft

A birth defect caused by incomplete joining of facial tissues during development. It may affect the lip, nose, mouth, or other facial structures and can interfere with feeding, speech, breathing, hearing, or appearance.

Facial Colliculus

An anatomical elevation on the floor of the fourth ventricle in the dorsal pons, formed by motor fibers of the facial nerve (cranial nerve VII) looping over the underlying abducens nucleus (cranial nerve VI); a lesion produces ipsilateral facial paralysis and lateral gaze palsy.

Facial Edema

Swelling of the face caused by excess fluid in tissues. Allergy, infection, injury, kidney or heart disease, and blocked veins may cause it; sudden lip, tongue, or throat swelling with breathing difficulty is an emergency.

Facial Expression

The visible movement or position of facial muscles that communicates emotion, pain, intention, or other information. Reduced or unequal expression can indicate facial-nerve or muscle dysfunction.

Facial Fractures

Breaks in one or more facial bones, such as the nasal, orbital, cheek, maxillary, or mandibular bones, usually caused by trauma. Pain, swelling, deformity, bleeding, double vision, malocclusion, or airway problems may occur.

Facial Muscle

A muscle that moves the skin of the face for expression and helps with speaking, eating, breathing through the mouth, or closing the eyes. Weakness may result from nerve, muscle, or brain disease.

Facial Neoplasm

A benign or malignant growth arising in facial skin, soft tissue, bone, salivary glands, nerves, or other structures. Symptoms and treatment depend on its tissue of origin, size, location, and spread.

Facial Nerve

The seventh cranial nerve, which controls facial expression and carries taste from part of the tongue. It also contributes to tear and saliva production and helps protect the ear from loud sounds.

Facial Nerve Palsy

Weakness or paralysis of facial muscles caused by dysfunction of the seventh cranial nerve. It may affect eye closure, smiling, taste, tears, or saliva; sudden weakness with arm or speech symptoms may indicate a stroke.

Facial Nerve Palsy From Birth Trauma

One-sided facial weakness in a newborn caused by pressure on the facial nerve during birth. It often improves as the nerve recovers. Weakness can interfere with eye closure or feeding, and other causes of facial weakness should be excluded.

Facial Nerve Problems

Disorders affecting the nerve that controls facial movement and some taste, tear, saliva, and sound-protection functions. Causes include Bell palsy, stroke, infection, injury, or a tumor; sudden weakness may occur with stroke or other acute disease.

Alternate Names:
Facial Nerve Disorder; Facial Nerve Dysfunction

Facial Nucleus

A group of nerve cells in the pons, part of the brainstem, whose fibers form the facial nerve and control facial-expression muscles. Injury can cause weakness of the face and related functions.

Facial Pain

Pain in the face that may arise from teeth, sinuses, jaw joints, nerves, skin, or other tissues. The location and associated symptoms help identify the cause.

Facial Palsy

Weakness or paralysis of facial muscles caused by dysfunction of the facial nerve or its brain pathways. Causes include Bell palsy, stroke, infection, injury, Lyme disease, and tumors; the pattern of weakness and accompanying findings vary with the cause.

Alternate Names:
Facial Paralysis

Facial Paralysis

Partial or complete loss of facial-muscle movement caused by disease or injury of the facial nerve or its brain pathways. Sudden onset, especially with limb weakness or speech trouble, may occur with stroke.

Facial Paresis

Weakness of muscles supplied by the facial nerve, causing reduced facial movement and sometimes poor eye closure, altered taste, or abnormal tearing. The cause may be nerve inflammation, injury, infection, stroke, or a tumor.

Facial Rejuvenation

A broad group of cosmetic treatments intended to reduce visible signs of facial aging or alter facial contours. Methods may include skin resurfacing, injectable treatments, and surgery such as a facelift or blepharoplasty.

Facial Soft Tissue Injuries

Lacerations, abrasions, contusions, punctures, or avulsions involving the skin and underlying soft tissues of the face. Associated injuries can involve facial nerves, ducts, vessels, the eye, and deeper facial structures.

Facial Spasm

Involuntary repeated tightening of facial muscles. It may affect one side around the eye or mouth and can result from nerve irritation, medicines, stress, or another neurologic disorder.

Facial Swelling

Enlargement of part or all of the face caused by infection, allergy, injury, dental or salivary disease, sinus disease, fluid retention, or a growth. Rapid swelling of the mouth or throat with breathing difficulty is an emergency.

Facial Tics

Sudden, repeated, involuntary facial movements or sounds, such as blinking, grimacing, or nose wrinkling. They may increase with stress and occur in tic disorders; persistent or disruptive tics can be treated.

Facial Trauma

Injury affecting facial skin, soft tissue, teeth, nerves, blood vessels, eyes, nose, or bones. Associated concerns include airway injury, bleeding, vision loss, brain injury, and structural damage.

Facial Vein

A vein that drains blood from the superficial face toward the internal jugular vein. Connections with deeper veins mean facial infections can rarely spread toward the eye socket or brain.

Facies

A distinctive pattern of facial features associated with a disease or physiologic state. Examples include the rounded facial appearance of Cushing syndrome and reduced facial expression in Parkinson disease. A facies may suggest a diagnosis but cannot confirm it by itself.

Facies Hippocratica

A historical term for a gaunt, sunken facial appearance described in severe illness or near death. It is nonspecific and does not identify a particular disease.

Alternate Names:
Hippocratic Facies; Hippocratic Face

Facilitated Diffusion

Movement of a substance across a cell membrane through a channel or carrier protein, from higher to lower concentration. The process does not directly use cellular energy and helps move substances that cannot cross the membrane unaided.

Facio-Scapulo-Humeral Dystrophy

Alternate name; see *Facioscapulohumeral Muscular Dystrophy*.

Facioscapulohumeral Dystrophy

Alternate name; see *Facioscapulohumeral Muscular Dystrophy*.

Facioscapulohumeral Muscular Dystrophy

An inherited disorder causing progressive, often uneven weakness of facial, shoulder-blade, and upper-arm muscles. Symptoms may begin in adolescence or adulthood and can later involve the trunk, hips, or legs.

Factitious Disorder

A mental disorder in which a person deliberately falsifies or induces physical or psychological signs or symptoms in themselves and presents as ill, impaired, or injured. The behavior involves identified deception and occurs without an obvious external reward; this distinguishes it from malingering, in which symptom production is motivated by an external incentive.

Alternate Names:
Munchausen Syndrome; Pathomimicry

Factitious Disorder by Proxy

Alternate name; see *Factitious Disorder Imposed on Another*.

Factitious Disorder Imposed on Another

A mental disorder in which a person falsifies or induces physical or psychological symptoms in another person under their care and presents that person as ill or injured, with identified deception and no obvious external reward. The behavior can seriously harm the dependent person and is a form of abuse.

Alternate Names:
Munchausen Syndrome by Proxy; MSBP; Pediatric Symptom Falsification

Factitious Disorders

Alternate name; see *Factitious Disorder*.

Factitious Hyperthyroidism

A state of excessive thyroid hormone in the body caused by ingestion of thyroid hormone or another external source rather than increased thyroid-gland production.

Factor

A substance that contributes to a biological process or clinical result. In hematology, the term usually refers to blood-clotting proteins that work together to stop bleeding.

Factor H Deficiency

A rare inherited or acquired problem in which a protein that keeps part of the immune system under

control is missing or faulty. It can cause repeated infections or inflammation that damages small blood vessels, especially in the kidneys.

Factor I Deficiency

An ambiguous name for two distinct disorders. In blood clotting, factor I is fibrinogen, and its deficiency can cause abnormal bleeding. In immunology, complement factor I deficiency disrupts regulation of the complement system and can increase susceptibility to bacterial infections. The intended disorder should be specified as fibrinogen deficiency or complement factor I deficiency.

Factor II Assay

A blood test measuring factor II activity, which helps assess the clotting pathway and investigate abnormal bleeding, prolonged prothrombin time, or suspected prothrombin deficiency or inhibition.

Factor IX

A vitamin-K-dependent blood-clotting protein that works with factor VIII to form clots. Inherited deficiency causes hemophilia B, leading to prolonged or spontaneous bleeding, especially into joints and muscles.

Factor IX Assay

A blood test measuring factor IX activity, used to diagnose or monitor factor IX deficiency, the cause of hemophilia B, and to guide replacement treatment.

Factor V

A blood-clotting protein that helps generate thrombin and fibrin, the mesh that strengthens a clot. Too little can cause bleeding; an inherited change affecting its regulation can increase venous-clot risk.

Factor V Assay

A blood test measuring how well factor V supports clotting. It helps investigate abnormal bleeding or clotting-test results and diagnose inherited deficiency or an acquired reduction from liver disease or other illness.

Factor V Deficiency

An inherited or acquired bleeding disorder caused by too little active factor V. It may cause easy bruising, nosebleeds, heavy menstrual bleeding, or excessive bleeding after injury, dental work, surgery, or childbirth.

Factor VII

A liver-made blood-clotting protein that starts clot formation when tissue is injured. Inherited or acquired deficiency can cause easy bruising, nosebleeds, or serious bleeding after injury or procedures.

Factor VII Assay

A blood test measuring factor VII activity. It helps investigate a prolonged prothrombin time and identify inherited deficiency, liver disease, vitamin-K deficiency, or medicine-related reduction.

Factor VII Deficiency

A bleeding disorder caused by too little or poorly functioning factor VII. Bleeding severity varies and may include bruising, nosebleeds, heavy periods, bleeding after surgery, or severe hemorrhage; prothrombin time is usually prolonged.

Factor VIII

A blood-clotting protein that works with factor IX to form a stable clot. Inherited deficiency causes hemophilia A, with prolonged or spontaneous bleeding, often into joints, muscles, or other tissues.

Factor VIII Assay

A blood test measuring factor VIII activity. It helps diagnose or monitor hemophilia A and investigate acquired reductions caused by inhibitors, liver disease, or other conditions.

Factor V Leiden

The most common inherited blood clotting disorder, caused by a genetic mutation that alters a clotting protein called factor V. Because of this mutation, factor V cannot be easily switched off by the body's natural anticoagulant mechanisms, making the blood more prone to forming abnormal clots.

People with this condition have an increased risk of developing deep vein thrombosis (clots in the legs) and pulmonary embolism (clots in the lungs), although many carriers never experience a clot.

Alternate Names:
FVL; Activated Protein C Resistance; APCR

Factor V Leiden Mutation

Alternate name; see *Factor V Leiden*.

Factor X

A blood-clotting protein that helps start the final steps of clot formation. Too little factor X can cause prolonged or unexpected bleeding and is assessed with clotting tests and other blood studies.

Factor X Assay

A blood test measuring factor X activity, a key clotting step shared by two clotting pathways. It helps investigate abnormal bleeding and diagnose or monitor inherited or acquired factor X deficiency.

Factor X Deficiency

A rare inherited or acquired bleeding disorder caused by too little active factor X. Bleeding severity varies from bruising to serious hemorrhage, and both major clotting-time tests may be prolonged.

Factor XI Deficiency

An inherited or acquired bleeding disorder caused by reduced factor XI activity. Bleeding is variable and is often noticed after surgery, dental procedures, childbirth, or trauma rather than occurring spontaneously.

Factor XII

A blood-clotting protein that starts one pathway measured by laboratory clotting tests. Factor XII deficiency can greatly prolong the activated partial-thromboplastin time but usually does not cause abnormal bleeding.

Factor XII Assay

A blood test measuring factor XII activity. It may help explain an isolated prolonged activated partial-thromboplastin time, especially when the person has no unusual bleeding.

Factor XII Deficiency

A deficiency of factor XII that can greatly prolong one laboratory clotting test but usually does not cause bleeding. It is often discovered unexpectedly during testing for another reason.

Factor XIII

The clot-stabilizing protein that strengthens the fibrin mesh after a clot forms. Factor XIII deficiency can cause delayed bleeding, poor wound healing, or repeated pregnancy loss despite initially normal routine clotting tests.

Factor XIII Deficiency

A rare inherited or acquired bleeding disorder caused by too little factor XIII, the protein that strengthens a blood clot. Bleeding may start hours after an injury or procedure and can include bleeding from the umbilical cord in newborns, poor wound healing, or bleeding in the brain. Routine clotting tests may be normal.

Alternate Names:
Fibrin-Stabilizing Factor Deficiency; FXIII Deficiency

Facultative Anaerobe

A microorganism that can grow with or without oxygen. It uses oxygen when available but can switch to other energy-producing processes when oxygen is absent; many intestinal bacteria have this ability.

Faecal Fistula

An abnormal connection between the intestine and another organ, the skin, or the body surface that allows stool or intestinal fluid to leak. It can cause infection, dehydration, skin injury, and poor nutrition.

Faecalibacterium

A group of oxygen-sensitive bacteria commonly found in the intestine. They can produce butyrate, a substance that supports the colon lining; their

presence is studied in relation to gut health and inflammation.

Faeces

Alternate spelling; see *Feces*.

Faget Sign

The unusual clinical physical finding of fever accompanied by a paradoxically normal or slow pulse rate (sphygmothermic dissociation / relative bradycardia), classically seen in yellow fever, typhoid fever, Legionnaires' disease, and tularemia.

Alternate Names:
Faget's Sign; Sphygmothermic Dissociation

Fahr Disease

An older name for primary familial brain calcification, an uncommon inherited condition in which calcium deposits build up in brain regions. Some people have no symptoms; others develop movement, thinking, or psychiatric changes. Similar deposits can occur for other reasons, so primary and secondary causes are distinguished.

Fahr's Disease

Alternate spelling; see *Fahr Disease*.

Fahr's Syndrome

Alternate spelling; see *Fahr Disease*.

Fahr Syndrome

An older, imprecise name sometimes used for brain calcium deposits from inherited or other causes; see *Fahr Disease*.

Failed Induction Of Labor

Failure of labor to progress after medicines or procedures intended to start it. The decision to continue induction or perform cesarean birth depends on cervical change, contractions, time, the mother's condition, and fetal well-being.

Failed Intubation

Inability to place a breathing tube safely in the windpipe. It is an airway emergency in which oxygen delivery and alternative airway methods are central to management.

Failure To Thrive

Older term for faltering weight, a pattern of slower-than-expected weight gain in a child. See *Faltering Weight*.

Fainting

A brief loss of consciousness and muscle tone caused by temporarily reduced blood flow to the brain, followed by spontaneous recovery. Reflex episodes are common; fainting during exercise, with chest pain, or without warning can occur with serious causes.

Alternate Names:
Syncope; Passing Out

Falciform Ligament

A fold of tissue attaching the liver to the front abdominal wall and diaphragm. It marks the division between the liver's right and left lobes and contains the remnant of a fetal umbilical vein.

Falciparum Malaria

Malaria caused by Plasmodium falciparum parasites transmitted by infected mosquitoes. It can worsen rapidly and cause brain involvement, severe anemia, kidney injury, breathing failure, shock, or death.

Fall

An unplanned movement to the ground or another lower level. Falls may result from poor balance, weakness, vision problems, medicines, dizziness, low blood pressure, or environmental hazards and can cause serious injury.

Fallen Arches

Flattening of the foot's inner arch, also called flat feet. It may be flexible or rigid and may cause no symptoms or lead to foot, ankle, knee, or back discomfort; treatment depends on symptoms and cause.

Alternate Names:
Pes Planus; Flat Feet; Flatfoot; Fallen Foot Arches

Fallen Bladder

A common term for bladder prolapse, in which weakened pelvic-support tissues allow the bladder to bulge into the front wall of the vagina. It may cause pressure, leakage, incomplete emptying, or no symptoms.

Fallopian Tube

One of a pair of narrow, muscular tubes in the female reproductive system connecting each ovary to the uterus. Each month, the tube's delicate finger-like ends sweep up an egg released by the ovary and gently guide it inward. The fallopian tube is the normal site where fertilization takes place when sperm meets the egg, after which the fertilized egg travels into the uterus to implant.

Alternate Names:
Fallopian Tubes; Uterine Tube; Oviduct; Salpinx

Fallopian Tube Cancer

A rare cancer beginning in a fallopian tube. It may cause pelvic pain, a mass, abnormal or watery discharge, or no early symptoms; diagnosis, staging, and treatment resemble those for ovarian cancer.

Fallopian Tube Disorders

Disorders affecting the tubes that transport the ovum, including infection, inflammation, blockage, ectopic pregnancy, hydrosalpinx, torsion, endometriosis, and cancer. They may cause pelvic pain, infertility, abnormal bleeding, or acute abdominal symptoms.

Fallopian-Tube Endometriosis

Endometriosis involving or surrounding a fallopian tube. It may cause pelvic pain, adhesions, or infertility, or be found unexpectedly; treatment depends on symptoms, disease extent, and fertility goals.

Fallopian Tubes

Plural form; see *Fallopian Tube*.

Fallopian Tube Torsion

Twisting of a fallopian tube, sometimes around a cyst or fluid-filled tube, that can cut off blood flow. It may cause sudden severe pelvic pain, nausea, or vomiting.

Fallot's Tetralogy

A birth defect combining four heart abnormalities that reduce blood flow to the lungs and may cause bluish skin, breathing difficulty, poor growth, or fainting. Specialist care and usually surgery are required.

Fall Prevention

Steps to reduce falling, including strength and balance training, medication review, vision and hearing checks, safe footwear, adequate lighting, removal of hazards, and support with walking when needed.

Fall Risk

The likelihood of falling based on factors such as previous falls, balance, walking ability, strength, vision, medicines, dizziness, blood-pressure changes, cognition, and environmental hazards.

Falls

Plural form; see *Fall*.

Fall Screening

A brief assessment of previous falls, balance, walking, strength, medicines, vision, dizziness, cognition, and surroundings to identify fall risk and guide prevention or further evaluation.

False Labor

Contractions that may be uncomfortable but do not progressively open and thin the cervix. They are often irregular and may lessen with rest, hydration, or a change in activity, unlike established labor.

False Negative

A test result that says a condition is absent when it is actually present. It can occur because testing was too early, the sample was inadequate, the condition level was low, or the test was not sensitive enough.

False-Negative Result

A negative result when the tested condition is actu-

ally present. Early testing, an inadequate sample, prior treatment, low levels of the target, technical error, or limited test sensitivity can cause it.

False Passages

Abnormal channels made through tissue during instrumentation, surgery, or injury instead of following the normal body pathway. They can cause bleeding, perforation, infection, or failure to place a tube correctly.

False Positive

A test result that indicates a condition is present when it is not. It may result from cross-reaction, contamination, technical error, or testing in a group where the condition is uncommon.

False-Positive Result

A positive result when the tested condition is actually absent. Cross-reaction, contamination, technical error, limited specificity, or testing in a low-risk population can produce it.

False Pregnancy

Alternate name; see *Pseudocyesis*.

False Ribs

The lower ribs that do not attach directly to the breastbone. Their cartilage joins the cartilage above or ends freely, allowing flexibility but leaving them vulnerable to injury in some areas.

Faltering Weight

Slower-than-expected weight gain or a concerning downward change in a child's growth pattern. The 2026 AAP and NASPGHAN guideline uses this term in place of failure to thrive; feeding difficulty, inadequate intake, poor absorption, chronic disease, or other factors may contribute.

Alternate Names:
Failure To Thrive; Growth Faltering

Falx Cerebelli

A small, triangular crescent-shaped fold of dura mater situated in the posterior cranial fossa inferior to the tentorium cerebelli, projecting vertically forward between the right and left cerebellar hemispheres.

Falx Cerebri

A large, sickle-shaped vertical fold of dura mater that dips vertically into the longitudinal cerebral fissure between the right and left cerebral hemispheres, attaching anteriorly to the crista galli and frontal crest and posteriorly to the tentorium cerebelli and internal occipital protuberance.

Famciclovir

An antiviral medicine that changes into penciclovir in the body and limits multiplication of herpes viruses. It can treat selected shingles, cold-sore, or genital-herpes episodes but does not remove the virus permanently.

Familial

Occurring more often within a family because of shared genes, environment, behaviors, or a combination. Familial does not necessarily mean that one specific gene causes the condition.

Familial Adenomatous Polyposis

A rare, inherited genetic condition characterized by the growth of hundreds to thousands of noncancerous polyps throughout the colon and rectum, usually beginning in the teenage years. Caused by a mutation in the extitAPC gene, this condition carries a near 100% lifetime risk of developing colorectal cancer if the colon is not removed, and affected individuals require specialized early genetic screening and surveillance.

Alternate Names:
FAP; Adenomatous Polyposis Coli

Familial Adenomatous Polyposis (FAP)

Alternate name; see *Familial Adenomatous Polyposis*.

Familial Alobar Holoprosencephaly

An inherited or familial form of alobar holoprosencephaly, a severe developmental defect in which the embryonic forebrain fails to divide normally. It may

be associated with major midline facial abnormalities and requires genetic and specialist evaluation.

Familial Benign Pemphigus (Hailey-Hailey Disease)

An inherited disorder caused by impaired calcium handling between epidermal cells, producing recurrent fragile blisters, erosions, and painful fissures in skin folds. Heat, sweating, friction, and infection can trigger flares; it is not contagious.

Familial Chordoma

A familial predisposition to chordoma, a rare malignant tumor arising from remnants of the embryonic notochord. A family history may warrant genetic counseling and evaluation for tumors involving the skull base or spine.

Familial Combined Hyperlipidemia

An inherited tendency to have high LDL cholesterol, high triglycerides, or both, often affecting several relatives. It increases early cardiovascular risk and is managed with lifestyle measures and lipid-lowering treatment when indicated.

Familial Congestive Cardiomyopathy

Older name for familial dilated cardiomyopathy; see *Familial Dilated Cardiomyopathy (FDC)*.

Familial Cutaneous Amyloidosis

An inherited tendency to develop amyloid deposits limited mainly to the skin, often producing itchy lichen or rippled macular lesions. The specific pattern and associated systemic risk require dermatologic assessment.

Familial Dilated Cardiomyopathy (FDC)

A form of dilated cardiomyopathy that occurs in multiple family members, often because of an inherited genetic change. It causes enlargement and weakened pumping of the left ventricle; inheritance, age of onset, and severity vary, and some relatives with a disease-associated variant may have no symptoms.

Familial Dysautonomia

An inherited nerve disorder affecting sensation and automatic functions such as blood pressure, heart rate, sweating, tears, digestion, and swallowing. Symptoms may include dizziness, temperature problems, repeated lung infections, and poor growth.

Familial Dysbetalipoproteinemia

An inherited disorder in which the body clears certain cholesterol- and triglyceride-rich particles poorly. It can cause high blood fats, yellowish skin deposits, and premature artery disease, especially with other metabolic risk factors.

Familial Emphysema

Emphysema caused or strongly predisposed by an inherited disorder, especially alpha-1 antitrypsin deficiency. It can occur at a younger age and may be worsened by smoking or occupational exposures.

Familial Hypercholesterolaemia

Alternate spelling; see *Familial Hypercholesterolemia*.

Familial Hypercholesterolemia

An inherited genetic disorder that prevents the body from effectively clearing low-density lipoprotein (LDL, or 'bad') cholesterol from the bloodstream. This leads to exceptionally high cholesterol levels from birth, causing fatty deposits to accumulate in tendons (xanthomas), around the eyes, and in coronary arteries, dramatically increasing the risk of early heart disease and heart attacks at a young age.

Familial Hypertriglyceridemia

An inherited tendency toward high blood triglycerides, often worsened by diabetes, obesity, alcohol, or certain medicines. Very high levels can cause abdominal pain, eruptive skin bumps, and acute pancreatitis.

Familial Hypocalciuric Hypercalcemia

An inherited condition causing lifelong, usually mild high blood calcium with low urinary calcium. People often have no symptoms, and recognizing it prevents

unnecessary parathyroid surgery; specialist testing may confirm the diagnosis.

Familial Jaundice

Jaundice caused by an inherited disorder of bilirubin production, conjugation, transport, or excretion. Examples include Gilbert syndrome, Crigler-Najjar syndrome, Dubin-Johnson syndrome, and Rotor syndrome.

Familial Lichen Amyloidosis (Type IX)

A hereditary form of primary localized cutaneous amyloidosis in which amyloid deposits in the skin cause intensely itchy, thickened, rippled, or hyperpigmented lesions, usually on the shins or upper back.

Familial Lipoprotein Lipase Deficiency

A rare inherited disorder in which triglycerides cannot be broken down normally. It causes extremely high triglycerides, recurrent pancreatitis, abdominal pain, and yellow-red skin bumps and requires specialist dietary and medical care.

Familial Mediterranean Fever

Usually an autosomal recessive inherited inflammatory disorder, often associated with changes in the *MEFV* gene, causing repeated short attacks of fever with abdominal, chest, or joint pain. Without treatment, ongoing inflammation can damage the kidneys; preventive medicine can reduce attacks and complications.

Familial Multiple Lipomatosis

An inherited tendency to develop many soft, slow-growing, usually painless fatty lumps under the skin, often on the trunk and limbs. They are generally benign; lumps may be painful, rapidly growing, or unusual.

Familial Multiple Polyposis

An older name for familial adenomatous polyposis, an inherited disorder causing numerous adenomatous colorectal polyps and a very high risk of colorectal cancer without appropriate surveillance and preventive treatment.

Familial Multiple Trichoepithelioma

An inherited condition causing many benign tumors from hair follicles, usually small skin-colored facial bumps. They may increase over time and can affect appearance; treatment is chosen according to number, size, and location.

Familial Paroxysmal Peritonitis

An inherited inflammatory disorder causing repeated short attacks of fever with severe abdominal, chest, or joint pain. Without treatment, ongoing inflammation can damage the kidneys; preventive treatment can reduce attacks and complications.

Alternate Names:
Familial Mediterranean Fever

Familial Partial Lipodystrophy

A group of inherited disorders involving selective loss of subcutaneous fat, usually from the limbs and buttocks, with relative fat accumulation in areas such as the face, neck, or trunk. Abnormal fat distribution can lead to insulin resistance, diabetes, high triglycerides, and fatty liver.

Familial Primary Pulmonary Hypertension

Heritable pulmonary arterial hypertension caused by pathogenic variants, most often involving the *BMPR2* pathway. Progressive narrowing of pulmonary arteries increases right-heart strain and can cause breathlessness, fainting, or right-heart failure.

Familial Renal Amyloidosis

An inherited amyloidosis in which a variant protein, often transthyretin or another hereditary amyloid precursor, deposits in the kidneys and sometimes the nerves, heart, or other organs. Proteinuria and progressive kidney dysfunction may occur; genetic and specialist evaluation guides care.

Familial Testotoxicosis

An inherited condition in which boys produce excess testosterone without normal brain stimulation. It causes early sexual development, rapid growth, and advanced bone age but may reduce adult height without treatment.

Familial Tremor

A tremor affecting more than one family member, often reflecting inherited essential tremor or another genetic movement disorder. The pattern, age of onset, medicines, and associated neurologic findings help identify the cause.

Family Involvement

Participation of family members or chosen support people in healthcare planning, treatment, rehabilitation, or daily care, with the patient's permission and attention to privacy, safety, preferences, and caregiver burden.

Family Medicine

The medical specialty providing first-contact, continuous, comprehensive care for individuals, families, and communities throughout life. It addresses preventive, acute, chronic, and behavioral health needs across organ systems, considers family and social context, and coordinates care with other health professionals and community services.

Alternate Names:
Family Practice; Family and General Medicine

Family Physician

A physician trained in family medicine who provides first-contact, continuous, comprehensive care for people of all ages. Family physicians address preventive, acute, and chronic health needs, consider physical and social context, and coordinate care across settings and specialties.

Common name: Family Doctor

Family Planning

Personal and healthcare decisions about whether and when to have children. It includes contraception, fertility care, preconception health, pregnancy planning, and support for informed reproductive choices.

Family Study

A structured review of health information in relatives to understand how a disease or trait occurs in a family. It may include family history, medical records, examination, genetic counseling, or testing.

Family Therapy

Counseling involving family members or other close relationships to improve communication, manage conflict, and support recovery. It may help with mental illness, addiction, chronic disease, caregiving stress, or family adjustment.

Famophos

An organophosphate insecticide that can poison the nervous system by blocking acetylcholinesterase. Exposure may cause sweating, salivation, vomiting, pinpoint pupils, muscle weakness, breathing failure, or death.

Famotidine

A medicine that blocks histamine signals to reduce stomach-acid production. It treats reflux, heartburn, and ulcers; dose reduction may be needed in kidney disease, and headache, diarrhea, or confusion can occur.

Fanconi Anemia

An inherited disorder affecting DNA repair and bone-marrow blood-cell production. It may cause low blood counts, infections, bleeding, short stature, birth differences, organ problems, and a high risk of leukemia or other cancers.

Fanconi-Bickel Syndrome

A rare autosomal recessive glycogen storage disease caused by mutations in the *SLC2A2* gene encoding the GLUT2 glucose/galactose transporter, characterized by hepatomegaly, glycogen accumulation, proximal renal tubular dysfunction (renal Fanconi syndrome), and severe growth failure.

Fanconi Syndrome

A kidney-tubule disorder causing excess loss of glucose, phosphate, bicarbonate, amino acids, and other substances in urine. It can lead to dehydration, abnormal blood acidity, weak bones, poor growth, or kidney disease.

FAP

Abbreviation; see *Familial Adenomatous Polyposis*.

Farad

The standard unit of electrical capacitance, equal to one coulomb per volt. It is used in medical equipment and electrophysiology to describe how much electrical charge a component can store.

Farber Lipogranulomatosis

A rare inherited storage disorder caused by deficient acid ceramidase. Fatty material accumulates and may cause painful skin lumps, joint stiffness, hoarseness, bone changes, breathing problems, and neurologic disease.

Farmer Lung

Alternate spelling; see *Farmer's Lung*.

Farmer's Lung

Lung inflammation caused by repeatedly inhaling moldy hay, grain, or other farm dust. It can cause fever, cough, chills, and breathlessness hours after exposure and may lead to permanent scarring if exposure continues.

Alternate Names:
Moldy Hay Hypersensitivity Pneumonitis

Farsightedness

A focusing problem in which close objects look blurred because light would focus behind the retina. It may cause eyestrain or headaches and is usually corrected with glasses or contact lenses.

Alternate Names:
Hyperopia; Hypermetropia

Fascia

A sheet or band of connective tissue that surrounds, supports, attaches, or separates muscles and other body structures. Fascia forms layers beneath the skin and around deeper structures, including muscles and organs.

Fascia Adherens

A strong connection joining neighboring cells, especially heart-muscle cells. It links the internal contractile framework of one cell to the membrane of another so force can pass through the tissue.

Fascia Lata

The deep, dense fibrous connective tissue investing sheath of the thigh, which encloses thigh musculature and thickens laterally to form the iliotibial tract, continuous superiorly with the inguinal ligament and fascia of the gluteus maximus.

Fascial Loop

A loop or sling made from a person's tissue or synthetic material to support a body structure. For example, a sling may support the urethra in selected treatment of stress urinary incontinence.

Fascicle

A small bundle of fibers. In skeletal muscle, it is a bundle of muscle fibers surrounded by connective tissue. In a peripheral nerve, it is a bundle of nerve fibers.

Alternate Names:
Fascicles

Fasciculation

A brief, involuntary twitch caused by spontaneous contraction of muscle fibers in a single motor unit (one motor nerve cell and the fibers it controls). It may be visible under the skin and usually causes little or no movement of a joint. Fasciculations can occur in healthy people or with disorders affecting motor nerves; by themselves, they do not identify the cause.

Alternate Names:
Fasciculations

Fasciculus Cuneatus

The lateral ascending white matter sensory tract of the posterior (dorsal) column of the spinal cord, present above thoracic level T6, carrying conscious proprioception, vibratory sense, and fine discriminative touch from the upper trunk, neck, and upper extremities to the nucleus cuneatus of the medulla.

Fasciculus Gracilis

The medial ascending white matter sensory tract of the posterior (dorsal) column of the spinal cord, present throughout the entire length of the spinal cord, conveying conscious proprioception, vibration,

and fine discriminative touch from the lower extremities and lower trunk to the nucleus gracilis of the medulla.

Fasciitis

Inflammation of the connective tissue around muscles and other structures. It may be localized, as in plantar fasciitis, or rapidly destructive, as in necrotizing infection requiring emergency surgery and antibiotics.

Fasciola

A genus of parasitic flatworms, or liver flukes, that infect some animals and people. Infection is acquired by swallowing immature parasites on contaminated water plants or water and may affect the liver and bile ducts.

Fasciola Hepatica

A liver fluke that infects people after contaminated aquatic plants or water are swallowed. Immature worms migrate through the liver, while adult worms live in bile ducts and can cause pain, fever, or obstruction.

Fascioliasis

Infection with liver flukes after eating contaminated aquatic plants or drinking contaminated water. It may cause fever, right-upper-abdominal pain, enlarged liver, or high eosinophils and later cause bile-duct pain, infection, or blockage.

Fasciolopsis

A genus of large intestinal flukes that can infect people who eat contaminated aquatic plants. Heavy infection may cause abdominal pain, diarrhea, swelling, poor nutrition, or intestinal obstruction.

Fasciolopsis Buski

A large intestinal fluke acquired by eating aquatic plants carrying immature parasites. Heavy infection may cause abdominal pain, diarrhea, intestinal inflammation, malnutrition, or swelling.

Fasciotomy

Emergency surgery that cuts tight fascia to release dangerous pressure in a muscle compartment. It may prevent permanent nerve and muscle damage after crush injury, fracture, burns, or loss and return of blood flow.

Fast Heart Rate

A heart rate faster than expected for a person's age and activity. Exercise, fever, pain, stress, dehydration, anemia, medicines, or an abnormal rhythm may cause it; chest pain or fainting may accompany serious causes.

Fasting

Going without food, and sometimes without drinks, for a defined period. It may be required before blood tests, anesthesia, surgery, or certain procedures, or undertaken for personal or religious reasons.

Fasting Blood Glucose

The blood glucose concentration measured after at least eight hours without calories. It is used to screen for and diagnose diabetes and prediabetes.

Fasting Lipid Profile

A blood test measuring cholesterol and triglycerides after a period without food. It helps assess cardiovascular risk and guide treatment; fasting is particularly useful when triglycerides need accurate measurement.

Alternate Names:
Lipid Panel; Blood Lipid Screen

Fasting Plasma Glucose Test

A blood test measuring blood glucose after fasting, usually at least eight hours. It helps identify diabetes or prediabetes and is interpreted with repeat testing or other results when needed.

Fast-Twitch Fiber

A muscle fiber capable of quick, powerful contraction but more rapid fatigue than a slow-twitch fiber. It supports sprinting, jumping, lifting, and other brief high-intensity activity.

Alternate Names:
Type II Muscle Fiber

Fat

An energy-rich lipid, usually a triglyceride made of glycerol and three fatty acids. Fats store energy, provide insulation, and help the body absorb vitamins A, D, E, and K. Dietary fats include saturated, monounsaturated, polyunsaturated, and trans fats.

Fatal Catatonia

An older term for malignant catatonia, a life-threatening form of catatonia with severe movement or behavior changes and unstable body functions such as temperature, heart rate, or blood pressure.

Fatal Familial Insomnia

A very rare inherited prion disease, usually caused by a disease-causing variant in one copy of the *PRNP* gene. Misfolded prion protein damages the thalamus and other brain areas involved in sleep and automatic body functions. It causes progressively severe loss of normal sleep, along with problems such as sweating, abnormal heart rate or blood pressure, temperature changes, weight loss, impaired movement, and changes in thinking. The disease usually begins in adulthood, progresses over time, and is fatal.

Fat Embolism

Entry of fat droplets into the bloodstream, usually after major trauma, a thigh or pelvic fracture, or orthopedic surgery. It may cause breathing difficulty, confusion, rash, or low oxygen and can become life-threatening.

Fat Embolism Syndrome

A rare, serious illness that can develop after a major bone injury, especially a long-bone or pelvic fracture. It usually begins within a few days and may cause low blood oxygen, breathing problems, confusion, or a pinpoint rash; not every person has all of these findings.

Alternate Names:
FES

Fatigue

Ongoing tiredness or low energy that makes daily activities harder and may not get better with rest. It can be caused by poor sleep, anemia, infection, hormone or other health problems, medicines, or low mood.

Fat Measurement

Estimation of body-fat amount or distribution using methods such as skinfolds, bioimpedance, DEXA, imaging, or laboratory analysis. Results vary by method and depend on overall health, strength, and metabolic findings.

Fat Necrosis

Death of fat cells, often after pancreatitis, injury, or breast surgery. It can cause pain, inflammation, or a firm lump that resembles cancer on examination or imaging and may require testing to distinguish the cause.

Fat Necrosis Of The Breast

Death of fat cells in the breast, often after injury, surgery, or radiation therapy. It may form a firm lump or calcifications that can resemble breast cancer on examination or imaging.

Fat Pad

A localized cushion of fatty tissue that protects, supports, insulates, or permits movement around an organ or joint. Inflammation or injury of a fat pad can cause localized pain and swelling.

Fat-Soluble Toxins

Poisonous chemicals that dissolve in body fat and may remain for a long time. Some pesticides, industrial chemicals, polychlorinated biphenyls, and dioxins can accumulate after repeated exposure and harm several organs.

Fat-Soluble Vitamin

A vitamin that dissolves in fat and can be stored in body tissues. Vitamins A, D, E, and K are fat-soluble; deficiency or excessive supplementation can cause illness.

Fat-Soluble Vitamins

Plural form; see *Fat-Soluble Vitamin*.

Fatty Acid

A fundamental building block of fats in the body and in food. Fatty acids consist of chains of carbon and hydrogen atoms and serve as a major source of concentrated energy and essential components of cell membranes. They are categorized as saturated (commonly solid at room temperature and found in animal products) or unsaturated (commonly liquid and found in plant oils, nuts, and fish), as well as essential fatty acids (such as omega-3 and omega-6) that the body cannot manufacture on its own.

Alternate Names:
Fatty Acids

Fatty Acid Oxidation

The cellular breakdown of fatty acids through several pathways to produce energy or other metabolites. Beta-oxidation is the main energy-producing pathway and occurs in mitochondria and peroxisomes; alpha- and omega-oxidation process selected fatty acids by different routes.

Fatty Acid Oxidation Disorder

An inherited disorder in which cells cannot use certain fats normally for energy. Fasting or illness may cause low blood sugar, vomiting, muscle breakdown, weakness, heart problems, or sudden metabolic illness.

Fatty Acids

Plural form; see *Fatty Acid*.

Fatty Acid Synthase

A group of linked enzymes that helps cells make fatty acids, especially palmitate. These fatty acids are used for energy storage, cell membranes, and other cellular functions.

Fatty Acid Synthesis

The metabolic production of fatty acids from smaller carbon-containing molecules, mainly through acetyl-CoA and malonyl-CoA. It supports the formation of energy stores, cell membranes, and signaling molecules.

Fatty Degeneration

Abnormal buildup of fat inside cells, especially liver cells, caused by metabolic problems, alcohol, toxins, poor nutrition, obesity, or other injury. The change may reverse or progress to inflammation and scarring.

Fatty Liver

Alternate name; see *Fatty Liver Disease*.

Fatty Liver Disease

Steatotic liver disease (SLD), commonly called fatty liver disease, is excess fat in liver cells. Causes include metabolic risk factors, alcohol, medicines, and other conditions. Metabolic dysfunction-associated steatotic liver disease (MASLD) is one subtype; inflammation and liver-cell injury in this subtype are called metabolic dysfunction-associated steatohepatitis (MASH). Some forms can progress to scarring, cirrhosis, liver failure, or liver cancer.

Alternate Names:
Hepatic Steatosis; Steatotic Liver Disease

Fatty Streak

An early artery-wall change in which cholesterol-rich immune cells collect beneath the lining. It can be an early stage of atherosclerosis, although some fatty streaks never progress to a harmful plaque.

Favism

Rapid destruction of red blood cells after eating fava beans, usually in a person with glucose-6-phosphate dehydrogenase deficiency. It may cause jaundice, dark urine, weakness, breathlessness, or severe anemia.

Favre-Racouchot Syndrome

A benign chronic-sun-damage disorder in which solar elastosis is accompanied by open or closed comedones and small epidermal cysts, usually around the temples, outer eyes, cheeks, or lateral neck. It is associated with photoaging and sometimes smoking.

Favus

A long-lasting fungal infection of the scalp, usually causing yellow cup-shaped crusts around hairs. Without treatment it can destroy follicles and cause permanent scarring hair loss.

FBN1

Gene encoding fibrillin-1, an extracellular matrix protein essential for connective tissue elasticity; mutations cause Marfan syndrome. See *Marfan Syndrome*.

Fc Receptor

A protein on an immune cell that binds the tail end of an antibody. This helps the cell recognize, ingest, or destroy the antibody's target and can also influence inflammation.

Fear

An emotional and body response to a perceived threat that prepares a person to protect themselves. Persistent or excessive fear can cause avoidance, panic, sleep problems, and impaired daily functioning.

Fears

Plural form; see *Fear*.

Febrile

Relating to fever, a temporary rise in body temperature usually caused by infection, inflammation, or another illness. Fever differs from heat-related hyperthermia; severe illness, dehydration, confusion, or fever with very low white cells can indicate serious disease.

Febrile Convulsion

Older term; see *Febrile Seizure*.

Febrile Convulsions

Alternate plural form; see *Febrile Seizure*.

Febrile Neutropenia

Fever in a person with neutropenia, defined as a single oral temperature of at least 38.3°C (101°F) or a temperature of at least 38.0°C (100.4°F) sustained for 1 hour, with an absolute neutrophil count below 500 cells/µL or expected to fall below that level within 48 hours. It is associated with increased risk of serious infection.

Febrile Seizure

A brief seizure or convulsion in an infant or young child (most commonly between 6 months and 5 years of age) triggered by a high fever, typically caused by a common childhood viral infection like the flu or an ear infection. While frightening for parents to witness, most febrile seizures last only a few minutes, do not signify epilepsy or brain damage, and leave no lasting harm.

Alternate Names:
Fever-Induced Seizure; Febrile Convulsion; Febrile Seizures

Febrile Seizures

Alternate plural form; see *Febrile Seizure*.

Febuxostat

A medicine that lowers uric-acid production for long-term prevention of gout attacks. It does not relieve sudden gout pain immediately and may require monitoring for liver problems and cardiovascular risk.

FEC

Abbreviation; see *FEC Protocol*.

Fecal Calprotectin

A stool test measuring a protein released during intestinal inflammation. A raised result can support evaluation for inflammatory bowel disease, but infection, medicines, age, and other conditions can also raise it.

Fecal Calprotectin Test

A stool test that measures calprotectin, a protein released by neutrophils during mucosal inflammation, used to differentiate inflammatory bowel disease from functional gastrointestinal disorders; see *Fecal Calprotectin*.

Fecal Culture

Laboratory testing that grows bacteria from a stool sample to investigate infectious diarrhea. It may identify a treatable cause and guide antibiotics, but some infections require toxin, molecular, or parasite testing instead.

Fecal Elastase

A stool test estimating whether the pancreas releases enough digestive enzymes. A low result may suggest pancreatic insufficiency, causing poor digestion, greasy stools, weight loss, or vitamin deficiency.

Fecal Fat

Measurement of excess fat in stool. High fecal fat suggests poor digestion or absorption from pancreatic disease, reduced bile, intestinal disease, or another condition and may explain greasy, difficult-to-flush stools.

Fecal Immunochemical Test

A stool screening test that detects human blood, mainly from the lower intestine, using antibodies. A positive result does not diagnose cancer but usually requires colon evaluation, often colonoscopy.

Fecal Impaction

A large, hard mass of stool trapped in the rectum or colon. It may cause pain, abdominal swelling, nausea, urinary symptoms, bowel blockage, or watery leakage around the mass; treatment can involve manual or procedural removal.

Fecal Incontinence

Inability to control passage of stool or gas, ranging from soiling to complete loss of bowel control. Causes include diarrhea, constipation, sphincter injury, nerve disease, rectal prolapse, and cognitive impairment.

Alternate Names:
Accidental Bowel Leakage

Fecalith

A hard mass of dried stool, often in the appendix or colon. It may contribute to appendicitis, blockage, inflammation, or perforation.

Fecal Lactoferrin

A protein released mainly by neutrophils during intestinal inflammation. A stool test can help distinguish inflammatory bowel disease from noninflammatory conditions, but infection and other causes of inflammation can also raise the result.

Fecal Microbiota Transplant

Alternate name; see *Fecal Microbiota Transplantation*.

Fecal Microbiota Transplantation

Transfer of processed fecal material from a screened donor into a recipient's gastrointestinal tract to modify the intestinal microbiota, using routes such as colonoscopy, enema, or capsules. It is used chiefly to prevent recurrence of *Clostridioides difficile* infection after antibiotic treatment. Transmission of infectious agents is a recognized risk; regulated microbiota-based products are related but distinct therapies.

Alternate Names:
Fecal Microbiota Transplant; Fecal Transplant; FMT

Fecal Occult Blood Test

A stool test that detects blood too small to see. It may screen for colorectal cancer or investigate digestive-tract bleeding, but it does not identify the cause; a positive result usually requires further colon evaluation.

Fecal Smear

Examination of a thin stool sample with a microscope or stain. Depending on the test, it may help identify parasites, inflammatory cells, blood, fat, or other abnormalities.

Fecal Transplant

Alternate name; see *Fecal Microbiota Transplantation*.

Fecaluria

Stool, gas, or a fecal smell in urine, usually indicating an abnormal connection between the intestine and urinary tract. It often accompanies recurrent urinary infection.

FECD

Abbreviation; see *Fuchs' Dystrophy*.

Feces

Solid or semisolid waste passed from the bowel, containing water, undigested material, bacteria, shed cells, and metabolic waste. Changes in stool can provide clues about digestion, bleeding, infection, or inflammation.

Fecolith

Alternate spelling; see *Fecalith*.

FEC Protocol

A chemotherapy regimen combining fluorouracil, epirubicin, and cyclophosphamide for selected cancers. Important adverse effects include low blood counts, infection, nausea, hair loss, mouth sores, infertility, and heart damage.

Fecundity

The biological capacity to reproduce. It depends on factors affecting either partner, including reproductive anatomy, hormones, age, and overall health; it differs from fecundability, the chance of conception in a given cycle.

Feedback

Information about a system's output that changes later activity. Negative feedback stabilizes functions such as temperature, glucose, and hormones, while positive feedback strengthens processes such as labor contractions.

Feedback Inhibition

A control process in which the end product of a chemical pathway slows an earlier step. This prevents unnecessary buildup of the product and helps cells use nutrients and energy efficiently.

Feedback Mechanism

A regulatory process in which a system's result influences what happens next. Negative feedback maintains stability, while positive feedback amplifies a response until a defined endpoint is reached.

Feeding Jejunostomy

Placement of a feeding tube into the jejunum, part of the small intestine, when eating or stomach feeding is unsafe or impossible. It provides nutrition but can cause infection, blockage, leakage, or bowel injury.

Feeding Methods

Ways of providing food or liquid, including breast or bottle feeding, oral feeding, tube feeding, and intravenous nutrition. The safest method depends on swallowing ability, age, illness, and nutritional needs.

Feeding Poor

Taking too little food or fluid for age or health needs. In an infant it may signal illness, swallowing difficulty, breathing problems, pain, reflux, or developmental difficulty, especially when persistent.

Feeding Tube

A flexible tube used to deliver nutrition, fluids, or medicines to the stomach or intestine when eating is inadequate or unsafe. Risks include blockage, leakage, infection, aspiration, and injury.

Feingold Diet

A restrictive diet that avoids certain food additives and some naturally occurring chemicals, promoted for behavior or attention problems. Evidence of benefit is limited, and restriction can cause nutritional problems without professional guidance.

Felbamate

An antiseizure medicine reserved for selected severe or drug-resistant epilepsy. It can rarely cause life-threatening bone-marrow failure or liver failure, so specialist prescribing and regular blood and liver tests are essential.

Felodipine

A calcium-channel blocker that relaxes artery walls and lowers blood pressure. It may cause ankle swelling, flushing, headache, fast heartbeat, or gum enlargement.

Felon

A painful bacterial infection in the fleshy fingertip, often after a small puncture. Pus and pressure can damage tissue, bone, or tendons; treatment may involve drainage and antibiotics.

Felty's Syndrome

Alternate spelling; see *Felty Syndrome*.

Felty Syndrome

A rare complication of long-standing rheumatoid arthritis involving a very low neutrophil count and often an enlarged spleen. It increases infection risk and requires specialist treatment of arthritis and neutropenia.

Female

Describing the sex category generally associated with ovaries, eggs, and female reproductive anatomy. Biological traits vary among individuals, and sex, gender identity, and gender expression are distinct concepts.

Female Athlete Triad

A spectrum of interrelated problems in physically active girls and women involving energy deficiency, altered menstrual function, and impaired bone health. Energy deficiency occurs when intake is insufficient for exercise and other needs, with or without disordered eating. The components vary in severity and need not all be present; bone effects include reduced density and bone stress injury.

Female Breast

A mammary gland and its skin, fat, connective tissue, ducts, and lobules on the front of the chest. Its structure changes with age, hormones, pregnancy, breastfeeding, and body composition.

Female Circumcision

Older and potentially misleading term; see *Female Genital Mutilation*.

Female Condom

Alternate name; see *Internal Condom*.

Female Condoms

Plural form; see *Internal Condom*.

Female Genitalia

The external and internal reproductive organs, including the vulva, vagina, cervix, uterus, fallopian tubes, and ovaries. These structures support urination, sexual function, menstruation, fertility, pregnancy, and birth.

Female Genital Mutilation

Partial or total removal of external female genitalia, or other injury to female genital organs, for nonmedical reasons. It has no health benefit and can cause bleeding, infection, urinary and sexual problems, childbirth complications, and lasting physical and psychological harm.

Female Genital Sores

Ulcers, blisters, or raw areas on the vulva, vagina, cervix, or nearby skin. Causes include infections, inflammatory skin conditions, injury, and, less often, cancer.

Alternate Names:
Female Genital Ulcers; Vulvar Ulcers; Vulvar Ulcerations

Female Gonad

An ovary, the reproductive gland that stores and releases eggs and produces hormones including estrogen and progesterone.

Female Infertility

Difficulty achieving pregnancy because of problems with ovulation, ovarian reserve, fallopian tubes, uterus, hormones, or other factors. Clinical evaluation may include both partners and timing depends on duration of trying and relevant risk factors.

Alternate Names:
Female Sterility; Subfertility in Women

Female Orgasmic Disorder

Persistent or recurrent difficulty achieving orgasm that causes personal distress. It may be lifelong or acquired and can relate to health conditions, medicines, mood, trauma, sexual pain, stimulation, or relationship factors.

Alternate Names:
Anorgasmia; Inhibited Female Orgasm

Female Pattern Baldness

Gradual scalp hair thinning, usually widest near the part or crown, influenced by genes and hormones. New or rapid hair loss can also be associated with iron deficiency, thyroid disease, medicines, and other causes.

Female Pelvis

The pelvic bones and soft tissues in a person with typical female anatomy. It is often broader with a wider outlet than typical male anatomy, but substantial individual variation exists.

Female Phenotype

The observable anatomical, physiologic, and developmental traits associated with female sex. These traits vary with genes, hormones, development, age, and individual biology.

Female Reproductive Organs

Female reproductive organs include the ovaries, fallopian tubes, uterus, cervix, vagina, and external genitalia, which support hormones, ovulation, menstruation, pregnancy, and birth.

Female Reproductive System

The ovaries, fallopian tubes, uterus, cervix, vagina, vulva, and related hormones. It supports egg release, menstruation, pregnancy, birth, and sexual function and can be affected by developmental, hormonal, infectious, structural, or cancerous disorders.

Female Self-Catheterization

Intermittent insertion and removal of a catheter through the female urethra to empty the bladder when normal urination is inadequate, reducing retention and protecting kidney function.

Female Sexual Dysfunction

A broad term for persistent or recurrent difficulty with sexual desire, arousal, lubrication, orgasm, or pain that causes clinically significant distress. Medical conditions, medicines, mood, trauma, relationships, and life changes may contribute.

Alternate Names:
FSD

Female Sexual Interest/Arousal Disorder

Persistent or recurrent low sexual interest or arousal causing personal distress. Medical conditions, medicines, mood, trauma, pain, relationship factors, hormonal changes, and other social or psychological factors may contribute.

Female Urethral Meatus

The external opening of the female urethra, through which urine leaves the body; it is located anterior and superior to the vaginal opening.

Female Urethral Opening

The opening through which urine leaves the female urethra, located in the vulvar vestibule in front of the vaginal opening. Its position and appearance may vary normally.

Feminization

Development of physical or hormonal traits commonly associated with female puberty, such as breast growth or reduced body hair. It may be normal, part of gender-affirming treatment, or caused by hormones, medicines, or disease.

Femoral

Relating to the femur or thigh, including the thigh bone, artery, vein, nerve, or neck of the femur.

Femoral Anteversion

An inward twist of the thigh bone that turns the knees or feet inward, often noticed in childhood. It commonly improves with growth; persistent pain, severe asymmetry, or walking problems may occur.

Femoral Artery

A major artery carrying blood through the groin and thigh to the leg. Its pulse can be felt in the groin, and it is used for some catheter procedures; injury or blockage can threaten the limb.

Femoral Canal

The medial, smallest compartment of the femoral sheath, measuring approximately 1.3 cm in length, containing loose connective tissue, lymphatic vessels, and the deep inguinal lymph node of Cloquet; site of femoral herniation below the inguinal ligament.

Femoral Hernia

A relatively uncommon type of groin hernia that occurs when a small portion of intestine or fatty tissue pushes through a natural weakness in the groin into the femoral canal (the passageway for the main blood vessels entering the upper thigh). It appears as a bulge in the upper thigh just below the groin crease. Because the canal is narrow and rigid, femoral hernias carry a higher risk of becoming trapped (incarcerated) or having their blood supply cut off (strangulated) compared to other groin hernias.

Femoral Head Osteonecrosis

Alternate name; see *Avascular Necrosis Of The Femoral Head*.

Femoral Neck Fracture

A break in the narrow part of the thighbone just below its ball-shaped head. It is a type of hip fracture and can cause hip or groin pain and difficulty standing or walking.

Femoral Hernia Repair

Surgery that returns trapped tissue to the abdomen and closes or reinforces the opening in the groin. Repair is commonly performed because femoral hernias can become trapped or strangulated.

Femoral Nerve

A large nerve from the lower back that supplies muscles that flex the hip and straighten the knee and provides sensation to the front thigh and inner leg. Injury can cause weakness, numbness, or falls.

Femoral Nerve Dysfunction

Reduced function of the nerve supplying the front thigh and knee-straightening muscles. It can cause hip or knee weakness and altered sensation and may result from diabetes, compression, injury, surgery, or pelvic disease.

Femoral Nerve Stretch Test

A neurological examination manoeuvre used to assess for upper lumbar nerve root irritation (L2, L3, or L4) or femoral neuropathy. With the patient prone, the examiner passively flexes the knee and extends the hip; reproduction of pain radiating down the anterior thigh indicates a positive test.

Alternate Names:
Prone Knee Bending Test; Reverse Straight Leg Raise

Femoral Neuropathy

Damage to the femoral nerve causing weakness in hip flexion or knee extension and numbness or pain in the front thigh or inner leg. Causes include diabetes, injury, bleeding, compression, and pelvic disease.

Femoral Pulse

The pulse felt over the femoral artery in the groin. Comparing it with pulses elsewhere helps assess blood flow to the leg and can provide clues about arterial blockage or shock.

Femoral Shaft Fractures

Breaks in the middle portion of the thigh bone, often from high-energy trauma but sometimes from weakened bone. They can cause major blood loss, deformity, and inability to walk; treatment often involves stabilization and surgery.

Femoral Sheath

A funnel-shaped fascial sleeve formed by downward prolongation of the transversalis fascia (anteriorly) and iliac fascia (posteriorly) beneath the inguinal ligament into the femoral triangle, compartmentalized into lateral (femoral artery), intermediate (femoral vein), and medial (femoral canal) spaces.

Femoral Triangle

A triangular area at the upper front of the thigh bordered by the groin ligament and nearby muscles. It contains the femoral nerve, artery, vein, and lymph nodes and is an important examination and access site.

Femoral Vein

The major deep vein of the thigh, carrying blood from the leg toward the pelvis and heart. A clot in it can cause deep-vein thrombosis and pulmonary embolism.

Femoroacetabular Impingement

Alternate name; see *Hip Impingement*.

Femtogram

A unit of mass equal to one quadrillionth of a gram, or 10^{-15} gram. It is used in laboratory measurements of extremely small quantities.

Femtoliter

A unit of volume equal to one quadrillionth of a liter, or 10^{-15} liter. It is used to describe very small laboratory or cellular volumes.

Femur

The thigh bone and the longest, strongest bone in the body. It joins the hip to the knee and includes a head, neck, shaft, and lower end; fractures can threaten mobility and blood supply.

Femur Fracture

A break in the thigh bone caused by trauma or weakened bone. It may cause severe pain, deformity, blood loss, and inability to bear weight; treatment depends on location, alignment, and overall health.

Femur Length

The ultrasound-measured length of a fetus's thigh bone. It helps estimate pregnancy age and assess growth, but interpretation depends on other measurements, family size, pregnancy dating, and possible skeletal or chromosomal conditions.

Fencer's Pose

A posture in which turning the head makes the arm and leg on that side straighten while the opposite arm and leg bend. It is a normal reflex in young infants but may indicate a brain or nerve problem if it persists or appears unexpectedly.

Fenfluramine

A medicine used to reduce seizures in Dravet syndrome and Lennox-Gastaut syndrome. It can reduce appetite and weight and may cause heart-valve disease or high blood pressure in lung arteries, so echocardiograms are required before, during, and after treatment.

Fenitrothion

A poisonous organophosphate insecticide. Exposure can cause sweating, excess saliva, vomiting, diarrhea, small pupils, muscle twitching, breathing difficulty, seizures, or weakness because it disrupts nerve signals.

Fenobucarb

A carbamate insecticide that can cause nerve poisoning after significant absorption, producing sweating, vomiting, small pupils, muscle weakness, breathing difficulty, or seizures.

Fenofibrate

A medicine that lowers blood triglycerides and can modestly change cholesterol levels by increasing the liver's processing of fats. It is used for selected lipid disorders; liver, kidney, muscle, and gallbladder risks require monitoring.

Fenoldopam

A short-acting dopamine D1-receptor agonist used intravenously for severe hypertension in selected settings; it can cause hypotension, flushing, headache,

and increased intraocular pressure.

Fenoprofen

Fenoprofen is a nonsteroidal anti-inflammatory drug used for pain and inflammatory arthritis; gastrointestinal bleeding, renal injury, fluid retention, and cardiovascular events are important risks.

Fenoprofen Calcium Overdose

Taking too much fenoprofen, an anti-inflammatory pain medicine, can cause nausea, vomiting, stomach bleeding, drowsiness, kidney injury, breathing or acid-base problems, seizures, or coma.

Fenoterol

A short-acting beta-2 bronchodilator that relaxes airway muscle and relieves bronchospasm. It may cause tremor, nervousness, low potassium, or a fast or irregular heartbeat and is not approved everywhere.

Fenoxycarb

An insect-growth regulator that imitates juvenile hormone and disrupts development of immature insects. It is used for pest control; some formulations can irritate skin, eyes, or airways.

Fentanyl Citrate

The citrate salt of fentanyl, a potent opioid analgesic used for severe pain and anesthesia; respiratory depression, sedation, dependence, and overdose are major risks.

Fentanyl Derivatives

Strong synthetic opioid medicines related to fentanyl, including sufentanil, remifentanil, and alfentanil. They may relieve severe pain or support anesthesia but can rapidly slow breathing, cause overdose, and produce dependence, so close monitoring is essential.

Fentanyl Vaccine

An investigational vaccine designed to prompt antibodies that bind fentanyl in the bloodstream, limiting its passage into the brain and reducing its opioid effects. Candidate vaccines link a fentanyl-like molecule to an immunogenic carrier to provoke this response. They are being evaluated in early-phase clinical research and are not approved for routine clinical use.

Fenthion

A poisonous organophosphate insecticide. Exposure can cause sweating, excess saliva, vomiting, diarrhea, small pupils, muscle twitching, breathing difficulty, seizures, or weakness because it disrupts nerve signals.

Fermentation

A metabolic process in which microorganisms or cells convert organic substrates without using oxidative respiration, producing products such as acids, alcohols, or gases.

Ferriman-Gallwey Score

A standardized clinical scoring system used to quantify the severity of hirsutism in women by visually grading terminal hair density from zero (absence) to four (extensive) across nine androgen-sensitive body areas, with a total score of eight or higher generally indicating clinical hirsutism.

Alternate Names:
Modified Ferriman-Gallwey Scale; mFG Score

Ferritin

A protein that stores iron inside cells and releases it when needed. Blood ferritin often reflects body iron stores, but inflammation, infection, liver disease, or cancer can raise it even when iron is low.

Ferritin Blood Test

A blood test measuring stored iron indirectly. Low ferritin strongly supports iron deficiency; high ferritin may reflect iron excess, inflammation, infection, liver disease, or cancer and varies with other test results.

Ferritin Test

A blood test measuring ferritin, the primary intracellular iron-storage protein, reflecting total body iron stores; see *Ferritin* and *Iron Studies*.

Ferroptosis

A controlled form of cell death caused by iron-dependent damage to cell fats and failure of antioxidant protection. It differs from apoptosis and ordinary tissue necrosis and is being studied in cancer and other diseases.

Ferrous Sulfate

An oral iron supplement used to prevent or treat iron-deficiency anemia. It may cause nausea, constipation, abdominal discomfort, or dark stools; accidental overdose can be life-threatening, especially in children.

Fertile Period

The several days in a menstrual cycle when sex can result in pregnancy, including the days before and shortly after ovulation. Timing varies, and calendar estimates are not reliable contraception for everyone.

Fertilisation

Union of a sperm and an egg to form a zygote, the first cell of an embryo. It usually occurs in a fallopian tube before the developing embryo moves toward the uterus.

Fertility

The biological ability to conceive and produce offspring. It depends on ovulation, sperm production, reproductive anatomy, hormones, age, general health, and other factors affecting either partner.

Fertility Domain

The part of health concerned with reproductive function, ability to conceive, fertility goals, infertility, preservation of fertility, and related medical, emotional, and social care.

Fertility Drugs

Medicines used to stimulate ovulation, support reproductive treatment, or improve the chance of pregnancy. They can cause side effects and multiple pregnancy; selection and monitoring are individualized.

Fertility Medicine

The clinical field focused on evaluating and treating difficulty conceiving and other disorders of reproductive function. It includes assessment of ovulation, sperm, reproductive anatomy, and hormones, as well as fertility treatments and preservation; it overlaps with reproductive endocrinology and infertility.

Fertility Preservation

Steps taken to protect the possibility of future pregnancy before treatment or disease may damage reproductive function. Options include freezing eggs, embryos, sperm, or selected reproductive tissue, depending on age, timing, and goals.

Fertility Treatment

Medical or procedural care intended to help achieve pregnancy. Options include treating underlying disease, ovulation medicines, surgery, insemination, or in-vitro fertilization, chosen according to cause, age, health, and reproductive goals.

Fertilization

Fusion of sperm and egg genetic material to form a zygote, usually in a fallopian tube. This begins embryonic development, which may continue after the zygote reaches the uterus and implants.

Ferumoxytol

An intravenous iron preparation used for selected adults with iron-deficiency anemia. It can cause allergic reactions, low blood pressure, or iron overload, so monitoring is required during and after infusion.

FESS

Functional endoscopic sinus surgery uses instruments passed through the nostrils to open blocked sinus drainage pathways and remove selected diseased tissue. It may improve chronic sinus disease but can cause bleeding, infection, eye injury, or fluid leakage.

Festinating Gait

Walking with increasingly short, quick steps and a forward-leaning posture, commonly associated with Parkinson disease or other movement disorders. It

increases fall risk and may improve with specialist treatment and physical therapy.

Fetal Acid-Base Status

An assessment of a fetus's oxygen supply and blood acidity, often using umbilical-cord blood gases at birth. Results depend on the sampling site, timing, fetal condition, and clinical record.

Fetal Alcohol Spectrum Disorder

A group of lifelong conditions that can occur after alcohol exposure before birth. Effects vary widely and may involve growth, physical development, brain development, learning, memory, attention, behavior, speech, coordination, or everyday functioning. Some people have characteristic facial features, birth defects, or problems with organs such as the heart or kidneys, but these are not present in everyone. The effects can occur even when the person does not have the facial features or growth problems associated with fetal alcohol syndrome.

Alternate Names:
FASD

Fetal Alcohol Spectrum Disorders

Alternate plural form; see *Fetal Alcohol Spectrum Disorder*.

Fetal Alcohol Syndrome

A severe condition caused by maternal alcohol consumption during pregnancy. Because alcohol crosses the placenta freely, it disrupts the developing baby's brain and physical growth. Children with fetal alcohol syndrome typically exhibit a distinctive combination of facial characteristics (such as a smooth philtrum and thin upper lip), low birth weight, small head size, lifelong learning disabilities, and behavioral or social challenges.

Alternate Names:
FAS

Fetal Anatomy Survey

A detailed ultrasound examination, usually in the second trimester, that checks fetal anatomy, growth, placenta, and amniotic fluid. It can detect some structural differences but cannot identify every condition.

Alternate Names:
Level II Ultrasound; Fetal Anomaly Scan

Fetal Anemia

An abnormally low concentration of red blood cells or hemoglobin in a developing fetus, commonly caused by red-cell alloimmunization (Rh disease), fetomaternal hemorrhage, or parvovirus B19 infection, which can lead to high-output cardiac failure and hydrops fetalis.

Fetal Anomaly Scan

Mid-pregnancy ultrasound examination performed between 18 and 22 weeks to evaluate fetal anatomy and development. See *Anomaly Scan*.

Fetal Arrhythmia

An irregularity, abnormal acceleration, or slowing of the fetal heart rhythm outside the normal baseline rate of 110 to 160 beats per minute; see *Fetal Bradyarrhythmia* and *Fetal Tachycardia*.

Fetal Attitude

The position of a fetus's head, arms, legs, and trunk in relation to one another. Normal flexion helps birth; unusual extension or flexion can change the presenting part and affect labor.

Fetal Bradyarrhythmia

An unusually slow or irregular fetal heart rhythm. Causes include conduction block, extra beats, maternal or fetal disease, or medicines; persistent abnormalities may reflect fetal or maternal illness.

Fetal Bradycardia

A fetal heart-rate baseline below 110 beats per minute for at least ten minutes. Medicines, maternal illness, fetal heart disease, low oxygen, cord problems, or placental separation may cause it; persistent cases may indicate fetal compromise.

Fetal Circulation

Blood flow before birth in which the placenta supplies oxygen and nutrients and special connections

direct much blood around the lungs, which are not yet used for breathing. These connections normally close after birth.

Fetal Death

Death of a fetus before delivery. Medical and legal definitions vary by gestational age and location; care includes confirming the diagnosis, supporting the family, and discussing delivery and follow-up.

Fetal Development

Growth and maturation from the end of the embryonic period until birth. Organs enlarge and mature, movements develop, and body systems gradually acquire the functions needed after delivery.

Fetal Disease

A disease, structural abnormality, or developmental problem affecting a fetus before birth. Causes include genetic changes, infection, medicines, toxins, and poor placental function; ultrasound and prenatal tests may identify it.

Fetal Distress

An older, imprecise term for findings suggesting possible fetal compromise, usually during labor. Clinicians generally use nonreassuring fetal status and name the specific findings, such as recurrent late heart-rate decelerations, prolonged bradycardia, or a low biophysical profile. The term alone does not establish fetal oxygen deprivation or injury.

Fetal Echocardiography

A specialized ultrasound examination of the fetal heart used to assess cardiac structure, rhythm, and function, including possible congenital heart disease.

Fetal Fibronectin

A protein found where the fetal membranes meet the lining of the uterus. In a pregnant person with symptoms of early labor, testing fluid from the vagina or cervix can help estimate the chance of giving birth soon; a negative result makes birth in the near term less likely but does not rule it out.

Alternate Names:
fFN

Fetal Growth Restriction

Pathologic limitation of fetal growth potential, often associated with placental dysfunction. It may be suspected from small fetal size, slowed growth, or abnormal Doppler findings. Small-for-gestational-age describes size below a percentile cutoff and includes some constitutionally small fetuses; growth restriction can also occur above that cutoff.

Alternate Names:
Intrauterine Growth Restriction; IUGR

Fetal Heart

The developing heart of a fetus, whose rate and rhythm can be assessed by ultrasound or electronic monitoring to evaluate fetal well-being.

Fetal Heart Monitoring

Assessment of fetal heart rate during pregnancy or labor by intermittent auscultation or electronic fetal monitoring. Electronic monitoring may be continuous or intermittent and records the fetal heart rate, often alongside uterine contractions; cardiotocography refers to this electronic recording.

Alternate Names:
Cardiotocography; CTG; Electronic Fetal Monitoring

Fetal Heart Rate

The number of times a fetus's heart beats each minute, usually about 110–160 during pregnancy and labor. It can be checked with a Doppler or electronic monitor; changes may reflect normal activity, medicines, or reduced oxygen.

Fetal Hemoglobin

The main oxygen-carrying protein in a fetus's red blood cells. It binds oxygen more strongly than adult hemoglobin, helping the fetus obtain oxygen from the placenta; its amount normally falls after birth.

Fetal Hydantoin Syndrome

A distinct pattern of congenital malformations resulting from maternal gestational exposure to hydantoin anticonvulsants (predominantly phenytoin). Hallmarks include craniofacial dysmorphism (cleft

lip/palate, broad depressed nasal bridge, hypertelorism), hypoplasia of distal phalanges and nails, intrauterine growth restriction, microcephaly, and neurodevelopmental delay.

Alternate Names:
Dilantin Embryopathy; Phenytoin Syndrome

Fetal Hydrops

Abnormal fluid buildup in at least two fetal body areas, such as under the skin, around the lungs or heart, or in the abdomen. It may result from maternal antibodies attacking fetal red blood cells (immune hydrops) or from other causes (nonimmune hydrops), including anemia, heart disease, infection, or genetic conditions; specialist evaluation is needed.

Fetal Hypoxia

Too little oxygen reaching a fetus before or during birth. Placental disease, maternal breathing or circulation problems, cord compression, or prolonged labor can contribute; abnormal heart-rate patterns may accompany it.

Fetal Kick Counts

Observation and recording of fetal movements during pregnancy to assess changes in the fetus's usual movement pattern. Methods vary; a marked decrease in usual movement may indicate fetal compromise.

Alternate Names:
Kick Counting

Fetal Lie

The direction of a fetus's long body axis compared with the pregnant person's spine. The fetus may lie lengthwise, sideways, or diagonally; a sideways or diagonal position near birth can affect delivery planning.

Fetal Lung Maturity

Development of the fetal lungs, including production of surfactant by type II pneumocytes, which helps keep air sacs open after birth. Amniotic-fluid tests such as the lecithin-to-sphingomyelin ratio or lamellar-body count can estimate surfactant development, but do not measure overall fetal maturity or predict all newborn outcomes.

Alternate Names:
FLM

Fetal Macrosomia

A fetus that is larger than expected, often estimated at 4,000–4,500 grams or more at birth depending on the clinical definition. Diabetes and previous large babies increase risk; complications include difficult birth, injury, and cesarean delivery.

Fetal Malformation

A primary structural defect of an organ, limb, or tissue resulting from an intrinsically abnormal developmental process during prenatal organogenesis; see *Birth Defect*.

Fetal Malpresentation

A fetal presentation other than the usual vertex presentation, including breech, transverse, or oblique lie, which may affect labor and delivery planning.

Fetal-Maternal Erythrocyte Distribution Blood Test

A test that estimates the amount of fetal red blood cells in maternal circulation, helping guide Rh immune globulin dosing after fetomaternal hemorrhage.

Fetal Monitor

A device that records fetal heart rate and, when configured for electronic fetal monitoring, uterine contractions. An external Doppler ultrasound sensor detects the fetal heartbeat, while a tocodynamometer detects uterine contractions. In selected labor settings, a fetal scalp electrode can provide an internal fetal heart-rate signal.

Fetal Monitoring

Assessment of fetal heart rate and, in labor, sometimes uterine contractions to evaluate fetal status. Methods include intermittent auscultation and electronic monitoring; results are interpreted with the clinical circumstances.

Fetal Presentation

The part of the baby positioned to enter the pregnant person's pelvis first. The usual presentation is head first; breech, shoulder, face, brow, and mixed presentations can affect labor and delivery planning.

Fetal Pyelectasis

Mild widening of the urine-collecting area of a fetus's kidney seen on an ultrasound scan. It may go away before birth or be linked to a urinary blockage or another condition, so follow-up depends on its size and other findings.

Fetal Scalp Electrode

A small electrode placed on the fetus's scalp through the cervix to record the heart rate directly during labor. It may give a clearer signal when external monitoring is inadequate but can cause infection, bleeding, or scalp injury.

Fetal Scalp PH Testing

A test that analyzes a small blood sample from the baby's scalp during labor to assess whether reduced oxygen may be causing acid buildup. It may clarify an abnormal fetal heart-rate pattern, but use is limited and depends on local expertise and clinical circumstances.

Fetal Scalp Stimulation

A test during labor in which the baby's scalp is gently touched during a vaginal examination. A brief rise in the baby's heart rate may be reassuring; significance depends on the full heart-rate recording and clinical situation.

Fetal Stage

The fetal stage begins after the embryonic period and continues until birth, characterized mainly by growth and maturation of established organs.

Fetal Tachycardia

A sustained fetal heart-rate baseline above 160 beats per minute for at least 10 minutes. Causes may include maternal fever, infection, medicines, fetal hypoxia, or fetal arrhythmia.

Fetal Tissue

Fetal tissue is tissue from a developing fetus and may be relevant to pregnancy care, pathology, research, transplantation, or genetic testing under applicable ethical and legal rules.

Fetal Ultrasound

Imaging during pregnancy using sound waves to assess the fetus, placenta, fluid, growth, movement, and anatomy. It can estimate gestational age, identify some structural problems, assess growth or blood flow, and guide selected procedures.

Fetal Viability

The possibility that a fetus could survive outside the uterus with intensive medical care. Survival depends on gestational age at birth, fetal size and condition, treatments given before birth, and the availability of neonatal intensive care; no single week marks viability for every pregnancy.

Fetal Weight

An estimate of a fetus's mass, usually calculated from ultrasound measurements. It helps assess growth and identify possible growth restriction or unusually large size, but it is not exact.

Fetishism

A recurrent sexual interest in a nonliving object or a specific non-genital body part. The interest alone is not a mental disorder.

Fetishistic Disorder

A mental-health disorder involving repeated, intense sexual arousal from a nonliving object or a specific non-genital body part, with clinically significant distress or impairment or involvement of harm or lack of consent.

Fetomaternal Hemorrhage

Passage of fetal blood into the pregnant person's bloodstream through the placenta. Small amounts can occur normally, but heavy bleeding across the placenta after trauma, placental separation, or a procedure can cause fetal anemia and affect preventive treatment.

Fetomaternal Transfusion

Movement of fetal blood cells across the placenta into the pregnant person's bloodstream. Small amounts are common, but heavy transfer after trauma, placental problems, or procedures can cause fetal anemia.

Fetor Hepaticus

A musty or sweet breath odor that can occur with severe liver dysfunction when certain substances are not adequately cleared. It is a warning sign requiring evaluation for advanced liver disease and complications.

Fetoscope

An instrument used to hear or assess the fetal heartbeat through the pregnant person's abdominal wall, especially later in pregnancy.

Fetus

A developing human from the start of the ninth week after fertilization until birth. During this period, established organs grow and mature; medical descriptions may instead use pregnancy weeks counted from the last menstrual period.

FEV1/FVC Ratio

The amount of air forcefully exhaled in the first second divided by the total amount exhaled. A lower-than-expected ratio suggests narrowed airways, but interpretation uses age, sex, height, reference values, and bronchodilator response.

Fever

A regulated rise in body temperature caused by changes in the body's temperature-control system, commonly in response to infection or inflammation. It may also occur with certain medicines, cancers, autoimmune disorders, or other conditions. Fever differs from hyperthermia, in which body temperature rises without a normal change in the temperature set point.

Fever And Headache

Fever with headache may occur with viral illness, influenza, sinus disease, dehydration, meningitis, encephalitis, or other infection. Severe sudden headache, neck stiffness, confusion, rash, seizure, weakness, or reduced consciousness requires emergency assessment.

Fever Blister

Alternate name; see *Cold Sore*.

Fever-Induced Seizure

Alternate name; see *Febrile Seizure*.

Fever Of Unknown Origin

Persistent or recurrent fever whose cause remains unexplained after an appropriate initial evaluation. Causes may include infection, inflammation, cancer, or medicines and require systematic reassessment.

Fexofenadine

An antihistamine used to relieve sneezing, itching, runny nose, and watery eyes from allergies and itching from hives. It usually causes less drowsiness than older antihistamines, but headache or nausea can occur.

FGFR3

Gene regulating bone development; specific mutations cause achondroplasia, the most common form of dwarfism. See *Achondroplasia*.

Fiber

Dietary fiber is plant material that the small intestine cannot digest. It adds bulk to stool, supports regular bowel movements, and some types help lower blood cholesterol and slow rises in blood glucose.

Fiber Optic

A technology that sends light through thin glass or plastic fibers. Flexible fiber-optic instruments are used in endoscopy to view body passages and guide some minimally invasive procedures.

Fibrates

A group of medicines that mainly lower high triglyceride levels by changing how the liver and tissues handle fats. They can cause indigestion, gallstones,

liver problems, or muscle injury, especially with some other lipid medicines.

Fibre

A threadlike structure in the body or another material. In nutrition, fibre is plant material that is not digested in the small intestine and helps regulate bowel movements.

Fibrillary Glomerulonephritis

A rare kidney disease in which abnormal protein fibers collect in the kidney's filtering units. It may cause blood or protein in the urine and declining kidney function; kidney biopsy and a DNAJB9 stain can help confirm the diagnosis.

Alternate Names:
FGN; DNAJB9 Glomerulopathy

Fibrillation

Rapid, disorganized activity of muscle fibers. In the heart, atrial fibrillation causes an irregular rhythm and can lead to blood clots; ventricular fibrillation stops effective pumping.

Fibrin

An insoluble, threadlike protein that forms a mesh at an injured blood vessel. The mesh traps blood cells and strengthens the clot that helps stop bleeding.

Fibrin Degradation Products Blood Test

A blood test that measures fragments released when blood clots are broken down. High levels may occur with widespread clotting, severe infection, liver disease, recent surgery, or pregnancy, so results require clinical interpretation.

Fibrinogen

A blood protein made mainly by the liver that is changed into fibrin during clot formation. Low levels can cause bleeding; levels may rise with inflammation and fall in severe liver disease or widespread clotting.

Fibrinogen Assay

A laboratory test that measures the amount or clotting activity of fibrinogen in blood. It helps investigate unexplained bleeding, abnormal clotting, liver disease, or suspected widespread clotting disorders.

Fibrinogen Blood Test

A blood test measuring fibrinogen, a liver-made protein needed to form blood clots. Low levels may contribute to bleeding, while high levels commonly accompany inflammation, infection, pregnancy, or cardiovascular risk.

Fibrinogen Decreased

A lower-than-normal blood fibrinogen level, which can weaken clot formation and cause bleeding. Causes include inherited deficiency, severe liver disease, major blood loss or transfusion, and widespread activation of clotting.

Fibrinoid

Describing homogeneous, eosinophilic, hyaline-like material in tissue, especially in blood-vessel walls. Its composition varies and is not necessarily fibrin; when associated with vessel-wall necrosis, the lesion is called fibrinoid necrosis.

Fibrinoid Leukodystrophy

An older name associated with Alexander disease, a rare astrocyte disorder in which Rosenthal fibers accumulate and white matter is damaged. Clinical features vary by age and may include developmental regression, seizures, movement problems, or bulbar dysfunction.

Fibrinoid Necrosis

Severe damage to a blood-vessel wall in which blood proteins and immune material collect within the wall. It can occur in some inflammatory vessel diseases and is identified by examining affected tissue.

Fibrinolysis

The natural process that dissolves a blood clot after healing begins. An enzyme called plasmin breaks down fibrin; excessive breakdown can cause bleeding, while insufficient breakdown can allow harmful clots to persist.

Fibrinolytic Agent

A medicine that dissolves a blood clot by helping the body convert plasminogen into plasmin, which breaks down fibrin. It may treat selected emergencies but can cause serious bleeding, including bleeding in the brain.

Fibrinolytic Therapy

Treatment that uses clot-dissolving medicine to restore blood flow in selected emergencies, such as certain strokes, heart attacks, or pulmonary embolisms. The main risk is serious bleeding, so eligibility is assessed urgently.

Alternate Names:
Thrombolytic Therapy; Clot-Dissolving Therapy

Fibrinopeptide A Blood Test

A blood test that measures a protein fragment released when the body begins converting fibrinogen into fibrin. It can indicate clotting activity but is not specific enough to diagnose a condition by itself.

Fibrinous Pericarditis

Inflammation of the sac surrounding the heart, with a sticky protein called fibrin coating its surfaces. It may cause sharp chest pain, a scratchy heart sound, and fluid around the heart.

Fibrin Sealant

A surgical adhesive containing clotting proteins that form a fibrin clot when applied to tissue. It can help control bleeding or seal selected tissues, but it does not replace repair of major blood-vessel injuries.

Fibrin Split Products

Soluble protein fragments released into the bloodstream during plasmin-mediated enzymatic cleavage and degradation of cross-linked fibrin polymers and fibrinogen, elevated in disseminated intravascular coagulation, deep vein thrombosis, and acute pulmonary embolism.

Alternate Names:
FDPs; Fibrin Degradation Products

Fibroadenoma

A common noncancerous breast lump made of glandular and connective tissue. It is usually firm, smooth, movable, and painless, especially in adolescents and young adults; imaging helps distinguish it from other breast masses.

Fibroadenoma Of The Breast

Alternate name; see *Fibroadenoma*.

Fibroblast

A cell that makes collagen and other supporting materials in connective tissue. Fibroblasts help maintain skin, tendons, and organs and become active during wound healing and scar formation.

Fibrocartilage

A tough type of cartilage that combines strength with limited flexibility. It helps absorb pressure and resist pulling in the discs between spinal bones, the pubic joint, and the knee menisci.

Fibrocystic Breast Changes

Common benign changes in breast tissue that may include cysts, fibrous areas, lumpiness, tenderness, or swelling, sometimes varying with the menstrual cycle. The effect on breast cancer risk depends on the tissue pattern; nonproliferative changes alone do not increase risk.

Alternate Names:
Fibrocystic Breast Disease (deprecated historical term)

Fibrocystic Breast Condition

Alternate name; see *Fibrocystic Breast Changes*.

Fibrocystic Breasts

Alternate name; see *Fibrocystic Breast Changes*.

Fibrodysplasia Ossificans Progressiva

A rare inherited disorder in which muscles, tendons, ligaments, and other connective tissues gradually turn into bone. This extra bone forms outside the normal skeleton and can make joints stiff or fixed, restricting movement. Episodes of soft-tissue swelling

and inflammation may be followed by permanent bone formation, and injury or invasive procedures can trigger these episodes. The disorder usually becomes noticeable in early childhood and may later limit opening of the mouth or expansion of the rib cage. Most cases are caused by a change in the *ACVR1* gene. A characteristic feature present from birth is a malformed, shortened, or inward-turned big toe.

Alternate Names:
FOP; Stone Man Syndrome

Fibroepithelial Polyp Of The Vulva

A usually noncancerous, soft tissue growth on the vulva or nearby vaginal tissue. It may enlarge during pregnancy or the reproductive years and can cause irritation, bleeding, or discomfort if large.

Fibrofolliculoma

A small, usually noncancerous skin growth arising around a hair follicle, often on the face, neck, or upper trunk. Multiple lesions may occur with an inherited disorder that also raises kidney-tumor risk.

Fibroid

Alternate name; see *Uterine Fibroids*.

Fibroids

Alternate name; see *Uterine Fibroids*.

Fibroid Tumor

Alternate name; see *Uterine Fibroids*.

Fibrolamellar Carcinoma

A rare primary liver cancer that usually affects adolescents and young adults without cirrhosis. It may cause abdominal pain, a mass, weight loss, or abnormal liver tests; imaging and biopsy establish diagnosis and resection is considered when feasible.

Fibrolamellar Hepatocellular Carcinoma

A distinct primary malignant hepatic neoplasm occurring predominantly in adolescents and young adults without pre-existing cirrhosis or viral hepatitis, histologically characterized by large polygonal eosinophilic hepatocytes embedded within dense, lamellar collagenous stroma; associated with a DNAJB1-PRKACA fusion gene.

Fibrolipoma

A usually noncancerous, slow-growing lump made of mature fat and fibrous tissue. It is often painless and lies beneath the skin; lumps may be new or enlarging.

Fibroma

A usually benign tumor made mainly of fibrous connective tissue. Fibromas can develop in skin, soft tissue, bone, or organs; their effects depend on their location and size, and some site-specific forms may recur or interfere with organ function.

Fibroma Of Tendon Sheath

A usually noncancerous, slow-growing lump attached to the covering of a tendon, most often in a finger, hand, or wrist. It is firm and may recur after removal.

Fibromatoses

A group of fibroblast growth disorders that do not spread to distant organs but can recur locally. Superficial forms include palmar and plantar fibromatosis; deep desmoid-type fibromatosis can grow into nearby tissues and impair their function.

Fibromatosis

An overgrowth of connective-tissue cells that does not spread to distant organs but can invade nearby tissue and recur. Desmoid-type disease may cause pain, a firm mass, or impaired organ function.

Fibromuscular Dysplasia

An abnormal structure of medium-sized artery walls, most often in the kidney or neck arteries. It can cause high blood pressure, headache, or stroke, or produce an artery bulge or tear.

Fibromyalgia

A chronic disorder characterized by widespread pain and tenderness throughout the muscles, joints, and

soft tissues, accompanied by persistent fatigue, sleep disturbances, and memory or concentration difficulties (often called 'fibro fog'). It is thought to involve heightened sensitivity in the central nervous system, causing the brain to amplify normal pain signals.

Alternate Names:
FMS; Fibromyalgia Syndrome; FM

Fibromyalgia Syndrome

Alternate name; see *Fibromyalgia*.

Fibromyxosarcoma

A rare cancer of soft tissue containing fibrous and jelly-like material. It may present as a growing lump or pain; diagnosis requires tissue examination, and treatment depends on its site and spread.

Fibronectin

A protein found in blood and connective tissue that helps cells attach, move, and organize during tissue repair. It supports wound healing and the structure of tissues around cells.

Fibroproliferation

Excess growth of connective-tissue cells with increased production of scar tissue. It can thicken or stiffen organs, including the lungs, and may develop after injury, inflammation, or surgery.

Fibrosarcoma

A rare cancer arising from cells that make fibrous connective tissue. It usually develops in deep soft tissue or bone and may cause a growing mass, pain, or reduced movement.

FibroScan

A painless ultrasound-based test that estimates liver stiffness. Greater stiffness can suggest scarring, but inflammation, congestion, obesity, or fluid in the abdomen can affect accuracy and results may need other tests.

Fibrosing Alopecia

Hair loss caused by inflammation and permanent scarring of hair follicles. The affected skin may look smooth or shiny, and regrowth is unlikely once follicles are destroyed; treatment may limit progression.

Fibrosing Cholangitis

Chronic inflammation and scarring of the bile ducts, most commonly referring to primary sclerosing cholangitis. It can cause cholestasis, itching, jaundice, recurrent bacterial cholangitis, cirrhosis, and increased risk of bile-duct cancer.

Fibrosis

Excess formation of scar tissue after ongoing injury or inflammation. Fibrosis can make an organ stiff and reduce its function, such as causing breathlessness in the lungs or impaired filtration in the kidneys.

Fibrous Cavernositis

Inflammation and fibrosis of the erectile tissue of the penis, which may cause pain, swelling, erectile dysfunction, or curvature. Infection, trauma, injections, and other inflammatory conditions can contribute.

Fibrous Dysplasia

A noncancerous bone disorder in which normal bone is replaced by weaker abnormal tissue. It may affect one or several bones and cause pain, deformity, fractures, or pressure on nearby nerves.

Fibrous Dysplasia Pathology

A fibro-osseous lesion containing irregular strands of woven bone in a cellular fibrous stroma, classically without prominent osteoblastic rimming. The lesion may be monostotic or polyostotic.

Fibrous Interstitial Pneumonia

A pattern of lung disease in which inflammation and scar tissue thicken the interstitium and impair oxygen transfer. Causes include idiopathic pulmonary fibrosis, autoimmune disease, medication toxicity, and environmental exposure.

Fibrous Joint

A joint in which bones are held together by strong connective tissue and have little or no movement.

Skull sutures and syndesmoses are examples.

Fibrous Plaque

A thickened area in an artery wall containing scar-like tissue, cholesterol, and other material. It can narrow blood flow or rupture, allowing a blood clot to form and block the artery.

Alternate Names:
Atherosclerotic Plaque

Fibrous Plaques of the Penis

Fibrous scar-like plaques within the penile tunica albuginea, characteristic of Peyronie disease. They may cause penile curvature, pain during erection, shortening, or difficulty with sexual activity.

Fibrous Sclerosis of the Penis

Another descriptive name for Peyronie disease, a disorder in which fibrous plaques form in the erectile covering and may bend or shorten the penis.

Fibula

The slender bone on the outer side of the lower leg. It provides muscle attachment and forms the outer ankle. The nerve near its upper end can be injured by pressure or fracture.

Fibular Artery

Also called the peroneal artery, it is a branch of the leg's main artery that supplies the outer and back lower leg and contributes blood flow around the ankle.

Fick Principle

A method for estimating blood flow from how much oxygen the body uses and the difference in oxygen content between blood entering and leaving the lungs. It can estimate cardiac output during specialized heart testing.

Alternate Names:
Fick Method; Fick Cardiac Output Determination

Fiducial Markers

Small visible markers placed on or inside the body to identify a precise location during imaging, radiation treatment, or surgery. They help clinicians align equipment and target the intended tissue accurately.

Field Fever

An older name for leptospirosis, a bacterial infection acquired through water or soil contaminated with urine from infected animals. It may cause fever, headache, muscle pain, jaundice, kidney injury, or meningitis.

Field Of View

The area included in a medical image or examination. A wider field shows more of the body, while a narrower field provides greater detail about a smaller area.

Fifth Disease

A usually mild infection caused by parvovirus B19. Children may develop fever, cold-like symptoms, bright-red cheeks, and a lacy rash. It can cause serious fetal anemia during pregnancy and prolonged anemia in some vulnerable people.

Alternate Names:
Erythema Infectiosum; Slapped Cheek Syndrome

FIGO Leiomyoma Classification

A system that describes where a uterine fibroid lies in relation to the uterine cavity and outer surface. The location category helps clinicians predict symptoms and choose treatment.

Filamentous Fungus

A fungus that grows as branching threads called hyphae, which form a network called mycelium. Some filamentous fungi cause skin, nail, lung, or invasive infections, especially in people with weakened immunity.

Filarial Elephantiasis

Long-lasting swelling and thickening of skin and underlying tissues caused by lymphatic blockage from filarial worms. It commonly affects the legs or genitals and may require antiparasitic treatment, skin care, and swelling management.

Filarial Lymphedema

Chronic swelling of a limb, genitalia, or breast caused by lymphatic damage from filarial infection, most often due to *Wuchereria bancrofti* or *Brugia malayi*. Persistent lymphedema can lead to skin thickening and elephantiasis.

Filariasis

Infection with threadlike parasitic worms spread by mosquitoes, flies, or other insects. Depending on the species, worms may affect lymph vessels, skin, or eyes, causing swelling, inflammation, itching, or vision problems.

Filler

A material injected or placed in tissue to restore volume, smooth wrinkles, change contours, or replace lost structure. Risks include pain, infection, lumps, and accidental blockage of a blood vessel.

Filler Excipient

An inactive ingredient added to a medicine to provide bulk, improve stability, or help form a tablet, capsule, or liquid. It may rarely cause allergy or intolerance.

Filopodium

A thin, finger-like projection from a cell surface. It senses nearby surroundings and helps cells attach, move, communicate, or form connections, including connections made by developing nerve cells.

Filoviridae

A family of viruses that includes Ebola and Marburg viruses. They can cause severe fever, bleeding, organ failure, and death, and are mainly spread through direct contact with blood or other infected body fluids.

Filoviruses

Viruses such as Ebola and Marburg that can cause severe hemorrhagic fever. Symptoms may include fever, headache, muscle pain, vomiting, diarrhea, bleeding, and organ failure; spread occurs through infected body fluids.

Filtered Back Projection

A computer method for creating an image from scan measurements, especially in computed tomography. It is fast, but images may contain more noise or artifacts than those made with newer reconstruction methods.

Filtering Procedure

Eye surgery that creates a new drainage route for fluid to lower pressure inside the eye. It may treat glaucoma when medicines or other procedures do not control pressure adequately.

Filtration

Separation of particles or dissolved substances from a fluid by passing it through a barrier. In the kidneys, tiny filters remove water and small waste products from blood to begin urine formation.

Filtration Fraction

The percentage of plasma flowing through the kidneys that is filtered to begin urine formation. It helps describe kidney blood flow and filtering function and is calculated from kidney filtration compared with plasma flow.

Filum Terminale

A thin strand of connective tissue that anchors the lower end of the spinal cord to the tailbone. Abnormal attachment can restrict cord movement and cause symptoms of tethered spinal cord.

Fimbria

A fringe-like structure. In the fallopian tube, the fimbria are finger-like projections near the ovary that help guide a released egg into the tube; the term is also used for bacterial attachment structures.

Fimbriae

Finger-like projections at the end of each fallopian tube that help collect an egg released from the ovary and guide it into the tube. Their movement and tiny surface hairs help direct the egg toward the uterus.

Fimbriae Proteins

Bacterial surface proteins that form hair-like projections used to attach bacteria to human cells, medical devices, or other surfaces. Attachment can help bacteria form communities and begin infection.

Fine Crackles

Brief, high-pitched, popping sounds heard mainly during breathing in. They may occur when small airways or air sacs open in conditions such as lung scarring, fluid congestion, or other lung disease.

Finegoldia

A group of bacteria that grow without oxygen and normally live on skin or mucous membranes. They can occasionally cause wound, soft-tissue, bone, joint, or bloodstream infections.

Finegoldia Magna

A bacterium normally found on skin and mucous membranes that grows without oxygen. It can cause infections after wounds or surgery, including abscesses and deeper soft-tissue infections.

Fine Motor Control

The coordinated use of small muscles for accurate movements, especially of the hands and fingers. It supports tasks such as writing, buttoning clothes, using utensils, and handling small objects.

Fine Motor Skills

Abilities that use small muscles for controlled movements, especially in the hands and fingers. Children develop skills such as grasping, feeding themselves, drawing, dressing, and writing at different individual rates.

Fine Needle Aspiration

Alternate spelling; see *Fine-Needle Aspiration*.

Fine-Needle Aspiration

A procedure that uses a thin needle to collect cells or fluid from a lump or organ for laboratory testing. It may be guided by touch or imaging and is usually less invasive than a surgical biopsy.

Alternate Names:
FNA; Fine-Needle Aspiration Cytology; FNAC

Fine Needle Aspiration Of The Thyroid

A procedure using a thin needle, often guided by ultrasound, to collect thyroid cells from a nodule. Laboratory examination helps determine whether the nodule is benign, malignant, or needs further testing.

Finger

One of the hand's digits, made of bones, joints, muscles, tendons, nerves, blood vessels, and skin. Fingers support grasping, touch, balance, and precise movements.

Finger Dislocation

An injury in which the bones of a finger joint are forced out of their normal alignment. Pain, swelling, deformity, and limited movement are common; associated injuries can include fractures, tendon damage, and impaired circulation.

Finger Flexors

Muscles and tendons that bend the fingers at their joints. Injury, especially a cut or forceful injury, can cause pain or inability to bend a finger.

Finger Injury

Damage to a finger's bone, joint, tendon, ligament, nerve, blood vessel, nail, or skin, usually from trauma. Assessment checks alignment, movement, sensation, blood flow, and possible hidden fractures.

Finger Joint

A connection between the bones of a finger that allows bending, straightening, and limited side-to-side movement. Finger joints can be affected by injury, arthritis, inflammation, infection, or dislocation.

Fingernail

The hard protective plate covering the end of a finger, made mainly of keratin and growing from the nail root. Changes in color, shape, or growth can sometimes signal injury or disease.

Finger-Nose Test

A clinical coordination test in which the patient alternately touches their own nose and the examiner's outstretched finger using the index finger. Dysmetria (overshooting or undershooting) or intention tremor during the movement indicates ipsilateral cerebellar hemisphere dysfunction.

Finger Pain

Discomfort in one or more fingers caused by injury, arthritis, tendon problems, nerve compression, infection, inflammation, or reduced blood flow. Sudden severe pain, deformity, numbness, or discoloration may indicate significant injury or impaired circulation.

Fingers That Change Color

Fingers that become white, blue, purple, or red because of changes in blood flow, temperature, or oxygen. Recurrent attacks may be Raynaud phenomenon; persistent changes, pain, numbness, or sores may indicate vascular disease.

Finger Stick

A small fingertip puncture used to collect a drop of capillary blood. The sample can be tested immediately, commonly for blood glucose or other point-of-care measurements.

Finger Sucking

Persistent sucking of a finger or thumb beyond early childhood. Prolonged habit can alter tooth position, the palate, bite, and facial growth; dental assessment may be useful when it persists or causes injury.

Finkelstein Test

A wrist maneuver used to assess for de Quervain tenosynovitis. In the classic test, the examiner holds the thumb and gently moves the hand toward the little finger, stretching tendons on the thumb side of the wrist. Reproduced pain near the radial styloid supports the diagnosis but does not confirm it. The fist-with-thumb-inside variation is Eichhoff's test, though it is often called Finkelstein's.

Alternate Names:
Finkelstein's Test; Finkelstein Sign

Finnish Type Amyloidosis (Type V)

A hereditary gelsolin amyloidosis caused by variants in the *GSN* gene. It commonly causes slowly progressive corneal lattice dystrophy, cranial-nerve weakness, and lax or aging-looking skin, with variable systemic involvement.

Fire Ants

Ants whose stings inject venom and cause immediate burning pain, redness, and itchy pus-filled bumps. Multiple stings can cause severe swelling, vomiting, breathing difficulty, or a life-threatening allergic reaction.

Firesetting Behavior

Deliberately starting fires. Repeated fire-setting may be linked to an impulse-control disorder, mental illness, substance use, developmental problems, or social stress and can involve safety risks to others.

First Adult Seizure

The first suspected seizure in an adult, which may be provoked or unprovoked. Evaluation distinguishes seizure from mimics such as syncope and considers immediate causes, recurrence risk, injury, medicines, and substances.

First Aid

Immediate assistance given for injury or sudden illness before definitive medical care. It may include scene safety, emergency activation, basic life support, and measures to limit bleeding or further injury.

First Aid for Burns

Initial care for a burn before definitive treatment, including cooling a thermal burn with cool running water and protecting the injured area with a clean covering. Ice, tight dressings, and breaking blisters can worsen tissue injury; deep, extensive, chemical, electrical, or airway burns may require emergency treatment.

First Aid Kit

A group of supplies for treating minor injuries and giving temporary care during emergencies. Useful

items include gloves, dressings, bandages, antiseptic, scissors, and emergency contact information.

First-Degree Atrioventricular Block

Alternate name; see *First-Degree AV Block*.

First-Degree AV Block

A mild delay in the electrical signal traveling from the heart's upper chambers to its lower chambers. Every signal still reaches the lower chambers; it is often symptomless but may reflect medicines or heart disease.

First-Degree Burn

A superficial burn affecting only the outer skin layer. It causes redness, pain, and dryness without blisters, as with mild sunburn, and usually heals within several days without scarring.

First-Degree Heart Block

Alternate name; see *First-Degree AV Block*.

First-Episode Psychosis

The first recognized period of losing contact with reality, such as hearing or seeing things that are not present or holding fixed false beliefs. Causes include medical, medication, substance, and psychiatric conditions.

First Menstrual Period

Menarche, the first menstrual bleeding, usually occurring during puberty. Its timing varies with development, health, and other individual factors; unusually early or delayed onset may reflect an underlying condition.

First-Pass Effect

Alternate name; see *First-Pass Metabolism*.

First-Pass Metabolism

Breakdown of a swallowed medicine by the intestinal wall and liver before it enters general circulation. Extensive breakdown lowers the active amount reaching the body and can influence dose or route of administration.

First Stage Of Labor

The time from regular labor contractions that cause cervical change until the cervix is fully open. It includes early and active phases, with progress varying according to the person, fetus, and clinical circumstances.

First Trimester

The first part of pregnancy, extending from the first day of the last menstrual period through 13 weeks and 6 days of gestation in standard obstetric dating. It includes embryonic development and early fetal growth.

Fisher's Syndrome

A rare nerve disorder, usually after an infection, causing eye-muscle weakness, poor coordination, and reduced or absent reflexes. It is a variant of Guillain-Barré syndrome.

Fisher Syndrome

An acute autoimmune variant of Guillain-Barré syndrome characterized by the classic clinical triad of acute ophthalmoplegia, ataxia, and areflexia, strongly associated with anti-GQ1b IgG ganglioside antibodies following an upper respiratory or gastrointestinal infection.

Alternate Names:
Miller Fisher Syndrome; MFS

Fish-Handler's Disease

A skin infection caused by Erysipelothrix bacteria after handling infected fish, shellfish, meat, or animals. It usually causes a slowly expanding, painful purple-red lesion on the hand or fingers.

Fishhook Removal

Removal of a fishhook from skin or deeper tissue. The method depends on the hook's location and depth; clinicians assess nerves, blood vessels, tendons, joints, tetanus protection, and infection risk.

Fish Odour Syndrome

A rare metabolic disorder in which trimethylamine builds up and causes a fish-like smell in sweat,

breath, or urine. Symptoms may vary with diet; testing, dietary guidance, and emotional support can help.

Fish Oil

Oil containing omega-3 fatty acids, usually obtained from oily fish. Supplements may lower triglycerides at therapeutic doses, but benefits vary and adverse effects or medicine interactions can occur.

Fish Poisoning

Illness caused by toxins or germs in contaminated or improperly stored fish. Symptoms may include vomiting, diarrhea, flushing, tingling, weakness, or breathing difficulty; severe illness can be life-threatening.

Fish Tank Granuloma

A chronic localized cutaneous mycobacterial infection caused by Mycobacterium marinum, contracted through contact of broken skin with non-chlorinated aquarium water or infected fish. It presents as persistent red-to-violaceous papules, nodules, or ulcers typically on the hands or fingers, occasionally ascending along lymphatic channels in a sporotrichoid pattern.

Alternate Names:
Aquarium Granuloma; Swimming Pool Granuloma

Fish Tapeworm Infection

An intestinal infection acquired by eating raw or undercooked fish containing tapeworm larvae. It may cause abdominal discomfort, diarrhea, weight loss, or vitamin B12 deficiency and is usually treatable with antiparasitic medicine.

Fish Venom

Poison produced by certain fish, usually delivered through spines or sharp body parts. It can cause immediate severe pain, swelling, numbness, tissue injury, or rarely whole-body poisoning.

Fissure

A narrow crack, groove, or split in a body structure. An anal fissure is a painful tear in the anal lining, often causing sharp pain and bright-red bleeding during bowel movements.

Fissured Tongue

A usually harmless condition in which grooves develop on the tongue's surface. Food debris may collect in the grooves and sometimes cause irritation or odor.

Fistula

An abnormal passage between two body parts, such as two organs, a blood vessel and another structure, or an organ and the skin. It may result from infection, inflammation, injury, surgery, or cancer. Symptoms and treatment depend on its location; some close with medical treatment, while others need a procedure or surgery.

Alternate Names:
Pathologic Fistula; Fistulous Tract; Abnormal Organ Tunnel

Fistula-In-Ano

Alternate term; see *Anal Fistula*.

Fistulotomy

Surgery that opens an anal fistula, an abnormal tunnel between the anal canal and nearby skin, so it can heal from the inside out. It is mainly used for simple fistulas. More complex fistulas may need another treatment to protect bowel control.

Alternate Names:
Anal Fistulotomy; Fistula-in-Ano Surgery; Laying Open of Fistula

Fit

A seizure or sudden episode of altered movement or awareness; this everyday term is also used to mean physically healthy. In medical writing, it can be ambiguous because it has these distinct meanings.

Fitz Hugh Curtis Syndrome

Alternate spelling; see *Fitz-Hugh-Curtis Syndrome*.

Fitz-Hugh-Curtis Syndrome

Inflammation and scarring around the liver caused by pelvic inflammatory disease, usually from gonor-

rhea or chlamydia. It can cause sharp right-upper-abdominal pain, fever, and pain that worsens with movement or breathing.

Five-Alpha Reductase

An enzyme that changes testosterone into dihydrotestosterone (DHT). DHT supports male sexual development and contributes to prostate growth and male-pattern hair loss. Medicines that block this enzyme are used for an enlarged prostate and some types of hair loss.

Alternate Names:
5-Alpha Reductase; 5-α-Reductase; Steroid 5-Alpha Reductase

Five-Year Survival Rate

The percentage of people alive five years after a diagnosis or treatment. It summarizes outcomes for groups, not an individual's exact prognosis, which also depends on cancer type, stage, health, and treatment.

Fixation

Holding a body part, tissue, or broken bone in the correct position while it heals. Methods include stitches, wires, screws, plates, rods, casts, splints, or external frames.

Fixative

A chemical used to preserve cells or tissue for laboratory examination by preventing decay and maintaining structure. Common fixatives can irritate skin, eyes, and airways; handling involves appropriate ventilation and protective equipment.

Fixator Muscle

A muscle that holds one part of the body steady while another part moves.

Fixed Drug Eruptions

Recurrent sharply demarcated red or dusky patches caused by a medicine, often at the same sites each time exposure occurs. Lesions may blister or ulcerate and leave persistent dark pigmentation; stopping the culprit drug prevents recurrence.

Fixed Joint

A joint that permits little or no movement because the bones are joined by bone or dense connective tissue. Some fixed joints are normal; others result from injury, disease, or surgical fusion.

Alternate Names:
Synarthrosis; Immovable Joint

Fixed Macrophage

An immune cell that stays within a particular tissue instead of circulating in blood. It removes dead cells and microbes and helps coordinate inflammation and repair.

Flaccid

Soft and lacking normal firmness or muscle tone. It may describe a limb, muscle, bladder, or penis; sudden flaccid weakness, especially on one side, can signal a neurologic emergency.

Flagellin

The main protein in a bacterial flagellum, the whip-like structure that helps some bacteria move. Human immune cells can recognize flagellin and respond with inflammation.

Flagellum

A long, whip-like structure that helps a cell or microorganism move. Human sperm and some bacteria have flagella, which differ in structure and function.

Flail Chest

A serious chest injury in which several ribs break in more than one place, leaving part of the chest wall unstable. Severe pain and difficult breathing can result, often with lung bruising.

Flakka

A street name for illicit synthetic stimulant drugs, especially alpha-PVP. Overdose can cause extreme agitation, hallucinations, seizures, dangerously high temperature, muscle breakdown, irregular heartbeat, or death and requires emergency treatment.

Flanged Needle

A needle with a widened rim or attached flange that helps stabilize it, limit how far it enters, or connect it to another device. The flange may reduce movement and tissue injury during sampling, injection, drainage, or infusion.

Flank

The side of the body between the lower ribs and the hip, including part of the abdomen and back. Pain in this area may arise from the kidney, muscles, spine, bowel, or nearby organs.

Flank Pain

Pain between the lower ribs and hip, often caused by kidney stones, kidney infection, muscle strain, spine problems, or nearby abdominal disease. Fever, vomiting, blood in urine, injury, or severe pain may accompany serious causes.

Flap Operation

Surgery that moves a piece of skin, tissue, or muscle, while preserving its blood supply, to cover a wound or reconstruct a damaged body part. Risks include infection, bleeding, and loss of the flap.

Flapping Tremor

An involuntary, irregular jerky movement (asterixis) characterized by brief, sudden lapses of posture in the dorsiflexed hands when the arms are held extended with the wrists hyperextended, characteristic of hepatic encephalopathy, uremic encephalopathy, and severe hypercapnia.

Alternate Names:
Asterixis; Liver Flap

Flare

A temporary increase in symptoms or inflammation after a disease has been stable or less active. Flares may be triggered by infection, stress, injury, or treatment changes; symptoms can be severe or unusual.

Alternate Names:
Exacerbation; Disease Flare-Up

Flare-Up

A sudden or gradual worsening of a long-term disease after a period of relative stability. The cause may be infection, stress, missed treatment, or disease progression; symptoms may be severe or persistent.

Flashes

Brief flickers or streaks of light seen without an outside light source. They may result from changes in the eye's gel, migraine, or inflammation; sudden flashes with floaters or missing vision can indicate a retinal tear or detachment.

Flashing

Seeing brief flashes or streaks of light without an external source. New flashing, especially with floaters, a curtain-like shadow, eye pain, or reduced vision, can indicate a retinal emergency.

Flat Affect

Very little outward expression of emotion, such as reduced facial movement, gestures, or voice variation. It is a clinical sign, not a diagnosis, and may occur with psychiatric, neurologic, or medication-related conditions.

Flat Epithelial Atypia

A change in the cells lining small breast ducts, in which the cells look mildly abnormal and form a flat layer. It is usually found in a tissue sample taken after breast imaging. It is not cancer, but may occur alongside a more serious nearby change.

Flat Bones

Broad, relatively thin bones such as the skull, ribs, breastbone, and shoulder blades. They protect organs, provide surfaces for muscle attachment, and contain marrow that produces blood cells.

Flat Feet

Alternate name; see *Fallen Arches*.

Flatfoot

Alternate name; see *Fallen Arches*.

Flatfoot (Pes Planus)

Alternate name; see *Fallen Arches*.

Flatulence

Passage of gas through the anus, produced by swallowed air and bacterial digestion of food in the intestine. It may increase with diet, constipation, swallowing air, or digestive disorders.

Flatus

Gas released through the anus after air is swallowed or intestinal bacteria break down food. Passing gas is normal; inability to pass gas with increasing abdominal swelling, vomiting, or pain may indicate bowel obstruction.

Alternate Names:
Intestinal Gas; Expelled Gas

Flatus and Bloating

Passing gas through the anus (flatus) and a feeling of abdominal fullness or swelling (bloating). Gas can contribute to bloating, but the two are distinct symptoms and bloating may occur without excess intestinal gas.

Flavin Adenine Dinucleotide

A helper molecule made from vitamin B2 that allows enzymes to transfer electrons during energy production and other chemical reactions. It is commonly abbreviated FAD.

Alternate Names:
FAD; Riboflavin Dinucleotide

Flaviviridae

A family of single-stranded RNA viruses that includes dengue, yellow fever, Zika, hepatitis C, and West Nile viruses. Different members spread through insects, blood, or other routes and cause different illnesses.

Flavivirus

A group of viruses primarily spread to humans through the bites of infected mosquitoes or ticks. Notable members of this virus family include the dengue virus, yellow fever virus, Zika virus, West Nile virus, and Japanese encephalitis virus. Infections can range from mild flu-like symptoms to severe hemorrhagic fevers or neurological brain infections (encephalitis).

Alternate Names:
Flaviviruses; Flaviviridae

Flaviviruses

Plural form; see *Flavivirus*.

Flavobacteriaceae

A family of mainly gram-negative bacteria found in water, soil, and other environments. Most do not infect people, but some can cause opportunistic infections, especially in hospitalized or immunocompromised patients.

Flavobacterium

A group of gram-negative bacteria commonly found in water and soil. A few species can cause opportunistic infections in people or animals, particularly when immunity is weakened.

Flavoxate

A medicine used to relieve bladder spasms, urgency, frequency, or painful urination. It treats symptoms rather than infection or blockage and can cause dry mouth, blurred vision, dizziness, or constipation.

Flaxseed Extract

A preparation made from flaxseed that may contain omega-3 fat, lignans, and soluble fiber. Effects vary by product; it may interact with medicines affecting clotting, blood sugar, or blood pressure.

Flea

A small, wingless, laterally compressed, hematophagous ectoparasitic insect belonging to the order Siphonaptera. Possessing specialized piercing-sucking mouthparts and elongated hind legs adapted for jumping onto animal and human hosts, fleas feed on blood and produce pruritic, papular urticarial dermatological eruptions. Clinically significant species include the human flea (*Pulex irritans*), the oriental rat flea (*Xenopsylla cheopis*, the primary vector of

bubonic plague caused by *Yersinia pestis* and murine typhus caused by *Rickettsia typhi*), the cat flea (*Ctenocephalides felis*, vector of cat-scratch disease caused by *Bartonella henselae*), and the chigoe flea (*Tunga penetrans*, which burrows into skin causing tungiasis).

Alternate Names:
Fleas; Siphonaptera

Flea Bites

Itchy red bumps caused by fleas feeding on the skin, often clustered around the ankles or lower legs. Scratching can cause infection; treating pets and the environment helps prevent new bites.

Flea Bites In Humans

Small itchy bumps, often around the ankles or lower legs, caused by flea feeding. Allergic reactions may produce larger areas of swelling; control requires treating infested animals, bedding, rooms, and symptoms.

Alternate Names:
Pulicosis; Flea-Borne Dermatitis

Fleas

Plural form; see *Flea*.

Flecainide

A prescription antiarrhythmic medicine that slows electrical signals in the heart to prevent selected abnormal rhythms. It is not suitable for everyone and can worsen dangerous rhythms, especially with structural heart disease.

Fleischner Sign

A chest radiographic sign of acute pulmonary embolism consisting of a prominent, enlarged central pulmonary artery terminating abruptly, caused by distension of the vessel by a large impacted thromboembolus and downstream vasoconstriction.

Alternate Names:
Fleischner's Sign; Dilated Central Pulmonary Artery Sign

Flesh-Eating Bacteria

Informal name for bacteria that can cause necrotizing fasciitis, a rapidly progressive deep soft-tissue infection. Severe pain, swelling, fever, skin discoloration, blisters, or serious illness requires emergency treatment.

Flesh-Eating Bug

An informal name for necrotizing fasciitis, a rapidly spreading infection of deep skin and soft tissue. Severe pain out of proportion to visible changes, swelling, fever, blisters, or skin discoloration requires emergency care.

Flex

To bend a joint so the angle between connected bones becomes smaller. For example, bending the elbow brings the forearm toward the upper arm; pain, swelling, stiffness, or weakness can limit this movement.

Alternate Names:
Flexion; Joint Bending

Flexed Breech

Alternate name; see *Complete Breech*.

Flexibility

The range of movement available at a joint or group of joints. It depends on bones, muscles, tendons, ligaments, joint health, nervous-system control, age, training, and pain.

Flexible Nasolaryngoscopy

An examination using a thin flexible camera passed through the nose to view the nasal passages, throat, and voice box. It helps investigate hoarseness, swallowing difficulty, blockage, lesions, and vocal-cord movement.

Flexible Sigmoidoscopy

An examination using a flexible camera to view the rectum and lower colon. It can investigate bleeding, diarrhea, or bowel symptoms and monitor known disease; preparation and biopsy may be needed.

Flexion

Movement that bends a joint and decreases the angle between connected bones, such as bending the elbow, knee, hip, or fingers.

Flexor

A muscle or tendon that bends a joint or body part. Flexors in the arm and hand bend the fingers and wrist; injury can cause pain, weakness, or loss of movement.

Flexor Digitorum Profundus

A deep forearm muscle whose tendons bend the end joints of the fingers and also assist wrist movement. Its inner part is supplied by the ulnar nerve and its outer part by the median nerve.

Flexor Digitorum Superficialis

A forearm muscle whose tendons bend the middle joints of the fingers and assist wrist movement. Damage to the muscle, tendon, or median nerve can cause pain and difficulty bending the fingers.

Flexor Hallucis Longus Tendinitis

Irritation or inflammation of the tendon that bends the big toe. It passes behind the inner ankle and under the foot, so pain may occur there or beneath the big toe, especially during push-off when walking or running.

Flexor Tendon Anatomy

The arrangement and function of the tendons that bend the fingers, thumb, and wrist. Flexor tendons pass from forearm muscles through the wrist and hand in defined zones and sheaths; injury can impair finger flexion and involve nerves or blood vessels.

Flexor Tenosynovitis

A serious infection around a tendon that bends a finger, often after a cut or puncture. The finger may become swollen, stay partly bent, and hurt when straightened; infection can damage the tendon and surrounding tissues.

Alternate Names:
Suppurative Tenosynovitis; Kanavel Tenosynovitis

Flexural

Relating to a skin fold or the inner surface of a bent joint, such as the elbow crease, back of the knee, armpit, groin, or fold beneath the breast.

Flibanserin

A prescription medicine for persistent, distressing low sexual desire in some premenopausal women. It is taken regularly rather than as needed and can cause dizziness, sleepiness, low blood pressure, or fainting, especially with alcohol.

Flight-Or-Fight Response

The body's rapid response to perceived danger, releasing stress hormones that increase heart rate, breathing, alertness, and muscle readiness so a person can escape or confront a threat.

Alternate Names:
Sympathoadrenal Response

Floater

Alternate name; see *Floaters*.

Floaters

Moving spots, threads, cobwebs, or rings in the field of vision caused by shadows from material in the eye's vitreous gel. They are often age-related, but sudden onset can indicate bleeding or a retinal tear.

Floating Kidney

Unusual downward movement of a kidney when a person stands, sometimes called nephroptosis. It is often symptomless but may cause position-related flank pain, urinary symptoms, or rarely impaired urine drainage.

Floating Rib

One of the two lowest pairs of ribs (the eleventh and twelfth ribs) on each side of the rib cage. Unlike the other ribs, which connect either directly or indirectly to the breastbone (sternum) via cartilage, floating ribs are attached only to the spine in the back, leaving their front ends free in the muscle wall of the lower abdomen.

Alternate Names:

Floating Ribs; Costa Fluctuans

Floating Ribs

Plural form; see *Floating Rib*.

Flocculation

The joining of tiny particles suspended in a liquid into larger clumps. Laboratory tests may use this visible reaction to detect antibodies or other substances; it is also used in water treatment and pharmaceutical preparation.

Floor Of The Mouth Cancer

Cancer arising in the tissues beneath the tongue, most often from surface cells. It may cause a persistent ulcer, lump, pain, bleeding, numbness, or difficulty swallowing or speaking.

Alternate Names:
Oral Floor Squamous Cell Carcinoma; Sublingual Malignancy

Floppy Baby Syndrome

An informal description of an infant with unusually low muscle tone and a limp posture. Causes include brain, spinal cord, nerve, muscle, genetic, or metabolic disorders.

Floppy Eyelid Syndrome

A disorder in which the upper eyelid is unusually lax and easily turns inside out, with chronic papillary conjunctivitis (inflammation of the inner eyelid). The eyelid may turn outward during sleep, exposing and irritating the eye and causing redness, tearing, discharge, or a gritty feeling, often worse on waking. The syndrome is associated with obstructive sleep apnea and keratoconus.

Floppy Iris Syndrome

A cataract-surgery complication in which the iris becomes unusually loose, moves with fluid currents, and narrows the working space. It is associated with some prostate medicines.

Floppy Valve Syndrome

A condition in which the mitral valve's leaflets bulge backward into the upper heart chamber when the heart contracts. It is often harmless but may cause palpitations, chest discomfort, or leakage through the valve.

Alternate Names:
Mitral Valve Prolapse; Barlow Syndrome

Flora

The microorganisms living normally or temporarily in a body site or environment. Some protect against harmful organisms, but they can cause infection if they enter another body site or defenses are weakened.

Flossing

Cleaning between teeth with dental floss or another interdental device to remove plaque and food that a toothbrush cannot reach. Gentle daily cleaning can help prevent gum disease and cavities.

Flotation

A laboratory method that separates material by density. For example, a flotation test can concentrate parasite eggs from stool so they are easier to identify under a microscope.

Flow Cytometry

A laboratory test that examines cells or particles one at a time as they pass through a laser beam. It can count cells and identify their features, helping diagnose blood cancers and immune disorders.

Flowmeter

A device that measures the rate at which a gas or liquid moves. In medicine, it may measure oxygen delivery, intravenous fluid flow, or breathing flow such as peak expiratory flow.

Flow-Volume Loop

A graph showing how much air moves in and out of the lungs at different speeds during forceful breathing. Its shape can help identify airway narrowing, reduced lung size, or an upper-airway blockage.

Floxacillin

An antibacterial medicine used in some countries to treat infections caused by susceptible bacteria, especially staphylococci. It can cause allergic reactions, diarrhea, liver problems, or other antibiotic-related effects.

Floxuridine

An anticancer medicine that interferes with DNA production, slowing or killing rapidly dividing cells. It is used only in selected treatment plans and may cause low blood counts, mouth sores, diarrhea, or other toxicity.

Flu

An acute respiratory infection caused by influenza viruses. It commonly causes sudden fever, cough, sore throat, headache, muscle aches, and fatigue and can lead to pneumonia or worsen chronic diseases.

Flucloxacillin

An antibiotic used for selected bacterial infections, especially those caused by susceptible staphylococci. Adverse effects include nausea, diarrhea, allergy, and liver injury.

Fluconazole

An antifungal medicine used for selected yeast and other fungal infections. It can interact with many medicines and may cause nausea, rash, or liver injury; treatment depends on the infection and patient.

Flucytosine

An antifungal medicine converted inside susceptible fungi into substances that interfere with genetic-material production. It is used for selected serious infections, usually with another antifungal, and requires blood-count and liver monitoring.

Fludarabine

A chemotherapy medicine that interferes with DNA production in abnormal blood cells. It treats selected blood cancers but can severely suppress immunity and blood counts, increasing the risk of serious infections.

Fludarabine Phosphate

A form of fludarabine used in selected blood-cancer treatment plans. It interferes with DNA production and can cause prolonged low blood counts, immune suppression, infections, and neurologic or other serious effects.

Fludeoxyglucose F-18

A radioactive form of glucose used in positron-emission tomography scans. Active tissues absorb more of it, helping doctors assess some cancers, brain disorders, and heart muscle; uptake is not specific for cancer.

Fludrocortisone

A medicine that helps the body retain salt and water and raise blood pressure. It treats some adrenal-hormone deficiencies and selected orthostatic disorders; monitoring is needed for swelling, high blood pressure, and low potassium.

Fluid Around The Heart

Extra fluid in the sac surrounding the heart. Small amounts may cause no symptoms, while rapid or large collections can restrict heart filling and cause breathlessness, low blood pressure, or life-threatening tamponade.

Alternate Names:
Pericardial Effusion; Hydropericardium

Fluid Balance

The relationship between water entering and leaving the body. The kidneys, hormones, thirst, breathing, sweat, and stool help regulate it; disruption can cause dehydration, swelling, or abnormal blood salts.

Fluid Imbalance

Too much or too little body water or an abnormal level of salts such as sodium or potassium. Causes include vomiting, diarrhea, kidney or heart disease, hormone disorders, dehydration, or excess fluid treatment.

Fluid in Lungs

An informal phrase that can refer to two different findings: pulmonary edema, fluid in the lung's tissue or air sacs, or pleural effusion, fluid in the space around the lung. The medical term should identify which location is involved.

Fluid Management

Planning and monitoring fluids, salts, and urine output to maintain circulation and organ function. Treatment may involve drinking, intravenous fluids, diuretics, or fluid restriction according to the underlying problem.

Fluid Overload

Excess water and salt in the body, causing swelling, rapid weight gain, high blood pressure, or fluid in the lungs. It may result from heart, kidney, or liver disease or too much fluid treatment.

Fluid Therapy

Treatment using fluids, by mouth or through a vein, to restore hydration, blood volume, or salt balance. The type and amount depend on the cause; excess fluid can worsen swelling, heart failure, or lung congestion.

Fluid Wave

A physical test for fluid buildup in the belly (ascites); tapping one side of the stomach causes a ripple or wave that can be felt with the other hand on the opposite side.

Flu (Influenza)

Alternate name; see *Flu*.

Alternate Names:
Influenza; Grippe; Viral Flu

Fluke

A flat, leaf-shaped parasitic worm. Different species infect the liver, lungs, intestines, or blood vessels and are acquired through contaminated food, water, or contact with freshwater.

Flumazenil

An antidote that can reverse sedation and slowed breathing caused by some benzodiazepine medicines. It can trigger seizures or sudden withdrawal and is not suitable for every overdose, especially mixed overdoses.

Flunarizine

A medicine used in some countries to prevent migraine and treat selected balance disorders. Adverse effects include sleepiness, weight gain, depression, or movement problems.

Flunisolide

An inhaled or nasal corticosteroid used to reduce inflammation in asthma or allergic rhinitis. It may cause throat irritation, nosebleeds, or oral thrush; regular use does not relieve a sudden severe asthma attack.

Fluocinolone

A corticosteroid applied to skin, scalp, or other affected areas to reduce inflammation and itching. Prolonged or extensive use can thin the skin or rarely cause effects throughout the body.

Fluocinolone Acetonide

A corticosteroid medicine applied to the skin or scalp to reduce redness, swelling, and itching. Overuse can thin the skin, worsen infections, or rarely affect the body's hormone system.

Fluocinonide

A strong corticosteroid applied to selected inflammatory skin conditions to reduce itching, redness, and swelling. Prolonged or extensive use can damage skin or cause systemic effects.

Fluocortolone

A corticosteroid used in selected skin or other inflammatory conditions. It reduces inflammation but can cause skin thinning, infection, or other steroid effects, especially when used for a long time or over large areas.

Fluorescein

A bright fluorescent dye used in eye examinations and some imaging tests. In the eye, it highlights scratches, ulcers, and abnormal blood-vessel leakage; rare allergic reactions can occur after injection.

Fluorescein Angiography

An eye test in which fluorescent dye is injected into a vein and photographs track its movement through retinal blood vessels. It can show leakage, blockage, or abnormal vessels in retinal disease.

Fluorescein Eye Stain

A test in which dye is placed on the eye and viewed under blue light. It highlights scratches, ulcers, foreign-body injuries, and some dry-eye surface damage.

Fluorescence

The emission of visible light by a substance after it absorbs light or other energy. Clinicians and researchers use it to identify cells, chemicals, microbes, or structures in laboratory and imaging tests.

Fluorescence In Situ Hybridization

A laboratory test that uses glowing DNA probes to find specific chromosome regions or gene changes in cells. It can detect selected missing, extra, rearranged, or amplified genetic material.

Alternate Names:
FISH; Molecular Cytogenetic Assay

Fluorescence Microscopy

A microscope method that uses fluorescent labels to make selected cells, molecules, or microbes visible. It helps examine tissue structure, cell proteins, genetic material, and infectious organisms.

Fluorescent Dye

A substance that absorbs light of one color and emits light of another. It can label cells, tissues, molecules, or microbes so they can be detected during laboratory or imaging examinations.

Fluoridation

Adding a controlled amount of fluoride to water or dental products to strengthen tooth enamel and reduce cavities. Excessive fluoride during tooth development can cause dental fluorosis, which appears as enamel discoloration or pits.

Fluoride

A mineral that strengthens tooth enamel, helps repair early damage, and reduces acid production by cavity-causing bacteria. It is found in some water supplies, toothpaste, mouth rinses, and professional dental treatments.

Fluoride In Diet

Fluoride obtained from drinking water and foods or drinks made with fluoridated water. The right amount helps protect teeth, while excessive intake, especially in children, can damage developing enamel.

Fluoride Overdose

Excessive fluoride swallowed over a short time. It can cause nausea, vomiting, abdominal pain, low blood calcium, muscle spasms, abnormal heart rhythms, or seizures; severe poisoning can be life-threatening.

Fluoride Poisoning

Illness caused by swallowing too much fluoride. Early symptoms include nausea, vomiting, and abdominal pain; severe poisoning can lower blood calcium and cause muscle spasms, seizures, or dangerous heart rhythms.

Fluoride Toxicity

Alternate term; see *Fluoride Poisoning*.

Fluoride Varnish

A concentrated fluoride coating painted onto teeth by a dental professional to prevent or slow cavities. It hardens quickly and is used at intervals based on age, tooth condition, and cavity risk.

Fluorimetry

A laboratory method that measures light emitted by a fluorescent substance. It can detect or estimate very small amounts of chemicals, medicines, proteins, or biological material.

Fluorine

A highly reactive chemical element found in compounds such as fluoride. Small controlled amounts of fluoride help protect teeth, while excessive exposure can poison the body or damage developing bones and teeth.

Fluorine-18

A radioactive form of fluorine used to label tracers for positron-emission tomography scans. Its short half-life allows useful imaging while limiting how long radioactivity remains in the body.

Fluorometholone

A corticosteroid eye medicine used for selected inflammatory conditions. Prolonged use can raise eye pressure, delay healing, worsen infection, or increase cataract risk, so it requires medical supervision.

Fluorophotometry

A method that measures fluorescent light from the eye or another sample. It can help estimate substances or tissue properties; results depend on the test method and clinical findings.

Fluoropyrimidine

A class of anticancer medicines that resembles substances used to build DNA and RNA. They disrupt genetic-material production in rapidly dividing cells and can cause mouth sores, diarrhea, low blood counts, and hand-foot symptoms.

Fluoroquinolone

A class of synthetic, broad-spectrum, bactericidal antimicrobial agents (e.g., ciprofloxacin, levofloxacin, moxifloxacin, delafloxacin) that directly inhibit bacterial DNA replication, transcription, and repair by targeting bacterial type II topoisomerases: DNA gyrase (primarily in gram-negative bacteria) and topoisomerase IV (primarily in gram-positive bacteria). Classified into generations with progressively expanded atypical and respiratory gram-positive coverage. Although highly effective for complicated urinary tract infections, severe intra-abdominal infections, and selected hospital-acquired pneumonias, clinical utilization is strictly regulated due to significant class-wide black-box toxicities, including tendinitis and tendon rupture (most commonly the Achilles tendon), peripheral neuropathy, central nervous system toxicities, QT-interval prolongation predisposing to torsades de pointes, dysglycemia, and an elevated risk of aortic aneurysm and dissection.

Alternate Names:
Fluoroquinolones; Quinolones

Fluoroquinolone-Associated Disability

A term used for disabling, sometimes long-lasting adverse effects associated with fluoroquinolone antibiotics. Reported effects may involve tendons, muscles, joints, peripheral nerves, the central nervous system, or other organs and may occur together; it is not a formally established single diagnosis.

Alternate Names:
FQAD

Fluoroquinolones

Plural form; see *Fluoroquinolone*.

Fluoroscopy

An X-ray method that produces moving images inside the body. It helps guide procedures and examine swallowing, blood vessels, joints, and digestive or urinary passages; contrast dye may be used and radiation exposure occurs.

Fluorosis

A change in developing tooth enamel caused by too much fluoride during childhood. It usually appears as white streaks or spots; more severe cases cause brown discoloration or pits.

Fluorouracil

An anticancer medicine that interferes with DNA production. It is applied to selected precancerous skin lesions or given for some cancers; possible

effects include mouth sores, diarrhea, low blood counts, and serious toxicity in susceptible people.

Fluorouracil Side Effect

An unwanted effect of fluorouracil, such as mouth sores, diarrhea, nausea, low blood counts, hand-foot skin reactions, or heart problems. Severe toxicity may lead to treatment interruption or dose adjustment.

Fluoxetine

An antidepressant that increases available serotonin in the brain. It treats depression and several other conditions, but may cause nausea, sleep or sexual problems, agitation, or rarely dangerous serotonin excess or suicidal thoughts.

Fluoxymesterone

A synthetic androgen medicine used in selected hormone-related conditions. Potential effects include liver injury, altered cholesterol, mood changes, reduced fertility, prostate effects, and changes in blood count.

Flupentixol

An antipsychotic medicine used in some countries for schizophrenia and other psychiatric conditions. It can reduce hallucinations and delusions but may cause movement problems, sleepiness, hormonal changes, or rare serious reactions.

Fluphenazine

An antipsychotic medicine used to treat schizophrenia and related psychotic symptoms. It can cause stiffness, tremor, restlessness, sleepiness, hormonal changes, and rare but serious involuntary movements or fever.

Fluphenazine Hydrochloride

The hydrochloride salt form of fluphenazine, an antipsychotic medicine for selected psychotic disorders. Monitoring is needed because it can cause movement disorders, sedation, hormonal effects, and other serious adverse reactions.

Flurandrenolide

A corticosteroid applied to the skin to reduce inflammation, redness, and itching. Prolonged, extensive, or covered use can thin the skin, worsen infection, or allow steroid effects throughout the body.

Flurazepam

A long-acting sedative medicine used for short-term treatment of insomnia in some settings. It can cause next-day drowsiness, falls, memory problems, dependence, and dangerous breathing suppression with alcohol or opioids.

Flurbiprofen

A nonsteroidal anti-inflammatory medicine used for pain and swelling and, in some forms, eye inflammation. Adverse effects include stomach bleeding, kidney problems, cardiovascular events, and allergic reactions.

Flush

A sudden feeling of warmth or visible reddening caused by increased skin blood flow. In healthcare, flush can also mean washing a tube, body passage, or intravenous line with fluid.

Flushable Reagent Stool Blood Test

Alternate name; see *Fecal Occult Blood Test*.

Flushing

Temporary redness and warmth of the skin caused by increased blood flow. Triggers include heat, exercise, emotion, alcohol, medicines, fever, or hormone disorders; flushing with wheezing, diarrhea, faintness, or palpitations needs evaluation.

Flutamide

A medicine that blocks male-hormone effects and is used with other hormone treatment for prostate cancer. It can seriously injure the liver and may cause nausea, breast tenderness, or reduced blood counts.

Flutter

A rapid, regular, repetitive movement or contraction.

Atrial flutter is an abnormal heart rhythm caused by a fast electrical circuit in the upper chambers and can increase the risk of stroke.

Flutter Valve

A handheld breathing device that creates gentle pressure and vibrations during exhalation. It can help loosen and move mucus in some people with bronchiectasis, cystic fibrosis, or chronic lung disease.

Fluvastatin

A statin medicine that lowers low-density lipoprotein cholesterol by reducing cholesterol production in the liver. It lowers cardiovascular risk but can cause muscle symptoms, liver abnormalities, or rare muscle breakdown.

Fluvoxamine

An antidepressant that increases serotonin signaling and is used mainly for obsessive-compulsive disorder and selected other conditions. It can cause nausea, sleep changes, sexual problems, medicine interactions, or rarely serotonin toxicity.

Flux

An old, nonspecific term for diarrhea or an excessive discharge, especially from the bowel. Modern descriptions usually specify the symptom, duration, severity, and suspected cause.

FM

Abbreviation for fibromyalgia; see *Fibromyalgia*.

FMR1

Gene producing fragile X messenger ribonucleoprotein; trinucleotide repeat expansion causes Fragile X syndrome. See *Fragile X Syndrome*.

FMRI

Functional magnetic resonance imaging maps changes in brain blood flow and oxygen use while a person performs tasks or rests. It can help identify language or movement areas and does not use X-ray radiation.

FMS

Abbreviation sometimes used for fibromyalgia syndrome; see *Fibromyalgia*. The abbreviation can have other meanings.

FNA

An abbreviation for fine-needle aspiration, a procedure using a thin needle to collect cells or fluid from a lump or organ for laboratory examination. The full term is clearer in patient information.

FND

Abbreviation; see *Functional Neurologic Disorder*.

Foam Cell

A lipid-laden macrophage (or modified vascular smooth muscle cell) characterized histologically by a vacuolated, pale, "foamy" cytoplasm filled with accumulated cholesteryl esters and lipid droplets. Forms during early atherogenesis when circulating monocytes adhere to injured vascular endothelium, migrate into the subendothelial intima, and differentiate into macrophages. Macrophages express cell-surface scavenger receptors (such as CD36 and SR-A) that internalize oxidized low-density lipoproteins (oxLDL) in an unregulated manner, escaping normal negative feedback cholesterol regulation. The progressive accumulation of foam cells produces the earliest visible lesion of atherosclerosis, the "fatty streak." Over time, foam cells undergo apoptotic and necrotic cell death, releasing their lipid cargo into the extracellular space to form the necrotic, prothrombotic core of mature atheromatous plaques.

Alternate Names:
Foam Cells; Lipid-Laden Macrophage

Foam Cells

Plural form; see *Foam Cell*.

Focal

Limited to one specific area rather than spread widely. A focal finding may involve an image, seizure, infection, injury, or neurologic problem; its location helps define its significance.

Focal Adhesion

A specialized attachment site where a cell connects to its surrounding support material. It helps cells stick, sense physical forces, move, and send signals during growth and tissue repair.

Focal Aware Seizures

Seizures arising from a localized brain network in which awareness is preserved during the event. Symptoms may be motor, sensory, autonomic, cognitive, emotional, or experiential.

Focal Cortical Dysplasia

A spectrum of localized malformations of the cerebral cortex involving abnormal cortical layering, cell types, or both. It can cause focal epilepsy; subtypes are distinguished by tissue findings, and some are associated with drug-resistant seizures.

Alternate Names:
FCD

Focal Dermal Hypoplasia Syndrome

A rare X-linked disorder, usually in females, with thin or absent areas of skin following Blaschko lines and variable abnormalities of limbs, teeth, eyes, hair, and other organs. Management is multidisciplinary and tailored to the findings.

Focal Glomerulosclerosis

Scarring affecting some kidney filters or only parts of affected filters. It can cause protein to leak into urine, swelling, high blood pressure, and gradual loss of kidney function.

Focal Impaired Awareness Seizures

Focal-onset seizures in which awareness is impaired during part or all of the seizure. Automatisms, behavioral arrest, confusion, and postictal amnesia may occur.

Focal Neurological Deficit

Alternate spelling; see *Focal Neurologic Deficits*.

Focal Neurologic Deficits

Loss of a particular function, such as strength, sensation, speech, vision, or coordination, because of a localized problem in the brain, spinal cord, or a nerve. Sudden onset may indicate stroke.

Focal Neuropathy

Damage or irritation affecting one peripheral nerve or a small group of nerves. It may cause pain, tingling, numbness, weakness, or altered movement in the area supplied by those nerves.

Alternate Names:
Mononeuropathy; Isolated Nerve Lesion

Focal Nodular Hyperplasia

A usually harmless overgrowth of liver tissue related to an unusual local blood supply. It often causes no symptoms, is found on imaging, and rarely needs treatment unless its diagnosis is uncertain.

Focal-Onset Seizure

A seizure that begins in one area of the brain. Awareness may remain normal or become impaired, and symptoms depend on the affected area; the seizure may spread and cause whole-body stiffening and jerking.

Focal Sclerosis

Hardening or scarring limited to a particular area of tissue. In the kidney, it may describe scarring of some filters or parts of filters, which can impair filtration and cause protein in urine.

Focal Segmental Glomerular Sclerosis

Alternate form; see *Focal Segmental Glomerulosclerosis*.

Focal Segmental Glomerulosclerosis

A kidney disease or pattern of injury in which scarring affects some kidney filters or parts of them. It can cause protein in the urine, swelling, high blood pressure, or kidney failure; it may be primary or secondary to another condition.

Focal Seizure

A seizure that begins in one area of the brain. It may cause unusual movement, sensation, behavior,

emotion, or awareness and can spread to involve both sides of the brain.

Focused Assessment with Sonography for Trauma

A rapid bedside point-of-care ultrasonographic examination performed in acute trauma resuscitation to screen for free intraperitoneal blood (Morison pouch, splenorenal recess, pelvis) and hemopericardium (subxiphoid view).

Alternate Names:
FAST Exam; Trauma Ultrasound

Focus Words

Words or short phrases used during relaxation or stress-management exercises to direct attention and support calm breathing. They may help coping but are not a treatment for an underlying medical disorder.

FODMAP

An acronym for Fermentable Oligosaccharides, Disaccharides, Monosaccharides, And Polyols—a collection of short-chain dietary carbohydrates and sugar alcohols that are poorly or incompletely absorbed in the human small intestine. Encompasses fructans (found in wheat, rye, onions, garlic), galacto-oligosaccharides (GOS, found in legumes), lactose (dairy), excess fructose (honey, apples), and polyols (sorbitol, mannitol, xylitol). Due to small molecular size, unabsorbed FODMAPs exert an osmotic draw that increases small intestinal water volume, and upon transit to the colon, undergo rapid enzymatic fermentation by resident gut microbiota, generating hydrogen, methane, and short-chain fatty acids. In individuals with visceral hypersensitivity (notably irritable bowel syndrome [IBS]), this luminal distension provokes symptoms of bloating, abdominal pain, flatulence, and altered bowel habits. A short-term low-FODMAP elimination diet followed by systematic reintroduction is an established clinical therapeutic dietary intervention for IBS.

Alternate Names:
FODMAPs; Fermentable Carbohydrates

FODMAP Diet

A short-term eating plan that reduces certain poorly absorbed carbohydrates that can cause gas, bloating, pain, or diarrhea. Foods are gradually reintroduced with professional guidance to identify personal triggers.

FODMAPs

Plural form; see *FODMAP*.

Foetal Acidosis

Excess acidity in fetal blood, usually caused by inadequate oxygen delivery or impaired gas exchange. Fetal heart-rate monitoring and, in selected situations, blood testing help assess its likelihood and severity.

Foetal Alcohol Syndrome

A lifelong condition caused by alcohol exposure before birth, with characteristic facial features, poor growth, and brain-development problems affecting learning, behavior, or coordination. No amount of alcohol is known to be safe during pregnancy.

Foetor Hepaticus

A distinctive, sweet, musty, or breath odor resembling rotten eggs and garlic, caused by the exhalation of volatile dimethyl sulfide and mercaptans that bypass hepatic metabolism due to portosystemic shunting and severe liver failure.

Alternate Names:
Fetor Hepaticus; Breath of the Dead

Foetus

The developing human offspring from the end of the embryonic period, about nine weeks after fertilization, until birth. During this period, organs grow and mature and body functions become more coordinated.

Foix-Alajouanine Syndrome

A subacute necrotizing myelopathy caused by a slow-flow spinal dural arteriovenous fistula (dAVF), resulting in chronic spinal venous hypertension, progressive venous congestion, ischemic myelopathy,

and lower-extremity paraparesis with sphincter impairment.

Alternate Names:
Subacute Necrotic Myelopathy; Spinal Dural AV Fistula Myelopathy

Folate

Vitamin B9, needed for DNA production, cell division, and healthy red blood cells. Adequate folate before and during early pregnancy lowers neural-tube-defect risk; high-dose supplements can correct anemia while nerve damage from vitamin B12 deficiency continues.

Folate Antagonist

A medicine that blocks folate-related processes needed to make DNA. Depending on the drug, it may treat cancer, inflammatory disease, or bacterial infection, but can cause low blood counts, mouth sores, or liver problems.

Folate Deficiency

Too little vitamin B9, caused by poor intake, increased need, malabsorption, alcohol use, or some medicines. It can cause large abnormal red blood cells, anemia, fatigue, sore tongue, and pregnancy complications.

Folate Deficiency Anemia

Anemia caused by too little folate, or vitamin B9. Red blood cells become unusually large and immature, causing fatigue, weakness, pale skin, shortness of breath, or a sore tongue. Blood tests help confirm the cause, and folate replacement is given after vitamin B12 deficiency is considered.

Alternate Names:
Vitamin B9 Deficiency Anemia; Megaloblastic Folate Anemia

Folate-Deficiency Anemia

Alternate spelling; see *Folate Deficiency Anemia*.

Folate Test

A blood test measuring serum or red blood cell folate (vitamin B9) to assess nutritional status and investigate macrocytic anemia; see *Folate*.

Folate Vitamin B9

Alternate name; see *Folate*.

Foley Catheter

A flexible tube placed through the urethra into the bladder to drain urine. A small balloon holds it in place; risks include discomfort, blockage, urinary infection, and urethral injury.

Folic Acid

A manufactured form of vitamin B9 needed for DNA production and healthy blood cells. Supplements prevent many fetal neural-tube defects when taken before conception and treat folate deficiency.

Folic Acid And Birth Defect Prevention

Taking folic acid before conception and during early pregnancy reduces the risk of neural-tube defects, which affect development of the fetal brain and spinal cord. Higher-risk people may need a prescribed dose.

Folic Acid Deficiency Anemia

Alternate name; see *Folate Deficiency Anemia*.

Folic Acid In Diet

Folate occurs naturally in leafy vegetables, beans, citrus fruits, and liver, while folic acid is added to some fortified foods. Intake supports blood formation and fetal development; needs increase during pregnancy.

Folic Acid Supplementation

Use of folic acid, a form of vitamin B9, to reduce neural-tube-defect risk when taken before conception and during early pregnancy or to treat folate deficiency. The amount used depends on the clinical indication and individual risk.

Folic Acid Test

A clinical laboratory blood test measuring serum or red blood cell folate concentrations to evaluate megaloblastic anemia, malnutrition, malabsorption

syndromes, or dietary deficiency.

Alternate Names:
Folate Blood Test

Folie a Deux

A psychiatric syndrome in which a delusional belief or paranoid ideation is transmitted from an individual with an established primary psychotic disorder to one or more emotionally close, dependent individuals who share the delusion.

Alternate Names:
Shared Psychotic Disorder; Shared Delusional Disorder

Folinic Acid

A reduced form of folate used to prevent or treat folate-antagonist toxicity and to support selected chemotherapy regimens.

Alternate Names:
Leucovorin; Calcium Folinate

Follicle

A small sac or organized tissue structure. A hair follicle produces a hair, while an ovarian follicle contains a developing egg; other follicles can occur in glands or lymphatic tissue.

Follicle Stimulating Hormone

Alternate spelling; see *Follicle-Stimulating Hormone*.

Follicle-Stimulating Hormone

A hormone released by the pituitary gland. It supports egg-containing follicle development and estrogen production in females and sperm production in males. Its level varies with age and reproductive stage.

Follicle-Stimulating Hormone Abnormalities

Abnormally high or low FSH levels may reflect altered ovarian or testicular function, pituitary or hypothalamic disease, menopause, pregnancy, medicines, or a changing menstrual cycle. Interpretation requires age, sex, reproductive stage, and related hormone tests.

Follicle-Stimulating Hormone Blood Test

A blood test measuring a hormone involved in ovarian function and sperm production. It helps evaluate infertility, menstrual changes, puberty problems, menopause, testicular or ovarian failure, and pituitary disorders.

Follicular

Relating to a follicle, especially a hair follicle or an ovarian follicle. A follicular skin problem is centered around a hair and may appear as a bump, pustule, plug, or inflamed area.

Follicular Cyst

A usually harmless ovarian cyst that forms when a follicle does not release an egg or does not shrink normally. It often causes no symptoms and disappears within a few menstrual cycles without treatment.

Follicular Fluid

The liquid inside an ovarian follicle surrounding a developing egg. It contains hormones and other substances that support follicle growth and help coordinate ovulation.

Follicular Hyperkeratosis

Excess keratin blocking hair follicles and causing small rough bumps. It commonly occurs with keratosis pilaris and, less often, with nutritional deficiency or other skin conditions.

Follicular Lymphoma

A usually slow-growing cancer of immune cells that often causes painless swelling of lymph nodes. It may involve bone marrow or other organs and can sometimes change into a faster-growing lymphoma.

Follicular Thyroid Carcinoma

A thyroid cancer that begins in follicle-forming cells and can spread through the bloodstream, especially to bone or lungs. Tissue examination is needed to show invasion and distinguish it from a benign growth.

Follicular Unit

A natural group of one or more hair follicles along with nearby skin glands, nerves, and tiny muscles. Hair-transplant procedures may move these units from a fuller area to a thinning area.

Follicular Unit Transplantation

Hair-restoration surgery that moves natural groups of hair follicles from a donor area to thinning or bald areas. Results take months, and possible problems include scarring, infection, and continued hair loss.

Alternate Names:
FUT; Strip Hair Restoration

Folliculitis

An acute superficial or deep inflammatory reaction of the hair follicle, most frequently triggered by infectious microbial pathogens or chemical and physical irritation. Classified etiologically into: bacterial folliculitis, most commonly caused by *Staphylococcus aureus* (superficial folliculitis or Bockhart impetigo, and deep folliculitis progressing to furuncles and carbuncles); "hot tub" folliculitis, caused by *Pseudomonas aeruginosa* contaminating poorly chlorinated heated water; fungal folliculitis, notably *Pityrosporum* (Malassezia) folliculitis (pruritic monomorphic follicular papules and pustules on the upper chest and back) and dermatophytic fungal folliculitis (Majocchi granuloma); viral folliculitis (herpetic folliculitis); and non-infectious variants including folliculitis decalvans, eosinophilic folliculitis (frequently associated with advanced HIV infection), and pseudofolliculitis barbae (mechanical inflammatory foreign-body reaction to ingrown, closely shaved facial hairs in individuals with curly hair). Clinically manifests as crops of small, dome-shaped, erythematous follicular papules or pustules centered on hair shafts, often accompanied by pruritus or tenderness. Diagnosis is primarily clinical, supported by Gram stain, bacterial/fungal culture, or dermoscopy. Mild superficial bacterial cases resolve spontaneously or respond to topical antiseptics (chlorhexidine) or topical antibiotics (mupirocin, clindamycin); widespread, recurrent, or deep-seated folliculitis warrants targeted oral antimicrobials.

Folliculitis Decalvans

A rare inflammatory scalp disorder causing repeated pustules, crusting, hair loss, and permanent scarring. Early dermatologic treatment aims to control inflammation and infection and limit further follicle destruction.

Fomentation

Applying a warm, moist cloth or material to part of the body to soothe pain, relax muscles, or improve comfort. Excessive heat can burn skin.

Fomepizole

An antidote for poisoning with methanol or ethylene glycol. It blocks formation of their toxic breakdown products and may be combined with intensive supportive care and dialysis.

Fomite

A nonliving object or surface that carries an infectious organism and can pass it to a person through contact. Examples include contaminated medical equipment and shared items; transmission requires the organism to survive on the object and reach a person's eyes, nose, mouth, or broken skin.

Fomites

Plural form; see *Fomite*.

Fondaparinux

An injectable anticoagulant that prevents formation or extension of blood clots by blocking activated factor X. It is used for selected clotting disorders and prevention after surgery; bleeding is its main risk.

Fondaparinux Sodium

The sodium salt form of fondaparinux, an injectable medicine that reduces clotting by blocking activated factor X. It treats or prevents selected blood clots but can cause serious bleeding and requires dose adjustment in kidney disease.

Fong Disease

Alternate name; see *Nail-Patella Syndrome*.

Fonofos

A highly poisonous organophosphate insecticide. Exposure can cause sweating, excess saliva, vomiting, small pupils, muscle twitching, breathing difficulty, seizures, or weakness.

Fonsecaea

A group of darkly pigmented fungi that can cause slow-growing skin and soft-tissue infections called chromoblastomycosis. Infection usually follows injury and may produce warty plaques or nodules, especially in tropical regions.

Fontanel

A soft gap between an infant's skull bones that allows the brain and skull to grow and helps the skull mold during birth. Its size and firmness can provide clues about hydration or pressure inside the skull.

Fontanelle

A soft membranous space between an infant's skull bones. Fontanelles allow growth and molding during birth; the front one usually closes during the second year, while the back one closes earlier.

Fontan Procedure

An operation for some children born with only one effective pumping chamber. It directs blood returning from the body to the lungs without a separate pumping chamber, improving circulation but requiring lifelong follow-up for rhythm, heart, liver, clotting, and protein-loss problems.

Alternate Names:
Fontan Operation; Total Cavopulmonary Connection (TCPC)

Food Addiction

A nonformal term for intense cravings or loss of control around eating. It is not a universally accepted diagnosis; related factors include binge-eating disorder, mood, stress, medicines, sleep, and access to food.

Food Additives

Substances added to food to preserve it or change its flavor, color, texture, or stability. Most are safe in approved amounts, but some people may have intolerance or allergy to particular additives.

Food Allergies

Plural form; see *Food Allergy*.

Food Allergy

An immune reaction to a food protein that can cause skin, gastrointestinal, respiratory, or cardiovascular symptoms. Reactions range from localized symptoms to anaphylaxis; common triggers include milk, egg, peanut, tree nuts, fish, shellfish, soy, and wheat.

Foodborne Disease

Illness acquired by eating or drinking material contaminated with germs, toxins, or harmful chemicals. Severity ranges from brief diarrhea to dehydration, organ damage, or life-threatening infection.

Food-Borne Illness

Illness caused by eating food contaminated with bacteria, viruses, parasites, toxins, or chemicals. Symptoms commonly include nausea, vomiting, diarrhea, cramps, and fever; safe handling and cooking help prevent it.

Alternate Names:
Food Poisoning; Acute Alimentary Toxicosis

Food Contamination

The presence of harmful germs, toxins, chemicals, allergens, or foreign materials in food. Contamination can occur during production, storage, preparation, or serving and may cause infection, poisoning, allergic reactions, or injury.

Food Hygiene

Practices that prevent food contamination and foodborne illness, including washing hands, separating raw and cooked foods, cooking thoroughly, chilling promptly, and using safe water.

Food Intolerance

A troublesome reaction to a food that does not involve the immune system. Lactose intolerance is common; symptoms may include gas, bloating, cramps, or diarrhea and depend on the food and amount.

Food Jags

A child's repeated preference for only a few foods or refusal of foods previously accepted. It is common during development but may limit nutrition, growth, or social eating or cause distress.

Food Poisoning

Illness from eating food contaminated with germs, toxins, or harmful chemicals. Nausea, vomiting, diarrhea, abdominal cramps, and fever are common.

Food Protein-Induced Allergic Proctocolitis

A non-IgE-mediated food reaction, usually in an infant, causing inflammation of the lower bowel and visible blood or mucus in otherwise well-appearing stools. Cow's-milk or soy protein is often involved.

Food Protein-Induced Enterocolitis Syndrome

A delayed, non-IgE-mediated food allergy that usually causes repeated vomiting, diarrhea, pallor, lethargy, or dehydration several hours after eating a trigger food. It is most common in infants and young children.

Food Safety

Handling, storing, preparing, and labeling food in ways that prevent germs, toxins, harmful chemicals, and allergens from causing illness.

Food Supplement

A product taken to add nutrients or other substances to the diet, such as vitamins, minerals, herbs, or protein. Supplements can interact with medicines and are not automatically safe or effective.

Foot

The part of the lower limb below the ankle, made of bones, joints, muscles, tendons, ligaments, nerves, and blood vessels. Its shape and arches support standing, balance, shock absorption, and walking.

Foot Abscess

A pocket of pus in the skin or deeper tissues of the foot, usually caused by bacteria entering through a wound or ulcer. It can cause a painful, warm, swollen area; see also *Abscess*.

Foot Cellulitis

A bacterial infection of the skin and tissue beneath it in the foot. The area may become painful, warm, swollen, or discolored; see also *Cellulitis*.

Foot Drop

Difficulty lifting the front of the foot because of weakness in the ankle and foot muscles. It may cause tripping or a high-stepping walk and can result from nerve injury, spinal disease, muscle disease, or stroke.

Alternate Names:
Drop Foot

Foot Fracture

A break in one or more foot bones caused by sudden injury, repeated stress, or weakened bone. Pain, swelling, bruising, and difficulty bearing weight are common; treatment ranges from protection and immobilization to surgery.

Foot Gangrene

Death of tissue in part of the foot, often a toe, usually because blood flow is severely reduced or infection has damaged the tissue. The area may become dark, cold, numb, swollen, or foul-smelling; see also *Gangrene*.

Footling Breech

A breech presentation in which one or both fetal feet lie below the buttocks and present first. It is associated with increased risks of umbilical cord prolapse and entrapment of the after-coming head;

delivery planning depends on gestational age, labor progress, and the applicable clinical protocol.

Alternate Names:
Footling Breech Presentation

Foot Lymphedema

Long-lasting swelling of the foot caused by poor drainage of lymph fluid. It may affect the toes and top of the foot and can make the skin feel tight or become thicker; see also *Lymphedema*.

Foot Osteomyelitis

Infection of one or more bones in the foot, sometimes spreading from a nearby wound or ulcer. It can cause lasting pain, swelling, or tenderness and sometimes fever; see also *Osteomyelitis*.

Foot Pain

Pain in the foot caused by injury, overuse, arthritis, nerve problems, infection, or poor circulation. It may be persistent or accompanied by inability to bear weight, numbness, discoloration, fever, or an open wound.

Foot Pain (Plantar Fasciitis)

Foot pain caused by plantar fasciitis, a disorder of the strong band of tissue supporting the sole. Pain is often felt near the heel and may be worst with the first steps after sleep or rest; see also *Foot Pain*.

FOP

Abbreviation; see *Fibrodysplasia Ossificans Progressiva*.

Foramen

A natural opening or passage through a bone or other body structure, usually allowing a nerve, blood vessel, or other tissue to pass.

Foramen Lacerum

A triangular, irregular aperture in the middle cranial fossa base bounded by the sphenoid, apex of the petrous temporal, and basilar occipital bones, filled with fibrocartilage in life and crossed superiorly by the internal carotid artery as it enters the cavernous sinus.

Foramen of Monro

A paired, crescent-shaped aperture situated between the column of the fornix and the anterior pole of the thalamus connecting each lateral cerebral ventricle with the midline third ventricle, permitting the physiological circulation of cerebrospinal fluid.

Alternate Names:
Interventricular Foramen

Foramen Ovale

An opening between the upper chambers of the fetal heart that directs blood away from the lungs before birth. It usually closes after birth; if it remains open, the condition is called patent foramen ovale.

Foramen Rotundum

A circular bony canal in the greater wing of the sphenoid bone that connects the middle cranial fossa with the pterygopalatine fossa, transmitting the maxillary division of the trigeminal nerve (cranial nerve V2).

Foramen Spinosum

A small, round aperture located posterolateral to the foramen ovale in the greater wing of the sphenoid bone, transmitting the middle meningeal artery, middle meningeal vein, and the nervous spinosus (meningeal branch of CN V3) into the cranial cavity.

Foraminotomy

Surgery that enlarges an opening where a spinal nerve leaves the backbone, relieving pressure caused by arthritis, a disc problem, or other narrowing. Risks include infection, bleeding, nerve injury, and persistent symptoms.

Forbes-Albright Syndrome

A clinical syndrome characterized by hyperprolactinemia, galactorrhea, and amenorrhea in women in the absence of recent pregnancy, classically caused by a prolactin-secreting pituitary adenoma (prolactinoma).

Forced Expiratory Volume

The amount of air forcefully exhaled during a measured time after taking a full breath. The first-second value helps assess narrowed or restricted airways and is interpreted with other lung-test results.

Forced Oscillation Technique

A breathing test in which a device sends gentle pressure waves through the airways while a person breathes normally. It measures how easily air moves and can help assess lung disease when forceful breathing tests are difficult.

Forced Vital Capacity

The total amount of air forcefully exhaled after a person breathes in fully. A low value may occur when the lungs are small or stiff or when airways prevent complete emptying.

Force Plates

Platforms that measure forces beneath the feet during standing, walking, or other movement. Clinicians and researchers use them to assess balance, gait, symmetry, and how weight is distributed.

Forceps

A handheld instrument used to grasp, hold, or move tissue or medical materials. Different designs have smooth or toothed tips and are chosen according to the procedure.

Forceps-Assisted Delivery

A vaginal delivery assisted by placing forceps around the fetal head. It is considered only when the cervix is fully open, the head's position is known, and vaginal birth is judged safe; maternal and newborn injuries can occur.

Forceps Delivery

An assisted vaginal birth in which forceps guide the baby's head out of the birth canal. It may be used for prolonged labor, concerning fetal findings, or inability to push safely; tears and newborn injury are possible.

Forchheimer Spots

Small red spots on the soft palate that may appear around the time a rubella rash begins. They are not specific to rubella and do not confirm the diagnosis.

Alternate Names:
Forchheimer's Spots; Rubella Enanthem

Forcible Intercourse

Sexual intercourse without freely given consent, involving force, threats, coercion, or inability to consent. It is sexual violence and may cause physical injury, pregnancy, sexually transmitted infection, or psychological trauma.

Fordyce Granules

Visible oil glands that appear as tiny, painless white or yellow bumps on the lips, inside the mouth, or genitals, including the penis. They are a common normal variation and are not an infection or sexually transmitted disease.

Alternate Names:
Fordyce Spots; Fordyce's Granules

Fordyce's Angiokeratomas

Small, usually harmless dark-red or purple spots caused by widened tiny blood vessels, commonly on the scrotum or vulva. They may bleed after injury; other lesions can resemble them.

Forearm

The part of the arm between the elbow and wrist, containing the radius and ulna bones, muscles, tendons, nerves, and blood vessels.

Forearm Circumference

The distance around the forearm at a specified point. Measurement can help monitor growth, muscle loss, swelling, nutrition, or changes during treatment and rehabilitation.

Forehead

The part of the face above the eyebrows and in front of the frontal skull bone. It contains skin, muscles, nerves, and blood vessels and helps with facial expression and protection.

Forehead Lift

Cosmetic surgery that raises drooping eyebrows or forehead skin and may reduce wrinkles. Risks include scarring, numbness, asymmetry, hairline changes, bleeding, infection, and nerve injury.

Alternate Names:
Brow Lift

Foreign Body

An object that is not normally part of the body and becomes lodged in tissue or a body passage, such as glass, metal, food, or a splinter. It may cause injury, blockage, infection, or inflammation.

Foreign Body Airway Obstruction

Partial or complete blockage of the breathing passages by an inhaled object or material. Severe choking with inability to speak, cough, or breathe is life-threatening.

Foreign Body Aspiration

Inhalation of an object or food into the airway, especially in young children. Choking, persistent cough, wheezing, noisy breathing, or reduced breath sounds may occur; complete blockage is an emergency.

Foreign-Body Aspiration

Alternate spelling; see *Foreign Body Aspiration*.

Foreign Body in Ear

Alternate name; see *Ear Foreign Body*.

Foreign Body In The Nose

An object lodged in a nasal passage, often in a child. One-sided blockage, foul discharge, bleeding, pain, or difficulty breathing may occur; safe removal prevents tissue damage and infection.

Foreign Body Reaction

Inflammation around material that remains in tissue, such as a splinter, stitch, implant, or device. It may cause a lump, redness, pain, drainage, or scar tissue and can resemble infection.

Forensic

Pertaining to, suitable for, or applied in court proceedings, legal investigations, or the judicial administration of justice. In medical science, forensic medicine (medicolegal practice) encompasses the application of medical, surgical, and scientific knowledge to legal questions, including postmortem examinations (forensic pathology) to determine the cause and manner of death (natural, accidental, suicide, homicide, or undetermined), clinical forensic examinations of living victims of assault, trauma, or toxic exposure, forensic toxicology, forensic odontology, and the rigorous preservation of chain of custody for biological evidence.

Alternate Names:
Forensics; Legal Medicine; Medicolegal

Forensic Anthropology

The examination of human remains, especially bones, for legal investigations. It can help determine whether remains are human, estimate biological characteristics, assess injury, and support identification.

Forensic Autopsy

A specialized post-mortem examination performed under statutory or judicial authority by a forensic pathologist or medical examiner to determine the cause and manner of violent, sudden, suspicious, unnatural, or unattended deaths and preserve legal evidence.

Alternate Names:
Medico-Legal Autopsy; Coroner Post-Mortem

Forensic Autopsy of Blunt Force Trauma

Postmortem examination of injuries caused by blunt impact, including abrasions, contusions, lacerations, fractures, and internal organ damage. Wound patterns, distribution, vitality, and associated evidence help reconstruct the event.

Forensic Autopsy of Sharp Force Injuries

Postmortem examination of incised, stab, chop, or other sharp-force wounds. The examiner documents wound morphology, depth, direction, vital reaction, clothing damage, and associated injuries to help

determine mechanism and manner of death.

Forensic Defense Wounds

Injuries, often on the hands or forearms, that may occur when a person raises or uses the limbs to block an attack. Their location and pattern may be consistent with a defensive action, but they do not by themselves prove that an assault occurred or establish how the injuries were caused.

Alternate Names:
Forensic Defense Injuries

Forensic Evidence

Physical, biological, digital, or documentary material collected and analyzed during a legal investigation. Examples include blood, DNA, fibers, fingerprints, toxicology samples, photographs, and medical records.

Forensic Examination

A structured medical or scientific assessment performed for legal purposes. It may document injuries, collect evidence after assault, assess impairment, examine a death, or analyze a scene or specimen.

Forensic Genetics

The use of DNA testing to identify people, establish biological relationships, or compare biological evidence in legal investigations. Results require proper collection, chain of custody, and expert interpretation.

Forensic Laceration

A torn wound caused by blunt force, usually with irregular bruised edges and tissue strands crossing the wound. These features help distinguish it from a clean cut caused by a sharp object.

Alternate Names:
Blunt Force Tear

Forensic Odontology

The use of dental knowledge in legal investigations. Comparing teeth, dental records, and radiographs can help identify remains and document dental injuries or other evidence.

Forensic Pathology

A branch of pathology that applies medical knowledge to the investigation of deaths with legal or public-safety importance. Forensic pathologists examine the body and consider medical history and the circumstances of death, often including an autopsy, to determine the cause and manner of death.

Forensic Pathology of Firearm Wounds

Examination of firearm-related injuries, including entrance and exit wounds, soot, stippling, bullet paths, projectile effects, clothing damage, and range-of-fire findings, integrated with imaging, scene evidence, and recovered bullets.

Forensic Pathology of Thermal Injuries

Examination of burns and other heat-related injuries, including burn depth and distribution, soot or airway injury, heat artifacts, and evidence of vital reaction. Findings are interpreted with scene information and toxicology.

Forensic Psychiatry

A subspecialty of psychiatry applying clinical and scientific expertise to legal questions in civil, criminal, correctional, regulatory, and administrative settings. It includes psychiatric assessments related to competence to stand trial, criminal responsibility, decision-making capacity, and risk, as well as consultation and research at the intersection of mental health and law.

Forensic Radiography

The use of X-rays, computed tomography, magnetic resonance imaging, or other imaging in legal investigations. It can identify people, document injuries, locate objects, assess trauma, and support death investigations.

Forensics

Plural form; see *Forensic*.

Forensic Toxicology

The testing of blood, urine, hair, tissue, or other specimens for medicines, alcohol, drugs, poisons, and their breakdown products to assess possible

roles in illness, impairment, poisoning, or death.

Forensic Toxicology Screen

An initial laboratory test of biological samples for medicines, alcohol, drugs, poisons, or their breakdown products. A positive screen usually needs confirmation and measurement before legal or medical conclusions are made.

Foreskin

The fold of skin covering and protecting the head of the penis. It normally becomes retractable over time; forceful retraction can cause pain, tearing, or scarring.

Alternate Names:
Prepuce; Penile Prepuce

Formaldehyde

A strong-smelling chemical used in manufacturing and tissue preservation. It can irritate the eyes, skin, and airways, cause allergic reactions, and increase cancer risk with substantial or long-term exposure.

Formalin

A water-based solution of formaldehyde used to preserve tissue for laboratory examination. It can irritate or burn the skin, eyes, and airways; laboratory handling uses ventilation and protective equipment.

Formalin-Fixed Paraffin-Embedded Tissue

Tissue preserved in formalin, processed, and embedded in wax so thin sections can be examined. These blocks support microscopic, protein, and many genetic tests, although preservation can alter some results.

Formate

A salt or ester of formic acid. In medicine, formate is important because it is a toxic breakdown product of methanol and can contribute to severe acidosis and vision loss after poisoning.

Formed Elements Of Blood

The cells and cell fragments suspended in blood: red blood cells carry oxygen, white blood cells help defend against infection, and platelets help form clots and stop bleeding.

Formetanate

A carbamate insecticide that can poison the nervous system by disrupting acetylcholine breakdown. Exposure may cause sweating, vomiting, small pupils, muscle weakness, breathing difficulty, or seizures.

Formication

The feeling that insects are crawling on or under the skin when none are present. It may occur with nerve disease, menopause, substance withdrawal, medicines, or psychiatric illness; persistent symptoms can be associated with an underlying condition.

Formoterol Fumarate

A long-acting beta-2 agonist that relaxes airway muscle and helps prevent bronchoconstriction. It is used with an inhaled corticosteroid for asthma and with other inhaled medicines for chronic obstructive pulmonary disease. In asthma, an inhaled corticosteroid-formoterol combination can serve as both maintenance and reliever therapy in selected regimens; formoterol alone is not an asthma reliever.

Formothion

An organophosphate insecticide that can poison the nervous system. Exposure may cause sweating, excess saliva, vomiting, muscle twitching, breathing difficulty, seizures, or weakness; severe poisoning can be fatal.

Formparanate

A carbamate pesticide. Significant exposure can cause cholinergic poisoning, with excess saliva, sweating, tearing, vomiting, small pupils, muscle weakness, and breathing problems; suspected poisoning is an emergency.

Formulae

The plural of formula. In healthcare, the word

may mean mathematical equations, medicine formulations, or prepared nutritional products such as infant formula.

Formula Feed

Prepared infant nutrition given by bottle, cup, or feeding tube when breast milk is unavailable, insufficient, or not chosen. Formulas and preparation methods vary with infant age and medical needs.

Formula Feeding

Feeding an infant with commercially prepared formula instead of or in addition to breast milk. Safe preparation, clean equipment, correct dilution, and age-appropriate amounts help prevent infection, dehydration, and poor nutrition.

Formulary

A list of medicines approved or preferred by a health system, insurer, or institution. It may show coverage, restrictions, alternatives, and requirements for approval, but does not replace a clinician's prescribing judgment.

Fornix

A recess or arch-shaped structure. In the eye, the conjunctival fornix is the fold where the eyelid lining joins the surface covering the eyeball; the term also describes parts of the brain and vagina.

Forrest Classification

A standardized, internationally recognized endoscopic classification system used to stratify peptic ulcer hemorrhage into risk categories for rebleeding and determine the necessity of endoscopic hemostasis. Subdivided into active spurting hemorrhage (Ia), active oozing (Ib), visible non-bleeding vessel (IIa), adherent clot (IIb), pigmented flat spot (IIc), and clean-based ulcer (III).

Alternate Names:
Forrest Endoscopic Bleeding Criteria; Forrest Staging

Forrester Classification

A system that groups people with severe heart failure or shock according to blood flow and congestion. "Warm" means adequate flow and "cold" reduced flow; "dry" means little congestion and "wet" significant congestion, helping guide treatment.

Alternate Names:
Forrester Hemodynamic Subsets

Fortification

Adding vitamins or minerals to foods to improve nutritional intake and prevent deficiency. Examples include iodine in salt, vitamin D in some dairy products, and folic acid in many grain products.

Fortified Wine

Wine with added distilled alcohol, giving it a higher alcohol content than ordinary wine. Excess use can cause intoxication, dependence, liver disease, injuries, and interactions with medicines.

Fosaprepitant Dimeglumine

An intravenous medicine converted to aprepitant that blocks a brain signaling pathway involved in nausea and vomiting. It helps prevent chemotherapy-related sickness and can interact with other medicines.

Foscarnet Sodium

An antiviral medicine used for selected serious or resistant cytomegalovirus and herpesvirus infections. It can damage the kidneys and disturb blood salts; treatment commonly includes hydration and laboratory monitoring.

Fosfomycin

An antibiotic that blocks an early step in bacterial cell-wall production. It is used for selected urinary or difficult-to-treat infections; diarrhea, allergic reactions, and resistance can occur.

Fosinopril

An angiotensin-converting enzyme inhibitor used for high blood pressure and some forms of heart failure. It relaxes blood vessels and reduces fluid strain; cough, high potassium, kidney problems, or swelling can occur.

Fossa

A shallow hollow or depression in a bone or other body structure. It may provide space for a joint, muscle, blood vessel, nerve, gland, or part of an organ.

Fossa Navicularis

An expanded, boat-shaped anatomical dilation of the penile urethra situated within the glans penis immediately proximal to the external urethral meatus, lined by non-keratinized stratified squamous epithelium.

Alternate Names:
Navicular Fossa of the Urethra

Fossula

A small pit or shallow depression in an anatomical structure. Examples include small depressions in a bone or on a tooth; the term describes shape and location rather than a disease.

Foster Kennedy Syndrome

A neuro-ophthalmic syndrome characterized by ipsilateral optic atrophy and anosmia (due to direct compression of the optic nerve and olfactory tract by an anterior cranial fossa tumor, such as an olfactory groove meningioma) and contralateral papilledema (due to raised intracranial pressure).

Alternate Names:
Kennedy Syndrome; Gowers-Paton-Kennedy Syndrome

Fotemustine

A chemotherapy medicine that can cross into the brain and is used in some countries for selected advanced cancers. It can suppress bone marrow, increasing the risk of infection and bleeding.

Fothergill Sign

A physical examination test used to differentiate an abdominal wall mass (such as a rectus sheath hematoma) from an intra-abdominal mass; a hematoma or mass within the rectus sheath does not cross the midline and remains fixed and palpable during contraction of the rectus abdominis muscles when the patient raises their head.

Alternate Names:
Fothergill's Sign; Rectus Sheath Hematoma Sign

Foul Breath

Alternate name; see *Halitosis*.

Foul-Smelling Stools

Strongly odorous feces that may result from diet, infection, bleeding, malabsorption, altered gut bacteria, or rapid transit; persistent change with weight loss or diarrhea warrants review.

Found Dead

A circumstance in which a person is discovered deceased without the death having been observed. Medical or forensic examination may determine identity, timing, cause, and manner of death.

Fourchette

The small fold of tissue at the back of the opening of the vulva, where the inner labial folds meet. It may stretch or tear during childbirth or sexual injury.

Four-Dimensional Ultrasound

Three-dimensional ultrasound shown as movement over time, creating a live view. It may help assess fetal anatomy or other structures, but image quality and diagnostic value depend on the examination and equipment.

Fourier Analysis

A mathematical method that separates a complex signal into simpler repeating frequencies. It is used in medical imaging, heart and brain signal analysis, and other measurements to identify patterns.

Fournier Disease

Alternate name; see *Fournier Gangrene*.

Fournier Gangrene

A rapidly spreading, life-threatening infection that destroys tissue around the genitals, perineum, or anus. It may cause severe pain, swelling, fever, skin discoloration, or systemic illness.

Alternate Names:

Fournier's Gangrene; Fournier's Gangrene

Fourth-Degree Tear

A severe childbirth tear extending from the vaginal area through the anal sphincter and into the rectal lining. It can cause pain, infection, and later bowel-control problems; treatment involves surgical repair and follow-up.

Fourth Finger

The ring finger, located between the middle finger and little finger. It contains bones, joints, tendons, nerves, blood vessels, and skin that support movement and grasping.

Fourth Heart Sound

A low-pitched sound heard in late diastole, just before the first heart sound, when atrial contraction fills the ventricle. It is commonly associated with reduced ventricular compliance, although increased late filling can produce it in other settings.

Fourth Stage Of Labor

The first hours after the placenta is delivered, when the birthing person is closely observed for heavy bleeding, abnormal blood pressure, poor uterine contraction, pain, and other early complications.

Fourth Venereal Disease

Alternate name; see *Lymphogranuloma Venereum*.

Fovea

A tiny central depression in the retina responsible for the sharpest detailed and color vision. Damage to it can impair reading, face recognition, and central vision.

Fovea Centralis

Alternate name; see *Fovea*.

Foville Syndrome

An inferior medial pontine stroke syndrome typically resulting from occlusion of paramedian perforating branches of the basilar artery. Characterized by ipsilateral facial paralysis (cranial nerve VII), ipsilateral horizontal conjugate gaze palsy (abducens nucleus or PPRF), and contralateral hemiplegia of the upper and lower extremities (corticospinal tract).

Alternate Names:
Foville Inferior Pontine Syndrome

Fowler Position

A bed position in which a person lies on the back with the head of the bed raised, often 45 to 90 degrees from horizontal. High Fowler position is near upright, at about 90 degrees. The exact angle range can vary by clinical convention.

Fowler's Syndrome

A rare cause of persistent difficulty emptying the bladder, usually in young women, related to abnormal relaxation of the urethral sphincter. Diagnostic evaluation excludes blockage and nerve disease; treatment may involve drainage or neuromodulation.

Fox-Fordyce Disease

A rare chronic skin disorder caused by blocked and inflamed sweat glands. It produces intensely itchy small bumps, commonly in the armpits, pubic region, or around the nipples.

Foxglove Poisoning

Poisoning from foxglove plants or medicines containing cardiac glycosides. It can cause nausea, vomiting, confusion, visual changes, dangerously slow or irregular heart rhythms, or cardiac arrest.

Fractional Excretion Of Sodium

The percentage of filtered sodium leaving the body in urine. It can help assess kidney function and distinguish reduced kidney blood flow from some tubular injuries, but diuretics and other illnesses can make it misleading.

Fractional Excretion of Urea

The percentage of filtered urea excreted in urine. It can support assessment of kidney blood flow when diuretics affect sodium testing, but infection, bleeding, nutrition, and chronic kidney disease also influ-

ence the result.

Alternate Names:
FEUrea; Urinary Urea Excretion Index

Fractional Exhaled Nitric Oxide

A breath test that estimates type 2, often eosinophilic, airway inflammation. The result is interpreted with symptoms, age, treatment, and other clinical findings.

Alternate Names:
Exhaled NO Marker

Fractional Flow Reserve

A pressure measurement made during coronary angiography to determine whether a narrowed heart artery significantly limits blood flow. The result helps guide decisions about stents or medical treatment.

Fractional IPV

A smaller-than-usual dose of inactivated polio vaccine given into the skin rather than the muscle. When used in an approved schedule, it helps protect against polio; the number of doses and timing follow local immunization guidance.

Fractional Shortening

An echocardiographic measurement of left ventricular systolic contractile function representing the percentage change in the left ventricular internal diameter between end-diastole (LVIDd) and end-systole (LVIDs). Calculated as the difference divided by end-diastolic diameter multiplied by 100 percent, with normal values typically ranging from 25 to 45 percent.

Alternate Names:
LV Fractional Shortening; FS

Fracture

A structural discontinuity, crack, or complete disruption in the mechanical continuity of a bone or cartilage, resulting from mechanical forces that exceed the bone's structural strength. Classified by relationship to external skin into closed (simple) and open (compound, communicating with the external environment with elevated infection and osteomyelitis risks); by mechanical configuration into transverse, oblique, spiral, comminuted (more than two fragments), segmental, avulsion, impacted, or greenstick/torus (incomplete fractures in pediatric bone); and by underlying bone integrity into traumatic fractures, stress fractures (microfractures from repetitive submaximal loading), and pathologic fractures (occurring in bone weakened by pre-existing disease such as osteoporosis, osteolytic metastases, or multiple myeloma). In children, fractures involving the cartilaginous growth plate are classified by the Salter-Harris system (types I–V). Clinical features include acute pain, localized tenderness, swelling, ecchymosis, deformity, crepitus, and functional loss. Management centers on the "4 Rs": resuscitation, reduction (closed or open reduction), retention/stabilization (casting, splinting, external fixation, or internal fixation [ORIF]), and rehabilitation.

Alternate Names:
Fractures; Bone Fracture

Fractured Clavicle In The Newborn

A broken collarbone in a newborn, usually related to birth stress. The baby may move one arm less or cry when handled; most heal well with gentle support and follow-up.

Fractured Elbow

A break involving one of the bones forming the elbow. It can cause pain, swelling, deformity, and limited movement and may injure nearby nerves or blood vessels.

Fractured Ilium

A break in the broad upper part of the pelvic bone, usually from major trauma or weakened bone. It may cause severe pain and can accompany injury to pelvic organs or blood vessels.

Fracture Displacement

Movement of broken bone pieces out of their normal alignment, including sideways shift, angling, shortening, or rotation. The need for reduction or surgery depends on the bone, joint involvement, age, and function.

Fractured Nose

A break in the nasal bones or supporting cartilage, usually after a blow. Pain, swelling, bleeding, and deformity may occur; a collection of blood inside the septum can damage cartilage.

Alternate Names:
Nasal Bone Fracture

Fractured Rib

A break in one or more ribs, usually from injury or forceful coughing. Sharp pain worsens with breathing or movement; significant trauma can also cause lung collapse, bleeding, or injury to nearby organs.

Alternate Names:
Costal Fracture; Broken Ribs

Fracture Fixation

Stabilization of a broken bone with a cast, splint, plate, screw, nail, wire, or external frame. The goal is to maintain alignment while the bone heals and, when possible, preserve movement.

Fracture-Fixation Device

A plate, screw, rod, pin, wire, or external frame used to hold broken bone pieces in alignment during healing. Choice depends on the fracture, bone quality, soft-tissue injury, and expected movement.

Fracture Liaison Service

A coordinated healthcare program for people with fragility fractures. It evaluates bone strength and underlying causes, arranges treatment and fall prevention, and follows patients to reduce future fractures.

Fracture Malunion

Healing of a broken bone in an incorrect position, such as with angling, shortening, or rotation. It may cause deformity, pain, weakness, altered movement, or abnormal stress on nearby joints.

Fracture Nonunion

Failure of a broken bone to heal within the expected time, with no continuing progress toward healing. Pain, movement at the fracture site, or persistent weakness may occur, and causes include poor blood supply, infection, instability, and smoking.

Fracture Of The Temporal Bone

A break in a skull bone containing parts of the ear and nearby nerves and blood vessels. It may cause hearing loss, dizziness, facial weakness, bleeding, or leakage of brain fluid.

Fracture Prevention

Measures that lower the chance of broken bones, including treating osteoporosis, improving strength and balance, preventing falls, correcting vitamin or mineral deficiency, and reviewing medicines that increase risk.

Fracture Reduction

The realignment of broken bone fragments back into normal anatomical position, performed either non-surgically (closed reduction) or surgically (open reduction); see *Closed Reduction Of A Fractured Bone* and *Open Reduction And Internal Fixation*.

Fractures

Plural form; see *Fracture*.

Fragile X-Associated Tremor/Ataxia Syndrome

A late-onset progressive neurodegenerative disorder affecting premutation carriers (55 to 200 CGG repeats) of the *FMR1* gene, typically manifesting in men older than fifty years. Characterized by progressive intention tremor, cerebellar gait ataxia, parkinsonism, cognitive executive decline, and symmetric hyperintensities of the middle cerebellar peduncles ("MCP sign") on T2-weighted MRI.

Alternate Names:
FXTAS

Fragile X Syndrome

An X-linked inherited condition caused by a CGG-repeat expansion in the *FMR1* gene. It can affect learning, speech, behavior, social development, and physical features and is a common inherited cause of intellectual disability; expression varies because of repeat size, methylation, and sex.

FRAIL Scale

A brief questionnaire assessing fatigue, ability to climb stairs, walking ability, illness burden, and unintentional weight loss. It screens for frailty risk but does not replace a complete medical and functional assessment.

Frailty

A state of reduced physical reserve that makes an older or seriously ill person more vulnerable to falls, infection, hospitalization, disability, and other stress. Signs include weakness, slow walking, exhaustion, inactivity, and unintentional weight loss.

Frambesia

Alternate name; see *Yaws*.

Framboesia

Alternate spelling; see *Yaws*.

Frameshift Mutation

A genetic change caused by inserting or deleting DNA bases in numbers that are not multiples of three. This shifts how the genetic code is read and often produces a severely altered or nonworking protein.

Framycetin

An aminoglycoside antibiotic applied to selected bacterial skin, ear, or eye infections. It can cause local allergy or irritation; prolonged or extensive use may allow absorption and antibiotic-related toxicity.

Francisella

A group of small bacteria that includes Francisella tularensis, which causes tularemia. People can acquire infection through ticks, animals, contaminated water, food, or inhaled particles.

Francisellaceae

A family of small bacteria that includes Francisella species. Some cause tularemia or related infections in animals and people; disease type depends on the species and route of exposure.

Francisella Tularensis

A bacterium that causes tularemia, usually acquired through ticks, deer flies, infected animals, contaminated water or food, or inhalation. It can cause fever, an ulcer with swollen lymph nodes, pneumonia, or severe systemic illness.

Francois Dyscephaly Syndrome

Alternate name; see *Hallermann's Syndrome*.

Frank Breech

The most common breech presentation (accounting for 50–70% of all breech births), in which the fetus is positioned with hips flexed and knees extended so that the feet lie near the head and the buttocks present first to the birth canal. Compared to complete or footling breech, it has the lowest risk of umbilical cord prolapse.

Alternate Names:
Extended breech; Frank breech presentation.

Frank Haemoptysis

Alternate form; see *Haemoptysis*.

Frank Sign

A diagonal crease across the earlobe, sometimes called diagonal earlobe crease. It has been studied for a possible association with coronary artery disease, but its diagnostic accuracy is limited.

Alternate Names:
Frank's Sign; Diagonal Earlobe Crease

Frank-Starling Law

Within limits, greater filling of the heart's main pumping chambers stretches heart muscle and increases the force of contraction and the amount of blood pumped. This helps the heart match its output to the blood returning to it; excessive filling does not keep increasing output.

Alternate Names:
Starling Law of the Heart; Heterometric Autoregulation

Frank-Starling Mechanism

The heart normally contracts more strongly when

its chambers fill with more blood, up to a limit. This helps match the amount pumped with the amount returning to the heart.

Fraser Syndrome

A rare congenital malformation syndrome, usually inherited in an autosomal recessive pattern, characterized by cryptophthalmos (skin covering part or all of an eye), syndactyly, and abnormalities of the urinary or genital tract. Respiratory, ear, nose, and skeletal anomalies may also occur. The features and severity vary, and some affected pregnancies end in fetal or neonatal death.

Alternate Names:
Cryptophthalmos Syndrome; Cryptophthalmos-Syndactyly Syndrome

Frasier Syndrome

A rare inherited disorder caused by changes in the WT1 gene. It can cause abnormal sexual development, progressive kidney disease, and increased risk of tumors in the gonads.

Fraternal Twins

Twins formed when two separate eggs are fertilized by two separate sperm. They are genetically like ordinary siblings and may be the same or different sex.

FRAXA

Alternate genetic name; see *Fragile X Syndrome*.

FRAX Tool

A calculator estimating a person's ten-year probability of a major osteoporosis-related fracture or hip fracture. It uses factors such as age, sex, bone density, previous fracture, and other risks and supports treatment decisions.

Alternate Names:
FRAX Fracture-Risk Calculator

Freckle

A small, flat, light brown or tan spot that develops on sun-exposed areas of the skin, such as the face, neck, and arms. Freckles are caused by an increased production of melanin pigment by normal skin cells in response to ultraviolet (UV) sunlight exposure, and they are particularly common in fair-skinned individuals with red or blond hair.

Alternate Names:
Freckles; Ephelis; Ephelides

Freckles

Plural form; see *Freckle*.

Free Fragment

A piece of spinal-disc material that has broken away from the main disc and may press on a nearby nerve. It can cause back or leg pain, numbness, weakness, or bladder and bowel problems.

Alternate Names:
Sequestered Disc Fragment; Extruded Herniated Fragment

Free Radical

A highly reactive molecule with an unpaired electron. The body makes some during normal metabolism, while excessive amounts can damage cell membranes, proteins, and DNA as part of oxidative stress.

Free Radical Injury

Cell damage caused by free radicals, highly reactive molecules that can alter cell-membrane fats, proteins, and DNA. It occurs when radical production exceeds the cell's antioxidant defenses and can contribute to tissue damage during inflammation or restoration of blood flow after ischemia.

Free T4 Test

A blood test measuring unbound thyroxine, the thyroid hormone available to tissues. It is usually interpreted with thyroid-stimulating hormone to assess overactive or underactive thyroid function and treatment response.

Free Thyroxine Index

A calculated estimate of the thyroid hormone available to tissues, using total thyroxine and a measure of hormone binding. It can help assess thyroid function when binding-protein levels affect total

hormone results.

Free Tissue Transfer

Microsurgical transplantation of tissue, such as skin, fat, muscle, bone, or a combination, from one part of the body to another. The transferred tissue is reconnected to local blood vessels, and sometimes nerves, to reconstruct a complex defect after trauma, cancer treatment, burns, or congenital difference.

Free Water Clearance

A kidney measurement showing whether urine contains more or less water than blood plasma. Positive values indicate excretion of dilute urine; negative values indicate water retention and concentrated urine.

Freeze Drying

A preservation process that freezes material and removes ice under low pressure. It helps preserve medicines, vaccines, biological samples, and foods while limiting damage from heat and moisture.

Freezing

Exposure to very low temperature that can freeze tissue, cause frostbite, or dangerously lower body temperature. The term also describes preserving food, medicines, or samples by storing them at low temperature.

Freiberg Disease

An idiopathic avascular necrosis (osteochondrosis) affecting the head of a metatarsal bone (most commonly the second metatarsal head), typically occurring in adolescent and young adult females, presenting with forefoot pain and stiffness exacerbated by weight-bearing.

Alternate Names:
Freiberg Infraction; Metatarsal Head Osteochondrosis

Fremitus

A vibration felt or heard through body tissues. During a chest examination, transmitted voice vibrations can change with fluid, air, or solid tissue in or around the lungs.

French Disease

An old name for syphilis, a sexually transmitted infection caused by Treponema pallidum. Untreated infection can progress from sores to widespread disease and later damage the brain, nerves, heart, or other organs.

Frenectomy

A procedure that removes or releases a frenulum, a fold of tissue that may restrict tongue movement, pull on the gums, separate teeth, or interfere with dentures. Bleeding, infection, and scarring are possible.

Frenulum

A fold of skin or mucous membrane that anchors a body part and limits its movement. Examples include the tongue fold, lip folds, and penile frenulum.

Frenulum Breve

An abnormally short penile frenulum that may cause pain, tearing, or bleeding during erection or sexual activity. Treatment depends on symptoms and may include observation or a minor surgical procedure.

Frenum

Alternate name; see *Frenulum*.

Frequency

Urinating more often than usual, sometimes with only small amounts passed. It differs from producing a large total urine volume and may result from infection, pregnancy, diabetes, medicines, or bladder disorders.

Frequency Of Urination

Alternate name; see *Frequency*.

Frequency Range

The lowest to highest sound or signal frequencies that a device can detect, produce, or amplify effectively. In hearing care, it helps describe which pitches a hearing aid can process.

Frequency Response

How strongly a device or body system responds to different sound or signal frequencies. In a hearing aid, it describes the amount of amplification provided for low, middle, and high pitches.

Frequent Bowel Movements

Passing stool more often than is usual for a person. Causes include diet, infection, medicines, inflammation, poor absorption, or functional bowel disorders; blood, fever, dehydration, or weight loss may accompany more serious causes.

Frequent Or Urgent Urination

Urinating often or having sudden urges that are difficult to postpone. Infection, bladder irritation, diabetes, pregnancy, medicines, obstruction, or overactive bladder can cause these symptoms.

Frequent Urination

Alternate name; see *Frequency*.

Fresh Frozen Plasma

Plasma separated from whole blood or collected by apheresis and frozen within the specified time after collection, usually 8 hours. It contains coagulation factors and other plasma proteins and is transfused to replace multiple deficient factors.

Alternate Names:
FFP

Fresh Specimen

A recently collected biological sample tested promptly or preserved correctly before changes affect its cells, organisms, chemistry, or diagnostic accuracy.

Frey'S Syndrome

Alternate spelling; see *Frey Syndrome*.

Frey Syndrome

An abnormal gustatory sweating and facial flushing over the parotid and preauricular region occurring in response to mastication or tasting food, caused by aberrant misdirected regeneration of severed parasympathetic secretomotor fibers of the auriculotemporal nerve into sympathetic sweat glands following parotid gland surgery or trauma.

Alternate Names:
Auriculotemporal Syndrome; Gustatory Sweating

Friable

Describes tissue that is unusually soft, fragile, and easily torn. Friable tissue may bleed readily when touched and can occur with inflammation, infection, cancer, or poor healing.

Friction

Rubbing between surfaces. Skin friction can cause irritation, blisters, or sores; reducing moisture, pressure, and rubbing helps prevent injury.

Friction Blisters

Fluid-filled blisters caused by repeated rubbing or pressure, commonly on the feet or hands. Reduced friction and wound cleanliness support healing; extensive, infected, or recurrent blisters may have complications.

Friedlander Pneumonia

An older name for pneumonia caused by *Klebsiella pneumoniae*. It can cause fever, cough, chest pain, and thick, blood-tinged sputum, especially in people with underlying illness; the organism can also cause other types of infection.

Friedman Curve

An older graph describing cervical opening over time during labor. Modern labor care recognizes wider normal variation and does not use this historical curve alone to diagnose slow labor or decide on intervention.

Friedreich Ataxia

An inherited disorder that progressively damages nerves and coordination. It can cause unsteady walking, weakness, reduced sensation, spinal curvature, heart muscle disease, and sometimes diabetes.

Friedreich's Ataxia

Alternate spelling; see *Friedreich Ataxia*.

Friedreichs Ataxia Syndrome

Alternate name; see *Friedreich Ataxia*.

Froin Syndrome

The triad of clear xanthochromia, elevated protein content, and rapid spontaneous clotting of cerebrospinal fluid (CSF) obtained below a complete anatomical obstruction of the spinal subarachnoid space (e.g., from a compressive spinal cord tumor or severe spinal stenosis).

Alternate Names:
Froin's Syndrome; Spinal Subarachnoid Blockade Syndrome

Froment Sign

A clinical sign of ulnar nerve palsy; when attempting to firmly pinch a piece of paper between the thumb and index finger, paralysis of the adductor pollicis forces the patient to compensate by flexing the interphalangeal joint of the thumb using the flexor pollicis longus (innervated by the anterior interosseous nerve).

Alternate Names:
Froment's Paper Sign; Ulnar Pinch Sign

Frontal

Relating to the forehead, frontal skull bone, or frontal lobe of the brain. The frontal lobe helps control voluntary movement, planning, attention, speech, behavior, and decision-making.

Frontal Bone

The skull bone forming the forehead, roof of the eye sockets, and part of the nasal region. It contains the frontal sinuses and protects the front of the brain.

Frontal Bossing

An unusually prominent forehead caused by forward bulging of the frontal skull bones. It may be familial or associated with bone disease, excess pressure in the skull, or skeletal disorders.

Frontalis Suspension

An operation connecting the upper eyelid to the forehead muscle with a sling to lift a drooping eyelid. It is used when the eyelid-lifting muscle is weak, especially in congenital or childhood ptosis.

Frontal Lobe

The front portion of the brain's outer layer. It helps control movement, planning, attention, judgment, behavior, personality, and speech production in the language-dominant hemisphere.

Frontal Lobe Disorder

A condition affecting brain areas involved in planning, judgment, movement, attention, speech, and behavior. Causes include stroke, injury, tumor, dementia, infection, or other neurologic disease.

Frontal Lobe Epilepsy

Epilepsy caused by seizures beginning in the frontal lobe. Episodes may involve sudden movements, unusual behavior, impaired awareness, or events during sleep and can be difficult to distinguish from sleep disorders.

Alternate Names:
FLE; Frontal Lobe Epilepsy Syndrome

Frontal Lobe Seizures

Seizures beginning in the front part of the brain, often causing brief unusual movements, behaviors, sensations, speech changes, or impaired awareness. Symptoms depend on the exact brain area involved.

Alternate Names:
Frontal Lobe Ictal Episodes

Frontal Lobe Syndrome

A clinical neuropsychiatric disorder resulting from traumatic, ischemic, or neurodegenerative injury to the frontal lobes, manifesting as executive dysfunction, behavioral disinhibition, apathy, abulia, impaired social judgment, utilization behavior, and loss of emotional control.

Alternate Names:
Frontal Dysexecutive Syndrome

Frontal Sinus

An air-filled cavity within the frontal skull bone above the eye. It connects with the nasal passages and can become inflamed or blocked during sinusitis.

Frontal Sinusitis

Inflammation of the air-filled cavities above the eyes, usually from a viral infection or blocked drainage. It can cause forehead pain, congestion, and discharge; severe headache, eye swelling, fever, confusion, or neurologic symptoms may indicate complications.

Frontotemporal Dementia

A group of progressive brain disorders affecting the frontal and temporal lobes. Early changes often involve personality, behavior, judgment, language, or movement rather than memory alone.

Alternate Names:
FTD; Pick Complex; Behavioral Variant FTD

Frontotemporal Lobar Degeneration

Progressive loss of nerve cells in the frontal and temporal brain regions. It can cause early changes in behavior, personality, language, judgment, or movement and may occur at a relatively young age.

Frostbite

A freezing injury to the skin and deeper tissues that can cause numbness, pale or waxy skin, swelling, blisters, and tissue death.

Frotteuristic Disorder

A mental disorder involving persistent sexual arousal from touching or rubbing against a person without consent, with clinically significant distress or impairment or acting on the urges. Nonconsensual touching is sexual assault.

Frozen Section

A rapid tissue examination performed during surgery. A specimen is frozen, cut into thin slices, and examined to provide immediate information about a lesion or surgical margin, although permanent sections are often more accurate.

Frozen Shoulder

A painful condition in which the shoulder capsule tightens, progressively limiting movement. The primary form is idiopathic; secondary cases are associated with conditions such as diabetes or thyroid disease, or prolonged immobility. It often improves slowly over months or years.

Alternate Names:
Adhesive Capsulitis; Periarthritis of Shoulder

Fructosamine

A blood measurement of sugar attached to blood proteins, reflecting average blood glucose over roughly the previous two to three weeks. It can help when the longer-term hemoglobin A1c test is unreliable.

Fructose

A natural sugar found in fruit, honey, some vegetables, and many sweetened foods. It is processed mainly by the liver; poor absorption can cause gas, bloating, cramps, or diarrhea after eating it.

Alternate Names:
Fruit Sugar; Levulose

Fructose-1,6-Bisphosphatase Deficiency

An inherited disorder of gluconeogenesis caused by deficient fructose-1,6-bisphosphatase. Fasting or illness can lead to low blood glucose, lactic acidosis, ketosis, vomiting, and marked weakness.

Fructose Intolerance

An ambiguous term used for two distinct disorders. Hereditary fructose intolerance is an inherited aldolase B deficiency that can cause hypoglycemia and liver injury after fructose exposure; fructose malabsorption is incomplete intestinal absorption that can cause gas, bloating, pain, or diarrhea.

Fructose Malabsorption

Incomplete absorption of fructose in the small intestine. Unabsorbed sugar is fermented by bacteria and can cause gas, bloating, cramps, or diarrhea; reducing personal dietary triggers may help.

Fructose Metabolism

The body's processing of fructose, mainly in the liver, into substances used for energy or stored. Rare enzyme defects can cause harmless fructose in urine or serious low blood sugar and liver injury after intake.

Fruity Breath

A sweet, acetone-like breath odor caused by ketones. In someone with diabetes, especially with high glucose, vomiting, abdominal pain, deep breathing, or confusion, it may signal life-threatening ketoacidosis.

Frustration

An emotional response to blocked goals, unmet needs, or difficult circumstances. It may cause irritability, anger, distress, withdrawal, or behavior changes and becomes clinically important when persistent or impairing.

Fryns Syndrome

A rare inherited condition present from birth, often involving a hole in the diaphragm, characteristic facial features, and abnormal fingers or toes. Brain, heart, kidney, or genital abnormalities may also occur.

FSH

Abbreviation; see *Follicle-Stimulating Hormone*.

Ft.

An abbreviation for foot or feet, a length of 12 inches or about 30.48 centimeters. In medical records, context distinguishes it from other abbreviations.

FTA-ABS Blood Test

A blood test detecting antibodies against Treponema pallidum, the bacterium that causes syphilis. It supports diagnosis but often stays positive after treatment and cannot by itself show whether infection is active.

FTA-ABS Test

Alternate name; see *FTA-ABS Blood Test*.

Fuchs' Dystrophy

A usually inherited disease in which cells lining the inside of the cornea gradually stop removing fluid. The cornea can swell and become cloudy, causing blurred vision, glare, or light sensitivity, often worse in the morning. It usually affects both eyes; advanced disease can cause painful blisters and vision loss.

Alternate Names:
Fuchs Dystrophy; Fuchs Corneal Dystrophy

Fuchs Endothelial Corneal Dystrophy

Alternate name; see *Fuchs' Dystrophy*.

Fuchs Endothelial Dystrophy

Alternate name; see *Fuchs' Dystrophy*.

Fucose

A sugar found in some cell-surface proteins and fats. It helps cells recognize and attach to one another and participates in immune signaling and other biological processes.

Fucosidosis

A rare inherited disorder in which cells cannot break down certain sugar-containing substances. Their buildup progressively affects development, movement, bones, growth, sweating, and organ function.

Fucosyltransferase

An enzyme that attaches the sugar fucose to proteins or fats. This changes how cells recognize one another, develop, interact with microbes, and display some blood-group markers.

Fuel Oil Poisoning

Illness after swallowing, inhaling, or having fuel oil on the skin. Inhalation can damage the lungs and cause coughing or breathing difficulty.

Fugue

A rare dissociative state involving unexpected travel or wandering with loss of memory about personal identity or the past. It may be associated with trauma, mental illness, substances, neurologic dis-

ease, or safety risks.

Fukuda Stepping Test

A bedside vestibular test in which a person marches in place with eyes closed while an examiner observes turning or displacement. Results vary, and the test has limited diagnostic accuracy; rotation alone cannot reliably confirm or localize one-sided vestibular loss.

Alternate Names:
Unterberger-Fukuda Test; Vestibular Stepping Test

Fukuyama Congenital Muscular Dystrophy

A rare inherited muscle disorder beginning in infancy, causing low muscle tone, weakness, contractures, and delayed development. Abnormalities of the brain and eyes, seizures, and heart disease may also occur.

Alternate Names:
FCMD; Fukuyama Type Congenital Muscular Dystrophy

Fulguration

Destruction or sealing of tissue using electrical energy during a procedure. It may control bleeding or treat selected abnormal tissue, but nearby tissue can be burned or injured.

Full Agonist

A medicine or chemical that binds to a cell receptor and produces the strongest response that receptor can generate. The actual effect still depends on dose, receptor number, tissue, and individual response.

Full Blood Count

See *Complete Blood Count*.

Alternate Names:
FBC; Complete Blood Count (CBC)

Full Liquid Diet

A diet containing liquids and foods that become liquid at room temperature, such as milk, strained soups, yogurt, and custard. It may be used temporarily, but prolonged use can lack fiber and some nutrients.

Full Sibling

A person who shares both biological parents with another person. This relationship is relevant to family medical history, genetic-risk assessment, and some tissue or organ-donor matching.

Full-Thickness Skin Graft

A graft containing the outer skin layer and the entire dermis, moved to cover a wound or reconstruct a defect. It usually gives durable coverage but requires a suitable donor site and blood supply.

Fulminant

Beginning suddenly and becoming severe very quickly. The term describes a dangerous pattern of illness, such as rapidly progressive liver failure, infection, or inflammation.

Fulminant Hepatitis

Rapid, severe liver injury causing loss of liver function, abnormal bleeding, and sometimes confusion or coma from toxin buildup. It is a medical emergency that may require intensive care and liver transplantation.

Fulminant Myocarditis

Sudden, severe inflammation of the heart muscle causing poor pumping, dangerous rhythms, or shock. It requires intensive care and treatment of the cause and complications; temporary mechanical heart support may be needed.

Fulminating Hyperpyrexia

Alternate name; see *Malignant Hyperthermia*.

Fulvestrant

An injectable hormone treatment that blocks and helps destroy estrogen receptors in selected hormone-sensitive breast cancers. It can cause injection-site pain, hot flushes, joint symptoms, fatigue, and liver-test changes.

Fumigation

Treating an enclosed area with gas, vapor, or smoke to kill pests or microorganisms. The process requires evacuation of people and animals and adequate ventilation before re-entry.

Functional Amblyopia

Reduced visual acuity in an eye that failed to develop normal vision during early childhood. See *Amblyopia*.

Functional Asplenia

Poor or absent spleen function even though the spleen is present. It increases the risk of severe infections, especially from certain bacteria; prevention may include vaccination and, in selected cases, preventive antibiotics.

Functional Assessment

Evaluation of how well a person moves, communicates, thinks, and performs daily activities. It identifies support needs, tracks change, guides rehabilitation, and helps plan safe care.

Functional Capacity

The level of physical, mental, communication, and self-care activity a person can safely perform under particular conditions. It depends on health, environment, assistance, and personal goals.

Functional Constipation

Long-lasting constipation without an identified blockage or other clear disease causing it. Stools may be hard or difficult to pass, or a person may feel that the bowel has not emptied fully. It may be related to diet, low fluid intake, inactivity, or regularly ignoring the urge to pass stool.

Functional Decline

A reduction in a person's ability to move, think, communicate, or perform daily activities compared with their previous level. In older adults it may result from illness, medicines, hospitalization, pain, poor nutrition, or lack of activity.

Functional Diarrhea

Long-lasting loose or watery stools without an identified infection or other clear disease causing them. Unlike irritable bowel syndrome, belly pain is not the main symptom. Diet, medicines, stress, and changes in bowel movement can contribute.

Functional Disorder

A condition in which symptoms or impaired body function arise from altered processing or regulation without a structural abnormality sufficient to explain them. The symptoms are real and can cause substantial disability.

Functional Dyspepsia

Repeated upper-abdominal discomfort without a clear structural cause. It may cause pain or burning in the upper middle abdomen, uncomfortable fullness after meals, or feeling full too soon while eating. Signals between the gut and brain may affect how the stomach senses and moves food.

Alternate Names:
Nonulcer Dyspepsia (older term)

Functional Electrical Stimulation

Electrical impulses applied to nerves or muscles to produce a useful movement, such as lifting the foot during walking. It may assist rehabilitation after stroke, spinal injury, or other nerve damage.

Functional Endoscopic Sinus Surgery

Surgery performed through the nostrils using a small camera and instruments to open blocked sinus passages or remove tissue such as nasal polyps. It may be used for selected long-lasting sinus problems. Bleeding, infection, or injury to nearby structures can occur.

Alternate Names:
FESS; Endoscopic Sinus Surgery; ESS; Functional Sinus Surgery

Functional Gastrointestinal Disorders

Digestive symptoms caused by altered gut movement or sensitivity without an obvious structural disease. Symptoms may include pain, bloating, constipation, diarrhea, nausea, or early fullness.

Alternate Names:
Disorders of Gut-Brain Interaction; FGIDs

Functional Hypothalamic Amenorrhea

Missing menstrual periods because stress, inadequate energy intake, excessive exercise, or disordered eating suppresses reproductive hormones. It can lower estrogen, impair fertility, and weaken bones, but often improves when the underlying imbalance is corrected.

Alternate Names:
Hypothalamic Amenorrhea; FHA

Functional Impairment

Difficulty performing usual work, study, self-care, relationships, or other daily activities because of symptoms, illness, injury, or treatment. The degree of impairment is considered separately from the diagnosis and may change over time.

Functional Incontinence

Urine leakage because a person cannot reach, recognize, or use the toilet in time, even when bladder storage may be adequate. Mobility, memory, vision, clothing, communication, or environmental barriers may contribute.

Functional Independence Measure

A structured tool that rates how much help a person needs with self-care, toileting, transfers, walking, communication, and thinking. It is used mainly in rehabilitation to track function and progress.

Functional MRI

A magnetic-resonance scan that estimates brain activity from changes in blood flow and oxygen use. It can map language or movement areas before selected brain procedures and does not use X-ray radiation.

Functional Murmur

A heart murmur produced by turbulent or accelerated blood flow without structural heart disease. It may become audible during states that increase cardiac output, such as fever, anemia, pregnancy, or exercise. A murmur is a flow sound, distinct from additional heart sounds such as S3 or S4.

Functional Neurological Disorder

Alternate name; see *Functional Neurologic Disorder*.

Functional Neurological Symptom Disorder

Alternate name; see *Functional Neurologic Disorder*.

Functional Neurologic Disorder

A condition in which changes in how the brain and nervous system function cause real symptoms, such as weakness, abnormal movements, seizures, or altered sensation. Diagnosis is based on specific examination findings, not simply on the absence of another disease.

Alternate Names:
FND; Conversion Disorder (historical term); Functional Neurological Symptom Disorder

Functional Neurologic Disorder/Conversion Disorder

Alternate name; see *Functional Neurologic Disorder*.

Functional Ovarian Cysts

Ovarian cysts related to the normal menstrual cycle, usually a follicular cyst or corpus-luteum cyst. They commonly resolve without treatment but may cause pain, bleeding, rupture, or ovarian torsion.

Functional Residual Capacity

The amount of air left in the lungs after a normal relaxed breath out. It helps keep air sacs open and may be reduced by obesity or restrictive lung disease or increased by air trapping.

Functional Screening

A brief check of a person's ability to move safely, communicate, perform daily activities, and manage basic self-care. Abnormal results may lead to a fuller medical, occupational, or rehabilitation assessment.

Functional Status

A person's ability to manage daily activities such as bathing, dressing, eating, toileting, walking, shop-

ping, cooking, medicines, finances, and transportation. Decline may signal illness or a need for support.

Functional Urinary Incontinence

Urine leakage that happens because a person cannot reach, recognize, or use the toilet in time, even when the bladder may work normally. Problems with walking, memory, vision, clothing, communication, or the environment can contribute; treatment addresses these barriers and other causes of leakage.

Functioning Carcinoid

A carcinoid neuroendocrine tumor that releases hormones or other active substances in amounts that cause clinical symptoms. Not all carcinoid tumors are functioning.

Fundal Height

The distance from the pubic bone to the top of the uterus, measured during pregnancy. It roughly follows weeks of pregnancy after about 20 weeks; differences may reflect dating error, growth problems, twins, or fluid changes.

Fundoplication

Surgery that wraps the upper stomach around the lower esophagus to strengthen the valve and reduce acid reflux. It may also repair a hiatal hernia; swallowing difficulty, gas, or recurrent reflux can occur afterward.

Fundoscopy

Examination of the back of the eye using an ophthalmoscope or camera. It views the retina, optic nerve, macula, and blood vessels to assess conditions such as diabetes, high blood pressure, or retinal disease.

Fundus

The rounded or farthest part of a hollow organ. Examples include the upper part of the stomach, the top of the uterus, and the inside back surface of the eye.

Fundus Oculi

The inside back surface of the eye visible through the pupil. It includes the retina, optic nerve, macula, and retinal blood vessels.

Fundus Photography

Photographing the back of the eye to record the retina, optic nerve, macula, and blood vessels. Images help detect and monitor retinal disease and allow comparison over time.

Fundus Uteri

The rounded upper part of the uterus above the openings of the fallopian tubes. Its position and size can be assessed during pelvic examination and pregnancy.

Fungal

Relating to fungi or caused by a fungus. Fungal infections may affect the skin, nails, mouth, lungs, bloodstream, or other organs.

Fungal Arthritis

A fungal infection inside a joint, usually after surgery, injury, injection, bloodstream spread, or with weakened immunity. It often develops slowly with persistent pain, swelling, and reduced movement and may need prolonged treatment and surgery.

Fungal Corneal Ulcer

A serious fungal infection and open sore on the cornea, the clear front surface of the eye. It may follow an injury involving plant material, contaminated contact lenses, or prolonged steroid eye-drop use. Severe pain, redness, light sensitivity, blurred vision, or a cloudy spot may occur. Eye examination and testing of a corneal sample can support the diagnosis; delayed treatment can threaten vision.

Alternate Names:
Fungal Keratitis; Keratomycosis; Mycotic Corneal Ulcer

Fungal Endophthalmitis

A fungal infection inside the eye, often after blood-

stream infection, surgery, injury, or weakened immunity. It can rapidly damage vision; treatment includes antifungal medicine and sometimes surgery.

Fungal Ear Infection

Alternate name; see *Otomycosis*.

Fungal Infection

An illness caused by a fungus, such as a yeast or mold. It may affect the skin, nails, or moist body surfaces, or spread to organs such as the lungs or brain. The type and severity depend on the fungus and the part of the body affected; serious invasive infections are more common when immune defenses are weakened.

Alternate Names:
Mycosis; Mycotic Infection; Fungal Disease

Fungal Nail Infection

A fungal infection of a fingernail or toenail causing thickening, discoloration, brittleness, or separation from the nail bed. Diagnosis may require testing because injury and skin disease can look similar.

Alternate Names:
Onychomycosis; Tinea Unguium; Nail Mycosis

Fungal Nail Infections

Alternate name; see *Fungal Nail Infection*.

Fungal Nails

Alternate name; see *Fungal Nail Infection*.

Fungal Pathogenesis

The ways fungi cause disease, including attaching to cells, growing into tissue, avoiding immune defenses, and releasing damaging substances. The process varies with the fungus, body site, and person's immunity.

Fungal Pneumonia

Pneumonia caused by fungi, including endemic fungi, Aspergillus, Pneumocystis, and other opportunistic organisms. Risk depends on geography, immune status, neutropenia, transplantation, and inhaled exposures; diagnosis may require cultures, antigen or molecular tests, imaging, and bronchoscopy.

Fungal Sinusitis

A group of conditions in which fungi affect the nasal and sinus cavities. Forms range from noninvasive fungal growth or fungus-triggered allergic inflammation to invasive infection that damages tissue, especially in people with weakened immunity.

Alternate Names:
Fungal Rhinosinusitis

Fungal Resistance Mechanisms

Changes that allow fungi to survive antifungal medicines, such as altering a drug target, pumping medicine out of the cell, or changing cell-wall production. Resistance can make infections harder to treat.

Fungal Skin Infections

Infections of the skin caused by dermatophytes or yeasts, including ringworm, athlete's foot, and candidiasis. They often cause red, itchy, scaly, or ring-shaped areas and thrive in warm, moist conditions.

Fungating

Describing a mass or wound that grows outward with an irregular, ulcerated, dead, or foul-smelling surface. It may occur with advanced cancer or severe chronic wounds and can bleed, leak, and become infected.

Fungemia

The presence of living fungi in the bloodstream, most often Candida in hospitalized patients. It can spread to organs; treatment includes antifungal medicines and management of the infection source.

Fungi

Organisms including yeasts, molds, and mushrooms. Some live harmlessly in the environment or body, while others cause infections of the skin, mouth, lungs, bloodstream, or other organs.

Fungicide

A chemical used to kill or inhibit fungi. Some fungicides are used on crops or surfaces, while selected medicines act against fungi in people; toxicity depends on the substance and exposure.

Fungoid

Resembling a fungus or mushroom in appearance. In medicine it may describe an outward-growing, irregular lesion or mass, but appearance alone does not establish its cause.

Fungus

A type of organism including yeasts and molds, with distinctive cell walls and membranes. Fungi reproduce in various ways and can cause superficial or invasive infection, especially when immunity is weakened.

Funiculus

A cord-like bundle of nerve fibers or other structures. In the spinal cord, a funiculus contains nerve pathways; in the spermatic cord, it is the bundle carrying the vas deferens, blood vessels, nerves, and lymph vessels.

Funisitis

Inflammation of the umbilical cord, usually associated with infection or inflammation of the membranes around the fetus. It may increase newborn infection risk.

Funnel Chest

Alternate name; see *Pectus Excavatum*.

Funnel-Web Spider Bite

A potentially life-threatening bite from a funnel-web spider. Venom may cause pain, sweating, tingling, muscle spasms, breathing difficulty, or collapse; first aid commonly includes keeping the person still and pressure immobilization.

Furan

A chemical compound used in manufacturing and found in small amounts in some heated foods. High or repeated exposure may harm the liver and other organs.

Furocoumarin

A plant chemical found in some citrus and other plants that can make skin unusually sensitive to ultraviolet light. Contact followed by sunlight may cause redness, blistering, or dark pigmentation.

Furrowed Tongue

Alternate name; see *Fissured Tongue*.

Fursultiamin

A fat-soluble form of thiamine, or vitamin B1, used in some countries as a vitamin preparation. Its clinical value and safety depend on the indication, dose, and other medicines.

Furuncle

A painful, pus-filled infection of a hair follicle, usually caused by Staphylococcus aureus. It forms a red lump and may drain; lesions may be larger, recurrent, facial, or associated with fever.

Furuncle And Carbuncle

A furuncle is a deep infected hair follicle, or boil. A carbuncle is a connected group of boils forming a larger, deeper infection; both may require drainage and sometimes antibiotics.

Furuncular Myiasis

A fly-larva infestation forming a boil-like skin lump with a central opening through which the larva breathes. It may cause pain, movement sensations, or drainage and requires safe removal.

Furunculosis

Repeated or multiple boils caused by infection of hair follicles, often with Staphylococcus aureus. Risk factors include close contact, skin disease, diabetes, and weakened immunity; treatment may involve drainage or antibiotics.

Fusariosis

An opportunistic infection caused by Fusarium fungi,

mainly affecting people with severely weakened immunity or prolonged low neutrophil counts. It can cause skin lesions, bloodstream infection, pneumonia, and disease in multiple organs.

Fusarium

A group of environmental molds that can cause nail, eye, skin, sinus, lung, or widespread infections. Severe disease occurs mainly in people with weakened immunity, especially prolonged neutropenia.

Fusarium Infection

An infection caused by Fusarium molds, which may affect the nails, eyes, skin, sinuses, lungs, or bloodstream. Invasive disease mainly affects people with severe immune suppression and is treated with antifungal medicines.

Fusarium Solani

An environmental mold that can cause eye, nail, skin, or invasive infections, especially in people with weakened immunity. Its clinical importance depends on the specimen, body site, symptoms, and laboratory confirmation.

Fused Placenta

A placenta in which areas that normally form separate lobes are joined. It is often an anatomical variation, but careful examination after delivery helps identify any retained placental tissue or abnormal blood vessels.

Fused Teeth

Alternate name; see *Fusion*.

Fusidic Acid

An antibiotic that blocks bacterial protein production and is used for selected staphylococcal infections. Resistance can develop, so it is often combined with another antibiotic and used according to local guidance.

Fusiform

Shaped like a spindle, wider in the middle and narrowing toward both ends. The term may describe a muscle, cell, swelling, or blood-vessel enlargement such as an aneurysm.

Fusiform Aneurysm

An aneurysm involving a relatively elongated, spindle-shaped expansion of the circumference of a blood vessel.

Fusion

Joining of two structures that are normally separate. It may describe bones, joints, teeth, organs, genes, or tissues and can occur naturally, during development, after injury, or through surgery.

Alternate Names:
Dental Fusion; Synodontia

Fusion Gene

A gene formed when parts of two separate genes become joined. It may produce an abnormal protein that drives some cancers and can sometimes be identified by genetic testing.

Fusion Of The Ear Bones

Abnormal joining or stiffening of the tiny middle-ear bones, which can reduce sound transmission and cause conductive hearing loss. Evaluation identifies the cause and whether surgery or hearing support may help.

Fusion Protein

A protein made when parts of two different proteins become joined, usually because their genes have fused. Some fusion proteins drive cancer; others are deliberately engineered for research or treatment.

Fusobacterium

A group of bacteria that grow without oxygen and commonly live in the mouth and intestine. Some species can cause dental, throat, abdominal, wound, bloodstream, or other invasive infections.

Fusobacterium Infection

Infection caused by Fusobacterium bacteria, which may spread from the mouth or intestine to the throat, lungs, abdomen, skin, joints, or bloodstream.

Symptoms and treatment depend on the site and severity.

Fusobacterium Necrophorum

A bacterium that can cause severe throat infection and Lemierre syndrome, in which infection spreads to neck veins and may produce infected clots, lung complications, and bloodstream infection.

Fusobacterium Nucleatum

A common mouth bacterium associated with gum disease. It can occasionally cause bloodstream or other invasive infection and has also been studied for possible links with intestinal and pregnancy-related disease.

Fusospirochetal Gingivitis

A painful gum infection involving fusobacteria and spirochetes, causing bleeding, ulcers, swelling, and foul breath. It is associated with poor oral hygiene, stress, smoking, or illness and needs dental treatment.

G

G6PD Deficiency

An inherited condition in which red blood cells can break down after infections, fava beans, or certain medicines. Episodes may cause anemia, jaundice, fatigue, shortness of breath, or dark urine.

G6PD Deficiency in the Newborn

G6PD deficiency present at birth, often causing jaundice when red blood cells break down. Severe jaundice can harm the brain, so it is monitored and treated in affected newborns.

Gabapentin

A medicine used for certain seizures and nerve-related pain. It can cause sleepiness, dizziness, swelling, or impaired coordination; the dose often needs adjustment in kidney disease and stopping suddenly can cause problems.

GABA Receptor

A protein on nerve cells that responds to GABA, a chemical messenger that usually quiets nerve activity. These receptors help regulate sleep, anxiety, muscle control, and seizures and are targets of several medicines.

GAD

An abbreviation for generalized anxiety disorder, involving excessive, difficult-to-control worry about several areas of life for at least six months, with symptoms such as restlessness, tension, fatigue, poor concentration, or sleep disturbance.

Alternate Names:
Generalized Anxiety Disorder

Gadolinium

A metal used in chemically bound form in some MRI contrast agents. The risk of a serious reaction depends on the agent and the patient; certain agents can cause nephrogenic systemic fibrosis in people with severe kidney disease, and small amounts may remain in the body after repeated exposure.

Gadolinium-Based Contrast Agent

A contrast agent injected during some MRI scans to make organs, blood vessels, or abnormal tissue easier to see. Nephrogenic systemic fibrosis is a rare risk, greatest with certain older agents in people with acute kidney injury or severe chronic kidney disease; the risk is very low with current group II agents.

Gadolinium-Induced Nephrogenic Systemic Fibrosis

A rare disorder causing thickened, tight skin and sometimes internal-organ involvement after exposure to certain gadolinium-based MRI contrast agents, mainly in people with severe kidney impairment.

Gadopentetate Dimeglumine

A linear gadolinium-based contrast agent used for MRI. The American College of Radiology classifies it as a Group I agent, the group associated with the greatest number of nephrogenic systemic fibrosis cases; the risk is greatest in severe kidney impairment.

Gag Gene

A retroviral gene that encodes structural proteins

forming the virus's inner support, shell, and core. These proteins help assemble new virus particles inside infected cells.

Gagging

Retching caused by stimulation of the throat or back of the tongue. It may occur with swallowing difficulty, reflux, infection, examination, aspiration, or distress.

Gag Protein

A large retroviral protein that is cut into components forming the virus's inner support, protective shell, and genetic-material core. These parts are required to assemble new virus particles.

Gag Reflex

A protective response in which touching the back of the throat causes throat-muscle contraction and sometimes retching. It helps prevent food or objects from entering the airway.

Alternate Names:
Pharyngeal Reflex

Gain

The amount by which a hearing aid or amplifier increases sound intensity, measured in decibels. Correct gain improves hearing while limiting excessive loudness, feedback, discomfort, and further hearing damage.

Gain-Of-Function Mutation

A genetic change that makes a gene or its protein more active, gives it a new activity, or causes activity at the wrong time or place. Its effects range from harmless variation to inherited disease or cancer.

Gaisbock Syndrome

An older term for apparent or relative erythrocytosis in which the hematocrit is high because plasma volume is reduced, while red-cell mass is not increased. The term is used inconsistently and is sometimes called stress polycythemia.

Alternate Names:
Stress Polycythemia; Polycythemia Hypertonica

Gait

A person's pattern of walking, including speed, balance, step length, posture, arm movement, and turning. Gait reflects the combined function of the brain, nerves, muscles, joints, vision, and balance system.

Gait Abnormality

A change from a person's usual walking pattern caused by problems with muscles, joints, nerves, balance, vision, heart function, or general health. Assessment examines speed, stability, symmetry, strength, sensation, and pain.

Gait Apraxia

Difficulty starting or carrying out walking even though basic muscle strength is adequate. It may occur with disease or injury affecting the front of the brain and can cause short steps, freezing, or instability.

Gait Assessment

An examination of how a person walks, including speed, steps, balance, posture, turning, and use of aids. It can reveal problems with strength, sensation, coordination, joints, vision, or thinking.

Gait Ataxia

Unsteady, poorly coordinated walking caused by problems in the cerebellum, sensation pathways, balance organs, or other parts of the nervous system.

Gait Cycle

The sequence of walking movements from initial contact of one foot to its next initial contact. It includes the stance phase, when that foot supports weight, and the swing phase, when it moves forward.

Gait Disturbance

Alternate name; see *Gait Abnormality*.

Gaits

Plural form; see *Gait*.

Gait Speed

Walking speed measured over a set distance. It is a simple indicator of mobility and physical reserve, helps estimate fall or disability risk, and can track changes during illness or rehabilitation.

Gait Training

Therapy that teaches or retrains safer walking after injury, illness, weakness, or balance problems. It may use exercises, parallel bars, walkers, canes, stairs, or other aids to improve independence.

Galactagogue

A medicine or other substance used to increase breast-milk production. Evidence and safety vary by substance, and effects may depend on milk removal, underlying causes, and interactions.

Galactocele

A milk-filled breast cyst caused by blockage of a milk duct, usually during breastfeeding or after weaning. It commonly feels like a painless lump; examination and ultrasound distinguish it from other breast masses.

Galactocerebrosidase Deficiency

An inherited lack of an enzyme needed to break down certain fats in nerve tissue. Severe deficiency causes Krabbe disease, which progressively damages the brain and nerves.

Alternate Names:
Krabbe Disease; Galactosylceramidase Deficiency

Galactocerebrosidase (GALC) Deficiency

Alternate name; see *Galactocerebrosidase Deficiency*.

Galactocerebroside Beta-Galactosidase Deficiency

Alternate name; see *Galactocerebrosidase Deficiency*.

Galactokinase Deficiency

A rare inherited problem in processing galactose, a sugar found in milk. Galactose can build up in the eye and cause cataracts, usually without the liver and other organ damage seen in classic galactosemia.

Alternate Names:
GALK Deficiency; Type II Galactosemia

Galactorrhea

Milk-like breast discharge unrelated to normal pregnancy or breastfeeding. Causes include medicines that raise prolactin, pituitary disorders, hypothyroidism, kidney disease, nipple stimulation, and sometimes no identifiable cause. Spontaneous discharge from one breast, especially if bloody or clear, may have a different cause.

Alternate Names:
Galactorrhoea; Non-Puerperal Lactation

Galactorrhea-Amenorrhea Syndrome

The coexistence of milk-like breast discharge unrelated to pregnancy or breastfeeding and absent menstrual periods. It can occur with high prolactin levels, including from a prolactinoma, but the combination has multiple possible causes; Forbes-Albright syndrome is one specific cause.

Galactorrhoea

Alternate name; see *Galactorrhea*.

Galactosaemia

British spelling; see *Galactosemia*.

Galactose

A simple sugar that forms part of lactose in milk. The body normally processes it for energy, but inherited galactosemia can make milk and other galactose-containing foods dangerous for infants.

Galactose-1-Phosphate Uridyltransferase Blood Test

A blood test measuring an enzyme needed to process galactose. It helps screen for or diagnose classic galactosemia, especially in newborns or infants with symptoms after milk feeding.

Galactose-1-Phosphate Uridyl

Transferase Deficiency

A deficiency of the GALT enzyme that causes classic galactosemia, impairing galactose processing and potentially causing liver injury, jaundice, cataracts, poor feeding, infection, and developmental problems in untreated infants.

Galactose Metabolism

The body's process for changing galactose, part of milk sugar, into energy or other useful substances. Inherited enzyme problems can block this process and cause galactosemia.

Galactosemia

An inherited disorder in which the body cannot properly process galactose. Classic disease can cause vomiting, jaundice, liver injury, cataracts, serious infection, and developmental problems after milk feeding.

Galactosialidosis

A rare inherited storage disorder in which cells accumulate certain sugar-containing substances. It can cause developmental delay, muscle weakness, bone changes, kidney disease, and eye problems, with severity varying widely.

Galactoside

A compound in which the sugar galactose is joined to another molecule, such as another sugar, a fat, or a protein. Galactosides occur in cells and in some foods.

Galactosyltransferase

An enzyme that attaches galactose to proteins, fats, or other sugars while cells build complex molecules. These molecules support cell structure, recognition, signaling, and nerve insulation.

Galant Reflex

A newborn reflex in which stroking one side of the back causes the infant's trunk to curve toward that side. It normally fades during early infancy; marked asymmetry or persistence can occur with nervous-system problems.

Galeazzi Fracture

A break in the lower part of the radius, one of the forearm bones, with displacement of the nearby joint between the radius and ulna. It can cause wrist pain and difficulty turning the forearm.

Alternate Names:
Piedmont Fracture

Galeazzi Fracture-Dislocation

Alternate name; see *Galeazzi Fracture*.

Galeazzi Sign

A finding in an infant lying with hips and knees bent, in which one knee is lower than the other. It may suggest hip dislocation, developmental hip dysplasia, or unequal thigh-bone length.

Alternate Names:
Allis Sign; Galeazzi Test

Gallavardin Phenomenon

A finding in severe aortic-valve narrowing where the heart murmur sounds harsh near the upper chest but musical near the apex. It reflects different sound frequencies transmitted through the chest.

Gall-Bladder

Alternate spelling; see *Gallbladder*.

Gallbladder

A pear-shaped organ beneath the liver that stores and concentrates bile produced by the liver. When needed for digestion, bile passes through the cystic and common bile ducts into the small intestine.

Alternate Names:
Gall Bladder

Gallbladder Absence

A congenital condition in which the gallbladder did not develop. It may be found incidentally or during evaluation of abdominal symptoms; absence after surgery is described as prior cholecystectomy.

Gallbladder Adenomyomatosis

A usually benign thickening of the gallbladder wall, with small pockets extending into the muscle layer.

It is often found on ultrasound and may cause no symptoms.

Alternate Names:
Adenomyoma of Gallbladder; Diverticular Gallbladder Disease

Gallbladder Cancer

Cancer that begins in the gallbladder. It may cause upper-right abdominal pain, jaundice, or weight loss, but can also be found unexpectedly after gallbladder surgery.

Gallbladder Carcinoma

Alternate name; see *Gallbladder Cancer*.

Gall Bladder Disease

Alternate spelling; see *Gallbladder Diseases*.

Gallbladder Diseases

Conditions affecting the gallbladder, including stones, inflammation, infection, polyps, abnormal emptying, and cancer. Symptoms and treatment depend on the exact disorder and whether bile flow is blocked.

Gallbladder Duplication

A rare birth variation in which two gallbladders develop, with separate or shared drainage ducts. It may cause no symptoms but can be associated with stones or inflammation and is relevant to surgical planning.

Gallbladder Hydrops

Enlargement of the gallbladder with clear or mucus-like fluid, usually because a blockage prevents bile from draining. It may cause pain and can become infected.

Alternate Names:
Mucocele of Gallbladder; Hydrops Vesicae Felleae

Gallbladder Infection

Informal term sometimes used for acute cholecystitis, which is usually caused by a gallstone blocking the gallbladder outlet. Inflammation does not always mean bacterial infection.

Gallbladder Inflammation

Inflammation of the gallbladder, most often caused by a gallstone blocking its drainage. It can cause persistent right-upper-abdominal pain, fever, nausea, and vomiting.

Alternate Names:
Cholecystitis

Gallbladder Mucocele

Alternate name; see *Gallbladder Hydrops*.

Gallbladder Neck

The narrow end of the gallbladder that joins the cystic duct, the tube carrying bile out of it. A gallstone lodged here can block bile flow.

Alternate Names:
Collum Vesicae Biliaris

Gallbladder Necrosis

Death of gallbladder tissue caused by severe inflammation or inadequate blood supply. It can lead to perforation, abdominal infection, and sepsis.

Gallbladder Pain

Pain from temporary blockage of the gallbladder outlet, usually by a stone. It is often steady, severe, and felt under the right ribs after meals and may include nausea or vomiting.

Alternate Names:
Biliary Colic; Gallstone Pain

Gallbladder Perforation

A hole through the gallbladder wall that allows bile or infected contents into the abdomen. It can cause severe inflammation, abscess, peritonitis, or sepsis.

Gallbladder Polyp

A growth projecting from the inner wall of the gallbladder, often a harmless cholesterol deposit rather than a true tumor. Cancer risk is higher with larger or growing polyps and is also associated with a sessile shape, primary sclerosing cholangitis, and older age.

Gallbladder Radionuclide Scan

A nuclear medicine test that follows a tracer through the liver, gallbladder, and bile ducts. It helps assess suspected gallbladder inflammation, blockage, or abnormal bile flow.

Gallbladder Volvulus

Twisting of the gallbladder around its supporting tissues and duct, cutting off blood flow. It causes sudden severe right-upper-abdominal pain, nausea, vomiting, and abdominal irritation.

Gallium

A metallic element used in some radioactive tracers, medical compounds, and technology. Its medical effects depend on the isotope or compound and how it is administered and distributed in the body.

Gallium-68

A radioactive isotope used to label tracers for PET scans. Linked to a suitable targeting molecule, it can help locate some neuroendocrine tumors or prostate-cancer lesions; it is used for diagnosis, not direct treatment.

Gallium Nitrate

A gallium-containing compound formerly used in selected cancer settings to reduce high calcium levels. Its use is limited because it can damage the kidneys and has largely been replaced by other treatments.

Gallium Scan

A nuclear medicine scan using radioactive gallium to locate some infections, inflammation, or tumors. It is used less often now because newer imaging tests may provide more specific or faster information.

Gallop Rhythm

An extra heart sound creating a three- or four-beat rhythm. It may reflect abnormal heart filling, stiff heart muscle, or heart failure and is interpreted with symptoms and other examination findings.

Gallstone

Singular form; see *Gallstones*.

Gallstone Ileus

A blockage of the intestine caused by a large gallstone that has entered through an abnormal connection from the gallbladder. It can cause pain, vomiting, swelling, and inability to pass stool or gas.

Gallstone Pancreatitis

Sudden inflammation of the pancreas caused by a gallstone blocking the shared opening of the bile and pancreatic ducts. It usually causes severe persistent upper-abdominal pain and may be associated with complications or remaining duct stones.

Gallstones

Hard deposits, usually formed in the gallbladder and occasionally in the bile ducts, composed mainly of cholesterol, bilirubin-rich pigment, or a mixture. Cholesterol stones form when bile is supersaturated with cholesterol; pigment stones form when bilirubin compounds precipitate. Black pigment stones are associated with chronic hemolysis, while brown stones are associated with biliary infection or stasis. Many cause no symptoms, but duct blockage may cause biliary colic or complications such as inflammation, jaundice, infection, or pancreatitis.

Alternate Names:
Cholelithiasis; Biliary Calculi

GALT Deficiency

Abbreviation; see *Galactose-1-Phosphate Uridyl Transferase Deficiency*.

Galvanocautery

Use of heat generated by electric current to destroy selected tissue or control bleeding during a procedure. It can cause burns or damage nearby structures if not carefully controlled.

Gambling Disorder

A persistent inability to control gambling despite financial, relationship, work, health, or emotional harm. The disorder can cause debt, secrecy, distress, and suicide risk and benefits from professional behavioral and mental-health support.

Alternate Names:

Pathological Gambling; Compulsive Gambling; Ludomania

Gamete

A mature reproductive cell, such as a sperm or egg, containing one set of chromosomes. Two gametes combine during fertilization to form a cell with genetic material from both biological parents.

Gamete Intrafallopian Transfer

An assisted-reproduction procedure in which eggs and sperm are placed into a fallopian tube so fertilization may occur inside the body. It is now used less often than in-vitro fertilization.

Gametogenesis

The formation and maturation of sperm or eggs in the testes or ovaries. It includes cell division that reduces chromosome number so gametes can combine during fertilization.

Gamma-Aminobutyric Acid

A chemical messenger that usually reduces nerve activity in the brain and spinal cord. It helps regulate sleep, anxiety, muscle activity, and seizures through two main receptor types.

Alternate Names:
GABA

Gamma-Benzene Hexachloride

An insecticide, also called lindane, that can cause nervous-system toxicity and seizures after excessive exposure. Medical use is restricted in many places because safer treatments are available.

Gamma Camera

A device used in some nuclear-medicine scans to detect radiation from a small tracer inside the body and create pictures showing an organ's structure or activity.

Gamma-Chemokines

Signaling proteins that attract or activate immune cells through specific receptors. They help coordinate inflammation, immune surveillance, and movement of defensive cells into affected tissue.

Gamma Globulin

The part of blood plasma containing most immunoglobulins, or antibodies, which help defend against infections and can be measured or given as immune treatment.

Gamma-Globulin

Alternate spelling; see *Gamma Globulin*.

Gamma-Glutamyl Transferase Blood Test

A blood test measuring an enzyme found mainly in the liver and bile ducts. It can support evaluation of liver or bile-duct disease and help explain a high alkaline-phosphatase result.

Gamma-Glutamyl Transferase Test

A blood test measuring GGT enzyme activity to assess biliary tract disease, biliary obstruction, and liver damage; see *Gamma-Glutamyl Transferase Blood Test*.

Gammaherpesvirinae

A subgroup of herpesviruses that establish long-lasting infection in lymphoid or related cells. Some members, including Epstein-Barr virus, can cause human disease and contribute to certain cancers.

Gamma Hydroxybutyrate

A central-nervous-system depressant that can cause drowsiness, confusion, slowed breathing, coma, or death in overdose. It is also misused recreationally and can cause dependence and withdrawal.

Gamma-Hydroxybutyrate Toxicity

Rapid-onset central nervous system depression from GHB or related compounds, with drowsiness, ataxia, vomiting, bradycardia, respiratory depression, coma, and sometimes agitation or delirium during recovery. There is no specific antidote; protect the airway, support ventilation, and monitor until mental status and breathing recover.

Gamma-Interferon

A cytokine made by activated immune cells that strengthens macrophage activity and cell-mediated defense against certain infections. It also contributes to inflammation and immune regulation.

Gamma Knife

A noninvasive radiation treatment that aims many focused beams at selected brain tumors or other lesions. It avoids an open operation but can cause swelling, bleeding, or injury to nearby brain tissue.

Gamma Knife Radiosurgery

Alternate name; see *Gamma Knife*.

Gamma Rays

High-energy electromagnetic radiation produced by radioactive decay or nuclear reactions. It can damage cells and is used in controlled amounts for some cancer treatments and medical sterilization.

Gamma-Ray Therapy

Treatment that uses controlled gamma radiation to damage the DNA of selected abnormal cells. It can treat some cancers, but nearby healthy tissue may also be affected and side effects depend on the treated area.

Gamna-Gandy Bodies

Small fibrous nodules in the spleen containing iron and calcium deposits. They form after repeated small hemorrhages, often in chronic congestion of the spleen or sickle cell disease, and may be visible on imaging.

Alternate Names:
Gamna-Gandy Nodules; Siderofibrotic Bodies

GAN

Abbreviation; see *Giant Axonal Neuropathy*.

Ganciclovir

An antiviral medicine that interferes with viral DNA production and is used mainly for serious cytomegalovirus infection. It can suppress bone marrow, affect the kidneys, and cause other serious toxicity.

Ganglia

Groups of nerve-cell bodies outside the brain and spinal cord. They relay and organize signals between the central nervous system and the rest of the body.

Ganglioglioma

A usually slow-growing tumor containing nerve cells and supporting brain cells. It often causes seizures and may occur in the brain or spinal cord; treatment commonly involves surgical removal.

Ganglion

A cluster of nerve-cell bodies outside the brain and spinal cord. It acts as a relay point for signals between the central nervous system and body tissues.

Ganglion Cell

A nerve cell located in a ganglion. Retinal ganglion cells collect visual signals and send them through the optic nerve to the brain.

Ganglion Cyst

A noncancerous, fluid-filled lump near a joint or tendon, most often at the wrist or hand. It may be painless or cause pressure, pain, numbness, or limited movement.

Ganglionectomy

Surgical removal of a ganglion, a cluster of nerve-cell bodies, or occasionally a ganglion cyst. The purpose, benefits, and risks depend on the exact structure and body site being treated.

Ganglioneuroblastoma

A tumor made of both mature and immature nerve-related cells, usually in the adrenal or tissue beside the spine. It mainly affects children and may cause a mass, pain, high blood pressure, or other symptoms.

Ganglioneuroma

A usually noncancerous tumor arising from nerve tissue of the autonomic nervous system. It often causes no symptoms but may produce a mass, pain,

or hormone-related effects depending on its location.

Ganglioneuromatosis

Diffuse overgrowth of ganglion cells, nerve fibers, and supporting tissue, most often in the intestinal wall. Intestinal disease can disrupt bowel movement and cause abdominal swelling, constipation, diarrhea, or obstruction; it is associated with multiple endocrine neoplasia type 2B.

Ganglionic Blockers

Medicines that interrupt nerve signals at autonomic ganglia, affecting blood pressure, heart rate, digestion, and other automatic functions. They are rarely used because of widespread side effects.

Ganglions

Alternate plural form; see *Ganglion*.

Ganglioside

A fat-containing molecule in cell membranes, especially nerve cells. Gangliosides help cells communicate and recognize one another; abnormal accumulation occurs in several inherited storage disorders.

Gangliosidosis

A group of inherited disorders in which gangliosides accumulate inside cells because a breakdown enzyme is missing. The buildup often damages the nervous system and may also affect the eyes, bones, organs, and development.

Gangliosidosis GM2 Type 2

Alternate name; see *Sandhoff Disease*.

Gangrene

Death of body tissue caused by severely reduced blood flow, infection, injury, or a combination of these factors. It may affect skin, muscle, or an internal organ. The area may become discolored, cold, swollen, painful, numb, or foul-smelling; fever, confusion, or feeling very ill may occur with spreading infection.

Ganser Syndrome

A rare dissociative or psychiatric syndrome characterized by approximate answers, confusion, altered awareness, and sometimes hallucinations or neurologic-like symptoms. It may occur with severe stress, trauma, other mental disorders, or medical and substance-related conditions.

Gap Junction

A tiny connection between neighboring cells that allows ions and small molecules to pass directly between them. Gap junctions help coordinate heartbeats, nerve activity, and tissue growth.

Gardnerella

A group of bacteria that may live in the genital tract. Overgrowth of Gardnerella, especially G. vaginalis, can contribute to bacterial vaginosis with discharge, odor, and altered vaginal bacteria.

Gardnerella Vaginalis

A bacterium associated with bacterial vaginosis, in which normal vaginal bacteria become imbalanced. It may be present without illness; when symptomatic, discharge, odor, irritation, or burning can occur.

Gardner Syndrome

An inherited condition caused by an APC gene change, producing many colon polyps and increasing colorectal-cancer risk. It may also cause bone growths, dental abnormalities, skin cysts, and desmoid tumors.

Alternate Names:
Bone Tumor-Epidermoid Cyst-Polyposis; Familial Adenomatous Polyposis With Osteomas

Gargle

To rinse the mouth and throat with liquid while making a bubbling sound. Gargling may soothe irritation or help deliver a prescribed treatment.

Garré's Osteomyelitis

A chronic inflammatory reaction in the jawbone, often near an infected tooth, causing firm swelling.

Dental infection, persistent swelling, or pain may be present.

Gartner Duct

A remnant of an embryonic duct in the female reproductive tract. It can persist harmlessly or form a cyst along the side wall of the vagina or broad ligament.

Gartner Duct Cyst

A usually harmless fluid-filled cyst arising from an embryonic duct remnant along the side wall of the vagina. It often causes no symptoms, but a large cyst may cause pressure, pain, or difficulty with intercourse.

Gas

A state of matter without a fixed shape or volume. In medicine, gas may mean air or another gas in the digestive tract, blood, tissues, or a body cavity.

Gas And Gas Pains

Fullness, bloating, cramps, or discomfort from swallowed air or gas made by intestinal bacteria. Foods, constipation, food intolerance, and digestive disorders can contribute.

Gas Chromatography

A laboratory method that separates vaporized chemicals so they can be identified or measured. It is often combined with mass spectrometry to test medicines, poisons, pollutants, or biological samples.

Gas Exchange

Movement of oxygen from inhaled air into blood and carbon dioxide from blood into exhaled air. Oxygen then moves to tissues while carbon dioxide returns to the lungs for removal.

Gas – Flatulence

Passage of gas from the digestive tract through the anus, caused by swallowed air and bacterial digestion of food. It is normal, but excess gas with bloating or pain may reflect diet, constipation, or digestive disease.

Gas (Flatus)

Alternate name; see *Gas – Flatulence*.

Alternate Names:
Flatulence; Flatus Expulsion

Gas Gangrene

A rapidly progressive infection in which toxin-producing bacteria destroy muscle and produce gas in tissue. It is usually caused by *Clostridium* species and can cause severe pain, swelling, skin discoloration, systemic toxicity, and shock. See also *Clostridial Myonecrosis*.

Gaskin Maneuver

A maneuver for shoulder dystocia in which the birthing person moves onto hands and knees. The position can change pelvic dimensions and help release the baby's shoulder.

Alternate Names:
All-Fours Position; Hands-and-Knees Posture

Gasoline Poisoning

Harm from swallowing, inhaling, or getting gasoline on the skin. It can cause nausea, dizziness, drowsiness, seizures, abnormal heart rhythms, or chemical lung injury, especially if vomited and inhaled.

Gas Poisoning

Illness caused by inhaling a toxic gas. Carbon monoxide and cyanide interfere with oxygen delivery or use, while chlorine, ammonia, and similar irritants injure the airways and lungs. Effects may include headache, confusion, cough, breathing difficulty, pulmonary edema, seizures, or collapse.

Gas Scavenger

A substance or device that removes unwanted gases from a fluid, container, or breathing system. In healthcare it may help prevent toxic exposure or maintain safe gas delivery.

Gasserian Ganglion

A cluster of nerve cells near the base of the skull

that carries sensation from the face and controls some chewing muscles. It is involved in trigeminal neuralgia and other facial-nerve disorders.

Gastralgia

Pain in the upper abdomen or stomach area. Causes include indigestion, reflux, ulcers, gallbladder disease, pancreatic inflammation, infection, or other conditions; severe pain may occur with bleeding, vomiting, fever, or weight loss.

Gas Transport

Movement of oxygen from the lungs to body tissues and carbon dioxide back to the lungs through the blood. Hemoglobin carries most oxygen and part of the carbon dioxide.

Gastrectomy

Surgery removing part or all of the stomach, usually for cancer or severe disease. Food passage is reconstructed, and possible effects include early fullness, weight loss, nutritional deficiencies, reflux, or dumping symptoms.

Gastric Acid

Strong acid made by the stomach lining that helps break down food, activate digestive enzymes, and kill many swallowed microbes. Excess can contribute to reflux or ulcers; too little can impair digestion and nutrient absorption.

Gastric Adenocarcinoma

The most common stomach cancer, arising from cells lining the stomach. It may cause indigestion, pain, early fullness, vomiting, bleeding, or weight loss; tissue examination and staging identify its type and extent.

Gastric Adenoma

A usually noncancerous growth of gland-forming cells in the stomach lining. Some adenomas can develop into stomach cancer, so their size, appearance, and tissue findings matter.

Gastric Analysis

Examination of stomach contents for volume, acidity, or selected substances. It is used only in specific situations because endoscopy, imaging, and blood tests are more useful for many stomach disorders.

Gastric Antral Vascular Ectasia

Enlarged fragile blood vessels in the lower stomach that can cause slow internal bleeding and iron-deficiency anemia. It may appear as red stripes or spots during endoscopy and is associated with some liver and autoimmune diseases.

Alternate Names:
GAVE; Watermelon Stomach

Gastric Antrum

The lower part of the stomach between its body and the pylorus. It grinds food and helps regulate stomach emptying; its G cells release gastrin, which stimulates acid secretion elsewhere in the stomach.

Gastric Balloon

A temporary balloon placed inside the stomach to create fullness and support weight loss. Nausea, vomiting, reflux, deflation, blockage, bleeding, or perforation can occur.

Gastric Bezoar

A mass of material that cannot be digested and collects in the stomach. It may contain plant fiber, hair, or medicines and can cause fullness, pain, vomiting, blockage, or poor nutrition.

Gastric Biopsy

Removal of a small sample of stomach lining, usually during endoscopy, for laboratory examination. It can help assess inflammation, infection, precancerous changes, or cancer.

Gastric Body

The main middle part of the stomach between the fundus and the antrum. It stores and mixes food and contains glands that release acid and digestive substances.

Gastric Bypass

An operation that makes a small stomach pouch and connects it to the small intestine, changing food intake, gut-hormone signals, and nutrient absorption. Roux-en-Y gastric bypass is a common form; the term does not refer to every bariatric operation.

Gastric Bypass Surgery

Alternate name; see *Gastric Bypass*.

Gastric Cancer

See *Stomach Cancer*.

Gastric Carcinoid Tumor

Older term for a usually well-differentiated neuroendocrine tumor in the stomach; see *Gastric Neuroendocrine Tumor*.

Gastric Cardia

The anatomical transition zone of the stomach immediately surrounding the gastroesophageal junction where the tubular esophagus empties into the stomach, lined by simple columnar mucous-secreting glands without parietal or chief cells.

Gastric Culture

A laboratory test that grows bacteria from a stomach sample, usually collected during endoscopy. It can identify Helicobacter pylori and help select antibiotics, although other tests are more commonly used.

Alternate Names:
Helicobacter Pylori Culture; Gastric Biopsy Culture

Gastric Crohn's Disease

See *Gastroduodenal Crohn Disease*.

Gastric Diverticulum

A pouch that bulges outward from the stomach wall. It is often present from birth and causes no symptoms, but some people have pain, nausea, or trouble swallowing, depending on its size and location.

Gastric Dysplasia

Abnormal cells in the stomach lining that have some features of cancer but have not invaded deeper tissue. Low- or high-grade changes may increase the risk of stomach cancer.

Gastric Emptying

The passage of food and liquid from the stomach into the small intestine through coordinated stomach contractions and opening of the pylorus. Abnormally slow or rapid emptying can cause digestive symptoms.

Gastric Emptying Study

A test that measures how quickly food leaves the stomach. The patient eats a meal containing a small tracer, and a scanner records the remaining food over several hours to detect unusually slow or rapid emptying.

Gastric Fistula

An abnormal passage between the stomach and another organ or the skin. Stomach contents may leak through it, causing drainage, infection, skin irritation, dehydration, or poor nutrition.

Gastric Fundus

The upper, rounded part of the stomach, located above the main stomach body and near the diaphragm. It can expand to store food and contains glands that produce digestive secretions.

Gastric Glands

Glands in the stomach lining that make acid, digestive enzymes, mucus, intrinsic factor, and hormones.

Gastric Hemorrhage

Bleeding from the stomach, commonly caused by an ulcer, a tumor, or blood-vessel damage. It may cause vomiting blood, black stools, dizziness, anemia, or shock. It is one possible source of upper gastrointestinal bleeding, which can also come from the esophagus or duodenum.

Alternate Names:
Gastric Bleeding

Gastric Intestinal Metaplasia

A change in which cells lining the stomach become more like cells that normally line the intestine, often after long-term inflammation. It can raise the future risk of stomach cancer, especially when widespread or severe.

Gastric Ischemia

Reduced blood flow to the stomach that deprives its lining or wall of oxygen. It is uncommon because the stomach has a rich blood supply, but severe or prolonged ischemia can cause ulcers, bleeding, tissue death, or a hole in the wall.

Gastric Juice

Fluid made by the stomach containing acid, digestive enzymes, mucus, water, salts, and intrinsic factor. It helps break down food, protect the stomach lining, and absorb vitamin B12 later in digestion.

Gastric Lavage

A procedure that flushes the stomach through a tube passed through the mouth or nose. It is rarely used because it can cause aspiration or injury and is reserved for selected emergencies.

Gastric Leiomyoma

A usually noncancerous growth of smooth muscle in the stomach wall. It may cause no symptoms or appear as a lump beneath the stomach lining; larger growths can bleed or block food passage.

Gastric Leiomyosarcoma

A rare cancer of smooth muscle in the stomach wall. It may cause pain, bleeding, vomiting, or a mass and is evaluated with imaging and biopsy; treatment usually involves surgery when possible.

Gastric Lipoma

A usually noncancerous growth made of fat cells in the stomach wall. Most cause no symptoms, but a larger one may bleed, cause pain, or block the stomach outlet.

Gastric Lymphoma

A lymphoma that starts in the stomach. Some mucosa-associated lymphoid tissue (MALT) lymphomas are linked to *Helicobacter pylori*; the relationship and clinical course vary by lymphoma type.

Gastric MALT Lymphoma

A type of lymphoma that starts in immune tissue in the stomach lining. It is often linked to *Helicobacter pylori* infection and is usually slow-growing; see also *MALT Lymphoma*.

Gastric Malignancy

See *Stomach Cancer*.

Gastric Motility

The coordinated muscle activity that mixes stomach contents and moves them toward the small intestine.

Gastric Dysmotility

Abnormal movement of food through the stomach because its muscle contractions are weak or poorly timed. It may cause nausea, fullness, bloating, or delayed stomach emptying; gastroparesis is one specific form.

Gastric Mucosa

The moist inner lining of the stomach. It contains glands that produce acid, digestive enzymes, mucus, and intrinsic factor and is protected by a mucus barrier; inflammation or injury can cause pain or bleeding.

Gastric Muscularis

The muscle layers in the stomach wall that mix food and move it toward the pylorus. The stomach has an extra inner muscle layer that helps with grinding.

Gastric Necrosis

Death of stomach tissue caused by severely reduced blood flow, corrosive injury, extreme stretching, infection, or another serious insult. It can lead to perforation, severe infection, and shock.

Gastric Neuroendocrine Tumor

A tumor arising from hormone-producing cells in the stomach lining. Some grow slowly and are linked to long-term stomach inflammation or excess gastrin, while others behave more aggressively; behavior depends on the tumor type and grade.

Gastric Neuroendocrine Tumour

Alternate spelling; see *Gastric Neuroendocrine Tumor*.

Gastric Obstruction

Partial or complete blockage that prevents food and liquid from leaving the stomach normally. It may cause repeated vomiting, upper-abdominal pain, fullness, swelling, dehydration, and weight loss.

Gastric Outlet Obstruction

Blockage where the stomach empties into the small intestine, usually at the pylorus or duodenum. Causes include ulcer scarring, tumors, inflammation, and infantile pyloric stenosis; vomiting can cause dehydration.

Gastric Perforation

A hole through the stomach wall that allows stomach contents to leak into the abdomen. It can cause severe inflammation, infection, and shock.

Gastric Pneumatosis

Gas within the stomach wall. It may result from pressure-related injury and be relatively mild, or from severe infection, which can destroy tissue and cause sepsis.

Gastric Polyps

Growths projecting from the stomach lining. Most are harmless, but some types are linked to chronic inflammation, inherited conditions, or long-term acid-suppressing treatment and may contain precancerous changes.

Gastric Rugae

Folds in the inner lining of the empty stomach that flatten as the stomach fills. They allow the stomach to expand and increase the lining's surface area.

Gastric Secretion

The release of acid, enzymes, mucus, intrinsic factor, and hormones by the stomach lining.

Gastric Schwannoma

A usually noncancerous growth from nerve-supporting cells in the stomach wall. It may cause no symptoms or appear as a lump beneath the stomach lining; its type is confirmed by examining tissue.

Gastric Serosa

The thin outer covering of the stomach, formed by the visceral peritoneum. It reduces friction as the stomach moves inside the abdomen.

Gastric Stenosis

Abnormal narrowing of the stomach or its outlet that slows or blocks emptying. It may result from birth defects, ulcer scarring, inflammation, tumors, or thickening of the outlet muscle.

Gastric Submucosa

The connective-tissue layer beneath the stomach lining. It contains blood vessels, lymph vessels, nerves, and supporting tissue.

Gastric Suction

Removal of stomach contents through a tube passed through the nose or mouth. It may relieve severe distension or vomiting from obstruction and is used only when clinically indicated because complications can occur.

Alternate Names:
Nasogastric Aspiration; Stomach Pumping

Gastric Surgery

An operation on the stomach to remove disease, repair damage, reduce its size, or bypass a blockage. The exact procedure and risks depend on the condition and may include bleeding, infection, leakage, or altered digestion.

Gastric Tissue Biopsy And Culture

Removal of small stomach-lining samples during endoscopy for microscopic examination and, when needed, laboratory testing for infection. It can investigate inflammation, Helicobacter pylori, precancerous changes, or tumors.

Gastric Tuberculosis

A rare form of tuberculosis that affects the stomach. It may cause pain, ulcers, bleeding, or a blockage and can resemble an ulcer or stomach cancer; diagnosis may require testing a stomach-tissue sample for tuberculosis.

Alternate Names:
Endoscopic Gastric Biopsy; Mucosal Culture

Gastric Ulcer

An open sore in the stomach lining, commonly caused by Helicobacter pylori infection or anti-inflammatory medicines. It may cause burning upper-abdominal pain, bleeding, anemia, or perforation.

Gastric Varices

Enlarged, fragile veins in the stomach caused by increased pressure in the portal circulation, often from advanced liver disease. Rupture can cause sudden, life-threatening vomiting of blood.

Gastric Volvulus

Twisting of the stomach that can block food passage and cut off blood supply. It may cause sudden severe upper-abdominal pain, retching without vomiting, bloating, and inability to pass a tube.

Gastric Wall

The layered wall of the stomach, made up of the mucosa, submucosa, muscle layers, and outer covering. It allows the stomach to store, mix, and move food.

Gastric Xanthoma

A small, usually harmless yellow patch in the stomach lining made of immune cells containing fat. It is often found during endoscopy and may occur where the lining has been inflamed or injured.

Gastrin

A hormone made mainly in the lower stomach and upper small intestine. It stimulates stomach acid production and helps maintain the stomach lining; levels rise after eating and may become excessive in certain diseases.

Gastrin Blood Test

A blood test measuring the hormone gastrin. It helps investigate excessive stomach acid, recurrent ulcers, or loss of acid-producing cells. Acid-suppressing medicines and fasting can significantly affect the result.

Alternate Names:
Serum Gastrin Level; Fasting Gastrin Assay

Gastrinoma

A tumor that makes too much gastrin, a hormone that causes the stomach to produce acid. It usually starts in the pancreas or duodenum and may cause Zollinger–Ellison syndrome, repeated peptic ulcers, diarrhea, and acid reflux. Some cases are linked to MEN1 and may spread to the liver or nearby lymph nodes.

Gastrin-Releasing Peptide

A signaling molecule released by nerves in the digestive tract that stimulates G cells in the stomach to release gastrin. Gastrin then promotes stomach acid secretion and other digestive functions.

Alternate Names:
GRP; Mammalian Bombesin

Gastrin Secretion

Release of the hormone gastrin, mainly from cells in the lower stomach after food enters. Gastrin increases stomach acid and digestive-enzyme release and supports growth and function of the stomach lining.

Gastritis

Inflammation of the stomach lining. It may begin suddenly (acute) or last a long time (chronic),

and may cause no symptoms or upper-abdominal pain, nausea, vomiting, or bleeding. *H. pylori* infection and autoimmune disease are important causes. Some medicines, alcohol, and severe illness can also injure the lining; when injury occurs without prominent inflammation, it is called gastropathy.

Gastrocnemius

The large muscle at the back of the calf. It helps point the foot downward and bend the knee during standing, walking, running, and jumping; injury can cause calf pain, swelling, or weakness.

Gastrocnemius Muscle

Alternate name; see *Gastrocnemius*.

Gastroduodenal Artery

A major arterial branch arising from the common hepatic artery, descending posterior to the first part of the duodenum before dividing into the right gastro-omental and superior pancreaticoduodenal arteries; erosion by a posterior duodenal ulcer produces massive upper gastrointestinal hemorrhage.

Alternate Names:
GDA

Gastroduodenal Crohn Disease

Crohn disease affecting the stomach or first part of the small intestine. It may cause upper-abdominal pain, nausea, vomiting, weight loss, ulcers, narrowing, or blockage; treatment varies with symptoms and disease severity.

Gastroduodenostomy

An operation creating a new opening between the stomach and duodenum so food can pass directly into the small intestine. It may bypass a blockage or restore passage after part of the stomach is removed.

Gastroenteritis

Infection or inflammation of the stomach and intestines, commonly caused by viruses and sometimes by bacteria, parasites, or toxins. It usually causes diarrhea, vomiting, cramps, and fever and can lead to dehydration.

Gastroenteritis Bacterial

Inflammation of the stomach or intestines caused by bacteria, usually after contaminated food or water. It can cause diarrhea, cramps, fever, vomiting, and dehydration; blood in stool or severe illness may occur.

Gastroenteritis Viral

Alternate index label; see *Viral Gastroenteritis*.

Gastroenterologic Surgery

Alternate name; see *Gastrointestinal Surgery*.

Gastroenterologist

A physician specializing in disorders of the digestive tract, liver, gallbladder, bile ducts, and pancreas. They diagnose and treat digestive problems using medicines, endoscopy, procedures, lifestyle care, and surgery referrals.

Gastroenterology

The medical specialty concerned with the digestive tract, liver, gallbladder, bile ducts, and pancreas. Gastroenterologists diagnose and treat these conditions with medicines, endoscopy, procedures, and referrals for surgery.

Gastroenterostomy

Surgical creation of an opening between the stomach and a segment of the small intestine, usually the jejunum, to bypass or replace a blocked or diseased gastric outlet.

Gastroepiploic Artery

The gastroepiploic arteries run along the greater curve of the stomach and supply blood to the stomach and nearby omentum.

Gastroesophageal

Relating to both the stomach and esophagus, especially their joining point or the backward movement of stomach contents into the esophagus.

Gastroesophageal Junction

Adenocarcinoma

A gland-forming cancer arising where the esophagus joins the stomach. It may cause difficulty swallowing, reflux, weight loss, anemia, or bleeding; endoscopy, biopsy, and scans determine treatment and extent.

Gastroesophageal Reflux

Backward flow of stomach contents into the esophagus. It may cause heartburn, sour fluid in the throat, cough, chest discomfort, or no symptoms. Spitting up is common in healthy infants and usually resolves with age; reflux is called disease when it causes troublesome symptoms or complications.

Gastroesophageal Reflux Disease

A chronic digestive condition that occurs when stomach acid and digestive juices repeatedly flow backward into the esophagus (the swallowing tube). This backwash irritates and inflames the delicate lining of the esophagus. Common symptoms include a burning sensation in the chest (heartburn), acid regurgitation or a sour taste in the mouth, chest discomfort, difficulty swallowing, or a persistent dry cough.

Alternate Names:
GERD; Acid Reflux Disease; Reflux Esophagitis

Gastroesophageal Reflux Disease (GERD)

Alternate name; see *Gastroesophageal Reflux Disease*.

Alternate Names:
GERD; Acid Reflux Disease

Gastroesophageal Z-Line

The visible boundary between the squamous lining of the esophagus and the columnar lining of the stomach. Its position relative to the gastroesophageal junction is assessed during endoscopy, including when evaluating Barrett esophagus.

Alternate Names:
Squamocolumnar Junction; SCJ; Ora Serrata of the Esophagus

Gastrogastric Intussusception

A rare condition in which one part of the stomach folds into an adjoining part, sometimes because of a polyp or tumor. It may cause pain, vomiting, blockage, or bleeding.

Gastrografin Study

An X-ray study using a water-soluble contrast liquid to show the digestive tract. It may be chosen when a leak or perforation is possible, because the contrast is safer outside the tract than barium.

Gastrointestinal

Relating to the stomach and intestines, or to the complete digestive tract from the mouth to the anus. These organs digest food, absorb nutrients and water, move contents forward, and remove waste.

Gastrointestinal Agents

Medicines or other substances that act on the digestive tract to relieve or treat problems such as nausea, vomiting, diarrhea, constipation, ulcers, reflux, or intestinal spasms. Their effects and risks depend on the specific agent.

Gastrointestinal Amyloidosis

Buildup of abnormal protein deposits in the digestive tract. It can impair movement, absorption, or bleeding control and may occur with disease affecting other organs such as the heart, kidneys, or nerves.

Gastrointestinal Bleeding

Bleeding anywhere in the digestive tract. It may be acute or chronic and may come from the upper digestive tract, small intestine, or lower digestive tract. It can cause vomiting blood, black stools, or red blood in the stool.

Gastrointestinal Bleeding Scan

A nuclear-medicine scan that uses a small radioactive tracer in the blood to find active bleeding in the digestive tract. It can help localize bleeding when endoscopy does not identify the source.

Gastrointestinal Cancer

Cancer arising in the digestive tract or related organs, including the esophagus, stomach, intestine, rectum, liver, pancreas, and biliary tract. Symptoms and treatment depend on the organ, tumor type, and stage.

Gastrointestinal Decontamination

Methods used after some poisonings to reduce absorption, such as activated charcoal or whole-bowel irrigation. The choice depends on the substance, timing, symptoms, and risk of aspiration; stomach washing is rarely used.

Gastrointestinal Disease

Any disorder affecting the digestive tract or related organs. Examples include reflux, ulcers, inflammatory bowel disease, infection, malabsorption, liver disease, and cancer.

Gastrointestinal Disease and Pregnancy

Pregnancy can alter gastrointestinal motility and symptoms, while inflammatory bowel disease, reflux, gallbladder or liver disease, and bowel obstruction can affect nutrition and pregnancy. Severe pain, persistent vomiting, bleeding, fever, or dehydration can signal a complication.

Gastrointestinal Disorder

A broad category for diseases affecting the digestive tract, from the esophagus to the anus; it is not one specific diagnosis. The disorder may involve a particular organ or function, such as reflux from the esophagus, inflammation of the bowel, or impaired nutrient absorption.

Gastrointestinal Fistula

An abnormal connection between the digestive tract and another organ, the skin, or another section of bowel. Digestive fluid may leak through it, causing infection, dehydration, skin damage, or poor nutrition.

Gastrointestinal Failure

See *Intestinal Failure*.

Gastrointestinal Foreign Bodies

Objects swallowed or inserted into the gastrointestinal tract that may pass spontaneously or become lodged, cause obstruction, perforation, bleeding, or poisoning. Evaluation and removal depend on the object, location, symptoms, and risk of injury.

Gastrointestinal Gas

Air or other gas within the stomach or intestines, usually from swallowed air or bacterial digestion of food. Excess gas may cause belching, bloating, cramps, or passing gas and can increase with constipation or food intolerance.

Gastrointestinal Health

Normal digestive-system function without active digestive disease or symptoms that impair quality of life. It includes breaking down food, absorbing nutrients and water, and moving waste through the bowel.

Gastrointestinal Hemorrhage

Bleeding from any part of the digestive tract, from the esophagus to the anus. It may cause vomiting blood, black stools, red blood in stool, anemia, dizziness, or shock.

Gastrointestinal Hormone

A chemical messenger made by cells in the digestive tract that helps regulate stomach acid, intestinal movement, digestion, appetite, gallbladder activity, or blood-glucose control.

Gastrointestinal Motility Disorder

Abnormal movement of food, liquid, or stool through the digestive tract. It can cause difficulty swallowing, nausea, vomiting, bloating, abdominal pain, constipation, or diarrhea; causes may involve digestive muscles, nerves, hormones, or a blockage.

Gastrointestinal Neoplasm

An abnormal growth arising in the digestive tract. It may be a harmless growth, a precancerous change, or cancer; symptoms and treatment depend on its tissue, location, and behavior.

Gastrointestinal Obstruction

Partial or complete blockage of food, fluid, or stool through the digestive tract. It can cause cramping pain, vomiting, swelling, constipation, dehydration, loss of blood supply, perforation, or sepsis.

Gastrointestinal Pain

Pain arising from the digestive tract or related organs. Causes include infection, ulcers, inflammation, blockage, gallstones, and diseases of the liver or pancreas. It may be severe, persistent, or worsening.

Gastrointestinal Perforation

A hole through the wall of the digestive tract that allows its contents to leak into surrounding tissue. It can cause severe abdominal pain, peritonitis, sepsis, and shock.

Gastrointestinal Stromal Tumor

A mesenchymal tumor arising from specialized cells in the digestive-tract wall, most often the stomach or small intestine. Many are driven by changes in *KIT* or *PDGFRA*. They may cause bleeding, pain, or blockage, or be found incidentally; risk depends on tumor size, site, cell division rate, and rupture.

Gastrointestinal Stromal Tumors

Alternate plural form; see *Gastrointestinal Stromal Tumor*.

Gastrointestinal Stromal Tumors (GISTs)

Alternate plural form; see *Gastrointestinal Stromal Tumor*.

Gastrointestinal Surgery

Surgery to treat diseases or injuries of the digestive tract and related organs, including the esophagus, stomach, intestines, liver, gallbladder, bile ducts, and pancreas. Surgeons may specialize in particular organs or procedures.

Gastrointestinal System

The connected organs that move and digest food, absorb nutrients and water, and remove solid waste. It includes the mouth, esophagus, stomach, intestines, rectum, and anus, with help from the liver, gallbladder, and pancreas.

Gastrointestinal Tract

The continuous digestive passage from the mouth through the esophagus, stomach, small and large intestines, rectum, and anus. It moves food, digests it, absorbs nutrients and water, and removes waste.

Gastrointestinal Villi

Tiny finger-like projections lining the small intestine that greatly increase the area available to absorb nutrients and water. Each contains small blood vessels and a lymph vessel that carry absorbed substances away.

Gastrojejunostomy

An operation creating a new connection between the stomach and jejunum, the middle part of the small intestine. It may bypass a blocked stomach outlet or replace a damaged section of digestive tract.

Gastrojejunostomy Tube Intolerance

A descriptive term for gastrointestinal symptoms associated with feeding through a gastrojejunostomy (GJ) tube. Symptoms may include nausea, vomiting, retching, abdominal pain or distension, and diarrhea. It is not a single diagnosis; possible contributors include feed composition or delivery rate, tube displacement or blockage, altered gut motility, or other disease.

Gastromalacia

Abnormal softening of the stomach wall. It is a rare descriptive finding that may result from severe inflammation, poor blood supply, or tissue injury and can increase the risk of weakness or perforation.

Gastroparesis

A condition in which the stomach empties food too slowly even though there is no blockage. It may cause early or lasting fullness after meals, nausea, vomiting, bloating, or upper-abdominal discomfort. Causes include diabetes, surgery, some medicines, and nerve disorders; some cases have no known cause.

Alternate Names:
Delayed Gastric Emptying

Gastropathy

Damage or disease of the stomach lining without the prominent inflammation seen in gastritis. Causes include medicines, alcohol, poor blood flow, bile reflux, and severe illness; symptoms may include pain, nausea, or bleeding.

Gastroplasty

Surgery that changes the size or shape of the stomach, usually to support weight loss or repair a defect. Possible complications include bleeding, infection, leakage, reflux, and nutritional deficiencies.

Gastroptosis

Downward displacement of the stomach from its usual position. It may be seen on imaging and may or may not cause symptoms; the finding alone does not establish the cause of digestive complaints.

Alternate Names:
Gastric Prolapse

Gastroschisis

A birth defect in which the intestine, and sometimes other organs, protrudes through an opening beside the umbilicus without a protective covering. The exposed bowel may be swollen or damaged.

Gastroschisis Repair

Surgical repair of gastroschisis, a congenital abdominal wall defect where intestines protrude through an opening near the umbilicus. The bowel is returned to the abdomen and the defect is closed, sometimes in stages using a temporary covering.

Gastroscope

A thin, flexible instrument with a light and camera used to view the esophagus, stomach, and first part of the small intestine. It can also pass tools for biopsy or treatment.

Gastroscopy

Examination of the esophagus, stomach, and duodenum using a flexible camera tube passed through the mouth. It can identify bleeding, ulcers, inflammation, narrowing, or tumors and allows biopsies or selected treatments.

Gastrospenic Fistulization

Misspelling; see *Gastrosplenic Fistula*.

Gastrosplenic Fistula

An abnormal connection between the stomach and spleen. It may result from lymphoma, another tumor, ulceration, or infection and can cause abdominal pain or gastrointestinal bleeding.

Gastrostomy

A surgically created opening through the abdominal wall into the stomach. A tube placed through it can provide food, fluids, or medicines or remove stomach contents when normal feeding is unsafe or impossible.

Gastrostomy Tube

A tube passed through the abdominal wall into the stomach to provide food, fluids, or medicines when swallowing is unsafe or inadequate. Problems can include skin infection, leakage, blockage, bleeding, and movement of the tube.

Gastrostomy Tube Insertion

A surgical, laparoscopic, or endoscopic procedure in which a feeding tube is placed directly through the abdominal wall into the stomach for long-term enteral nutrition.

Alternate Names:
G-Tube Placement

Gastrostomy Tube Placement

The surgical or endoscopic creation of an opening into the stomach to place a feeding tube directly through the abdominal wall; see *Gastrostomy Tube Insertion* and *Percutaneous Endoscopic Gastrostomy*.

Gastrula

An early embryo stage formed after gastrulation,

when cell layers reorganize into ectoderm, mesoderm, and endoderm that give rise to body tissues.

Gastrulation

An early stage of embryo development in which cells move and reorganize into three layers that later form all major tissues and organs.

Gated Blood Pool Scan

A radionuclide cardiac study, also called radionuclide ventriculography or MUGA, that uses ECG-gated images of labeled blood to measure ventricular ejection fraction and assess ventricular wall motion. It is used selectively when quantitative ventricular function is needed.

Gatifloxacin

Gatifloxacin is a fluoroquinolone antibiotic that inhibits bacterial DNA gyrase and topoisomerase IV; systemic use is restricted in many settings because of dysglycaemia and other class toxicities, while ophthalmic use remains available in some regions.

Gaucher Disease

An inherited condition in which a missing or weak enzyme lets fatty substances build up in cells. It can enlarge the liver and spleen and cause anemia, easy bruising, low platelets, or bone pain. Some forms also damage the brain and nerves. The condition is usually caused by changes in the *GBA1* gene.

Gaucher-Schlagenhaufer

Alternate name; see *Gaucher Disease*.

Gaucher's Disease

Alternate spelling; see *Gaucher Disease*.

Gaucher Splenomegaly

Alternate name; see *Gaucher Disease*.

Gaultheria Oil

Oil of wintergreen, an essential oil containing concentrated methyl salicylate. It may be used in small amounts in topical products, but swallowing even a small amount can cause serious salicylate poisoning, especially in children.

Gauss

A unit of magnetic flux density equal to 10^{-4} tesla, used in physics, imaging, and descriptions of magnetic fields.

Gauze

A woven or nonwoven material used to clean, dress, pack, or absorb fluid from a wound. It may be sterile or nonsterile and comes in several forms.

Gavage

Giving liquid food or medicine through a tube into the stomach. It is used when swallowing is unsafe or oral intake is inadequate, including for premature infants who cannot coordinate sucking, swallowing, and breathing.

Gayet-Wernicke Syndrome

Alternate name; see *Wernicke Encephalopathy*.

Gaze Palsy

An inability to move both eyes conjugately in a particular direction (horizontal, vertical, or upgaze), caused by lesions involving the cortical frontal eye fields, the paramedian pontine reticular formation (PPRF), or the midbrain rostral interstitial nucleus of the medial longitudinal fasciculus (riMLF).

Alternate Names:
Conjugate Gaze Palsy; Ocular Conjugate Palsy

GBM

Abbreviation for glioblastoma, an aggressive adult-type diffuse glioma classified as glioblastoma, IDH-wildtype. It can grow quickly and cause headache, seizures, weakness, or changes in speech, memory, or behavior. *Glioblastoma multiforme* is a historical name.

Alternate Names:
Glioblastoma

Gefitinib

An oral epidermal growth factor receptor tyrosine-kinase inhibitor used for selected advanced non-

small-cell lung cancers with activating EGFR mutations.

Gegenhalten

A velocity-independent, variable increase in resistance to passive limb movement in which the patient involuntarily opposes the examiner's manipulation with a force proportional to that applied by the examiner, commonly observed in diffuse frontal lobe disease, dementia, and metabolic encephalopathy.

Alternate Names:
Paratonia; Oppositional Paratonia

Geiger Counter

An instrument that detects and measures ionizing radiation. It can identify radioactive contamination or exposure, but its readings do not by themselves show how much biological harm the radiation caused.

Gel

A semisolid preparation in which liquid is held in a soft network. Gels may be applied to the skin, eyes, mouth, or other areas to soothe tissue, deliver medicine, or form a protective layer.

Gelastic Seizure

A rare seizure that causes sudden, repeated bursts of laughter without feeling amused. It is often linked to a small growth called a hypothalamic hamartoma, but other brain conditions can also cause it.

Gelatin

Gelatin is a protein made from collagen and used in foods, medicines, capsules, and some medical materials.

Gelatin Sponge

A sterile gelatin material placed during surgery to help control bleeding by supporting clot formation. It is gradually absorbed; swelling or infection can rarely occur.

Gel Electrophoresis

Gel electrophoresis separates DNA, RNA, or proteins by moving them through a gel in an electric field, usually according to size and charge.

Gelineau Syndrome

A sleep disorder causing repeated, uncontrollable daytime sleep episodes. Some people also have sudden muscle weakness triggered by emotion, sleep paralysis, or vivid dream-like experiences while falling asleep or waking.

Gemcitabine

A chemotherapy medicine that becomes active inside cells and interferes with DNA production, slowing or killing rapidly dividing cancer cells. It is used for several cancers and may cause low blood counts, nausea, rash, or organ toxicity.

Gemcitabine Hydrochloride

The hydrochloride form of gemcitabine, a chemotherapy medicine that interferes with DNA production in dividing cells. It is used for several cancers; important risks include infection from low blood counts and treatment-related organ injury.

Gemella

Gemella is a group of bacteria that normally may inhabit the mouth and upper airway but can rarely cause serious infections, including bloodstream infection.

Gemfibrozil

A medicine that lowers very high blood triglycerides and may reduce the risk of pancreatitis. It changes how the liver processes fats but can interact with statins and increase the risk of serious muscle injury.

Gemifloxacin

An antibiotic in the fluoroquinolone group used for selected bacterial respiratory infections. It can cause nausea and, rarely, tendon injury, nerve symptoms, abnormal heart rhythm, severe diarrhea, or dangerous allergic reactions.

Gemination

An attempt by one developing tooth bud to divide,

producing a large tooth with a split or partly divided crown. The total number of teeth is usually normal, and dental assessment guides treatment.

Gemistocytic Astrocytoma

A former histologic variant of diffuse astrocytoma composed partly of gemistocytic astrocytes. The term is now used mainly descriptively because integrated molecular classification determines the modern tumor diagnosis and grade.

Gemtuzumab Ozogamicin

An antibody-linked chemotherapy medicine used for selected acute myeloid leukemia. The antibody attaches to CD33-positive leukemia cells and delivers a toxic drug; liver injury, infusion reactions, and low blood counts are important risks.

Gender

A social, cultural, and personal concept involving identity, roles, expression, and expectations. Gender is related to, but distinct from, sex characteristics and sexual orientation.

Gender-Affirming Surgery

Surgical procedures intended to align physical characteristics with a person's gender identity. Procedures may involve the chest, face, voice, or external genitalia and are individualized according to anatomy, goals, health, and informed consent.

Gender Dysphoria

Clinically significant distress or impairment associated with incongruence between a person's experienced or expressed gender and sex assigned at birth. Having a gender identity different from sex assigned at birth does not by itself constitute gender dysphoria.

Gender Identity

A person's internal sense of being a woman, man, both, neither, or another gender, which may or may not correspond to sex assigned at birth.

Gender Incongruence

A difference between a person's experienced or expressed gender and sex assigned at birth. Gender incongruence is a descriptive term and does not by itself imply distress, impairment, or a mental disorder.

Gene

A section of DNA that contains instructions for making a functional product, usually a protein or RNA. Genes are arranged at specific locations on chromosomes and influence inherited traits and cell function.

Gene Amplification

An increase in the number of copies of a gene or genomic region, which can raise gene expression and drive some inherited conditions or cancers.

Gene Conversion

A nonreciprocal transfer of sequence information from one DNA region to a homologous region, potentially changing an allele during recombination or repair.

Gene Deletion

Loss of part or all of a gene from DNA, potentially abolishing its product or altering dosage and causing disease when clinically significant.

Gene Dosage

The number of functional copies of a gene and the amount of product they produce, influenced by deletions, duplications, chromosome number, and regulation.

Gene Duplication

An extra copy of a gene created by replication or rearrangement, which may have no effect, alter dosage, or provide material for new gene function.

Gene-Environment Interaction

A gene-environment interaction occurs when an environmental exposure changes disease risk differently according to a person's genotype, so inherited sus-

ceptibility and exposure jointly influence phenotype.

Gene Expression

The process by which a cell uses information in a gene to make RNA or protein. Cells control when and how strongly genes are expressed, allowing different tissues to develop and perform specialized functions.

Gene Frequency

The proportion of all gene copies in a population that carry a particular version, or allele, of that gene. It describes population genetics and does not by itself predict an individual's disease risk.

Gene Fusion

A hybrid gene formed when segments of two separate genes join, sometimes producing an abnormal protein that drives cancer or other disease.

Gene Modification

An intentional or naturally occurring alteration of DNA sequence or gene regulation that changes cellular function or inherited traits.

Gene-Modified

Describing cells or organisms whose genetic material has been deliberately altered using recombinant DNA or genome-editing methods.

Gene Mutation

A permanent change in the DNA sequence of a gene, which may be harmless, beneficial, or pathogenic depending on its effect and inheritance.

Gene Panel

A genetic test that examines a selected group of genes linked to a person's symptoms or suspected condition. It can provide focused results but may miss changes in genes or DNA regions not included in the panel.

General Anesthesia

A controlled, temporary state of unconsciousness produced by medicines so a person does not feel or remember a procedure. Breathing, blood pressure, heart rate, and other body functions are monitored throughout.

General Anesthetic

A medicine used to produce a controlled, reversible state of unconsciousness and lack of awareness during surgery or another procedure. It may be combined with separate medicines for pain relief or muscle relaxation; breathing and other vital functions require monitoring.

Alternate Names:
General Anesthetics

Generalised

British spelling; see *Generalized*.

Generalized

Distributed widely or involving most or all of a body region, system, or population rather than being confined to one focus.

Generalized Anxiety Disorder

A mental-health disorder involving excessive, difficult-to-control worry about several areas of life on most days for at least six months. Restlessness, tiredness, poor concentration, irritability, muscle tension, and sleep problems may occur.

Generalized Anxiety Disorder (GAD)

Alternate name; see *Generalized Anxiety Disorder*.

Generalized Anxiety Disorder In Children

Excessive, difficult-to-control worry about several areas of life on most days for at least six months, causing distress or interfering with a child's functioning. Restlessness, fatigue, difficulty concentrating, irritability, muscle tension, and sleep disturbance may occur.

Alternate Names:
Pediatric GAD; Childhood Generalized Anxiety

Generalized Essential Telangiectasia

Widespread fine superficial dilated vessels without

an identifiable underlying systemic disease or localized cause. They are usually asymptomatic; a new or rapidly progressive pattern can be associated with medicines, connective-tissue disease, liver disease, or other secondary causes.

Generalized Granuloma Annulare

A widespread skin condition causing many small, skin-colored, red, or purple bumps over the trunk and limbs. It may be associated with diabetes and can last longer than localized granuloma annulare.

Generalized Lipodystrophy

A disorder with near-total loss of adipose tissue, severe insulin resistance, diabetes, high triglycerides, fatty liver, and abnormal fat deposition in other tissues.

Generalized Lymphadenopathy

Enlargement of lymph nodes in several separate areas of the body. It may result from an infection, an immune disorder, or a blood cancer and differs from swelling limited to one area.

Alternate Names:
Diffuse Lymphadenopathy; Systemic Lymphadenopathy

Generalized-Onset Seizure

Older classification term; see *Generalized Seizure*.

Generalized Seizure

A seizure arising within and rapidly engaging networks distributed across both sides of the brain. It may appear to start in one area or have asymmetric movements; visible symptoms alone do not determine whether onset is focal or generalized.

Generalized Tonic-Clonic Seizure

A seizure causing loss of consciousness, stiffening of the whole body, and then repeated jerking of the limbs. Confusion and sleepiness often follow; a seizure lasting five minutes or longer is prolonged.

Generalized Weakness

Reduced strength affecting multiple body regions, caused by systemic illness, metabolic or electrolyte disturbance, medication, infection, muscle disease, nerve disease, neuromuscular-junction disease, or brain or spinal-cord disease. It may occur with speech, facial, breathing, or walking difficulty.

General Paresis

A late form of neurosyphilis affecting the brain. It can gradually cause memory loss, personality or mood changes, poor judgment, tremor, weakness, or difficulty walking.

Alternate Names:
General Paresis of the Insane; Paralytic Dementia

General Surgery

A surgical specialty concerned with a broad range of conditions, particularly those involving the abdomen, digestive tract, breast, endocrine glands, skin, and soft tissues. It also includes surgical care of many injuries and urgent conditions.

Generator

A device that produces a short-lived radioactive substance from a longer-lived one for nuclear-medicine tests. The product is separated, checked for purity and sterility, and then used to make a tracer.

Gene Rearrangement

Reorganization of DNA segments within or between chromosomes that can alter gene structure, expression, immune-receptor diversity, or cancer biology.

Generic

Describing a medicine by its active ingredient rather than a brand name; an approved generic drug must meet applicable standards for quality and therapeutic equivalence to its reference product.

Genes

Sections of DNA that contain instructions for making proteins or functional RNA. They are arranged on chromosomes and influence inherited traits, cell activity, disease risk, and responses to some treatments.

Gene Silencing

Reduction or stopping of a gene's activity through DNA changes, chromatin control, RNA interference, or other processes that limit protein production.

Genesis

The origin, formation, or development of something, such as a disease, organ, symptom, or process. Understanding its genesis can help explain causes, risk factors, progression, prevention, and treatment.

Gene Targeting

A molecular method that changes a chosen genomic locus through homologous recombination or engineered editing to study or alter gene function.

Gene Therapy

Treatment that changes DNA, RNA, or gene activity in a person's cells to treat disease. It may add a gene, switch off a harmful gene, replace a faulty gene, or edit DNA. Changes may be made inside the body or in cells changed outside the body and then returned.

Genetic Anticipation

Earlier onset or increasing severity of a hereditary disorder in successive generations, often caused by expansion of unstable repeated DNA sequences.

Genetic Carrier

A person who carries a disease-associated genetic variant and may pass it to children. Carriers of one variant for an autosomal recessive condition usually do not have that condition, although this is not true for every inherited disorder.

Genetic Code

The rules cells use to read genetic instructions in groups of three DNA or RNA building blocks. Each group directs the cell to add a particular amino acid to a protein or to stop making the protein.

Genetic Counseling

A professional discussion that explains how inherited factors may affect a person or family. It may cover risk, testing choices, results, reproductive options, emotional support, and implications for relatives.

Genetic Counselling

Alternate spelling; see *Genetic Counseling*.

Genetic Counselor

A trained health professional who explains inherited conditions, estimates genetic risk, discusses testing, and helps patients and families understand results and choices. They may coordinate testing of relatives when appropriate.

Genetic Disease

Alternate name; see *Genetic Disorder*.

Genetic Disorder

A disease or disorder caused wholly or partly by a pathogenic change in genetic material. The change may involve one or more genes, chromosome number or structure, mitochondrial DNA, or gene regulation. It may be inherited through germline DNA, arise de novo, or occur only in certain tissues as a somatic change. Some conditions also result from interactions among multiple genetic variants and environmental factors; not every genetic change causes disease.

Genetic Drift

Random changes in allele frequencies from one generation to the next, especially in small populations, independent of natural selection.

Genetic Engineering

Deliberate changing, adding, removing, or transferring genetic material using laboratory methods. It supports research, diagnosis, treatment development, agriculture, and biotechnology but requires careful assessment of safety, ethics, and unintended effects.

Genetic Heterogeneity

The situation in which similar features or the same disease can result from different genetic causes. Different genes or different changes within one gene

may produce overlapping effects.

Genetic Linkage

The tendency of nearby genes or DNA markers on the same chromosome to be inherited together because crossing over is less likely between them.

Genetic Marker

A detectable DNA variation or feature used to track inheritance, identify a chromosome region, assess disease risk, or distinguish samples.

Genetic Polymorphism

A common DNA variation with at least two alleles in a population, which may influence traits, drug response, or disease susceptibility.

Genetic Profile

A set of genetic variants or DNA markers describing an individual, tumor, organism, or sample for diagnosis, risk assessment, identification, or research.

Genetic Recombination

Exchange or rearrangement of DNA segments that creates new allele combinations during meiosis, repair, immune-cell development, or laboratory manipulation.

Genetics

Genetics is the study of genes, heredity, genetic variation, and how DNA and gene regulation influence traits, disease risk, diagnosis, and treatment response.

Genetic Screening

Testing people or groups without symptoms to identify an increased chance of a genetic condition or a risk of passing one to children. Examples include newborn and carrier screening; a positive screening result generally requires diagnostic testing.

Genetic Sequencing

Determination of the order of DNA bases in a selected gene or larger DNA region. Sequencing can identify genetic variants, but findings must be interpreted in light of the clinical question and other evidence.

Alternate Names:
DNA Sequencing

Genetic Sonogram

An older term for a detailed pregnancy ultrasound used to examine fetal anatomy and look for findings associated with some chromosome conditions. Ultrasound does not diagnose or exclude all genetic conditions.

Genetic Susceptibility

Inherited tendency to develop a disease or respond to an exposure, which usually modifies risk rather than determining outcome alone.

Genetic Technique

A laboratory method used to detect, amplify, sequence, edit, compare, or otherwise analyze DNA, RNA, chromosomes, or gene expression.

Genetic Testing

Analysis of DNA or chromosomes to assess disease risk, explain symptoms, identify carriers, or guide treatment. Results may also provide information about inherited traits and conditions affecting relatives.

Genetic Transcription

The first step in using a gene: an enzyme copies information from DNA into RNA. The RNA may then guide protein production or perform another function inside the cell.

Genetic Variant Of Uncertain Significance

A DNA change whose effect on health is not yet known. It does not by itself show that a person has a disease or predict future disease and may later be classified as harmless or disease-causing as evidence improves.

Gene Transfer

Movement of genetic material into a cell or organism,

naturally or through laboratory vectors, potentially changing gene expression or correcting a defect.

Geniculate Body

One of two paired relay structures in the brain. The lateral geniculate body processes visual signals, while the medial geniculate body processes hearing signals before sending them to the cerebral cortex.

Geniculate Ganglion

An L-shaped sensory ganglion of the facial nerve (cranial nerve VII) located within the facial canal of the temporal bone, housing the primary pseudounipolar sensory neuronal cell bodies conveying special taste sensation from the anterior two-thirds of the tongue (via chorda tympani).

Genital

Pertaining or relating to the anatomical organs and physiological structures of reproduction and external sexuality. In embryology, male and female external genitalia develop from common, bipotential primordial precursors: the genital tubercle (giving rise to the glans penis in males and glans clitoridis in females), urogenital folds (ventral shaft of the penis and spongiform urethra in males; labia minora in females), and labioscrotal swellings (scrotum in males under dihydrotestosterone stimulation; labia majora in females in the absence of androgens). Genital disorders encompass infectious, congenital, dermatological, and neoplastic conditions affecting the vulva, vagina, cervix, uterus, ovaries, fallopian tubes, penis, scrotum, testes, or prostate.

Alternate Names:
Genitals; Reproductive Organs

Genital Edema

Swelling of genital tissues from fluid accumulation caused by infection, inflammation, allergy, trauma, venous or lymphatic obstruction, or systemic disease.

Genital Herpes

An infection of the genital or anal area caused by herpes simplex virus type 1 or type 2 (HSV-1 or HSV-2). It spreads mainly through sexual skin-to-skin contact and can be transmitted even when no sores are present. It may cause painful blisters or ulcers, burning urination, swollen glands, or no symptoms; outbreaks can recur. Infection during pregnancy can threaten the newborn.

Genital Herpes in Pregnancy

Genital herpes caused by HSV-1 or HSV-2 can be acquired, recur, or be transmitted to the newborn during pregnancy or delivery. Management considers timing of infection, lesions or prodrome at labor, antiviral therapy, and delivery planning to reduce neonatal transmission.

Genital Herpes in Women

Herpes simplex virus infection of the female genitalia, causing painful blisters or ulcers. It may have no symptoms. Antiviral treatment can reduce symptoms and transmission; infection during pregnancy can affect the newborn.

Alternate Names:
Female Genital Herpes

Genitalia

The external and internal reproductive organs. The term includes the vulva and vagina, or the penis, scrotum, and associated structures, together with the gonads and reproductive ducts when used broadly; anatomy varies with sex, age, and developmental stage.

Genital Injury

Damage to the external or internal genital tissues from childbirth, accidents, sexual contact, assault, medical procedures, or disease. It may cause pain, swelling, bleeding, or difficulty urinating.

Genital Mycoplasmas

Mycoplasma species found in the genital or urinary tract. *Mycoplasma genitalium* is a sexually transmitted infection associated with urethritis, cervicitis, and pelvic inflammatory disease; other species, such as *M. hominis*, may colonize the tract without causing disease.

Genital Prolapse

The dropping or bulging of one or more pelvic organs (such as the bladder, uterus, or rectum) into or through the vagina due to weakening of the pelvic floor muscles and supporting tissues. It commonly causes a feeling of a vaginal bulge or heaviness, lower back discomfort, and urinary or bowel difficulties; risks include vaginal childbirth, aging, menopause, and chronic straining.

Alternate Names:
Pelvic Organ Prolapse; Urogenital Prolapse

Genitals

Plural form; see *Genital*.

Genital System

The organs involved in reproduction and sexual function, including the gonads, reproductive ducts, accessory glands, and external genital structures. Anatomy differs between individuals and changes with development and age.

Genital Ulcer

An open sore on the skin or moist lining of the genitals. Causes include infections such as herpes or syphilis, skin conditions, injury, or cancer. Testing may be needed to find the cause.

Genital Ulcer Disease

A syndrome involving one or more ulcers of the genital or perianal skin or mucosa. Causes include sexually transmitted infections such as herpes simplex, syphilis, and chancroid, as well as noninfectious conditions.

Alternate Names:
GUD

Genital Wart

Alternate singular form; see *Genital Warts*.

Genital Warts

Benign growths of genital or anal skin or mucosa caused by human papillomavirus (HPV), most often types 6 or 11. They may be flat, raised, or cauliflower-like and are often asymptomatic. They can recur and may occur at multiple anogenital sites.

Alternate Names:
Condylomata Acuminata; Anogenital Warts

Genitofemoral Nerve

A branch of the lumbar plexus (arising from L1 and L2 nerve roots) that pierces the anterior surface of the psoas major muscle and divides into a genital branch (innervating the cremaster muscle and scrotal/labial skin; mediating the cremasteric reflex) and a femoral branch (cutaneous sensation to the anterior upper thigh).

Genito-Pelvic Pain/Penetration Disorder

Persistent or recurrent difficulty with vaginal penetration, including pain, fear or anxiety about pain, involuntary pelvic-floor tightening, or pain during attempted penetration, causing clinically significant distress. Causes may include pelvic-floor problems, infection, hormonal changes, injury, or emotional factors.

Genitourinary

Relating to the urinary system and the reproductive organs, which share developmental and anatomical relationships.

Genitourinary Fistula

Alternate name for urogenital fistula, an abnormal connection between the urinary and genital tracts.

Genito-Urinary Medicine

The medical specialty concerned with urinary and reproductive health. It includes evaluation and treatment of urinary infections, sexual health problems, sexually transmitted infections, and some reproductive conditions.

Genitourinary Neoplasm

An abnormal growth in the urinary or reproductive organs, such as the kidney, bladder, prostate, testis, ovary, or uterus. It may be benign or cancerous; examination, imaging, and sometimes biopsy identify its nature.

Genitourinary Syndrome Of Menopause

A group of changes in the genital and urinary tissues after menopause, caused mainly by lower estrogen levels. It may include vaginal dryness, burning, pain during sex, urinary urgency, painful urination, or repeated urinary infections.

Genitourinary Tract

The combined urinary and reproductive organs and their associated ducts.

Genodermatoses

Inherited disorders that mainly affect the skin, hair, nails, sweat glands, or related organs. Examples include inherited scaling disorders, blistering diseases, and some neurocutaneous syndromes; severity varies widely.

Genome

The complete genetic material of an organism, including genes and DNA that does not directly code proteins. It contains instructions influencing development, body function, inherited traits, disease risk, and treatment response.

Genomic Imprinting

A pattern in which a gene's activity depends on whether its copy came from the mother or father. Abnormal imprinting can cause conditions such as Prader–Willi or Angelman syndrome.

Genomic Instability

An increased tendency for DNA changes, chromosome damage, and mutations to accumulate, contributing to cancer development, treatment resistance, and disease progression.

Genomics

The study of an organism's complete genetic material, including its DNA sequence, variation, activity, and interaction with disease and treatment. It supports research, diagnosis, risk assessment, and personalized care.

Genotoxicity

The ability of a substance or physical agent to damage genetic material. Genotoxicity may cause mutations or chromosome damage, but a positive test does not by itself establish that an agent causes cancer in humans.

Genotype

A person's genetic makeup, meaning the versions of one or more genes they carry. The genotype helps influence observable traits and disease risk together with other genes and environmental factors.

Genotype Determination

Genotype determination is the use of laboratory testing to identify an individual's genetic variants or alleles at one or more locations.

Genotype-Phenotype Correlation

The relationship between a person's genetic makeup and the observable features, severity, age of onset, or clinical course of a condition; correlations may be incomplete because other genetic and environmental factors contribute.

Gentamicin

An aminoglycoside antibiotic that interferes with bacterial protein production. It can injure the kidneys or hearing and is used with dose and blood-level monitoring.

Gentamicin Sulfate

The sulfate salt of gentamicin, an aminoglycoside antibiotic that interferes with bacterial protein production. It can injure the kidneys or hearing and is used with careful dosing and monitoring.

Gentian

A plant of the Gentiana genus whose roots or other parts have been used in herbal preparations, traditionally as a bitter digestive; clinical evidence and product quality vary.

Gentian Violet

A purple antiseptic and dye with antifungal and

antibacterial activity, used in selected topical applications but capable of irritating tissue and staining skin.

Genu

The knee or a knee-shaped part of an anatomical structure; the term also describes a bend, such as the genu of the corpus callosum.

Genu Recurvatum

Hyperextension of the knee beyond the usual straight position, caused by laxity, deformity, muscle imbalance, neurologic disease, or injury.

Genu Valgum

An alignment abnormality in which the knees angle inward and may touch while the ankles remain apart. It may be developmental or caused by bone, joint, or metabolic disease.

Alternate Names:
Knock-Knees; Tibial Valgus

Genu Varum

Outward bowing of the legs, commonly called bowlegs. It is often normal in young children and improves with growth, but persistent, worsening, unequal, painful, or severe bowing may result from rickets, growth-plate disease, or another condition.

Alternate Names:
Bowlegs; Bandy Legs

Geographic Atrophy

An advanced form of dry age-related macular degeneration in which areas of light-sensing and supporting cells in the center of the retina are permanently lost. It causes slowly worsening blind spots and loss of detailed central vision.

Geographic Tongue

A harmless condition in which smooth red patches with pale borders appear and change location on the tongue. It usually causes no symptoms but may make spicy or acidic foods sting.

Alternate Names:
Benign Migratory Glossitis

Geophagia

Persistent eating of soil or other nonfood substances; it may cause poisoning, infection, intestinal obstruction, or iron-deficiency anemia.

Geophagy

The deliberate ingestion of soil or clay; it may cause lead or parasite exposure, gastrointestinal obstruction, or iron-deficiency anemia and can occur with pica.

Geotrichum

Geotrichum is a genus of fungi that may colonize humans and can rarely cause superficial or invasive infection, especially in people with weakened immunity.

GERD

Common digestive disorder where stomach contents rise into the esophagus, producing heartburn or regurgitation. See *Gastroesophageal Reflux Disease*.

Geriatric Assessment

A broad review of an older person's medical conditions, medicines, mobility, memory, mood, daily activities, nutrition, safety, home situation, and goals. It identifies treatable problems and guides an individualized care plan.

Geriatric Bioethics

The study of ethical questions in the care of older adults, including decision-making capacity, consent, use of surrogate decision-makers, treatment goals, and fair access to care.

Geriatric Dentistry

Dental care adapted to the needs of older adults, including tooth decay, gum disease, dry mouth, dentures, swallowing concerns, medicine effects, and examination for oral cancer.

Geriatric Depression

Depression in an older adult may cause low mood, loss of interest, fatigue, sleep or appetite changes, slowed thinking, physical complaints, or memory

problems. Medical illness, medicines, isolation, and bereavement may contribute.

Alternate Names:
Late-Life Depression; Depression in the Elderly

Geriatric Depression Scale

A questionnaire used to screen older adults for symptoms of depression. It can identify people with possible depression, but a positive result does not by itself establish depression or explain its cause.

Geriatric Dysphagia

Difficulty swallowing in an older adult. It may cause coughing or choking during meals, food remaining in the mouth, weight loss, dehydration, or aspiration and can result from stroke, dementia, muscle disease, blockage, or medicines.

Geriatric Hospitalization

Hospital care for an older adult, with attention to medical illness as well as mobility, medicines, nutrition, hearing, vision, and cognition. Preventing falls, delirium, pressure injuries, and loss of independence supports safer recovery.

Geriatrician

A physician specializing in the health care of older adults, including complex illness, multiple conditions, medications, function, and goals of care.

Geriatric Infection

Infection in an older adult may cause confusion, weakness, reduced appetite, or a fall without causing fever. Common sites include the urine, lungs, skin, and bloodstream; illness can worsen quickly.

Alternate Names:
Infection in the Elderly; Late-Life Infection

Geriatric Informed Consent

The process of confirming that an older adult with decision-making capacity understands a proposed intervention, its benefits, risks, and alternatives and makes a voluntary choice. Age alone does not determine decision-making capacity.

Geriatric Medical Ethics

Ethical decision-making in the care of older adults, including respect for the person's wishes, decision-making capacity, likely benefits and harms, fairness, privacy, and appropriate involvement of family or caregivers.

Geriatric Neurology

The neurology subspecialty concerned with nervous-system disorders in older adults. It considers how aging, frailty, other illnesses, and medicines affect diagnosis and function, and commonly addresses dementia, stroke, movement disorders, seizures, and gait problems.

Geriatric Nursing

Nursing care focused on the health, function, medication safety, cognition, mobility, and goals of older adults.

Geriatric Nutrition

Nutrition care for older adults that considers aging, illness, medicines, frailty, dental or swallowing problems, appetite, and access to food. Goals include maintaining strength, muscle, hydration, function, and quality of life.

Geriatric Osteoarthritis

Osteoarthritis occurring in later life, commonly affecting the knees, hips, hands, or spine and causing joint pain, stiffness, and reduced movement. Management may include exercise, weight management, medicines, assistive measures, or joint replacement when appropriate.

Alternate Names:
Age-Related Osteoarthritis

Geriatric Rehabilitation

Therapy that helps an older adult regain or maintain movement, strength, independence, and safety after illness, injury, surgery, or functional decline. The plan is adapted to health, abilities, goals, and support needs.

Geriatrics

The medical specialty focused on health, function, independence, and quality of life in older adults. Care considers multiple illnesses, medicines, memory, mobility, nutrition, mood, safety, goals, and support.

Geriatric Screening

Screening for diseases or health risks in older adults without related symptoms. The appropriate screening depends on age, health, life expectancy, preferences, and evidence of benefit.

Geriatric Sleep Changes

Changes in sleep timing, duration, or continuity that may occur with aging. Insomnia, sleep apnea, medicines, pain, and other illnesses can also cause sleep problems; these conditions are not an inevitable part of normal aging.

Geriatric Syndrome

A common problem in older adults caused by several interacting factors rather than one disease. Examples include falls, frailty, delirium, incontinence, immobility, and pressure injuries; causes may be medical, social, or both.

Geriatric Trauma

Injury in an older adult, often involving falls, fractures, head injury, or bleeding. Age-related frailty, osteoporosis, balance problems, and medicines that increase bleeding can make injuries more serious and recovery slower.

Germ

Alternate informal term; see *Microorganism*.

Germanium

A chemical element sometimes included in unproven health supplements. Germanium compounds have no established medical benefit and can cause kidney damage, nerve damage, or other serious toxicity when taken internally.

German Measles

Alternate name; see *Rubella*.

Alternate Names:
Rubella; Three-Day Measles

Germ Cell

A reproductive cell or precursor that gives rise to sperm or eggs and carries genetic material to the next generation.

Germ Cell Tumor

A tumor arising from cells that normally develop into sperm or eggs. It may occur in the testicles, ovaries, or other sites such as the chest or abdomen; some types are highly treatable with surgery, chemotherapy, or both.

Germ Cell Tumors

Alternate plural form; see *Germ Cell Tumor*.

Germ Cell Tumor Staging

Determination of the extent and risk of a germ-cell tumor using examination, imaging, tumor markers, surgical findings, and pathology. Stage and histologic type guide surgery, chemotherapy, surveillance, and prognosis.

Germinoma

A usually slow-growing germ-cell cancer that most often develops in the pineal or suprasellar area of the brain. Related tumors occur in the testicles or ovaries; treatment commonly uses radiation, chemotherapy, surgery, or combinations.

Germ Layer

One of the three early layers of an embryo—ectoderm, mesoderm, or endoderm—from which all major tissues and organs develop. Each layer gives rise to characteristic body structures during development.

Germline Mutation

A disease-causing genetic change in an egg, sperm, or their precursor cells that can be passed to children. It is usually present in nearly every cell of the person

and may increase the risk of inherited disorders or cancer.

Germline Testing

Genetic testing of blood, saliva, or another sample to look for changes that may be inherited or passed to children. Results can affect the person's care, relatives, cancer screening, and reproductive decisions.

Germline Variant

A DNA change present in cells that can give rise to eggs or sperm and therefore may be passed to children. It is usually present in most cells of the person, unlike a change limited to a tumor or other tissue.

Germ Theory Of Disease

The evidence-based principle that particular microorganisms can cause particular infectious diseases. It underlies infection control, vaccination, antimicrobial treatment, sterilization, and methods used to identify disease-causing organisms.

Gerontologist

A specialist studying aging and its biological, psychological, social, or economic effects. Gerontologists may work in research, healthcare, policy, counseling, education, housing, or community services for older people.

Gerstmann-Straussler-Scheinker Syndrome

A rare, autosomal dominant inherited prion disease caused by mutations in the PRNP gene (most commonly P102L), characterized pathologically by multicentric PrP-amyloid plaques throughout the cerebellum and cerebral cortex, presenting with slowly progressive cerebellar ataxia, spasticity, and late dementia.

Alternate Names:
GSS Syndrome; GSS Prion Disease

Gerstmann Syndrome

A neurological cognitive syndrome caused by a lesion of the dominant angular gyrus in the inferior parietal lobule (typically left hemisphere), characterized by the classic tetrad of agraphia (dysgraphia), acalculia (dyscalculia), finger agnosia, and right-left disorientation.

Alternate Names:
Angular Gyrus Syndrome; Dominant Parietal Lobe Syndrome

Gesell Developmental Schedules

Standardized developmental assessment schedules that describe expected motor, language, adaptive, and social milestones in children; they support screening but do not by themselves diagnose a disorder.

Gestation

The period of pregnancy during which an embryo and fetus develop in the uterus. Pregnancy is usually dated as about 40 weeks from the first day of the last menstrual period, or about 38 weeks from fertilization.

Gestational Age

The length of a pregnancy measured in weeks from the first day of the last menstrual period. It is usually about two weeks longer than the time since fertilization and helps estimate development, due date, and appropriate care.

Alternate Names:
Menstrual Age

Gestational Diabetes

A type of diabetes that first develops during pregnancy, usually detected in the second or third trimester. During pregnancy, hormones produced by the placenta make the body's cells more resistant to insulin. If the mother's pancreas cannot produce enough extra insulin to overcome this resistance, blood sugar levels rise above normal. While blood sugar usually returns to normal after delivery, the condition increases the risk of pregnancy complications and raises the mother's future risk of developing type 2 diabetes.

Alternate Names:
GDM; Gestational Diabetes Mellitus

Gestational Diabetes Mellitus

Alternate medical term; see *Gestational Diabetes*.

Gestational Hypertension

New-onset high blood pressure after 20 weeks of pregnancy without protein in the urine or other features of preeclampsia. It may later develop into preeclampsia.

Gestational Pyelonephritis

A kidney infection occurring during pregnancy, usually causing fever, flank pain, nausea, or urinary symptoms. It can lead to sepsis, preterm labor, or breathing complications.

Alternate Names:
Pyelonephritis in Pregnancy; Gravid Kidney Infection

Gestational Choriocarcinoma

A fast-growing cancer of placenta-forming cells that develops after a pregnancy, most often after a molar pregnancy but sometimes after a normal pregnancy, miscarriage, abortion, or pregnancy outside the uterus. It can invade the uterine wall and spread through the blood to other organs. It usually produces the pregnancy hormone hCG.

Gestational Sac

The first fluid-filled structure usually seen inside the uterus on an early pregnancy ultrasound. Its size and appearance help estimate pregnancy age and assess early development, but an early scan may not yet show an embryo.

Gestational Trophoblastic Disease

A group of uncommon conditions caused by abnormal growth of cells that normally help form the placenta. It includes molar pregnancy and some pregnancy-related cancers and may cause unusually high pregnancy hormone levels, bleeding, or a uterus larger than expected.

Gestational Trophoblastic Neoplasia

Persistent or cancerous growth of placenta-related cells after a pregnancy, miscarriage, abortion, or molar pregnancy. It is often detected by pregnancy-hormone levels that remain high or rise and is usually very responsive to specialist cancer treatment.

Gestation Period

Alternate name; see *Gestation*.

GFR

Abbreviation for glomerular filtration rate; see *Glomerular Filtration Rate*.

GHD

Abbreviation; see *Growth Hormone Deficiency*.

Ghon Complex

The combination of a primary tuberculous lung focus (Ghon focus) and caseous granulomatous lymphadenitis in the draining regional hilar or mediastinal lymph nodes, representing the hallmark of primary pulmonary tuberculosis that often undergoes fibrocalcification.

Alternate Names:
Primary Tuberculous Complex

Ghon Focus

A primary granulomatous tuberculous pulmonary lesion consisting of a circumscribed area of caseous necrosis typically located subpleurally in the mid-to-lower lung zone, representing the initial site of Mycobacterium tuberculosis infection.

Alternate Names:
Primary Focus of Ghon; Subpleural Tuberculous Focus

Ghrelin

A hormone produced mainly in the stomach that increases hunger and helps regulate energy balance. It also stimulates growth-hormone release and changes with eating, fasting, sleep, and body weight.

Gianotti Crosti Syndrome

Alternate spelling; see *Gianotti-Crosti Syndrome*.

Alternate Names:
Papular Acrodermatitis of Childhood; Infantile Lichenoid Acrodermatitis

Gianotti-Crosti Syndrome

A childhood skin condition characterized by a papular or papulovesicular rash on the face, buttocks, and extremities, often following viral infections (EBV, hepatitis B, CMV). Self-limited, lasting 2-8 weeks. Also called papular acrodermatitis of childhood.

Giant Axonal Disease

Alternate name; see *Giant Axonal Neuropathy*.

Giant Axonal Neuropathy

A rare inherited disorder in which abnormal giant nerve fibers develop, causing progressive peripheral neuropathy, weakness, loss of sensation, poor coordination, and sometimes changes in hair or skin. Onset and severity vary.

Giant Cell Arteritis

Inflammation of arteries, usually in people over 50, often affecting vessels near the temples and eyes. It can cause new headache, scalp tenderness, jaw pain while chewing, or vision changes and may permanently damage sight.

Giant Cell Arteritis Emergency

A severe presentation of suspected giant cell arteritis with visual symptoms, jaw or tongue pain during chewing, or reduced blood flow to the nervous system. It carries a risk of permanent visual loss.

Giant Cell Glioblastoma

A rare histologic variant of glioblastoma characterized by numerous large, often multinucleated tumor cells. It may cause headache, seizures, weakness, or changes in speech, vision, memory, or behavior, depending on location. Diagnosis uses brain imaging and tumor tissue analysis; treatment is coordinated by a neuro-oncology team.

Alternate Names:
Glioblastoma, Giant Cell; Monstrocellular Sarcoma

Giant Cell Interstitial Pneumonia

A rare occupational interstitial lung disease, usually associated with inhalation of hard-metal dust containing cobalt and tungsten carbide. It features multinucleated giant cells in the air spaces and can cause cough, breathlessness, and lung scarring.

Giant Cell Myocarditis

A rare, severe inflammation of the heart muscle caused by an abnormal immune reaction. It can weaken the heart and cause dangerous heart rhythms or heart failure.

Giant Cells

Large cells formed by fusion of macrophages or abnormal cellular growth, seen in granulomatous inflammation, foreign-body reactions, and some tumors.

Giant Cell Tumor

See *Giant Cell Tumor Of Bone*.

Giant Cell Tumor Of Bone

A usually noncancerous but locally aggressive bone tumor made up of abnormal cells and many large bone-resorbing cells. It usually occurs near the ends of long bones in adults after skeletal growth is complete. It can damage nearby bone, recur, and rarely spread to the lungs.

Alternate Names:
GCTB; Osteoclastoma

Giant Cell Tumor Of Soft Tissue

A usually low-grade soft-tissue neoplasm containing numerous osteoclast-like giant cells, most often arising in the extremities of adults and generally having a favorable outcome after excision.

Giant Cell Tumor Of Tendon Sheath

A common benign localized tenosynovial tumor, usually presenting as a slow-growing firm nodule on a finger or hand; recurrence can occur after excision.

Giant Congenital Nevus

A very large dark or brown skin mark present at birth. It may grow with the child and has a higher risk of melanoma than smaller birthmarks.

Alternate Names:

Giant Pigmented Nevus

Giant Coronary Aneurysm

An unusually large bulge in an artery supplying the heart. It can form a clot, reduce blood flow, or rarely rupture.

Giant Cyst of the Retina

A large fluid-filled retinal cystic lesion that can distort or damage the retina and impair vision. Evaluation typically requires a detailed eye examination and retinal imaging.

Giant Fibroadenoma

An uncommon clinical variant of benign breast fibroadenoma exceeding 5 cm in diameter or 500 grams in weight, characterized by rapid encapsulated proliferation of epithelial and stromal elements, frequently occurring during adolescence or pregnancy.

Giant Hypertrophic Gastritis

Severe thickening of the stomach lining and its folds, which can cause stomach pain, nausea, swelling, and loss of blood proteins. It may increase stomach-cancer risk.

Giant Lymph Node Hyperplasia

A rare condition in which lymph-node tissue grows excessively. It may affect one area or many parts of the body and can cause enlarged nodes, fever, fatigue, anemia, weight loss, or organ problems.

Alternate Names:
Castleman Disease; Angiofollicular Lymph Node Hyperplasia

Giant Platelet Syndrome

An inherited platelet disorder caused by deficiency of glycoprotein Ib/IX/V complex, resulting in large platelets and impaired platelet adhesion. Presents with mucocutaneous bleeding, thrombocytopenia, and giant platelets on blood smear.

Alternate Names:
Bernard-Soulier Syndrome; Platelet Glycoprotein Ib Deficiency

Giant Right Atrium

Marked enlargement of the heart's right upper chamber, usually from long-standing valve disease, a congenital heart defect, or abnormal rhythm. It can disturb the heartbeat, compress nearby structures, or allow clots to form and is assessed with heart imaging.

Giant Urticaria

Older term for angioedema, a sudden swelling of deeper skin or tissue beneath a mucous membrane; see *Angioedema*.

Giardia

A microscopic parasite that infects the small intestine and spreads through contaminated water, food, or hands. It can cause foul-smelling diarrhea, cramps, bloating, nausea, weight loss, or no symptoms.

Giardia Infection

An intestinal infection caused by Giardia parasites, usually spread through contaminated water, food, or contact with an infected person. It can cause prolonged foul-smelling diarrhea, cramps, bloating, weight loss, and poor nutrient absorption.

Giardia Lamblia

The parasite that causes giardiasis. It is swallowed in contaminated water, food, or material from an infected person and can cause foul-smelling diarrhea, abdominal cramps, gas, bloating, and weight loss.

Giardiasis

An intestinal infection caused by the parasite Giardia duodenalis. It spreads when contaminated water, food, surfaces, or material from an infected person is swallowed. It may cause diarrhea, foul-smelling or greasy stools, gas, abdominal cramps, nausea, bloating, weight loss, and poor nutrient absorption.

Gibbus Deformity

A sharp, angular, structural kyphosis of the spine produced by the anterior collapse or destruction of one or more adjacent vertebral bodies, classically

seen in tuberculosis of the spine (Pott disease) or severe osteoporotic wedge fractures.

Alternate Names:
Pott Gibbus; Angular Kyphosis

Gibraltar Fever

An old name for brucellosis, an infection caused by Brucella bacteria, usually acquired through unpasteurized dairy products or contact with infected animals.

Giemsa Stain

A laboratory dye used to show blood cells and some bacteria, parasites, and other organisms under a microscope. It can help identify malaria parasites and other infections in blood or tissue samples.

Gigabecquerel

A unit of radioactivity equal to one billion nuclear disintegrations per second. It measures the activity of a radioactive source, not directly the radiation dose absorbed by a person.

Gigantism

Excessive growth caused by too much growth hormone during childhood, before the bones finish lengthening. It usually results from a pituitary growth and causes unusual height and enlargement of body tissues.

Gigli Saw

A flexible wire saw used during some orthopedic, neurosurgical, or amputation procedures to cut bone. It is handled carefully to limit injury to nearby soft tissues.

Gilbert-Lereboullet Syndrome

Alternate name; see *Gilbert Syndrome*.

Gilbert's Disease

Alternate spelling; see *Gilbert Syndrome*.

Gilbert's Syndrome

A common inherited condition in which the liver processes bilirubin slowly, causing occasional mild yellowing of the eyes, especially during illness, fasting, or stress.

Gilbert Syndrome

A common inherited condition in which the liver processes bilirubin more slowly than usual. It can cause occasional mild yellowing of the eyes or skin, especially during fasting, illness, dehydration, or stress, and usually does not harm the liver.

Gilles De La Tourette Syndrome

Alternate name; see *Tourette Syndrome*.

Gingiva

The firm pink tissue, commonly called the gums, that surrounds and protects the teeth and the bone around their roots. Healthy gingiva usually does not bleed with gentle brushing; redness, swelling, or bleeding may indicate gum disease.

Alternate Names:
Gums; Gingival Tissue

Gingiva Disease

Alternate name; see *Gum Disease*.

Gingival Bleeding

Alternate name; see *Gingival Hemorrhage*.

Gingival Disease

Alternate name; see *Gum Disease*.

Gingival Hemorrhage

Bleeding from the gums. It is often caused by gum inflammation or plaque, but injury, medicines, or bleeding problems can also cause it.

Gingival Hyperplasia

Overgrowth of gum tissue around the teeth. It can make cleaning difficult and may cause bleeding. Plaque, some medicines, inherited traits, and other health conditions can contribute.

Gingival Infections

Infections of the gums, usually involving bacteria in dental plaque. They can cause red, swollen, tender,

or bleeding gums, bad breath, pus, and sometimes spreading facial swelling; persistent infection can damage gum tissue and supporting bone.

Gingival Margin

The edge of the gum tissue that surrounds and touches a tooth. It normally forms a shallow seal; inflammation or recession can make it bleed or expose the tooth root.

Gingival Melanoma

A rare, aggressive cancer of pigment-producing cells in the gums. It may appear as a dark or non-pigmented lump, patch, or ulcer; biopsy can identify it.

Gingival Neoplasm

An abnormal growth in the gums that may be reactive, benign, precancerous, or cancerous. It may cause persistent swelling, ulceration, bleeding, pain, or a lump; examination and sometimes biopsy identify its nature.

Gingival Overgrowth

Gingival overgrowth is an abnormal increase in gum tissue, which may be caused by medicines, inflammation, or systemic disease.

Gingival Pocket

The small space between the gum and tooth surface, measured during a dental examination. A persistently deep pocket usually indicates loss of attachment from periodontal disease and can collect plaque and bacteria.

Gingival Recession

Pulling back of the gums so that part of a tooth root becomes exposed. Gum disease, forceful brushing, tooth position, thin gum tissue, or treatment can cause it and may lead to sensitivity or root decay.

Gingivectomy

Surgical removal of gum tissue to treat overgrowth, reshape the gums, expose decay, or improve access. Possible complications include bleeding, sensitivity, infection, or gum recession.

Gingivitis

Mild gum disease, usually caused by plaque on the teeth. The gums may be red, swollen, or bleed during brushing. It can usually be reversed with good tooth cleaning; it does not always lead to periodontitis.

Gingivoplasty

Surgical reshaping or contouring of the gums to improve their form, remove diseased tissue, or make cleaning easier. It may be combined with gingivectomy or other periodontal treatment.

Gingivostomatitis

Common viral infection of the mouth and gums, most often caused by primary herpes simplex virus infection but also associated with other infections, trauma, or systemic disease. It may cause painful ulcers, swollen bleeding gums, fever, and difficulty eating or drinking.

Ginkgo Biloba

An herbal product derived from Ginkgo biloba leaves and marketed for cognitive or circulatory benefits; evidence is variable and it may increase bleeding risk or interact with medicines.

Ginseng

A group of plants whose roots are used in traditional medicine and dietary supplements; products vary in composition and may interact with medicines or affect blood glucose and clotting.

Ginseng Preparation

A product made from ginseng root and sold as a supplement. Products vary in strength and purity; interactions and side effects can occur.

Girdle Pain

Pain that wraps around the chest or abdomen in a band-like pattern. It may result from nerve irritation, spinal disease, shingles, muscle injury, or internal-organ disease.

Gitelman Syndrome

A rare inherited kidney disorder that causes the body to lose too much salt and magnesium in urine. It may lead to muscle cramps, weakness, tiredness, thirst, or abnormal heart rhythms.

Glabella

The smooth area of the forehead between the eyebrows and above the bridge of the nose.

Gland

An organ or group of cells that produces and releases substances. Endocrine glands release hormones into blood, while exocrine glands release substances through ducts or onto a surface.

Glanders

A serious infection caused by the bacterium *Burkholderia mallei*, which mainly affects horses and can rarely infect people exposed to infected animals or tissues. It may cause skin sores, fever, pneumonia, or bloodstream infection.

Glandular Fever

Alternate name; see *Infectious Mononucleosis*.

Glandular Plague

Alternate name; see *Bubonic Plague*.

Glans Penis

The expanded, sensitive distal end of the penis containing the external urethral opening and covered by the foreskin when present.

Glanzmann Thrombasthenia

An inherited platelet function disorder caused by deficiency or dysfunction of platelet glycoprotein IIb/IIIa, producing mucocutaneous bleeding despite a normal platelet count.

Glasgow Coma Scale

A bedside score describing a person's level of consciousness by assessing eye opening, speaking, and movement. Scores range from 3 to 15; lower scores indicate less response, but medicines and injuries can affect the result.

Glass Eye

A glass eye is an ocular prosthesis made to replace the appearance of an eye that is missing or severely damaged.

Glass Ionomer

A tooth-colored dental cement made from fluoroaluminosilicate glass and a polyalkenoic acid. It bonds chemically to enamel and dentin and releases fluoride. It is used as a filling, liner, or luting cement, especially in areas with lower chewing stress, because it is less wear-resistant than resin composites.

Alternate Names:
Glass Ionomer Cement; Glass-Ionomer Cement; Glass Polyalkenoate Cement

Glassy Cell Carcinoma

A rare poorly differentiated adenosquamous carcinoma of the cervix with distinctive glassy cytoplasm, prominent nucleoli, and aggressive clinical behavior.

Glaucoma

A group of eye conditions that damage the optic nerve, the vital cable that carries visual information from the eye to the brain. This damage is most commonly linked to abnormally high fluid pressure inside the eye (intraocular pressure), which builds up when the eye's natural drainage system becomes blocked or inefficient. Because it typically causes gradual, painless loss of peripheral (side) vision before affecting central vision, it can progress unnoticed without regular eye examinations.

Glaucoma Drainage Implant

A tube-and-plate device implanted in the eye to divert aqueous humor from the anterior chamber to a reservoir beneath the conjunctiva, lowering intraocular pressure.

Alternate Names:
Glaucoma Drainage Device; Glaucoma Drainage Implants

Glaucoma Surgery

Laser or incisional procedures that lower intraocular pressure by improving aqueous-humor outflow or, less often, reducing its production. They aim to limit further optic-nerve damage but cannot restore vision already lost.

Glaze Poisoning

Toxic exposure to ceramic or pottery glaze, which may contain lead, cadmium, or other heavy metals. Symptoms depend on the metal involved and may include abdominal pain, neurological symptoms, and organ damage. Severe cases may be treated with chelation therapy.

Alternate Names:
Ceramic Glaze Poisoning

Gleason Grading System

A histological grading system for prostate cancer based on glandular pattern differentiation. Scores historically ranged from 2 to 10, but current reporting summarizes them as Grade Groups 1 to 5 (scores 6 to 10), with higher groups indicating more aggressive cancer. Used to guide treatment decisions and predict prognosis.

Gleason Score

A grading system estimating prostate cancer aggressiveness by examining tissue patterns under a microscope and combining the two most common patterns.

Gleason Tumor Grade

A histopathologic grade of prostate adenocarcinoma based on the architectural pattern of the tumor glands; it contributes to the Gleason score and Grade Group.

Glenn Procedure

A staged heart operation for some children born with only one effective pumping chamber. It connects the large vein returning blood from the upper body directly to the lung arteries, allowing blood to pick up oxygen while reducing the workload on the heart.

Alternate Names:
Bidirectional Glenn (BDG) Procedure; Cavopulmonary Anastomosis

Glenohumeral Joint

The ball-and-socket shoulder joint formed by the upper-arm bone and shoulder blade. It allows the arm to move in many directions but is relatively easy to dislocate because it sacrifices some stability for movement.

Glenoid

The shallow socket on the shoulder blade that joins the head of the upper-arm bone to form the shoulder joint. Its shape and surrounding labrum help balance mobility with stability.

Alternate Names:
Glenoid Cavity; Scapular Glenoid Fossa

Glenoid Cavity

Alternate name; see *Glenoid*.

Glenoid Labrum

A rim of fibrocartilage attached to the edge of the shoulder blade's glenoid cavity. It deepens the socket and helps stabilize the shoulder; the long-head biceps tendon attaches to its upper part.

Gliadin

A group of wheat storage proteins that, together with glutenin, form gluten; gliadin peptides trigger the immune response in celiac disease.

Glial Cell

A cell in the brain, spinal cord, or nerves that supports and protects nerve cells. Different types help keep nerve cells' surroundings stable, defend against infection, remove waste, or form an insulating layer around nerve fibers so signals travel quickly.

Glial Cells

Plural form; see *Glial Cell*.

Glial Fibrillary Acidic Protein

A protein found mainly in support cells of the brain and nervous system. Laboratory tests can use it to help identify some brain tumors or detect injury to

support cells after brain trauma.

Alternate Names:
GFAP

Glibenclamide

An oral sulfonylurea medicine, also called glyburide, used for type 2 diabetes. It stimulates the pancreas to release insulin and can cause prolonged, sometimes severe low blood sugar and weight gain.

Gliclazide

Gliclazide is a sulfonylurea for type 2 diabetes that stimulates pancreatic beta-cell insulin release; hypoglycaemia, weight gain, and dose accumulation in organ impairment are important considerations.

GLIM Criteria

An international framework for diagnosing malnutrition. It considers body changes such as weight or muscle loss together with causes such as poor intake, poor absorption, or illness-related inflammation and grades severity according to the findings.

Glimepiride

An oral sulfonylurea medicine for type 2 diabetes that increases insulin release from functioning pancreatic beta cells. Low blood sugar is the main serious risk, particularly with missed meals, kidney disease, or other glucose-lowering medicines.

Glioblastoma

A fast-growing cancer that starts in the brain's support cells (glial cells) and spreads into nearby brain tissue. Symptoms depend on where it grows and may include headache, seizures, weakness, or changes in speech, memory, vision, balance, or behavior. *Glioblastoma multiforme* is an older name.

Glioblastoma Multiforme

Historical name; see *Glioblastoma*.

Glioma

A tumor that starts in glial cells in the brain or spinal cord. Glial cells support and protect nerve cells. Some gliomas grow slowly, while others grow quickly into nearby tissue. Symptoms depend on where the tumor grows and may include headache, seizures, weakness, or changes in movement, vision, speech, or thinking.

Glioma-Polyposis Syndrome

Alternate name; see *Turcot Syndrome*.

Gliomatosis Cerebri

A diffuse infiltrative growth pattern of glioma involving multiple brain regions, rather than a separate tumor type in current classifications; it may cause progressive cognitive, motor, or seizure-related symptoms.

Gliosarcoma

A rare aggressive brain cancer containing both glial and connective-tissue-like tumor features. Symptoms depend on location and may include headache, seizures, weakness, or cognitive changes; tissue examination identifies the tumor type.

Gliosis

A reactive increase in glial cells after injury, infection, ischemia, or other damage to the central nervous system.

Glipizide

Glipizide is a short-acting sulfonylurea that lowers blood glucose by stimulating insulin secretion from functioning pancreatic beta cells; hypoglycaemia is the principal adverse effect.

Glisson's Capsule

A thin layer of connective tissue surrounding the liver and extending between its sections. It contains nerves and blood vessels and can cause pain when the liver becomes swollen or inflamed.

Global Aphasia

A severe language disorder caused by extensive damage to the dominant cerebral hemisphere, impairing speech production, comprehension, reading, and writing.

Global Developmental Delay

Noticeably delayed development in at least two areas, such as movement, speech, learning, social skills, or daily activities, in a child younger than five years. Causes vary and may include genetic, neurologic, hearing, vision, or environmental factors; assessment guides support and further testing.

Alternate Names:
GDD

Global Health

The study and practice of improving health across countries and populations. It includes problems that cross borders, such as outbreaks, unequal access to care, pollution, climate change, malnutrition, and differences in life expectancy.

Global Longitudinal Strain

An echocardiogram measurement showing how much the heart muscle shortens lengthwise as it contracts. It can detect early weakening of the left ventricle before the usual pumping measurement changes and is interpreted with the complete heart scan and clinical findings.

Alternate Names:
GLS; 2D Speckle-Tracking GLS; Left Ventricular Longitudinal Strain

Globe Rupture

A full-thickness break in the wall of the eye caused by blunt trauma. It can distort the eye and allow internal tissues to prolapse, with severe vision loss or loss of the eye.

Globin

A protein that joins with heme to form hemoglobin and related oxygen-carrying molecules. Different globin chains help determine the type of hemoglobin made at different stages of life.

Globoid Cell Leukoencephalopathy

Alternate name; see *Krabbe Disease*.

Globozoospermia

A rare sperm disorder in which sperm heads are round and lack a normal acrosome, causing impaired fertilization and male infertility.

Globulin

A group of blood proteins that includes antibodies and proteins involved in transport, inflammation, and clotting. Blood tests may divide globulins into several groups; an abnormal level can occur with infection, immune disease, liver disease, kidney disease, or some cancers.

Globus

Alternate name; see *Globus Sensation*.

Globus Pharyngeus

Alternate name; see *Globus Sensation*.

Globus Hystericus

A sensation of a lump or tightness in the throat without a structural obstruction, now called globus sensation; reflux, muscle tension, and anxiety may contribute.

Globus Pallidus

The globus pallidus is a group of deep brain structures involved in regulating movement as part of the basal ganglia.

Globus Sensation

A persistent or intermittent lump-like feeling in the throat without a structural blockage or difficulty swallowing. It is often noticed between meals and may be associated with reflux, muscle tension, or stress.

Glomangiomyoma

A benign glomus tumor showing both vascular and smooth-muscle differentiation, usually presenting as a small painful subcutaneous nodule.

Glomangiosarcoma

A rare cancerous glomus tumor with abnormal cells and invasive growth. It may occur in the skin or deeper soft tissue.

Glomerular Basement Membrane

A thin supporting layer in the kidney's filtering units. It helps keep blood cells and most proteins in the bloodstream while water and small waste products pass into the urine.

Glomerular Capsule

A cup-shaped structure around a tiny group of blood vessels in the kidney. It collects the fluid filtered from blood and passes it into a kidney tubule, where useful water and substances are reclaimed and waste is removed.

Glomerular Diseases

A diverse group of kidney disorders that injure the glomeruli, the microscopic filters that remove waste from blood. Damage may cause blood or excess protein in urine, high blood pressure, swelling, or reduced kidney function. Causes include immune, genetic, metabolic, infectious, and systemic diseases; the clinical pattern and course vary with the specific disorder.

Alternate Names:
Glomerular Disease

Glomerular Filtrate

The watery fluid filtered from blood into the kidney tubules by a glomerulus, a small group of kidney blood vessels. It normally contains water and small dissolved substances but very little protein or no blood cells.

Glomerular Filtration

The first step in urine formation, in which pressure moves water and small dissolved substances from blood through kidney filters into the tubules. Blood cells and most proteins normally remain in the bloodstream.

Glomerular Filtration Rate

The volume of plasma filtered by the glomeruli of both kidneys per unit of time, usually indexed to a standard body-surface area. GFR can be measured directly; routine clinical results generally report estimated GFR (eGFR), calculated from serum creatinine or cystatin C. A persistently reduced eGFR can indicate chronic kidney disease when interpreted with other findings.

Glomerular Hyperfiltration

Filtration by the kidney glomeruli above the expected level. It can occur with diabetes, obesity, pregnancy, or loss of functioning kidney tissue. No single cutoff defines it across all people, and the finding alone does not diagnose kidney disease.

Glomeruli

Microscopic clusters of capillaries in the kidneys where blood filtration begins. Each glomerulus is surrounded by a capsule that collects filtered fluid and passes it into a kidney tubule.

Alternate Names:
Renal Glomeruli; Malpighian Corpuscles

Glomerulomegaly

Abnormal enlargement of kidney glomeruli, seen with diabetes, obesity-related hyperfiltration, congenital syndromes, or other causes of glomerular stress.

Glomerulonephritis

An inflammation of the glomeruli, the microscopic filtering units inside the kidneys that clean waste and excess fluid from the blood. It can develop suddenly (acute) following an infection such as strep throat, or gradually over many months (chronic) due to autoimmune diseases or high blood pressure. When these filters become inflamed and damaged, red blood cells and protein leak into the urine, which can cause tea-colored urine, swelling (edema) in the face and legs, and high blood pressure.

Alternate Names:
GN; Glomerular Nephritis

Glomerulonephritis Acute

Sudden inflammation of the kidney glomeruli that can cause blood or protein in urine, edema, hypertension, and reduced kidney function.

Glomerulopathy

Any disease affecting the kidney's filtering units. It

may cause blood or protein in urine, swelling, high blood pressure, reduced filtration, or kidney failure and may result from diabetes, infection, immune disease, inherited disorders, or other injury.

Glomerulosclerosis

Scarring and hardening of the kidney's filtering units. It can reduce filtration and cause protein in urine, swelling, high blood pressure, or kidney failure; causes include diabetes, inflammation, genetic disease, and other injury.

Glomerulus

A tuft of tiny blood vessels inside a kidney capsule where water and small dissolved substances are filtered from blood to begin urine formation. Damage can allow blood or excess protein into urine and reduce kidney function.

Glomus Jugulare Tumor

A usually slow-growing paraganglioma arising at the jugular foramen of the temporal bone. It may cause pulsatile tinnitus, hearing loss, dizziness, or lower cranial nerve problems; rarely, it secretes catecholamines. Paragangliomas have variable metastatic potential.

Alternate Names:
Jugular Paraganglioma; Tympanojugular Glomus

Glomus Tumor

A usually harmless growth arising from cells that help control blood flow and temperature, most often beneath a fingernail or in a finger. It typically causes severe pinpoint pain and sensitivity to cold or pressure.

Glomus Tumors

Plural form; see *Glomus Tumor*.

Glomus Tympanicum

Alternate name; see *Glomus Tympanicum Tumor*.

Glomus Tympanicum Tumor

A usually slow-growing paraganglioma arising in the middle ear. It may cause pulsatile tinnitus, hearing loss, or a reddish mass behind the eardrum; some tumors secrete catecholamines or affect nearby nerves.

Alternate Names:
Middle Ear Paraganglioma; Tympanic Glomus

Glossal

Relating to the tongue, the muscular organ used for chewing, swallowing, tasting, and speaking.

Glossalgia

Pain or burning of the tongue, with causes including trauma, infection, nutritional deficiency, neuropathy, medication, or burning-mouth syndrome.

Glossectomy

Surgical removal of all or part of the tongue, performed for malignancies, severe trauma, or an unusually large tongue. Procedures range from partial to total removal. Speech and swallowing rehabilitation may follow.

Glossinidae

The family of flies belonging to the genus Glossina, commonly known as tsetse flies. These insects are vectors of trypanosomes that cause African trypanosomiasis (sleeping sickness) in humans and nagana in animals.

Alternate Names:
Tsetse Flies; Glossina Vectors

Glossitis

Inflammation of the tongue that can cause pain, swelling, or changes in how it looks. Causes include low iron, vitamin B12, or folate; infections; allergies; and diseases in which the immune system attacks the body.

Glossitis Areata Migrans

Alternate name; see *Geographic Tongue*.

Glossodynia

Persistent burning, soreness, or tingling in the tongue, lips, palate, or other mouth tissues, often without visible changes. It may occur with

dry mouth, altered taste, nutritional deficiency, medicines, nerve problems, or other illness.

Glossopharyngeal Nerve

The ninth cranial nerve, carrying sensation and taste from the back of the tongue and throat, signals from blood-pressure and blood-chemistry sensors, and motor control for one throat muscle. It also stimulates saliva production.

Glossopharyngeal Neuralgia

Recurrent, brief attacks of severe stabbing or electric-shock-like pain in the throat, tonsillar region, base of the tongue, or ear, caused by irritation of the glossopharyngeal nerve. Swallowing, coughing, or talking may trigger attacks.

Glossoptosis

Backward displacement of the tongue that can narrow the upper airway, particularly in infants with craniofacial disorders.

Glossopyrosis

Alternate name; see *Burning Mouth Syndrome*.

Glottis

The part of the voice box containing the vocal folds and the opening between them. It opens for breathing, closes to protect the airway during swallowing, and vibrates to produce the voice.

GLP-1 Agonists

Alternate name; see *GLP-1 Receptor Agonists*.

GLP-1 Receptor Agonists

Medicines that activate the glucagon-like peptide-1 (GLP-1) receptor. They increase insulin release when blood sugar is high, reduce glucagon release, and can slow stomach emptying and increase feelings of fullness. They are used for type 2 diabetes; some are also used for chronic weight management or other conditions. Approved uses vary by medicine. Common side effects include nausea, vomiting, diarrhea, and constipation.

Alternate Names:
Incretin Mimetics

GLS

Alternate name; see *Global Longitudinal Strain*.

Glu

Commonly an abbreviation for glucose in laboratory or clinical notes; in biochemical notation, Glu can also denote the amino acid glutamic acid, so context matters.

Glucagon

A hormone made by pancreatic alpha cells that raises blood glucose when it falls too low. It prompts the liver to release stored glucose and can be given for severe hypoglycemia.

Glucagon Blood Test

Laboratory measurement of glucagon levels in the blood, used to evaluate suspected glucagonoma, hypoglycemia, or other pancreatic endocrine disorders. Levels are affected by fasting, meals, and medications.

Alternate Names:
Serum Glucagon Level; Plasma Glucagon Assay

Glucagon-like Peptide-1

A hormone released mainly by the intestine after eating. It helps regulate blood glucose by enhancing glucose-dependent insulin secretion, reducing glucagon release, slowing stomach emptying, and influencing appetite.

Glucagonoma

A rare pancreatic neuroendocrine tumor that secretes excess glucagon, causing diabetes mellitus (mild, new onset), dermatitis (necrolytic migratory erythema, characteristic painful, erythematous, blistering rash on groin, perineum, extremities), diarrhea, and deep vein thrombosis.

Glucagon Signaling

The chain of cell signals started when glucagon binds its receptor. These signals increase cyclic AMP and activate proteins that help the liver release glucose

and the body maintain energy balance.

Glucan

A complex carbohydrate made of many linked glucose molecules. Different glucans occur in plants, fungi, bacteria, and foods and may act as dietary fiber or interact with the immune system.

Glucarpidase

An enzyme that rapidly breaks down methotrexate in the bloodstream and is used for toxic methotrexate concentrations when renal clearance is inadequate.

Glucocerebrosidase Deficiency

Gaucher Disease: an inherited lysosomal storage disorder caused by deficient glucocerebrosidase, leading to lipid accumulation in cells and possible enlargement of the spleen and liver, anemia, bone disease, or neurologic disease.

Alternate Names:
Gaucher Disease; Acid Beta-Glucosidase Deficiency

Glucocorticoid

A class of steroid hormones synthesized within the zona fasciculata of the adrenal cortex under the regulatory control of adrenocorticotropic hormone (ACTH), or their synthetic pharmacological analogues (e.g., prednisone, dexamethasone, hydrocortisone). The primary endogenous human glucocorticoid is cortisol (hydrocortisone). Lipophilic in structure, glucocorticoids cross cell membranes and bind intracellular glucocorticoid receptors (GRs), translocating to the nucleus where they exert both genomic transactivation (inducing transcription of anti-inflammatory proteins such as lipocortin-1/annexin A1 and gluconeogenic enzymes) and transrepression (directly interfering with pro-inflammatory transcription factors NF-κB and AP-1 to potently suppress production of cytokines, chemokines, and prostaglandins). Physiologically essential for intermediary metabolism (stimulating hepatic gluconeogenesis and lipolysis while inhibiting peripheral glucose uptake), maintenance of vascular responsiveness to catecholamines, and adaptation to systemic stress. Exogenous glucocorticoids serve as mainstay therapies for inflammatory, allergic, autoimmune, and lymphoid neoplastic disorders; prolonged systemic administration induces severe iatrogenic adverse effects, including hypothalamic-pituitary-adrenal (HPA) axis suppression, iatrogenic Cushing syndrome, secondary osteoporosis, hyperglycemia, central adiposity, cutaneous atrophy, and heightened susceptibility to opportunistic infections.

Alternate Names:
Glucocorticoids; Glucocorticosteroid

Glucocorticoid-Induced Osteoporosis

Bone loss and increased fracture risk caused or accelerated by prolonged or high-dose glucocorticoid treatment; risk depends on dose, duration, baseline bone health, and other factors.

Glucocorticoid Remediable Aldosteronism

Alternate spelling; see *Glucocorticoid-Remediable Aldosteronism*.

Glucocorticoid-Remediable Aldosteronism

An inherited form of high blood pressure in which the adrenal glands make too much aldosterone, a hormone that controls salt and fluid balance. It often begins early in life.

Alternate Names:
GRA; Familial Hyperaldosteronism Type I

Glucocorticoid Replacement Therapy

Treatment of adrenal insufficiency with a glucocorticoid medicine to replace the cortisol the body lacks. Doses may vary with symptoms, illness, and physical stress.

Glucocorticoids

Plural form; see *Glucocorticoid*.

Glucocorticoid-Sparing Therapy

Use of a non-glucocorticoid treatment strategy to control inflammation while reducing cumulative corticosteroid exposure. It aims to limit osteoporosis, infection, diabetes, hypertension, adrenal suppres-

sion, and other glucocorticoid complications.

Glucometer

A handheld device that measures blood glucose, usually from a small capillary-blood sample obtained by finger prick.

Gluconates

Salts or esters of gluconic acid used in some medicines and supplements. Examples include calcium gluconate and ferrous gluconate; their effects, dosing, and risks depend on the specific compound.

Gluconeogenesis

A metabolic pathway that generates glucose from non-carbohydrate precursors such as lactate, glycerol, and glucogenic amino acids. It occurs mainly in the liver and, to a variable extent, in the kidneys and other tissues.

Glucosamine

A naturally occurring compound used in cartilage formation and sometimes taken as a supplement for joint symptoms.

Glucosamine and Chondroitin

Dietary supplements marketed for joint symptoms and cartilage support. Evidence of benefit varies, and products may interact with medicines or affect blood sugar or bleeding risk.

Glucose

A simple sugar (monosaccharide) and a major source of energy for cells. It enters the blood after carbohydrates are digested. The liver can also release glucose from stored glycogen or make it from other substances. Insulin and other hormones help regulate blood glucose levels.

Glucose-6-Phosphatase

An enzyme in the liver and kidneys that releases glucose from glucose-6-phosphate. Inherited deficiency causes glycogen-storage disease type I, which can produce low blood glucose, enlarged liver, and metabolic problems.

Glucose-6-Phosphate Dehydrogenase Deficiency

The most common red blood cell enzymopathy in humans, affecting over 400 million people worldwide, transmitted as an X-linked recessive genetic disorder caused by mutations in the *G6PD* gene on chromosome Xq28. The G6PD enzyme catalyzes the rate-limiting first step of the hexose monophosphate (pentose phosphate) shunt, converting glucose-6-phosphate to 6-phosphoglucono-δ-lactone and generating NADPH. Because erythrocytes lack mitochondria and alternative NADPH-generating pathways, they depend entirely on G6PD-derived NADPH to reduce oxidized glutathione back to reduced glutathione (GSH), the primary cellular antioxidant defense that detoxifies reactive oxygen species and hydrogen peroxide. Loss of functional G6PD activity renders erythrocytes exquisitely susceptible to acute oxidative damage. When exposed to external oxidative stressors—specifically infections (the most common trigger), ingestion of fava beans (favism, containing toxic pyrimidine glucosides vicine and convicine), or medications (dapsone, primaquine, rasburicase, nitrofurantoin, phenazopyridine, methylene blue)—sulfhydryl groups on hemoglobin chains oxidize, causing hemoglobin denaturation and precipitation into insoluble intracellular aggregates called Heinz bodies. Splenic red pulp macrophages pluck these inclusions from erythrocytes, creating characteristic "bite cells" (degmacytes) and "blister cells," culminating in acute intravascular and extravascular episodic hemolytic anemia. Clinically presents 2 to 4 days post-exposure with sudden fatigue, pallor, dark cola-colored urine (hemoglobinuria), scleral icterus, and back/abdominal pain. Confirmatory testing requires quantitative erythrocyte G6PD spectrophotometric enzymatic assays, which may yield false-negative normal results during acute hemolytic episodes because mature G6PD-deficient red cells have hemolyzed, leaving a reticulocyte-rich population with higher enzyme levels; re-testing 2 to 3 months post-crisis is mandatory. Management focuses on avoidance of oxidative triggers and supportive transfusions during severe hemolytic crises.

Alternate Names:
G6PD Deficiency; Favism

Glucose-6-Phosphate Dehydrogenase Test

Laboratory test that measures G6PD enzyme activity in red blood cells to diagnose G6PD deficiency. The result can identify risk of hemolytic anemia from oxidant medicines such as primaquine or dapsone.

Alternate Names:
G6PD Assay; Erythrocyte Enzyme Screen

Glucose Challenge Test

A screening test for gestational diabetes mellitus, commonly using a nonfasting 50-g glucose drink followed by a one-hour plasma-glucose measurement. An abnormal screening result is followed by a diagnostic oral glucose tolerance test; the threshold depends on the protocol used.

Alternate Names:
GCT; One-Hour Glucose Challenge; O'Sullivan Screening Test

Glucose Intolerance

Impaired handling of glucose resulting in blood-glucose concentrations above normal but below the diagnostic threshold for diabetes in a defined testing context. It often reflects insulin resistance or inadequate insulin secretion and is associated with increased risk of type 2 diabetes and cardiovascular disease.

Glucose Management Indicator

An estimate of the hemoglobin A1c value calculated from average continuous-glucose-monitoring readings. It helps summarize recent glucose exposure but is not the same as a laboratory A1c and may differ from it.

Glucose Screening Tests During Pregnancy

Laboratory tests to detect gestational diabetes mellitus, including the oral glucose tolerance test and glucose challenge test. They are usually performed between 24 and 28 weeks of gestation; abnormal results are followed by additional testing or management.

Alternate Names:
Gestational Diabetes Screening; Maternal Glucose Screen

Glucose Sensor

A small sensor placed under the skin that measures glucose in the fluid between cells. Used in continuous glucose monitoring, it sends repeated readings to a receiver or compatible device and can show trends and alerts.

Glucose Test

A test that measures glucose in a blood, urine, or other sample. Blood tests used for diabetes include fasting plasma glucose, random plasma glucose, and the oral glucose tolerance test; the method and timing determine how a result is interpreted.

Glucose Tolerance Test

A test of how the body handles a measured glucose drink. Blood samples are taken before and at set times afterward to help diagnose diabetes or gestational diabetes; thresholds depend on the protocol.

Alternate Names:
Oral Glucose Tolerance Test (OGTT)

Glucose Transport

Movement of glucose across cell membranes through specialized transport proteins. Insulin increases glucose entry into muscle and fat cells, while other transporters allow glucose to enter the brain, liver, kidneys, and intestines.

Glucose Transporter

A membrane protein that moves glucose across a cell membrane; transporter defects or altered regulation can affect glucose metabolism.

Glucose Urine Test

A urine test that detects glucose, usually with a reagent strip. Glucose can appear when blood levels exceed the kidney's reabsorption capacity, but it may also occur with pregnancy, some medicines, or kidney-tubule disorders; it is not a substitute for blood-glucose testing.

Alternate Names:

Urinary Glucose; Glycosuria Screen

Glucosuria

Alternate spelling; see *Glycosuria*.

Glucosylceramidase

A lysosomal enzyme that breaks down glucosylceramide, a fat-containing cell substance. Inherited deficiency causes Gaucher disease, allowing fatty material to accumulate in the spleen, liver, bone marrow, bones, or nervous system.

Glucosyl Ceramide Lipidosis

Alternate name; see *Gaucher Disease*.

Glucuronate

The anion or salt of glucuronic acid, a sugar-acid component of connective-tissue substances and a molecule used in hepatic conjugation reactions.

Glucuronic Acid

A sugar acid used by the liver to conjugate bilirubin, drugs, hormones, and toxins, increasing their water solubility for excretion.

Glucuronide

A compound formed when glucuronic acid is conjugated to a drug, hormone, bilirubin, or other molecule, usually increasing water solubility and facilitating excretion.

Glucuronyl Transferase

An enzyme that attaches glucuronic acid to bilirubin, medicines, hormones, and other substances, usually making them easier to excrete. Reduced activity of specific UDP-glucuronosyltransferase enzymes contributes to Gilbert syndrome or Crigler–Najjar syndrome.

Alternate Names:
UDP-Glucuronosyltransferase; UGT Enzyme

Glue Ear

Persistent fluid in the middle ear without acute infection, often causing conductive hearing loss and a feeling of blockage. It is common in children.

Alternate Names:
Secretory Otitis Media; Otitis Media with Effusion (OME)

GLUT4 Transporter

The major insulin- and exercise-regulated glucose transporter isoform expressed primarily in striated muscle (skeletal and cardiac) and adipose tissue, which translocates from intracellular vesicles to the plasma membrane upon insulin stimulation to facilitate cellular glucose uptake.

Glutamate

The main excitatory chemical messenger in the brain and spinal cord. It helps nerve cells communicate, learn, and form memories; excessive glutamate activity can contribute to nerve-cell injury.

Glutamate Decarboxylase

Glutamate decarboxylase is an enzyme that converts glutamate into the neurotransmitter GABA; antibodies against it are associated with some autoimmune disorders.

Glutamate Receptor

A neuronal receptor activated by glutamate, the major excitatory neurotransmitter, including NMDA, AMPA, kainate, and metabotropic receptor classes.

Glutamic Acid

An amino acid that acts as a metabolic intermediate and neurotransmitter precursor; its charged form, glutamate, mediates most fast excitatory signaling in the brain.

Glutamic Acid Decarboxylase

An enzyme that converts glutamate to GABA; antibodies to it can occur in type 1 diabetes.

Alternate Names:
GAD; Glutamate Decarboxylase

Glutamine

An amino acid used to build proteins, transport nitrogen, and provide energy for some cells, especially cells in the intestine and immune system. The body

usually makes enough, but needs may change during severe illness.

Glutaral

Glutaral is a chemical disinfectant and tissue fixative that can irritate the skin, eyes, and airways.

Glutaric Acidemia Type 1

A rare inherited disorder in which the body cannot break down certain amino acids, allowing harmful substances to build up. Babies may have a large head and can develop sudden brain injury, abnormal movements, or stiffness during illness; newborn screening and dietary treatment can reduce harm.

Alternate Names:
Glutaric Aciduria Type 1 (GA-1); Glutaryl-CoA Dehydrogenase Deficiency

Glutaric Aciduria

An inherited metabolic disorder in which the body cannot properly break down certain amino acids. Type I can cause brain injury, movement problems, and enlarged head size.

Glutathione

A small molecule made from glutamate, cysteine, and glycine that helps protect cells from oxidative damage. It also participates in processing drugs and other reactive chemicals, including a toxic metabolite of acetaminophen.

Glutathione Disulfide

The oxidized form of glutathione, produced after glutathione neutralizes reactive oxygen compounds. Cells normally convert it back to active glutathione to maintain antioxidant protection.

Glutathione Peroxidase

A family of enzymes that uses glutathione to break down hydrogen peroxide and other peroxides, helping protect cells from oxidative damage. Several forms contain selenium.

Alternate Names:
GPx

Glutathione Synthetase Deficiency

An inherited disorder caused by deficient glutathione synthetase, the enzyme needed to make glutathione. Severity ranges from hemolytic anemia and excess 5-oxoproline to metabolic acidosis, neurologic impairment, recurrent infection, or seizures.

Glutathione Transferase

A family of enzymes that attaches glutathione to selected medicines, toxins, and products of cell metabolism. This usually makes them less reactive and easier for the body to process or remove.

Gluteal

Relating to the buttock or the gluteal muscles, which extend and rotate the hip and help stabilize the pelvis.

Gluteal Gait

An abnormal walking gait caused by weakness or paralysis of the hip abductor muscles (gluteus medius and minimus) innervated by the superior gluteal nerve, manifested by a downward pelvic tilt toward the unsupported swing leg during single-leg stance, compensated by leaning the trunk toward the affected stance side.

Alternate Names:
Trendelenburg Gait; Gluteus Medius Gait

Gluteal Injury

Damage to the muscles, tendons, nerves, or soft tissues of the buttock caused by trauma, overuse, injection, or falls. Pain, bruising, weakness, difficulty walking, severe swelling, numbness, inability to bear weight, or bowel or bladder changes may occur.

Gluteal Muscle

One of the large muscles of the buttock, especially the gluteus maximus, medius, or minimus. These muscles extend, rotate, and move the hip and help stabilize the pelvis during standing and walking.

Gluteal Tendinopathy

Tendon degeneration, microtrauma, and tearing af-

fecting the insertion of the gluteus medius or gluteus minimus tendons onto the greater trochanter of the femur, representing the predominant cause of greater trochanteric pain syndrome in middle-aged and older adults.

Gluteal Muscle Strain

An overstretch or small tear in one of the buttock muscles. It can cause pain, tenderness, or weakness in the buttock, often after a sudden movement or intense exercise.

Gluten

A complex of storage proteins (prolamins and glutelins) found in wheat (gliadin), barley (hordein), and rye (secalin). Gluten provides elasticity to dough. In susceptible individuals, gluten triggers an autoimmune response (celiac disease) or non-autoimmune sensitivity (non-celiac gluten sensitivity, NCGS).

Gluten Enteropathy

Celiac disease, an immune reaction to gluten that damages the small intestine and can cause diarrhea, weight loss, anemia, fatigue, or poor nutrient absorption.

Alternate Names:
Celiac Disease; Celiac Sprue

Gluten-Free Diet

A diet that avoids wheat, barley, rye, and foods contaminated with them. It is essential for celiac disease and may help selected people with non-celiac gluten sensitivity; poorly planned diets can lack fiber or nutrients.

Gluten Intolerance

An informal, nonspecific label for symptoms associated with eating foods containing gluten or wheat. It may refer to celiac disease, wheat allergy, or non-celiac gluten or wheat sensitivity, which are distinct conditions with different mechanisms and diagnostic criteria. The term alone does not identify which condition is present.

Gluten-Sensitive Enteropathy

Alternate name; see *Celiac Disease*.

Gluten Sensitivity

A commonly used name for non-celiac gluten/wheat sensitivity: symptoms after eating wheat- or gluten-containing foods in people without celiac disease or wheat allergy. The food trigger may not be gluten itself, and no single test confirms the condition.

Gluteus

Relating to the buttock muscles. The gluteus maximus, medius, and minimus move and stabilize the hip and pelvis during standing, walking, climbing, and other movements.

Gluteus Maximus Muscle

The largest, most superficial buttock muscle. It extends and rotates the hip and helps raise the body from a seated position, climb stairs, and stand upright; it is supplied by the inferior gluteal nerve.

Gluteus Medius Muscle

Thick fan-shaped muscle between maximus and minimus, from external ilium to the greater trochanter. Innervated by superior gluteal nerve (L4-S1). Primary hip abductor essential for pelvic stability during single-leg stance. Superior gluteal nerve injury causes Trendelenburg sign with contralateral pelvic drop.

Gluteus Minimus Muscle

The smallest and deepest gluteal muscle, extending from the outer ilium to the greater trochanter. It abducts and medially rotates the hip and helps stabilize the pelvis during walking.

Glyburide

An oral sulfonylurea that stimulates pancreatic insulin release for type 2 diabetes; prolonged or severe hypoglycemia is an important risk.

Glycaemia

British spelling; see *Glycemia*.

Glycated Hemoglobin

Hemoglobin with glucose attached through a nonenzymatic chemical reaction. Hemoglobin A1c is a specific glycated form measured in a blood test used to estimate average blood glucose over the preceding two to three months; results can be affected by abnormal red-cell survival.

Alternate Names:
Glycohemoglobin; Glycosylated Hemoglobin (older term)

Glycated Hemoglobin Test

A blood test (HbA1c) measuring the percentage of hemoglobin bound to glucose, providing an average index of blood sugar control over the preceding 2 to 3 months; see *Glycated Hemoglobin*.

Glycation

A chemical process in which sugar attaches to proteins, fats, or genetic material without the usual enzyme control. Excess glycation during prolonged high blood glucose can damage blood vessels, nerves, kidneys, eyes, and other tissues.

Glycemia

The amount of glucose in the blood. It is affected by food, activity, illness, the liver, and hormones such as insulin and glucagon. Too little is hypoglycemia; too much is hyperglycemia.

Glycemic Control

The level and pattern of blood-glucose management over time. It includes glucose values, symptoms, and the effects of food, activity, illness, medicines, pregnancy, and other circumstances.

Glycemic Index

A measure of how much a food containing available carbohydrate raises blood glucose compared with a reference food, when equal amounts of carbohydrate are tested. It does not represent the effect of a usual serving; that is better reflected by glycemic load.

Alternate Names:
GI

Glycemic Load

A measure that combines a food's glycemic index with the amount of available carbohydrate in a serving to estimate its effect on blood glucose.

Glyceraldehyde

A small sugar with three carbon atoms that appears as the body breaks down glucose and other carbohydrates. It is quickly changed into other substances during the steps that release energy from food.

Glyceride

A glyceride is a compound formed when glycerol is linked to one or more fatty acids, including many dietary fats.

Glycerin

A colorless, odorless, sweet-tasting liquid also known as glycerol. It attracts water, dissolves some substances, and is used in medicines, skin products, foods, and selected treatments.

Glycerol

A colorless, sweet-tasting alcohol that forms part of fats. It is used in medicines, foods, and skin products and can draw water into the bowel when used in some laxatives.

Alternate Names:
Glycerine; Trihydroxypropane

Glycerol Kinase

Glycerol kinase is an enzyme that adds phosphate to glycerol, allowing it to enter pathways for energy production and fat metabolism.

Glycerophosphates

Compounds containing glycerol and phosphate that help build cell membranes and participate in energy metabolism, chemical signaling, and other cellular processes.

Glycerophospholipids

The major membrane phospholipids built from glycerol, fatty acids, phosphate, and a polar head group, including phosphatidylcholine and phos-

phatidylethanolamine.

Glycerylphosphorylcholine

A choline-containing substance formed when certain membrane fats are broken down. It occurs in body fluids and cells and participates in membrane metabolism and the supply of choline.

Glyceryl Trinitrate

A nitrate medicine, also called nitroglycerin, that releases nitric oxide and relaxes blood vessels. It can relieve or prevent angina, but may cause headache, dizziness, or low blood pressure and can interact dangerously with phosphodiesterase-5 inhibitors.

Glycine

A small amino acid used to make proteins and heme. It also acts as an inhibitory chemical messenger, especially in the spinal cord and brainstem, helping regulate movement and reflexes.

Glycine Receptor

A ligand-gated chloride channel activated by glycine that mediates inhibitory neurotransmission, especially in the spinal cord and brainstem.

Glycocalyx

A sugar-rich coating on the outside of many cells, including cells lining blood vessels. It helps protect surfaces, control passage of substances, support cell attachment, and influence inflammation and clotting.

Glycogen

The body's stored form of glucose. It is kept mainly in the liver, which releases it between meals, and in muscles, which use it during activity.

Glycogenesis

The process of converting glucose into glycogen for storage, mainly in the liver and muscles. It occurs after eating, when blood glucose and insulin levels rise.

Glycogenolysis

The breakdown of stored glycogen. The liver uses it to release glucose into the blood between meals, while muscles use their glycogen locally for energy during exercise.

Glycogen Storage Disease

A group of rare, inherited metabolic disorders in which the body lacks one of the specialized enzymes needed to properly make, store, or break down glycogen (the body's stored form of glucose). Depending on which specific enzyme is missing, glycogen accumulates abnormally in the liver, muscles, or heart, which can cause episodes of dangerously low blood sugar (hypoglycemia), an enlarged liver, muscle cramps, and exercise weakness.

Alternate Names:
Glycogen Storage Diseases; GSD; Glycogenosis

Glycogen Storage Diseases

Plural form; see *Glycogen Storage Disease*.

Glycogen Storage Disease Type 0 (GSD-0)

An inherited glycogen-synthase deficiency in which the liver or muscles cannot store normal amounts of glycogen. Liver disease may cause fasting ketotic hypoglycemia and post-meal hyperglycemia, while muscle disease may cause exercise intolerance, weakness, or cardiomyopathy.

Glycohemoglobin

Alternate name; see *Glycated Hemoglobin*.

Glycolipid

A lipid containing a carbohydrate group that contributes to cell membranes, recognition, signaling, and myelin structure.

Glycolysis

A series of reactions in the cytosol that breaks one glucose molecule into two pyruvate molecules. It produces ATP and other molecules used in further energy production and can proceed when oxygen is limited.

Glycopeptide

A molecule made of a short protein chain with one or more attached sugar groups. Glycopeptides occur in cell-surface proteins, antibodies, and some medicines, and the attached sugars can affect structure and function.

Glycophorin

A sugar-coated protein in the red-blood-cell membrane that helps maintain the cell surface and carries markers used to distinguish blood-cell types.

Glycoprotein

A protein with covalently attached carbohydrate chains, important in receptors, antibodies, enzymes, mucus, cell adhesion, and extracellular matrix.

Glycopyrrolate

Glycopyrrolate is an anticholinergic medicine used to reduce secretions and, in some inhaled forms, to help control chronic obstructive lung disease; it may cause dry mouth, constipation, or urinary retention.

Glycosaminoglycan

A long, unbranched carbohydrate chain found in the extracellular matrix and connective tissues. Abnormal breakdown or accumulation of GAGs occurs in mucopolysaccharidoses.

Glycosaminoglycans

Plural form; see *Glycosaminoglycan*.

Glycoside

A compound in which a sugar is chemically linked to another molecule. Glycosides occur in plants, foods, and medicines; their effects depend on the attached molecule and how the body breaks the bond.

Glycosphingolipid

A membrane lipid containing ceramide and one or more sugars, involved in cell recognition, signaling, and nervous-system structure.

Glycosuria

The presence of glucose in the urine. It can occur when blood glucose exceeds the kidney's reabsorption capacity, or when kidney tubules do not reabsorb glucose normally; pregnancy and some medicines can also contribute.

Glycosylated Hemoglobin

Alternate name; see *Glycated Hemoglobin*.

Glycosylation

Attachment of sugar chains to proteins or fats inside cells. This process helps determine their shape, stability, location, and activity; abnormal glycosylation can contribute to inherited disease, cancer, and immune disorders.

Glycosylphosphatidylinositol

A lipid-and-sugar anchor that attaches certain proteins to the outer surface of a cell membrane. Defects in making or attaching this anchor can cause rare blood, nerve, or developmental disorders.

Glycosyltransferase

Glycosyltransferase is an enzyme that transfers a sugar to a protein, lipid, or other molecule during glycan synthesis.

Glycyrrhetinic Acid

An active metabolite of licorice glycosides that inhibits 11-beta-hydroxysteroid dehydrogenase; excess exposure can cause hypertension, low potassium, and fluid retention.

Glycyrrhizic Acid

The major saponin in licorice root that is converted to glycyrrhetinic acid and can produce mineralocorticoid-like toxicity when consumed excessively.

Glyphosate

A broad-spectrum herbicide that inhibits plant EPSP synthase; concentrated exposure can irritate tissues and cause systemic poisoning, especially after ingestion.

Gm

Abbreviation; see *Gram*.

GN

Abbreviation; see *Glomerulonephritis*.

Gnathic

Relating to the jaw, especially the upper jaw or lower jaw and their development, structure, or position.

Gnathion

The lowest midline point on the outer surface of the lower jaw. It is used as a landmark in dental, orthodontic, facial, and skull measurements.

Gnathitis

Inflammation of the jaw or jaw tissues. It may cause pain, swelling, tenderness, difficulty opening the mouth, or chewing problems and can result from infection, injury, or inflammatory disease.

Gnathoplasty

Plastic or reconstructive surgery to reshape or repair the jaw. It may improve function, facial balance, or a structural defect; risks include infection, nerve injury, altered bite, and recurrence.

Gnathostoma

A group of roundworms that can infect people who eat raw or undercooked freshwater fish, frogs, or other carriers. Larvae may migrate through skin, organs, or the nervous system and cause swelling, pain, or serious neurologic disease.

Gnathostoma Spinigerum

A roundworm that can cause gnathostomiasis after people eat raw or undercooked freshwater animals. Migrating larvae may produce recurring painful skin swellings and, rarely, eye or brain disease.

Gnathostomiasis

A parasitic infection caused by Gnathostoma larvae acquired from undercooked freshwater fish or other hosts, producing migratory skin swellings or deeper neurologic or ocular disease.

Gnawing Pain

A dull, persistent pain often described as an ache or a feeling that something is eating away at the body. It can arise from muscles, nerves, internal organs, or inflammation. Its location, duration, triggers, and accompanying symptoms help identify the cause.

GNE Myopathy

A rare inherited muscle disease that usually begins in early adulthood and slowly weakens the muscles of the lower legs, causing foot drop, then the hands and arms. The thigh muscles are often spared until late disease. There is no cure, but rehabilitation helps maintain function.

Alternate Names:
Nonaka Myopathy; Distal Myopathy with Rimmed Vacuoles (DMRV); Hereditary Inclusion Body Myopathy (HIBM)

GnRH

Gonadotropin-releasing hormone, a hormone from the brain that signals the pituitary gland to release hormones controlling ovulation, sperm production, and sex-hormone production.

Alternate Names:
Gonadotropin-Releasing Hormone

GnRH Agonist

A medicine that first increases and then suppresses signals from the pituitary gland to the reproductive organs. It lowers sex-hormone production and is used in selected fertility treatments, endometriosis, fibroids, and hormone-sensitive cancers.

GnRH Antagonist

A medicine that directly blocks the brain-to-pituitary signal controlling reproductive hormones. It lowers these hormones quickly without the temporary hormone rise that can occur when a GnRH agonist is started.

GnRH Antagonists

Plural form; see *GnRH Antagonist*.

Goal Attainment Scaling

A way to measure progress toward personal healthcare goals. The goal is defined in advance with levels ranging from much less than expected to much better than expected, then scored after treatment.

Goal Setting

Choosing clear, realistic outcomes and deciding how and when to work toward them. In healthcare, goals can reflect a person's priorities, include a way to measure progress, and change as needs or circumstances change.

Goals-Of-Care Discussion

A clinical conversation that aligns treatment recommendations with a patient's values, priorities, prognosis, acceptable burdens, and preferred outcomes. It may include decisions about hospitalization, resuscitation, artificial nutrition, and comfort-focused care.

Goblet Cell

A specialized, polarized, simple columnar epithelial cell found interspersed throughout the mucosal lining of the respiratory tract (trachea, bronchi, large bronchioles) and gastrointestinal tract (predominantly the small intestine and large intestine). Named for its goblet-like morphology, it possesses a narrow basal stem containing the nucleus and compressed organelles, and an expanded, distended apical cup packed with membrane-bound mucinogen granules. Secretes high-molecular-weight gel-forming mucin glycoproteins (principally MUC2 in the intestine and MUC5AC/MUC5B in the respiratory tract) via basal merocrine exocytosis and compound exocytosis. Upon hydration at the epithelial surface, mucin swells several hundred-fold to form a protective, viscoelastic, lubricating mucous gel layer that shields underlying mucosal cells from enzymatic degradation, mechanical shearing, pathogenic invasion, and chemical injury. Goblet cell hyperplasia occurs in chronic airway inflammation (asthma, COPD, chronic bronchitis). Ectopic appearance of goblet cells in the distal esophagus defines specialized intestinal metaplasia (Barrett esophagus); malignant transformation of goblet-like cells characterizes aggressive signet-ring cell adenocarcinomas.

Alternate Names:
Goblet Cells

Goblet Cell Adenocarcinoma

A distinctive appendiceal adenocarcinoma composed of goblet-like mucinous cells, formerly called goblet cell carcinoid. It can spread within the peritoneum or to the ovaries and is managed according to grade, stage, and dissemination.

Goblet Cells

Plural form; see *Goblet Cell*.

Goeckerman Regimen

A dermatological therapy used for extensive or recalcitrant plaque psoriasis combining the daily topical application of crude coal tar with exposure to ultraviolet B (UVB) phototherapy.

Alternate Names:
Goeckerman Therapy; Coal Tar and UVB Regimen

Goiter

Enlargement of the thyroid gland, either throughout the gland or as one or more nodules. Thyroid hormone levels may be normal, high, or low. Causes include iodine deficiency, autoimmune thyroid disease, and nodular growth; a goiter does not by itself mean that the thyroid is overactive or cancerous.

Goitre

British spelling; see *Goiter*.

Goitrogenic Foods

Foods or food components that can interfere with thyroid hormone production or iodine use under some conditions; risk depends on intake, preparation, iodine status, and thyroid health.

Goitrous Autoimmune Thyroiditis

Alternate name; see *Hashimoto Thyroiditis*.

Gold

A metal used in selected dental restorations, im-

plants, laboratory applications, and historical medicinal preparations; exposure can cause contact allergy or toxicity depending on the compound and dose.

Gold Alloy

A mixture of gold and other metals used for some dental restorations. It is durable, fits closely, and is usually well tolerated by body tissues, but it costs more and has a distinctive appearance.

Gold Alloys

Plural form; see *Gold Alloy*.

Goldenhar Syndrome

A birth condition, also called oculo-auriculo-vertebral spectrum, in which one side of the face, ear, eye, or spine develops differently. Features may include facial asymmetry, a small or misshapen ear, hearing loss, eyelid or eye-surface growths, and spinal differences.

Golden Hour

An informal term for the early period after serious injury when prompt assessment and treatment may be important. There is no fixed one-hour cutoff that applies to all injuries or emergencies.

Goldmann Tonometry

A slit-lamp examination that estimates intraocular pressure by measuring the force needed to flatten a defined area of the cornea.

Gold Therapy

Treatment with gold-containing medicines, formerly used mainly for rheumatoid arthritis. Its use is now limited because benefit is slow and serious effects can include skin or mouth inflammation, kidney injury, and reduced blood-cell counts.

Golfer Elbow

Alternate spelling; see *Golfer's Elbow*.

Golfer's Elbow

Painful irritation or degeneration of tendons attached to the inner side of the elbow. Repeated gripping or wrist movement can cause tenderness, reduced strength, and pain during lifting or bending.

Golgi Apparatus

A structure inside cells that modifies, sorts, and packages proteins and fats made by the cell, sending them to other parts of the cell or releasing them outside it.

Golgi Cisternae

Flattened membrane-bound sacs that form the Golgi apparatus and modify, sort, and package proteins and lipids for transport within or outside the cell.

Golgi Tendon Organ

A sensory structure where a muscle joins its tendon. It detects tension in the muscle and tendon and helps the nervous system control muscle force and protect against excessive strain.

Gomori's Stain

Gomori's stain is a group of laboratory stains used to highlight structures such as connective tissue, carbohydrates, fungi, or muscle components in tissue samples.

Gomphosis

A fixed joint in which a tooth is held in its socket by a strong ligament.

Gonad

A reproductive organ, usually a testis or ovary, that produces sperm or eggs and sex hormones. Gonads may vary in development or function and influence puberty, fertility, and other body processes.

Gonadal Agenesis

Congenital absence of one or both gonads. It can impair sex-hormone production and fertility and may occur with differences in sex development.

Gonadal Dysgenesis

Incomplete or abnormal development of the ovaries or testes, often resulting from chromosomal abnormalities, gene variants, or disordered sex develop-

ment. It may cause atypical genital development, delayed or absent puberty, infertility, and abnormal gonadal hormone production.

Gonadal Vein

A vein draining a testis or ovary. The right gonadal vein usually drains directly into the inferior vena cava, while the left usually drains into the left renal vein.

Gonad Disorder

A broad category for diseases that affect the testes or ovaries. Depending on the cause, a disorder may impair sperm or egg production, sex-hormone production, or normal gonadal development; the specific disease and affected function should be named when known.

Gonadoblastoma

A rare tumor that develops in an abnormal or incompletely developed ovary or testicle. It may produce sex hormones and has a risk of becoming a malignant germ-cell tumor, especially when a Y-chromosome change is present.

Gonadorelin

Synthetic gonadotropin-releasing hormone that stimulates pituitary release of luteinizing hormone and follicle-stimulating hormone when given intermittently.

Gonadotrophin

British spelling; see *Gonadotropin*.

Gonadotrophin-Releasing Factors

Alternate spelling and plural form; see *Gonadotropin-Releasing Hormone*.

Gonadotrophins

British spelling and plural form; see *Gonadotropin*.

Gonadotrophs

Pituitary cells that release luteinizing hormone and follicle-stimulating hormone after stimulation by GnRH, regulating the ovaries, testes, fertility, and sex-hormone production.

Gonadotropin

A member of a family of heterodimeric glycoprotein hormones that act directly on the gonads (ovaries and testes) to stimulate gametogenesis and steroidogenesis. Composed of two non-covalently linked glycosylated polypeptide subunits: a common α-subunit (identical across LH, FSH, hCG, and TSH) and a hormone-specific β-subunit that confers unique receptor binding specificity and biological action. The principal human gonadotropins are: Luteinizing Hormone (LH) and Follicle-Stimulating Hormone (FSH), synthesized and secreted in a pulsatile manner by anterior pituitary gonadotrophs under the hypothalamic stimulation of gonadotropin-releasing hormone (GnRH); and Human Chorionic Gonadotropin (hCG), synthesized by the placental syncytiotrophoblast during pregnancy to maintain the corpus luteum. In females, FSH stimulates ovarian follicular maturation and granulosa cell estrogen synthesis via aromatase induction, while LH stimulates theca cell androgen production, triggers mid-cycle ovulation, and supports corpus luteum progesterone secretion. In males, FSH acts on Sertoli cells in the seminiferous tubules to promote spermatogenesis and synthesize androgen-binding protein, while LH acts on Leydig cells in the interstitial compartment to stimulate testosterone biosynthesis. Clinical applications include recombinant gonadotropins for ovulation induction and assisted reproductive technologies.

Alternate Names:
Gonadotropins; Gonadotrophic Hormone; Gonadotrophin; Gonadotrophins

Gonadotropin Hormone

Redundant form; see *Gonadotropin*.

Gonadotropin-Releasing Hormone

A hormone made in the brain that signals the pituitary gland to release two hormones, FSH and LH. These hormones control the ovaries and testes, including egg development, ovulation, sperm production, and sex-hormone production.

Alternate Names:

GnRH

Gonadotropins
Plural form; see *Gonadotropin*.

Gonads
Plural form; see *Gonad*.

Gondoic Acid
A 20-carbon monounsaturated fatty acid found in some seed oils and incorporated into dietary and tissue lipids.

Goniometer
An instrument measuring joint angles and range of motion, used to assess stiffness, document impairment, and track progress during rehabilitation.

Gonioscopy
An eye examination using a special contact lens to view the angle where the iris meets the cornea. It helps determine whether glaucoma is open-angle or angle-closure and guides treatment.

Gonococcal
Relating to Neisseria gonorrhoeae, the bacterium that causes gonorrhea. Gonococcal infection commonly affects the genitals, rectum, or throat and may spread to joints or blood.

Gonococcal Arthritis
A disseminated infection of joints caused by Neisseria gonorrhoeae, often with fever, migrating joint or tendon pain, skin pustules, and inflammation around tendons.

Gonococcal Pharyngitis
Infection of the throat by Neisseria gonorrhoeae, usually acquired through sexual contact. It may cause sore throat or no symptoms.

Gonococcal Urethritis
Infection and inflammation of the urethra caused by Neisseria gonorrhoeae. It may cause burning urination or discharge, but some people have no symptoms; untreated infection can spread.

Gonococcus
A spherical bacterium of the genus Neisseria. Neisseria gonorrhoeae, the gonococcus, causes the sexually transmitted infection gonorrhea.

Gonorrhea
A sexually transmitted infection caused by the bacterium Neisseria gonorrhoeae. It may cause discharge, painful urination, pelvic or rectal symptoms, or no symptoms. Untreated infection can lead to infertility, joint infection, or infection in a newborn.

Gonorrhoea
Alternate spelling; see *Gonorrhea*.

Goodell Sign
A clinical sign of early pregnancy characterized by marked softening of the uterine cervix (produced by increased pelvic vascularity and edema), identifiable upon digital pelvic bimanual examination around the sixth to eighth week of gestation.

Goodpasture's Syndrome
Alternate spelling; see *Goodpasture Syndrome*.

Goodpasture Syndrome
A rare condition involving bleeding in the lungs and inflammation of the kidney filters. It is often linked to antibodies against tissues in the lungs and kidneys; when these antibodies cause the illness, it is called anti-GBM disease.

Goose Bump
A small raised area around a hair follicle caused by contraction of tiny arrector pili muscles, commonly in response to cold, fear, or strong emotion.

Gooseflesh
Temporary raised bumps around hair follicles caused by contraction of tiny skin muscles, often in response to cold, fear, or strong emotion. It is usually harmless.

Goose-Skin

Goose skin is the temporary raising of hair follicles, usually caused by cold, fear, or strong emotion.

Gorlin's Syndrome

An inherited disorder that increases the risk of multiple basal-cell skin cancers, jaw cysts, and abnormalities of the bones, eyes, and nervous system.

Gorlin Syndrome

Alternate name; see *Gorlin's Syndrome*.

Goserelin

A gonadotropin-releasing hormone agonist that initially stimulates and then suppresses pituitary gonadotropins; it is used in hormone-sensitive prostate or breast cancer and selected gynecologic conditions.

Gottron Papules

Erythematous to violaceous, often scaly papules or plaques over the extensor surfaces of the finger joints, especially the knuckles. They are a characteristic skin finding of dermatomyositis and may occur without muscle weakness. Similar lesions on the elbows, knees, or ankles are often called Gottron sign.

Alternate Names:
Gottron's Papules

Gottron Sign

Symmetrical, violaceous, macular or papular erythematous patches and scaling located over the extensor aspects of the joints (particularly the elbows, patellae, and medial malleoli), serving as a characteristic cutaneous hallmark of dermatomyositis.

Alternate Names:
Gottron's Sign; Dermatomyositis Extensor Erythema

Gougerot-Carteaud Syndrome

A skin disorder causing brown, slightly raised spots that join into net-like patches, usually on the upper chest, back, or neck of young people.

Gout

A painful form of inflammatory arthritis caused by high levels of uric acid in the blood (hyperuricemia). When excess uric acid cannot be eliminated by the kidneys, it forms sharp, needle-like crystals that accumulate in joints and surrounding tissues. This triggers sudden, severe attacks of excruciating pain, swelling, redness, and heat, most famously in the base of the big toe, but also in the ankles, knees, wrists, and fingers.

Alternate Names:
Gouty Arthritis; Monosodium Urate Arthropathy; Podagra

Gout Flare

A sudden attack of gout caused by inflammation around urate crystals in a joint. The joint becomes very painful, swollen, warm, and red, often beginning in the big toe. Infection can cause similar symptoms.

Gout Nodulosis

A condition in which many firm urate deposits, called tophi, form under the skin or around joints because of long-standing gout. They may occur at the ears, fingers, toes, elbows, or Achilles tendons and can restrict movement or break through the skin.

Gout Suppressants

An older, imprecise term for urate-lowering medicines used to reduce serum urate and prevent gout flares or urate deposits over time. Examples include xanthine oxidase inhibitors and uricosuric medicines.

Gouty Tophus

A firm deposit of monosodium urate crystals that accumulates in tissues in long-standing gout. Tophi often occur at the ears, elbows, fingers, toes, or Achilles tendons and may limit movement or damage nearby tissue.

Alternate Names:
Tophus

Gowers Sign

A maneuver in which a person uses the hands to push up from the floor or thighs because of proximal muscle weakness, classically seen in muscular dystrophy.

Gower Syndrome

A historical term for episodes William Gowers described as vagal or vasovagal attacks. The name was not consistently adopted and may have included episodes now classified as vasovagal syncope, psychogenic pseudosyncope, or seizures; it is not a current diagnostic term. See also *Vasovagal Syncope* and *Situational Syncope*.

GPA

Systemic necrotizing vasculitis affecting small to medium blood vessels, particularly in the airways and kidneys. See *Granulomatosis With Polyangiitis*.

G Protein-Coupled Receptor

A cell-surface receptor that binds hormones, neurotransmitters, medicines, or other signals and activates proteins inside the cell. These receptors regulate many functions, including heart rate, vision, digestion, and inflammation.

Alternate Names:
G Protein-Coupled Receptors; GPCR

Graafian Follicle

A mature, fluid-filled sac in an ovary that contains an egg ready for release. It enlarges during the menstrual cycle and normally opens at ovulation; after release, the remaining tissue forms the corpus luteum.

GRACE Score

A risk score used in people with an acute coronary syndrome to estimate the chance of death or another heart attack during the hospital stay and over the next six months. It uses age, vital signs, kidney function, cardiac arrest, ECG changes, heart-failure signs, and heart-injury blood tests to guide treatment intensity.

Alternate Names:
Global Registry of Acute Coronary Events Score; GRACE Risk Model

Gracilis Muscle

A long, slender strap-like muscle located on the medial aspect of the thigh originating from the inferior pubic ramus and body of the pubis, descending to insert into the pes anserinus on the proximal medial tibia; acts to adduct the thigh and flex and internally rotate the leg.

Grade

A measure of how abnormal cells look under a microscope and, in many cancers, how quickly the growth is likely to behave. Lower grades usually look more like normal cells; higher grades usually look more abnormal. The grading system differs by disease.

Graded Potentials

Small changes in an electrically active cell caused by a stimulus. Their size depends on the stimulus strength, and they can either increase or decrease the chance that the cell will send a nerve signal.

Grade IV Astrocytoma

A historical term for an astrocytoma assigned grade 4 under earlier classification systems. It does not map uniformly to one current tumor type: current classification distinguishes astrocytoma, IDH-mutant, grade 4 from glioblastoma, IDH-wildtype.

Gradenigo Syndrome

A classic clinical triad consisting of suppurative otitis media (otorrhea), retro-orbital or temporal pain in the sensory distribution of the trigeminal nerve (cranial nerve V), and ipsilateral abducens nerve palsy (cranial nerve VI) caused by petrous apicitis.

Alternate Names:
Gradenigo's Syndrome; Petrous Apicitis Triad

Graefe's Sign

A delayed downward movement of the upper eyelid during downward gaze, classically associated with thyroid eye disease but not specific to it.

Graft

Tissue or a synthetic material transferred to another site to replace, repair, reinforce, or bypass a damaged body structure.

Grafting

The surgical transfer of tissue or a synthetic substitute to repair, replace, or support a body structure. An autograft comes from the same person, whereas an allograft comes from another person of the same species.

Graft Versus Host

Alternate name; see *Graft Versus Host Disease*.

Graft Versus Host Disease

A complication of a stem-cell or bone-marrow transplant in which immune cells from the donor attack the recipient's tissues. It commonly affects the skin, liver, and digestive tract and may be short-term or long-lasting; prevention and treatment use immune-suppressing medicines.

Alternate Names:
GVHD

Graft-Versus-Host Disease

Alternate spelling; see *Graft Versus Host Disease*.

Graft-Versus-Host Reaction

Alternate name; see *Graft Versus Host Disease*.

Graham-Little-Piccardi-Lasseur Syndrome

A rare variant of lichen planopilaris characterized by scarring hair loss on the scalp, nonscarring loss of axillary or pubic hair, and follicular papules on the trunk. It is an inflammatory disorder; treatment may limit permanent hair loss.

Gram

A metric unit used to measure mass, equal to one-thousandth of a kilogram. Grams are commonly used for medicines, laboratory samples, food, and body substances; one thousand milligrams make one gram.

Alternate Names:
Metric Gram; Unit G

Gramicidin

Gramicidin is a topical antibiotic that forms channels in bacterial membranes; it is not generally used systemically because it can be toxic.

Gram Mass Unit

Alternate name; see *Gram*.

Gram Metric Unit

Alternate name; see *Gram*.

Gram-Negative

Describing bacteria with a thin peptidoglycan cell wall and an outer membrane containing lipopolysaccharide; they stain pink or red with the Gram stain.

Gram-Negative Bacilli

Rod-shaped bacteria that appear pink or red with a Gram stain because they have a thin peptidoglycan layer and an outer membrane. They include harmless body organisms and bacteria that can cause urinary, respiratory, intestinal, bloodstream, wound, or other infections.

Gram-Negative Bacteria

Bacteria that do not retain crystal violet during Gram staining and therefore appear pink or red. They have a thin peptidoglycan layer and an outer membrane that may contain lipopolysaccharide. Examples include Escherichia coli, Klebsiella, Pseudomonas, and Neisseria.

Gram-Negative Bacterial Resistance

Resistance of gram-negative bacteria to one or more antibiotics. Resistance may be naturally present or acquired through genetic changes or genes transferred from other bacteria. The outer membrane can limit the entry of some antibiotics. Other resistance mechanisms include enzymes that destroy or inactivate antibiotics, changes in drug targets, and pumps that remove antibiotics from bacterial cells.

Gram-Negative Cocci And Coccobacilli

Gram-negative bacteria that are either round or short rod-shaped. Cocci are round, while coccobacilli are short rods that may look almost round. They include bacteria that can cause respiratory, genital, bloodstream, intestinal, and other infections.

Gram-Negative Folliculitis

Inflammation of hair follicles caused by gram-negative bacteria, sometimes after prolonged antibiotic treatment for acne. It often causes pustules on the face, particularly around the mouth and chin.

Gram-Negative Meningitis

Meningitis caused by gram-negative bacteria, including Escherichia coli, Klebsiella, and Neisseria species. It can progress rapidly to sepsis, neurologic injury, and death.

Gram-Negative Toe Web Infection

Infection of the moist spaces between the toes by gram-negative bacteria, causing maceration, erosions, malodor, pain, or discharge. Moisture, occlusive footwear, and existing tinea pedis predispose; drying and appropriate antimicrobial treatment are important.

Gram-Positive

Describing bacteria with a thick peptidoglycan cell wall that retains crystal violet during Gram staining and therefore appears purple.

Gram-Positive Bacilli

Rod-shaped bacteria that retain the purple part of the Gram stain because of their thick peptidoglycan cell wall. Some are harmless colonizers, while others can cause wound, intestinal, respiratory, bloodstream, or nervous-system infections.

Gram-Positive Bacteria

Bacteria that retain crystal violet in the Gram stain (appear purple/blue), characterized by a thick peptidoglycan cell wall and no outer membrane.

Gram-Positive Cocci

Round bacteria that appear purple with a Gram stain because they have a thick peptidoglycan cell wall. Important groups include staphylococci, streptococci, and enterococci, which may normally live on the body or cause skin, throat, lung, urinary, heart-valve, or bloodstream infections.

Gram's Stain

Gram's stain is a laboratory method that classifies bacteria by how their cell walls retain the stain, helping guide identification and initial antibiotic choices.

Gram Stain

A laboratory test that colors bacteria to group them as Gram-positive or Gram-negative. It helps identify possible causes of infection quickly and can guide initial treatment while more specific tests are performed.

Gram Stain Of Skin Lesion

Microscopic examination of a skin lesion specimen stained with Gram stain to identify bacteria. Useful for diagnosing bacterial skin infections and guiding antibiotic therapy. Results available within hours.

Gram Stain Of Tissue Biopsy

Microscopic examination of tissue biopsy specimen stained with Gram stain to identify bacteria. Used to diagnose tissue infections and guide antimicrobial therapy. May be performed alongside culture and histopathology.

Alternate Names:
Tissue Gram Stain; Histochemical Bacterial Stain

Grand Multipara

A person who has given birth five or more times beyond the gestational threshold used to count parity; definitions can vary by obstetric system.

Grand Rounds

An educational medical conference in which clinicians present a case, diagnosis, management, or clinical topic to a professional audience.

Granisetron

Granisetron is a selective 5-HT3-receptor antagonist used to prevent chemotherapy-, radiotherapy-, or surgery-related nausea and vomiting; headache, constipation, and QT prolongation can occur.

Granisetron Hydrochloride

The hydrochloride form of granisetron, a medicine that blocks serotonin 5-HT3 receptors to prevent nausea and vomiting from chemotherapy, radiation, or surgery. Headache, constipation, and heart-rhythm changes may occur.

Granular Casts

Small grainy particles formed inside kidney tubules and seen in urine. They may occur when kidney cells are injured or break down and can be found in acute kidney injury or some chronic kidney diseases.

Granular Cell Tumor Of The Breast

An uncommon tumor showing Schwann-cell differentiation that can occur in the breast and mimic carcinoma clinically or on imaging. Histologic examination distinguishes it from malignancy; most are benign.

Granular Cell Tumors

Usually slow-growing tumors derived from Schwann-cell-lineage tissue, most often affecting the skin, tongue, or subcutaneous tissue. Most are benign, but some are malignant; persistent or changing nodules require examination and histologic diagnosis.

Granular Leukocyte

A granulocyte, a white blood cell containing cytoplasmic granules; the main types are neutrophils, eosinophils, and basophils.

Granular Parakeratosis

A rare skin condition causing brown or reddish, sometimes itchy patches or papules, often in skin folds such as the armpits. It reflects abnormal keratinization and may be difficult to distinguish from other rashes.

Granulation

The formation of new vascular connective tissue during wound healing, producing moist red or pink granulation tissue made of capillaries, fibroblasts, and extracellular matrix.

Granulation Tissue

New tissue that grows in a healing wound and contains small blood vessels, connective tissue, and immune cells. Healthy granulation tissue is usually pink or red and moist.

Granulicatella

Granulicatella is a group of bacteria that may live in the mouth and can rarely cause bloodstream infection or endocarditis.

Granulicatella Adiacens

A mouth bacterium that can rarely cause serious infection, especially infection of heart valves or the bloodstream. It may be difficult to grow in culture, and treatment depends on susceptibility testing.

Granulicatella Elegans

A bacterium normally found in the mouth that can rarely cause bloodstream infection or infection of a heart valve. It may grow poorly in routine culture, so repeated positive cultures and compatible symptoms are important when judging its significance.

Granulocyte

A type of white blood cell containing visible granules. Neutrophils, eosinophils, and basophils are granulocytes that help fight infection, trigger inflammation, and respond to allergic or parasitic disease.

Granulocyte Colony-Stimulating Factor

A hematopoietic glycoprotein growth factor that stimulates the bone marrow to produce and differentiate granulocyte precursors into mature neutrophils and mobilize them into circulating blood; recombinant forms (filgrastim, pegfilgrastim) are used to treat and prevent chemotherapy-induced neutropenia.

Alternate Names:

G-CSF

Granulocyte Count

A granulocyte count measures the number of neutrophils, eosinophils, and basophils in the blood and helps assess infection, inflammation, and bone-marrow function.

Granulocytic Sarcoma

A mass of immature myeloid blood-forming cells outside the bone marrow, also called myeloid sarcoma. It may occur with acute myeloid leukemia or precede it.

Granulocytopenia

An abnormally low number of granulocytes, especially neutrophils, which can increase susceptibility to bacterial and fungal infection.

Granuloma

A small area of organized inflammation formed when immune cells surround material they cannot easily remove, such as certain germs, foreign material, or substances released by the body.

Granuloma Annulare

A benign, noninfectious inflammatory skin disorder producing smooth, firm, skin-colored, pink, or reddish papules arranged in ring-shaped plaques, often on the backs of the hands or feet and over joints. It is usually asymptomatic or mildly tender; its cause is unknown.

Granuloma Fungoides

Alternate spelling; see *Mycosis Fungoides*.

Granuloma Gluteale Infantum

A sharply defined reddish-purple inflammatory plaque in the diaper area of an infant, often related to prolonged irritant dermatitis, occlusion, or topical products. Removing irritants and treating the underlying diaper dermatitis usually leads to improvement.

Granuloma Inguinale

A sexually transmitted infection caused by *Klebsiella granulomatis*, producing slowly enlarging, usually painless ulcers in the genital or groin region.

Granulomatosis

A broad term for a disease marked by granulomas, organized clusters of immune cells that form in response to persistent infection, foreign material, or certain inflammatory diseases. It does not identify one specific condition; the particular disease must be named. Granulomatosis with polyangiitis, for example, is a specific disease that inflames blood vessels.

Granulomatosis With Polyangiitis

An autoimmune disease that inflames and damages small and medium-sized blood vessels, often affecting the nose, sinuses, lungs, and kidneys. It may cause sinus problems, cough, coughing blood, or kidney injury.

Alternate Names:
GPA

Granulomatous Amebic Encephalitis

A rare, severe brain infection caused by free-living amoebae, usually in people with weakened immunity. It develops over days or weeks and may cause headache, confusion, seizures, weakness, or coma.

Granulomatous Colitis

Inflammation of the colon in which granulomas are found on tissue examination, often associated with Crohn disease but also possible with infections or other inflammatory conditions.

Granulomatous Inflammation

A pattern of long-lasting inflammation in which immune cells form small clusters around material they cannot easily remove. It can occur with infections, foreign materials, autoimmune disease, or other inflammatory conditions.

Granulomatous Mastitis

Inflammation of the breast in which clusters of im-

mune cells called granulomas form in breast tissue, often around the lobules. Causes include idiopathic disease, infection such as tuberculosis or Corynebacterium, and systemic inflammatory disease; it can cause a painful mass, abscesses, or draining sinuses.

Granulosa Cell

A granulosa cell is a cell surrounding an ovarian egg that supports its development and produces hormones such as estrogen and inhibin.

Granulosa Cell Tumor

A tumor arising from hormone-producing cells in the ovary. It may release estrogen, causing irregular bleeding or early puberty, and can recur years after treatment even when it initially appears slow-growing.

Granulosa Cell Tumors

Plural form; see *Granulosa Cell Tumor*.

Granulosa Tumor

Alternate form; see *Granulosa Cell Tumor*.

Granzyme

A protease released by cytotoxic T lymphocytes and natural killer cells that enters target cells through perforin-associated pores and promotes programmed cell death.

Grasp Reflex

An automatic closing of a baby's fingers when the palm is touched. It is normal in early infancy and usually fades as voluntary hand control develops; persistence or asymmetry can occur with nervous-system problems.

Grass Allergy

An allergic reaction to grass pollen that can cause sneezing, nasal congestion, itchy eyes, and throat irritation. Symptoms may recur during periods when the relevant grass pollen is present in the air.

Alternate Names:
Grass Pollen Allergy; Gramineae Pollinosis

Grass And Weed Killer Poisoning

Illness caused by swallowing, inhaling, or getting herbicide on the skin or eyes. Effects range from irritation, vomiting, and breathing problems to severe poisoning, depending on the product and amount.

Alternate Names:
Herbicide Intoxication; Weedicide Poisoning

Graves Disease

An autoimmune disorder that is the leading cause of an overactive thyroid gland (hyperthyroidism). In this condition, the immune system mistakenly produces abnormal antibodies that stimulate the thyroid gland to produce far too much thyroid hormone. This excess hormone speeds up the body's metabolism, causing weight loss despite an increased appetite, rapid or irregular heartbeat, hand tremors, heat intolerance, anxiety, and in many cases, bulging eyes (Graves ophthalmopathy).

Alternate Names:
Graves' Disease; Graves' Disease; Basedow Disease; Toxic Diffuse Goiter

Graves Ophthalmopathy

An autoimmune inflammatory disorder of the retro-orbital tissues and extraocular muscles associated with Graves disease, driven by autoantibodies against the TSH receptor leading to fibroblastic proliferation, glycosaminoglycan deposition, proptosis, upper lid retraction, and diplopia.

Alternate Names:
Graves Orbitopathy; Thyroid Eye Disease

Grave Wax

Alternate name; see *Adipocere*.

Gravida

The number of times a person has been pregnant, regardless of pregnancy outcome; the current pregnancy is included in the count.

Gravidity

Gravidity is the number of times a person has been pregnant, including the current pregnancy and pregnancies that did not result in a live birth.

Gray

A unit used to measure the amount of ionizing radiation absorbed by a material or body tissue. One gray equals one joule of radiation energy absorbed per kilogram. It is used in radiation treatment and safety assessment.

Gray Baby Syndrome

A serious form of chloramphenicol toxicity in newborns, caused by immature drug metabolism and characterized by abdominal distension, vomiting, cyanosis or gray skin color, cardiovascular collapse, and potentially death.

Gray Matter

Areas of the brain and spinal cord containing many nerve-cell bodies and connections. Gray matter processes information and helps control movement, sensation, memory, speech, and other functions.

Greater Curvature

The long, rounded outer border of the stomach, extending from its upper opening to its outlet. It provides attachment for the greater omentum and receives blood from several stomach arteries.

Greater Omentum

A fold of fatty peritoneal tissue that hangs from the stomach and partly covers the abdominal organs.

Greater Trochanter

The large bony prominence on the outer upper thigh, where several hip muscles attach. It can be felt through the skin and is a common site of pain from tendon problems, bursitis, or injury.

Greater Trochanteric Pain Syndrome

Pain over the outer hip near the greater trochanter, most often associated with gluteal tendon disease and sometimes with nearby bursae. Pain may worsen with walking, climbing stairs, or lying on the affected side.

Alternate Names:
GTPS

Greater Vestibular Glands

Paired glands near the vaginal opening that secrete mucus into the vestibule, contributing to lubrication. They are also called Bartholin glands.

Alternate Names:
Bartholin Glands; Vulvovaginal Glands

Great Saphenous Vein

The longest superficial vein of the lower limb, ascending from the medial foot to drain into the femoral vein at the saphenofemoral junction.

Green Blindness

A form of red-green color-vision deficiency in which distinguishing green from certain other colors is difficult, usually because of an inherited cone-photopigment difference.

Green Nail Syndrome

Green discoloration of one or more nails, usually caused by colonization or infection with Pseudomonas aeruginosa, often in an onycholytic or chronically moist nail.

Greenstick Fracture

An incomplete fracture in which a young bone bends and cracks rather than breaking all the way through.

Green Stool

Stool with a green color that may result from diet, food coloring, rapid intestinal transit, medicines, or infection.

Grenz Zone

A narrow, uninvolved zone of normal collagenous dermis located immediately beneath the epidermis, separating the epidermal basement membrane from a dense underlying dermal cellular infiltrate, classically seen in lepromatous leprosy, granuloma faciale, and cutaneous lymphomas.

Alternate Names:
Subepidermal Grenz Zone; Clear Dermal Zone

Grey Ankle Phenomenon

A gray or dusky discoloration around the ankle

associated with chronic venous insufficiency and hemosiderin deposition. It occurs with other signs of venous disease.

Grey Matter

Brain and spinal-cord tissue containing many nerve-cell bodies, connections, and supporting cells. It processes information and helps control movement, sensation, thinking, memory, and other functions.

Grey Turner Sign

Bruise-like discoloration of one or both flanks caused by blood from internal abdominal or retroperitoneal bleeding spreading into the skin. It is classically associated with severe acute pancreatitis but can occur with other causes of internal bleeding; it is uncommon and not specific to pancreatitis.

Grey Turner's Sign

Alternate name; see *Grey Turner Sign*.

Grid Implant

A flexible electrode array placed on or near the brain or another tissue surface to record electrical activity or deliver stimulation.

Grief

The natural emotional response to loss, particularly the death of a loved one, but also following other significant losses such as divorce, job loss, or declining health. It encompasses a range of feelings including sadness, anger, guilt, and numbness, often occurring in waves rather than linear stages.

Grief and Bereavement

Grief is the emotional response to loss, while bereavement is the period of adjustment after a death. Responses vary and may include emotional, physical, social, and spiritual changes.

Grief Disorder

Persistent, intense mourning and functional impairment enduring well beyond typical cultural expectations; see *Complicated Grief*.

Grimontia Hollisae

A salt-loving bacterium from seawater and seafood, formerly called *Vibrio hollisae*. Eating contaminated raw or undercooked seafood can cause watery diarrhea, abdominal cramps, nausea, and fever; severe infection is uncommon but more likely in people with serious underlying illness.

Griping

Cramping or spasmodic abdominal pain, often caused by contractions, gas, inflammation, or obstruction of a hollow digestive organ.

Grip Strength

The force generated when the hand closes around an object, commonly measured with a dynamometer to assess hand function, muscle strength, nutrition, or rehabilitation progress.

Griscelli Syndrome

A rare inherited disorder causing unusually light or silvery hair and skin pigmentation. Some forms also cause neurologic problems or severe immune overactivation, which can lead to fever, enlarged organs, low blood counts, and life-threatening illness.

Griseofulvin

Griseofulvin is an oral antifungal that deposits in newly formed keratin and disrupts dermatophyte mitosis, treating infections of skin, hair, and nails; treatment is prolonged and hepatic or drug-interaction risks apply.

Groin

The region where the lower abdomen meets the upper thigh, containing the inguinal canal and related muscles, vessels, nerves, and lymph nodes.

Groin Lump

A palpable mass in the inguinal region, which may represent enlarged lymph nodes, a hernia, cyst, tumor, or another condition.

Alternate Names:
Inguinal Mass

Groin Pain

Pain in the inguinal region, which may originate from musculoskeletal, genitourinary, gastrointestinal, or vascular causes. Common causes include muscle strain, hernia, enlarged lymph nodes, and hip disease.

Alternate Names:
Inguinal Pain

Grommet Tube

A miniature, spool-shaped synthetic ventilation tube surgically inserted through an incision in the tympanic membrane (myringotomy) to equalize middle ear pressure and facilitate fluid drainage in chronic otitis media with effusion.

Alternate Names:
Tympanostomy Tube; Ventilation Tube

Groove

A long, narrow depression or channel on a body structure, such as a groove on a bone for a tendon or a groove between folds of the brain. Its exact function depends on its location.

Grooved Tongue

Alternate name; see *Fissured Tongue*.

Gross Anatomy

The study of body structures visible without a microscope, including organs, body regions, bones, muscles, blood vessels, and their relationships.

Gross Examination

Inspection of a tissue or other specimen with the unaided eye before it is examined under a microscope. The pathologist records its size, shape, color, and visible abnormalities to help guide diagnosis.

Gross Hematuria

Visible blood in the urine, appearing pink, red, or brown. Causes include urinary tract infections, kidney stones, bladder or kidney cancer, trauma, and disease of the kidney filters.

Alternate Names:
Macroscopic Hematuria; Visible Hematuria

Gross Motor Control

The ability to use large muscle groups for coordinated movements such as walking, running, jumping, and maintaining posture. Develops progressively from infancy through childhood and is assessed as part of developmental milestones.

Alternate Names:
Large Motor Coordination

Gross Motor Skills

Movements that use the large muscles for posture, balance, walking, running, jumping, and climbing. Children develop these skills at different rates.

Ground-Glass Opacity

An area of increased whiteness on a lung CT scan through which blood vessels remain visible. It can result from partial filling of air sacs, increased blood volume, or early scarring, and occurs with infections, fluid buildup, bleeding, inflammation, and some tumors. Its distribution and accompanying findings, such as dense consolidation or thickened septa, help narrow the cause.

Ground Itch

An itchy skin rash caused by hookworm larvae entering the skin, usually after bare-foot contact with contaminated soil. It produces small, red, intensely itchy bumps.

Ground Substance

The gel-like, noncellular part of connective tissue surrounding cells and fibers. It contains water, proteoglycans, and other molecules that support tissues, allow nutrient movement, and influence inflammation and repair.

Group 1 Pulmonary Hypertension (PAH)

A type of high blood pressure in the lung arteries caused by narrowing or changes in those vessels. It makes the right side of the heart work harder. Causes include inherited disease, some medicines, and conditions affecting the heart, immune system, or liver.

Group 2 Pulmonary Hypertension

Pulmonary hypertension caused by left-heart disease, including left-ventricular dysfunction, valvular disease, or congenital left-heart disorders. Treatment focuses on the underlying cardiac condition and volume status; pulmonary arterial hypertension-specific drugs are not routinely interchangeable with this group.

Group 3 Pulmonary Hypertension

Pulmonary hypertension associated with lung disease or hypoxia, such as COPD, interstitial lung disease, sleep-disordered breathing, or chronic hypoventilation. Management emphasizes treating the lung disorder, correcting hypoxemia, and evaluating for severe or disproportionate vascular disease.

Group 4 Pulmonary Hypertension

Pulmonary hypertension caused by obstruction of the pulmonary arteries, most commonly chronic thromboembolic pulmonary hypertension from organized blood clots. Other causes include pulmonary artery tumors, arteritis, and congenital or acquired arterial stenosis.

Group A Strep

Alternate name; see *Group A Streptococcus*.

Group A Streptococcal Infections

Infections caused by Streptococcus pyogenes, including pharyngitis, scarlet fever, impetigo, cellulitis, pneumonia, necrotizing soft-tissue infection, and bloodstream infection. Immune-mediated complications can include rheumatic fever and poststreptococcal glomerulonephritis.

Group A Streptococcus

Streptococcus pyogenes, a bacterium that can cause pharyngitis, skin infections, invasive disease, and immune-mediated complications.

Group B Strep

Alternate name; see *Group B Streptococcus*.

Group B Strep Disease

Illness caused by group B Streptococcus bacteria, which can cause serious infections in newborns and infections in pregnant people or adults with medical risks.

Group B Streptococcal Disease

Alternate name; see *Group B Strep Disease*.

Group B Streptococcal Infection In Pregnancy

Maternal colonization or infection with Streptococcus agalactiae, which can be transmitted to the newborn during labor and cause serious early-onset infection. Screening and intrapartum management reduce neonatal risk.

Group B Streptococcal Infections in Newborns

Alternate name; see *Group B Streptococcal Neonatal Sepsis*.

Group B Streptococcal Neonatal Sepsis

Serious bloodstream infection caused by Group B Streptococcus in neonates, typically acquired during birth. It can cause fever, lethargy, poor feeding, and breathing difficulty; treatment includes antibiotics and supportive care.

Alternate Names:
Neonatal Streptococcus Agalactiae Sepsis

Group B Streptococcal Septicemia of the Newborn

Alternate name; see *Group B Streptococcal Neonatal Sepsis*.

Group B Streptococcus

A bacterium that may colonize the bowel or genital tract without symptoms but can cause serious infection in newborns, pregnant people, and some adults. In newborns, infection can cause sepsis, pneumonia, or meningitis.

Alternate Names:
Streptococcus Agalactiae

Group B Streptococcus in Pregnancy

Group B strep bacteria may be present in the bowel or vagina during pregnancy without causing symptoms. Screening late in pregnancy, usually at 36 or 37 weeks, identifies people who may be offered antibiotics during labor to lower the risk of serious newborn infection.

Group Therapy

A form of psychotherapy where a small group of individuals with similar issues meet to discuss, interact, and develop coping strategies under the guidance of a trained therapist. Used for depression, anxiety, substance use disorders, grief, and chronic illness. Benefits include peer support and shared experiences.

Grover Disease

A transient or recurrent acantholytic dermatosis causing itchy red papules or papulovesicles, usually on the trunk of middle-aged or older adults; heat, sweating, and occlusion may aggravate it.

Grover's Disease

Alternate spelling; see *Grover Disease*.

Growing Pains

Recurrent, bilateral leg pain in children ages 3-12, typically occurring in the late afternoon or evening and resolving by morning. Pain is deep, aching in the calves, shins, and thighs (not joints). No limping, fever, swelling, or functional impairment.

Growth

The process of increasing in physical size and development, including physical, cognitive, and emotional maturation. In medicine, growth is monitored using growth charts and anthropometric measurements to assess health and development in children.

Growth Chart

A graphical representation of growth (weight, height/length, head circumference, BMI) plotted against age, standardized by population (WHO growth standards 0-5 years; CDC growth charts 2-20 years; percentiles/z-scores).

Growth Cone

A specialized, moving tip at the end of a growing nerve fiber. It senses chemical and physical signals and guides the axon toward its target during nervous-system development or repair.

Growth Disorder

A condition in which a child or adult grows unusually slowly, quickly, or unevenly because of genetic, hormonal, nutritional, chronic, or other medical causes.

Growth Factor

A protein that sends signals controlling cell growth, division, specialization, survival, or repair. Different growth factors act on different tissues and are involved in wound healing, blood-vessel formation, immunity, and cancer.

Growth Failure

Growth that is slower than expected or weight gain that is inadequate for age. It can result from poor nutrition, chronic illness, hormone problems, genetic conditions, or difficulty absorbing nutrients.

Growth Faltering

Alternate name; see *Faltering Weight*.

Growth Hormone

A hormone released by the anterior pituitary that promotes growth partly through insulin-like growth factor 1 and also affects protein, fat, and carbohydrate metabolism.

Growth Hormone Deficiency

Insufficient secretion of growth hormone from the anterior pituitary, causing short stature in children and metabolic effects in adults. In children: delayed growth, short stature, delayed bone age, and increased fat mass. In adults: decreased muscle mass, increased fat mass, reduced bone density, fatigue, and dyslipidemia.

Growth Hormone Deficiency in Adults

Inadequate growth-hormone secretion in adulthood,

usually due to hypothalamic or pituitary disease or prior treatment. It may affect body composition, bone density, exercise capacity, lipids, and quality of life and requires confirmatory endocrine testing.

Growth Hormone Physiology

Growth hormone is released in pulses by the pituitary gland, especially during sleep. It acts directly on tissues and also stimulates the liver to produce insulin-like growth factor 1, which supports bone and tissue growth.

Growth Hormone-Releasing Hormone

A 44-amino-acid hypothalamic peptide hormone synthesized by neurons of the arcuate nucleus that travels via the hypophyseal portal system to bind G-protein coupled receptors on anterior pituitary somatotropes, stimulating growth hormone synthesis and pulsatile secretion.

Alternate Names:
GHRH; Somatoliberin

Growth Hormone Stimulation Test

A test for suspected growth-hormone deficiency. A medicine or other controlled stimulus is given, and blood samples are taken over time to see whether the pituitary gland releases enough growth hormone. Results depend on the protocol and laboratory.

Alternate Names:
GH Provocation Test

Growth Hormone Suppression Test

A test for excess growth hormone, usually performed after drinking a glucose solution. In healthy people, glucose lowers growth-hormone levels; failure to suppress them supports a diagnosis such as acromegaly.

Alternate Names:
GH Suppression Test; Glucose Loading GH Assay

Growth Hormone Test

Laboratory measurement of growth hormone levels in the blood, used to evaluate GH deficiency or excess. Random GH levels have limited utility; stimulation or suppression tests are more informative.

Growth Medium

A nutrient preparation supporting microbial multiplication in vitro, supplying carbon, nitrogen, minerals, and growth factors in liquid or solid form.

Growth Plate

A layer of cartilage near the end of a growing bone where the bone lengthens. It gradually closes after puberty.

Growth Plate Fracture

A break involving the cartilage growth area of a child's or adolescent's bone. It can disturb future growth if displaced or untreated; imaging and specialist management may be used.

Alternate Names:
Physeal Fractures

Growth Plate Fractures

Plural form; see *Growth Plate Fracture*.

Growth Retardation

Older wording for growth that is slower than expected for age or developmental stage. Possible causes include inadequate nutrition, chronic illness, hormone or genetic disorders, poor absorption, and normal family variation; growth is assessed over time rather than by one measurement.

Growth Scan

An ultrasound examination used to assess fetal size, growth pattern, amniotic fluid, and sometimes blood flow. Measurements are compared with gestational-age standards to identify possible growth restriction or excessive growth.

Gtp Binding

GTP binding is the attachment of guanosine triphosphate to a protein, often switching that protein into an active state for cell signaling.

Gtt.

An abbreviation from the Latin *guttae*, meaning drops. It refers to a liquid dose or the number of drops.

Guaifenesin

An expectorant used to loosen respiratory mucus and make coughing more productive. It provides symptomatic relief in some respiratory illnesses; dosing depends on the formulation and patient.

Guanfacine

Guanfacine is a centrally acting alpha-2A adrenergic agonist used for hypertension and, in extended-release form, ADHD; sedation, hypotension, bradycardia, and rebound hypertension after abrupt withdrawal are important risks.

Guanine

Guanine is a purine nitrogenous base in DNA and RNA; it pairs with cytosine and is present in nucleotides such as GMP and GTP that support energy transfer and signaling.

Guanosinetriphosphatase

An enzyme that hydrolyzes guanosine triphosphate to guanosine diphosphate and phosphate, regulating signaling and other cellular processes.

Guanosine Triphosphate

A guanine nucleotide that provides energy and acts as a molecular switch in protein synthesis, cytoskeletal regulation, and G-protein signaling.

Guanylate Cyclase

Guanylate cyclase is an enzyme that converts GTP to cyclic GMP, a second messenger involved in nitric-oxide signaling, smooth-muscle relaxation, phototransduction, and intestinal fluid secretion.

Guarana

A plant whose seeds contain caffeine and other stimulants. It is used in energy products and supplements; excessive intake may cause anxiety, insomnia, rapid heartbeat, high blood pressure, or interactions with medicines.

Guarding

Involuntary tightening of the abdominal muscles when the abdomen is examined, often reflecting irritation or inflammation of the abdominal lining.

Guenther Porphyria

Alternate spelling; see *Gunther Disease*.

Guevedoces

A term used in the Dominican Republic for individuals with 46,XY differences in sex development caused by 5-alpha-reductase type 2 deficiency; they may have female-appearing or ambiguous external genitalia at birth and increased virilization at puberty.

Guide Device

A tool used to direct, position, or stabilize another instrument during a procedure, such as a guidewire, drill guide, or needle guide. It helps ensure accurate placement and reduces injury to surrounding tissue.

Guided Imagery

Guided imagery is a relaxation technique that uses imagined sights, sounds, or other sensations to promote calm and sometimes help manage pain or stress.

Guided Tissue Regeneration

A dental procedure placing a barrier membrane to encourage regrowth of bone, root covering, and supporting ligament around a tooth. It may repair selected periodontal defects after inflammation is controlled.

Guidewire

A thin, flexible wire introduced through a blood vessel or body passage to guide placement of a catheter, sheath, stent, or other medical device.

Guillain-Barre Syndrome

Alternate spelling; see *Guillain-Barré Syndrome*.

Guillain-Barré Syndrome

A rare, serious neurological disorder in which the body's immune system mistakenly attacks the peripheral nervous system, usually triggered one to four weeks after a viral or bacterial respiratory or

digestive infection. The immune attack damages the protective coating around nerves, leading to symmetrical muscle weakness and tingling that characteristically begins in the feet and legs and spreads upward to the arms and upper body. In severe cases, the weakness can paralyze the breathing muscles or affect heart rhythm and blood pressure.

Alternate Names:
GBS; Acute Inflammatory Demyelinating Polyradiculoneuropathy; AIDP

Guillaume Dupuytren

A French surgeon whose name is associated with Dupuytren contracture, progressive thickening and shortening of palmar fascia that bends the fingers toward the palm.

Guinea Worm

A parasitic infection caused by Dracunculus medinensis, acquired by drinking water containing infected copepods and characterized by emergence of a long worm through the skin.

Guinea Worm Infection

Alternate name; see *Guinea Worm*.

Gulf War Syndrome

A term for a group of persistent symptoms reported by some Gulf War veterans, such as fatigue, pain, cognitive difficulties, gastrointestinal symptoms, and respiratory problems. The term chronic multisymptom illness is also used for this symptom complex.

Alternate Names:
Gulf War Illness

Gullet

The esophagus, a muscular tube carrying swallowed food and liquid from the throat to the stomach. It moves contents by coordinated squeezing and is protected from injury by its moist inner lining.

Alternate Names:
Esophagus; Food Pipe

Gum

The soft tissue around the teeth that covers the jawbone and helps hold the teeth in place.

Alternate Names:
Gingiva; Gingival Mucosa

Gum Biopsy

Histological examination of gingival tissue obtained by biopsy, used to diagnose gingival diseases, infections, or malignancies. May involve excisional or incisional biopsy techniques.

Alternate Names:
Gingival Biopsy; Periodontal Tissue Sampling

Gum Disease

A broad term for conditions affecting the gums and tooth-supporting tissues. Gingivitis causes gum inflammation; periodontitis also damages the supporting ligament and bone and may loosen teeth.

Alternate Names:
Periodontal Disease

Gum Hypertrophy

Alternate name; see *Gingival Hyperplasia*.

Gumma

A soft area of tissue damage caused by late untreated syphilis. It can develop in the skin, bones, liver, or other organs and may cause a lump, pain, or organ damage.

Alternate Names:
Syphilitic Gumma; Tertiary Syphilis Granuloma

Gummata

More than one gumma: soft inflammatory masses caused by late untreated syphilis. They can affect skin, bone, liver, or other organs and may damage tissue.

Gummy Smile

A smile showing more gum than usual. It may result from lip movement, tooth eruption, jaw shape, or gum position; treatment is optional and depends on the cause and the person's goals.

Gum Problems

Gum problems include inflammation, bleeding, recession, ulcers, infection, trauma, and growths. Causes include plaque, tobacco, dry mouth, medicines, nutritional or immune disease, and poorly fitting appliances.

Gums

Plural form; see *Gum*.

Gunn Sign

An ophthalmologic sign of hypertensive retinopathy in which an arteriosclerotic, rigid retinal arteriole crosses and compresses an underlying retinal venule, producing visible tapering and apparent deflection of the venule on both sides of the crossing.

Alternate Names:
Gunn's Sign; Arteriovenous Nicking

Gunn's Sign

Ophthalmic sign where an arteriole crosses and compresses a vein in the retina, associated with chronic hypertension. See *Gunn Sign*.

Gunshot Wound

An injury caused by a firearm projectile. Damage may include bleeding, tissue destruction, fractures, nerve injury, organ damage, and infection.

Alternate Names:
Firearm Injury; Ballistic Trauma; Bullet Wound

Gunther Disease

A severe autosomal recessive disorder of heme biosynthesis caused by a deficiency of uroporphyrinogen III synthase, leading to massive accumulation of isomer I porphyrins in tissues, manifesting with extreme cutaneous photosensitivity, blistering, mutilating scar formation, erythrodontia, and hemolytic anemia.

Alternate Names:
Congenital Erythropoietic Porphyria; CEP

Gustation

The sense of taste. Special cells in taste buds detect sweet, salty, sour, bitter, and savory flavors. Most taste buds are on the tongue, with some in the soft palate and throat. Signals travel through several head nerves to the brain. Taste can change with infections, medicines, smoking, aging, or damage to the mouth or nerves.

Gustatory

Relating to taste or the sense of taste, including taste buds, taste nerves, and the brain pathways that interpret flavors.

Gustatory Lacrimation

Excessive tearing triggered by eating or smelling food, usually after an injury to the facial nerve or recovery from facial paralysis. The nerve signals for saliva and tears become incorrectly linked.

Gustatory Sweating

Sweating triggered by eating or thinking about food, usually over the cheek or temple after injury or surgery involving the parotid region.

Alternate Names:
Frey Syndrome

Gut

Alternate informal term; see *Digestive Tract*.

Gut-Brain Axis

The two-way communication between the digestive tract and brain through nerves, hormones, immune signals, and substances made by gut microorganisms. It influences digestion, appetite, stress responses, and mood, but its clinical importance is still being studied.

Gut Epithelium

The layer of cells lining the intestines. It absorbs nutrients and water, forms a barrier against harmful substances, and interacts with immune cells and gut microorganisms.

Guthrie Test

An older name for a newborn blood-spot screening test, originally used to detect phenylketonuria. Modern screening covers more conditions; an abnormal

result is followed by confirmatory testing.

Gut Microbiome

The complex community of trillions of microorganisms, including bacteria, viruses, and fungi, residing in the gastrointestinal tract. The gut microbiome plays a crucial role in digestion, immune function, vitamin synthesis, and protection against pathogens.

Guttae

Drop-like excrescences of Descemet membrane on the inner surface of the cornea, often associated with Fuchs endothelial corneal dystrophy. Extensive guttae can disrupt corneal endothelial cells and contribute to corneal swelling and blurred vision.

Guttate Psoriasis

A form of psoriasis causing many small, scaly, drop-shaped spots, often after a streptococcal throat infection. It commonly affects children or young adults and may clear, recur, or later become plaque psoriasis.

Guttural

Relating to the throat. A guttural sound is produced mainly in the throat or back of the mouth rather than at the front of the tongue and lips.

Guyon Canal Syndrome

An entrapment neuropathy of the ulnar nerve as it passes through Guyon canal (the fibro-osseous ulnar tunnel at the wrist between the pisiform and hook of the hamate), causing sensory loss over the little finger and medial half of the ring finger and motor weakness of the hypothenar and interosseous muscles.

Alternate Names:
Ulnar Tunnel Syndrome; Handlebar Palsy

GVHD

Abbreviation; see *Graft Versus Host Disease*.

Gymnast Wrist

A chronic overuse repetitive stress injury of the distal radial growth plate (physis) occurring in skeletally immature gymnasts and athletes who subject the upper extremities to intense axial loading and hyperextension. Radiographs typically demonstrate distal radial physeal widening, irregular metaphyseal margins, and cystic changes.

Alternate Names:
Distal Radial Physeal Stress Syndrome; Gymnast's Epiphysitis

Gynaecologist

A medical doctor who specializes in the health of the female reproductive system (vagina, cervix, uterus, fallopian tubes, ovaries) and breasts.

Gynaecology

The medical specialty concerned with the female reproductive system, including the ovaries, fallopian tubes, uterus, cervix, vagina, and vulva, as well as related hormonal health.

Gynaecomastia

Alternate name; see *Gynecomastia*.

Gynatresia

Absence of or blockage in an opening of the female reproductive tract, present from birth or acquired later. If menstrual blood cannot leave the body, it may cause absent periods, pelvic pain, or enlargement of the uterus or vagina.

Gynecic

Relating to the female reproductive system or to gynecology.

Gynecoid Pelvis

A commonly described pelvic shape with a rounded inlet, relatively broad dimensions, and a spacious outlet; it is associated with typical female pelvic anatomy but individual variation is substantial.

Gynecological Examination

A gynecological examination assesses the female reproductive organs and may include inspection, a pelvic examination, and screening tests when appropriate.

Gynecologic Oncology

The subspecialty of medicine focused on cancers of the female reproductive organs, including cancers of the ovaries, uterus, cervix, vagina, and vulva. It includes diagnosis and cancer-directed care, often coordinating surgery, medicines, radiation, pathology, and supportive services.

Gynecologic Pain

Pain arising from the vulva, vagina, cervix, uterus, tubes, ovaries, pelvic floor, or related nerves and organs. Causes include infection, endometriosis, cysts, torsion, pregnancy complications, malignancy, musculoskeletal disease, and neuropathic or chronic pain.

Gynecologic Tumor Markers

Blood or tissue measurements that may support diagnosis, staging, treatment selection, or monitoring of gynecologic tumors. They are not usually diagnostic alone because benign conditions and other cancers can also alter marker levels.

Gynecologist

A gynecologist is a physician who provides care for the female reproductive system, including preventive care, diagnosis, and treatment.

Gynecology

The medical specialty concerned with the health of the female reproductive system (uterus, ovaries, fallopian tubes, cervix, vagina, and vulva).

Gynecomastia

Benign growth of glandular breast tissue in boys or men, distinct from breast enlargement caused only by extra fat. It commonly occurs in newborns, during puberty, and with aging; changes in hormone balance, some medicines, or illness can also cause it.

Alternate Names:
Gynaecomastia; Male Breast Enlargement; Breast Enlargement in Males

Gyrate Atrophy

An inherited retinal disorder causing gradually worsening peripheral and night vision loss. It results from abnormal ornithine metabolism and may be managed with dietary treatment, supplements, and regular eye monitoring.

Gyrus

A raised fold on the surface of the brain, separated from neighboring folds by grooves called sulci. These folds increase the cerebral cortex's surface area within the skull and contain areas responsible for different functions.

H

H1N1 Flu

Alternate name; see *H1N1 Influenza*.

H1N1 Influenza

Influenza A infection caused by an H1N1 virus. It spreads through respiratory droplets and commonly causes sudden fever, cough, sore throat, muscle aches, headache, and tiredness; some people develop pneumonia or severe breathing problems.

H1N2

A subtype of influenza A virus that can infect humans and pigs. Human infections are uncommon and usually cause an influenza-like respiratory illness; surveillance and testing help distinguish it from other influenza viruses.

H2 Blockers

Medicines that reduce stomach-acid production by blocking histamine H2 receptors in the stomach. They can relieve heartburn and treat some ulcers; possible adverse effects include headache, diarrhea, constipation, and interactions with other medicines.

Alternate Names:
H2 Receptor Antagonists; Histamine-2 Receptor Blockers

H2 Receptor Antagonists Overdose

Taking too much of an H2 blocker medicine. It may cause drowsiness, confusion, agitation, abnormal heartbeat, or rarely seizures.

H5N1

A subtype of avian influenza A virus that mainly infects birds but can occasionally infect mammals and humans after close contact with infected animals or contaminated environments. Human illness can be severe.

Habenula

A small brain structure helping process reward, unpleasant experiences, stress, motivation, and learned behavior. It connects several brain regions and may influence mood, sleep, pain, and responses to negative outcomes.

Haberland Syndrome (Encephalocraniocutaneous Lipomatosis)

A rare congenital mosaic disorder characterized by unilateral scalp and facial lipomas or hairless skin lesions, eye abnormalities, and sometimes seizures, developmental differences, or brain malformations.

Habit

A repeated behavior or pattern of action that may be ordinary, helpful, or harmful; in clinical assessment, its frequency, control, and effect on functioning determine whether it is a concern.

Habit-Tic Nail Deformity

Nail damage caused by repeated rubbing, picking, or pushing back the skin at the nail base. It often produces a central groove with rows of horizontal ridges, especially on the thumbnails. The repeated trauma can disturb nail growth and resembles median canaliform nail dystrophy.

Habituation

A gradual reduction in response to a repeated, harmless stimulus. For example, a person may stop

noticing a constant sound; habituation differs from addiction or drug tolerance.

Habitus

A person's general body build and appearance as observed during a medical examination. Clinicians may describe body habitus when noting nutritional state, muscle mass, or features relevant to a condition.

HAE

Abbreviation for hereditary angioedema, an inherited disorder causing repeated episodes of swelling; see *Hereditary Angioedema*.

Haem

The iron-containing part of hemoglobin that binds oxygen inside red blood cells. Its structure allows blood to carry oxygen from the lungs to tissues and return carbon dioxide.

Haemangioma

Alternate spelling; see *Hemangioma*.

Haemarthrosis

Bleeding into a joint, causing swelling, pain, and reduced movement. It may follow an injury or occur with hemophilia, blood-thinning medicines, surgery, or certain joint disorders.

Haematemesis

Vomiting blood or material that looks like coffee grounds, usually from bleeding in the esophagus, stomach, or upper small intestine. It can be life-threatening.

Haematinics

Nutrients or medicines needed to make healthy red blood cells, especially iron, vitamin B12, and folate. Deficiency can cause anemia, although treatment depends on the specific cause.

Haematocele

A collection of blood in a body cavity or tissue, often in the scrotum after injury, surgery, or bleeding. It may cause swelling, pain, or pressure and sometimes needs imaging or drainage.

Haematocolpos

Accumulation of menstrual blood in the vagina, usually because the vaginal opening is blocked or too narrow. It can cause absent periods, monthly pelvic pain, and a swollen vagina or uterus.

Haematocrit

The proportion of blood volume occupied by red blood cells, expressed as a percentage or decimal fraction. The reference range varies with age, sex, altitude, pregnancy, and laboratory method.

Haematogenous

Spread through the bloodstream. An infection, cancer, or other material that travels this way can reach organs or tissues far from its original site.

Haematologist

A medical doctor who specializes in the diagnosis, treatment, and prevention of diseases of the blood and blood-forming organs.

Haematoma

A collection of blood outside a blood vessel, usually caused by injury, surgery, bleeding disorders, or blood-thinning medicines. A hematoma may cause swelling and pain and can compress nearby organs or nerves.

Haematometra

A collection of menstrual blood in the uterus, usually because the cervix or vagina is blocked or absent. It may cause missed periods, recurring pelvic pain, and uterine enlargement.

Haematomyelia

Bleeding into the spinal cord, usually after severe injury or because of an abnormal blood vessel or bleeding disorder. It can cause sudden back pain, weakness, numbness, paralysis, or loss of bladder control.

Haematopericardium

Blood within the sac around the heart, usually after chest injury, heart surgery, or a tear in the heart or a blood vessel. It can compress the heart and cause life-threatening tamponade.

Haematopoiesis

The process of making blood cells, mainly inside the bone marrow. It produces red cells that carry oxygen, white cells that fight infection, and platelets that help stop bleeding.

Haematoporphyria

An obsolete general term for porphyria, a group of disorders caused by problems in heme production that lead to a buildup of porphyrins or their precursors. The term does not identify a specific type of porphyria.

Haematosalpinx

Alternate spelling; see *Hematosalpinx*.

Haematuria

Blood in the urine. It may be visible or found only with a urine test and can have many causes, including infection, stones, medicines, or kidney disease.

Haemochromatosis

Alternate spelling; see *Hemochromatosis*.

Haemodialysis

Alternate spelling; see *Hemodialysis*.

Haemoflagellate

A parasite with a whip-like structure that lives in blood or tissues. Examples include the parasites that cause sleeping sickness and Chagas disease.

Haemoglobin

The iron-containing protein inside red blood cells that carries oxygen from the lungs to tissues and helps return carbon dioxide to the lungs. A low level is anemia; an abnormal form can cause disease.

Haemoglobinopathy

An inherited disorder affecting the amount or structure of hemoglobin, the oxygen-carrying protein in red blood cells. Examples include sickle-cell disease and thalassemia, which can cause anemia or other complications.

Haemoglobinuria

Free hemoglobin in the urine, often released when red blood cells break apart in the bloodstream. It can make urine red or brown and may occur with infections, medicines, burns, or blood disorders.

Haemolysis

The breakdown of red blood cells, which releases hemoglobin into the blood. It can happen normally as old cells are removed or too quickly because of disease.

Haemolytic Anaemia

Anemia caused by red blood cells being destroyed faster than the bone marrow can replace them. It may cause tiredness, jaundice, dark urine, rapid heartbeat, breathlessness, or an enlarged spleen.

Haemolytic Disease Of The Newborn

Anemia and jaundice in a newborn caused by antibodies from the pregnant person crossing the placenta and destroying the baby's red blood cells. Severe cases can cause brain injury from bilirubin accumulation.

Haemoperitoneum

Bleeding into the abdominal cavity, commonly after injury, a ruptured ectopic pregnancy, or a bleeding liver, spleen, artery, or other organ. It can cause shock.

Haemophilia

Alternate spelling; see *Hemophilia*.

Haemophilia A

Hemophilia A, an inherited bleeding disorder caused by deficiency or dysfunction of clotting factor VIII. It can cause prolonged bleeding, easy bruising, and

bleeding into joints or muscles; treatment replaces or stimulates factor VIII activity.

Haemophilus

A group of bacteria that may live harmlessly in the nose and throat or cause infection. Depending on the species, illness can affect the ears, sinuses, lungs, blood, joints, or brain coverings.

Haemophilus Aegyptius

A bacterium associated with eye infections and, rarely, severe bloodstream disease. It can spread through respiratory secretions or direct contact, and laboratory identification helps guide treatment and public-health precautions.

Haemophilus Ducreyi

A fastidious, facultatively anaerobic Gram-negative coccobacillus that is the causative etiological agent of chancroid, characterized by painful, non-indurated genital ulcers with purulent bases and prominent suppurative inguinal lymphadenopathy (buboes).

Haemophilus Haemolyticus

A bacterium that commonly lives harmlessly in the upper airway but can occasionally cause respiratory or invasive infection, especially in people with weakened immunity or serious underlying illness.

Haemophilus Infections

Infections caused by Haemophilus bacteria, which may affect the ears, sinuses, lungs, bloodstream, joints, or brain coverings. Severity depends on the species, infection site, age, vaccination, and immune health.

Haemophilus Influenzae

A type of bacteria that can cause ear infections, pneumonia, meningitis, and other infections. Type b, or Hib, can cause severe disease in children, but vaccination greatly reduces this risk.

Haemophilus Parainfluenzae

A small gram-negative bacterium that normally colonizes the upper respiratory tract but can rarely cause respiratory, bloodstream, or other opportunistic infections.

Haemoptysis

Coughing up blood or blood-stained mucus from the airways or lungs. Causes include infection, bronchiectasis, a blood clot, cancer, or irritation; larger amounts may occur with breathlessness or chest pain.

Haemorrhage

British spelling of Hemorrhage; see Hemorrhage.

Haemorrhagic Fever

A group of severe infections caused by certain viruses that can damage blood vessels and disrupt clotting. Fever, weakness, bleeding, shock, and organ failure may occur.

Haemorrhagic Fever With Renal Syndrome

A hantavirus infection usually acquired by inhaling dust contaminated with infected rodent urine or droppings. It causes fever, headache, bleeding, low blood pressure, and temporary kidney failure and may be severe.

Haemorrhagic Stroke

A stroke caused by a burst blood vessel in the brain or in the space around it. The bleeding injures brain tissue and may cause sudden weakness, speech trouble, severe headache, vomiting, or loss of consciousness.

Haemorrhoids

Alternate spelling; see *Hemorrhoids*.

Haemosiderin

A brownish iron-storage material that forms inside cells when iron accumulates, often after repeated bleeding, transfusions, or excess iron absorption. Large deposits can contribute to tissue damage.

Haemosiderosis

Excess deposition of haemosiderin, an iron-storage pigment, in tissues. Deposits may be focal after bleeding into a tissue or widespread after repeated transfusions or excess iron absorption; widespread iron can injure the liver, heart, or hormone-producing organs.

Haemostasis

The body's normal process for stopping bleeding. Blood vessels narrow, platelets form a temporary plug, and clotting proteins strengthen it with a stable clot.

Haemostat

A substance, device, or instrument used to control bleeding. It may work by pressing on a vessel, sealing tissue, promoting clotting, or temporarily blocking blood flow during an operation.

Haemothorax

Blood collecting between the lung and chest wall, usually after chest injury, surgery, or a medical procedure. It can compress the lung, cause breathing difficulty or shock, and may require drainage.

Haff Disease

Sudden muscle breakdown and severe muscle pain after eating certain contaminated fish or seafood. It can release muscle proteins that damage the kidneys; treatment includes fluids and monitoring for complications.

Hafnia

A genus of gram-negative intestinal bacteria; Hafnia alvei is the species most often identified in human specimens.

Hafnia Alvei

A Gram-negative bacterium found in the intestine and environment that rarely causes opportunistic infection, usually in people with serious illness or weakened immunity.

Hageman Factor

An older name for factor XII, a blood protein that helps start one pathway of clotting. Factor XII deficiency can prolong a laboratory clotting test but usually does not cause abnormal bleeding.

Haglund Deformity

An anatomical prominence (posterosuperior calcaneal exostosis) of the heel bone causing mechanical friction and chronic inflammation of the retrocalcaneal bursa and Achilles tendon, exacerbated by rigid shoes ('pump bump').

Alternate Names:
Retrocalcaneal Exostosis; Pump Bump

Hailey-Hailey Disease

An inherited skin disorder that causes repeated blisters, raw areas, and painful cracks, especially in skin folds such as the neck, armpits, and groin. Heat, sweating, friction, and infection can trigger flares.

Hair

Keratinized filaments produced by follicles in the skin. Hair protects the scalp, contributes to temperature regulation and sensation, and grows through anagen, catagen, and telogen phases.

Hair-Ball

A hair-ball, or trichobezoar, is a mass of swallowed hair in the stomach or intestine, usually associated with repeated hair eating.

Hair Bleach Poisoning

Illness after swallowing or inhaling hair-bleaching chemicals, which may contain peroxide or persulfates. They can irritate or burn the mouth, throat, skin, eyes, or lungs.

Hair Bulb

The rounded base of a hair follicle where new hair is produced. It contains growing cells and a small blood-supplied area that provides nutrients and helps determine hair growth and color.

Hair Cells

Special cells in the inner ear that change sound vibrations and head movement into nerve signals for hearing and balance.

Hair Disease

A disorder affecting hair growth, the hair shaft, or the scalp; causes include genetics, inflammation, infection, medicines, and nutritional problems.

Hair Dye Poisoning

Harm caused by swallowing or inhaling hair-dye chemicals. Depending on the ingredients and amount, symptoms may include vomiting, swelling, breathing difficulty, allergic reaction, kidney injury, or muscle damage.

Hair Follicle

A small tube in the skin that produces a hair. Each follicle has a growth phase, a brief transition phase, and a resting phase.

Hair Loss

Partial or complete loss of hair from areas where it normally grows, most often the scalp. Causes include inherited pattern hair loss, alopecia areata, illness, medicines, hormonal changes, and some nutritional deficiencies.

Alternate Names:
Alopecia; Baldness

Hair Loss Classification

Hair loss is classified as scarring or nonscarring. Scarring hair loss destroys follicles and is usually permanent; nonscarring loss leaves follicles intact and may improve when its cause, such as illness, medicines, stress, or autoimmune disease, is treated.

Hair-Pulling Syndrome

Alternate name; see *Trichotillomania*.

Hair Removal

Removal of unwanted hair by shaving, trimming, waxing, depilatory products, electrolysis, or laser treatment. Possible problems include irritation, burns, ingrown hairs, pigment changes, and infection.

Hair Shaft

The part of a hair that extends above the skin. It is made of dead, hardened cells produced by the follicle and can be affected by cutting, heat, chemicals, friction, or damage to the hair root.

Hair Spray Poisoning

Illness after swallowing or inhaling hair spray. Small accidental exposures may irritate the mouth or lungs, while larger exposures can cause vomiting, drowsiness, breathing problems, or chemical injury.

Hair Straightener Poisoning

Harm after swallowing a hair-straightening product, which may contain corrosive chemicals. It can burn the mouth, throat, esophagus, or stomach and cause breathing or swallowing problems.

Hair Tonic Poisoning

Illness after swallowing or inhaling a hair-tonic product. Ingredients such as alcohols or solvents may cause vomiting, drowsiness, low blood sugar, or breathing problems; the product and amount determine severity.

Hair Tourniquet

Circumferential constriction of a finger, toe, external genital structure, or other appendage by a strand of hair, thread, or similar fiber. The resulting swelling can tighten the band further, reduce blood flow, and cause tissue injury or tissue death. It occurs most often in infants and young children.

Alternate Names:
Hair Tourniquet Syndrome; Hair-Thread Tourniquet Syndrome

Hair Transplant

A procedure that moves hair follicles, usually from a donor area of the scalp, to areas affected by permanent hair loss; results depend on diagnosis, donor supply, technique, and postoperative care.

Hairy Cell Leukaemia

Alternate spelling; see *Hairy Cell Leukemia*.

Hairy Cell Leukemia

A rare, usually slow-growing cancer of a type of white blood cell. Abnormal cells build up in the bone marrow, blood, and spleen, causing low blood counts, infections, tiredness, or an enlarged spleen.

Alternate Names:
HCL; Leukemic Reticuloendotheliosis

Hairy Leukoplakia

A painless, white, ridged patch that usually appears on the sides of the tongue and cannot be scraped off. It is caused by Epstein-Barr virus and occurs mainly in people with a weakened immune system, especially those with HIV.

Alternate Names:
Oral Hairy Leukoplakia; OHL

Hairy Tongue

A usually harmless elongation and discoloration of the tongue's surface papillae, often appearing black, brown, or white. It may be associated with smoking, dry mouth, poor oral hygiene, or some medicines, including antibiotics.

Hajdu-Cheney Syndrome

A rare inherited bone disorder causing fragile bones, short stature, abnormal skull and facial development, and sometimes loose joints or dental problems. Severity varies, and specialist monitoring helps prevent complications.

Halcinonide

A potent topical corticosteroid used to reduce inflammation and itching in steroid-responsive dermatitis and other inflammatory skin disorders; prolonged or extensive use can cause skin atrophy and systemic effects.

Haldane Effect

The effect of oxygen binding to hemoglobin in the lungs, which helps release carbon dioxide for exhalation. In body tissues, hemoglobin without oxygen carries more carbon dioxide back toward the lungs.

Half-Life

The time it takes for the amount of a medicine in the body, or its blood level, to decrease by half. It influences dosing intervals and how long a medicine remains in the body.

Alternate Names:
Terminal Half-Life; t1/2

Halitosis

Persistent unpleasant breath odor, most often from bacteria on the tongue, teeth, or gums. Dry mouth, smoking, foods, sinus or throat disease, reflux, and some illnesses or medicines can also contribute.

Alternate Names:
Bad Breath; Oral Malodor; Fetor Oris

Hallermann's Syndrome

A rare congenital disorder characterized by distinctive craniofacial development, sparse hair, dental abnormalities, and sometimes eye or skeletal findings.

Alternate Names:
Hallermann-Streiff Syndrome

Hallpike Test

A clinical vestibular provocative maneuver used to diagnose benign paroxysmal positional vertigo (BPPV) of the posterior semicircular canal; the patient is rapidly lowered from a sitting position to supine with the head extended and turned 45 degrees, provoking rotational upbeat nystagmus and vertigo.

Alternate Names:
Dix-Hallpike Test; Nylan-Barany Test

Hallucination

A sensory experience that feels real but occurs without a matching external stimulus. It may involve seeing, hearing, feeling, smelling, or tasting something that is not present.

Hallucinations

Plural form; see *Hallucination*.

Hallucinogen

A psychoactive substance that can alter perception, thought, and mood and may produce hallucinations; effects and toxicity vary by substance, dose, co-ingestants, and mental state.

Hallux

The great toe, or big toe. It has two bones and helps the foot stay stable and push off during walking. Common problems include hallux valgus (a bunion), hallux rigidus (a stiff, arthritic joint), turf toe (a sprain), and gout causing sudden pain and swelling at the joint where the toe meets the foot.

Hallux Rigidus

Arthritis of the joint where the big toe meets the foot, causing pain, stiffness, swelling, and reduced upward movement. A bony bump may develop and make walking or wearing shoes difficult.

Hallux Valgus

A bunion: a change in the alignment of the joint at the base of the big toe, with the toe pointing inward and a prominent area on the inner forefoot. It may become painful from pressure or inflammation.

Alternate Names:
Bunion; Hallux Abductovalgus

Hallux Varus

Abnormal medial deviation of the great toe, often following surgery, trauma, neuromuscular imbalance, or congenital deformity; it can cause shoe difficulty and pressure-related pain.

Halogen

An element in group 17 of the periodic table, including fluorine, chlorine, bromine, iodine, and astatine; halogens and their compounds have medical, biologic, and toxicologic importance.

Halo Nevus

A usually harmless mole surrounded by a ring of lighter skin. The immune system causes the mole and nearby pigment cells to lose color; it often occurs in children or young adults and may slowly fade.

Haloperidol

Haloperidol is a first-generation antipsychotic that blocks dopamine D2 receptors and is used for psychosis, agitation, delirium, and tics; extrapyramidal reactions, tardive dyskinesia, hyperprolactinaemia, and QT prolongation are important risks.

Halo Sign

A ground-glass rim around a pulmonary nodule or area of consolidation on computed tomography. It is a nonspecific finding that can occur with infection, including invasive fungal disease in immunocompromised people, as well as hemorrhage, inflammation, or neoplasm.

Halothane

A volatile inhaled anesthetic formerly used to induce or maintain general anesthesia; it can cause hypotension, arrhythmias, and rare severe immune-mediated liver injury.

Halushi-Behcet's Syndrome

Alternate name; see *Behcet Disease*.

Hamamelis

A botanical preparation from witch hazel used topically as an astringent for minor skin or mucosal irritation; evidence and product composition vary.

Hamartoma

A usually harmless growth made of an abnormal arrangement of tissue types normally found in that part of the body. It may occur in organs such as the lung, skin, brain, or intestine and may cause problems if it grows or presses on nearby structures.

Hamartomatous Polyposis

A condition in which multiple hamartomatous gastrointestinal polyps develop from disorganized but benign tissue overgrowth, sometimes as part of an inherited cancer-predisposition syndrome.

Hamate

A small, wedge-shaped bone on the little-finger side of the wrist. Its hook provides attachment for liga-

ments and tendons; fractures there may cause wrist pain or pressure on a nearby nerve.

Hamate Bone

Alternate name; see *Hamate*.

Hamman-Rich Syndrome

An acute, fulminant idiopathic interstitial pneumonia characterized by sudden onset of cough, rapidly progressive dyspnea, hypoxemic respiratory failure, and diffuse alveolar damage on lung biopsy in the absence of a known cause or preexisting lung disease.

Alternate Names:
Acute Interstitial Pneumonia; AIP

Hamman Sign

A crunching or clicking noise heard with a stethoscope over the chest in time with the heartbeat, caused by air trapped in the center of the chest.

Hamman's Sign

Alternate spelling; see *Hamman Sign*.

Hammer

The common name for the malleus, one of the three small bones of the middle ear.

Hammer Toe

A deformity in which a lesser toe bends downward at its middle joint and may press against the shoe. It can cause pain, stiffness, corns, or calluses and may be flexible at first or become fixed.

Hammertoe

Alternate spelling; see *Hammer Toe*.

Hammer Toe Repair

Surgery to correct a fixed or painful flexion deformity of a lesser toe, using soft-tissue release, tendon balancing, bone correction, or temporary fixation as indicated.

Hammertoes

Plural form; see *Hammer Toe*.

Hampton Hump

A wedge-shaped opacity next to the pleura on a chest X-ray, classically associated with pulmonary infarction from a pulmonary embolism. It is not specific enough to confirm a clot by itself.

Hampton Line

A historical X-ray sign described as a thin line across the neck of a stomach ulcer on a barium study. It was thought to favor a benign ulcer, but the sign is rarely used today and cannot reliably rule out cancer.

Alternate Names:
Hampton's Radiolucent Line; Peptic Hampton Line

Hampton's Hump

Alternate spelling; see *Hampton Hump*.

Hamstring

One of three muscles forming the posterior compartment of the thigh: semitendinosus, semimembranosus, and biceps femoris (long and short heads). Common origin: ischial tuberosity (except short head of biceps femoris which originates from the linea aspera of the femur).

Hamstring Injury

A strain or tear of one or more muscles or tendons at the back of the thigh.

Hamstring Muscles

The muscles at the back of the thigh. They bend the knee and help move the hip, especially during walking, running, and jumping. A sudden stretch or forceful contraction can strain or tear them.

Hamstring Strain

Alternate name; see *Hamstring Injury*.

Hand

The part of the upper limb beyond the wrist, containing the palm, fingers, bones, joints, muscles, nerves, and blood vessels used for grasping and sensation.

Hand-Arm Vibration Syndrome

An occupational disorder from prolonged exposure to vibrating tools, causing numbness, tingling, reduced grip, and episodic whitening of the fingers from vascular spasm.

Hand Deformity

An abnormal shape, alignment, or loss of motion of the hand or fingers caused by congenital difference, trauma, arthritis, nerve dysfunction, tendon disease, or other conditions.

H And E Staining

A standard laboratory stain using hematoxylin and eosin to show cell nuclei, cytoplasm, and tissue structure under a microscope. It is widely used to examine biopsies and identify inflammation, infection, or tumors.

Alternate Names:
H & E; H&E

Hand Foot And Mouth Disease

A contagious viral illness, most common in young children but possible at any age. It causes fever, painful mouth sores, and a rash or small blisters on the hands and feet, sometimes the buttocks. It spreads through saliva and mucus, blister fluid, stool, and contaminated surfaces. Most people recover in 7 to 10 days.

Hand-Foot-And-Mouth Disease

Alternate spelling; see *Hand Foot And Mouth Disease*.

Hand-Foot-And-Mouth Syndrome

Alternate name; see *Hand Foot And Mouth Disease*.

Hand-Foot-Mouth Disease

Alternate spelling; see *Hand Foot And Mouth Disease*.

Hand-Foot Syndrome

A dose-limiting toxic cutaneous reaction triggered by certain systemic antineoplastic and targeted chemotherapy agents (notably capecitabine, 5-fluorouracil, pegylated liposomal doxorubicin, cytarabine, and multi-kinase inhibitors like sorafenib and sunitinib). It is characterized by progressive bilateral burning dysesthesia, tingling, painful symmetric erythema, swelling, and subsequent blistering or desquamation primarily localized to the friction-bearing pressure areas of the palms and soles.

Alternate Names:
Palmar-Plantar Erythrodysesthesia; PPE; Chemotherapy-Induced Acral Erythema; Burgdorf Reaction

H And H

Abbreviation for hemoglobin and hematocrit, two blood measurements commonly used to assess red-blood-cell levels and anemia.

Hand-Held Retractor

A handheld surgical instrument used to hold tissue or an organ away from the operative field.

Alternate Names:
Manual Retractor; Handheld Retractor

Hand Hygiene

Cleaning the hands with soap and water or an alcohol-based hand rub to remove or kill germs. In health care, it is performed before and after patient contact, after touching body fluids, and when hands are visibly dirty.

Hand Infections

Infections involving the skin, tendon sheaths, joints, bones, or deep spaces of the hand. Pain, swelling, redness, impaired movement, fever, or a flexed finger can indicate deep or rapidly progressing infection.

Handlebar Palsy

Compression neuropathy of the ulnar nerve at the wrist, frequently caused by prolonged handlebar pressure in cyclists. See *Guyon Canal Syndrome*.

Handling Sharps And Needles

Handling sharps and needles means using, passing, disposing of, and storing sharp medical instruments safely to prevent needlestick injuries and infection

transmission.

Hand Microsurgery

Specialized hand surgery performed with magnification and fine instruments to repair or reconstruct small blood vessels, nerves, and other delicate tissues. It may be used for complex injuries, replantation, and restoration of blood flow to a threatened digit or hand.

Hand of Benediction

An abnormal hand posture observed when a patient attempts to make a fist, resulting in extension of the index and middle fingers with flexion of the fourth and fifth fingers. It occurs due to proximal median nerve injury, which paralyses the flexor digitorum superficialis and the lateral half of the flexor digitorum profundus.

Alternate Names:
Benediction Sign; Preacher's Hand

Hand Or Foot Spasms

Sudden, involuntary tightening of muscles in a hand or foot. Causes include overuse, dehydration, abnormal calcium or other salts, nerve disease, medicines, and reduced blood flow; repeated or painful spasms need assessment.

H And P

Abbreviation for a patient's history and physical examination. The history covers symptoms, past health, medicines, and relevant background; the examination checks the body for signs of illness.

Hand Pain

Pain or discomfort in the hand, fingers, or wrist caused by injury, arthritis, nerve compression, tendon problems, infection, or other conditions. Sudden severe pain, deformity, numbness, or loss of circulation can indicate serious injury or impaired blood flow.

Hand Prolapse

A fetal hand or arm lying beside or below the part leading into the birth canal. It can obstruct labor and may reduce blood flow to the limb.

Hand-Schuller-Christian Disease

A multifocal, chronic form of Langerhans cell histiocytosis occurring predominantly in young children, classically defined by the clinical triad of multifocal lytic bone lesions ('punched-out' skull defects), diabetes insipidus, and exophthalmos.

Alternate Names:
Multifocal Unisystem LCH; Schuller-Christian Triad

Hand-SchüLler-Christian Disease

Hand-Schüller-Christian disease is an older name for a multisystem form of Langerhans cell histiocytosis, often involving bone, skin, and the pituitary gland.

Handwashing

Cleaning the hands with soap and water to remove dirt and germs. It is one method of hand hygiene; alcohol-based hand rub is another.

Hand X-Ray

Radiographic imaging of the hand used to evaluate fractures, dislocations, arthritis, infection, tumors, bone age, and other abnormalities of the bones and joints.

HANE

Historical abbreviation for hereditary angioneurotic edema, an older name for hereditary angioedema; see *Hereditary Angioedema*.

Hanging And Strangulation Signs

Injuries or other findings caused by pressure around the neck that restricts breathing or blood flow. Findings may include neck marks, swelling, voice changes, trouble swallowing, breathing difficulty, confusion, or loss of consciousness; internal injury can be serious even without visible marks.

Hanging Injuries and Strangulation

Injuries caused by constriction of the neck or suspension of the body, with potential airway, vascular, neurologic, and cervical-spine damage. Serious internal injury may occur even when external findings are limited.

Hangman Fracture

A traumatic bilateral fracture passing through the neural arch, pedicles, or pars interarticularis of the second cervical vertebra (axis, C2), classically caused by sudden violent hyperextension and axial loading or distraction of the cervical spine.

Alternate Names:
Traumatic Spondylolisthesis of the Axis

Hangman's Fracture

Alternate spelling; see *Hangman Fracture*.

Hang-Nail

A small torn flap of skin beside a fingernail or toenail, often caused by dryness or trauma and vulnerable to local infection if torn or contaminated.

Hangover

A group of symptoms after alcohol use, such as headache, nausea, thirst, fatigue, dizziness, and sensitivity to light; symptoms reflect effects of alcohol and its metabolites, dehydration, sleep disruption, and inflammation.

Hansen Disease

A long-lasting infection caused by Mycobacterium leprae that mainly affects the skin and peripheral nerves. Pale or reddish numb patches, weakness, and eye problems may occur; multidrug antibiotics cure infection and prevent disability.

Alternate Names:
Leprosy; Hanseniasis; Mycobacterium Leprae Infection

Hantavirus

A group of viruses spread mainly by breathing dust contaminated with infected rodent urine, droppings, or nesting material. They can cause severe lung disease or a fever that damages the kidneys.

Hantavirus Cardiopulmonary Syndrome

Another name for hantavirus pulmonary syndrome, a severe hantavirus infection that can progress from fever and muscle aches to fluid in the lungs, breathing failure, and shock.

Hantavirus Cardiopulmonary Syndrome (HCPS)

Alternate name; see *Hantavirus Cardiopulmonary Syndrome*.

Hantavirus Infection

A zoonotic viral infection acquired mainly through inhalation of contaminated rodent excreta. It may cause hemorrhagic fever with renal syndrome or hantavirus pulmonary syndrome, which can progress rapidly to respiratory failure.

Hantavirus Pulmonary Syndrome

A severe lung infection acquired mainly by inhaling dust contaminated with infected rodent urine, droppings, or nesting material. Fever, muscle aches, headache, and stomach symptoms can rapidly progress to fluid-filled lungs and respiratory failure.

Alternate Names:
HPS; HCPS

Haploid

Having one complete set of chromosomes, as in a human sperm or egg. Haploid cells contain half the chromosome number of most body cells and restore the full number when they join during fertilization.

Haploidentical Donor

A donor who shares one human leukocyte antigen haplotype with the recipient, commonly used for selected hematopoietic stem-cell or organ transplantation when a fully matched donor is unavailable.

Haploidy

The state of having one complete set of chromosomes, as in human gametes; haploid cells contain 23 chromosomes.

Haploinsufficiency

A genetic state in which one functional copy of a gene does not produce enough gene product for normal function, so loss or inactivation of the other copy can cause disease.

Haplotype

A group of nearby gene versions inherited together on one chromosome. Haplotype information can help study inherited disease risk, identify tissue donors, and trace how genetic traits are passed through families.

Hapten

A hapten is a small molecule that is not immunogenic by itself but can trigger an immune response after binding to a larger carrier protein, as in some drug allergies.

Haptoglobin

A blood protein made mainly by the liver that binds free hemoglobin released when red blood cells break down. Low levels can support evaluation of hemolysis, but liver disease and inflammation also affect the result.

Haptoglobin Analyses

Alternate name; see *Haptoglobin Blood Test*.

Haptoglobin Blood Test

A blood test measuring haptoglobin, a protein that binds free hemoglobin. A low result can support evaluation of red-cell breakdown but may also occur with reduced liver production.

Haptoglobin Decreased

A low blood haptoglobin result, commonly caused by intravascular red-cell destruction, reduced hepatic production, or severe liver disease; it is interpreted with hemoglobin, bilirubin, reticulocytes, and a blood smear.

Hardness of Skin

Alternate name; see *Skin Induration*.

Hardness (Thickening) of Skin

Alternate name; see *Skin Induration*.

Hard Palate

The bony, mucosa-covered front portion of the roof of the mouth that separates the oral and nasal cavities and provides a surface for chewing and speech.

Harlequin Color Change

A temporary, harmless change in a newborn's skin color in which one side becomes red while the other remains pale. It often appears when the baby lies on one side and usually fades within minutes.

Harlequin Foetus

Older term; see *Harlequin Ichthyosis*.

Harlequin Ichthyosis

A rare severe inherited skin disorder in which newborns have thick plates of skin separated by deep cracks. It can impair temperature control, movement, feeding, breathing, and protection from infection and requires intensive neonatal care.

Harmless Murmur

An innocent or physiologic heart murmur produced by normal blood flow without structural heart disease; it is diagnosed only after appropriate clinical assessment.

Harm Reduction

Evidence-based strategies that decrease health, social, and legal harms associated with substance use without requiring immediate abstinence. Examples include naloxone access, sterile injecting equipment, drug-checking where available, safer-use education, and linkage to treatment.

Harm Reduction Therapy

Care that aims to reduce illness, injury, infection, overdose, and other harms related to substance use. It can include safer-use services and support for treatment, including treatment for substance-use disorders.

Alternate Names:
Risk Mitigation Strategy

Harrison's Sulcus

Harrison's sulcus is a horizontal groove along the lower chest wall caused by inward pulling of the

ribs, classically in long-standing childhood breathing difficulty.

Harseness of Voice

Alternate name; see *Hoarseness*.

Hartmann Pouch

An anatomical outpouching or dilatation of the inferior wall of the gallbladder neck adjacent to the junction with the cystic duct; gallstone impaction here may cause acute calculous cholecystitis or compress the adjacent common hepatic duct (Mirizzi syndrome).

Alternate Names:
Infundibulum of the Gallbladder

Hartmann Procedure

An operation that removes the diseased lower colon, brings the remaining colon through the abdominal wall as a colostomy, and closes the downstream bowel. It is often used when infection, blockage, perforation, or severe illness makes immediate reconnection unsafe.

Hartnup Disease

A rare inherited problem absorbing and reusing certain amino acids. It may cause a sun-sensitive rash, poor coordination, or mood and thinking changes, although some people have no symptoms.

Hartnup Disorder

An inherited disorder of neutral amino-acid transport that can cause pellagra-like skin changes, neurologic symptoms, or no symptoms.

HAS-BLED Score

A score estimating bleeding risk in a person with atrial fibrillation who may need a blood thinner. It considers high blood pressure, kidney or liver disease, previous stroke or bleeding, unstable clotting results, age, medicines, and alcohol; a high score identifies risk factors associated with bleeding.

Alternate Names:
HAS-BLED; Anticoagulant Bleeding Risk Index

Hashimoto Disease

Alternate name; see *Hashimoto Thyroiditis*.

Hashimoto Encephalopathy

A proposed, uncommon autoimmune encephalopathy reported in people with thyroid autoimmunity. It may involve confusion, seizures, abnormal movements, or stroke-like episodes. The relationship to thyroid disease remains uncertain, and thyroid antibodies alone do not establish the diagnosis; diagnosis depends on excluding other causes of encephalopathy.

Alternate Names:
Steroid-Responsive Encephalopathy Associated with Autoimmune Thyroiditis; SREAT

Hashimoto's Disease

Alternate spelling; see *Hashimoto Thyroiditis*.

Hashimoto's Thyroiditis

Alternate spelling; see *Hashimoto Thyroiditis*.

Hashimoto Thyroiditis

An autoimmune disorder in which immune-mediated inflammation gradually damages the thyroid gland and may cause hypothyroidism. The gland may be enlarged or atrophic, and thyroid autoantibodies are often present.

Hashish

A concentrated form of cannabis made from resin of the cannabis plant. It contains cannabinoids that can impair memory, coordination, and judgment and may cause anxiety, dependence, or psychosis in susceptible people.

Hashitoxicosis

A temporary period of excess thyroid hormone caused by release of stored hormone during Hashimoto thyroiditis.

Hassall Corpuscles

Rounded, layered structures in the thymus medulla, made of thymic epithelial cells and associated with the development of immune tolerance.

Alternate Names:
Thymic Corpuscles; Hassall's Bodies

Hassall's Corpuscles

Alternate spelling; see *Hassall Corpuscles*.

Haustra

The series of small pouches along the outside of the large intestine. They form as the bowel muscles contract and help the colon mix and move its contents.

Haverhill Fever

Rat-bite fever acquired by swallowing food or drink contaminated with *Streptobacillus moniliformis*. It may cause fever, vomiting, headache, muscle or joint pain, and a rash.

Haversian Canal

A central longitudinal microscopic channel running through the core of each osteon (Haversian system) in compact cortical bone, carrying neurovascular structures (capillaries, postcapillary venules, and unmyelinated nerve fibers) to supply osteocytes embedded within surrounding concentric lamellae.

Alternate Names:
Central Canal of Bone

Hawkins Test

A physical examination maneuver used to identify subacromial shoulder impingement; the examiner flexes the patient's arm and elbow to 90 degrees and forcefully performs internal rotation of the humerus, compressing the supraspinatus tendon against the coracoacromial ligament.

Alternate Names:
Hawkins-Kennedy Impingement Test; Hawkins Sign

Hay Fever

A common name for seasonal allergic rhinitis, an allergic response to airborne outdoor plant pollens and mold spores that causes sneezing, a blocked or runny nose, an itchy palate, and watery, irritated eyes. See also *Seasonal Allergies*.

Alternate Names:
Seasonal Allergies; Seasonal Allergic Rhinitis; Pollinosis

Hazardous Materials

Substances that can cause injury, poisoning, fire, radiation exposure, or environmental harm; safe handling requires labeling, protective equipment, exposure control, and emergency procedures.

Hazardous Substance

A chemical, biological agent, or other material that can harm health through swallowing, inhalation, skin contact, injection, radiation, or environmental exposure. Risk depends on its properties, amount, route, and duration of exposure.

Hb

Hemoglobin, the iron-containing protein in red blood cells that carries oxygen and contributes to carbon-dioxide transport and blood's acid–base buffering.

HbA1c

Abbreviation; see *Hemoglobin A1c*.

HCG

Human chorionic gonadotropin is a hormone produced mainly during pregnancy; its measurement is used in pregnancy testing and evaluation of selected tumors.

HCG In Urine

A urine test detecting human chorionic gonadotropin, commonly used as a pregnancy test; accuracy depends on timing, urine concentration, and test performance.

Hct

The percentage of blood volume occupied by red blood cells, measured as part of a complete blood count.

HCV-Associated Rheumatic Disease

Joint, muscle, blood-vessel, or autoimmune problems associated with hepatitis C virus infection.

Possible manifestations include joint pain or inflammation, mixed cryoglobulinemia, vasculitis, fatigue, or muscle symptoms.

HCV PCR

A polymerase chain reaction test that detects or measures hepatitis C virus RNA in blood, helping identify active infection and monitor treatment response.

HD

Abbreviation; see *Huntington Disease*.

HDL

High-density lipoprotein, a class of particles that transports cholesterol and other lipids in the blood. HDL concentration is one component of cardiovascular risk assessment and does not by itself indicate an individual's overall cardiovascular risk.

HDL Cholesterol

Cholesterol carried in high-density lipoprotein particles; HDL participates in transporting cholesterol from tissues toward the liver, but its concentration alone does not determine cardiovascular risk.

HDL Test

A blood test measuring high-density lipoprotein cholesterol, which is used with the rest of the lipid profile to assess cardiovascular risk.

HDR Syndrome

A genetic disorder characterized by hypoparathyroidism, sensorineural deafness, and renal dysplasia or other kidney abnormalities, usually caused by a pathogenic variant in *GATA3*.

Head

The body region containing the brain, eyes, ears, nose, mouth, skull, and face, connected to the trunk by the neck and supplied by major cranial nerves and vessels.

Headache

Pain or discomfort in the head, scalp, or upper neck. Primary headaches include migraine and tension headache; secondary headaches result from another problem such as infection, injury, bleeding, very high blood pressure, or a brain disorder.

Headache and Migraine

Combined topic; see *Headache* and *Migraine*.

Headache Medicine

A medical subspecialty focused on headache and facial-pain disorders. It includes migraine, tension-type headache, cluster headache, and secondary headaches caused by another condition, with attention to their neurologic features, patterns, and effects on daily function.

Headache Red Flags

Features that raise concern for a secondary cause of headache, such as sudden severe onset, fever with neck stiffness, a new neurologic deficit, papilledema, a new headache after age 50, cancer or immune suppression, or a headache that changes with posture. These findings guide assessment but do not identify a cause by themselves.

Alternate Names:
Headache Warning Signs; Red Flag Headaches; Danger Signs in Headache

Headaches/Migraines

Alternate consumer label for headache disorders, especially *Migraine*; recurrent or new severe headaches can have primary or secondary causes.

Head And Face Reconstruction

Reconstructive surgery to restore the form or function of the skull, face, or associated soft tissues after trauma, cancer treatment, congenital difference, or other disease.

Head And Neck Cancer

Cancer arising in areas such as the mouth, throat, voice box, nasal cavity, or salivary glands. Most are squamous-cell cancers. Tobacco and alcohol are major risk factors; human papillomavirus is associated with some cancers of the throat.

Head And Neck Oncologic Surgery

Surgical treatment of cancers of the oral cavity, throat, larynx, nose, sinuses, salivary glands, or neck lymph nodes. Procedures may remove the tumor, treat involved lymph nodes, and reconstruct affected tissues while preserving breathing, swallowing, speech, and appearance when possible.

Alternate Names:
Head and Neck Surgical Oncology; Maxillofacial Oncologic Surgery

Head Circumference

The measurement around the largest part of a baby's or child's head, taken above the eyebrows and ears. It is plotted over time to assess brain growth; unusually small, large, or rapidly changing measurements may need evaluation.

Head CT Scan

Computed tomography of the head using x-rays and computer reconstruction to evaluate the brain, skull, bleeding, stroke, tumors, trauma, and other abnormalities.

Head Impulse Test

A bedside test of the reflex that keeps vision steady when the head moves. The examiner turns the head quickly while the person looks at a target; a brief eye movement to regain the target can indicate reduced balance-organ function on that side.

Alternate Names:
Halmagyi-Curthoys Test

Head Injury

Damage to the scalp, skull, or brain caused by a blow, fall, collision, or penetrating object. It may cause a wound, skull fracture, concussion, or bleeding inside the skull. The effects range from a minor scalp injury to life-threatening brain damage.

Head Injury First Aid

Initial assessment and care after a head injury, including evaluation for brain, skull, and neck injury. Confusion, repeated vomiting, seizure, weakness, or loss of consciousness may indicate serious injury.

Alternate Names:
Cranial Trauma First Aid; Head Trauma Immediate Care

Head Lice

Infestation of the scalp by the insect *Pediculus humanus capitis*. It may cause itching, and small eggs called nits may be attached to hair near the scalp. Lice spread mainly through close head-to-head contact, not from poor hygiene.

Head-Lice

Alternate spelling; see *Head Lice*.

Head Movement

Motion of the head produced mainly by the cervical spine and neck muscles, including flexion, extension, rotation, and side bending; pain or restricted movement may indicate injury or disease.

Head MRI

Magnetic resonance imaging of the head using a magnetic field and radio waves to produce detailed images of the brain, cranial nerves, blood vessels, and surrounding structures.

Head-nodding

Repeated up-and-down movement of the head. This describes an observed movement rather than a diagnosis; it may be voluntary or involuntary, and its rhythm, triggers, and associated findings help distinguish a tremor, tic, seizure-related movement, or other cause.

Head Of The Epididymis

The upper part of the epididymis, connected to the testis by small ducts and receiving newly made sperm.

Head Thrust Test

Alternate name; see *Head Impulse Test*.

Head Trauma

Alternate name; see *Head Injury*.

Healing

The body's process of repairing damaged tissue. It usually involves stopping bleeding, reducing inflammation, forming new tissue, and remodeling a scar; healing may be delayed by infection, poor blood flow, diabetes, or inadequate nutrition.

Health Anxiety Disorder

Excessive worry about having or developing a serious illness, often despite reassurance or limited medical findings. It can cause repeated checking or health-care visits and is treated with supportive care and evidence-based psychological therapy.

Health Behavior

An action or pattern of action that affects health, such as eating, physical activity, tobacco use, alcohol use, sexual practices, or taking medicines.

Health Behavior Change

Modification of behaviors that affect health, such as tobacco use, diet, physical activity, and adherence to treatment.

Health Behavior Motivation

Factors that influence initiation and maintenance of health-related behaviors, including adherence, physical activity, and smoking cessation.

Health Care

The prevention, diagnosis, treatment, and ongoing support provided to maintain or improve health, delivered by professionals, institutions, public-health systems, and informal caregivers.

Health Care Agents

People legally chosen to make healthcare decisions for someone who cannot make or communicate them. Their authority and responsibilities depend on local law and the document that appoints them.

Healthcare Associated Infection

An infection acquired while receiving healthcare or as a result of a medical procedure. It may occur in hospitals, clinics, nursing facilities, or at home and can involve a wound, urinary tract, lungs, bloodstream, or other site.

Health Care Facility

A place where health services are delivered, such as a clinic, hospital, laboratory, nursing facility, or rehabilitation center; its services and level of care determine appropriate referrals.

Health Care Personnel

People who provide or support health services, including clinicians, nurses, therapists, technicians, and aides.

Healthcare Provider

A healthcare professional or organization that provides medical care, such as a physician, nurse, therapist, or clinic.

Health Care Proxy

A person designated to make healthcare decisions for someone who cannot make or communicate those decisions. The appointment may be recorded in an advance directive or other legal document.

Healthcare Proxy

Alternate spelling; see *Health Care Proxy*.

Health Checkup

A preventive visit to review a person's health risks and update age- or risk-based care. It may include blood-pressure measurement, review of medicines and vaccinations, and screening for conditions such as high cholesterol, diabetes, or cancer.

Health Disparities

Differences in health outcomes or access to care among groups, often associated with social, economic, environmental, geographic, or structural factors.

Health Disparity

Singular form; see *Health Disparities*.

Health Education

The process of giving people understandable information and skills to prevent illness, recognize symptoms, use treatment safely, and make informed health decisions.

Health Inequity

A systematic, avoidable, and unjust difference in health or access to health resources between social groups. It differs from health variation that is not preventable or not linked to unfair social conditions.

Health Information Technology

The use of computers and digital systems to collect, store, exchange, protect, and use health information. Examples include electronic records, telemedicine, patient portals, decision-support tools, and remote monitoring; safe systems protect privacy and support accurate care.

Health Literacy

The ability to find, understand, judge, and use health information and services to make appropriate decisions. It includes communicating with clinicians, understanding instructions and medicine labels, and identifying when care may be needed; clear communication by healthcare staff also improves health literacy.

Health Maintenance Organization

A health-insurance arrangement that usually uses a network of clinicians and requires a primary-care clinician to coordinate specialist care. Coverage rules, referrals, costs, and services vary by plan.

Health Promotion

Actions that help people improve or protect their health and prevent illness. They may include vaccination, healthy eating, physical activity, sleep, screening, safer environments, social connection, and avoiding tobacco. Effective approaches vary with age, abilities, culture, risks, and preferences.

Health-Related QoL

A person's physical, emotional, social, and daily functioning as affected by health and illness. It reflects the patient's experience and is assessed separately from laboratory results or survival.

Health Risk

The likelihood that a behavior, exposure, condition, or other factor will cause harm to health, considered together with the severity and timing of possible harm.

Health Risks Of Alcohol Use

Alcohol use can increase the risk of liver disease, several cancers, high blood pressure, injuries, dependence, and problems affecting mental health and relationships.

Health Surveillance

The ongoing collection and analysis of health data to identify patterns, monitor disease, and guide public-health action.

Health Survey

A structured set of questions used to collect information about health, symptoms, behaviors, healthcare use, or population needs.

Healthy Aging

Developing and maintaining the physical and mental abilities that support well-being and independence in later life. It is influenced by health conditions, activity, nutrition, relationships, environment, and access to care.

Hearing

The ability to detect and understand sound. Sound vibrations are converted into nerve signals in the inner ear and interpreted by the brain. Hearing loss may result from the outer or middle ear, inner ear, hearing nerve, or brain pathways.

Hearing Aid

A small electronic device worn in or behind the ear that makes sounds louder or clearer for someone with hearing loss. It contains a microphone, processor, and speaker and is fitted and adjusted according to hearing-test results.

Hearing Aids And Devices

Alternate name; see *Hearing Aid*.

Hearing Disorder

A condition that reduces or distorts hearing through disease of the outer or middle ear, cochlea, auditory nerve, or central pathways; audiometry and examination help distinguish conductive from sensorineural loss.

Hearing Impairment

Partial or complete reduction in the ability to detect or understand sound. It may be conductive, sensorineural, or mixed and can result from congenital disorders, infection, noise, ototoxic injury, trauma, ageing, or disease of the ear or auditory pathways.

Hearing Loss

Reduced ability to hear. Conductive loss results from a problem in the outer or middle ear; sensorineural loss results from damage to the inner ear or hearing nerve; mixed loss has both types. Causes include aging, noise, infection, injury, and some medicines.

Hearing Loss And Music

Difficulty hearing or distinguishing musical sounds because of reduced hearing or changes in how the brain processes sound. Music may seem quieter, distorted, or lacking certain pitches.

Hearing Loss: Sudden Deafness

A rapid sensorineural hearing loss, usually developing over hours to a few days, that may affect one or both ears. It is an otologic emergency; early hearing testing and treatment may improve recovery.

Hearing Screening

A quick test used to identify possible hearing loss before symptoms are obvious. Newborns are commonly screened before leaving hospital; abnormal results are followed by repeat testing and a full hearing assessment and do not by themselves confirm permanent loss.

Hearing Test

An audiologic assessment that measures hearing thresholds and speech perception across frequencies to identify conductive, sensorineural, or mixed hearing loss.

Heart

A four-chambered muscular pump (two atria, two ventricles) located in the mediastinum, responsible for circulating blood throughout the body.

Heart And Vascular Services

Heart and vascular services include prevention, diagnosis, and treatment of diseases affecting the heart and blood vessels.

Heart Aneurysm

A localized bulging or outpouching of a weakened heart wall, often after myocardial infarction or from cardiomyopathy, that can impair contraction or form clots and arrhythmias.

Heart Arrhythmia

An abnormal heart rate or rhythm caused by altered electrical activity in the heart. At rest, the adult heart usually beats regularly at about 60–100 times per minute; an arrhythmia may make it beat too fast, too slowly, or irregularly.

Alternate Names:
Cardiac Dysrhythmias

Heart Assist Device

A mechanical device that supports the pumping function of the heart, such as a ventricular assist device, in selected patients with severe heart failure.

Heart Attack

A heart attack (myocardial infarction) occurs when blood flow to part of the heart muscle is suddenly reduced or blocked, usually because a blood clot forms in a heart artery. The reduced oxygen supply can injure or kill heart muscle. Symptoms may include chest discomfort, shortness of breath, sweating, or nausea, but they vary and may be mild or absent. A suspected heart attack is a medical emergency.

Heart Attack First Aid

Initial response to a suspected heart attack, centered on rapid emergency assessment and recognition of cardiac arrest. Aspirin may be used in some settings when appropriate and not contraindicated.

Heart Attack Prevention

Heart-attack prevention targets blood pressure, atherogenic cholesterol, diabetes, tobacco exposure, diet, physical activity, weight, sleep, and adherence to prescribed medicines. Risk-based preventive treatment is more effective than relying on one supplement or symptom.

Heartbeat

One complete contraction and relaxation of the heart, which moves blood through the lungs and the rest of the body. The rate and rhythm can be assessed by feeling a pulse or recording the heart's electrical activity.

Heart Block

A delay or interruption in the electrical signal traveling from the heart's upper chambers to its lower chambers. It may cause a slow or irregular heartbeat, dizziness, fainting, or no symptoms.

Heartburn

A burning feeling behind the breastbone caused by stomach contents flowing back into the esophagus. It may be accompanied by a sour taste or regurgitation and is not usually caused by the heart. Frequent symptoms may indicate reflux disease.

Heartburn/GERD

Alternate name; see *Gastroesophageal Reflux Disease*.

Heart Bypass Surgery

Coronary artery bypass grafting creates new routes around blocked coronary arteries using graft vessels to improve myocardial blood flow and relieve ischemic symptoms or reduce selected risks.

Heart Catheterization

A procedure in which a catheter is passed through a blood vessel into the heart to measure pressures, assess coronary arteries, inject contrast, obtain samples, or perform treatment.

Heart Chambers

The four spaces inside the heart: the right and left atria, which receive blood, and the right and left ventricles, which pump blood out.

Heart Contraction

The squeezing of heart muscle that pushes blood from the lower chambers to the lungs and the rest of the body. Electrical signals coordinate the heartbeat, and abnormal contraction can reduce blood flow or cause rhythm problems.

Heart CT Scan

Computed tomography of the heart and nearby structures, sometimes with ECG synchronization or contrast, used to evaluate coronary arteries, cardiac anatomy, calcium, or selected masses.

Heart Defect

An abnormality of the heart or major blood vessels. It may be present from birth or develop later and can affect blood flow, heart rhythm, valve function, or pumping ability.

Heart Disease

A broad term for conditions affecting the heart, including coronary artery disease, heart failure, abnormal rhythms, valve disease, and congenital defects. Related blood-vessel conditions are usually described as vascular disease. Symptoms vary with the condition and may include chest pain, breathlessness, palpitations, or swelling.

Heart Disease And Depression

Depression may coexist with heart disease and is associated with reduced quality of life and poorer cardiovascular outcomes. Each condition can affect the course and management of the other.

Heart Disease And Intimacy

Heart disease and some treatments can affect sexual function, desire, and confidence. The effects vary with the condition, its severity, and the treatment.

Heart Disease And Women

Heart disease affects women as well as men. Heart attack symptoms in women may include chest discomfort, shortness of breath, nausea, fatigue, or jaw, back, or arm discomfort; chest discomfort remains common.

Heart Failure

A chronic condition that occurs when the heart muscle cannot pump blood effectively enough to supply the body's cells with adequate oxygen and nutrients. It can develop after a heart attack, long-standing high blood pressure, or valve disease. When the weakened or stiff heart cannot keep up with the body's circulation, fluid backs up into the lungs and body tissues, leading to shortness of breath (especially when lying flat or during exercise), persistent fatigue, and swelling in the legs, ankles, and feet.

Alternate Names:
Congestive Heart Failure; CHF; Cardiac Failure

Heart Failure Due To Valvular Heart Disease

Heart failure caused by narrowing or leakage of one or more heart valves. The valve problem can strain the heart or limit blood flow, causing breathlessness, tiredness, reduced ability to exercise, or swelling. Assessment identifies the affected valve and how it affects heart function.

Heart Failure In Children

A condition in which a child's heart cannot pump or fill well enough to meet the body's needs. It may cause fast breathing, sweating or tiring during feeds, poor growth, swelling, or reduced activity.

Heart Failure Stages

A framework describing progression from risk without heart disease, to heart changes without symptoms, to heart failure with symptoms, and finally advanced disease with persistent symptoms. Stages help guide prevention and treatment and are different from scales that describe how limited a person feels during activity.

Heart Failure With Mildly Reduced Ejection Fraction

Heart failure in which the left ventricle pumps out a somewhat smaller-than-usual proportion of its blood, commonly about 41–49 percent. Symptoms may include breathlessness, tiredness, and fluid-related swelling.

Heart Failure With Preserved Ejection Fraction

Heart failure in which the left ventricular ejection fraction—the proportion of blood ejected with each beat—is at least 50

Alternate Names:
HFpEF

Heart Failure With Reduced Ejection Fraction

Heart failure with a left ventricular ejection fraction of 40% or less. It can cause breathlessness, tiredness, and swelling and may result from coronary artery disease, heart-muscle disease, high blood pressure, or valve disease.

Heart Injury

Damage to heart muscle or surrounding cardiac structures caused by trauma, ischemia, inflammation, toxins, or procedures; symptoms and tests depend on the injured tissue and severity.

Heartland Virus

A tick-borne virus associated with fever, fatigue, headache, muscle aches, diarrhea, and low white-cell or platelet counts. It can resemble ehrlichiosis and may be severe, especially in older or medically vulnerable people.

Heart-Lung Machine

A device that temporarily takes over the pumping and gas-exchange functions of the heart and lungs during selected cardiac operations.

Alternate Names:
Cardiopulmonary Bypass Pump

Heart MRI

Magnetic resonance imaging of the heart that evaluates cardiac structure, function, tissue characteristics, blood flow, and selected congenital, ischemic, inflammatory, or infiltrative disorders.

Heart Murmur

An extra or unusual sound heard when blood flows through the heart or nearby blood vessels. Some murmurs are harmless, while others result from a valve problem, heart defect, or altered blood flow.

Heart Murmurs

Plural form; see *Heart Murmur*.

Heart Muscle

The myocardium, the specialized cardiac muscle that contracts rhythmically to pump blood through the heart and circulation.

Heart Neoplasm

An abnormal growth in the heart or its surrounding tissues. It may be benign or cancerous and can interfere with blood flow, heart rhythm, or pumping; evaluation uses imaging and sometimes biopsy.

Heart Pacemaker

A heart pacemaker is a device that sends electrical impulses to maintain an appropriate heartbeat when the heart's natural rhythm is too slow or unreliable.

Heart Palpitations

Alternate name; see *Palpitation*.

Heart PET Scan

Positron-emission tomography of the heart using a radiotracer to assess myocardial perfusion, metabolism, viability, inflammation, or selected cardiac masses.

Heart Rate

The number of heartbeats per minute. Resting rates vary with age, fitness, activity, illness, medicines, and emotion; a persistently very fast, slow, or irregular rate may need assessment.

Heart Rate Variability

The natural change in time between one heartbeat and the next. It reflects several influences on the heart's rhythm, including breathing, activity, sleep, and the nervous system.

Alternate Names:
HRV

Heart Rhythm

The rate and pattern of cardiac electrical activation and contraction, normally initiated by the sinoatrial node; abnormal rhythms include bradycardia, tachycardia, atrial fibrillation, and ventricular arrhythmias.

Heart Rhythm Disorders

Arrhythmias, in which the heart beats too fast, too slowly, or irregularly because of abnormal electrical impulse formation or conduction.

Alternate Names:
Cardiac Arrhythmias; Dysrhythmias

Heart Septum

The muscular or membranous wall separating the right and left sides of the heart, including the atrial and ventricular septa; defects can permit abnormal blood flow between chambers.

Heart-Smart Substitutions

Food substitutions intended to reduce saturated fat, sodium, or refined grains, such as replacing butter with unsaturated oils or refined grains with whole grains.

Heart Sounds

The sounds made as the heart valves open and close during each heartbeat. The usual two sounds are called "lub-dub"; extra or unusual sounds may suggest a valve problem, heart failure, or another condition.

Heart Surgery

Surgical procedures performed on the heart or great vessels to treat structural or functional cardiac conditions. Common operations include coronary artery bypass grafting (CABG), valve repair or replacement, and repair of congenital heart defects.

Heart Tamponade

A life-threatening condition in which fluid or blood builds up around the heart and prevents it from filling normally. It can cause breathlessness, faintness, low blood pressure, and shock; treatment usually involves urgent drainage of the fluid.

Heart Transplant

Replacement of a failing heart with a donor heart, followed by lifelong immunosuppression and surveillance for rejection, infection, coronary allograft disease, kidney injury, and medication complications.

Heart Transplantation

Alternate term; see *Heart Transplant*.

Heart Valve

A flap-like structure that directs one-way blood flow through the heart. The four valves are the tricuspid, pulmonary, mitral, and aortic valves.

Heart Valve Disease

Damage or abnormality of one or more of the heart's valves. A valve may become narrowed and restrict blood flow (stenosis), or may not close fully and allow blood to leak backward (regurgitation). Causes include age-related changes, a defect present at birth, rheumatic disease, and infection.

Heart Valve Disorder

Alternate name; see *Heart Valve Disease*.

Heart Valve Prosthesis

An artificial valve used to replace or repair a diseased heart valve. Mechanical valves are durable but usually require long-term blood-thinning medicine. Tissue valves may avoid lifelong blood thinners but can wear out and sometimes need another procedure.

Heart Valve Surgery

Repair or replacement of a diseased cardiac valve to correct severe narrowing or leakage and improve blood flow; choice of repair, mechanical valve, or tissue valve depends on anatomy and patient factors.

Alternate Names:
Heart Valve Repair Or Replacement

Heart Valve Replacement

A surgical or catheter-based procedure to excise a diseased, stenotic, or incompetent heart valve and replace it with a mechanical or bioprosthetic tissue valve; see *Heart Valve Surgery* and *Transcatheter Aortic Valve Replacement*.

Heart Ventricle

One of the two lower heart chambers that pumps blood to the lungs or systemic circulation; the right ventricle pumps to the pulmonary artery and the left to the aorta.

Heart Ventricles

Plural form; see *Heart Ventricle*.

Heat

Thermal energy that raises tissue or body temperature; excessive heat exposure can cause heat cramps, heat exhaustion, heatstroke, or thermal injury.

Heat Cramps

Painful, involuntary muscle spasms occurring during or after strenuous activity in heat, often associated with fluid and electrolyte loss. Confusion, fainting, or altered mental status suggests a more serious heat illness rather than uncomplicated heat cramps.

Heat Emergencies

Heat emergencies range from heat cramps and exhaustion to heat stroke, in which dangerous core-temperature elevation causes central nervous system dysfunction and organ injury.

Heat Exhaustion

A heat-related illness caused by losing too much water and salt through sweating. It may cause heavy sweating, weakness, dizziness, headache, nausea, or fainting. Confusion, seizures, or very hot skin suggest heat stroke, a life-threatening illness.

Heat Intolerance

An abnormal inability to tolerate warm environments or increased body heat, often causing excessive sweating, flushing, fatigue, or dizziness. Common causes include hyperthyroidism, menopause, fever, medications, autonomic disorders, and dehydration.

Heat Pack

A device that applies warmth to the body surface to relieve some muscle pain or stiffness. Excessive heat or prolonged contact can cause burns.

Heat Prostration

Older term; see *Heat Exhaustion*.

Heat Rash

An itchy or prickly rash caused by blocked sweat ducts during hot, humid conditions. Small red bumps or clear vesicles often appear in skin folds or areas covered by clothing.

Heat Shock Protein

A stress-response protein that helps other proteins fold, avoid aggregation, and recover after heat, oxidative, infectious, or other cellular stress; some also influence immunity and cancer biology.

Heat Stress

The strain placed on the body when it cannot adequately lose heat, often during hot or humid conditions, exertion, or inadequate hydration. It can progress from heat cramps or exhaustion to life-threatening heat stroke.

Heat Stroke

A life-threatening heat-related illness with markedly elevated body temperature and altered mental status. It may cause confusion, seizures, loss of consciousness, and damage to multiple organs.

Heavy Menstrual Bleeding

Menstrual bleeding that is unusually heavy, prolonged, or disruptive to daily life. Causes include fibroids, adenomyosis, polyps, changes in ovulation, bleeding disorders, medicines, or other medical conditions. Ongoing blood loss may cause iron-deficiency anemia; bleeding during pregnancy is not menstrual bleeding and needs separate assessment.

Alternate Names:
Menorrhagia; Hypermenorrhea

Heavy Metal Poisoning

Illness caused by toxic exposure to metals or metalloids such as lead, mercury, arsenic, cadmium, or thallium. Lead and mercury can injure the brain and nerves, cadmium can damage the kidneys and lungs, and arsenic can affect the skin and internal organs. The effects depend on the substance, amount, route, and duration of exposure.

Heberden Node

A small, hard bony bump or swelling that develops on the finger joint closest to the fingernail (the distal joint). It is a classic physical sign of osteoarthritis, caused by the gradual breakdown of joint cartilage and subsequent bone spurs (osteophytes) forming around the joint edges. While often painless or only mildly tender when fully formed, these nodes can cause joint stiffness or crookedness in the fingers.

Alternate Names:
Heberden Nodes; Heberden's Node; Heberden's Nodes; Heberden Arthropathy

Heberden Nodes

Plural form; see *Heberden Node*.

Heberden's Node

Alternate form; see *Heberden Node*.

Heberden's Nodes

Alternate plural; see *Heberden Node*.

Hecht's Pneumonia

A rare, severe form of measles-related pneumonia, usually affecting people with weakened immunity. It can cause rapidly worsening breathing problems and is treated in hospital with supportive care and management of complications.

Hedgehog Proteins

Signaling proteins that help guide the growth and organization of tissues before birth and during repair. Abnormal activity in this pathway can contribute to some birth differences and cancers.

Heel

The heel is the back and underside of the foot, formed mainly by the calcaneus and a cushioning fat pad.

Heel Fat Pad Syndrome

Pain caused by thinning, damage, or loss of spring in the cushioning fat pad beneath the heel. It often feels like a deep bruise in the center of the heel and may worsen with standing or walking on hard surfaces; see also *Plantar Fasciitis*.

Heel Pain

Pain beneath or around the heel, commonly caused by plantar fasciitis, Achilles tendinopathy, bursitis, stress fracture, nerve compression, or inflammatory arthritis.

Heel Spur

A bony growth arising from the heel bone, often associated with plantar-fascia strain. The spur itself may cause no symptoms; heel pain is more often related to surrounding soft-tissue inflammation.

Heel-to-Shin Test

A neurological test of lower limb coordination in which the patient places the heel of one foot on the opposite knee and slides it smoothly down the crest of the tibia to the ankle. Inability to maintain contact or an irregular, jerky trajectory indicates cerebellar ataxia or sensory ataxia.

Heerfordt Syndrome

A specific clinical presentation of acute sarcoidosis characterized by the classic tetrad of anterior uveitis, bilateral parotitis (parotid gland enlargement), low-grade pyrexia, and unilateral or bilateral lower motor neuron facial nerve (CN VII) palsy.

Alternate Names:
Uveoparotid Fever; Heerfordt-Waldenström Syndrome

Hegar's Dilators

Hegar's dilators are graduated metal instruments used to gently widen the cervix or other body openings during selected procedures.

Hegar's Sign

Softening of the lower part of the uterus, once used as an early sign of pregnancy. It is not specific and is not sufficient to confirm pregnancy without testing.

Height

The vertical distance from the base of a person to the top of the head, measured for growth assessment, nutritional evaluation, drug dosing, and calculation of body-mass index.

Heimlich Maneuver

A common name for abdominal thrusts used to relieve severe choking in a responsive person. First-aid techniques differ for adults, children, infants, and pregnant people; serious airway obstruction may require emergency treatment.

Heimlich Maneuver On Self

A self-administered abdominal-thrust technique sometimes used for severe choking when a person cannot breathe, speak, or cough effectively; severe obstruction can cause loss of consciousness or death.

Heimlich Manoeuvre

An emergency procedure for relieving upper airway obstruction caused by a foreign body (choking). The maneuver is performed on a conscious, choking adult who cannot speak, cough effectively, or breathe.

Heine-Medin Disease

An older name for polio, a viral infection that can inflame the spinal cord and brain. It may cause fever and weakness and sometimes permanent paralysis; vaccination prevents most cases.

Heinz Bodies

Clumps of damaged hemoglobin inside red blood cells, usually formed after oxidative injury. They may occur in glucose-6-phosphate dehydrogenase deficiency or after exposure to certain medicines, chemicals, or infections.

Hejama

An Arabic term for cupping, a traditional practice in which suction is applied to the skin; wet cupping also involves superficial skin incisions and carries bleeding and infection risks.

Helcococcus

A genus of gram-positive cocci that can rarely cause opportunistic skin, wound, bone, or bloodstream infections.

Helcococcus Kunzii

A Gram-positive round bacterium usually found on skin that rarely causes opportunistic infection. Reported infections may involve wounds, blood, or implanted devices in people with serious illness or weakened defenses.

Helcococcus Pyogenes

A rarely encountered Gram-positive round bacterium that may cause opportunistic human infection. It has been found in wounds or blood, particularly in people with serious illness, chronic wounds, or weakened immunity.

Helicase

An enzyme that uses cellular energy to separate the paired strands of DNA or RNA. This allows genetic material to be copied, repaired, or read.

Helicobacter

A genus of spiral-shaped bacteria that colonize the stomach or intestine; some species cause ulcers, gastritis, or other disease.

Helicobacteraceae

A family of spiral-shaped bacteria that includes Helicobacter and related genera, many of which inhabit the digestive tract.

Helicobacter Cinaedi

A Helicobacter species that can cause bloodstream, skin, bone, joint, or other invasive infections, especially in people with weakened immunity.

Helicobacter Fennelliae

An intestinal Helicobacter species that rarely causes bloodstream or other opportunistic infection. Disease is more likely in people with weakened defenses, and diagnosis requires specialized laboratory identification.

Helicobacter Pylori

A gram-negative, spiral-shaped bacterium adapted to colonize the stomach. It can cause chronic gastritis, peptic ulcer disease, and increase the risk of gastric cancer and gastric MALT lymphoma.

Helicobacter Pylori-Associated Active Gastritis Pathology

Chronic active gastritis with lymphoplasmacytic inflammation, neutrophils in pits or surface epithelium, lymphoid aggregates, and curved organisms along the surface mucus or foveolar epithelium.

Helicobacter Pylori Eradication

Elimination of a stomach infection with *Helicobacter pylori* using a combination of medicines. The regimen is selected based on factors such as antibiotic resistance and past treatment. A follow-up test can confirm whether the infection has cleared.

Helicobacter Pylori Infection

Infection of the stomach by H. pylori, a spiral-shaped bacterium associated with chronic gastritis, peptic ulcer disease, gastric adenocarcinoma, and gastric MALT lymphoma. It is diagnosed with

noninvasive or endoscopic testing and treated with combination eradication therapy.

Helicotrema

The narrow anatomical communication aperture located at the apex of the cochlea where the scala vestibuli meets and continues into the scala tympani, allowing pressure equilibration of perilymph between the two compartments.

Heliotherapy

Treatment using controlled exposure to sunlight or artificial ultraviolet light. It has been used for selected skin disorders, but excessive exposure can cause burns, premature aging, eye injury, and skin cancer.

Heliotrope Rash

Symmetric violaceous or dusky-red discoloration of the upper eyelids, sometimes extending around the eyes and accompanied by eyelid swelling. It is a characteristic skin finding of dermatomyositis and may occur even without muscle weakness; diagnosis depends on the overall clinical findings, not the rash alone.

Alternate Names:
Heliotrope Erythema; Dermatomyositis Eyelid Sign

Helium

A chemically inert gas used in respiratory mixtures, cryogenics, imaging, and laboratory applications; inhalation can displace oxygen and cause hypoxia despite its lack of direct toxicity.

Helix

The curved outer rim of the external ear. Its shape is formed by cartilage covered with skin; swelling, tenderness, or a skin change on the helix may follow injury, infection, sun damage, or other skin disease.

Heller Myotomy

A surgical procedure that cuts the muscles of the lower esophageal sphincter to relieve obstruction in achalasia, usually performed laparoscopically and often combined with an antireflux procedure.

Heller's Operation

A surgical procedure that cuts the lower esophageal muscle to relieve achalasia, usually with an antireflux procedure.

HELLP syndrome

A pregnancy-associated syndrome named for hemolysis, elevated liver enzymes, and low platelet count. It is a form of microangiopathic disease that may occur with preeclampsia and can involve upper-abdominal pain, nausea, headache, or high blood pressure.

Helminth

A medical term for a parasitic worm that lives in human or animal tissues or organs. The major types that cause human infections include roundworms (such as pinworms and hookworms), tapeworms, and flukes. Infections typically occur from swallowing worm eggs in contaminated food or water, walking barefoot on contaminated soil, or through insect bites, and can cause digestive symptoms, nutrient deficiencies, or organ irritation.

Alternate Names:
Helminths; Parasitic Worm

Helminthiasis

Infection or infestation caused by parasitic worms, including roundworms, tapeworms, and flukes. Symptoms vary by species and may include abdominal problems, anemia, cough, rash, malnutrition, or organ damage.

Alternate Names:
Worm Infestation; Helminthic Parasitosis

Helminths

Plural form; see *Helminth*.

HELPERR Mnemonic

A memory aid for managing shoulder dystocia during birth: call for help, consider an episiotomy, flex the birthing person's legs, apply suprapubic pressure, perform internal maneuvers, remove the baby's posterior arm, and roll to an all-fours position. It is used by trained obstetric staff.

Helper T Cell

A vital type of white blood cell (lymphocyte) that coordinates the body's adaptive immune system against infections. Also known as a CD4-positive T cell, it acts as an immune conductor: when it recognizes foreign antigens from viruses, bacteria, or other invaders, it releases chemical messengers (cytokines) that activate B cells to make antibodies and alert killer T cells and macrophages to destroy infected cells.

Alternate Names:
Helper T Cells; CD4+ T Cell; T-Helper Lymphocyte

Helper T Cells

Plural form; see *Helper T Cell*.

Helper Virus

A virus that supplies functions needed for another virus or defective viral genome to replicate.

Help Prevent Hospital Errors

Patient-safety practices intended to reduce preventable harm in hospitals, including accurate identification, medication reconciliation, clear communication, and timely reporting of clinical changes.

Hemagglutination Test

A test in which antibodies or other agents cause red blood cells to clump; the reaction can help detect antibodies, antigens, or selected infectious agents.

Hemagglutinin

A surface glycoprotein, especially on influenza viruses, that binds sialic-acid receptors and helps the virus attach to and enter host cells; it is a major target of protective antibodies.

Hemangioblastoma

A usually slow-growing tumor made of blood-vessel-forming cells, most often found in the cerebellum or spinal cord. It may cause headache, balance problems, or weakness and can be associated with von Hippel–Lindau disease.

Hemangioendothelioma

A rare tumor arising from cells that line blood vessels. Its behavior ranges from slow-growing to cancerous, depending on the subtype and location, so diagnosis requires tissue examination and specialist assessment.

Hemangioma

A benign tumor formed by an overgrowth of blood vessels. It can occur in the skin or an internal organ. Infantile hemangiomas usually appear in the first weeks of life, grow for a time, then gradually shrink. Some lesions once called hemangiomas are vascular malformations, not tumors. Depending on its size and location, a hemangioma can bleed, form sores, or affect nearby body parts.

Alternate Names:
Vascular Hemangioma

Hemangiopericytoma

A rare tumor formerly defined by branching "staghorn" vessels and perivascular cells; many lesions classified this way are now recognized as solitary fibrous tumors.

Hemangiosarcoma

A malignant tumor of vascular endothelial cells, an aggressive sarcoma that may arise in the skin, liver, or bone.

Hemarthrosis

Bleeding into a joint, most often the knee, causing rapid swelling, warmth, pain, and limited movement. Injury and bleeding disorders such as hemophilia are common causes; repeated episodes can damage cartilage and lead to long-term joint disease.

Hematemesis

Vomiting blood, either bright red or dark and granular like coffee grounds because stomach acid has altered the blood. It usually signals bleeding from the upper digestive tract, such as the esophagus, stomach, or duodenum, the first part of the small intestine. The bleeding can be life-threatening.

Hematidrosis

A very rare condition in which blood-tinged fluid appears through apparently intact skin or other surfaces, sometimes during extreme stress. The diagnosis requires careful examination to exclude injury, skin disease, bleeding disorders, or contamination.

Hematocele

A collection of blood around a testicle, usually after scrotal injury or surgery and sometimes from a tumor. It can cause a heavy, firm, painful swelling; ultrasound is needed to check the testicle and blood flow, and large collections may need surgery.

Alternate Names:
Scrotal Hematocele; Tunica Vaginalis Blood Collection

Hematochezia

Passing bright-red or maroon blood from the rectum. It often comes from the large intestine, rectum, or anus, but heavy bleeding higher in the digestive tract can look the same.

Hematocolpos

Accumulation of menstrual blood in the vagina, usually because an imperforate hymen or another obstructing anomaly prevents outflow; it may cause cyclic pelvic pain and a bulging vaginal membrane.

Hematocrit

The percentage of blood volume made up by red blood cells, also called packed cell volume. It is measured in a blood sample and is usually reported as part of a complete blood count. A low or high result can reflect changes in red-cell amount or in the fluid portion of blood and is interpreted with other findings.

Hematocrit Test

A laboratory measurement of the percentage of total blood volume occupied by red blood cells; see *Hematocrit* and *Complete Blood Count*.

Hematocytopenia

Alternate term; see *Cytopenia*.

Hematocyturia

Alternate term; see *Hematuria*.

Hematogenous

Spread through the bloodstream, as when infection, tumor cells, or embolic material travels from one body site to another.

Hematogenous Osteomyelitis

An invasive bone infection arising from bacteremic seeding of the vascular marrow spaces, classically affecting the metaphyses of long bones in growing children (due to slow sinusoidal capillary blood flow) and the vertebral bodies (spondylodiscitis) in older adults, most frequently caused by *Staphylococcus aureus*.

Hematologic Agents

Medicines or biologic therapies that act on blood cells, coagulation, marrow, or immune pathways, including agents used for anemia, thrombosis, leukemia, and lymphoma.

Hematological Disease

A disorder of blood cells, bone marrow, lymphatic tissue, or coagulation, including anemia, leukemia, lymphoma, bleeding disorders, and clotting disorders.

Hematologic Changes In Pregnancy

Pregnancy normally increases the fluid part of blood more than the red-cell mass, so blood counts may show mild dilutional anemia. White-cell counts also commonly rise, mainly because of more neutrophils. Normal ranges differ from those outside pregnancy.

Hematologic Malignancy

Alternate name; see *Blood Cancer*.

Hematologic Response

A measurable improvement or change in blood counts or marrow findings after treatment, such as recovery of neutrophils, platelets, or hemoglobin or reduction of malignant cells.

Hematologist

A physician who diagnoses and treats disorders of blood, bone marrow, lymph nodes, clotting, and hematologic cancers.

Hematology

The branch of medicine concerned with the study, diagnosis, treatment, and prevention of disorders of the blood and blood-forming organs (bone marrow, lymph nodes, spleen).

Hematology-Oncology

The medical specialty concerned with blood disorders and cancers, including anemia, leukemia, lymphoma, myeloma, and clotting disorders.

Hematoma

A collection of blood outside a blood vessel, usually after injury, surgery, or bleeding caused by illness or medicines. It may cause swelling and pain and can press on nearby nerves or organs.

Hematoma Evacuation

Surgical removal or drainage of a collection of blood to relieve pressure and prevent further tissue injury. Intracranial hematoma evacuation may use a burr hole, craniotomy, or craniectomy and is considered when bleeding causes neurologic deterioration, dangerous mass effect, or increased intracranial pressure.

Hematometra

Blood trapped inside the uterus because the normal outlet is blocked or too narrow. It can cause absent periods, monthly pelvic pain, and an enlarged tender uterus; the blockage may be present from birth or develop after scarring, surgery, infection, or radiation.

Hematometrocolpos

A buildup of menstrual blood in the uterus and vagina because the normal outlet is blocked, often by tissue present from birth. It may cause absent periods, monthly pelvic pain, and a lower-abdominal mass.

Hematomyelia

Bleeding inside the spinal cord, usually after a serious injury or from an abnormal blood vessel or bleeding disorder. It may cause sudden neck or back pain, weakness, numbness, or loss of bladder or bowel control.

Hematophobia

An excessive or persistent fear of blood, blood-related sights, or medical procedures involving blood that causes distress or avoidance; some people have a vasovagal fainting response.

Hematopoiesis

The process of making and maturing blood cells, mainly in the bone marrow. It produces red blood cells for oxygen transport, white blood cells for immune defense, and platelets for stopping bleeding.

Hematopoietic Growth Factor

A cytokine or medicine that stimulates production, maturation, or survival of blood-forming cells in bone marrow, such as erythropoietin or granulocyte colony-stimulating factor.

Hematopoietic Neoplasm

A cancer arising from blood-forming cells in the bone marrow or immune tissues. Leukemias, lymphomas, and plasma-cell cancers are examples; symptoms and treatment depend on the exact cell type and extent.

Hematopoietic Stem Cell Transplantation

Infusion of blood-forming stem cells to replace damaged or diseased bone marrow. The cells may come from the patient or a donor. Treatment can cause serious infection, bleeding, infertility, or an immune reaction against donor and recipient tissues.

Hematopoietic System

The bone marrow and related organs and cells that produce, mature, circulate, and remove blood cells, including red cells, white cells, and platelets.

Hematoporphyrin Derivative

A porphyrin-based photosensitizer that accumulates in some tumors and can be activated by light in photodynamic treatment; it may also cause prolonged photosensitivity.

Hematosalpinx

Blood collected inside a fallopian tube, usually causing it to expand. It is often associated with a tubal ectopic pregnancy or endometriosis, though other causes occur. It may cause pelvic pain and can impair fertility if the tube is damaged or blocked. Unlike hydrosalpinx, which contains non-purulent fluid, hematosalpinx contains blood; a pus-filled tube is a pyosalpinx.

Hematosis

The exchange of gases in the lungs: oxygen moves from inhaled air into the blood, while carbon dioxide moves from the blood into the air to be breathed out.

Hematospermia

Blood in the semen, often temporary and associated with infection, inflammation, trauma, or a recent urologic procedure. Persistent or recurrent bleeding, pain, fever, urinary symptoms, or older age can be associated with underlying disease.

Hematoxylin

A dye used in histology, usually with eosin, to stain cell nuclei blue-purple and help show tissue structure.

Hematuria

Blood in the urine. It may be visible as pink, red, or brown urine or found only under a microscope. Causes include infection, stones, medicines, injury, prostate disease, and kidney or urinary-tract disorders.

Heme

Heme is an iron-containing porphyrin group that binds oxygen in haemoglobin and myoglobin and forms the functional centre of several enzymes; abnormal heme metabolism contributes to porphyrias and jaundice.

Hemeralopia

Hemeralopia is reduced vision in bright light, sometimes associated with retinal disorders or abnormal cone function.

Hemianesthesia

The complete loss of tactile, thermal, or nociceptive somatic sensation affecting one vertical half of the body, classically caused by an ischemic or hemorrhagic lesion disrupting the contralateral primary somatosensory cortex or the ventral posterolateral (VPL) nucleus of the thalamus.

Hemianopia

Loss of vision in half of the area a person can see, affecting one or both eyes. It often results from a problem in the brain's visual pathways, such as a stroke or tumor; sudden onset can occur with a serious brain disorder.

Hemianopsia

Alternate term; see *Hemianopia*.

Hemiballism

A movement disorder causing sudden, large-amplitude, flinging movements on one side of the body, usually from a lesion involving the subthalamic region.

Hemiballismus

Alternate spelling; see *Hemiballism*.

Hemicolectomy

Surgical removal of the right or left portion of the colon, sometimes with nearby lymph nodes and reconnection of the bowel.

Hemidesmosome

A specialized junction that anchors basal epithelial cells to the underlying basement membrane by linking intracellular keratin filaments with extracellular matrix proteins.

Hemidiaphragm

One of the two muscular halves of the diaphragm separating the chest from the abdomen and assisting breathing.

Hemifacial Atrophy

Progressive wasting of skin, subcutaneous tissue, muscle, and sometimes bone on one side of the face, also called Parry–Romberg syndrome.

Hemifacial Microsomia

A birth difference in which one side of the face is smaller or less developed than the other, often affecting the jaw, ear, cheek, and nearby soft tissues. Hearing, vision, and spinal differences may also occur.

Hemifacial Spasm

Repeated involuntary twitching on one side of the face, usually beginning around the eye and sometimes spreading to the cheek or mouth. Irritation of the facial nerve is a common cause; persistent spasms need evaluation.

Hemihypertrophy

Unequal overgrowth of one side or region of the body, producing asymmetry of limbs, trunk, or face; some childhood cases carry increased risk of embryonal tumors.

Hemilaryngectomy

Hemilaryngectomy is surgery to remove part of the larynx, usually to treat a selected laryngeal cancer while preserving as much speech and swallowing function as possible.

Hemimandibulectomy

Hemimandibulectomy is surgery to remove one side of the lower jaw, usually for a tumor or severe bone disease, sometimes followed by reconstruction.

Hemimegalencephaly

A rare developmental brain malformation in which one cerebral hemisphere is abnormally enlarged and dysplastic, often causing infantile seizures, developmental impairment, and contralateral neurologic signs.

Hemimelia

A congenital limb-reduction defect in which part or all of a limb segment is absent, such as fibular or radial hemimelia.

Hemineglect

A neurological attentional disorder classically resulting from an acute lesion of the non-dominant (usually right) posterior parietal cortex, in which the patient fails to orient toward, respond to, or perceive sensory stimuli presented in the hemispace contralateral to the brain lesion.

Alternate Names:
Spatial Neglect; Unilateral Neglect

Hemiparesis

Weakness on one side of the body, affecting the face, arm, leg, or a combination. It is less severe than paralysis and may result from stroke, brain injury, a tumor, multiple sclerosis, or another nervous-system disorder.

Hemiparesis with Conjugate Gaze Deviation

Weakness on the left side with both eyes looking to the right. This pattern can occur with a serious injury to the right side of the brain, including stroke, but examination and brain imaging are needed to identify the cause.

Hemipelvectomy

Hemipelvectomy is major surgery that removes part or all of one side of the pelvis, with or without removal of the leg, usually for extensive cancer or severe trauma.

Hemiplegia

Complete or near-complete paralysis of one side of the body, including the face, arm, or leg. It usually results from injury to movement pathways in the brain, commonly a stroke; sudden onset can occur with a serious brain disorder.

Hemispatial Neglect

Hemispatial neglect is reduced awareness of one side of the body or space, usually after injury to the opposite cerebral hemisphere.

Hemispherectomy

Hemispherectomy is surgery that removes or disconnects much of one cerebral hemisphere to treat severe, otherwise uncontrolled epilepsy in selected patients.

Hemisternebra

A congenital or developmental partial segment of the sternum, caused by incomplete formation or fusion of sternal elements and sometimes associated with chest-wall anomalies.

Hemithorax

One side of the thorax, including the lung, pleural space, ribs, and other structures on that side of the chest.

Hemivertebrae

Congenital vertebrae formed from only part of the normal vertebral body, producing wedge-shaped bone and potentially causing congenital scoliosis or spinal-cord abnormalities.

Hemizygous

Having only one copy of a gene or chromosome region rather than the usual pair, as occurs for many X-linked genes in people with one X chromosome.

Hemobilia

Bleeding originating within the hepatobiliary tree that enters the gastrointestinal tract via the ampulla of Vater, classically presenting with the triad of biliary colic, upper gastrointestinal bleeding, and obstructive jaundice (Sandblom triad), frequently following liver trauma, biopsy, or instrumentation.

Hemochromatosis

An inherited genetic disorder that causes the body to absorb and store too much iron from the diet. Because the human body has no natural way to get rid of excess iron, the mineral gradually builds up in vital organs—especially the liver, heart, pancreas, joints, and skin. Over many years, iron toxicity can lead to liver damage (cirrhosis), diabetes, heart failure, arthritis, and chronic fatigue.

Alternate Names:
Hereditary Hemochromatosis; Iron Overload Disorder; Bronze Diabetes

Hemochromatosis Cardiomyopathy

Heart-muscle damage caused by excess iron buildup. The heart may become stiff or weak and cause breathlessness, swelling, abnormal rhythms, or heart failure; treatment aims to remove excess iron and support heart function.

Hemocyanin

A copper-containing oxygen-transport protein in many mollusks and arthropods; unlike human hemoglobin, it circulates dissolved in their hemolymph.

Hemocytometer

A ruled counting chamber used with a microscope to determine the concentration of cells or other particles in a measured volume of fluid.

Hemodialysis

A treatment that cleans blood using a dialyzer with a semipermeable membrane. Waste and excess salts move into the dialysate mainly by diffusion; excess water is removed by ultrafiltration driven by a pressure difference across the membrane. Blood returns to the circulation after passing through the filter. Hemodialysis replaces some kidney functions but not their hormone production or vitamin D activation.

Hemodialysis Access Care

Daily maintenance protocols and hygiene measures for an arteriovenous fistula, arteriovenous graft, or central venous catheter used for hemodialysis. Includes daily palpation for a vascular thrill, avoiding blood pressure cuffs or constrictive clothing on the access arm, and promptly reporting signs of infection or thrombosis.

Alternate Names:
Vascular Access Care; Fistula and Graft Maintenance; Dialysis Access Management

Hemodialysis Access Procedures

Procedures that create, maintain, repair, or revise vascular access for hemodialysis, including fistula or graft creation, catheter placement, angioplasty, thrombectomy, and treatment of stenosis or infection.

Hemodialysis Clearance

The volume of plasma from which hemodialysis removes a solute per unit time; it depends on blood and dialysate flow, membrane properties, treatment time, and the substance's distribution.

Hemodialysis Solution

The dialysate fluid circulated across a semipermeable membrane during hemodialysis to remove waste and help correct electrolyte, acid–base, and fluid abnormalities.

Hemodynamics

The movement of blood through the heart and blood vessels, including pressure, flow, heart output, and resistance. Hemodynamic measurements help assess circulation and guide treatment in conditions such as shock, heart failure, and critical illness.

Hemofiltration

A kidney-support treatment in which blood passes through a semipermeable filter. Pressure drives water and dissolved waste across the membrane by convection, and sterile replacement fluid is added to maintain fluid and salt balance. Pure hemofiltration uses no dialysate; hemodiafiltration combines hemofiltration with diffusion using dialysate.

Hemoglobin

The iron-containing protein in red blood cells that carries oxygen from the lungs to tissues and helps carry carbon dioxide back to the lungs. Low or abnormal hemoglobin can cause anemia or other blood disorders.

Hemoglobin A

The main type of hemoglobin in most adults. It is the oxygen-carrying protein in red blood cells and is made from two alpha and two beta protein parts.

Hemoglobin A1c

A blood test that measures the proportion of hemoglobin with glucose attached at a specific site on its beta chain. The result estimates average blood glucose over roughly the preceding two to three months and helps diagnose and monitor diabetes; it may be less reliable when red-cell survival or hemoglobin structure is abnormal.

Alternate Names:
HbA1c; A1C Test; Hemoglobin A1c Test

Hemoglobin A1C Variability

Factors that can make hemoglobin A1c less reliable include altered red-cell survival, hemoglobin variants, anemia, pregnancy, kidney disease, transfusion, and some treatments. An alternative measure of glucose may be needed when A1c does not reflect recent glycemia.

Hemoglobin C

A beta-globin variant caused by a hemoglobin gene mutation; homozygosity can cause mild hemolytic anemia and splenomegaly, while inheritance with hemoglobin S causes a clinically significant sickling disorder.

Hemoglobin C Disease

An inherited hemoglobinopathy caused by a beta-globin variant that produces hemoglobin C. It may cause mild hemolytic anemia, jaundice, splenomegaly, or, when combined with hemoglobin S, clinically significant sickling disease.

Hemoglobin Electrophoresis

A blood test that separates the different types of hemoglobin. It helps identify inherited conditions such as sickle-cell disease, sickle-cell trait, and thalassemia. Results are interpreted with age, pregnancy, blood counts, recent transfusion, and other tests.

Hemoglobin H

An unusual form of hemoglobin made from four beta protein parts when the body makes too little alpha hemoglobin. It is unstable and can cause ongoing breakdown of red blood cells in alpha-thalassemia.

Hemoglobin Increased

A blood-test result in which hemoglobin concentration is above the laboratory's reference range. Dehydration can raise the concentration by reducing plasma volume; chronic low oxygen or a bone-marrow disorder can raise the number of red blood cells. Hematocrit and red-cell count help distinguish these causes.

Hemoglobin M

A group of abnormal hemoglobins that stabilize iron in the ferric state and can cause congenital methemoglobinemia and cyanosis.

Hemoglobin Normal Values

Reference ranges for blood hemoglobin concentration, which vary with age, sex, pregnancy, altitude, laboratory method, and other factors; the reporting laboratory's range applies to its results.

Hemoglobinopathies

A group of inherited disorders affecting the structure or production of hemoglobin. They include sickle-cell disorders and thalassemias and may cause anemia, hemolysis, abnormal oxygen transport, or blood-vessel complications.

Hemoglobinopathies: Thalassemias

Thalassemias are inherited disorders of globin chain synthesis imbalance: alpha-thalassemia (HBA1/HBA2 deletions) and beta-thalassemia (HBB mutations).

Hemoglobinopathy

An inherited disorder affecting the structure or production of hemoglobin. Examples include sickle-cell disease and thalassemia; effects range from no symptoms to anemia, painful blood-vessel blockages, and organ damage.

Hemoglobin S

An inherited form of hemoglobin that can make red blood cells become stiff and sickle-shaped when oxygen is low. It can cause anemia, painful blockages, and organ damage in sickle-cell disease.

Hemoglobin SC Disease

An inherited form of sickle cell disease caused by having one hemoglobin S gene and one hemoglobin C gene. It can cause anemia, pain episodes, and organ complications.

Alternate Names:
HbSC; Sickle-Hemoglobin C Disease

Hemoglobin Test

A blood test measuring the concentration of hemoglobin, the iron-containing protein that transports oxygen in red blood cells; see *Hemoglobin* and *Complete Blood Count*.

Hemoglobin Trait

The inherited presence of a hemoglobin variant in a heterozygous state, usually causing no symptoms but potentially affecting screening results or reproductive risk.

Hemoglobinuria

Haemoglobinuria is free haemoglobin in urine, usually from intravascular haemolysis; urine may be dipstick-positive for blood with few or no red cells, and causes include transfusion reactions, malaria, and paroxysmal nocturnal haemoglobinuria.

Hemoglobinuria Test

A urine test used to detect free hemoglobin released when red blood cells break apart in the bloodstream. A urine dipstick detects heme but may also react to intact red blood cells or myoglobin; urine microscopy helps distinguish hemoglobinuria from bleeding into the urinary tract.

Hemogram

See *Complete Blood Count*.

Hemolysin

A toxin or immune substance that damages the outer covering of red blood cells and makes them break open. Some bacteria produce hemolysins, and the resulting destruction of red cells is called hemolysis.

Hemolysis

Breakdown of red blood cells, releasing hemoglobin. It may occur within blood vessels or as cells are removed by the spleen and liver; excessive hemolysis can cause anemia, jaundice, or dark urine.

Hemolytic

Relating to hemolysis, the premature destruction of red blood cells, which can release hemoglobin and produce anemia or jaundice.

Hemolytic Anemia

Anemia caused by red blood cells being destroyed faster than the body can replace them. It may result from an inherited cell problem, an immune reaction, infection, medicine, toxin, or another illness and can cause jaundice and dark urine.

Hemolytic Anemia From Toxins

Anemia caused by accelerated destruction of red blood cells after exposure to a chemical or toxin; evaluation identifies hemolysis and removes or treats the responsible exposure.

Hemolytic Anemias: Autoimmune

Anemias in which the immune system mistakenly destroys red blood cells. Warm-antibody and cold-antibody forms differ in triggers and temperature sensitivity; symptoms may include tiredness, jaundice, dark urine, and breathlessness.

Hemolytic Anemias: Hereditary

Inherited conditions in which red blood cells are destroyed too quickly. Hereditary spherocytosis is one example; it can cause anemia, jaundice, an enlarged spleen, and gallstones. Other inherited red-cell or enzyme problems can cause similar anemia.

Hemolytic Crisis

A sudden increase in red-cell destruction causing worsening anemia, jaundice, dark urine, pain, or other manifestations of hemolysis.

Hemolytic Disease Of The Fetus And Newborn

A condition in which antibodies from the pregnant person cross the placenta and destroy the fetus's red blood cells; the antibodies may continue to affect the newborn after birth. It can cause anemia and jaundice, and severe cases can cause widespread fluid buildup or brain injury.

Hemolytic Index

A laboratory-quality indicator estimating hemolysis in a blood specimen; substantial in-vitro hemolysis can interfere with measurement of several analytes.

Hemolytic Jaundice

Jaundice resulting from excessive hemolysis (breakdown of red blood cells) causing overproduction of unconjugated bilirubin that exceeds the liver's capacity for conjugation and excretion. See *Jaundice* for complete overview.

Hemolytic Transfusion Reaction

An immune or nonimmune complication in which transfused red blood cells are destroyed, potentially causing fever, pain, hemoglobinuria, kidney injury, shock, or disseminated intravascular coagulation.

Hemolytic Uremic Syndrome

A serious illness in which tiny blood clots damage small blood vessels, causing red blood cells to break apart, platelets to fall, and the kidneys to become injured. It often follows severe diarrheal infection but can have other causes.

Hemolytic-Uremic Syndrome

Alternate spelling; see *Hemolytic Uremic Syndrome*.

Hemoperfusion

A treatment in which blood passes through a material such as charcoal or resin that traps selected

poisons or medicines. It is used only for certain severe overdoses because effectiveness depends on the substance and timing.

Hemopericardium

Accumulation of blood in the pericardial sac around the heart. If pressure rises and prevents the heart from filling, cardiac tamponade can occur.

Hemoperitoneum

Blood collecting inside the abdominal cavity, usually from trauma, a ruptured blood vessel or organ, surgery, or a ruptured ectopic pregnancy. It can cause abdominal pain, distention, dizziness, or shock and may require emergency imaging and surgery or another procedure.

Hemopexin

A plasma glycoprotein that binds free heme and transports it to the liver, helping limit oxidative injury during hemolysis.

Hemophagocytic Lymphohistiocytosis

A rare, potentially life-threatening syndrome in which immune cells become overactive and cause widespread inflammation that can damage organs. It may be inherited or develop in association with an infection, cancer, or immune disorder. Common features include persistent fever, an enlarged spleen, low blood-cell counts, liver problems, bleeding, or neurologic symptoms such as confusion.

Hemophagocytosis Of Sickle Cells

A finding in which immune cells engulf blood cells in the bone marrow or other tissues during severe inflammation, infection, or sickle-cell complications. It can worsen anemia and low platelet counts and requires specialist evaluation.

Hemophilia

A rare, inherited bleeding disorder in which the blood cannot clot properly because it lacks sufficient amounts of specific blood-clotting proteins. Usually affecting males and passed down through carrier mothers, the most common forms are extbfhemophilia A (lack of clotting factor VIII) and extbfhemophilia B (lack of clotting factor IX). People with hemophilia bleed for a longer time after an injury and can experience painful, damaging internal bleeding into joints and muscles without an obvious injury.

Alternate Names:
Haemophilia; Inherited Coagulopathy

Hemophilia A

An inherited bleeding disorder caused by too little or poorly working clotting factor VIII. It usually follows an X-linked inheritance pattern but can cause bleeding symptoms in people of any sex. Severity varies with factor VIII activity.

Hemophilia B

An inherited bleeding disorder caused by too little or poorly working clotting factor IX. It usually follows an X-linked inheritance pattern but can cause bleeding symptoms in people of any sex. Severity varies with factor IX activity.

Hemophilic Arthritis

Chronic joint damage caused by repeated bleeding into a joint, usually in people with hemophilia. Recurrent bleeds inflame and thicken the joint lining and can progressively damage cartilage and bone, causing pain, stiffness, and reduced movement.

Alternate Names:
Hemophilic Arthropathy; Haemophilic Arthropathy; Haemophilic Arthritis

Hemophilus

An older spelling or variant of Haemophilus, a group of small gram-negative bacteria that includes respiratory and genital pathogens.

Hemophilus Ducreyi

A gram-negative bacterium that causes chancroid, a sexually transmitted infection with painful genital ulcers and tender lymph nodes.

Hemophobia

An excessive or persistent fear of blood, also called hematophobia, that causes significant dis-

tress, avoidance, or sometimes a vasovagal faint.

Hemopoietic Stem Cell

A blood-forming stem cell found mainly in the bone marrow. It can make copies of itself and develop into red blood cells, white blood cells, or platelets.

Alternate Names:
Hematopoietic Stem Cell (HSC); Blood-Forming Cell

Hemopoietic Tissue

Tissue that produces blood cells, chiefly bone marrow, containing stem cells and supporting cells that generate erythrocytes, leukocytes, and platelets.

Hemoprotein

A protein containing a heme group with an iron atom, such as hemoglobin, myoglobin, cytochromes, and many oxidoreductive enzymes.

Hemoptysis

Coughing up blood or blood-stained mucus from the airways or lungs. Causes include infection, irritated or widened airways, a blood clot, or cancer. Larger amounts may occur with breathlessness or chest pain.

Hemorrhage

Abnormal escape of blood from a damaged blood vessel or, less commonly, from the heart. It may be external or internal, acute or chronic, and range from minor bleeding to life-threatening blood loss causing anemia, shock, or organ compression; the cause and site determine management.

Hemorrhagic

Pertaining to or characterized by hemorrhage (extravasation of blood from vessels). Used in contexts such as hemorrhagic stroke, hemorrhagic shock, and hemorrhagic fever.

Hemorrhagic Anemia

Anemia caused by losing blood faster than the body can replace it. Blood loss may be sudden, such as after an injury, or slow, such as from heavy menstrual or intestinal bleeding.

Hemorrhagic Disorder

A condition that causes abnormal bleeding because of platelet number or function, clotting-factor deficiency, excessive fibrinolysis, or blood-vessel fragility.

Hemorrhagic Fever

A group of severe viral illnesses that can disrupt vascular function or blood clotting. Some cause bleeding, low blood pressure, shock, or organ failure; bleeding is not present in every case. Examples include Ebola, Marburg, dengue, and yellow fever.

Alternate Names:
Viral Hemorrhagic Fever; VHF; Hemorrhagic Fevers

Hemorrhagic Shock

Circulatory failure caused by severe blood loss. It may produce rapid pulse, low blood pressure, cool skin, reduced urine output, confusion, or collapse. Treatment focuses on controlling bleeding, restoring circulating volume, giving blood products when indicated, and correcting associated injuries or clotting abnormalities.

Hemorrhagic Stroke

A stroke caused by a blood vessel breaking and bleeding in or around the brain. It can cause sudden weakness, speech or vision problems, severe headache, vomiting, confusion, or loss of consciousness. The effects depend on the location and amount of bleeding.

Hemorrhagic Thyroid Nodule

Bleeding into a lump in the thyroid gland can cause sudden neck swelling or pain. It often occurs in a fluid-filled cyst or other thyroid nodule. Ultrasound can show blood within the lump, but further testing may be needed to identify its cause and determine whether the nodule is benign.

Alternate Names:
Intrathyroidal Hemorrhage; Hemorrhagic Thyroid Cyst; Bleeding Into A Thyroid Nodule; Thyroid Nodule Bleed

Hemorrhoid

Singular form; see *Hemorrhoids*.

Hemorrhoidal Hemorrhage

Rectal bleeding from enlarged or injured hemorrhoidal vessels, usually bright red and associated with defecation; heavy, persistent, painful, or unexplained bleeding requires evaluation for other causes.

Hemorrhoidectomy

An operation to remove enlarged hemorrhoids that continue to bleed, prolapse, clot, or cause severe symptoms despite other treatment. Recovery may include significant pain, bleeding, difficulty passing urine, or temporary bowel discomfort.

Hemorrhoids

Enlarged blood-vessel cushions in the lower rectum or anus, often associated with straining, constipation, or pregnancy. Internal hemorrhoids may cause painless, bright-red bleeding or tissue that bulges during bowel movements. External hemorrhoids lie under sensitive skin and can become painful, especially when a blood clot forms. Rectal bleeding can also have other causes.

Alternate Names:
Piles; Hemorrhoidal Disease; Haemorrhoids

Hemorrhoid Surgery

An operation to remove or reduce symptomatic internal or external hemorrhoids when bleeding, prolapse, thrombosis, or pain persists despite appropriate conservative treatment.

Hemosiderin

An iron-containing pigment left in cells after hemoglobin from red blood cells is broken down. It can build up after repeated bleeding, excessive red-cell destruction, or too much iron in the body.

Hemosiderosis

Excess deposition of hemosiderin, an iron-storage pigment, in tissues. It may follow repeated bleeding or transfusions and can affect organs such as the lungs or liver.

Hemosiderotic Synovitis

Synovial inflammation with hemosiderin deposition caused by recurrent bleeding into a joint, commonly associated with hemophilia, anticoagulation, trauma, or a vascular synovial lesion.

Hemospermia

The presence of blood in semen, usually caused by inflammation or infection of the genitourinary tract and often self-limited, but persistent or recurrent cases require evaluation.

Hemostasis

The body's process for stopping bleeding after a blood vessel is injured. Blood vessels narrow, platelets form a plug, and clotting proteins strengthen it; later, the body removes the clot as healing occurs.

Hemostasis And Coagulation

The linked processes that stop bleeding. Blood vessels narrow, platelets make a plug, and clotting proteins form a stronger clot. Problems with these processes can cause excessive bleeding or unwanted clots.

Hemostasis Valve

A valve or sealing device used with an intravascular catheter or sheath to limit blood loss while allowing passage of wires or instruments.

Hemostat

A surgical clamping instrument with jaws that compress a blood vessel or tissue to control bleeding during a procedure. Many hemostats have a ratcheted locking mechanism that maintains pressure without continuous hand force.

Alternate Names:
Hemostatic Forceps; Artery Clamp

Hemostatic Agent

A medicine or material used to stop or reduce bleeding. It may form a physical seal, help the blood clot, slow clot breakdown, or replace a missing clotting protein.

Hemothorax

Blood collecting in the space between the lung and chest wall, usually after injury or surgery. It can cause chest pain, breathlessness, low blood pressure, and reduced breath sounds; treatment often includes drainage and control of the bleeding source.

Hemovac Drain

A closed-suction surgical drain with a compressible reservoir used to remove blood or other fluid from a wound or operative site.

Henderson-Hasselbalch Equation

A mathematical derivation expressing the relationship between blood pH, the dissociation constant (pKa) of carbonic acid (6.1), and the ratio of serum bicarbonate concentration to dissolved arterial carbon dioxide tension (0.03 times PaCO2), forming the quantitative framework for clinical acid-base interpretation.

Hendra Virus

A rare zoonotic virus carried by fruit bats that can infect horses and occasionally humans through close contact with infected horses. Human disease may cause severe respiratory or neurologic illness and is managed as a public-health concern.

Henipavirus

A genus of paramyxoviruses that includes Nipah and Hendra viruses, which can cause severe encephalitis and respiratory disease.

Henle Loop

The U-shaped hairpin segment of a renal nephron connecting the proximal convoluted tubule to the distal convoluted tubule, consisting of a water-permeable descending limb and an active sodium-potassium-chloride-transporting ascending limb that generates a hypertonic medullary interstitial gradient for urine concentration.

Alternate Names:
Loop of Henle; Ansa Nephroni

Henna

A plant dye used on skin, hair, and textiles. Natural henna is usually orange-brown; so-called black henna may contain para-phenylenediamine, which can cause severe allergic skin reactions and permanent scarring.

Henoch-Schonlein Purpura

Older name; see *IgA Vasculitis*.

Henoch-Schönlein Purpura

Alternate spelling; see *IgA Vasculitis*.

Henoch-Schonlein Purpura (HSP)

Alternate name; see *IgA Vasculitis*.

Alternate Names:
IgA Vasculitis; Anaphylactoid Purpura; Schönlein-Henoch Syndrome

HEPA Filter

A high-efficiency air filter that removes most very small airborne particles. It can reduce dust, allergens, and some infectious particles when properly fitted and maintained, but does not remove every gas or chemical.

Alternate Names:
High-Efficiency Particulate Air Filter

Hepar

Latin for liver; it is used in medical terminology and in names of substances or preparations relating to the liver.

Heparan Sulfate

A sulfated glycosaminoglycan in cell surfaces and extracellular matrix that binds growth factors, regulates signaling, and contributes to filtration-barrier and connective-tissue structure.

Heparin

An anticoagulant medicine that reduces blood clotting by enhancing antithrombin activity. It may be given by injection to prevent or treat blood clots.

Heparin Binding

The attachment of a protein or other molecule to heparin, a highly charged substance related to blood clotting. Binding can alter the molecule's activity, movement, or laboratory measurement.

Heparin-Induced Thrombocytopenia

An immune reaction to heparin that lowers the platelet count while making dangerous blood clots more likely. It usually begins several days after heparin exposure. Management involves discontinuing heparin and using a different anticoagulant.

Heparin Resistance

The clinical situation in which unusually high doses of unfractionated heparin (exceeding 35,000 units per 24 hours) are required to achieve a therapeutic activated partial thromboplastin time (aPTT) or anti-factor Xa level, most commonly caused by antithrombin deficiency, acute-phase reactant elevations, or high factor VIII levels.

Hepatectomy

Surgery to remove part or, rarely, nearly all of the liver, usually to treat a tumor or severe localized liver disease. Adequate function depends on the size and health of the remaining liver. Bleeding, bile leakage, infection, and liver failure are major risks.

Alternate Names:
Liver Resection

Hepatic

Relating to the liver. The liver processes nutrients and medicines, makes bile and important blood proteins, stores energy, and helps remove harmful substances; hepatic disease can affect one or several of these functions.

Hepatic Adenoma

Alternate name; see *Hepatocellular Adenoma*.

Hepatic Artery

The main artery supplying oxygen-rich blood to the liver. It divides into branches that deliver blood to the right and left parts of the organ.

Hepatic Artery Aneurysm

An abnormal localized enlargement of the hepatic artery, generally defined as at least 1.5 times its expected diameter. It may be a true aneurysm involving the artery wall or a pseudoaneurysm, a contained leak after wall injury; rupture can cause severe bleeding into the abdomen or bile ducts.

Hepatic Amyloidosis

Buildup of abnormal protein deposits in the liver as part of amyloidosis, a disease that can affect several organs. It may enlarge the liver or change liver blood tests, but often causes no liver symptoms. Severe liver damage is uncommon.

Hepatic Artery Embolization

A catheter-based procedure that blocks selected branches of the hepatic artery, often to reduce blood supply to a liver tumor or control bleeding. When chemotherapy is also delivered, the procedure is called transarterial chemoembolization.

Alternate Names:
Selective Hepatic Artery Embolization

Hepatic Artery Occlusion

Partial or complete blockage of the hepatic artery, usually caused by a blood clot, embolus, inflammation, injury, or a procedure. It may reduce blood flow to the liver and cause liver infarction or ischemic hepatitis, especially when portal-vein blood flow is also reduced.

Hepatic Biopsy

Alternate name; see *Liver Biopsy*.

Hepatic Coma

Severe loss of consciousness caused by advanced liver failure and buildup of toxic substances in the blood. It is a medical emergency, often preceded by confusion, sleepiness, personality change, or hand-flapping movements.

Hepatic Cyst

A fluid-filled sac in the liver. Most simple liver cysts cause no symptoms and are found by chance on

imaging. Cysts that are large, infected, bleeding, parasitic, or complex may cause pain, pressure, fever, or other problems.

Alternate Names:
Liver Cyst; Simple Liver Cyst

Hepatic Dose Adjustment

Changing a medicine or its dose because liver disease may slow its breakdown or removal. The correct adjustment depends on the medicine, liver function, other illnesses, and monitoring of benefit and toxicity.

Hepatic Duct

The duct formed by the union of the right and left liver ducts, carrying bile from the liver toward the common bile duct and intestine.

Hepatic Encephalopathy

Changes in thinking, alertness, behavior, or movement caused when poor liver function or blood bypassing the liver allows substances to affect the brain. Severe cases can lead to coma. Infection, bleeding, constipation, or some medicines can trigger or worsen it.

Hepatic Fibrosis

Alternate name; see *Liver Fibrosis*.

Hepatic Fissure

A natural groove or cleft on the liver's surface. It separates parts of the liver and may contain or provide a route for blood vessels, bile ducts, or supporting ligaments.

Hepatic Flexure

The bend where the right-sided ascending colon turns into the transverse colon near the liver. It is a normal anatomical landmark that may be seen during imaging, surgery, or colonoscopy.

Hepatic Granulomas

Small collections of immune cells that form in the liver in response to infections, medicines, sarcoidosis, or other inflammatory conditions. They often cause no symptoms, but the underlying condition may cause abnormal liver tests, bile-duct blockage, fibrosis, or portal hypertension.

Hepatic Hemangioma

A benign liver lesion made of blood-filled vascular spaces. Most are small, cause no symptoms, and are found incidentally on imaging; larger lesions can cause abdominal discomfort or fullness, while rupture and bleeding are very rare.

Hepatic Hydatid Cyst

A slow-growing cyst in the liver caused by the larval stage of an Echinococcus tapeworm. It may cause no symptoms for years. If it leaks or bursts, it can trigger a severe allergic reaction or spread the infection.

Hepatic Hydrothorax

A buildup of fluid around a lung caused by severe liver disease and high pressure in the abdomen. It is usually on the right side and can cause breathlessness; treatment focuses on the liver disease and fluid control.

Hepatic Ischemia

Liver injury caused by inadequate hepatic blood flow or oxygen delivery, often during shock, severe hypoxemia, cardiac failure, or hepatic vascular occlusion. It can produce a rapid, marked rise in aminotransferases and may progress to acute liver failure.

Hepatic Lamina

A sheet of cells in a developing embryo that contributes to the liver and its bile ducts.

Hepatic Necrosis

Death of liver cells caused by severe ischemia, toxins, viral infection, autoimmune injury, or other insults; extensive necrosis can produce acute liver failure.

Hepatic Portal System

A network of veins that carries blood from the digestive organs, spleen, and pancreas to the liver before

the blood returns to the heart. The liver processes nutrients, medicines, and harmful substances in this blood.

Hepatic Sarcoidosis

Sarcoidosis affecting the liver, where small clumps of immune cells called granulomas form. It often causes no symptoms but may change liver blood tests, enlarge the liver, or cause itching or jaundice. Long-lasting disease can scar the liver or raise pressure in its blood vessels.

Hepatic Sinusoidal Obstruction Syndrome

A potentially severe liver injury caused by narrowing or blockage of hepatic sinusoids, classically after hematopoietic-cell transplantation or certain chemotherapy. Painful liver enlargement, weight gain, fluid retention, jaundice, and rising bilirubin may occur.

Alternate Names:
Veno-Occlusive Hepatic Disease; Hepatic Veno-Occlusive Disease; VOD/SOS

Hepatic Steatosis

Excess accumulation of fat in liver cells, commonly called fatty liver; causes include metabolic disease, alcohol, medicines, and other conditions, and inflammation or fibrosis may develop in some people.

Hepatic Surgery

Surgical treatment of liver disease, including partial liver resection, transplantation, and procedures for tumors or biliary disorders. The operation depends on the diagnosis, tumor extent, liver function, and overall health.

Hepatic Synthetic Dysfunction

Reduced ability of the liver to make important proteins, including albumin and blood-clotting factors. It can cause swelling, easy bleeding, or abnormal clotting tests, although other problems such as vitamin K deficiency or blood-thinning medicines can also alter these tests.

Hepatic Trauma

Liver injury caused by blunt or penetrating trauma, potentially producing internal bleeding and requiring urgent imaging, monitoring, or surgery based on severity.

Hepatic Tuberculosis

Infection of the liver by tuberculosis bacteria, usually as part of infection affecting several organs. It can cause fever, weight loss, poor appetite, abdominal pain, or an enlarged liver. Small lumps of immune cells called granulomas may form in the liver.

Hepatic Vein

One of the veins that carries blood away from the liver and into the large vein leading to the heart. The main hepatic veins drain different regions of the liver.

Hepatic Vein Obstruction

Obstruction of hepatic venous outflow, usually from thrombosis or compression, causing abdominal pain, hepatomegaly, ascites, and potentially liver failure.

Hepatic Vein Thrombosis

A blood clot that blocks one or more veins carrying blood out of the liver. Hepatic venous outflow obstruction from a clot is commonly called Budd-Chiari syndrome; it can cause liver enlargement, upper-abdominal pain, and fluid buildup in the abdomen.

Hepatic Veno-Occlusive Disease

Blockage of the microscopic veins within the liver, often occurring after conditioning chemotherapy for stem cell transplantation. See *Sinusoidal Obstruction Syndrome*.

Hepatitis

Hepatitis is inflammation of the liver caused by viruses, alcohol, medications, toxins, metabolic disease, or autoimmunity and may be acute or chronic.

Hepatitis A

A short-term liver infection caused by hepatitis A virus. It spreads when virus from infected stool is swallowed, often through close contact or contaminated food or water. It may cause fever, tiredness, nausea, abdominal discomfort, or jaundice. Most people recover completely; chronic infection is not expected. Vaccination helps prevent it.

Hepatitis A Virus

The virus that causes hepatitis A. It spreads when virus from infected stool is swallowed, commonly through contaminated food, water, or close contact. It causes a short-term liver infection that may produce fever, nausea, tiredness, dark urine, pale stools, or jaundice; vaccination helps prevent it.

Hepatitis B

A liver infection caused by the hepatitis B virus (HBV). It spreads when infected blood, semen, or certain other body fluids enter another person's body, including through sex, shared needles or equipment, or from an infected parent to a baby around the time of birth. Infection may be acute (short-term) or chronic (long-term). Many people have no symptoms. When symptoms occur, they may include tiredness, fever, loss of appetite, nausea, abdominal pain, joint pain, dark urine, pale stools, or yellow skin and eyes (jaundice). Chronic infection, especially when acquired in infancy or childhood, can cause liver damage, cirrhosis, liver failure, or liver cancer. Vaccination prevents hepatitis B.

Hepatitis B Surface Antigen Test

A serologic blood test detecting the surface antigen (HBsAg) of the hepatitis B virus, indicating active acute or chronic infection; see *Hepatitis B* and *Hepatitis B Virus*.

Hepatitis B Virus

The virus that causes hepatitis B. HBV spreads when infected blood, semen, or certain other body fluids enter another person's body, including through sex, shared needles or equipment, or around childbirth. It can cause acute (short-term) or chronic (long-term) liver infection. Chronic infection can cause liver damage, cirrhosis, liver failure, or liver cancer. Vaccination prevents hepatitis B.

Hepatitis B Window Period

The interval during acute resolving hepatitis B virus infection between the disappearance of detectable hepatitis B surface antigen (HBsAg) and the appearance of protective anti-HBs antibodies, during which IgM antibody to hepatitis B core antigen (anti-HBc IgM) serves as the sole serological marker of acute infection.

Hepatitis C

A liver infection caused by the hepatitis C virus (HCV). It spreads mainly when infected blood enters another person's body, especially through shared injection equipment; it can also spread through some other blood exposures and, less often, through sex or from an infected parent to a baby. Acute infection often causes no symptoms, and some people clear the virus without treatment. In many others it becomes chronic (long-term) and can cause liver damage, cirrhosis, liver failure, or liver cancer. Direct-acting antiviral medicines cure more than 95% of infections in most people; no vaccine is available.

Hepatitis C Antibody Test

A serologic blood test that screens for antibodies against the hepatitis C virus, indicating past or present infection; see *Hepatitis C* and *Hepatitis C Virus*.

Hepatitis C Virus

The virus that causes hepatitis C. HCV spreads mainly when infected blood enters another person's body, especially through shared needles or other injection equipment. It can also spread through some medical exposures, from an infected parent to a baby, or less often through sex. Many people have no symptoms. The infection may be acute (short-term) or become chronic (long-term), which can cause liver damage, cirrhosis, liver failure, or liver cancer. Modern antiviral medicines cure more than 95% of infections in most people, but no vaccine is available.

Hepatitis D

A liver infection caused by the hepatitis D virus (HDV). HDV can infect only people who also have hepatitis B because it needs hepatitis B virus (HBV) to reproduce. Infection with both viruses at the same time is called coinfection; getting HDV after already having HBV is called superinfection. Superinfection is more likely to cause long-term liver disease, cirrhosis, liver failure, or death.

Hepatitis D Virus

A virus that can multiply only when hepatitis B virus is also present. It spreads through infected blood or body fluids and can make hepatitis B more severe, increasing the risk of cirrhosis and liver cancer. Hepatitis B vaccination also prevents hepatitis D.

Hepatitis E

A liver infection caused by the hepatitis E virus (HEV). It usually spreads when people swallow water or food contaminated with stool, and it can also spread through undercooked meat from infected animals. It usually causes a short-term illness, often with tiredness, nausea, vomiting, abdominal pain, dark urine, pale stools, or jaundice. Severe illness is more likely during pregnancy and in some people with weakened immune systems. Rarely, infection becomes chronic in people with weakened immunity. No vaccine is available in the United States.

Hepatitis E Virus

The virus that causes hepatitis E. HEV usually spreads through water or food contaminated with stool and can also spread through undercooked meat from infected animals. It commonly causes short-term liver infection, but it may cause severe illness during pregnancy and can occasionally become chronic in people with weakened immune systems. No vaccine is available in the United States.

Hepatitis Serology

Blood testing for antibodies, antigens, and other markers of hepatitis viruses. The results may show a current or past infection, immunity from vaccination, or whether infection has become chronic. Different viruses require different tests. For example, hepatitis B testing commonly includes hepatitis B surface antigen and antibodies to hepatitis B surface and core antigens; hepatitis C testing usually starts with an antibody test and uses an HCV RNA test to show current infection. Results depend on the virus, timing, vaccination history, and other laboratory findings, so a single result may not give the full answer.

Hepatitis Virus

Any one of a heterogeneous group of unrelated, hepatotropic human viruses that share a primary tropism for hepatocytes, provoking necroinflammatory liver injury (viral hepatitis). Classified alphabetically into five primary viral agents (A through E), differing markedly in viral structure, genomic composition, mode of transmission, and propensity for chronicity: (1) Hepatitis A virus (HAV; single-stranded RNA picornavirus, transmitted via the fecal-oral route through contaminated food/water, causing acute, self-limiting hepatitis without a chronic carrier state); (2) Hepatitis B virus (HBV; partially double-stranded circular DNA hepadnavirus, transmitted via parenteral, sexual, or perinatal vertical routes, capable of establishing chronic infection, cirrhosis, and hepatocellular carcinoma, with outcome governed by host immune clearance and viral HBeAg/HBsAg status); (3) Hepatitis C virus (HCV; single-stranded RNA flavivirus, transmitted primarily through parenteral blood exposure [intravenous drug use, contaminated blood products prior to 1992], establishing chronic infection in $\approx$ 75–85% of exposed individuals, leading to progressive liver fibrosis, cirrhosis, and hepatoma, now curable with direct-acting antivirals [DAAs]); (4) Hepatitis D virus (HDV; defective single-stranded circular RNA delta-virus requiring the surface antigen [HBsAg] of HBV to assemble its envelope and propagate, occurring either as a coinfection with HBV or a superinfection in an established HBV carrier, conferring severe, rapidly progressive liver failure); and (5) Hepatitis E virus (HEV; single-stranded RNA hepevirus, transmitted via the fecal-oral route, causing self-limiting acute hepatitis with an extraordinarily high mortality rate [15–25%] due to fulminant hepatic necrosis

in pregnant females).

Alternate Names:
Hepatitis Viruses; Hepatotropic Viruses

Hepatitis Viruses

Plural form; see *Hepatitis Virus*.

Hepatitis Virus Panel

A group of blood tests, usually done on one blood sample, that looks for signs of hepatitis A, B, and C infection. The tests may detect viral antigens or antibodies and may show a current infection, a past infection, or immunity after vaccination. The usual panel does not automatically test for hepatitis D or E, which require separate tests when appropriate. A positive antibody result does not always mean that the virus is still present; additional tests may be needed to confirm current infection.

Hepatobiliary

Relating to the liver, gallbladder, and bile ducts. The hepatobiliary system makes bile in the liver, stores and concentrates it in the gallbladder, and carries it through the bile ducts to the small intestine, where it helps digest fats. It also includes the liver's roles in processing nutrients, medicines, and waste products.

Hepatobiliary Iminodiacetic Acid Scan

Nuclear imaging procedure evaluating the function and patency of the gallbladder and bile ducts. See *Biliary Scintigraphy*.

Hepatobiliary Scintigraphy

A nuclear-medicine scan, often called a HIDA scan, that uses a small injected radioactive tracer to follow bile movement through the liver, bile ducts, gallbladder, and small intestine. A special camera records the tracer over time. The scan can show blocked bile flow, whether the gallbladder fills and empties normally, bile leaks, and findings that support acute gallbladder inflammation or other biliary disorders.

Alternate Names:
Biliary Scintigraphy; Cholescintigraphy; HIDA Scan; Hepatobiliary Iminodiacetic Acid Scan

Hepatobiliary System

The liver, gallbladder, and bile ducts. The liver makes and secretes bile, the gallbladder stores and concentrates it, and the bile ducts carry it to the small intestine, where it helps digest fats and carry some waste products out of the liver. The liver also processes nutrients and many medicines and toxins.

Hepatoblastoma

A rare cancer that begins in the liver and is the most common type of liver cancer in children. It usually affects children younger than 3 years. A child may have no symptoms until the tumor grows larger; possible findings include a lump or swelling in the abdomen, abdominal pain, poor appetite, nausea, vomiting, or unexplained weight loss. Evaluation may include imaging and blood tests, especially the tumor marker alpha-fetoprotein (AFP); a tissue sample may be used when needed to confirm the diagnosis.

Hepatocellular Adenoma

A rare, usually noncancerous tumor made of mature liver cells. It occurs most often in women of reproductive age and is associated with estrogen exposure, although it can also occur with anabolic steroid use, certain inherited metabolic diseases, or without a known cause. It is often found by chance on imaging and may cause no symptoms. Larger tumors can bleed or rupture, and a small number can change into liver cancer, especially certain subtypes.

Alternate Names:
HCA

Hepatocellular Carcinoma

A cancer that begins in liver cells called hepatocytes. It is the most common primary liver cancer in adults. It often develops in a liver affected by long-term disease, especially cirrhosis, chronic hepatitis B or C, fatty liver inflammation, or long-term heavy alcohol use, but it can occur without a known risk factor. Early disease may cause no symptoms. Later findings may include a lump or pain in the upper-right abdomen, abdominal swelling, jaundice, tiredness, poor appetite, or unexplained weight loss. Diagnosis may use imaging, liver blood tests, and

the tumor marker alpha-fetoprotein (AFP); a tissue sample is sometimes needed.

Hepatocellular Jaundice

Jaundice caused by impaired liver cells. Injured hepatocytes cannot take up, change into a water-soluble form, or remove bilirubin normally, so bilirubin builds up in the blood and makes the skin and whites of the eyes yellow. Urine may become dark and stools may become pale; itching, tiredness, nausea, or abdominal discomfort may also occur. Causes include viral or autoimmune hepatitis, alcohol-related liver disease, medicines or toxins, cirrhosis, hemochromatosis, and Wilson disease.

Hepatocerebral Degeneration

Usually referring to acquired hepatocerebral degeneration, a rare long-term brain disorder linked to advanced liver disease or a portosystemic shunt, an abnormal connection that lets blood bypass the liver. Harmful substances that are normally cleared by the liver, including excess manganese and other neurotoxins, can affect brain areas involved in movement and thinking. Symptoms may include tremor, slowed movement or parkinsonism, poor coordination, unsteady walking, speech changes, abnormal movements, mood or personality changes, and problems with thinking or memory. It is different from the short-lived episodes of hepatic encephalopathy, although the conditions can overlap.

Hepatocyte

The main working cell of the liver. Hepatocytes process carbohydrates, fats, proteins, medicines, and other substances from the blood. They make bile, albumin, clotting factors, and other blood proteins; store energy as glycogen; change ammonia into urea; and help remove or break down harmful substances. Injury to hepatocytes can reduce these functions and raise liver enzymes in the blood.

Hepatoduodenal Ligament

The thickened free right margin of the lesser omentum extending between the liver and the first part of the duodenum, transmitting the portal triad (common bile duct anterolaterally, proper hepatic artery anteromedially, and portal vein posteriorly) and forming the anterior boundary of the epiploic foramen.

Hepatojugular Reflux

A bedside physical sign, also called abdominojugular reflux. Firm, steady pressure on the upper abdomen briefly increases the amount of blood returning to the heart. In a normal response, the jugular veins in the neck rise briefly and then fall while the pressure continues. A sustained rise in jugular venous pressure suggests elevated right-sided heart filling pressure or limited right-ventricle function, often in heart failure. It is a clinical finding, not a diagnosis by itself.

Hepatolenticular Degeneration

Another name for Wilson disease, a rare inherited disorder caused by changes in the *ATP7B* gene. The altered gene prevents the liver from removing excess copper into bile, so copper builds up to harmful levels in the liver, brain, eyes, kidneys, and other tissues. It may cause hepatitis, cirrhosis, or liver failure; tremor, stiffness, poor coordination, speech or mood changes; and green, gold, or brown Kayser–Fleischer rings around the cornea. The disorder is inherited in an autosomal recessive pattern.

Hepatologist

A physician who specializes in diseases of the liver and its connected bile ducts and gallbladder. Hepatologists commonly diagnose and manage hepatitis, fatty liver disease, cirrhosis, jaundice, liver failure, liver tumors, and complications of chronic liver disease. Some also care for related diseases of the pancreas and people being assessed for liver transplantation. Hepatology is usually a subspecialty of gastroenterology.

Hepatology

The branch of medicine concerned mainly with the liver and also with the gallbladder, bile ducts, and related pancreas disorders. It covers how these organs work, how their diseases are diagnosed and managed, and complications such as hepatitis, fatty liver disease, cirrhosis, jaundice, bile-flow disorders,

liver cancer, and liver failure. Hepatology is usually a subspecialty of gastroenterology.

Hepatoma

An older, nonspecific term for a liver tumor. In some contexts it is used to mean hepatocellular carcinoma, a cancer arising from liver cells, but the word alone does not show whether a tumor is benign or malignant. *Hepatocellular carcinoma* is the preferred term when a malignant liver-cell tumor is meant.

Hepatomegaly

An enlarged liver. A health professional may feel it during an examination or see it on an ultrasound or other scan. It is a sign, not a disease by itself. Causes include infection or inflammation, fatty liver disease, heart problems, blocked bile flow, or cancer. It may cause no symptoms or discomfort under the right ribs.

Hepatopulmonary Syndrome

A complication of liver disease or portal hypertension in which blood vessels inside the lungs become abnormally widened. Blood then passes through the lungs without receiving enough oxygen, causing low oxygen levels in the blood. Symptoms may include shortness of breath, bluish skin, or clubbing of the fingers. Breathing difficulty and low oxygen may become worse when sitting or standing and improve when lying down; this pattern is called platypnea and orthodeoxia. The condition is identified by liver disease or portal hypertension, impaired oxygenation, and evidence of widened vessels inside the lungs.

Hepatorenal Recess

The deep peritoneal space located posteroinferiorly between the visceral surface of the right hepatic lobe and the right kidney, representing the most gravity-dependent recess of the upper abdomen in the supine position where free intraperitoneal fluid or blood preferentially collects.

Alternate Names:
Morison Pouch

Hepatorenal Syndrome

Serious kidney dysfunction that occurs mainly in advanced cirrhosis, usually with portal hypertension and ascites. Widening of blood vessels in the abdominal circulation lowers the amount of blood effectively reaching the kidneys. The kidneys respond by narrowing their blood vessels and retaining salt and water, so filtration falls even though the kidneys may not initially have a primary structural disease. Hepatorenal syndrome may cause acute kidney injury (HRS-AKI), which develops rapidly, or more persistent kidney dysfunction. Diagnosis requires excluding other important causes of kidney injury, such as shock, dehydration, medicines, infection, or intrinsic kidney disease.

Hepatosplenomegaly

Enlargement of both the liver and spleen at the same time. It is a physical finding rather than a disease itself and may be found during an examination or on imaging. Causes include infections, chronic liver disease with portal hypertension, blood-cell destruction, blood cancers, inherited storage or metabolic disorders, and other infiltrative or inflammatory diseases. It may cause abdominal fullness or discomfort, or no symptoms; other findings depend on the underlying cause. Blood tests and imaging may help identify the cause.

Hepatotoxicity

Toxic injury to the liver caused by a medicine, herbal product, dietary supplement, poison, chemical, or other exposure. The injury may mainly damage liver cells (hepatocellular injury), slow or block bile flow (cholestatic injury), or show both patterns. It may cause no symptoms but can lead to tiredness, nausea, poor appetite, abdominal pain, itching, dark urine, or jaundice, with abnormal liver blood tests. Most cases improve after the cause is removed, but severe injury can cause acute liver failure.

Hepatovirus

A genus in the Picornaviridae family of small RNA viruses. Its best-known human member is hepatitis A virus (HAV), which causes hepatitis A and usually spreads by the fecal–oral route, when virus from

stool reaches the mouth through contaminated food, water, hands, or close contact. Other hepatoviruses infect different animal hosts and are not established causes of human disease.

Hepcidin

A peptide hormone made mainly by liver cells and the main regulator of iron balance. When iron stores are high or inflammation is present, hepcidin binds to ferroportin, the protein that exports iron from intestinal cells, macrophages, and liver cells. Ferroportin is then removed, reducing iron absorption from food and the release of recycled or stored iron into the blood. When iron is low or the bone marrow needs more iron to make red blood cells, hepcidin levels usually fall.

Heptachlor

A persistent organochlorine insecticide formerly used mainly on crops and for termite control. It breaks down slowly into heptachlor epoxide, which can remain in soil and the food chain for a long time. Exposure can occur through contaminated soil, food, water, air, or contact with old treated materials. Studies, especially in animals, associate exposure with effects on the liver, nervous system, reproductive system, and development; evidence of health effects in humans is limited. Most uses have been canceled or severely restricted in the United States.

HER2

Short for human epidermal growth factor receptor 2, a protein on the surface of cells that helps control normal cell growth. It is made from the *ERBB2* gene. Some cancer cells have too much HER2 protein or extra copies of the *ERBB2* gene; these cancers may grow more quickly and spread more easily. Testing HER2 protein levels or gene copies can help classify a cancer and identify whether HER2-targeted treatment may be useful.

HER2-Positive

A cancer whose cells have increased expression or amplification of human epidermal growth factor receptor 2 (HER2). Some HER2-targeted medicines may be used according to the cancer type and clinical context.

HER2-Positive Breast Cancer

Breast cancer cells with unusually high levels of the HER2 growth receptor or extra copies of its gene. This can make the cancer grow faster, but it also allows treatment with medicines that specifically block HER2.

Herbal Supplement

A concentrated plant-derived product marketed for health or symptom relief; composition and evidence vary, and potential risks include contamination, drug interactions, liver injury, and pregnancy effects.

Herbaspirillum

A genus of gram-negative bacteria found in soil and plants; human infection is rare but can occur opportunistically.

Herbicide

A chemical used to kill or control unwanted plants; exposure can irritate skin, eyes, lungs, or the gastrointestinal tract, with toxicity determined by the specific compound and dose.

Herd Immunity

Protection that occurs when enough people in a community are immune to an infection that it spreads less easily. The proportion needed varies widely by infection, and herd immunity does not protect everyone equally.

Hereditary

Transmitted through genetic material from a parent or arising from an inherited variant; a hereditary trait may be dominant, recessive, X-linked, mitochondrial, or multifactorial.

Hereditary Amyloidosis

A group of inherited disorders in which mutations cause misfolded proteins to form amyloid deposits in organs such as the nerves, heart, kidneys, or

gastrointestinal tract.

Hereditary and Acquired Ichthyosis Vulgaris

Ichthyosis vulgaris is a scaling disorder that may be inherited, commonly related to filaggrin deficiency, or acquired with systemic disease, medicines, or nutritional problems. It produces dry fish-like scale that is often worse on the limbs and improves with moisturizers and keratolytics.

Hereditary Angioedema

An inherited, usually autosomal dominant and bradykinin-mediated disorder causing repeated episodes of swelling in the skin, hands, feet, stomach or bowel wall, or throat. Types 1 and 2 commonly result from deficiency or dysfunction of C1 inhibitor, often due to variants in the *SERPING1* gene; other forms may have normal C1-inhibitor levels. Attacks may cause severe abdominal pain or swelling that narrows the upper airway and often occur without itchy hives.

Hereditary Cancer

Cancer occurring because a person inherited a disease-causing genetic variant that raises cancer risk. Genetic counseling and risk-based screening can inform prevention and early detection.

Hereditary Coproporphyria

An inherited disorder of a chemical pathway used to make heme, the oxygen-carrying part of hemoglobin. Attacks may cause severe abdominal pain, vomiting, nerve or mental symptoms, and sometimes blistering skin after sunlight exposure.

Hereditary Diffuse Gastric Cancer

An inherited condition, often caused by a harmful CDH1 gene change, that greatly increases the risk of a hard-to-detect stomach cancer and also raises the risk of lobular breast cancer. Risk management can include genetic counseling, specialist screening, and risk-reducing stomach surgery.

Alternate Names:
HDGC; Familial Gastric Cancer Syndrome

Hereditary Diseases

Alternate name; see *Inherited Disease*.

Hereditary Elliptocytosis

An inherited red-cell membrane disorder in which erythrocytes are elliptical on the blood smear; most people are asymptomatic, but hemolytic anemia can occur in severe forms.

Hereditary Fructose Intolerance

An inherited disorder in which the body cannot properly break down fructose, a sugar in fruit, honey, and table sugar. Eating it can cause vomiting, sweating, low blood glucose, abdominal pain, or liver injury.

Hereditary Hemochromatosis

An inherited disorder that makes the body absorb too much iron from food. Iron can build up in the liver, heart, pancreas, joints, and other organs and cause damage. The most common form is linked to changes in the HFE gene, but not everyone with these changes develops iron overload.

Hereditary Hemorrhagic Telangiectasia

An inherited disorder in which fragile, abnormal blood vessels form in the nose, skin, lungs, brain, or liver. Recurrent nosebleeds and anemia are common; bleeding or abnormal vessels in internal organs may be serious.

Alternate Names:
HHT; Osler-Weber-Rendu Syndrome

Hereditary Hyperbilirubinemia

An inherited disorder of bilirubin production, conjugation, or excretion that causes persistent or intermittent jaundice, such as Gilbert, Crigler–Najjar, Dubin–Johnson, or Rotor syndrome.

Hereditary Leiomyomatosis And Renal Cell Cancer

An inherited condition that can cause painful skin muscle tumors, early or multiple uterine fibroids, and an aggressive type of kidney cancer. It is usually related to an FH gene change; genetic counseling and regular specialist skin, uterine, and kidney as-

sessment are important.

Alternate Names:
HLRCC; Reed Syndrome

Hereditary Motor and Sensory Neuropathy

Alternate name; see *Charcot-Marie-Tooth Disease*.

Hereditary Multiple Exostoses

An inherited disorder in which many benign, cartilage-capped bone growths called osteochondromas form near the ends of growing bones. They usually develop during childhood or adolescence and stop forming when skeletal growth ends. They may cause pain, limited joint movement, unequal limb lengths, short stature, bone deformity, or pressure on nearby nerves and blood vessels. The condition is usually caused by a change in the *EXT1* or *EXT2* gene and follows an autosomal dominant inheritance pattern. Most growths remain benign, but a small number can change into a cancerous cartilage tumor. Also called hereditary multiple osteochondromas.

Alternate Names:
Hereditary Multiple Osteochondromas; Diaphyseal Aclasis

Hereditary Neuropathy with Liability to Pressure Palsies

A usually autosomal dominant peripheral neuropathy caused by pathogenic variants in *PMP22*. About 80% of affected people have a recurrent 1.5-megabase deletion on chromosome 17p11.2; others have sequence variants. It causes recurrent focal numbness or weakness after pressure on a nerve. Nerve biopsy may show tomacula but is not required for diagnosis.

Alternate Names:
HNPP; Pressure Palsy Neuropathy

Hereditary Nonpolyposis Colorectal Cancer (Lynch Syndrome)

An inherited cancer-predisposition syndrome usually caused by impaired DNA mismatch repair. It increases the risk of colorectal, endometrial, ovarian, gastric, urinary-tract, and other cancers; genetic counseling and risk-based surveillance are important.

Hereditary Nonspherocytic Hemolytic Anemia (HNHA)

An inherited hemolytic anemia in which red blood cells are destroyed without the spherical shape typical of hereditary spherocytosis. Causes include red-cell enzyme defects, membrane disorders, and hemoglobin abnormalities; severity varies by the underlying genetic defect.

Hereditary Ovalocytosis

An inherited red-cell membrane disorder in which many erythrocytes are oval or elliptical; it is often mild but can cause hemolytic anemia in some individuals.

Hereditary Paraganglioma-Pheochromocytoma Syndrome

An inherited condition that increases the risk of tumors arising from nerve-related cells near blood vessels or in the adrenal glands. Some tumors release hormones that cause high blood pressure, headache, sweating, or palpitations; genetic counseling and lifelong imaging and hormone monitoring may be needed.

Alternate Names:
Hereditary Paraganglioma; SDH-Associated Pheochromocytoma

Hereditary Periodic Fever Syndromes

A group of inherited autoinflammatory disorders causing recurrent episodes of fever and inflammation without a usual infection. Examples include familial Mediterranean fever, tumor-necrosis-factor-receptor-associated periodic syndrome, mevalonate kinase deficiency, and cryopyrin-associated periodic syndromes.

Hereditary Persistence of Fetal Hemoglobin

An inherited condition in which production of fetal hemoglobin continues into adulthood. It is usually harmless and may lessen the severity of some beta-globin disorders such as sickle-cell disease.

Hereditary Spastic Paraplegia

A group of inherited neurologic disorders causing progressive stiffness and weakness of the legs because of corticospinal-tract degeneration. Some forms also affect speech, vision, sensation, coordination, or other organs.

Hereditary Spherocytic Anemia

An inherited red-cell membrane disorder, usually hereditary spherocytosis, in which fragile spherical erythrocytes are destroyed prematurely, causing hemolytic anemia, jaundice, and splenomegaly.

Hereditary Spherocytosis

Usually an autosomal dominant inherited blood disorder in which red blood cells are round rather than disc-shaped and are broken down too quickly, mainly in the spleen; less often it is autosomal recessive. It may cause anemia, jaundice, gallstones, and an enlarged spleen.

Hereditary Urea Cycle Abnormality

An inherited problem removing ammonia, a waste product, from the blood. Ammonia can build up and cause vomiting, sleepiness, confusion, seizures, coma, and brain injury, especially during illness or fasting.

Heredity

The passing of genetic characteristics from parents to children through genes and chromosomes. Heredity influences appearance, body function, disease risk, medicine response, and susceptibility to some inherited conditions.

Heredo-Ataxia

An inherited disorder causing gradually worsening problems with balance, walking, coordination, or speech. Different gene changes cause different forms, so diagnosis usually includes neurologic assessment and genetic testing.

Heredopolyneuritis

An inherited disorder affecting many peripheral nerves. It may cause gradually worsening weakness, muscle wasting, numbness, reduced reflexes, or difficulty walking, often beginning in the feet and lower legs.

Hering-Breuer Reflex

An automatic lung response that slows or stops breathing in when the lungs are stretched too much. It helps protect the lungs from overinflation, especially during large breaths.

Hermanski-Pudlak Syndrome

Alternate spelling; see *Hermansky-Pudlak Syndrome*.

Hermansky-Pudlak Syndrome

A group of inherited disorders that can cause reduced skin, hair, and eye pigment; easy bleeding because platelets do not work normally; and, in some types, lung scarring, bowel inflammation, or low white-cell counts. Genetic and specialized blood testing help confirm the diagnosis.

Hernia

A bulge formed when an organ or tissue pushes through a weak area in the muscle or connective tissue that normally holds it in place. Hernias commonly occur in the abdominal wall and may become trapped or lose their blood supply, causing severe pain.

Hernia Mesh

A sheet of synthetic or biologic material used to strengthen the body wall during some hernia repairs. It may reduce recurrence, but complications can include infection, persistent pain, movement of the mesh, or another hernia.

Hernia Repair

Surgery that returns the displaced tissue to its proper place and closes or strengthens the weak area in the body wall. Repair may use stitches, mesh, or a minimally invasive approach; the choice depends on the hernia and the person's health.

Alternate Names:
Herniorrhaphy; Hernioplasty

Herniated Disc

A spinal disk that bulges or tears so that its inner material irritates or presses on a nearby nerve. It can cause back or neck pain, pain spreading into an arm or leg, numbness, tingling, or weakness.

Herniated Disk

Displacement of disk material through a tear in the outer ring of an intervertebral disc, most commonly in the lumbar spine (often at L4-L5 and L5-S1) or the cervical spine, which may press on a nearby nerve and cause pain, numbness, tingling, or weakness.

Herniated Nucleus Pulposus

Displacement of the inner gelatinous core of an intervertebral disk through its outer ring, potentially compressing spinal nerves. See *Prolapsed Disk*.

Herniation

Protrusion of an organ, tissue, or structure through an abnormal opening or weak area, as in a herniated disk or abdominal-wall hernia.

Herniorrhaphy

Alternate term; see *Hernia Repair*.

Heroin

A highly addictive opioid that is converted to morphine in the body. Repeated use can cause opioid dependence, tolerance, and withdrawal; excessive exposure can cause opioid overdose with respiratory depression, coma, and death.

Heroin Toxicity

Opioid poisoning characterized by marked drowsiness or coma, pinpoint pupils, slow or absent breathing, hypoxia, and sometimes noncardiogenic pulmonary edema. Naloxone is used to reverse opioid effects, but recurrent respiratory depression can occur because the opioid effect may outlast a naloxone dose.

Herpangina

A common childhood viral illness causing fever, sore throat, and small blisters or ulcers at the back of the mouth. It spreads through respiratory or stool-contaminated secretions and usually improves on its own.

Herpes

Infection caused by a herpesvirus. The term commonly refers to herpes simplex infection, which causes oral or genital lesions, but other herpesviruses cause distinct diseases.

Herpes Encephalitis

Alternate name; see *Herpes Simplex Encephalitis*.

Herpes Gestationis

An older name for pemphigoid gestationis, an uncommon autoimmune blistering rash of pregnancy. It usually causes intensely itchy hives followed by blisters around the abdomen and may recur in later pregnancies.

Herpes Labialis

Alternate name; see *Cold Sore*.

Herpes Simplex

Infection with herpes simplex virus type 1 (HSV-1) or type 2 (HSV-2). HSV-1 most often causes oral herpes or cold sores, while HSV-2 most often causes genital herpes, although either type can infect either site. Many infections cause no symptoms; when symptoms occur, painful blisters or ulcers may appear and recur. The virus remains inactive in nerve cells and can reactivate later. It spreads mainly through skin-to-skin or oral contact, including when no sore is visible, and rarely passes from a parent to a baby during delivery. Rare complications include eye infection, brain infection, or severe infection in a newborn or a person with weakened immunity.

Herpes Simplex Encephalitis

A life-threatening brain infection caused most often by herpes simplex virus type 1. It can cause fever, headache, confusion, seizures, behavior changes, or loss of consciousness; treatment uses antiviral medicine.

Herpes Simplex Infection

A viral infection caused by herpes simplex virus type 1 (HSV-1) or type 2 (HSV-2). HSV-1 usually causes oral herpes, while HSV-2 usually causes genital herpes, but either type can affect the mouth or genitals. Many infections are symptom-free; painful blisters or ulcers may develop and return because the virus remains inactive in nerve cells and can reactivate. HSV spreads mainly through oral or skin-to-skin contact, including contact with skin that looks normal. Rare complications include infection of the eye or brain and severe infection in newborns or people with weakened immunity.

Alternate Names:
HSV Infection

Herpes Simplex Keratitis

Infection or inflammation of the cornea caused by herpes simplex virus, usually producing eye pain, redness, tearing, light sensitivity, or blurred vision. Recurrent disease can scar the cornea and impair sight.

Herpes Simplex Skin Infection

A herpes simplex infection of the skin or moist body linings that causes grouped blisters or shallow sores, often around the mouth or genitals. Widespread infection in someone with eczema can be severe.

Herpes Simplex Type 1

HSV-1, a DNA virus commonly causing oral or perioral blisters; it can also cause genital infection and remains latent with possible recurrence.

Herpes Simplex Virus

A double-stranded DNA virus belonging to the Herpesviridae family that causes oral and genital herpes. HSV has two serotypes: HSV-1, which typically causes oral herpes, and HSV-2, which typically causes genital herpes. The virus establishes latent infections in sensory ganglia and can reactivate periodically.

Herpes Simplex Virus Infection

Alternate name; see *Herpes Simplex Infection*.

Herpes Vegetans

A rare long-lasting herpes simplex infection that causes thick, wart-like or ulcerated growths, usually on genital or anal skin. It occurs mainly in people with weakened immunity and may be difficult to treat.

Herpes Viral Culture Of Lesion

A laboratory culture of fluid or tissue from a lesion to detect herpes simplex virus or varicella-zoster virus; molecular testing is generally more sensitive and is often preferred.

Herpesviridae

A family of DNA viruses that can remain inactive in the body after infection and reactivate later. Human members include herpes simplex viruses, varicella-zoster virus, cytomegalovirus, Epstein–Barr virus, and human herpesviruses 6, 7, and 8. They can cause skin or mouth lesions, chickenpox, shingles, glandular fever, congenital infection, or disease in people with weakened immunity.

Herpesviridae Infection

An infection caused by a herpesvirus; symptoms range from localized lesions to serious disease in newborns or people with weakened immunity.

Herpes Zoster

Reactivation of latent varicella-zoster virus in a sensory ganglion, causing a painful, blistering rash usually confined to one side of the body in one or two adjacent dermatomes. Pain, itching, or tingling may precede the rash; persistent nerve pain afterward is called postherpetic neuralgia.

Alternate Names:
Zoster; Acute Posterior Ganglionitis

Herpes Zoster Infection

Alternate name; see *Herpes Zoster*.

Herpes Zoster Ophthalmicus

Shingles affecting the forehead, eyelid, or nose near the eye. It can involve the cornea or other eye structures and cause inflammation, scarring, or vision

loss.

Herpetic Gingivostomatitis

The classic and most common manifestation of primary herpes simplex virus type 1 (HSV-1) infection in infants and young children aged 6 months to 5 years. It is characterized by high fever, irritability, painful submandibular and cervical lymphadenopathy, and widespread friable, inflamed gums with clusters of painful vesicles that rupture into shallow, coalescing ulcers across the buccal mucosa, tongue, and lips, often severely impairing oral intake.

Alternate Names:
Primary Herpetic Gingivostomatitis; Oral HSV-1 Stomatitis

Herpetic Glossitis

Painful inflammation and sores of the tongue caused by herpes simplex virus. It may occur with blisters or ulcers elsewhere in the mouth and can be more severe or persistent in people with weakened immunity.

Herpetic Keratitis

A herpes simplex infection of the clear front surface of the eye. It may cause one-sided eye pain, redness, light sensitivity, tearing, or blurred vision. A branching ulcer seen with a special dye supports the diagnosis; repeated or deep infection can scar the cornea and damage vision.

Alternate Names:
Herpes Simplex Corneal Infection

Herpetic Stomatitis

Inflammation and ulceration of the mouth caused by herpes simplex virus, most commonly primary HSV-1 infection, with painful vesicles or ulcers and sometimes fever or gingivitis.

Herpetic Whitlow

A painful herpes simplex infection of a finger, causing redness, swelling, and grouped blisters. Incision can spread the virus into surrounding tissues.

Herpetiform

Resembling herpes lesions, typically describing grouped vesicles or an arrangement of lesions; the term does not by itself establish herpesvirus infection.

Herring Bodies

Microscopic dilations and neurosecretory terminal swellings of unmyelinated axons within the posterior lobe of the pituitary gland (neurohypophysis) that store oxytocin and antidiuretic hormone (vasopressin) bound to neurophysin carrier proteins.

Alternate Names:
Neurosecretory Bodies; Neurohypophyseal Axonal Swellings

Hertel Exophthalmometer

An optical instrument used to measure the anterior-posterior distance between the lateral orbital rim and the corneal apex to quantify proptosis or exophthalmos.

Hertz

A unit used to measure frequency, equal to one complete cycle or repetition per second. It is used for sound, electrical signals, brain waves, heart signals, and other repeating events.

Herxheimer Reaction

A temporary worsening of fever, chills, headache, muscle aches, or other symptoms soon after antibiotics begin for some infections, especially syphilis. It usually settles within a day and is caused by the body's response to dying bacteria.

Hesitancy

Alternate name; see *Urinary Hesitation*.

Hesitation Wounds

Multiple superficial, tentative parallel incised cuts surrounding a deeper primary fatal cut wound, classically observed in suicides involving sharp instruments (wrists, neck).

Hesselbach Triangle

A naturally weaker area of the lower front abdominal wall. Direct groin hernias can push through this area, which lies between a central abdominal muscle, blood vessels, and the groin ligament.

Heterochromatin

DNA that is tightly packed inside a cell's nucleus and is usually less active in making proteins. It helps organize chromosomes and control which genes are available for use.

Heterochromia

A difference in iris color between the eyes or within one iris, which may be congenital or acquired from disease, trauma, medication, or inflammation.

Heterocyclic Amine

A nitrogen-containing chemical compound formed mainly when meat or fish is cooked at high temperatures; several heterocyclic amines are mutagens and potential dietary carcinogens.

Heterogeneity

Variation in composition, structure, or behavior within a tissue, sample, lesion, or population; in tumors, heterogeneity can affect biopsy interpretation and treatment response.

Heterogeneous Echotexture

An ultrasound appearance in which different parts of a tissue look unlike one another. It is a finding, not a diagnosis, and may result from inflammation, scarring, fat, bleeding, a tumor, or normal variation.

Heterograft

Alternate name; see *Xenograft*.

Alternate Names:
Heterologous Graft; Xenotransplant; Heteroplastic Graft

Heterologous

Coming from a different species, source, or type. In medicine, the term may describe a graft, tissue, antibody, hormone, or genetic material obtained from a different organism or cell type.

Heterophil Antibody

A heterophil antibody reacts with antigens from unrelated animal species; testing for these antibodies can help diagnose some infections, including infectious mononucleosis.

Heterophile Antibody

A heterophile antibody is an antibody that reacts with antigens from unrelated species and can interfere with some laboratory immunoassays.

Heterophyes Heterophyes

A small intestinal fluke acquired by eating raw or undercooked fish; it can cause abdominal symptoms and occasionally tissue complications.

Heteroplasia

Development of tissue in an abnormal location or of a type not normally found there. The effects depend on the tissue involved and may range from no symptoms to obstruction, pain, or impaired function.

Heteroplasmy

The presence of more than one type of mitochondrial DNA in a cell or person, usually a mixture of normal and changed copies. The proportion of changed copies can influence whether disease develops and how severe it is.

Heterosexual

Describing a person who experiences sexual or romantic attraction mainly toward people of a different sex or gender. Sexual orientation is distinct from gender identity and is not a disease or disorder.

Heterotaxy Syndrome

A birth condition in which organs in the chest and abdomen are arranged differently from usual. Heart defects, abnormal spleen function, and problems with the intestines or other organs may occur.

Heterotopic

Located in an abnormal or unusual place; a het-

erotopic pregnancy is simultaneous implantation outside the uterus and, usually, inside the uterus.

Heterotopic Ossification

Formation of bone in soft tissue where bone does not normally grow, often after injury, surgery, or damage to the nervous system. It may cause pain or limit movement near the affected joint.

Heterotopic Breast Tissue Of The Vulva

Breast-like glandular tissue located in the vulva outside the normal breast. It may respond to hormonal changes and develop benign lesions, inflammation, or rarely malignancy; histopathologic examination may be needed for diagnosis.

Heterotopic Pregnancy

A pregnancy in which one embryo implants inside the uterus while another implants outside it, usually in a fallopian tube. It is uncommon but more likely after fertility treatment; an intrauterine pregnancy does not rule out an ectopic pregnancy.

Heterotransplant

A transplant of cells, tissue, or an organ between members of different species. Because the immune difference is substantial, rejection is a major concern and long-term use requires specialized treatment.

Heterozygote

A heterozygote has two different alleles at a genetic locus, one inherited from each parent; phenotype depends on dominance, the variant's effect, and the surrounding genetic and environmental context.

Heterozygous

Having two different alleles of a particular gene at a genetic locus. The observable effect depends on the gene and the relationship between the alleles.

Hexachlorobenzene

A persistent organochlorine compound that can cause porphyria, liver injury, neurologic effects, and other toxicity after significant exposure.

Hexachlorophane

An antibacterial chemical formerly used in some skin cleansers. Repeated or extensive exposure can damage the nervous system, especially in infants, so its medical use is highly restricted.

Hexachlorophene

A topical antiseptic phenolic compound whose excessive or prolonged use can cause neurotoxicity and skin injury; many uses are restricted.

Hexadactyly

The presence of six fingers or six toes on a hand or foot, also called polydactyly.

Hexadecadienoic Acid

A long-chain fatty acid containing 16 carbon atoms and two double bonds, occurring in lipid metabolism and studied as a biochemical or signaling molecule.

Hexadecatetraenoic Acid

A 16-carbon polyunsaturated fatty acid containing four double bonds, present in lipid pathways and investigated for effects on membranes and signaling.

Hexamethonium

An older medicine that blocks nerve signals at autonomic ganglia and can lower blood pressure. It is rarely used because it also causes blurred vision, dry mouth, constipation, urinary retention, and other widespread effects.

Hexamine

A chemical used in industry and, in some settings, as methenamine, a urinary antiseptic. It releases formaldehyde in acidic urine and is unsuitable for some kidney or liver conditions.

Hexane

A solvent found in some industrial products and glue. Long-term inhalation can damage peripheral nerves, causing numbness, weakness, and difficulty walking; swallowing or heavy exposure can also injure the lungs and brain.

Hexanoic Acid

A six-carbon saturated fatty acid, also called caproic acid, found in some fats and odors and used in chemical synthesis; concentrated exposure irritates skin and mucosa.

Hexokinase

An enzyme that begins the use of glucose by adding a phosphate group to it inside cells. This traps glucose in the cell and allows it to enter energy-producing or storage pathways. Most tissues use hexokinase; the liver also uses a related enzyme called glucokinase.

Hexose

A six-carbon monosaccharide, such as glucose, fructose, or galactose, that serves as an energy substrate or metabolic intermediate.

Hexose Monophosphate Shunt

An alternative biochemical pathway used by cells alongside glycolysis to break down glucose. It serves two vital functions: producing NADPH (a chemical compound that protects red blood cells from oxidative damage and aids in building fats) and generating ribose-5-phosphate (a sugar needed to make DNA and RNA).

Alternate Names:
Pentose Phosphate Pathway; PPP

Hexylresorcinol

A phenolic antiseptic and local anesthetic used in some throat lozenges and topical products; excessive use or allergy can cause adverse effects.

Heyde Syndrome

A condition linking narrowing of the aortic valve, an acquired problem with von Willebrand factor (a blood-clotting protein), and bleeding from fragile blood vessels in the digestive tract. The clotting problem can make this bleeding more likely.

Alternate Names:
Heyde's Syndrome; Aortic Stenosis and Angiodysplasia Triad

Heyde Syndrome Triad

Alternate name; see *Heyde Syndrome*.

HHT

Abbreviation; see *Hereditary Hemorrhagic Telangiectasia*.

Hiatal

Relating to a hiatus, an opening or passage in an anatomical structure; a hiatal hernia occurs when abdominal tissue passes through the diaphragm's esophageal hiatus.

Hiatal Hernia

Protrusion of part of the stomach through the esophageal opening in the diaphragm into the chest. It may be sliding or paraesophageal and can be associated with reflux or other symptoms.

Hiatus

A natural opening or passage in a body structure. For example, the diaphragm has an opening through which the esophagus passes; tissue can sometimes bulge through such an opening.

Hiatus Hernia

Another term for hiatal hernia: protrusion of part of the stomach through the esophageal hiatus of the diaphragm into the chest. It may be sliding or paraesophageal.

Hib

Haemophilus influenzae type b, a bacterium that can cause serious infections such as meningitis, pneumonia, bloodstream infection, and swelling of the throat. Routine vaccination greatly reduces these infections in children.

Hibernoma

A rare benign tumor of brown fat, usually a slow-growing painless soft-tissue mass that may feel warm because of its high metabolic and vascular activity.

Hiccough

Alternate spelling; see *Hiccups*.

Hiccup

Singular form; see *Hiccups*.

Hiccups

Sudden tightening of the diaphragm, the muscle under the lungs. Each tightening briefly closes the voice opening and makes the familiar hiccup sound. Hiccups usually stop on their own; those that last a long time may be linked to illness or medicines.

HIDA Scan

Specialized nuclear medicine scan that evaluates gallbladder emptying and detects biliary obstructions. See *Biliary Scintigraphy*.

Hidradenitis

A term for inflammation involving sweat glands; it appears in the names of several skin disorders, including hidradenitis suppurativa and neutrophilic eccrine hidradenitis.

Hidradenitis Suppurativa

A chronic inflammatory disease of hair follicles, usually affecting the armpits, groin, buttocks, and skin beneath the breasts. Recurrent painful nodules and abscesses may progress to draining tunnels and scars. It is noncontagious; despite its name, it is primarily a follicular disorder, not a sweat-gland infection.

Hidradenocarcinoma

A rare malignant sweat-gland tumor that may arise de novo or from a hidradenoma, presenting as a firm nodule and capable of local recurrence and metastasis.

Hidradenoma

A usually harmless tumor arising from sweat-gland cells, typically appearing as a single slow-growing skin lump. It may be flesh-colored, red, cyst-like, or ulcerated, so examination or removal may be needed to distinguish it from other tumors.

Hidradenoma Papilliferum

A benign papillary tumor of apocrine or mammary-like glands, usually presenting as a solitary flesh-colored or red nodule in the vulvar or anogenital region.

Hidrocystoma

A benign cyst of a sweat gland near the eyelid or skin, appearing as a small translucent or bluish papule that may enlarge with heat or sweating.

Hidrosis

Sweating or perspiration; abnormal hidrosis may mean excessive sweating, reduced sweating, or sweating in an unusual pattern.

High Altitude

Elevation high enough that reduced atmospheric pressure lowers available oxygen, commonly beginning around 2,500 meters and increasing the risk of altitude illness.

High Altitude Cerebral Edema

Alternate spelling; see *High-Altitude Cerebral Edema*.

High-Altitude Cerebral Edema

A severe form of altitude illness in which the brain is affected, usually after rapid ascent to high elevation. It can cause confusion, unusual sleepiness, poor coordination, or loss of consciousness and may progress quickly to coma. It is a life-threatening emergency.

Alternate Names:
HACE; Mal de Montagne Cerebral

High Altitude Illness

Health problems caused by traveling to high elevation before the body adapts to lower oxygen levels. Symptoms range from headache and nausea to dangerous brain or lung swelling requiring immediate descent.

High-Altitude Pulmonary Edema

A life-threatening buildup of fluid in the lungs after rapid travel to high altitude. It can cause breathlessness, cough, weakness, and sometimes pink or frothy sputum, and may progress to respiratory failure.

Alternate Names:
HAPE; High Altitude Pulmonary Edema

High Arch

An unusually high curve along the inside of the foot. It may run in families or result from a nerve or muscle disorder and can cause pain, calluses, ankle instability, or difficulty finding comfortable shoes.

Alternate Names:
Pes Cavus; High-Arched Foot; Cavus Foot

High-Arched Foot

Abnormally elevated longitudinal foot arch that places excessive weight on the ball and heel. See *Pes Cavus*.

High Blood Cholesterol Levels

Too much cholesterol in the blood, especially LDL cholesterol, which can build up in artery walls and increase the risk of heart attack and stroke. It usually causes no symptoms and is found with a blood test.

High Blood Potassium

Elevated potassium concentration in the bloodstream; see *Hyperkalemia*.

High Blood Pressure

Lay term; see *Hypertension*.

High Blood Pressure And Eye Disease

Long-standing high blood pressure can damage retinal blood vessels and the optic nerve, causing hypertensive retinopathy or vision loss.

High Blood Pressure (Hypertension)

Alternate name; see *Hypertension*.

High Blood Protein

An abnormally increased concentration of proteins in the blood, which may result from dehydration, inflammation, infection, or a plasma-cell disorder.

High Blood Sugar

Hyperglycemia, an abnormally elevated concentration of glucose in the blood; persistent hyperglycemia is commonly associated with diabetes but can have other causes.

High Cholesterol

An abnormally high level of cholesterol in the blood, especially low-density lipoprotein cholesterol. It often causes no symptoms but can contribute to plaque buildup in the arteries and cardiovascular disease.

High-Density Lipoprotein

A particle that carries cholesterol through the blood. Often called "HDL cholesterol," its level is one part of heart-risk assessment and does not by itself determine whether someone will have heart disease.

High-Density Lipoprotein Cholesterol

Cholesterol carried in high-density lipoprotein particles, often called HDL cholesterol. Its level is measured as part of a lipid panel and is only one part of cardiovascular risk assessment.

Alternate Names:
HDL-C

High-Dependency Unit

A hospital area for people who need closer observation and more treatment than a general ward provides but do not need the full support of an intensive-care unit. Staff monitor vital signs frequently and provide specialized care.

High-Fiber Foods

Foods rich in soluble or insoluble dietary fiber, including legumes, whole grains, vegetables, fruit, nuts, and seeds, support bowel regularity and may improve cholesterol and glucose control when increased with adequate fluid.

High-Flow Nasal Cannula

A device that delivers warmed, moist oxygen through small tubes in the nose at a high flow rate. It can improve breathing and oxygen levels in people with serious lung illness and is also used after removal of a breathing tube.

High-Fructose Corn Syrup

A liquid sweetener containing varying proportions of glucose and fructose, used in many processed foods and drinks. Like other added sugars, high intake increases total energy exposure and is associated with dental caries and cardiometabolic risk; it is not inherently unique in effect compared with equivalent added sugars.

High-Grade Endometrial Stromal Sarcoma

An aggressive cancer arising from supporting tissue in the uterus. It can grow into the uterine wall, blood vessels, or distant organs and requires specialist treatment based on its extent and cell features.

High-Grade Serous Ovarian Carcinoma

An aggressive cancer involving the ovary, fallopian tube, or nearby lining of the abdomen. It often spreads before causing clear symptoms and may cause bloating, abdominal pain, or changes in bowel or bladder habits.

High-Grade Surface Osteosarcoma

An aggressive bone cancer that starts on the outer surface of a bone. It may cause pain or swelling and can spread to the lungs or other sites, so treatment usually requires specialist cancer care.

High HDL Cholesterol (Hyperalphalipoproteinemia)

An unusually high concentration of high-density lipoprotein cholesterol, caused by genetic traits, medicines, or other conditions. Its effect on cardiovascular risk depends on the underlying cause and the person's complete lipid profile.

High Hemoglobin Count

A hemoglobin level above the expected range, which may reflect dehydration, chronic low oxygen, smoking, medication effects, or a blood disorder.

High-Intensity Focused Ultrasound

A treatment that concentrates sound-wave energy to heat and destroy a selected area of tissue while limiting damage nearby. Uses include some tumors and other conditions, depending on the device and treatment site.

High-Level Disinfection

A cleaning process that kills nearly all microorganisms but may not destroy large numbers of bacterial spores. It is used for some reusable medical equipment that touches moist body surfaces and cannot be heat-sterilized.

Highly Pathogenic Avian Influenza

Highly pathogenic influenza A infection in birds that can cause severe disease and mortality in poultry; selected strains can rarely infect humans after animal exposure.

Highly Selective Vagotomy

A type of vagotomy that cuts the vagus-nerve branches that stimulate acid production in the upper stomach while preserving the branches that help the lower stomach empty.

Alternate Names:
Parietal Cell Vagotomy; Proximal Gastric Vagotomy

High Output Failure

Heart failure in which cardiac output may be high but is still insufficient for the body's unusually high metabolic or circulatory demand. Causes include severe anemia, thyrotoxicosis, beriberi, and large arteriovenous fistulas.

High-Output Heart Failure

Heart failure in which cardiac output is higher than usual but does not meet the body's increased needs, often because blood vessels are widely dilated or metabolic demand is high. Causes include severe anemia, thyrotoxicosis, beriberi, and large arteriovenous fistulas.

High-Pitched Cry

An unusually shrill infant cry that can occur with pain, neurologic dysfunction, drug withdrawal, or serious illness and warrants assessment when persistent or accompanied by abnormal behavior or feeding.

High Potassium

Alternate name; see *Hyperkalemia*.

High Potassium Level

Hyperkalemia is an elevated blood potassium concentration that can cause dangerous cardiac conduction abnormalities; confirmation, medication review, kidney assessment, ECG, and urgent treatment depend on level and symptoms.

High Protein Diet

An eating pattern providing more protein than a person's usual or estimated requirement; suitability depends on nutritional needs, kidney and liver function, and the overall diet.

High Red Blood Cell Count

An increased number or concentration of red blood cells in the blood, which may thicken the blood and result from dehydration, low oxygen, smoking, medications, or a bone marrow disorder.

Alternate Names:
Erythrocytosis; Polycythemia

High-Resolution Computed Tomography

A CT scan that uses very thin images and special settings to show fine detail, especially in the lungs. It can help detect scarring, inflammation, widened airways, and small-airway disease, but it uses X-rays.

Alternate Names:
HRCT; High-Resolution Chest CT

High-Risk Pregnancy

A pregnancy complicated by maternal medical conditions, previous obstetric complications, or fetal conditions that increase the likelihood of adverse perinatal or maternal outcomes; see *High-Risk Pregnancy Factors*.

High-Risk Pregnancy Factors

Preexisting maternal medical conditions, obstetric complications, or fetal conditions (such as advanced maternal age, chronic hypertension, gestational diabetes, preeclampsia, or fetal growth restriction) that increase morbidity or mortality for mother or child.

Alternate Names:
Maternal-Fetal Health Risks; High-Risk Gestation; Pregnancy Complication Risk Factors

High-Sensitivity Cardiac Troponin

A blood test that detects very small amounts of proteins released when heart muscle is injured. A raised result can occur with a heart attack or many other illnesses, so clinicians interpret repeated results with symptoms, ECG findings, and other tests.

Alternate Names:
hs-cTn; High-Sensitivity Troponin Assay

High Triglycerides

Alternate name; see *Hypertriglyceridemia*.

High Uric Acid Level

An increased concentration of uric acid in the blood, which may contribute to gout or kidney stones and can result from reduced kidney clearance, diet, medicines, or metabolic disease.

High White Blood Cell Count

An increased number of white blood cells, often associated with infection, inflammation, stress, medicines, or a blood or bone marrow disorder.

Hilar

Relating to a hilum, the gateway where vessels, nerves, ducts, or bronchi enter or leave an organ, especially the lung or kidney.

Hilar Cholangiocarcinoma

A cancer at the place where the liver's main bile ducts join. It can block bile flow and cause yellow skin or eyes, itching, dark urine, pale stools, weight loss, or repeated bile-duct infections.

Hilar Lymphadenopathy

Pathological enlargement of the bronchopulmonary (hilar) lymph nodes located at the hilum of the lungs, identifiable on chest radiography and CT, classically presenting as bilateral symmetrical hilar

adenopathy in sarcoidosis or unilateral enlargement in tuberculosis and lung malignancies.

Alternate Names:
Hilar Adenopathy; Bronchopulmonary Lymphadenopathy

Hill-Sachs Lesion

A dent or compression fracture in the back of the upper-arm bone caused when the shoulder dislocates forward, sometimes contributing to repeated dislocations.

Hill's Sign

Hill's sign is an older physical finding described in some cases of aortic regurgitation; it is not sufficient by itself to diagnose the condition.

Hilum

A depression or opening where blood vessels, nerves, ducts, or other structures enter or leave an organ.

Hilus

The hilus is an indentation or entry point on an organ where vessels, nerves, ducts, or airways enter or leave.

Hindbrain

The hindbrain is the lower part of the developing brain, giving rise to the medulla, pons, and cerebellum and helping control vital functions and coordination.

Hindgut

The hindgut is the embryonic part of the digestive tract that forms much of the distal colon, rectum, and upper anal canal.

H Influenzae Meningitis

A serious infection of the coverings of the brain and spinal cord caused by Haemophilus influenzae bacteria. It may cause fever, headache, stiff neck, confusion, seizures, or brain injury, especially in unvaccinated children.

Hinge Joint

A joint that mainly allows bending and straightening in one direction, like a door hinge. The elbow and knee are examples.

HINTS Examination

A bedside eye-movement examination comprising the horizontal head-impulse test, assessment of nystagmus, and test of skew (vertical eye misalignment). It helps distinguish central causes, especially stroke, from peripheral vestibular causes in acute continuous vestibular syndrome with nystagmus. Accuracy depends on appropriate training; HINTS-plus adds bedside hearing assessment.

Hip

The joint and surrounding region where the thigh bone meets the pelvis, allowing movement and bearing body weight.

Hip Arthroscopy

A minimally invasive procedure that uses a camera and instruments inserted through small incisions to diagnose and treat selected disorders inside or around the hip joint.

Hip Bursitis

Hip bursitis is inflammation of a bursa near the hip, commonly causing pain over the outer hip that worsens with lying on that side, stairs, or prolonged walking. Activity changes, physical therapy, medicines, or injection may help after other causes are considered.

Hip Circumference

The measurement around the widest part of the hips or buttocks, used in anthropometry and sometimes combined with waist circumference to assess body-fat distribution.

Hip Dislocation

The ball at the top of the thighbone comes out of the hip socket. It is usually caused by major injury and causes severe pain and inability to move the leg; nearby nerves and the blood supply to the bone may also be injured.

Hip Subluxation

Partial slipping of the ball of the thighbone out of the hip socket. It may result from injury or a problem with joint shape or stability and can cause pain or a feeling that the hip is giving way.

Hip Disorders

The hip joints are ball-and-socket joints connecting the femur to the pelvis, providing stability and a wide range of motion for walking, running, and weight-bearing activities. Common hip conditions include osteoarthritis, fractures, bursitis, and labral tears.

Hip Dysplasia

Alternate name; see *Developmental Dysplasia Of The Hip*.

Hip Fracture

A break in the upper thighbone, commonly near the femoral neck or just below it. It often follows a fall in someone with fragile bones and causes hip or groin pain, inability to bear weight, and sometimes a shortened or outward-turned leg.

Hip Fracture In Older Adults

A fracture of the upper thighbone in an older person, commonly after a fall or minor force when bone strength is reduced. It can cause pain, loss of mobility, delirium, blood clots, and loss of independence.

Alternate Names:
Geriatric Hip Fracture

Hip-Fracture Rehabilitation

Recovery care after a broken hip that helps restore walking, strength, balance, and independence. It may include early movement, pain control, exercises, nutrition, prevention of blood clots, delirium prevention, and treatment to reduce future fracture risk.

Hip Fracture Surgery

An operation to stabilize or replace a fractured proximal femur, using internal fixation, hemiarthroplasty, or total hip arthroplasty according to fracture pattern and patient factors.

Hip Impingement

A problem in which the ball of the thighbone and rim of the hip socket make abnormal contact during movement, often because of bone-shape differences. These differences may cause no symptoms; when they do, they can cause groin pain or stiffness, especially with deep bending. The contact can damage the labrum or joint cartilage; also called femoroacetabular impingement (FAI).

Alternate Names:
Femoroacetabular Impingement; FAI

Hip Instability

Too much movement or poor control of the hip joint, sometimes causing pain, clicking, or a feeling that the hip may give way. It can be related to joint shape, loose supporting tissues, or injury.

Hip Injury

Damage involving the hip joint, surrounding muscles, tendons, ligaments, or bones; causes range from strain and bursitis to fracture and dislocation, with inability to bear weight requiring prompt assessment.

Hip Joint

The ball-and-socket joint where the top of the thighbone fits into the pelvis. It supports body weight and allows the leg to move in many directions; strong ligaments and a cartilage rim help keep it stable.

Hip Joint Effusion

Extra fluid inside the hip joint. It may occur with injury, inflammation, or infection and can cause pain and reduced movement; see also *Joint Effusion*.

Hip Joint Infection

Alternate name; see *Septic Arthritis*.

Hip Joint Injection

Injection of local anesthetic, corticosteroid, or another prescribed agent into or around the hip joint for diagnosis or temporary relief of pain and inflam-

mation.

Hip Joint Replacement

Arthroplasty replaces damaged parts of the hip with prosthetic components to relieve pain and improve mobility, commonly for advanced osteoarthritis, fracture, or other destructive joint disease.

Hip Labral Tear

A tear in the ring of cartilage surrounding the hip socket. It may cause groin pain, clicking, catching, stiffness, or reduced movement and can result from injury, repeated stress, or abnormal hip shape.

Hip Osteoarthritis

Wear and damage of the smooth cartilage in the hip joint. It can cause groin or thigh pain, stiffness, and difficulty moving the hip, often worse with walking or after resting.

Hip Osteomyelitis

Infection of a bone near the hip joint, such as the pelvis or upper thighbone. It can cause lasting pain and tenderness, sometimes with fever; see also *Osteomyelitis*.

Hip Pain

Pain in or around the hip caused by joint disease, tendon or muscle injury, bursitis, fracture, nerve problems, or pain referred from the back.

Hip Chondral Injury

Damage to the smooth cartilage covering the surfaces inside the hip joint. It may cause pain, catching, or reduced movement and can occur after injury or with other joint problems.

Hip Flexor Strain

An overstretch or small tear in a muscle or tendon that bends the hip, often after a sudden sprint, kick, or other forceful movement. It can cause pain or tenderness at the front of the hip or groin, especially when lifting the knee.

Hip Stress Fracture

A small crack in a bone around the hip, usually the upper thighbone or pelvis, caused by repeated loading. Pain often begins gradually and worsens with activity; femoral-neck stress fractures can be serious.

Hip Synovitis

Inflammation of the thin lining inside the hip joint. It can cause pain and stiffness; temporary hip synovitis is a separate short-term condition seen mainly in children.

Hip Tendinitis

Irritation or inflammation of a tendon around the hip, often after repeated use or strain. It can cause pain and tenderness with movement; the affected tendon determines where symptoms occur. See also *Tendinitis* and *Tendinopathy*.

Hippocampal Sclerosis

Severe selective neuronal cell loss and astrocytic gliosis involving the pyramidal cell layer of the CA1 and CA4 subfields and the dentate gyrus of the hippocampus, representing the most common histopathological finding in medically refractory temporal lobe epilepsy.

Alternate Names:
Mesial Temporal Sclerosis; MTS

Hippocampus

A pair of structures deep in the brain that help form and retrieve new memories and support learning and navigation. Damage to them can cause difficulty forming new memories.

Hippocrates

An ancient Greek physician traditionally regarded as a major founder of Western clinical medicine; the Hippocratic corpus emphasizes observation, prognosis, and professional conduct.

Hippocratic Oath

A traditional promise that doctors make to practice medicine ethically, help patients, protect their

privacy, and avoid harm. Modern versions differ by country and institution.

Hippotherapy

A treatment in which a trained therapist uses the movement of a horse to support physical, occupational, or speech therapy. It may help some people improve balance, posture, muscle control, coordination, or communication, but it is tailored to individual goals and safety needs.

Hip Prosthesis

An artificial hip joint used to replace a damaged hip. It usually has a stem placed in the thighbone, a ball, and a socket; parts may be metal, ceramic, or durable plastic and may be fixed with or without bone cement.

Hippus

Hippus is rhythmic, involuntary widening and narrowing of the pupil, which may occur normally or with neurologic or eye disease.

Hip Replacement

A surgical procedure in which the diseased hip joint is replaced with a prosthetic implant (arthroplasty). Total hip replacement (THR) replaces both the femoral head and the acetabulum.

Alternate Names:
Total Hip Replacement; Total Hip Arthroplasty; THR

Hirata Disease

An uncommon autoimmune disorder characterized by recurrent episodes of severe hyperinsulinemic hypoglycemia triggered by high circulating titers of endogenous polyclonal autoantibodies directed against native human insulin. Occurs without prior exogenous insulin therapy, strongly associated with HLA-DR4 alleles and exposure to sulfhydryl-containing medications.

Alternate Names:
Insulin Autoimmune Syndrome; IAS

Hirayama Disease

A condition affecting the lower neck spinal cord, usually in teenage boys and young men. It causes slowly worsening, often one-sided weakness and wasting of the hand and forearm muscles. Neck bending can press the spinal cord and reduce its blood supply. Symptoms commonly stop progressing after several years. A neck MRI taken during bending helps confirm the diagnosis; early neck protection may limit damage.

Alternate Names:
Monomelic Amyotrophy; Juvenile Cervical Flexion Myelopathy

Hirschsprung Disease

A birth defect characterized by missing nerve cells (ganglion cells) in the muscular wall of part or all of the large intestine (colon). Because these missing nerves are required to trigger the rhythmic muscular contractions (peristalsis) that push stool forward, the affected segment of the intestine remains tightly constricted, causing a severe intestinal blockage. Newborns typically fail to pass their first bowel movement (meconium) within the first 48 hours of life, accompanied by severe abdominal swelling and vomiting.

Alternate Names:
Hirschsprung's Disease; Congenital Aganglionic Megacolon

Hirschsprung's Disease

Alternate spelling; see *Hirschsprung Disease*.

Hirsutism

Extra growth of coarse, dark hair on the face, chest, abdomen, or other areas where men usually grow hair. It is often linked to higher levels of male-type hormones, such as in polycystic ovary syndrome, but family traits or medicines can also cause it. Rapid new growth, a deeper voice, or severe acne should be checked by a healthcare professional.

Alternate Names:
Male-Pattern Hair Growth in Women; Androgenic Hair Excess

Hirudin

A potent, 65-amino-acid naturally occurring anticoagulant polypeptide originally isolated from the salivary glands of the European medicinal leech (*Hirudo medicinalis*). Unlike heparin, which requires the plasma cofactor antithrombin III, hirudin functions as a direct, bivalent thrombin inhibitor, binding with extremely high affinity and specificity to both the catalytic active site and the fibrinogen-binding exosite-1 of α-thrombin, completely blocking thrombin-mediated conversion of fibrinogen to fibrin and thrombin-induced platelet activation. Recombinant hirudins (e.g., lepirudin, desirudin) and synthetic hirudin analogues (bivalirudin, a synthetic 20-amino-acid peptide) have been developed for parenteral clinical use, particularly as alternative anticoagulants in patients with heparin-induced thrombocytopenia (HIT) and for procedural anticoagulation during percutaneous coronary intervention (PCI). Monitored via the activated partial thromboplastin time (aPTT) or ecarin clotting time; because hirudin has no specific neutralizing reversal antidote and is cleared renally, it requires careful dosage adjustment in renal impairment.

Alternate Names:
Hirudins; Direct Thrombin Inhibitor

Hirudins

Plural form; see *Hirudin*.

Hirudo Medicinalis

The medicinal leech, used in selected medical procedures to relieve venous congestion after reconstructive surgery.

His

Usually referring to the bundle of His, the atrioventricular conduction bundle that carries electrical impulses from the AV node into the right and left bundle branches.

His Bundle Electrography

An invasive electrophysiologic recording of electrical activity in the atrioventricular His bundle, used to assess conduction-system disease and localize atrioventricular block.

Histamine

A chemical messenger made by the body. It helps regulate brain activity, stomach acid, and other body functions. Immune cells release it during allergic reactions, where it can cause itching, redness, swelling, more mucus, and narrowing of the airways.

Histamine Degradation

The body's breakdown and removal of histamine after it has acted. This limits effects such as itching, swelling, airway narrowing, and increased stomach acid.

Histamine Receptor

A protein on or in a cell that responds to histamine. Different receptor types help control allergic symptoms, stomach-acid production, nerve signaling, and immune responses.

Histamine Release

Discharge of histamine from mast cells or basophils during allergic, immune, or nonimmune activation, causing effects such as itching, vasodilation, swelling, mucus production, and bronchoconstriction.

Histidine

Histidine is an amino acid used in protein synthesis and a precursor of histamine; it is essential during growth and can be metabolized to urocanic acid and other products.

Histidine Decarboxylase

An enzyme that converts the amino acid histidine into histamine. It is found in human cells and some microorganisms; histamine influences allergy, stomach acid, blood-vessel responses, and immunity.

Histidinemia

An inherited metabolic disorder caused by reduced histidase activity, leading to elevated histidine in blood and urine; many affected people have few or no clinically important symptoms.

Histiocyte

An immune cell found in tissues that can engulf

germs, damaged cells, or foreign material and help alert other immune cells.

Histiocytic Sarcoma

A rare aggressive cancer of cells that normally help process immune signals and foreign material. It may arise in lymph nodes, the intestine, skin, or other organs and requires specialist pathology and cancer care.

Histiocytoma

A tumor name used for different growths and not a single specific diagnosis. In the skin, benign fibrous histiocytoma usually refers to dermatofibroma, a benign nodule. The older term malignant fibrous histiocytoma has been replaced by more specific tumor diagnoses, such as undifferentiated pleomorphic sarcoma.

Histiocytosis

A group of uncommon disorders in which certain immune cells build up abnormally in the skin, bones, organs, or blood. Effects range from isolated skin or bone problems to serious disease affecting several organs.

Histiocytosis X

Historical name; see *Langerhans Cell Histiocytosis*.

Histochemical

Histochemical means using chemical stains or reactions in tissue sections to identify particular substances or cell components.

Histocompatibility

The degree to which donor and recipient tissues are immunologically alike. Matching tissue markers, especially HLA markers, can lower rejection risk, but antibody testing, organ type, and the recipient's health also influence transplant success.

Histocompatibility Antigen Test

A test identifying human leukocyte antigen types, which influence tissue compatibility for transplantation and are relevant to some immune-mediated and genetic associations.

Histocompatibility Testing

Laboratory typing of HLA and other immune markers to assess donor–recipient compatibility before transplantation and to investigate selected immune or transfusion-related questions.

Histogenesis

The developmental process by which unspecialized cells differentiate and organize into mature tissues with characteristic structures and functions.

Histological Techniques

Laboratory methods for preparing, staining, sectioning, and examining tissue under a microscope to reveal cellular architecture, deposits, organisms, or disease-related changes.

Histology

The study of cells and tissues under a microscope. A laboratory prepares a thin tissue section, applies stains that show its structures, and examines it for normal features or changes caused by disease.

Histology Cassette

A labeled perforated container that holds a tissue specimen during processing, allowing fixation, dehydration, paraffin infiltration, and later embedding for microscopic sectioning.

Histone

A protein around which DNA winds so it can fit inside the cell nucleus. Chemical changes to histones help control which genes are turned on or off.

Histone Acetylation

Addition of acetyl groups to histone proteins that usually loosens DNA packaging and can increase access of transcriptional machinery to genes.

Histone Acetyltransferase

An enzyme that transfers acetyl groups to histone proteins, generally promoting a more open chromatin state and regulating gene transcription.

Histone Deacetylases

Enzymes that remove acetyl groups from histones and other proteins, influencing chromatin structure, gene expression, cell differentiation, and disease biology.

Histone Deacetylation

Removal of acetyl groups from histones, often tightening chromatin and reducing transcription; histone deacetylases are targets of some anticancer drugs.

Histone Modification

A chemical change to a histone protein that alters how tightly DNA is packed and can change which genes a cell uses. These changes help regulate cell growth, development, and response to disease.

Histopathologic Grade

A microscopic estimate of how abnormal and aggressive tumor cells appear compared with their tissue of origin; grade contributes to prognosis and treatment planning alongside stage.

Histopathology

The diagnosis of disease by examining tissue under a microscope. A pathologist studies a biopsy or surgical specimen for abnormal cells, inflammation, infection, scarring, or cancer.

Histoplasma

A genus of fungi that includes Histoplasma capsulatum, which can cause histoplasmosis after inhalation of environmental spores.

Histoplasma Capsulatum

A fungus found in soil contaminated with bird or bat droppings that can cause histoplasmosis when its spores are inhaled.

Histoplasma Complement Fixation

A blood test that detects complement-fixing antibodies to Histoplasma and can support evaluation of histoplasmosis, although sensitivity, timing, cross-reactions, and immune status affect interpretation.

Histoplasmosis

A fungal infection acquired by breathing in spores from soil contaminated with bird or bat droppings. It often affects the lungs and may be mild, but can spread to other organs, especially in people with weakened immunity.

Histrionic Personality Disorder

A long-term pattern of intense emotional expression, strong need for attention, and behavior that may seem dramatic, suggestible, or uncomfortable when not the focus. Diagnosis requires a persistent pattern that causes significant problems and is made by a qualified mental-health professional.

Hitchhiker's Thumb

A descriptive term for an unusually flexible thumb that can bend backward at the distal joint. It is usually a harmless inherited variation unless associated with pain, instability, or a broader connective-tissue disorder.

HIV

Abbreviation; see *Human Immunodeficiency Virus*.

HIV/AIDS

Alternate term; see *HIV Infection*.

HIV/AIDS Immunopathogenesis

HIV enters and gradually destroys or disables important immune cells. Without treatment, immune defenses become weaker and serious infections or cancers may develop. Medicines stop most viral multiplication and allow immune recovery.

HIV/AIDS In Pregnant Women And Infants

HIV care in pregnancy and infancy uses maternal antiretroviral therapy, viral-load monitoring, delivery and feeding planning, infant prophylaxis, and early infant diagnostic testing to reduce vertical transmission.

HIV/AIDS Nutrition

Nutritional care for people living with HIV or AIDS.

Infection, poor appetite, diarrhea, medicine side effects, or other illnesses may cause weight loss or nutrient shortages; care may include food support, supplements, treatment of infections, and review of medicines.

Hiv Antibodies

Proteins made by the immune system after HIV infection and detected by blood or oral-fluid tests. A positive screening result needs confirmatory testing, and a negative result may be unreliable soon after exposure.

HIV-Associated Nephropathy

A severe renal disease occurring predominantly in individuals with advanced, untreated HIV infection. It is pathologically characterized by a collapsing variant of focal segmental glomerulosclerosis with marked podocyte injury and microcystic tubular dilation, typically presenting with heavy non-nephrotic or nephrotic proteinuria, rapid progression to kidney failure, and normal-to-enlarged echogenic kidneys on renal ultrasound.

Alternate Names:
HIVAN; HIV-Associated Kidney Disease

HIV-Associated Rheumatic Disease

Joint, muscle, bone, or connective-tissue problems associated with HIV infection or its immune effects. They may include inflammatory arthritis, reactive arthritis, muscle disease, osteoporosis, or symptoms related to infection or treatment. Antiretroviral therapy suppresses viral replication and reduces transmission and complications.

Hives

The common term for urticaria, describing raised, intensely itchy welts (wheals) on the skin. They happen when immune cells in the skin release histamine, causing fluid to leak from tiny blood vessels. Individual welts typically appear quickly, change shape, and fade away within 24 hours without leaving a scar. Hives lasting under six weeks are acute, often triggered by viral infections, foods, insect stings, or medications. Hives lasting longer than six weeks are chronic and often occur without a known external trigger.

Alternate Names:
Urticaria; Urticarial Weals

Hives And Angioedema

Hives are raised itchy welts; angioedema is deeper swelling of the skin or mucous membranes, often caused by allergy, medicines, or other immune reactions.

HIV Infection

A chronic infection caused by human immunodeficiency virus (HIV), which attacks CD4 immune cells. Without treatment, it can progress to acquired immunodeficiency syndrome (AIDS), defined by a CD4 count below 200 cells/mm^3 or an AIDS-defining illness. Antiretroviral therapy suppresses the virus and can prevent progression.

HIV in Pregnancy

HIV infection during pregnancy can affect maternal health and can be transmitted to the fetus or newborn without effective care. Antiretroviral treatment, viral-load monitoring, obstetric planning, and newborn prophylaxis greatly reduce perinatal transmission; treatment decisions require specialist guidance.

HIV-Related Kidney Disease

Kidney disease associated with HIV infection, its immune effects, or treatment. It may include collapsing focal segmental glomerulosclerosis, immune-complex disease, thrombotic microangiopathy, or drug toxicity; antiretroviral therapy and kidney-protective care are important.

Hiv Seropositivity

The presence of detectable HIV antibodies or other blood-test evidence of infection. A reactive screening test is not final until confirmatory testing is completed.

HIV Test

A blood or oral-fluid test that looks for HIV infection. Laboratory tests may detect viral material or antibodies; a reactive screening result needs con-

firmatory testing. Tests can be negative early in infection, so repeat testing may be needed after a recent exposure.

HIV Transmission And Prevention

The spread of HIV through infected blood, semen, vaginal fluids, rectal fluids, or breast milk, prevented by testing, treatment that suppresses viral load, condoms, sterile equipment, and pre- or post-exposure prophylaxis.

HIV Viral Load

The amount of HIV genetic material in the blood. It shows how actively HIV is multiplying and whether treatment is working; an "undetectable" result means the amount is below the test's detection limit, not that HIV has been cured.

Alternate Names:
HIV Viral Burden; Quantitative HIV RNA

HLA

A group of cell-surface proteins helping the immune system recognize the body's own cells, reject foreign tissue, and influence transplant compatibility.

Alternate Names:
Human Leukocyte Antigen System; Major Histocompatibility Complex (MHC)

Hla Antigen

A marker on the surface of cells that helps immune cells recognize what belongs to the body. HLA markers are important for matching donors and recipients in transplantation and are linked with risk of some immune diseases.

HLA-B27

An inherited immune-system marker associated with increased risk of some inflammatory conditions affecting the spine, joints, eyes, or bowel. A positive test does not prove that a person has one of these diseases.

HLA-B27 Antigen

A cell-surface immune marker associated with increased risk of ankylosing spondylitis and related spondyloarthritis, reactive arthritis, and uveitis; a positive result is not diagnostic by itself.

HLA System

The HLA system is a group of cell-surface proteins that present antigens to immune cells and influence transplant matching and autoimmune risk.

HLHS

Abbreviation; see *Hypoplastic Left Heart Syndrome*.

Hmgb Proteins

Proteins that help organize genetic material inside cells. When released from damaged cells, some can also signal tissue injury and promote inflammation.

HMG-CoA Reductase

An enzyme the liver uses to make cholesterol. Statin medicines partly lower blood cholesterol by blocking this enzyme.

Hmgn Proteins

Proteins that help control how genetic material is arranged and used inside cells. They can influence cell growth, specialization, and repair of genetic material.

Hoarding

Alternate name; see *Hoarding Disorder*.

Hoarding Disorder

A mental-health condition involving persistent difficulty discarding possessions, even when they have little value. Saving items causes distress and can fill living areas so that normal activities or safety are impaired.

Hoarseness

A change in the voice that makes it rough, weak, breathy, or strained. Common causes include a viral infection, voice overuse, smoking, reflux, or a growth on the vocal folds. Hoarseness lasting more than a few weeks needs assessment.

Hodgkin Lymphoma

A type of blood cancer that begins in the lymphatic system, part of the body's immune network. It is characterized by the presence of large, abnormal cancerous white blood cells called Reed-Sternberg cells within enlarged lymph nodes. Common symptoms include painless swelling of lymph nodes in the neck, armpits, or groin, persistent fatigue, unexplained weight loss, night sweats, and fever.

Alternate Names:
Hodgkin's Lymphoma; Hodgkin Disease; Hodgkin's Disease

Hodgkin Lymphoma In Children

A malignant lymphoma arising from lymphoid tissue in children, characterized by Hodgkin and Reed-Sternberg cells and treated according to subtype, stage, and risk.

Hodgkin's And Non-Hodgkin's Lymphoma Comparison

Hodgkin lymphoma is defined by characteristic Reed-Sternberg cells and commonly spreads in an orderly pattern, while non-Hodgkin lymphomas comprise many B-cell, T-cell, and other lymphoid cancers. Biopsy, immunophenotyping, and staging determine treatment and prognosis.

Hodgkin's Disease

Alternate name; see *Hodgkin Lymphoma*.

Hodgkin's Lymphoma

Alternate name; see *Hodgkin Lymphoma*.

Hoffmann Sign

A reflex test where flicking the middle fingernail makes the thumb and index finger quickly twitch inward, pointing to irritation or pressure on the spinal cord in the neck.

Hoffmann Syndrome

An uncommon form of adult muscle weakness caused by severe, untreated underactive thyroid disease. It may cause stiff or painful muscles, cramps, enlarged-looking muscles, slow reflex relaxation, and high muscle-enzyme levels; treating the thyroid problem usually improves it.

Alternate Names:
Hypothyroid Myopathy with Pseudohypertrophy

Hofmann's Syndrome

A rare form of adult hypothyroid muscle disease causing muscle enlargement, stiffness, cramps, weakness, and slowed reflexes. Treating the low thyroid hormone level usually improves the muscle problems.

Holiday Heart Syndrome

An episode of atrial or other cardiac arrhythmia occurring after heavy or binge alcohol intake, often in someone without known structural heart disease. Atrial fibrillation is the most common presentation.

Holistic Medicine

An approach that considers physical, psychological, social, behavioral, and sometimes spiritual factors in health and illness. Evidence, safety, and compatibility with conventional treatment vary among individual therapies.

Hollenhorst Plaque

A bright, glistening, refractile, golden-orange cholesterol crystal embolus observed on ophthalmoscopic examination lodged at a retinal arterial bifurcation, originating from an ulcerated atheromatous plaque in the ipsilateral carotid artery or aortic arch.

Alternate Names:
Hollenhorst's Plaque; Retinal Cholesterol Embolus

Holmium

A rare-earth metal used in some medical lasers and radioactive tracers. Holmium laser energy can cut or vaporize tissue, especially in urologic procedures; radioactive holmium requires strict handling and safety controls.

Holmium Laser Enucleation Of The Prostate

A procedure performed through the urine passage that uses a laser to separate and remove excess

prostate tissue blocking urine flow. The tissue is removed from the bladder and examined; temporary bleeding, burning, leakage, infection, or sexual and urinary changes can occur.

Alternate Names:
HoLEP; Holmium Prostate Enucleation

Holoprosencephaly

A birth difference in which the developing brain does not divide fully into two cerebral hemispheres. Severity varies; it may affect facial development, movement, feeding, seizures, and intellectual development.

Holorachischisis

A severe birth defect in which a long section of the spine and spinal cord fails to close during development. It usually causes major weakness, loss of sensation, and other serious nervous-system problems.

Holosystolic Murmur Differential

A heart murmur heard throughout the period when the heart's lower chambers contract. Common causes include leakage of the mitral or tricuspid valve and a hole between the lower chambers; its sound, location, and other findings help identify the cause.

Holter Electrocardiography

Continuous ambulatory ECG recording, usually for 24 hours or longer, used to detect intermittent arrhythmias, correlate symptoms with rhythm, and assess heart-rate patterns.

Holter Monitor

A small portable recorder that continuously tracks the heart's electrical rhythm, usually for a day or longer. It can detect intermittent abnormal rhythms and compare them with symptoms such as palpitations, dizziness, or fainting.

Holter Monitoring

Portable, continuous electrocardiographic recording over an extended period, commonly 24 hours or longer, to detect intermittent rhythm abnormalities and correlate them with symptoms.

Holt-Oram Syndrome

An inherited condition causing abnormalities of the bones in one or both arms or hands and heart defects. The heart problem may be a hole between chambers or an abnormal rhythm; the severity varies widely.

Homeobox Gene

A gene that helps control how an embryo's body is laid out and how organs and tissues develop. Changes in some homeobox genes can cause birth differences or disease.

Homeodomain Proteins

Transcription factors containing a homeodomain that bind regulatory DNA sequences and direct developmental patterning and cell differentiation.

Homeopathy

An alternative-health system that uses highly diluted preparations selected according to "like cures like"; reliable evidence has not shown homeopathic products to treat serious disease beyond placebo effects.

Homeostasis

The body's ability to keep internal conditions within a safe range despite changes outside it. It regulates temperature, blood sugar, blood pressure, fluid, salts, and acidity through coordinated feedback systems.

Homeotherm

An organism that maintains a relatively stable internal body temperature despite changes in environmental temperature, largely through physiological regulation.

Homicidal Ideation

Thoughts about killing or seriously harming another person. Intent, a specific plan, access to means, or inability to maintain safety indicate an acute risk of harm.

Homicide

The killing of one person by another, classified legally according to intent and circumstances; medical assessment may address injury patterns, cause of death, toxicology, and safeguarding.

Homocysteine

An amino acid formed during methionine metabolism. Persistently elevated blood levels may occur with genetic, nutritional, renal, or other disorders.

Homocysteine Test

A blood test measuring homocysteine, an amino acid intermediate whose elevation may indicate folate or vitamin B12 deficiency or increased vascular risk; see *Homocysteine*.

Homocystinuria

A rare inherited disorder in which the body cannot properly process homocysteine, an amino acid. It may cause eye problems, abnormal bones, learning or developmental problems, and an increased risk of blood clots.

Homograft

A transplant of tissue or an organ between two people of the same species but with different genetic makeup. The recipient's immune system may reject it, so matching and immune-suppressing treatment are important.

Homologous

Similar because of a shared origin, structure, or genetic relationship. In medicine, homologous tissue or cells come from the same species, while homologous chromosomes carry corresponding genes.

Homologous Recombination

A DNA-repair and genetic-exchange process that uses a matching or nearly matching sequence as a template to repair breaks or reshuffle genetic material.

Homologous Transplantation

Transplantation of cells, tissue, or an organ between genetically different people of the same species, requiring attention to compatibility, rejection, infection, and immunosuppression.

Homonymous Hemianopia

A visual field deficit characterized by the loss of the same half of the visual field (either both right halves or both left halves) in both eyes. It results from a retrochiasmal lesion affecting the optic tract, lateral geniculate nucleus, optic radiation, or primary visual cortex on the side opposite the visual defect.

Homo Sapiens

The scientific name for modern humans, the living human species with shared biological features, genetic variation, and worldwide populations.

Homosexual

Describing a person who experiences enduring romantic or sexual attraction to people of the same sex; sexual orientation is not a mental disorder.

Homosexuality

Sexual or romantic attraction to people of the same sex or gender; it is not a mental disorder or pathology.

Homovanillic Acid

A breakdown product of dopamine found in cerebrospinal fluid, blood, and urine; levels may reflect dopamine metabolism but are interpreted cautiously because many factors affect them.

Homozygote

An individual or cell carrying two identical alleles at a particular gene locus, whether the alleles are normal, pathogenic, or another variant.

Homozygous

Having two copies of the same version of a gene, one inherited from each parent. The effect depends on the gene and whether that version is harmless, protective, or disease-causing.

Homozygous Alpha-1-Antitrypsin Deficiency

Severe inherited alpha-1 antitrypsin deficiency caused by disease-associated variants in both gene copies, increasing risk of early emphysema and liver disease; see *Alpha-1 Antitrypsin Deficiency*.

Homozygous Familial Hypercholesterolemia

Severe familial hypercholesterolemia caused by pathogenic variants affecting both copies of a relevant lipid-clearance gene; LDL cholesterol can be extremely high and atherosclerotic disease may occur early.

Honey-Bee Stings

Injuries caused by a honey-bee injecting venom into the skin. A sting usually causes local pain, redness, and swelling; a severe allergic reaction can cause breathing difficulty, fainting, or shock and requires emergency treatment.

Honeycomb Lung

The characteristic advanced radiographic and histopathological pattern of end-stage diffuse pulmonary fibrosis, consisting of cystic air spaces (3 to 10 mm in diameter) bounded by thickened fibrotic walls, classic for usual interstitial pneumonia (UIP) and idiopathic pulmonary fibrosis.

Alternate Names:
Honeycombing; Pulmonary Honeycombing

Honeycomb Lung Pathology

End-stage fibrotic remodeling with multiple irregular cystic airspaces, often subpleural and lined by bronchiolar-type epithelium, accompanied by architectural distortion and interstitial fibrosis.

Honolulu Fever

An infection caused by Streptobacillus bacteria, usually after contact with rats or contaminated food. It may cause fever, vomiting, headache, muscle or joint pain, and a rash; treatment uses antibiotics.

Hookworm

An intestinal infection caused by parasitic worms whose larvae live in contaminated soil. The larvae can enter through bare skin, and the adult worms may cause abdominal symptoms, blood loss, anemia, or poor growth.

Hookworm Infection

Intestinal infection caused by hookworms acquired when larvae in contaminated soil penetrate the skin or are ingested. Chronic infection can cause abdominal symptoms, iron-deficiency anemia, protein loss, and impaired growth in children.

Hookworm Infestation

Intestinal infection by hookworm nematodes, which attach to the intestinal wall and may cause iron-deficiency anemia, abdominal symptoms, or poor growth.

Hordeolum

Alternate medical name; see *Stye*.

Horizontal Gene Transfer

The movement of genetic material between microorganisms rather than from parent to offspring. It can spread traits such as antibiotic resistance through direct contact, viruses, or uptake of DNA from the surroundings.

Horizontal Pursuit

Smooth, coordinated movement of both eyes horizontally to follow a slowly moving visual target while maintaining fixation.

Hormonal Drugs

Medicines that contain, replace, imitate, block, or change the effects of hormones. Examples include insulin, thyroid hormones, corticosteroids, sex hormones, contraceptives, and medicines that block hormones in some cancers. Their uses and risks vary widely by medicine and condition.

Hormonal Effects In Newborns

Transient newborn findings caused by maternal hor-

mones or normal neonatal endocrine transitions, such as breast enlargement or vaginal bleeding; persistent or severe findings require evaluation.

Hormone

A specialized chemical signaling messenger synthesized and secreted in microscopic quantities by endocrine glands (or specialized neuroendocrine cells) directly into the systemic circulation or extracellular fluid, designed to coordinate and modulate the physiological activities, metabolism, growth, development, and homeostasis of distant target cells and organ systems. Functioning via endocrine (bloodstream delivery to distant organs), paracrine (diffusion to adjacent cells), or autocrine (binding to receptors on the secreting cell itself) mechanisms, hormones act with high receptor specificity and exquisite potency at nanomolar to picomolar concentrations. Structurally categorized into three major biochemical classes: (1) Peptide and Protein Hormones (e.g., insulin, glucagon, growth hormone, ACTH, parathyroid hormone, TSH), which are water-soluble, circulate freely, and bind to cell-surface transmembrane receptors (G protein-coupled receptors or receptor tyrosine kinases) to activate second-messenger cascades (cAMP, IP3/DAG, MAPK); (2) Steroid Hormones (e.g., cortisol, aldosterone, estrogen, progesterone, testosterone), derived from cholesterol, which are lipophilic, circulate bound to plasma carrier globulins (CBG, SHBG, albumin), freely diffuse across cell lipid bilayers, and bind intracellular cytoplasmic or nuclear receptors to alter gene transcription; and (3) Amino Acid-Derived (Amine) Hormones (e.g., catecholamines [epinephrine, norepinephrine] derived from tyrosine, and thyroid hormones [T_3, T_4], which uniquely cross membranes via monocarboxylate transporters to bind nuclear thyroid hormone receptors). Hormonal secretion is tightly regulated by negative and positive feedback homeostatic loops governed predominantly by the hypothalamic-pituitary-end organ axes.

Alternate Names:
Hormones; Endocrine Chemical Messenger

Hormone Levels

Measurements of hormones in blood, urine, or other specimens used to evaluate endocrine function; interpretation depends on the specific hormone, timing, age, sex, medications, and clinical context.

Hormone Panel

A coordinated group of blood tests that measures multiple endocrine hormone concentrations to evaluate pituitary, thyroid, adrenal, or reproductive organ function; see *Hormone Levels*.

Hormone Receptor

A protein that binds a specific hormone and converts the signal into cellular responses, either at the cell surface or inside the cell nucleus.

Hormone-Receptor Positive

A cancer whose cells express receptors for hormones such as estrogen or progesterone. Hormone-blocking treatment may be useful for selected cancers with these receptors.

Hormone Replacement Therapy

Treatment that supplies a hormone the body does not make enough of, such as thyroid, adrenal, sex, or pituitary hormones. Menopausal hormone therapy can relieve hot flushes and vaginal symptoms for selected people, but benefits and risks depend on the hormone, dose, duration, and health history.

Hormones

Plural form; see *Hormone*.

Hormone-Sensitive Lipase

An enzyme in fat cells that breaks stored triglycerides into fatty acids and glycerol. Its activity rises when the body needs fuel, including during fasting or exercise, and falls after insulin increases.

Hormone Therapy

Treatment that adds, lowers, blocks, or changes the action of hormones. It may be used for hormone disorders, contraception, or hormone-sensitive cancers; the type and effects depend on the condition and medicine.

Hormone Therapy For Breast Cancer

Treatment that blocks or lowers estrogen or progesterone effects in hormone-sensitive breast cancer. It reduces stimulation of cancer cells and may be used after surgery or for advanced disease.

Hormone Therapy for Endometriosis

Hormonal treatment used to suppress ovarian cycling and reduce endometriosis-related pain or lesion activity. Options include combined hormonal contraceptives, progestins, or other ovarian-suppressing medicines selected according to symptoms, pregnancy plans, and risks.

Hormone Therapy For Prostate Cancer

Treatment that lowers androgen production or blocks androgen action to slow growth of hormone-sensitive prostate cancer.

Horn

A horn is a pointed, hard growth of keratinized tissue, usually on the skin or as a normal anatomical projection such as a uterine or spinal horn.

Horner's Syndrome

A group of findings caused by disruption of sympathetic nerves, including a drooping eyelid, a small pupil, and reduced sweating on one side of the face.

Horner Syndrome

A neurological condition resulting from a disruption or injury along the nerve pathway (sympathetic chain) that connects the brainstem to the eye and face on one side. The damage produces a classic triad of symptoms on the affected side of the face: a slightly drooping upper eyelid (ptosis), a constricted (smaller) pupil (miosis), and reduced or absent sweating on that side of the face (anhidrosis). Causes include neck injuries, strokes, spinal cord lesions, or tumors in the upper chest or neck.

Alternate Names:
Horner's Syndrome; Oculosympathetic Paresis

Hornet Stings

Hornet stings inject venom and usually cause local pain and swelling; multiple stings or allergy can cause a serious systemic reaction.

Horripilation

Piloerection, or the temporary raising of hair and development of gooseflesh due to cold, fear, emotion, or autonomic stimulation.

Horseshoe Kidney

A birth difference in which the lower parts of the two kidneys join across the middle of the body. Many people have no symptoms, but kidney stones, urine-flow problems, infections, or high blood pressure can occur.

Hospice

Care for a person nearing the end of life when the focus is comfort rather than cure. Hospice supports symptoms, emotional and practical needs, and family caregivers at home, in a hospice facility, or in a hospital; eligibility rules vary by location.

Hospice and Palliative Medicine

The medical specialty focused on relieving symptoms and other burdens of serious illness and supporting quality of life. Palliative care can accompany disease-directed treatment at any stage; hospice is a form of palliative care for people nearing the end of life.

Hospice Care

Team-based care for a person nearing the end of life that prioritizes comfort, symptom control, communication, and family support rather than disease-directed cure.

Hospice Rehabilitation

Rehabilitation provided during hospice care to maximize comfort, dignity, and participation rather than to restore function at all costs. It may include positioning, pain relief, safe transfers, equipment, and caregiver education.

Hospital-Acquired Infection

A localized or systemic infectious condition devel-

oping in a hospitalized patient that was neither present nor incubating at the time of hospital admission, medically defined as manifesting at least 48 hours following admission, or within 30 days after surgical discharge (up to 90 days following surgical implant placement). Driven by the convergence of vulnerable, immunocompromised hosts, invasive diagnostic and therapeutic devices that breach mucosal/cutaneous defense barriers, and high ambient concentrations of multidrug-resistant (MDR) pathogens within clinical environments. The four predominant clinical device- and procedure-related categories comprise: (1) Catheter-Associated Urinary Tract Infections (CAUTI, the most frequent, commonly due to *Escherichia coli*, *Klebsiella*, or *Candida*); (2) Central Line-Associated Bloodstream Infections (CLABSI, caused by biofilm-forming pathogens including coagulase-negative staphylococci, *Staphylococcus aureus*, and enterococci); (3) Ventilator-Associated Pneumonia (VAP, developing $>$ 48 hours following endotracheal intubation, frequently caused by virulent gram-negative bacilli such as *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and MRSA); and (4) Surgical Site Infections (SSI, classified as superficial incisional, deep incisional, or organ/space). Also encompasses healthcare facility-acquired *Clostridioides difficile* colitis induced by broad-spectrum antimicrobial selective pressure. Prevention mandates strict adherence to evidence-based infection control bundles, rigorous hand hygiene, antimicrobial stewardship, sterile insertion techniques, and early removal of unnecessary indwelling catheters and invasive devices.

Alternate Names:
Hospital-Acquired Infections; Nosocomial Infection; Healthcare-Associated Infection; HAI

Hospital-Acquired Infections

Plural form; see *Hospital-Acquired Infection*.

Hospital-Acquired Pneumonia

Lung infection that begins at least 48 hours after hospital admission and was not present when the person arrived. It may cause fever, cough, breathing difficulty, or low oxygen; treatment depends on severity, cultures, and resistance risk.

Hospital- and Ventilator-Associated Pneumonia

Pneumonia developing during hospitalization, including ventilator-associated pneumonia after mechanical ventilation. Diagnosis considers new infiltrates or respiratory decline plus clinical evidence of infection; antimicrobial selection depends on local resistance, prior antibiotics, and patient risk factors.

Hospital-Associated Disability

New or worsened difficulty with walking, self-care, or other daily activities that develops during or after hospitalization. It may result from illness, bed rest, weakness, delirium, poor nutrition, or treatments and can persist after discharge.

Hospital Code

An announcement used in a hospital to summon staff for an emergency. The number or color and the required response depend on that hospital's policy.

Hospital Latex Allergy Precautions

Clinical protocols and institutional safety measures implemented to protect sensitized hospital patients and healthcare workers from natural rubber latex exposure. Includes using non-latex gloves, latex-free medical devices, and clear allergy identification band protocols.

Alternate Names:
Latex Allergy Protocol; Latex-Safe Environment; Natural Rubber Latex Precautions

Host

A person or other living organism that can be infected by a virus or other pathogen under natural conditions. The host may be a human, animal, or plant. In medical contexts, the host is the patient in whom an infection or disease develops.

Host Cell

A cell in which an infectious agent, parasite, or symbiont lives, replicates, or uses cellular machinery; the host-cell response influences disease and clearance.

Hostility

An attitude or behavior marked by antagonism, anger, distrust, or intent to oppose another person; persistent severe hostility may occur with psychiatric, neurologic, substance-related, or situational problems.

Host Response

The body's reaction to an infection, foreign material, transplanted tissue, or other stimulus. It may include inflammation, immune defense, healing, scar formation, rejection, or tolerance.

Hot Flash

Alternate singular form; see *Hot Flashes*.

Hot Flashes

Sudden episodes of intense heat, sweating, flushing, and sometimes a racing heart or chills. They are common during menopause but can also result from hormone changes, medicines, cancer treatment, or other illness.

Hot Flushes

Alternate name; see *Hot Flashes*.

Hot Tub Folliculitis

A temporary bacterial infection of hair follicles, commonly caused by Pseudomonas aeruginosa after exposure to contaminated hot tubs or pools, producing itchy follicular papules or pustules.

Hounsfield Unit

A standard scale of measurement used in computed tomography (CT) scans to describe the density of different tissues in the body. Named after Sir Godfrey Hounsfield, one of the inventors of the CT scan, the scale assigns pure water a value of zero, air a value of negative 1000, and dense bone high positive values, allowing radiologists to distinguish fluid, fat, soft tissue, and bone on scans.

Alternate Names:
Hounsfield Units; HU; CT Number

Hounsfield Units

Plural form; see *Hounsfield Unit*.

Hour

A unit of time equal to 60 minutes, commonly used in medicine to describe symptom duration, dosing intervals, monitoring periods, and treatment timing.

Hour-Glass Contraction

An abnormal tight band that divides the uterus into upper and lower sections during difficult labor. It can obstruct delivery and is an obstetric emergency.

Housemaid's Knee

A common name for prepatellar bursitis, inflammation and fluid accumulation in the bursa over the kneecap, often caused by prolonged kneeling, trauma, infection, or inflammatory disease. Painful swelling, redness, warmth, or fever requires assessment for septic bursitis.

Howell-Jolly Bodies

Small leftover pieces of red-cell DNA seen on a blood smear. They are usually removed by a working spleen, so their presence may indicate absent or reduced spleen function; they can also occur with severe vitamin-B12 or folate deficiency.

Howship-Romberg Sign

Pain and paresthesias radiating along the medial and inner aspect of the thigh to the knee, caused by compression of the obturator nerve within the obturator canal by an obturator hernia, exacerbated by extension, abduction, and internal rotation of the hip.

Alternate Names:
Howship-Romberg Symptom; Obturator Nerve Compression Sign

HPA (Hypothalamic-Pituitary-Adrenal Axis)

A hormone system linking parts of the brain with the adrenal glands. It helps the body respond to stress by controlling the release of cortisol, which affects blood pressure, blood sugar, immune activity,

sleep, and energy.

Alternate Names:
Hypothalamic-Pituitary-Adrenal Axis

HPLC

A laboratory method that separates substances in a liquid sample so they can be identified and measured. It is used to test medicines, body chemicals, poisons, and other samples.

HPV/Genital Warts

Alternate name; see *Human Papillomavirus* and *Genital Warts*.

HPV (Human Papillomavirus)

Alternate name; see *Human Papillomavirus*.

HPV Infection

Alternate name; see *Human Papillomavirus Infection*.

HPV Test

A test that detects high-risk human papillomavirus genetic material or related markers in cervical samples to screen for cervical cancer risk or evaluate abnormal cervical cytology.

H. Pylori

Abbreviated name; see *Helicobacter Pylori*.

HPylori

Abbreviated name; see *Helicobacter Pylori*.

H. Pylori Stool Antigen

A stool test that detects proteins from *Helicobacter pylori*, a stomach bacterium. It can help diagnose an active infection and check whether treatment has cleared it. Medicines that reduce stomach acid and recent antibiotics can affect the result, so timing matters.

Alternate Names:
HpSA; Stool Antigen Test for H. Pylori

H. pylori Test

A diagnostic test (urea breath test, stool antigen assay, or biopsy) detecting *Helicobacter pylori* infection in the gastric mucosa; see *Helicobacter Pylori* and *Urea Breath Test*.

HRCT (High-Resolution Computed Tomography)

Alternate name; see *High-Resolution Computed Tomography*.

H-Reflex

An electrical response recorded during nerve-conduction testing after stimulation of a nerve, commonly the tibial nerve. It assesses the reflex pathway between sensory and motor nerves in the spinal cord and is used especially to evaluate the S1 nerve root.

Alternate Names:
Electrophysiological Monosynaptic Reflex

HRT (Hormone Replacement Therapy)

Hormone replacement therapy uses estrogen, with a progestogen when needed, to treat selected menopausal symptoms caused by declining ovarian hormone production. It can relieve vasomotor and genitourinary symptoms and help prevent bone loss, but benefits and risks depend on the person's age, medical history, regimen, and duration of use.

Hs-cTn

Alternate name; see *High-Sensitivity Cardiac Troponin*.

Ht (Hematocrit)

Common abbreviation for hematocrit, the percentage of blood volume occupied by red blood cells; in other contexts it may mean height.

Huber Needle

A special non-coring needle used to access an implanted port for giving medicines, fluids, blood products, or taking blood samples. Correct placement and sterile technique reduce infection, bleeding, and port damage.

Hughes-Stovin Syndrome

An extremely rare condition involving blood clots

in deep veins and several aneurysms in the lung arteries. It may be related to Behçet disease and can cause life-threatening bleeding in the lungs.

Alternate Names:
HSS; Pulmonary Artery Aneurysm-Thrombosis Syndrome

Human African Trypanosomiasis

A parasitic disease caused by *Trypanosoma brucei* and spread by infected tsetse flies in sub-Saharan Africa. It first affects the blood and lymph and can later involve the brain and spinal cord, causing sleep-wake changes, confusion, or other nervous-system problems. The two forms, caused by *T. b. gambiense* and *T. b. rhodesiense*, usually progress at different rates. Untreated disease can be fatal.

Alternate Names:
African Sleeping Sickness; African Trypanosomiasis; Sleeping Sickness

Human Bites

Injuries caused by human teeth that can inoculate mixed oral bacteria into skin, joints, tendons, or bone. Bites to the hand, deep punctures, delayed presentation, or signs of infection carry increased risk of complications; management can include wound care, antibiotics, and tetanus prevention.

Human Calcitonin

A peptide hormone produced by thyroid parafollicular cells that can lower blood calcium by inhibiting osteoclast activity; synthetic calcitonin is used selectively for bone and calcium disorders.

Human Chorionic Gonadotropin

A hormone produced mainly by the placenta and measured in blood or urine to detect and monitor pregnancy. Levels normally rise early in pregnancy; results vary with timing and other clinical findings.

Alternate Names:
HCG

Human Chorionic Gonadotropin Test

A qualitative or quantitative blood or urine test measuring hCG, a hormone produced by the placenta during pregnancy or by certain germ-cell tumors; see *Human Chorionic Gonadotropin* and *Pregnancy Test*.

Human Chromosome Count

Most human body cells contain 46 chromosomes arranged in 23 pairs, including one pair of sex chromosomes; mature egg and sperm cells normally contain 23.

Human Cyclic Neutropenia

Alternate name; see *Cyclic Neutropenia*.

Human Cytomegalovirus Infection

Alternate name; see *Cytomegalovirus Infection*.

Human Embryo

The developing human organism from fertilization through approximately the eighth week, during which the major body plan and organ systems are established.

Human Gastrin

A peptide hormone produced mainly by gastric G cells that stimulates gastric acid secretion and supports growth of the gastric mucosa after food enters the stomach.

Human Genome

The complete DNA sequence and genetic content of a human, organized into nuclear chromosomes and mitochondrial DNA; variants influence traits, disease risk, and treatment response.

Human Herpesvirus 6

A herpesvirus that commonly infects children and can cause roseola; it may reactivate and cause serious disease in people with weakened immunity.

Human Herpesvirus 8

A herpesvirus associated with Kaposi sarcoma, primary effusion lymphoma, and multicentric Castleman disease, especially in people with weakened immunity.

Human Immunodeficiency Virus

A virus that attacks immune cells, especially CD4 cells, and can gradually weaken the body's defenses. Without effective treatment it may lead to AIDS and serious infections or cancers. HIV-1 is widespread globally and HIV-2 is less common; daily treatment can suppress the virus and protect health.

Human Immunodeficiency Virus (HIV)

Alternate name; see *Human Immunodeficiency Virus*.

Human Leukocyte Antigen

A group of cell-surface proteins encoded by genes in the major histocompatibility complex. HLA molecules present antigens to T cells and are important in immune responses and tissue matching for transplantation.

Alternate Names:
HLA Complex; Human MHC

Human Metapneumovirus

A respiratory virus that commonly causes cough, fever, runny nose, and wheezing. Infants, older adults, and people with weakened immunity may develop bronchiolitis, pneumonia, or severe breathing difficulty.

Human Microbiome

The community of bacteria, viruses, fungi, archaea, and other microorganisms living on and inside the human body. These organisms and their genes can influence digestion, immune activity, metabolism, and disease, although finding a microorganism does not by itself prove that it causes illness.

Human Nociceptin

A neuropeptide that binds the nociceptin/orphanin FQ receptor and modulates pain, stress, reward, autonomic function, and other brain and spinal-cord processes.

Human Papillomavirus

A large group of viruses that infect the skin and moist body linings. Some types cause warts; persistent infection with high-risk types can lead to precancerous changes and cancers. See also *Human Papillomavirus Infection*.

Alternate Names:
HPV

Human Papillomavirus (HPV/Genital Warts)

Alternate name; see *Human Papillomavirus*.

Human Papillomavirus Infection

Infection with one or more human papillomavirus (HPV) types, spread mainly through intimate skin-to-skin or sexual contact. Most infections cause no symptoms and clear without causing health problems. Some types cause warts; persistent infection with high-risk types can cause precancerous changes and cancers of the cervix, anus, genitals, or throat. Vaccination prevents many infections, and cervical screening can detect precancerous changes.

Human Papillomavirus Vaccine

A vaccine that prevents infection from selected human papillomavirus (HPV) types and reduces the risk of HPV-related cancers; some formulations also prevent most genital warts caused by HPV. It does not treat an existing HPV infection.

Human Placental Lactogen

A hormone made by the placenta during pregnancy. It helps prepare the breasts for feeding and changes how the pregnant person uses fat and sugar, helping provide nutrients to the developing fetus.

Human T-Lymphotropic Virus Type 1 Infection

Infection with human T-lymphotropic virus type 1 (HTLV-1), a retrovirus transmitted mainly through breastfeeding, sexual contact, or contaminated blood. Most infected people remain asymptomatic, but a minority develop adult T-cell leukemia-lymphoma or HTLV-1-associated myelopathy/tropical spastic paraparesis.

Alternate Names:
HTLV-1 Infection; Human T-Cell Lymphotropic Virus Type 1 Infection

Humectant

A substance that attracts and holds water, often used in skin creams, lotions, foods, and medicines. In skincare, it draws water into the outer skin layer and can reduce dryness when used properly.

Humeral Epicondyle

A bony prominence at the distal humerus that provides attachment for forearm muscles and ligaments; the medial and lateral epicondyles are located on opposite sides of the elbow.

Humeral Fracture

A break in the upper-arm bone, involving the proximal, shaft, or distal humerus; pain, swelling, deformity, and possible nerve or blood-vessel injury guide urgent assessment and treatment.

Humeroradial Joint

The part of the elbow where the upper-arm bone meets the radius, one of the forearm bones. It helps the elbow bend and straighten and supports rotation of the forearm.

Humeroulnar Joint

The main hinge of the elbow, where the upper-arm bone meets the ulna. It allows the arm to bend and straighten and provides much of the elbow's stability.

Humerus

The long bone of the upper arm, extending from the shoulder to the elbow. It joins the shoulder blade above and the radius and ulna below; fractures can injure nearby nerves or blood vessels.

Humerus Fracture

A break in the upper-arm bone caused by trauma, falls, overuse, or weakened bone. Pain, swelling, deformity, and impaired movement may occur, with assessment for nerve and vascular injury.

Humidifier

A device that adds moisture to air; medical humidifiers require appropriate cleaning and water handling because contaminated equipment can disperse infectious or inflammatory material.

Humidifier Fever

A flu-like illness caused by inhalation of microorganisms or biologic contaminants from a contaminated humidifier or ventilation system, often involving fever, chills, cough, and malaise.

Humidity

The amount of water vapor in air, influencing heat loss, respiratory comfort, skin hydration, and survival or transmission of some microorganisms.

Humor

In anatomy, a fluid of the body, especially the aqueous or vitreous humor of the eye; in ordinary language, it means a sense of amusement or comedy.

Humoral Immunity

The part of the immune system that protects mainly through antibodies made by B cells. Antibodies can block germs and toxins and help other immune cells remove them.

Hunchback

A nontechnical term usually referring to pronounced kyphosis, an excessive forward curvature of the upper spine. Causes include osteoporosis, vertebral compression fractures, Scheuermann disease, degenerative change, and congenital disorders; evaluation depends on age, progression, pain, and neurologic findings.

Hunger

The physical drive to eat, influenced by stomach fullness, blood glucose, hormones such as ghrelin, emotions, habits, illness, and the availability or appeal of food.

Hungry Bone Syndrome

A severe drop in blood calcium after treatment of overactive parathyroid glands, often after surgery. Healing bones rapidly take up calcium and other minerals, causing tingling, cramps, spasms, seizures,

or abnormal heart rhythms.

Hunter's Syndrome

Alternate spelling; see *Hunter Syndrome*.

Hunter Syndrome

An inherited condition, usually affecting boys, in which iduronate-2-sulfatase deficiency causes complex sugars to accumulate in tissues. It can cause coarse facial features, enlarged organs, stiff joints, hearing loss, breathing problems, and developmental difficulties.

Huntington Disease

A progressive, inherited neurodegenerative disorder caused by a faulty gene that produces a toxic form of the huntingtin protein, leading to the gradual breakdown of nerve cells in the brain. Symptoms usually emerge in adulthood (between ages 30 and 50) and include involuntary jerking or writhing movements (chorea), poor coordination, mood swings, personality changes, and progressive cognitive decline.

Alternate Names:
Huntington's Disease; Huntington Chorea

Huntington's Chorea (HD)

Alternate name; see *Huntington Disease*.

Huntington's Disease (HD)

Alternate name; see *Huntington Disease*.

Hurler Disease

Alternate name for severe mucopolysaccharidosis type I; see *Mucopolysaccharidosis Type I*.

Hurler Syndrome

Mucopolysaccharidosis type I (MPS I), the severe form, an autosomal recessive lysosomal storage disorder caused by alpha-L-iduronidase deficiency (IDUA gene mutations). Accumulation of dermatan sulfate and heparan sulfate leads to progressive multisystem involvement.

Hurthle Cell

A thyroid follicular cell with abundant granular mitochondria-rich cytoplasm, seen in Hashimoto thyroiditis and Hürthle-cell neoplasms.

Hurthle Cell Cancer

A rare thyroid cancer arising from Hurthle cells, with behavior ranging from indolent to aggressive.

Alternate Names:
Oxyphilic Thyroid Carcinoma; Oncocytoid Carcinoma

Hurthle Cell Carcinoma (Oncocytic Carcinoma)

A differentiated thyroid cancer composed predominantly of oncocytic, or Hurthle, cells. It may behave more aggressively than some other differentiated thyroid cancers and is evaluated with thyroid imaging, cytology or histology, staging, and molecular findings.

Hürthle Cell Tumour

A growth arising from hormone-making cells in the thyroid. It may be benign or cancerous; ultrasound and examination of thyroid tissue help determine its nature and treatment.

Hutchinson-Gilford Progeria Syndrome

An extremely rare, fatal autosomal dominant progeroid disorder caused by a de novo point mutation in the *LMNA* gene that produces an aberrant, farnesylated lamin A protein called progerin, resulting in accelerated nuclear instability, premature aging, alopecia, atherosclerosis, and death from stroke or myocardial infarction in adolescence.

Alternate Names:
Progeria; HGPS

Hutchinson-Gilford Progeria Syndrome (HGPS)

Alternate name; see *Hutchinson-Gilford Progeria Syndrome*.

Hutchinson-Gilford Syndrome (HGPS)

Alternate name; see *Hutchinson-Gilford Progeria Syndrome*.

Hutchinson Sign

In herpes zoster ophthalmicus, vesicles on the tip, side, or root of the nose indicate involvement of the nasociliary branch of the ophthalmic division of the trigeminal nerve (cranial nerve V1). This sign is associated with increased risk of eye complications, but eye involvement can occur without nasal lesions.

Alternate Names:
Hutchinson's Sign; Nasociliary Zoster Sign

Hutchinson's Teeth

Hutchinson's teeth are permanently notched, widely spaced upper front teeth classically associated with congenital syphilis.

Hutchinson Teeth

A classic dental developmental abnormality occurring in congenital syphilis, characterized by permanent upper central incisors that are small, peg-shaped, or screwdriver-shaped with a distinctive central semilunar notch on their biting edge.

Alternate Names:
Hutchinson's Teeth; Notched Syphilitic Incisors

Hutchinson Triad

The classic diagnostic clinical triad of late congenital syphilis, consisting of chronic interstitial keratitis, eighth cranial nerve sensorineural deafness, and Hutchinson notched central incisors.

Alternate Names:
Hutchinson's Triad; Congenital Syphilis Triad

Hyaline

A glassy, translucent material or appearance, commonly describing proteinaceous deposits or homogeneous extracellular material seen microscopically in tissues.

Hyaline Cartilage

The most common type of cartilage, containing fine type II collagen fibers in a firm, glassy matrix. It supports airways, covers articular surfaces, and forms much of the fetal skeleton and growth plates.

Hyaline Casts

Clear, tube-shaped particles sometimes seen in urine. A small number may be normal, especially after exercise or dehydration; larger numbers can occur when the kidneys are under stress, with significance depending on other urine and blood findings.

Hyaline Membrane

A protein-rich layer that forms along the walls of damaged air sacs in the lungs. It blocks oxygen transfer and is classically seen in newborn respiratory distress caused by inadequate surfactant.

Hyalitis

Inflammation of the vitreous body of the eye, usually associated with intraocular infection, autoimmune inflammation, trauma, or another ocular disorder. It may cause floaters, blurred vision, or visual loss and requires ophthalmic assessment.

Hyaloid Canal

A narrow channel through the vitreous body of the eye that marks the former path of the hyaloid artery from the optic disc toward the lens during fetal development.

Hyaluronic Acid

A naturally occurring carbohydrate polymer that binds water in connective tissue, skin, joints, and the eye.

Alternate Names:
Hyaluronan; Sodium Hyaluronate

Hyaluronidase

An enzyme that breaks down hyaluronic acid in connective tissue. Medicines containing it can help injected fluids or medicines spread through tissue and may also dissolve certain hyaluronic-acid cosmetic fillers.

Hyaluronoglucosaminidase

An enzyme that degrades hyaluronan and related glycosaminoglycans; hyaluronidase preparations can increase tissue permeability and assist dispersion of injected fluids or medicines.

Hybridoma

A cell line formed by fusing an antibody-producing B lymphocyte with an immortal myeloma cell, allowing continuous production of a monoclonal antibody.

Hycanthone

An older antiparasitic drug formerly used against schistosomiasis; its use was abandoned or restricted because of serious toxicity, including liver injury and carcinogenic concern.

Hydatid Cyst

A cyst caused by the larval stage of Echinococcus granulosus, a tapeworm transmitted from dogs to humans through ingestion of contaminated food. The liver is the most commonly affected organ, followed by the lungs. Cysts grow slowly and may become symptomatic from mass effect or rupture, causing anaphylaxis.

Hydatid Disease

A parasitic infection caused by *Echinococcus* tapeworms. People usually become infected by swallowing eggs from infected dogs or contaminated food, water, or soil. Slow-growing fluid-filled cysts can form, most often in the liver or lungs. A leaking or burst cyst can cause a severe allergic reaction and spread the infection; treatment depends on the cyst and may include medicine, a procedure, or surgery.

Alternate Names:
Echinococcosis; Cystic echinococcosis; Hydatidosis

Hydatidiform Mole

A form of gestational trophoblastic disease in which abnormal trophoblastic tissue grows in the uterus. A complete mole has no viable fetus; a partial mole may contain abnormal fetal tissue. Both require follow-up because persistent disease can occur.

Hydralazine

Hydralazine is a direct arteriolar vasodilator used for selected hypertension, including severe hypertension in pregnancy; reflex tachycardia, fluid retention, headache, and drug-induced lupus are recognized adverse effects.

Hydramnios

Excess amniotic fluid during pregnancy, also called polyhydramnios, caused by fetal swallowing impairment, maternal diabetes, multiple gestation, fetal anomalies, infection, or sometimes no identifiable cause.

Hydranencephaly

A rare brain development disorder in which most of the upper brain is replaced by fluid-filled spaces. It can cause severe developmental and movement problems, seizures, feeding difficulty, and a shortened life expectancy.

Hydrarthrosis

Abnormal accumulation of clear synovial fluid within a joint, producing swelling and restricted movement; causes include osteoarthritis, inflammatory arthritis, trauma, and infection.

Hydration

The body's water balance and the process of replacing water and electrolytes lost through urine, stool, sweat, breathing, vomiting, or bleeding.

Hydrazine

A colorless, volatile, and flammable chemical compound with an ammonia-like odor. While widely recognized in industry and aerospace as a high-energy rocket fuel, hydrazine derivatives have played significant roles in medicine as chemical building blocks for certain antibiotics (such as the tuberculosis drug isoniazid) and antidepressant medications.

Alternate Names:
Hydrazines; Diamine

Hydrazines

Plural form; see *Hydrazine*.

Hydrazine Sulfate

A hydrazine-containing chemical once promoted experimentally for cancer-related symptoms; evidence of benefit is inadequate and toxicity can include liver injury, neuropathy, and seizures.

Hydrazones

Chemical compounds formed by reaction of hydrazine derivatives with aldehydes or ketones, important in medicinal chemistry, analytical chemistry, and some drug structures.

Hydroa Vacciniforme

A rare photodermatosis causing recurrent vesicles or papules on sun-exposed skin that heal with variolifform scars; some cases are associated with Epstein-Barr virus.

Hydrocarbon

An organic compound composed only of carbon and hydrogen; ingestion or inhalation of petroleum hydrocarbons can cause chemical pneumonitis and systemic toxicity.

Hydrocarbon Pneumonia

Lung inflammation caused by inhaling or aspirating petroleum products or other hydrocarbons, which can produce cough, breathing difficulty, and chemical pneumonitis.

Hydrocarbon Toxicity

Poisoning from petroleum distillates or other hydrocarbons, with the greatest danger often being aspiration and chemical pneumonitis after ingestion. Cough, choking, hypoxia, respiratory failure, central nervous system depression, or dysrhythmias may occur; treatment is mainly respiratory and supportive because vomiting or routine gastric lavage can worsen aspiration.

Hydrocele

A collection of fluid around a testicle. It may be present from birth or develop after infection, injury, or another problem. It often causes painless swelling; examination and, when needed, ultrasound help confirm the cause.

Hydrocele Repair

Surgery to close or remove the fluid-containing sac around a testicle when a hydrocele is persistent, large, painful, associated with a hernia, or obscures examination.

Hydrocephalus

A buildup of fluid in spaces inside the brain called ventricles. These spaces can enlarge and sometimes raise pressure inside the skull. It may be present at birth or develop later, often because fluid cannot flow or drain normally. Signs vary with age and can include a rapidly growing head in babies or walking, vision, memory, or bladder problems in adults.

Hydrocephalus Acquired

Acquired hydrocephalus is abnormal accumulation of cerebrospinal fluid after birth due to obstruction, impaired absorption, or rarely excess production; raised intracranial pressure may cause headache, vomiting, gait or cognitive change, and visual symptoms.

Hydrocephalus Ex-Vacuo

Enlargement of the brain's ventricles secondary to loss or shrinkage of surrounding brain tissue, rather than primarily from obstructed cerebrospinal-fluid flow.

Hydrocephaly

Hydrocephalus: abnormal accumulation or circulation of cerebrospinal fluid that enlarges the ventricles and may increase pressure on the brain.

Hydrochloric Acid

The strong acid in stomach juice that helps digest proteins and kill many swallowed microorganisms. The stomach's mucus lining and other protective mechanisms normally prevent this acid from damaging its tissues.

Hydrochloric Acid Poisoning

A corrosive injury after swallowing, inhaling, or contacting hydrochloric acid. It can burn the mouth, throat, esophagus, stomach, skin, or lungs and may cause airway swelling, bleeding, or perforation.

Hydrochlorothiazide

Hydrochlorothiazide is a thiazide diuretic that inhibits sodium-chloride reabsorption in the distal convoluted tubule and treats hypertension and mild oedema; hypokalaemia, hyponatraemia, hyperuri-

caemia, and photosensitivity may occur.

Hydrocodone

An opioid analgesic used for moderate to severe pain and, in some formulations, cough; it can cause respiratory depression, sedation, constipation, tolerance, dependence, and overdose.

Hydrocodone And Acetaminophen Overdose

Taking too much of this opioid-and-pain-reliever combination can slow breathing and cause coma, while acetaminophen can severely damage the liver. Emergency treatment is needed even before symptoms appear.

Hydrocodone Bitartrate

The bitartrate salt of hydrocodone, an opioid analgesic that can cause sedation, constipation, respiratory depression, tolerance, dependence, and overdose.

Hydrocodone/Oxycodone Overdose

Taking too much hydrocodone or oxycodone can cause extreme sleepiness, pinpoint pupils, slow or stopped breathing, coma, and death. Treatment may include naloxone, assisted ventilation, and close monitoring.

Hydrocolpos

Distension of the vagina with fluid due to obstruction of the vaginal outlet, often from an imperforate hymen or transverse septum, presenting as a pelvic mass in neonates or adolescents.

Hydrocortisone

A corticosteroid identical or similar to the body's cortisol. It reduces inflammation and immune activity and treats adrenal hormone deficiency; prolonged or high-dose use can cause infection, high blood sugar, skin thinning, or adrenal suppression.

Hydrocyanic Acid Poisoning

A life-threatening poisoning that prevents cells from using oxygen. It can cause sudden headache, confusion, seizures, breathing failure, cardiovascular collapse, and death; emergency antidote treatment is required immediately.

Hydroflumethiazide

An older thiazide diuretic that increases urinary salt and water loss to lower blood pressure or reduce swelling. It can disturb sodium, potassium, and glucose levels and may cause dehydration or increased uric acid.

Hydrofluoric Acid Exposure

Contact with hydrofluoric acid, which can cause deep tissue injury and systemic fluoride toxicity, including dangerous low calcium and cardiac arrhythmias.

Hydrofluoric Acid Poisoning

A medical emergency after contact with or inhalation of hydrofluoric acid. It can cause deep tissue burns and dangerous low calcium, heart rhythm changes, or death, even when the skin injury looks minor.

Hydrogel

A water-rich three-dimensional material that can hold and release substances. Hydrogels are used in wound dressings, contact lenses, drug delivery, tissue engineering, and research, with safety depending on composition and use.

Hydrogenation

A chemical process that adds hydrogen to a compound; in foods it can convert liquid oils into more solid fats.

Hydrogen Bond

A weak attraction between a hydrogen atom attached to an electronegative atom and another electronegative atom. These bonds help maintain the shapes of proteins and DNA and influence water's properties.

Hydrogen Breath Test

A test for some causes of bloating, diarrhea, or

abdominal pain. After drinking a measured sugar solution, the person breathes into collection tubes at intervals. The gases can suggest poor sugar absorption or excess bacteria in the small intestine.

Hydrogen Cyanide

A rapidly acting cellular toxin that inhibits cytochrome oxidase and prevents oxidative phosphorylation; significant exposure can cause severe lactic acidosis, seizures, cardiovascular collapse, and death.

Hydrogen-Ion Concentration

The concentration of hydrogen ions in a solution, expressed through pH and central to acid–base physiology, enzyme activity, and interpretation of blood-gas results.

Hydrogen Peroxide

An oxidizing chemical used in some antiseptic and industrial products; ingestion or concentrated exposure can injure tissue and release gas, causing embolic or respiratory complications.

Hydrogen Peroxide Poisoning

Harm after swallowing or inhaling hydrogen peroxide. It may irritate or burn tissues and release gas that blocks blood vessels; concentrated products can cause severe injury, so urgent poison-control or emergency advice is required.

Hydrogen Sulfide

A toxic, flammable gas with a rotten-egg odor at low concentrations that inhibits cellular respiration and can rapidly cause respiratory failure, neurologic effects, or death.

Hydromorphone

Hydromorphone is a potent opioid analgesic for severe pain; sedation, constipation, respiratory depression, tolerance, and dependence are important risks, especially with alcohol or other sedatives.

Hydromorphone Overdose

Taking too much hydromorphone, an opioid, can cause extreme sleepiness, pinpoint pupils, slow or stopped breathing, coma, and death. Treatment may include naloxone, assisted ventilation, and close monitoring.

Hydromyelia

Abnormal widening of the central canal of the spinal cord, which may be congenital or associated with obstruction of cerebrospinal-fluid flow and neurologic symptoms.

Hydronephrosis

Swelling of a kidney because urine cannot drain normally. Causes include a stone, narrowing, reflux, a tumor, or prostate enlargement. Prolonged or severe blockage can damage the kidney and may cause pain, infection, or reduced kidney function.

Hydronephrosis In Newborns

Swelling of a newborn's kidney caused by widened urine-collecting spaces. It may result from temporary changes, blockage, or urine flowing backward and can affect one or both kidneys.

Hydronephrosis Of One Kidney

Dilation of one kidney's renal pelvis and calyces caused by impaired urine drainage, often from a stone, stricture, reflux, or obstruction of the ureter or ureteropelvic junction.

Hydrophobia

An involuntary, agonizing spasm of the throat and vocal cord muscles triggered by attempting to drink or by the sight, sound, or mention of water. It is the hallmark neurological sign of furious (encephalitic) rabies, caused by viral damage to brainstem swallowing centers. The severe choking and pain make swallowing impossible, leading to a terrified avoidance of liquids, excessive drooling (hypersalivation), and often aerophobia (spasms triggered by a draft of air). Once hydrophobia appears, rabies is nearly 100% fatal, highlighting the critical need for immediate post-exposure rabies vaccination following animal bites.

Alternate Names:
Rabic Hydrophobia; Rabid Pharyngeal Spasms;

Fear of Water in Rabies

Hydropneumothorax

Air and fluid collected together in the space around a lung. It can compress the lung and cause chest pain or severe breathing difficulty, often requiring urgent hospital treatment and drainage.

Hydrops

Abnormal accumulation of fluid in tissues or body cavities. In fetal medicine, *hydrops fetalis* means abnormal fluid in at least two fetal compartments, such as the skin, abdomen, space around the lungs, or space around the heart. Outside this use, the affected site should be specified.

Hydrops Fetalis

Severe fluid buildup in an unborn baby, affecting at least two areas such as under the skin, around the lungs, around the heart, or in the abdomen. Causes include blood-group incompatibility, anemia, infection, genetic conditions, heart problems, and complications of twin pregnancy.

Hydrops Of The Gallbladder

Distension of the gallbladder by clear mucus or watery fluid, usually caused by prolonged obstruction of the cystic duct by a gallstone. It may cause right-upper-quadrant pain and can progress to inflammation or infection.

Hydrosalpinx

A fallopian tube swollen with trapped fluid because its end near the ovary is blocked. Scarring from a past pelvic infection is a common cause; endometriosis or pelvic surgery can also block the tube. It may cause no symptoms but can make it harder to become pregnant.

Hydrotherapy

Exercise or treatment performed in water. Water supports body weight and provides gentle resistance, which may reduce pain and help movement, strength, and balance during rehabilitation. Programs vary with a person's condition and safety needs.

Hydrothorax

An abnormal collection of clear fluid in the pleural space around a lung. It may result from heart, liver, kidney, or other disease and can cause breathlessness, cough, or chest pressure.

Hydroureter

Abnormal enlargement of a ureter caused by impaired urine drainage.

Hydroxamic Acid

An organic functional group containing hydroxylamine attached to a carbonyl, found in chelators and some medicines, including histone-deacetylase inhibitors.

Hydroxocobalamin

A cobalt-containing form of vitamin B12 used as an antidote for cyanide poisoning. It binds cyanide to form cyanocobalamin, which is excreted in urine; it can cause red discoloration of skin and body fluids and interfere with some laboratory tests.

Hydroxyapatite

A calcium-and-phosphate mineral that gives much of their hardness to bones and teeth. Bone cells continually remove and replace it as bone grows, repairs itself, and responds to changing physical forces.

Hydroxychloroquine

Hydroxychloroquine is an antimalarial and immunomodulatory drug used for malaria prevention or treatment and selected autoimmune diseases; cumulative retinal toxicity requires ophthalmic monitoring.

Hydroxychloroquine Retinopathy

Retinal damage caused by hydroxychloroquine, usually after prolonged exposure, affecting the parafoveal or pericentral retina around the macula. Early changes may cause no symptoms; progression can produce blind spots or loss of central vision. Damage is often irreversible, and advanced disease may continue to worsen after the drug is stopped. Risk increases with higher daily doses, longer use,

kidney disease, tamoxifen use, and older age when treatment begins.

Alternate Names:
Hydroxychloroquine Retinal Toxicity

Hydroxycholesterols

Oxidized forms of cholesterol produced in the body or during food processing. They participate in cell signaling and cholesterol regulation and may contribute to inflammation or blood-vessel disease when present in excess.

Hydroxylase Deficiency (21-Hydroxylase)

An inherited condition in which the adrenal glands cannot make enough of certain hormones. It can cause salt loss, low blood pressure, and excess male-type hormones, and is the most common cause of congenital adrenal hyperplasia.

Hydroxylation

An enzymatic or chemical reaction that adds a hydroxyl group to a molecule, often altering the activity, solubility, metabolism, or excretion of a drug or biomolecule.

Hydroxyproline

An amino acid formed mainly by post-translational modification of collagen; its measurement has been used as an indicator of collagen turnover but is not a routine diagnostic test.

Hydroxyprolinemia

A rare inherited metabolic finding caused by impaired hydroxyproline breakdown, leading to elevated hydroxyproline in blood or urine and usually little clinical illness.

Hydroxysteroid

A steroid hormone or steroid-related compound containing a hydroxyl group; hydroxysteroids include intermediates and products of adrenal and gonadal steroid metabolism.

Hydroxyurea

A medicine used for some blood cancers and sickle-cell disease. In sickle-cell disease it can reduce painful episodes and other complications by helping red blood cells remain less likely to sickle; blood counts and other safety tests are required.

Hydroxyzine

Hydroxyzine is a sedating H1-antihistamine used for itching, anxiety, and preoperative sedation; drowsiness, anticholinergic effects, and QT prolongation can occur.

Hydroxyzine Overdose

Taking too much hydroxyzine can cause severe drowsiness, confusion, agitation, seizures, low blood pressure, or dangerous heart-rhythm changes. Large or intentional overdoses can be life-threatening.

Hydrozoa

A group of mostly marine animals that includes hydroids and some jellyfish. Contact with certain species can cause painful stings or skin irritation; the medical risk depends on the species and exposure.

Hygiene

Practices that reduce exposure to pathogens and support health, including hand hygiene, oral care, skin care, food safety, and appropriate environmental cleanliness.

Hygiene Hypothesis

The theory that limited early-life microbial exposure may increase susceptibility to allergies and immune disorders.

Hygroma

A fluid-filled swelling, often caused by leakage or blockage of lymphatic vessels. A cystic hygroma usually appears in the neck of a fetus or child, while other hygromas may occur near joints or after injury.

Hygroma Colli

Alternate name for a cystic hygroma, a congenital lymphatic malformation usually involving the neck; see *Cystic Hygroma*.

Hymen

A thin fold of mucous membrane that partially covers the external opening of the vagina. The hymen is a remnant of fetal development, with no known physiological function in postnatal life.

Hymenectomy

Hymenectomy is a procedure to remove or open part of the hymen, usually to treat an obstructed hymenal opening or another symptomatic abnormality.

Hymenolepiasis

Intestinal infection with dwarf tapeworms, especially Hymenolepis nana, acquired by ingesting eggs; it may cause abdominal symptoms, diarrhea, or be asymptomatic.

Hymenolepis Diminuta

A tapeworm that can infect people who accidentally swallow infected insects, usually in contaminated food. Infection may cause abdominal discomfort, diarrhea, or no symptoms and is treated with an antiparasitic medicine.

Hymenolepis Nana

A small tapeworm that spreads when microscopic eggs are swallowed, often through contaminated hands, food, or water. It can cause abdominal pain, diarrhea, poor appetite, or no symptoms and is treatable with antiparasitic medicine.

Hymenolepis Tapeworm Infection

Intestinal infection with Hymenolepis nana or H. diminuta, acquired by ingesting eggs or infected arthropods and causing variable gastrointestinal symptoms.

Hymenoptera

An insect order that includes bees, wasps, hornets, and ants; stings or bites can cause pain, allergy, or life-threatening anaphylaxis.

Hyoid Bone

U-shaped bone in the anterior neck at C3, unique for not directly articulating with any other bone. Suspended by muscles and the stylohyoid ligament. Provides attachment for suprahyoid (digastric, stylohyoid, mylohyoid, geniohyoid) and infrahyoid (sternohyoid, sternothyroid, thyrohyoid, omohyoid) muscles.

Hyoscine

A medicine that blocks muscarinic acetylcholine receptors. Depending on the preparation, it can prevent motion sickness, reduce spasms, or lessen secretions; dry mouth, blurred vision, constipation, confusion, and urinary retention may occur.

Hyoscyamine

An antimuscarinic medicine that reduces smooth-muscle spasm and secretions; it may be used for selected gastrointestinal or urinary symptoms and can cause dry mouth, blurred vision, urinary retention, or confusion.

Hyperactivity

Excessive or developmentally inappropriate motor activity, restlessness, or difficulty remaining still; persistent impairment may occur in ADHD, mania, substance effects, or other conditions.

Hyperacusis

Reduced tolerance to ordinary environmental sounds, which may be perceived as excessively loud, painful, or distressing. It can occur with hearing disorders, migraine, head injury, neurologic conditions, or without an identifiable cause.

Hyperacute Rejection

A rare, immediate form of transplant rejection caused by preexisting antibodies against donor antigens, usually ABO blood-group or HLA antigens. Antibody activity injures graft blood vessels, causing clotting, loss of blood supply, and rapid graft failure within minutes to hours. Compatibility testing has made it uncommon.

Hyperadrenocorticism

Excess production or exposure to adrenal glucocorticoids, especially cortisol; in humans it causes

Cushing syndrome, which may result from adrenal, pituitary, ectopic, or medication-related causes.

Hyperaemia

Increased blood flow to a tissue, making it look red or feel warm. It may be a normal response to activity or a response to inflammation or renewed blood flow after temporary blockage.

Hyperaesthesia

Unusually strong sensitivity to touch, pain, temperature, or other sensations. It may occur with nerve injury, inflammation, migraine, medicines, or disorders affecting the brain or spinal cord.

Hyperaldosteronism

Excess production of the adrenal hormone aldosterone. It can cause high blood pressure, low potassium, muscle weakness, cramps, thirst, and frequent urination; an adrenal growth or overactivity of both glands may be responsible.

Hyperaldosteronism Complications

Beyond hypertension and hypokalemia, primary hyperaldosteronism causes target organ damage including left ventricular hypertrophy, fibrosis, stroke, coronary artery disease, atrial fibrillation, and chronic kidney disease. These complications occur at higher rates than in essential hypertension of similar severity.

Hyperalgesia

Feeling more pain than expected from something that normally hurts. It can happen with inflammation, nerve injury, changes in nervous-system pain processing, or opioid use; it differs from allodynia, which is pain from a normally painless touch.

Hyperammonemia

An abnormally high level of ammonia in the blood. It may result from severe liver disease, an inherited metabolic disorder, medicines, or other illness and can cause confusion, sleepiness, vomiting, seizures, coma, or brain swelling.

Hyperammonemia due to Ornithine Transcarbamylase Deficiency

An inherited urea-cycle disorder in which ornithine transcarbamylase deficiency causes ammonia to accumulate, potentially producing vomiting, confusion, seizures, brain swelling, or coma.

Hyperamylasemia

An elevated blood amylase concentration caused by pancreatic or salivary-gland disease, reduced clearance, macroamylasemia, or other conditions; it is not diagnostic of pancreatitis by itself.

Hyperargininemia

An inherited urea-cycle disorder caused by arginase deficiency, leading to high arginine and progressive spasticity, developmental impairment, seizures, or liver-related findings.

Alternate Names:
Arginase Deficiency

Hyperbaric

Having a pressure greater than the surrounding atmospheric pressure; hyperbaric oxygen therapy delivers oxygen at increased pressure for selected medical indications.

Hyperbaric Chamber

A pressurized chamber in which a person breathes oxygen or another gas at pressure above sea level, used for conditions such as decompression sickness, air embolism, and selected wounds.

Hyperbaric Oxygen Therapy

Breathing oxygen inside a chamber pressurized above normal air pressure. The treatment increases oxygen dissolved in the blood and is used for selected problems such as carbon-monoxide poisoning, decompression sickness, and certain severe wounds or infections.

Hyperbilirubinaemia

Hyperbilirubinaemia is an abnormally high level of bilirubin in the blood, which can cause jaundice and may result from increased breakdown of red cells, liver disease, or blocked bile flow.

Hyperbilirubinemia

An abnormally high concentration of bilirubin in blood that may cause jaundice; causes include hemolysis, impaired liver processing, hepatocellular injury, and bile-duct obstruction.

Hypercalcaemia

Alternate British spelling; see *Hypercalcemia*.

Hypercalcemia

An abnormally high level of calcium in the blood. It may be caused by overactive parathyroid glands, cancer, medicines, or other conditions. Symptoms can include thirst, frequent urination, constipation, nausea, weakness, confusion, kidney stones, or abnormal heart rhythms.

Alternate Names:
High Blood Calcium; Hypercalcaemia; Elevated Serum Calcium

Hypercalcemia Of Malignancy

A high blood-calcium level caused by cancer. It may occur because the cancer releases substances that raise calcium or damages bone. Severe cases can cause thirst, vomiting, weakness, confusion, kidney injury, or abnormal heart rhythms.

Hypercalcemia-Supravalvar Aortic Stenosis

A combination of high blood calcium and narrowing above the aortic valve, classically associated with Williams syndrome; see *Williams Syndrome*.

Hypercalcemic Small Cell Ovarian Carcinoma

A rare, highly aggressive ovarian tumor in young patients, often associated with alterations in SMARCA4 and sometimes presenting with hypercalcemia.

Hypercalciuria

Excessive urinary calcium excretion, which can promote calcium kidney stones and, in some settings, bone mineral loss; evaluation considers diet, medications, kidney function, and endocrine causes.

Hypercapnia

An abnormally high level of carbon dioxide in arterial blood, usually defined as a $PaCO_2$ above 45 mmHg. It occurs when the lungs do not remove carbon dioxide as quickly as the body produces it, often because ventilation is inadequate. Causes include lung disease, impaired breathing muscles, chest-wall disorders, or reduced brain drive to breathe. Severe hypercapnia may cause headache, drowsiness, confusion, or reduced consciousness; it is not synonymous with respiratory acidosis.

Hypercementosis

Excessive deposition of cementum around a tooth root, producing a bulbous root contour that can complicate extraction but is often asymptomatic.

Hyperchloremia

A higher-than-normal level of chloride in the blood. Chloride is a charged particle from salt that helps balance body fluids and acids. High levels may occur with dehydration, kidney disease, or other changes in acid balance. The result is interpreted with other blood tests and a person's health.

Hyperchloremic Acidosis

A normal-anion-gap metabolic acidosis in which bicarbonate loss is accompanied by a relative rise in chloride. Causes include gastrointestinal bicarbonate loss, renal tubular acidosis, certain medicines, and excessive chloride administration.

Hypercholesterolaemia

Alternate spelling; see *Hypercholesterolemia*.

Hypercholesterolemia

An abnormally high concentration of cholesterol in the blood, often involving LDL or non-HDL cholesterol. It may be inherited or associated with other conditions or medicines; it usually causes no symptoms but contributes to atherosclerotic plaque formation and cardiovascular disease risk.

Hypercoagulable State

A condition in which blood clots more easily than usual, increasing the risk of deep-vein thrombosis,

pulmonary embolism, stroke, or other clots. Causes may be inherited or acquired, including cancer, pregnancy, some medicines, inflammation, or prolonged immobility.

Hypercortisolism

Excessive exposure of body tissues to cortisol or related glucocorticoids, from internal overproduction or external sources such as glucocorticoid medicines. Sustained pathological excess can cause Cushing syndrome; temporary elevations associated with stress or illness do not necessarily meet criteria for the syndrome.

Hypercyanotic Tetralogy

A sudden episode of worsening blue or gray color, rapid breathing, distress, or faintness in a child with Tetralogy of Fallot. It results from reduced blood flow to the lungs and is an emergency requiring immediate medical treatment.

Hyperelastic Skin

Skin that stretches farther than usual and recoils abnormally; generalized hyperextensibility may occur in connective-tissue disorders such as Ehlers-Danlos syndromes.

Hyperemesis

Excessive or persistent vomiting that can cause dehydration, abnormal body salts, weight loss, and poor nutrition. It may result from pregnancy, infection, medicines, digestive disease, brain illness, or other causes.

Hyperemesis Gravidarum

Severe nausea and vomiting during pregnancy that causes dehydration, weight loss, or abnormal body salts and prevents adequate food or fluid intake. It often begins early in pregnancy and may require fluids, nutrition, medicines, and hospital care.

Hyperemia

Increased blood flow to a tissue, causing redness and warmth; it may be an active physiologic response to exercise or inflammation or a reactive response after temporary ischemia.

Hyperemia Grade

A graded clinical or endoscopic estimate of tissue redness and vascular congestion, used to describe the severity of inflammation or mucosal irritation.

Hyperesthesia

Increased sensitivity to sensory stimulation—touch (tactile), pain (hyperalgesia), or other stimuli—so that normally non-painful or mildly painful stimuli produce exaggerated discomfort.

Hyperextension

Movement that extends a joint beyond its usual neutral or anatomical range, potentially stretching or tearing ligaments, capsules, muscles, or nerves.

Hyperfibrinogenemia

An abnormally high level of fibrinogen, a blood protein needed for clotting. It often rises with inflammation, infection, pregnancy, obesity, or estrogen exposure and may be associated with increased clotting risk.

Hyperflexion

Excessive bending of a joint beyond its normal range, which can injure ligaments, discs, muscles, or other supporting structures.

Hypergammaglobulinemia

An excess of antibody proteins in the blood. It may result from long-term infection, inflammation, liver disease, or an abnormal immune-cell growth; testing determines whether many antibody types or one type is increased.

Hyperglycaemia

An abnormally high level of glucose in the blood. It may cause thirst, frequent urination, tiredness, or blurred vision and, if severe or prolonged, can damage organs or cause an emergency.

Hyperglycemia

A higher-than-normal level of glucose in the blood. Severe short-term elevation can cause excessive urination, dehydration, and dangerous changes in body

chemistry. Long-term elevation can damage the eyes, kidneys, nerves, heart, and blood vessels.

Hyperglycinemia

An abnormally high glycine concentration in blood, most notably in nonketotic hyperglycinemia, a disorder of glycine cleavage that can cause neonatal hypotonia, seizures, and developmental impairment.

Hypergonadotropic Hypogonadism

Reduced testicular or ovarian hormone production caused by gonad failure, with increased pituitary signals and possible infertility, absent periods, or delayed sexual development.

Hypergraphia

Excessive, compulsive, or unusually prolonged writing or drawing, sometimes associated with temporal-lobe epilepsy, mania, or other neurologic or psychiatric conditions.

Hyperhidrosis

Sweating in excess of what is needed to regulate body temperature. Primary hyperhidrosis often causes focal sweating of the palms, soles, underarms, or face in otherwise healthy people; secondary hyperhidrosis may result from medicines or an underlying disorder.

Hyperhomocysteinemia

An elevated blood homocysteine concentration associated with genetic enzyme defects, folate or vitamin B12 deficiency, kidney disease, medicines, and increased vascular or pregnancy-related risk in selected settings.

Hypericum Perforatum

St. John's wort, a plant used in some complementary products for depressive symptoms; it induces hepatic enzymes and transporters and can reduce the effects of many medicines or alter their blood levels.

Hyper-IgE Syndrome

A rare inherited immune disorder marked by very high levels of immunoglobulin E, eczema, and repeated skin or lung infections. Some forms also cause unusual bones, teeth, or blood vessels.

Hyper IgM Syndrome

Alternate spelling; see *Hyper-IgM Syndromes*.

Hyper-IgM Syndrome

See *Hyper-IgM Syndromes*.

Hyper-IgM Syndromes

Inherited immune disorders in which the body makes normal or high amounts of IgM antibodies but too little IgG, IgA, or IgE. People may develop repeated bacterial, viral, or fungal infections because antibody defenses do not mature normally.

Alternate Names:
HIGM

Hyperimmunization

Repeated or intensive exposure to an antigen, such as through vaccination or laboratory immunization, intended to produce a high antibody level. The term does not by itself describe an illness or harmful "over-vaccinated" state.

Hyperimmunoglobulin D Syndrome

A hereditary autoinflammatory disorder, usually caused by biallelic pathogenic variants in the mevalonate kinase gene. It causes recurrent episodes of fever, often with enlarged lymph nodes, abdominal symptoms, rash, and joint or muscle pain; it is the milder clinical form of mevalonate kinase deficiency.

Alternate Names:
HIDS

Hyperimmunoglobulin E Syndrome

A rare primary immunodeficiency characterized by very high IgE, eczema, recurrent skin and lung infections, and sometimes skeletal or dental abnormalities.

Hyperinsulinemia

An abnormally high insulin level in the blood, often caused by insulin resistance, excess insulin medicine,

or rarely an insulin-producing tumor. It may occur with normal or low glucose.

Hyperinsulinism

Excessive insulin secretion or action causing recurrent or persistent hypoglycemia; causes include congenital disorders, tumors, medications, and critical illness.

Hyperkalaemia

Alternate British spelling; see *Hyperkalemia*.

Hyperkalemia

An abnormally high concentration of potassium in the blood. Causes include impaired kidney excretion, medicines, tissue breakdown, or movement of potassium out of cells; haemolysis of a blood sample can produce pseudohyperkalemia. Hyperkalemia can disturb cardiac conduction and cause arrhythmias. ECG findings vary and do not reliably indicate the serum potassium concentration.

Alternate Names:
High Blood Potassium; Hyperkalaemia; Elevated Serum Potassium

Hyperkalemic Periodic Paralysis

An inherited muscle disorder causing repeated attacks of weakness or temporary paralysis. Attacks may follow rest after exercise, stress, or potassium-rich food and usually improve between episodes.

Hyperkeratosis

Thickening of the outer keratin layer of skin or mucosa, producing callus, scale, or rough plaques in response to friction, inflammation, infection, inherited disorders, or other causes.

Hyperkeratosis of Palm

Alternate name; see *Palmoplantar Hyperkeratosis*.

Hyperkeratosis of Palms

Alternate name; see *Palmoplantar Hyperkeratosis*.

Hyperkinesia

Excessive or involuntary movement, such as chorea, dystonia, tics, or tremor, resulting from abnormal activity in motor-control circuits or from drugs and other diseases.

Hyperlipasaemia

An abnormally high blood lipase concentration, often associated with pancreatic inflammation but also seen with kidney failure, gastrointestinal disease, medications, and other conditions.

Hyperlipidaemia

An abnormally high level of fats in the blood, including cholesterol or triglycerides. It may have no symptoms but can increase the risk of artery disease, heart attack, stroke, or pancreatitis.

Hyperlipidemia

Too much cholesterol or triglyceride fat in the blood. It usually causes no symptoms but can build up in artery walls, increasing the risk of heart attack and stroke; inherited disorders and other illnesses, medicines, diet, or alcohol can contribute.

Hyperlipoproteinemia

An excess of one or more lipoproteins in blood, producing high cholesterol or triglycerides and increasing risk of atherosclerosis, pancreatitis, or inherited lipid disease.

Hyperlordosis

Exaggerated inward curvature of the lumbar spine, often producing a swayback appearance and sometimes associated with pain, muscular imbalance, obesity, pregnancy, or structural spinal disease.

Hyperlordotic Posture

An exaggerated inward curvature of the lumbar spine, often producing increased anterior pelvic tilt and a prominent lower-back arch.

Hyperlysinemia

An inherited metabolic abnormality with elevated lysine in blood caused by altered lysine degradation; many people have few symptoms, but some have developmental or neurologic findings.

Hypermagnesemia

An abnormally high concentration of magnesium in the blood, often related to kidney failure or excessive magnesium intake; severe cases can cause weakness, low blood pressure, depressed reflexes, or arrhythmias.

Hypermetropia

Long-sightedness, in which the eye focuses light behind the retina instead of on it. Close objects may look blurred, and children may develop eye strain or an inward-turning eye.

Alternate Names:
Hyperopia; Farsightedness; Long-sightedness

Hypermobile Ehlers-Danlos Syndrome

An inherited connective-tissue disorder marked by unusually flexible or unstable joints, long-term muscle or joint pain, and other variable features involving the skin, automatic body functions, or digestion.

Hypermobile Joints

Joints that move farther than usual. This may cause no problems, or may lead to pain, repeated dislocations, sprains, fatigue, or joint instability.

Hypermobility

Greater-than-usual movement of one or more joints. It may be a harmless trait, but when associated with pain, instability, dislocations, fatigue, or other features it may be part of a hypermobility spectrum disorder.

Hypermobility Spectrum Disorder

A condition involving joint hypermobility together with symptoms such as pain, joint instability, soft-tissue injury, or fatigue, without meeting the criteria for another defined connective-tissue disorder.

Hypermobility Syndrome

Excessive joint movement associated with pain, instability, fatigue, or other symptoms; evaluation distinguishes generalized joint hypermobility from a defined hypermobility spectrum disorder or hypermobile Ehlers-Danlos syndrome.

Hypermotility

Abnormally rapid or excessive movement of an organ, especially the digestive tract. It may cause cramping, urgency, diarrhea, or poor absorption and can result from infection, medicines, inflammation, or other disorders.

Hypernatraemia

An abnormally high level of sodium in the blood, usually because the body has too little water. It may cause thirst, weakness, confusion, seizures, or coma.

Hypernatremia

A high blood-sodium level, usually because the body has lost too much water or cannot obtain enough. It can cause intense thirst, weakness, confusion, seizures, or coma.

Hypernatremia Result

A high blood sodium result, usually reflecting too little free water relative to body sodium; severity and rate of onset determine neurologic risk and the urgency and speed of correction.

Hyperopia

Alternate name; see *Hypermetropia*.

Hyperornithinemia

An elevated blood ornithine concentration caused by defects in ornithine metabolism or transport, including disorders that can produce retinal degeneration or neurologic disease.

Hyperosmolar

Having more dissolved particles than another fluid. When blood becomes too concentrated, water moves out of cells and can cause dehydration, confusion, or other nervous-system problems.

Hyperosmolar Hyperglycemic State

A life-threatening condition in which very high blood glucose causes severe dehydration and concentrated body fluids, usually with little or no ketone buildup. It may cause extreme thirst, weakness, confusion,

seizures, or coma.

Hyperosmolar Non-Ketotic Coma

A life-threatening complication of very high blood glucose, usually in type 2 diabetes, causing severe dehydration and sometimes confusion, seizures, or coma.

Hyperostosis

Abnormal excessive formation or thickening of bone, which may be localized or widespread and may occur in skeletal dysplasias, inflammation, endocrine disease, or medication effects.

Hyperoxaluria

An excess of oxalate in the urine, which can combine with calcium to form kidney stones or calcium deposits. Severe inherited forms can progressively damage the kidneys.

Hyperoxia

Exposure to an abnormally high oxygen concentration or tissue oxygen level, which can cause oxygen toxicity, absorption atelectasis, retinal injury in premature infants, or lung injury depending on dose and duration.

Hyperparakeratosis

Thickening of the outer skin layer in which cells retain their nuclei instead of fully maturing. It may produce rough scale and can result from irritation, inflammation, infection, or an inherited skin disorder.

Hyperparathyroid Bone Disease

Bone changes caused by prolonged high levels of parathyroid hormone. The hormone can increase bone breakdown, lowering bone strength and raising fracture risk; severe long-standing disease can cause osteitis fibrosa cystica.

Hyperparathyroidism

A disorder in which the parathyroid glands release too much parathyroid hormone. Primary hyperparathyroidism usually begins in a gland and often raises blood calcium; secondary hyperparathyroidism is a response to problems such as chronic kidney disease or vitamin D deficiency and may have normal or low calcium. Tertiary hyperparathyroidism can develop after long-standing secondary disease.

Hyperpathia

An unusually strong and sometimes delayed pain response to a painful stimulus. It may occur after nerve injury or with disorders that change how the nervous system processes pain.

Hyperphagia

An unusually strong or excessive appetite. It can occur with diabetes, some genetic or brain disorders, certain medicines, or mental health conditions.

Hyperphosphatemia

A high phosphate level in the blood, most often caused by kidney disease. It can disturb calcium balance, weaken bones, and contribute to calcium deposits in blood vessels or soft tissues.

Hyperpigmentation

Darkening of an area of skin because the body makes or stores more pigment there. Causes include sun exposure, inflammation, injury, medicines, hormone disorders, and some skin or internal diseases.

Hyperpituitarism

Excess production of one or more pituitary hormones, most often by a pituitary tumor. Growth-hormone excess can cause acromegaly in adults or gigantism in children; excess adrenocorticotropic hormone can cause Cushing disease; and excess prolactin can cause galactorrhea or reduced fertility.

Hyperplasia

An increase in the number of cells in a tissue or organ, which may make it larger. It can be a normal response or result from disease, hormones, or other stimuli.

Hyperplastic Polyp

A usually noncancerous overgrowth of lining cells, often in the colon or rectum, whose cancer risk depends on size, number, and location.

Hyperpnea

Breathing that is deeper, and sometimes faster, than normal, increasing air movement and occurring with exercise, illness, metabolic changes, or anxiety.

Hyperpnoea

Breathing that is deeper or faster than usual to meet increased demand for oxygen or remove extra carbon dioxide. It may occur during exercise, fever, anxiety, or lung, heart, or metabolic illness.

Hyperpolarization

An electrical change that makes a nerve or muscle cell less likely to send a signal. It occurs when the inside of the cell becomes more electrically negative after certain ion channels open.

Hyperprolactinaemia

An abnormally elevated concentration of prolactin in the blood. Causes include medicines, pregnancy, hypothyroidism, pituitary tumors, and other disorders.

Hyperprolactinemia

An abnormally high level of prolactin, a hormone that supports milk production, in the blood. Levels normally rise during pregnancy and breastfeeding; other causes include certain medicines, an underactive thyroid, kidney disease, or a prolactin-producing pituitary tumor. It may cause milk discharge, irregular or absent periods, low sex drive, erectile problems, or infertility; some people have no symptoms.

Hyperproteinemia

An abnormally high total blood-protein concentration, usually from dehydration, chronic inflammation, or a monoclonal immunoglobulin disorder.

Hyperpyrexia

An extreme elevation of body temperature, generally above 41.5 °C, that can result from severe infection, heatstroke, malignant hyperthermia, drug toxicity, or other life-threatening conditions.

Hyperreactio Luteinalis

Bilateral ovarian enlargement with multiple theca-lutein cysts caused by an exaggerated response to human chorionic gonadotropin, usually during pregnancy or with trophoblastic disease.

Hyperreflexia

Exaggerated or overactive deep-tendon (stretch) reflexes. It is a neurologic sign, not a diagnosis, and often reflects impaired descending upper-motor-neuron control; it may occur with spasticity, clonus, or an extensor plantar response. Distribution and associated findings help distinguish central nervous-system disease from systemic or toxic causes.

Hypersensitivity

An exaggerated or inappropriate immune response to an antigen, ranging from a mild reaction to anaphylaxis.

Hypersensitivity Pneumonitis

Lung inflammation caused by repeated breathing of substances such as mold, bird proteins, or other workplace dusts. It may cause cough, breathlessness, fever, or fatigue and can lead to permanent lung scarring if exposure continues.

Hypersensitivity Reactions

Inappropriate or excessive immune responses causing tissue damage or disease.

Hypersensitivity Type I

An immediate allergic reaction in which immunoglobulin E antibodies activate mast cells after exposure to an allergen. Symptoms can include itching, hives, wheezing, vomiting, swelling, or life-threatening anaphylaxis.

Hypersensitivity Type II

An immune reaction in which IgG or IgM antibodies attach to targets on cells or tissues and recruit other immune mechanisms that injure them. Examples include some drug reactions and autoimmune blood-cell destruction.

Hypersensitivity Type III

An immune reaction in which clusters of antibodies and foreign or self proteins settle in tissues or blood vessels, causing inflammation and injury. It can affect the skin, joints, kidneys, or blood vessels.

Hypersensitivity Type IV

A delayed immune reaction driven by T cells rather than antibodies. It usually develops 48 to 72 hours after exposure and can cause contact dermatitis, some drug rashes, or inflammation around an infection.

Hypersensitivity Vasculitis

Inflammation of small blood vessels, usually in the skin, often triggered by an infection, medicine, or immune reaction. It commonly causes raised purple spots or bruising on the legs.

Hypersomnia

Being very sleepy during the day or sleeping much longer than usual even after enough sleep. It can be caused by sleep disorders, medicines, depression, substance use, or other illness; it is different from feeling tired without wanting to sleep.

Hypersomnia Disorder

Excessive daytime sleepiness or prolonged nighttime sleep episodes not explained by inadequate sleep duration; see *Hypersomnia* and *Idiopathic Hypersomnia*.

Hypersplenism

A condition in which an enlarged or overactive spleen removes blood cells too quickly. It may lower red cells, white cells, platelets, or all three and can cause anemia, infections, or easy bleeding.

Hypertelorism

An unusually wide distance between the eyes because the bony eye sockets are farther apart than usual. It may be present from birth or occur as part of a genetic or developmental condition.

Hypertension

A chronic cardiovascular condition commonly known as high blood pressure, in which the long-term force of circulating blood against artery walls is consistently elevated. Because it typically produces no noticeable symptoms, it is often called a 'silent killer.' Over time, unmanaged high blood pressure strains the heart and blood vessels, dramatically increasing the risk of heart attacks, heart failure, strokes, kidney disease, and vision loss.

Alternate Names:
High Blood Pressure; Arterial Hypertension; Essential Hypertension

Hypertension and Pregnancy

High blood pressure before or during pregnancy ranges from chronic or gestational hypertension to preeclampsia and eclampsia. It can affect the brain, kidneys, liver, placenta, and fetal growth; blood-pressure monitoring, appropriate medicines, laboratory tests, and fetal surveillance are essential.

Hypertension and the Kidney

High blood pressure can damage renal arteries and glomeruli, while kidney disease can activate salt-retaining and hormonal pathways that raise blood pressure. Their interaction can accelerate chronic kidney disease, so both blood pressure and kidney function require monitoring.

Hypertension In Anesthesia

Abnormally high blood pressure during or around an operation. Pain, inadequate anesthesia, low oxygen, high carbon dioxide, shivering, bladder fullness, or stopping certain medicines may contribute and increase the risk of bleeding, heart injury, or stroke.

Hypertension With Chronic Kidney Disease

Alternate wording; see *Hypertension and the Kid-*

ney.

Hypertensive

Having blood pressure that remains above the accepted range for the person's age, health, and measurement setting, increasing risk of heart, brain, kidney, or vessel disease.

Hypertensive Cerebellar Hemorrhage

Bleeding into the cerebellum caused by rupture of a vessel damaged by high blood pressure.

Hypertensive Crisis

A dangerously high blood pressure. When it causes new organ injury, such as stroke, heart failure, kidney injury, or vision loss, it is a hypertensive emergency requiring controlled blood-pressure treatment.

Hypertensive Emergency

A severe rise in blood pressure that is causing new injury to the brain, heart, kidneys, eyes, or major blood vessels. Symptoms may include chest pain, breathlessness, weakness, confusion, seizures, or vision loss; treatment involves controlled blood-pressure reduction and management of organ injury.

Hypertensive Encephalopathy

Brain dysfunction caused by a sudden, severe rise in blood pressure. Headache, confusion, seizures, vision changes, or reduced consciousness may occur; treatment involves controlled blood-pressure reduction.

Hypertensive Heart Disease

Changes or damage to the heart caused by long-term high blood pressure. The heart has to work harder to pump against the increased pressure, which can make its muscle thicken or stiffen and may eventually lead to heart failure or abnormal heart rhythms.

Hypertensive Intracerebral Hemorrhage

Bleeding into brain tissue after a blood vessel weakened by high blood pressure breaks, potentially causing sudden headache, weakness, confusion, unconsciousness, or death.

Hypertensive Kidney Disease

Kidney damage associated with long-term high blood pressure. It may lead to protein in the urine and gradually reduced kidney function; diabetes, other kidney diseases, and inherited risk can cause similar findings.

Alternate Names:
Hypertensive Nephropathy

Hypertensive Nephrosclerosis

Scarring and narrowing of small kidney blood vessels caused by long-term high blood pressure. It can gradually reduce kidney function and may cause protein in the urine; controlling blood pressure helps slow progression.

Hypertensive Retinopathy

Damage to the retina's small blood vessels caused by high blood pressure. Findings may include narrowed arteries, changes where arteries cross veins, retinal bleeding, cotton-wool spots, and hard exudates; severe cases may cause swelling of the optic disc.

Hypertensive Urgency

A markedly high blood pressure without clear evidence of new organ injury. Treatment is generally adjusted gradually; sudden excessive reduction can impair blood flow to organs.

Hyperthermia

An abnormally high core body temperature caused by excess heat production or impaired heat loss without a rise in the hypothalamic temperature set point. Causes include environmental heat, exertion, medicines, endocrine or metabolic disorders, and impaired sweating. It differs from fever, in which the temperature set point rises; severe hyperthermia can cause confusion, seizures, organ injury, or death.

Hyperthermia For Treating Cancer

A cancer treatment that deliberately heats a tumor or part of the body, sometimes with radiation or medicines, to damage cancer cells or make other treatment work better.

Hyperthermia In Anesthesia

An elevated body temperature during or after anesthesia. Causes include fever from infection, drug reactions, thyroid storm, serotonin syndrome, and malignant hyperthermia, a rare emergency with muscle rigidity and rising carbon dioxide. Evaluation distinguishes fever from true hyperthermia, in which the hypothalamic temperature set point is not raised.

Hyperthermic Intraperitoneal Chemotherapy

Heated cancer medicine circulated through the abdominal cavity during surgery after visible tumor is removed. It is used for selected cancers that have spread across the abdominal lining and can cause infection, bleeding, organ injury, or other serious complications.

Hyperthyroidism

A condition in which the thyroid makes too much thyroid hormone. It may cause weight loss, sweating, heat intolerance, shaking, anxiety, diarrhea, or a fast or irregular heartbeat. Common causes include Graves disease and overactive thyroid nodules.

Alternate Names:
Overactive Thyroid

Hyperthyroxinemia

An abnormally high concentration of circulating thyroxine, caused by hyperthyroidism, thyroiditis, medication, binding-protein changes, or assay interference; symptoms and TSH clarify the cause.

Hypertonia

Abnormally increased muscle tightness or resistance when a limb is moved. It may cause stiffness, abnormal posture, spasms, or limited movement and can result from brain, spinal-cord, or other nervous-system disorders.

Hypertonic Saline

Saline containing more sodium than normal blood, commonly given through a vein for severe symptoms from dangerously low blood sodium or selected urgent conditions. Close monitoring is required because correcting sodium too quickly can cause serious brain injury.

Hypertonic Saline Inhalation

Inhaling a salty mist through a nebulizer to draw water into airway mucus and make it easier to clear. It may help some people with cystic fibrosis or bronchiectasis, but can briefly narrow the airways; use is generally guided by a respiratory treatment plan.

Hypertonic Solution

A solution with greater effective osmotic concentration than the fluid with which it is compared, causing water to move out of cells across a semipermeable membrane.

Hypertrichosis

Excessive hair growth in any body area, in a localized or generalized pattern, that is not limited to the androgen-dependent male pattern seen in hirsutism. It may be present from birth or develop later because of inherited conditions, medicines, nutritional or metabolic disease, skin disorders, or rarely cancer. New, widespread, or rapidly progressive growth can suggest an underlying cause.

Hypertriglyceridemia

An abnormally high level of triglycerides, a type of fat, in the blood. Causes include diabetes, obesity, alcohol, some medicines, and inherited disorders. Very high levels increase the risk of acute pancreatitis and require medical management.

Hypertrophic

Relating to hypertrophy, an enlargement of cells or tissue that increases the size of an organ or structure.

Hypertrophic Cardiomyopathy

An inherited heart condition in which the muscular wall of the heart—especially the wall dividing the lower chambers (the septum)—becomes abnormally thick and stiff without an obvious cause like high blood pressure. This excessive thickening makes it harder for the heart to fill with and pump blood, and can obstruct blood flow exiting the heart. While

many people have no symptoms, it can cause chest pain, shortness of breath, dizziness, and dangerous heart rhythm problems.

Alternate Names:
HCM; Hypertrophic Obstructive Cardiomyopathy; HOCM

Hypertrophic Cardiomyopathy Genetics

Many cases result from an inherited change in a gene for a heart-muscle protein, commonly MYH7 or MYBPC3. The condition can run in families, so genetic counseling and screening of close relatives may form part of family risk assessment.

Hypertrophic Cardiomyopathy Treatment

Management may include medicines to relieve symptoms, treatment of arrhythmias or obstruction, an implantable defibrillator for selected patients, and surgery or ablation when indicated. Treatment is guided by symptoms, anatomy, risk, and specialist assessment.

Hypertrophic Gastritis

Unusually thick folds in the stomach lining caused by overgrowth or swelling of its glands. Ménétrier disease is one type; other causes and effects vary. Some forms can lead to protein loss, nausea, or a higher risk of stomach cancer.

Hypertrophic Gastropathy

Thickening of the stomach lining, often with enlarged folds. It can result from several conditions, including Ménétrier disease; see also *Hypertrophic Gastritis*.

Hypertrophic Myocardiopathy

Alternate name; see *Hypertrophic Cardiomyopathy*.

Hypertrophic Obstructive Cardiomyopathy

A form of hypertrophic cardiomyopathy in which the thickened heart muscle causes dynamic narrowing of the left-ventricular outflow tract, the passage through which blood leaves the heart. The obstruction may be present at rest or appear with exercise or other changes in heart loading and contraction. It can cause breathlessness, chest pain, dizziness, or fainting.

Hypertrophic Osteoarthropathy

A syndrome of digital clubbing, periosteal new-bone formation, and joint pain or swelling. It may be primary and inherited or secondary to conditions such as lung cancer, chronic lung infection, cyanotic heart disease, or inflammatory disorders.

Hypertrophic Pyloric Stenosis

Thickening of the muscle at the stomach outlet, usually in the first weeks of life, that narrows the passage into the small intestine. It causes repeated, forceful vomiting after feeds, usually without green bile. A baby may still seem hungry but lose weight or become dehydrated. Ultrasound is commonly used to find it; an operation called pyloromyotomy loosens the narrowed opening.

Alternate Names:
Infantile Hypertrophic Pyloric Stenosis; Infantile Pyloric Stenosis; Congenital Hypertrophic Pyloric Stenosis

Hypertrophic Scar

A raised, thick scar that stays within the boundaries of the original wound. It forms when the body makes too much scar tissue during healing, often after burns, surgery, or injury. Unlike a keloid, it does not grow beyond the wound edges and may become flatter over time.

Hypertrophy

Enlargement of a tissue or organ because its individual cells become larger. It may develop in response to increased workload, hormones, disease, or other stimulation.

Hypertropia

Vertical misalignment of the eyes in which one eye deviates upward relative to the other, causing double vision, eye strain, or abnormal head posture.

Hyperuricemia

An abnormally high concentration of uric acid in the blood, which may be asymptomatic or contribute

to gout and uric-acid kidney stones.

Hyperventilating

Breathing faster or deeper than the body needs, lowering carbon dioxide in the blood. It may cause light-headedness, tingling, chest tightness, or fainting and can result from anxiety or serious illness.

Hyperventilation

Abnormally rapid, deep, or otherwise excessive breathing that removes more carbon dioxide than the body produces, often causing respiratory alkalosis. It may cause breathlessness, dizziness, tingling, chest tightness, muscle spasms, or fainting. Anxiety or panic can trigger it, but new or severe hyperventilation may reflect heart or lung disease, infection, bleeding, metabolic illness, or another emergency.

Hyperventilation Syndrome

Repeated overbreathing, often during stress or panic, that lowers carbon dioxide in the blood and causes breathlessness, chest tightness, dizziness, tingling, palpitations, or hand and foot spasms. Similar symptoms can arise from heart or lung disease.

Hypervigilance

A state of excessive alertness to possible threat, often accompanied by scanning, startle, irritability, and sleep difficulty in anxiety, trauma-related disorders, stimulant use, or medical illness.

Hyperviscosity Syndrome

A set of symptoms and signs caused by blood that is abnormally thick, usually from very high levels of an immunoglobulin paraprotein or of red or white blood cells. It can complicate Waldenström macroglobulinemia, multiple myeloma, polycythemia, leukemia, or severe infection. Features include bleeding from the nose or gums, blurred or lost vision from retinal changes, headache, dizziness, confusion, stroke-like symptoms, or heart failure; severe cases are an emergency managed with plasma exchange while the underlying disease is treated.

Hypervitaminosis A

Illness caused by too much vitamin A, usually from supplements or medicines. It may cause headache, nausea, dry skin, hair loss, liver injury, bone pain, or birth defects during pregnancy.

Hypervitaminosis D

Illness caused by too much vitamin D, leading to high blood calcium. It may cause nausea, vomiting, thirst, frequent urination, weakness, kidney stones, confusion, or kidney damage.

Hypervolaemia

An excess of blood or body fluid. It may cause rapid weight gain, swelling, breathlessness, raised neck veins, or high blood pressure, especially with heart, kidney, or liver disease.

Hypervolemia

Too much fluid in the bloodstream or body tissues. It may cause rapid weight gain, swelling, breathlessness, raised neck veins, or high blood pressure and can occur with heart, kidney, or liver disease.

Hypha

A branching tubular filament that forms the basic structural unit of most molds and many fungi; networks of hyphae form a mycelium and may invade tissue in fungal disease.

Hyphema

Blood collecting in the front part of the eye, usually after an injury. It may cause pain, blurred vision, light sensitivity, or increased eye pressure; complications can threaten vision.

Hypnagogic

Occurring during the transition from wakefulness to sleep. Hypnagogic sensations or hallucinations can be benign, but frequent or distressing episodes may occur with narcolepsy, sleep deprivation, medicines, or other sleep and neurologic disorders.

Hypnagogic Hallucinations

Vivid sights, sounds, sensations, or feelings that occur while a person is falling asleep. They are often harmless but may be linked to sleep deprivation,

narcolepsy, medicines, or other sleep disorders.

Hypnic Headache

A rare primary headache that repeatedly awakens a person during sleep, usually in later life and often at a similar time each night.

Hypnogram

A chart showing when a person is awake and in each sleep stage during a recording. It is commonly made from a sleep study and helps show sleep timing, awakenings, and stage patterns.

Alternate Names:
Sleep Architecture Diagram; Polysomnographic Hypnogram

Hypnosis

A state of focused attention and deep relaxation in which a person may respond more readily to guided suggestions. It is not sleep or loss of control; clinical hypnosis is conducted by a trained professional.

Hypnotherapy

Hypnotherapy uses focused attention and guided suggestion as an adjunct to care for selected problems such as pain, anxiety, or unwanted habits.

Hypnotic

A medicine used mainly to help a person fall asleep or stay asleep. Some hypnotics can cause next-day drowsiness, falls, dependence, or slowed breathing, especially when combined with alcohol or other sedatives. Not all sedatives are used as sleep medicines.

Hypoactive Sexual Desire Disorder

Persistently low or absent sexual interest that causes personal distress or relationship difficulty. Desire can be affected by medicines, hormones, illness, pain, mood, stress, trauma, or relationship factors, so assessment looks for the underlying cause.

Hypoadrenalism

Insufficient adrenal-cortex hormone production, especially cortisol and sometimes aldosterone; primary disease can cause fatigue, weight loss, low blood pressure, hyperpigmentation, and adrenal crisis.

Hypoalbuminemia

An abnormally low blood albumin concentration caused by reduced production, inflammation, kidney or gastrointestinal loss, or severe malnutrition; it can contribute to edema and alter drug binding.

Hypoalphalipoproteinemias

Disorders with low HDL-related apolipoprotein levels, which may impair reverse cholesterol transport and increase cardiovascular risk depending on the cause and overall lipid profile.

Hypoblast

The inner cell layer of the early embryonic disc that contributes to the yolk-sac lining and helps establish the embryonic body axes during gastrulation.

Hypocalcaemia

Alternate British spelling; see *Hypocalcemia*.

Hypocalcemia

An abnormally low level of calcium in the blood, especially the ionized form that is available for body functions. It can cause tingling around the mouth or fingers, muscle cramps, and, when severe, seizures or abnormal heart rhythms. Causes include low parathyroid hormone, vitamin D deficiency, kidney disease, low magnesium, and some medicines. Low albumin can lower total measured calcium while ionized calcium remains normal.

Alternate Names:
Low Blood Calcium; Hypocalcaemia

Hypocapnia

An abnormally low level of carbon dioxide in the blood, usually because a person is breathing too fast or deeply. Causes include anxiety, pain, low oxygen, lung disease, pregnancy, or excessive ventilator support.

Hypochloremia

A lower-than-normal level of chloride in the blood. Chloride is a charged particle from salt that helps

balance body fluids and acids. Low levels may follow prolonged vomiting or heavy sweating, or occur with some medicines, kidney problems, or other fluid-balance disorders. It may occur with metabolic alkalosis.

Hypochloremic Alkalosis

A chloride-depletion form of metabolic alkalosis, commonly associated with vomiting, gastric suction, or diuretic use. Low chloride reflects loss of hydrogen and chloride ions and helps guide assessment of the cause and response to treatment.

Hypochlorite

A chemical form of chlorine used in disinfectants and bleach. It can kill many germs, but swallowing it or getting concentrated solutions in the eyes, lungs, or skin can cause serious injury.

Hypocholesterolemia

An unusually low blood cholesterol concentration caused by malnutrition, malabsorption, hyperthyroidism, chronic illness, liver disease, or inherited lipid disorders.

Hypochondria

Older, nonspecific term for excessive fear or worry about having an illness. Depending on a person's symptoms, a current diagnosis may be illness anxiety disorder or somatic symptom disorder.

Hypochondroplasia

An inherited disorder of bone growth that causes short stature and shortened arms and legs, usually less severely than achondroplasia. People may have broad hands, increased inward curvature of the lower back, or limited elbow movement, while facial appearance and intelligence are often typical. It is usually caused by a change in the *FGFR3* gene.

Alternate Names:
HCH

Hypochromia

Reduced hemoglobin color in red blood cells, seen as increased central pallor on a blood smear and commonly associated with iron deficiency or thalassemia.

Hypochromic Anaemia

Hypochromic anaemia is anemia in which red blood cells contain too little hemoglobin and appear unusually pale, commonly because of iron deficiency or thalassemia.

Hypochromic Anemia

Anemia in which red cells contain too little hemoglobin and appear pale, most often because of iron deficiency, thalassemia, chronic disease, or sideroblastic disorders.

Hypocitraturia

Low urinary citrate excretion, which reduces inhibition of calcium-crystal formation and increases risk of calcium kidney stones; potassium citrate may be used when clinically appropriate.

Hypocupremia

An abnormally low copper concentration in blood or tissues, caused by inadequate intake, malabsorption, excess zinc, or inherited disorders, and potentially producing anemia, neutropenia, or neurologic disease.

Hypodermic Needle

A hollow needle designed to inject medicines or withdraw fluid through the skin, with gauge and length selected according to the substance, route, body site, and patient.

Hypodermis

The layer of fat and loose tissue beneath the skin. It cushions the body, stores energy, helps conserve heat, and contains blood vessels, nerves, and lymph channels.

Hypodontia

A condition present from birth in which one or more permanent teeth fail to develop. It most often affects wisdom teeth, upper side incisors, or second premolars and may affect chewing, appearance, or tooth alignment.

Hypoechoic

Describing a structure that returns fewer ultrasound echoes and appears darker than the surrounding reference tissue. This relative appearance can occur for many reasons and does not by itself identify the cause.

Hypoesthesia

Reduced sensitivity to touch, temperature, pain, or other sensations. It may result from nerve compression, neuropathy, spinal disease, stroke, injury, or other neurologic conditions; sudden or spreading numbness can occur with acute neurologic disease.

Hypogalactia

Insufficient breast-milk production for an infant's needs, caused by ineffective milk removal, hormonal or breast disorders, medications, illness, or other feeding difficulties.

Hypogammaglobulinemia

Lower-than-normal levels of antibodies (immunoglobulins) in the blood. It may be inherited or develop when illness, medicines, or protein loss reduce antibody production or increase antibody loss. Some people have repeated infections, especially in the lungs, sinuses, or ears; others have few symptoms.

Hypogastric Region

The lower central area of the abdomen, just above the pubic bone. It overlies the bladder and parts of the bowel and reproductive organs; pain or a lump there may arise from urinary, intestinal, or pelvic disease.

Hypoglossal Canal

A paired bony opening situated in the occipital bone above the anterolateral margin of the foramen magnum, directed laterally and forward to transmit the hypoglossal nerve (cranial nerve XII) and a meningeal branch of the ascending pharyngeal artery out of the posterior cranial fossa.

Alternate Names:
Anterior Condyloid Foramen

Hypoglossal Nerve

Cranial nerve XII, which supplies the muscles that move the tongue; a lesion causes tongue weakness, wasting, and deviation toward the affected side on protrusion.

Hypoglossal Nerve Injury

Damage to the nerve that controls tongue movement. It may follow skull-base injury, surgery, a tumor, or infection and can cause tongue weakness, wasting, or deviation when the tongue is extended.

Hypoglossal Nerve Palsy

Weakness or paralysis of the hypoglossal nerve (CN XII), leading to ipsilateral tongue weakness, atrophy, and fasciculations. Causes include tumors at the skull base or in the hypoglossal canal, surgical injury, or central lesions. Unilateral palsy causes the tongue to deviate toward the affected side on protrusion.

Hypoglycaemia

An abnormally low blood-glucose level. It may cause sweating, shaking, hunger, palpitations, confusion, seizures, or loss of consciousness and is especially associated with diabetes medicines, missed meals, or heavy alcohol use.

Hypoglycemia

An abnormally low blood-glucose concentration that may cause sweating, tremor, palpitations, hunger, confusion, seizures, or loss of consciousness. Causes include glucose-lowering medicines, missed meals, alcohol, and critical illness. Treatment depends on the person's ability to swallow and the cause; severe or recurrent episodes can signal serious illness.

Hypoglycemia In Diabetes

Blood glucose that falls too low in a person with diabetes, usually below 70 mg/dL. It may cause sweating, shaking, hunger, confusion, or fainting; severe episodes can prevent self-treatment and require assistance from another person.

Hypoglycemia Unawareness

Failure to feel the usual warning signs of low blood glucose, such as shaking, sweating, or a racing heart-

beat. It can occur after repeated low readings or long-standing diabetes and increases the risk of severe hypoglycemia.

Hypoglycemic

Relating to an abnormally low blood glucose level, or describing a medicine that lowers blood glucose.

Hypogonadism

Reduced function of the testes or ovaries, causing low sex-hormone levels and impaired production of sperm or eggs. It may lead to delayed puberty, absent periods, infertility, low sexual desire, hot flashes, reduced muscle or bone strength, or other symptoms.

Hypogonadism In Men

Low testosterone caused by reduced testicular function or by a problem in the brain signals that control the testes. It may cause low sexual desire, erectile problems, infertility, low energy, reduced muscle, or weak bones.

Hypogonadism In Women

Reduced ovarian hormone production, which may cause absent or irregular periods, hot flashes, vaginal dryness, infertility, low sexual desire, or loss of bone strength. Causes include ovarian failure, pituitary disease, some medicines, severe illness, or surgery.

Hypogonadotropic Hypogonadism

Low production of sex hormones because the brain or pituitary gland does not send enough stimulating signals to the testes or ovaries. It may cause delayed puberty, absent periods, infertility, low sexual desire, or reduced testosterone. Causes include genetic conditions, pituitary disease, obesity, medicines, or severe illness.

Hypohidrosis

Reduced or absent sweating. It can make it difficult for the body to cool itself and increase the risk of overheating. Causes include nerve disorders, skin damage, medicines, dehydration, and inherited conditions.

Hypokalaemia

British spelling of Hypokalemia; see Hypokalemia.

Hypokalemia

An abnormally low level of potassium in the blood, often caused by vomiting, diarrhea, diuretics, hormone disorders, or movement of potassium into cells. It may cause weakness, cramps, constipation, or dangerous heart-rhythm changes.

Hypokalemic Periodic Paralysis

An inherited disorder causing repeated attacks of muscle weakness or paralysis when blood potassium falls. Attacks often begin after rest following exercise or after a high-carbohydrate meal, while strength may be normal between attacks.

Hypokinesia

Reduced or slowed movement. It may cause small steps, less facial expression, reduced arm swing, or small handwriting and commonly occurs in Parkinson disease or other disorders affecting movement control.

Hypolipidemic Agents

Medicines that lower cholesterol or triglycerides, including statins, ezetimibe, fibrates, bile-acid sequestrants, niacin, and selected injectable therapies.

Hypolipoproteinemia

An abnormally low concentration of one or more blood lipoproteins, caused by inherited disorders, malabsorption, malnutrition, liver disease, or other systemic illness.

Hypomagnesaemia

An abnormally low level of magnesium in the blood. It may cause tremor, muscle cramps, weakness, seizures, or abnormal heart rhythms and can result from diarrhea, poor intake, alcohol use, or certain medicines.

Hypomagnesemia

A low level of magnesium in the blood, often caused by diarrhea, poor nutrition, alcohol use, kidney loss,

or some medicines. It may cause tremor, cramps, weakness, seizures, or abnormal heart rhythms.

Hypomania

A distinct period of unusually elevated, expansive, or irritable mood with increased energy or activity lasting at least four consecutive days. It may involve reduced need for sleep, rapid speech, racing thoughts, inflated self-esteem, or impulsive behavior; the change is observable by others but is not severe enough to cause marked impairment or require hospitalization and has no psychotic features.

Hypomanic Episode

Alternate name; see *Hypomania*.

Hypomelanosis Of Ito

A rare condition causing swirled or streaky areas of lighter skin, often from birth. Some affected children also have seizures, developmental differences, eye problems, or abnormalities of the bones or nervous system.

Hypomethylation

An abnormally low amount of methyl marking on DNA or other molecules. It can change which genes are active and may affect chromosome stability, development, inherited disorders, or cancer cells.

Hypomnesia

Reduced ability to remember or recall information, which may occur with aging, neurologic disease, psychiatric conditions, medications, or other causes.

Hyponatraemia

Alternate British spelling; see *Hyponatremia*.

Hyponatremia

An abnormally low level of sodium in the blood, often caused by excess water, fluid loss, medicines, heart or liver disease, kidney problems, or hormone disorders. It may cause nausea, headache, confusion, seizures, or coma; severe or rapidly developing cases are emergencies.

Hypoparathyroidism

A disorder in which too little parathyroid hormone causes low blood calcium and high phosphate. It most often follows neck surgery but can be inherited or autoimmune. Tingling, muscle cramps, spasms, seizures, or abnormal heart rhythms may occur; treatment replaces calcium and active vitamin D.

Hypopharyngeal Neoplasm

An abnormal growth in the lower part of the throat beside the voice box and esophagus. It may cause persistent sore throat, painful swallowing, difficulty swallowing, ear pain, or a neck lump and may be cancerous.

Hypopharynx

The lower part of the pharynx behind and beside the larynx, extending from the oropharynx to the esophagus. It directs food toward the esophagus during swallowing.

Hypophosphataemia

Alternate British spelling; see *Hypophosphatemia*.

Hypophosphatasia (HPP)

A rare inherited disorder caused by deficient tissue-nonspecific alkaline phosphatase, usually because of *ALPL* variants. Poor bone and tooth mineralization can cause rickets or osteomalacia, fractures, bone pain, premature loss of teeth, or respiratory problems in severe infantile disease.

Hypophosphatemia

An abnormally low concentration of phosphate in the bloodstream. Because phosphate is an essential mineral required by all cells to produce cellular energy and maintain strong bones and teeth, severe deficiency starves muscles and organs of energy. It can lead to muscle weakness, bone pain, breathing difficulty, and confusion, frequently occurring in malnourished individuals upon reintroducing nutrition, severe diabetes crises, or chronic alcohol use.

Alternate Names:
Low Blood Phosphate; Hypophosphataemia; Phosphate Deficiency

Hypophosphatemic Rickets

Rickets caused by low phosphate availability, often from renal phosphate wasting, leading to defective mineralization, bowed legs, bone pain, growth impairment, and dental abnormalities.

Hypophysectomy

Surgical removal of all or part of the pituitary gland, usually performed through the nose and sphenoid sinus (transsphenoidal hypophysectomy) or rarely through an open craniotomy to treat pituitary tumors, relieve optic nerve compression, or control hormone hypersecretion.

Alternate Names:
Pituitary Resection

Hypophysis

An endocrine gland at the base of the brain that regulates growth, thyroid and adrenal function, reproduction, lactation, and water balance through its hormones.

Alternate Names:
Pituitary Gland; Master Endocrine Gland

Hypophysitis

Inflammation of the pituitary gland that can cause headache, visual symptoms, and deficiency or excess of pituitary hormones; it may be autoimmune, related to pregnancy, or triggered by immune-checkpoint therapy.

Hypopigmentation

Reduced skin pigmentation producing paler areas than the surrounding skin, caused by decreased melanin, reduced melanocyte function or number, inflammation, injury, infection, or inherited disorders.

Hypopituitarism

Deficiency of one or more pituitary hormones due to a disorder of the pituitary gland or hypothalamus, or to surgery, radiation, or injury. Effects depend on the hormones affected and may include problems with growth, thyroid or adrenal function, menstruation, fertility, milk production, or water balance.

Alternate Names:
Pituitary Insufficiency

Hypoplasia

Incomplete or underdevelopment of a tissue, organ, or body structure, resulting in reduced size or functional capacity. It may be congenital, developmental, genetic, or acquired and ranges from a mild anatomical variant to severe organ dysfunction. Assessment considers the timing of onset, associated malformations, tissue function, and whether the process is isolated or syndromic.

Hypoplastic Left Heart Syndrome

A congenital heart defect in which the left ventricle and other left-sided structures, typically including the mitral valve, aortic valve, and ascending aorta, are severely underdeveloped. The left side cannot pump enough blood to support circulation to the body.

Hypoplastic Left Heart Syndrome (HLHS)

Alternate name; see *Hypoplastic Left Heart Syndrome*.

Hypoploidy

A chromosome number below the normal diploid complement, caused by loss of one or more chromosomes; in tumor cytogenetics it may have prognostic significance.

Hypopnea

A period of unusually shallow or reduced breathing, often during sleep. Repeated episodes can lower blood oxygen, disturb sleep, and contribute to obstructive sleep apnea or other breathing disorders.

Hypoproliferative Anemia

Anemia caused by inadequate red-cell production, usually with an inappropriately low reticulocyte response. Causes include iron deficiency, inflammation, kidney disease, endocrine or nutritional disorders, and bone-marrow failure or infiltration.

Hypoproteinaemia

Hypoproteinaemia is an abnormally low level of proteins in the blood, which may result from malnutrition, liver disease, kidney protein loss, or intestinal loss.

Hypoproteinemia

An abnormally low amount of protein in the blood, often involving albumin, which can cause swelling and reflect poor nutrition, liver disease, kidney loss, or illness.

Hypopyon

A visible white or yellow level of inflammatory material in the front chamber of the eye. It usually indicates severe eye inflammation or infection and may occur with pain, redness, light sensitivity, and reduced vision.

Hyporeninemic Hypoaldosteronism

Reduced aldosterone production associated with inappropriately low renin activity, often occurring with diabetic kidney disease or other chronic kidney disorders. Hyperkalemia and a mild normal-anion-gap metabolic acidosis are common findings.

Hyposmia

A reduced ability to smell, without complete loss of smell. It can follow a cold or COVID-19, nasal blockage, head injury, medicines, aging, or a neurologic disorder.

Hypospadias

A birth condition in which the opening of the urethra is on the underside of the penis rather than at its tip. The penis may curve, and the foreskin may be incomplete; severity depends on the opening's location and other abnormalities.

Hypospadias Repair

Surgery reconstructs the urethral opening and, when needed, straightens the penis in a child born with hypospadias; timing and technique depend on anatomy and surgeon assessment.

Hypotension

Abnormally low blood pressure that may reduce blood flow to the brain and other organs. It can result from bleeding, dehydration, heart problems, severe infection, allergy, or medicines and may cause dizziness, fainting, confusion, or shock.

Hypotension In Anesthesia

Low blood pressure during or soon after anesthesia. It may result from anesthetic medicines, blood loss, dehydration, heart problems, or an allergic reaction; the anesthesia team monitors and treats it according to the cause and severity.

Hypotensive

Describing a state of abnormally low blood pressure or an agent that lowers blood pressure; see also *Hypotension*.

Hypothalamic Amenorrhea

Absence of menstrual periods because the hypothalamus reduces its normal release of reproductive signals. It is often linked to low energy availability, excessive exercise, stress, illness, or weight loss and may cause infertility and bone loss.

Hypothalamic Dysfunction

A problem affecting the brain region that helps control hormones, temperature, appetite, thirst, sleep, stress, and reproduction. Causes include injury, tumors, inflammation, infection, surgery, radiation, or inherited disease.

Hypothalamic Hamartoma

A congenital, noncancerous mass of disorganized hypothalamic tissue that can cause gelastic seizures, precocious puberty, behavioral symptoms, or cognitive decline.

Hypothalamic Hormone

A releasing or inhibiting hormone produced by the hypothalamus that regulates pituitary secretion, including signals controlling thyroid, adrenal, reproductive, growth, and lactation axes.

Hypothalamic Neoplasm

An abnormal growth in or near the hypothalamus, a brain region controlling hormones, temperature, appetite, sleep, and water balance. Effects may include vision changes, hormone problems, headaches, seizures, or altered growth.

Hypothalamic-Pituitary-Adrenal Axis

The hormone system linking the brain's hypothalamus and pituitary gland with the adrenal glands. It controls cortisol release, helping regulate the body's response to stress, illness, blood pressure, metabolism, and immune activity.

Alternate Names:
HPA Axis; Neuroendocrine Stress Axis

Hypothalamic-Pituitary-Adrenal Axis Physiology

The brain signals the pituitary gland, which signals the adrenal glands to release cortisol. Cortisol normally follows a daily pattern and feeds back to reduce further signals when enough is present.

Hypothalamic-Pituitary-Gonadal Axis Physiology

The hormone system linking the hypothalamus, pituitary gland, and ovaries or testes. Signals from the hypothalamus prompt the pituitary to release hormones that control ovulation and menstrual cycles, or testosterone production and sperm development.

Hypothalamic-Pituitary-Thyroid Axis Physiology

The hormone system linking the hypothalamus, pituitary gland, and thyroid. The hypothalamus signals the pituitary to release thyroid-stimulating hormone, which prompts the thyroid to make hormones that regulate metabolism, temperature, and energy use.

Hypothalamic Tumor

Alternate name; see *Hypothalamic Neoplasm*.

Hypothalamus

A small region at the base of the brain that helps control automatic body functions and hormone release through the pituitary gland. It regulates body temperature, hunger, thirst, sleep, stress, and parts of emotional behavior.

Hypothermia

A dangerously low internal body temperature, usually below 35 degrees Celsius, caused by cold exposure or impaired heat production. It may cause shivering, confusion, drowsiness, slow breathing, or an abnormal heart rhythm. Severe cases are treated with active rewarming and supportive care.

Alternate Names:
Accidental Hypothermia; Low Core Body Temperature

Hypothermia In Anesthesia

An abnormally low body temperature during or after anesthesia. Anesthetic medicines reduce the body's ability to control heat and may allow heat loss during surgery; warming devices and temperature monitoring help prevent complications.

Hypothyroidism

A condition in which the thyroid gland does not make enough thyroid hormone. This slows many body functions and may cause tiredness, feeling cold, weight gain, constipation, dry skin, or a slow heartbeat. The most common cause is Hashimoto disease, in which the immune system attacks the thyroid. Other causes include thyroid inflammation, surgery or radiation treatment, some medicines, and, less often, problems with the pituitary gland or hypothalamus.

Alternate Names:
Underactive Thyroid; Hypothyroid State; Thyroid Hormone Deficiency

Hypotonia

Decreased muscle tone presenting as a floppy or poorly supported posture. It may result from muscle, peripheral nerve, neuromuscular-junction, spinal-cord, brain, genetic, or metabolic disorders and requires evaluation when persistent or associated with weakness or developmental delay.

Hypotonia-Hypomentia-Hypogonadism-

Obesity Syndrome (HHHO)

Historical descriptive name for Prader–Willi syndrome, a genetic disorder involving infantile hypotonia, developmental or intellectual disability, hypogonadism, and later hyperphagia with obesity; see *Prader-Willi Syndrome*.

Hypotonic Solution

A liquid containing fewer dissolved particles than the fluid inside cells. Water tends to move into cells when they are exposed to it, so medical use requires careful selection and monitoring.

Hypotony Maculopathy

A vision-threatening complication of persistent low intraocular pressure characterized by chorioretinal wrinkling and macular folds, optic disc edema, and decreased visual acuity.

Hypotrichosis

Abnormally sparse or absent hair caused by inherited follicle disorders, autoimmune disease, endocrine or nutritional problems, medications, or scarring alopecia.

Hypotrophy

Underdevelopment or reduced size of a tissue or organ that is present but smaller or less developed than usual. It may begin before birth or result from poor nutrition, reduced use, impaired blood flow, or disease and may affect function.

Hypotropia

Vertical eye misalignment in which one eye deviates downward relative to the other, potentially causing diplopia, abnormal head posture, or suppression of vision.

Hypoventilation

Breathing too slowly or shallowly to remove enough carbon dioxide. It can lower oxygen levels and cause sleepiness, headache, confusion, or respiratory failure; causes include medicines, lung disease, obesity, and muscle or nerve disorders.

Hypoventilation Syndromes

Disorders in which alveolar ventilation is inadequate, causing elevated carbon dioxide, often with low oxygen. Causes include obesity hypoventilation, neuromuscular weakness, chest-wall disease, medicines, and impaired respiratory control; evaluation includes sleep and blood-gas assessment.

Hypovolaemia

Hypovolaemia is an abnormally low volume of circulating blood or body fluid, commonly caused by bleeding, dehydration, or major fluid loss.

Hypovolemia

Hypovolemia is reduced effective circulating blood volume, usually from bleeding, fluid loss, or inadequate intake; it can cause tachycardia, hypotension, poor perfusion, kidney injury, and hypovolaemic shock.

Hypovolemic Shock

Circulatory failure from loss of intravascular volume, reducing venous return, cardiac output, and tissue perfusion. Hemorrhage is the most dangerous cause; other causes include vomiting, diarrhea, burns, third-spacing, and severe dehydration. Tachycardia, narrow pulse pressure, cool clammy skin, delayed capillary refill, oliguria, confusion, and elevated lactate may occur.

Hypoxaemia

An abnormally low oxygen level in arterial blood. It can result from lung disease, breathing problems, poor blood flow, or other conditions and may cause shortness of breath, confusion, bluish skin, or organ injury.

Hypoxanthine

A naturally occurring substance made when the body breaks down certain genetic-material building blocks. It is normally reused or changed into other compounds during purine metabolism.

Hypoxemia

An abnormally low oxygen level in arterial blood. It can lead to hypoxia, which means too little oxygen

in body tissues. Anemia or poor blood flow can cause hypoxia without hypoxemia.

Hypoxia

Inadequate oxygen availability at the tissue level. It may result from low arterial oxygen, anemia, reduced blood flow, or impaired cellular oxygen use.

Hypoxia And Hypoxemia

Hypoxemia is low oxygen in arterial blood, while hypoxia is inadequate oxygen at the tissue level. Causes include lung disease, airway obstruction, heart disease, anemia, shock, or high altitude; severe breathlessness, cyanosis, confusion, or collapse is urgent.

Hypoxia-Inducible Factor

A family of transcription factors that helps cells adapt to low oxygen. Each complex generally combines an oxygen-regulated alpha subunit (HIF-1 alpha, HIF-2 alpha, or HIF-3 alpha) with a constitutively expressed beta subunit. These factors activate genes involved in oxygen delivery, metabolism, and cell survival; HIF-1 is one member of the family.

Alternate Names:
HIF

Hypoxic Cell Injury

Damage to cells caused by too little oxygen. It may result from poor blood flow, low blood oxygen, anemia, or poisoning that prevents oxygen use; the outcome depends on how severe and prolonged the oxygen shortage is.

Hypoxic-Ischemic Brain Injury

Brain damage caused by too little oxygen and blood flow. It may follow cardiac arrest, suffocation, shock, or severe breathing failure and can cause seizures, coma, memory problems, movement problems, or disability.

Hypoxic Ischemic Encephalopathy

Brain dysfunction caused by insufficient oxygen and blood flow, usually around birth in newborns but also after cardiac arrest or severe respiratory failure. It can cause seizures, altered consciousness, and long-term neurologic disability.

Hypoxic Pulmonary Vasoconstriction

Narrowing of small blood vessels in an area of the lung that receives too little oxygen. This normally redirects blood toward better-ventilated lung areas, but widespread or prolonged narrowing can strain the heart.

Hypsarrhythmia

A very abnormal, disorganized pattern on an electroencephalogram, with large slow waves and spikes arising from many areas of the brain. It is strongly associated with infantile spasms, a serious seizure disorder in babies; treatment is directed at controlling the spasms and underlying cause.

Alternate Names:
Hypsarrhythmic EEG Pattern; Chaotic Dysrhythmic EEG

Hysterectomy

Surgical removal of the uterus. The cervix, fallopian tubes, and ovaries may or may not also be removed, depending on the procedure and clinical indication. Hysterectomy permanently ends menstruation and the ability to carry a pregnancy, but it does not cause immediate menopause when functioning ovaries remain. If the cervix remains, cervical cancer screening may still be needed. Indications include cancer, fibroids, severe bleeding, adenomyosis, endometriosis, chronic pelvic pain, and uterine prolapse.

Hysterectomy And Surgical Menopause

Hysterectomy removes the uterus and ends menstruation and the ability to carry a pregnancy. Surgical menopause occurs when both ovaries are removed or ovarian function otherwise stops abruptly; hysterectomy alone does not necessarily cause menopause if the ovaries remain.

Hysteria

An outdated term historically applied to a wide range of physical, emotional, and behavioral symptoms. It does not name one specific current diagnosis; some conditions once grouped under this label

are now diagnosed as functional neurologic disorder or other disorders.

Hysterosalpingo-Contrast Sonography

An ultrasound test using fluid or foam contrast to assess the uterine cavity and whether the fallopian tubes are open. It is often used during fertility evaluation without X-ray radiation.

Alternate Names:
HyCoSy; Fallopian Tubal Contrast Ultrasound

Hysterosalpingo-Contrast-Sonography

Alternate spelling; see *Hysterosalpingo-Contrast Sonography*.

Hysterosalpingogram

An X-ray procedure used to evaluate the uterine cavity and fallopian tube patency. A radiopaque contrast medium is injected through the cervix, and serial X-ray images are taken as the contrast fills the uterine cavity and spills from the fallopian tubes.

Hysterosalpingography

An X-ray test in which contrast liquid is placed through the cervix to outline the inside of the uterus and fallopian tubes. It can show blockage, an unusual uterine shape, fibroids, polyps, or scar tissue during infertility evaluation. Cramping, bleeding, infection, or contrast reaction can occur.

Hysteroscope

A thin camera-equipped instrument passed through the cervix to inspect the uterine cavity and, when designed for operative use, remove polyps, treat bleeding, or perform other procedures.

Hysteroscopic Metroplasty

A procedure that uses a small camera and instruments passed through the cervix to divide a wall of tissue separating part of the uterus. It may improve the uterine cavity in selected people with fertility problems or repeated pregnancy loss.

Hysteroscopic Myomectomy

A procedure that removes selected fibroids bulging into the inside of the uterus. A camera and instruments pass through the cervix, avoiding an abdominal incision; the procedure may reduce heavy bleeding and improve fertility.

Hysteroscopy

A procedure in which a thin camera tube is passed through the vagina and cervix into the uterus to view its lining. Fluid opens the uterine cavity for a clearer view. The procedure can help find causes of abnormal bleeding and may allow a tissue sample or removal of polyps, selected fibroids, or scar tissue.

Hysterotomy

A surgical incision into the uterus performed during selected obstetric or gynecologic procedures. It may be used to deliver a baby or reach the uterus, with risks including bleeding and infection.

I

Iatrogenic

Describing an illness, injury, or other harm caused unintentionally by medical examination, treatment, a medicine, a procedure, or a healthcare device. Examples include side effects, procedure-related bleeding, infection, nerve damage, or radiation injury. The term does not imply negligence.

Iatrogenic Cushing Syndrome

Cortisol excess caused by prescribed or nonprescribed glucocorticoid exposure, including systemic, injected, inhaled, topical, or potent local preparations. Features may include weight gain, hypertension, diabetes, bruising, muscle weakness, infection risk, and adrenal suppression.

Iatrogenic Disease

Illness or injury caused unintentionally by a medical examination, treatment, medicine, procedure, or healthcare device. It may be temporary or permanent and does not by itself imply negligence.

Iatrogenic Injury

Harm caused unintentionally by a medical examination, treatment, procedure, medicine, or healthcare device. It may be temporary or permanent and can include infection, bleeding, medication effects, nerve damage, or injury during surgery.

Iatrogenic Pneumothorax

A pneumothorax caused by medical care, such as insertion of a central venous catheter, lung biopsy, or thoracentesis. Positive-pressure ventilation can also cause pneumothorax through lung barotrauma.

Ibandronic Acid

A bisphosphonate medicine used in some settings to reduce bone loss and complications from cancer affecting bone. It can rarely damage the jaw or cause unusual thigh fractures.

IBD

Abbreviation; see *Inflammatory Bowel Disease*.

Alternate Names:
Inflammatory bowel disease

Ibritumomab Tiuxetan

An antibody linked to a radioactive substance and used in selected B-cell lymphomas. The antibody attaches to CD20-positive cells and delivers radiation; low blood counts, infection, and delayed marrow problems are important risks.

IBS

Abbreviation; see *Irritable Bowel Syndrome*.

IBS-D

The diarrhea-predominant form of irritable bowel syndrome, with recurrent abdominal pain and loose or frequent stools. It is a disorder of gut–brain interaction and does not cause visible damage to the digestive tract.

Alternate Names:
Diarrhea-Predominant Irritable Bowel Syndrome

IBS (Irritable Bowel Syndrome)

Alternate name; see *Irritable Bowel Syndrome*.

Ibuprofen

A medicine that reduces pain, fever, and inflammation. It can irritate or bleed the stomach, harm the kidneys, cause fluid retention, or increase heart risks in some people.

Ibuprofen Overdose

Toxic exposure to more ibuprofen than recommended, which can cause nausea, vomiting, abdominal pain, gastrointestinal bleeding, kidney injury, metabolic acidosis, drowsiness, seizures, or coma.

Ibuprofen Toxicity

Alternate term; see *Ibuprofen Overdose*.

IC

Abbreviation for interstitial cystitis, also called bladder pain syndrome; see *Interstitial Cystitis*.

ICD

Abbreviation that may mean implantable cardioverter-defibrillator, a device that detects and treats dangerous heart rhythms, or International Classification of Diseases, a system for coding health conditions. Context determines the meaning.

Alternate Names:
Implantable cardioverter defibrillator

ICD-10

The tenth revision of the World Health Organization's International Classification of Diseases, used to code diseases, injuries, and causes of death. National versions may add detail for clinical records and billing.

ICD-11

The World Health Organization's 11th revision of the International Classification of Diseases. It took effect on January 1, 2022, but countries adopt and implement it on different schedules. It is designed for recording, reporting, and analyzing diseases, injuries, and causes of death.

ICD-O Neoplasm Morphology

Classification

A coding system used by cancer registries and pathology services to record what type of tumor is present and whether it is benign or cancerous. It does not replace the diagnosis, location, or stage of the cancer.

ICD Shock Therapy

Treatment delivered by an implanted defibrillator to stop dangerous heart rhythms. The device may use painless pacing or an electrical shock, depending on the rhythm.

Iceland Disease

Historical name for epidemic neuromyasthenia, now generally classified among outbreaks of myalgic encephalomyelitis/chronic fatigue syndrome.

Icelandic Type Amyloidosis (Type VI)

Hereditary cerebral amyloid angiopathy caused by cystatin C amyloid deposition in cerebral blood vessels; it can cause recurrent brain hemorrhage and neurologic disability.

I-Cell Disease

Older name; see *Mucolipidosis II Alpha/Beta*.

Ice Pack

A device that applies cold to a body area to help relieve pain or swelling. Direct or prolonged contact can injure the skin.

Ice Pick Headache

A sudden, severe, stabbing head pain that usually lasts seconds. Attacks may recur in different head areas without warning; new, persistent, or unusually severe pain can have other causes.

Alternate Names:
Primary stabbing headache

ICF Framework

A World Health Organization framework for describing how a health condition affects body functions, daily activities, participation in life, and the person's environment. It supports a broader view of

disability than diagnosis alone.

Ichthyosis

A group of disorders of skin keratinization characterized by persistently dry, thickened, scaling skin. Forms may be inherited, with onset at birth or later, or acquired in association with systemic disease or medicines.

Ichthyosis Vulgaris

A common inherited skin condition causing dry, fine scaling, especially on the arms and legs. It often improves with age and can be managed with regular moisturizers and prescribed scale-reducing treatments.

Ictal State

The period during which an epileptic seizure is occurring, between the pre-seizure and recovery periods.

Icteric

Describing yellowing of the skin, whites of the eyes, or other tissues caused by too much bilirubin in the blood.

Icteric Index

The icteric index is a laboratory estimate of serum yellow discoloration related mainly to bilirubin and can signal jaundice or interfere with testing.

Icterus

Yellowing of the skin or whites of the eyes caused by excess bilirubin. It may result from liver disease, blocked bile flow, or rapid breakdown of red blood cells.

Icterus (Chronic Familial)

Alternate name for Gilbert syndrome, an inherited disorder causing intermittent mild unconjugated hyperbilirubinemia; see *Gilbert Syndrome*.

Ictus

A sudden neurologic event, usually a stroke or seizure. The word does not identify the specific illness or its cause.

ICU-Acquired Weakness

Generalized muscle weakness that develops during critical illness or an intensive-care stay. It may result from critical illness myopathy, critical illness polyneuropathy, or both and can delay movement and removal from a ventilator.

Idarubicin

An anthracycline chemotherapy medicine that damages cancer-cell DNA by inhibiting topoisomerase II. It is used mainly for acute myeloid leukemia; low blood counts and heart damage are important risks.

IDC

Abbreviation; see *Invasive Carcinoma Of No Special Type*.

Idea Of Reference

Singular form; see *Ideas Of Reference*.

Ideas Of Reference

The belief that ordinary events, comments, media messages, or other people's actions have a special personal meaning. When held with strong conviction despite contrary evidence, it may occur in psychotic or mood disorders.

Ideation

The formation or content of thoughts, especially thoughts related to a particular behavior or symptom. Clinical examples include suicidal ideation and homicidal ideation, for which intent, plan, means, and immediate safety are relevant features.

Identical Twins

Two individuals formed when one fertilized egg separates into two embryos. They usually have nearly identical DNA, but differences can develop through mutations, epigenetic changes, environment, and chance.

Idiopathic

Describing a condition for which no specific cause has been identified after appropriate evaluation. It does not mean that the condition is imaginary, unim-

portant, or untreatable; it means that its cause is currently unknown.

Idiopathic Amyloidosis

Amyloidosis without an identified underlying cause after appropriate evaluation; the clinical manifestations depend on the organs involved and the amyloid protein.

Idiopathic Anaphylaxis

Anaphylaxis for which no trigger is identified after a detailed history and appropriate evaluation; it is a diagnosis of exclusion. Some cases may reflect an overlooked allergen, medication, cofactor, or an underlying mast-cell disorder. The clinical features are the same as in anaphylaxis with an identified trigger.

Idiopathic Aplastic Anemia

Aplastic anemia in which no specific cause is identified after evaluation; see *Aplastic Anemia*.

Idiopathic Autoimmune Hemolytic Anemia

Autoimmune hemolytic anemia without an identified associated disease, medicine, or other trigger; see *Autoimmune Hemolytic Anemia*.

Idiopathic Basal Ganglia Calcification

Calcification of the basal ganglia without an identified secondary cause, historically called Fahr disease; symptoms may include movement, psychiatric, cognitive, or seizure disorders.

Idiopathic Chronic Erosive Gastritis

Long-standing erosive inflammation of the stomach lining without an identified cause; see *Erosive Gastritis*.

Idiopathic Dilated Cardiomyopathy

Dilated cardiomyopathy without an identified cause after evaluation; see *Dilated Cardiomyopathy*.

Idiopathic Edema

Persistent swelling, usually of the legs, occurring without an identified heart, kidney, liver, venous, lymphatic, or medication-related cause. The diagnosis is one of exclusion after common causes are evaluated.

Idiopathic Facial Paralysis

Alternate name; see *Bell's Palsy*.

Idiopathic Granulomatous Mastitis

A rare benign inflammatory breast disease in which granulomas form around breast lobules and no specific cause is identified after evaluation. It can cause a painful breast mass, redness, abscesses, or draining sinuses and can resemble breast cancer. The diagnosis requires excluding infections and other causes of granulomatous inflammation.

Idiopathic Guttate Hypomelanosis

Harmless, small, flat white spots caused by reduced skin pigment, usually on the shins or forearms of older adults. They are not contagious and generally cause no symptoms.

Idiopathic Hypercalciuria

Excess calcium in the urine without an identified cause. It can increase the risk of kidney stones and, less often, bone loss.

Idiopathic Hypersomnia

A sleep disorder that causes extreme daytime sleepiness, long or unrefreshing sleep, and difficulty waking up, even when a person has enough time to sleep. Diagnosis follows exclusion of other causes of excessive sleepiness.

Idiopathic Interstitial Pneumonias

A group of interstitial lung diseases with no identified cause, characterized by varying degrees of lung inflammation and fibrosis; diagnosis requires clinical, radiologic, and sometimes pathologic assessment.

Idiopathic Intracranial Hypertension

A disorder of elevated cerebrospinal-fluid pressure without an identified cause. It can cause headache, pulsatile tinnitus, and papilledema (optic-nerve

swelling), which can impair vision or lead to permanent vision loss.

Idiopathic Myelofibrosis

Alternate name; see *Primary Myelofibrosis*.

Idiopathic Normal-Pressure Hydrocephalus

A condition, usually affecting older adults, in which the brain's fluid-filled ventricles enlarge without a known cause. It often causes a slow, unsteady walk, slowed thinking, or urinary urgency or loss of bladder control. The pressure of the fluid around the brain and spinal cord is typically within the normal range when measured, although it can fluctuate.

Idiopathic Pulmonary Arterial Hypertension

Group 1 pulmonary arterial hypertension in which no associated disease, drug or toxin, heritable cause, or other explanation is found after appropriate evaluation. It increases resistance in the pulmonary arteries and strains the right ventricle, causing exertional breathlessness, fatigue, chest discomfort, dizziness, fainting, or swelling. Diagnosis is confirmed with right-heart catheterization and specialist assessment.

Idiopathic Pulmonary Fibrosis

A chronic, progressive lung disease in which the tissue deep inside the lungs becomes thick, stiff, and scarred over time without a known cause. As scarring worsens, the lungs lose their elasticity and cannot effectively transfer oxygen into the bloodstream. It most commonly affects older adults, causing a dry, persistent cough and worsening shortness of breath during daily physical activities.

Alternate Names:
IPF; Cryptogenic Fibrosing Alveolitis

Idiopathic Thrombocytopenic Purpura

Older name; see *Immune Thrombocytopenia*.

Idiopathic Toe Walking

Persistent walking on the toes without an identified neurologic, muscular, or structural cause. It usually begins in childhood and may occur on one or both sides; continued toe walking can shorten the calf muscles or Achilles tendons.

Idiosyncrasy

An unusual individual reaction to a medicine or exposure that is not explained by the usual pharmacologic effect.

Idiosyncratic Reaction

An unusual adverse response to a medicine that is not predictable from its usual pharmacologic effects and may occur at ordinary doses. Some idiosyncratic reactions are linked to genetic factors.

Idioventricular Rhythm

A slow heart rhythm that starts in the lower chambers of the heart instead of the normal pacemaker. It may occur when the usual electrical signal is blocked or when the heart is severely ill.

Id Reaction (Autoeczematization)

A secondary, usually itchy eczematous rash that appears at sites distant from an infection or inflammatory skin disorder, often on the hands, feet, or trunk.

Ifosfamide

Ifosfamide is an alkylating chemotherapy drug that forms DNA cross-links and is used for selected sarcomas and other cancers; adverse effects include haemorrhagic cystitis, encephalopathy, infertility, and myelosuppression. Mesna and monitoring are used to reduce selected toxicities.

iFR

Alternate name; see *Instantaneous Wave-Free Ratio*.

Ig

Abbreviation for immunoglobulin, an antibody protein produced by B cells and plasma cells; major classes include IgG, IgA, IgM, IgE, and IgD.

IgA

Abbreviation; see *Immunoglobulin A*.

IgA Nephropathy

A kidney disease caused by deposits of immunoglobulin A in the kidney filters, potentially leading to blood in urine, protein loss, high blood pressure, or kidney failure.

Alternate Names:
Berger's Disease

IgA Pemphigus

A rare autoimmune blistering disorder in which IgA antibodies target epidermal cell-adhesion proteins. It causes superficial pustules or blisters, often in annular or circinate patterns, and diagnosis relies on biopsy and direct immunofluorescence.

IgA Vasculitis

A small-vessel vasculitis associated with IgA immune deposits, also called Henoch-Schönlein purpura. It most often affects children and classically causes palpable purpura, joint pain, abdominal symptoms, and sometimes kidney inflammation.

Alternate Names:
Henoch-Schonlein Purpura

IgD

Abbreviation; see *Immunoglobulin D*.

IgE

Abbreviation; see *Immunoglobulin E*.

IgG

Abbreviation; see *Immunoglobulin G*.

IgG4-Related Disease

An uncommon immune disorder that causes inflammation and scar-like growths in one or more organs. It may affect the pancreas, salivary glands, eyes, kidneys, lungs, or blood vessels; diagnosis usually requires imaging, blood tests, and sometimes a biopsy.

IgG4-Related Disease Arteritis

Inflammation of a large or medium-sized artery as part of IgG4-related disease. It may thicken or weaken the artery and can cause narrowing, an aneurysm, pain, or reduced blood flow.

IgG4-Related Ophthalmic Disease

An immune disorder that causes inflammation and firm swelling around the eye, including the tear glands, eyelids, or eye muscles. It may cause bulging, eyelid swelling, double vision, or reduced vision and may affect other organs.

IgG and Complement Deposition

A skin-biopsy finding on direct immunofluorescence in which immunoglobulin G (IgG) and complement proteins, often C3, collect along the junction between the outer skin layer and the tissue beneath it. Linear deposits can occur in pemphigoid diseases, while granular deposits can occur in lupus; the pattern helps distinguish these conditions but does not establish a diagnosis by itself.

IgM

Abbreviation; see *Immunoglobulin M*.

IGRT

Image-guided radiation therapy uses medical imaging, such as CT, MRI, ultrasound, or X-ray, to position the patient and target radiation accurately before or during treatment. It helps deliver radiation to a tumor while reducing exposure to nearby healthy tissue.

IIH

Abbreviation; see *Idiopathic Intracranial Hypertension*.

Ileal Atresia

A condition present at birth in which part of the ileum, the last section of the small intestine, is closed or missing. It causes bowel blockage in a newborn, with a swollen abdomen, green vomiting, and failure to pass the first stool.

Ileal Conduit

A surgically created urine passage made from a short piece of the ileum, the last part of the small intestine. It carries urine from the ureters to an

opening in the abdominal wall and an external bag.

Ileal Fistula

An abnormal connection involving the ileum and another organ, bowel segment, or skin surface, which may cause intestinal contents to leak and lead to infection, malnutrition, or fluid loss.

Ileal Hemorrhage

Bleeding from the ileum, the distal portion of the small intestine, caused by ulceration, inflammation, vascular lesions, tumors, trauma, or other disease.

Ileal Neoplasm

An abnormal growth in the ileum, the last part of the small intestine. It may be noncancerous or cancerous and can cause pain, bleeding, blockage, anemia, or no symptoms.

Ileal Obstruction

Partial or complete blockage of the ileum, the final part of the small intestine. Adhesions, hernias, inflammatory bowel disease, tumors, or twisting may cause cramping pain, vomiting, swelling, and inability to pass stool or gas.

Ileal Pouch-Anal Anastomosis

An operation that removes the colon and rectum and creates a pouch from the end of the small intestine. The pouch is connected to the anus so bowel movements can continue through the usual route.

Ileal Stenosis

Narrowing of the ileum that may impair passage of intestinal contents and result from Crohn disease, inflammation, scarring, ischemia, tumor, or surgery.

Ileal Ulcer

An ileal ulcer is a break in the lining of the ileum caused by inflammation, infection, medicines, ischemia, trauma, or another intestinal disorder.

Ileitis

Inflammation of the ileum, the last part of the small intestine. Causes include Crohn disease, infection, reduced blood flow, medicines, and other disorders; symptoms may include lower-right abdominal pain, diarrhea, fever, or bleeding.

Ileocaecal

Relating to the junction between the ileum, the last part of the small intestine, and the cecum, the first part of the large intestine.

Ileocecal Junction

The point where the ileum, the last part of the small intestine, joins the cecum, the first part of the large intestine.

Ileocecal Valve

A flap-like structure where the last part of the small intestine joins the first part of the large intestine. It helps control passage of intestinal contents and limits backflow from the colon.

Ileostomy

An operation that brings the end of the small intestine through an opening in the abdomen so stool drains into an external pouch. Output is often liquid and can cause fluid and salt loss or skin irritation.

Ileum

The final and longest part of the small intestine. It absorbs vitamin B12, bile salts, and remaining nutrients before food passes into the large intestine.

Ileus

A temporary slowdown or stop in the normal movement of the intestines, without a physical blockage. It can cause a swollen belly, nausea, vomiting, and difficulty passing stool or gas. It often follows surgery or occurs with illness or certain medicines.

Iliac

Relating to the ilium or the iliac region, including the iliac bones and iliac blood vessels.

Iliac Artery

One of the large arteries that carries blood to the pelvis and lower limb. The common iliac arteries

divide into internal branches for the pelvic organs and external branches that continue into the legs.

Iliac Crest

The iliac crest is the curved upper border of the ilium and a landmark and attachment site for abdominal, back, and pelvic muscles.

Iliac Crest Bone Graft

The surgical harvesting of cancellous and cortical bone from the anterior or posterior iliac crest of the pelvis to provide an osteoconductive, osteoinductive, and osteogenic autologous graft for orthopaedic nonunion fracture repair or spinal fusion.

Alternate Names:
ICBG

Iliac Vein

An iliac vein drains blood from the pelvis and lower limb toward the inferior vena cava; thrombosis can cause swelling and pulmonary embolism.

Iliopsoas Muscles

The psoas major and iliacus muscles working together to bend the hip. They help lift the thigh, stabilize the spine, and maintain posture, and may cause groin or back pain when strained.

Alternate Names:
Iliopsoas

Iliopsoas Tendinitis

Overuse-related irritation of the iliopsoas tendon, causing pain in the groin or front of the hip that may worsen with hip flexion, running, or rising from a chair.

Iliopsoas Bursitis

Inflammation of the fluid-filled sac between the iliopsoas muscle and the front of the hip joint. It can cause pain in the groin or front of the hip, especially when straightening or bending the hip.

Iliotibial Band

A strong band of tissue running along the outer side of the thigh from the hip to the knee. It helps stabilize the hip and knee during movement.

Iliotibial Band Friction Syndrome

Alternate name; see *Iliotibial Band Syndrome*.

Iliotibial Band Syndrome

Pain on the outer side of the knee caused by irritation of the iliotibial band, especially during repeated activities such as running or cycling.

Alternate Names:
ITBS; IT Band Friction Syndrome

Ilium

The broad, upper part of each hip bone. It joins the sacrum at the back, helps form the hip socket, and provides attachment for muscles of the abdomen, back, pelvis, and thigh. Its upper edge is the iliac crest.

Illinois Type Amyloidosis

Historical or imprecise label for primary, usually immunoglobulin light-chain amyloidosis; the label alone does not establish the type of deposited protein.

Illness Anxiety Disorder

Persistent fear of having or developing a serious illness despite few or no physical symptoms. The person may repeatedly check the body, seek reassurance, search for health information, or avoid medical care; symptoms last at least six months.

Illusion

A misperception or misinterpretation of a real external stimulus, such as mistaking a shadow for a person. Illusions may occur with visual impairment, delirium, seizures, intoxication, or severe psychiatric illness and differ from hallucinations, which occur without an external stimulus.

Iloprost

A prostacyclin analogue that causes vasodilation and inhibits platelet aggregation; inhaled or infused formulations are used for selected forms of pulmonary hypertension and severe peripheral is-

chemia.

Image-Guided Ablation

Destruction of selected abnormal tissue with heat, cold, electricity, or chemicals while ultrasound, CT, MRI, or another imaging method guides and monitors the treatment. It may treat tumors, abnormal heart rhythms, or other disease.

Image-Guided Biopsy

Removal of a tissue sample while ultrasound, CT, MRI, mammography, or fluoroscopy guides the needle or instrument to the target and helps avoid critical structures.

Image-Guided Drainage

Placement of a needle or catheter while imaging guides its path to remove pus, blood, bile, urine, or other trapped fluid. It may treat an abscess, infected collection, or symptomatic cyst and can cause bleeding or infection.

Image-Guided Therapy

A procedure in which ultrasound, CT, X-ray, MRI, or another imaging method guides a needle, catheter, or treatment device to a specific area. This can improve accuracy while limiting injury to nearby tissue.

Imaging

The production of pictures of internal body structures using methods such as radiography, ultrasound, computed tomography, magnetic resonance imaging, or nuclear medicine.

Imaging And Radiology

Imaging and radiology use methods such as X-ray, ultrasound, CT, and MRI to create pictures that help diagnose or guide treatment of disease.

Imaging-Guided Biopsy

Alternate name; see *Image-Guided Biopsy*.

Imaging Technique

An imaging technique is a method for producing pictures of body structures or processes, such as ultrasound, CT, MRI, or nuclear imaging.

Imatinib Mesylate

The mesylate salt of imatinib, a tyrosine-kinase inhibitor used to treat BCR-ABL-positive chronic myeloid leukemia, gastrointestinal stromal tumors with KIT alterations, and other selected cancers.

Imerslund-GräSbeck Syndrome

A rare inherited disorder in which the small intestine cannot absorb vitamin B12 properly. It can cause low B12 levels, anemia, tiredness, numbness, balance problems, or other nerve damage despite adequate dietary intake.

Imidazoles

A group of antifungal medicines, including clotrimazole, miconazole, and ketoconazole, used to treat fungal infections of the skin, mouth, or other body areas.

Iminoacetic Acid Scan

A nuclear medicine scan using a radioactive iminodiacetic acid tracer to show how bile moves through the liver, gallbladder, and bile ducts.

Alternate Names:
HIDA Scan; Hepatobiliary Iminodiacetic Acid Scan

Imipenem

A strong antibiotic, usually given with cilastatin, used for serious bacterial infections. It can cause allergic reactions, stomach problems, seizures, or antibiotic resistance.

Imipramine

A medicine used for depression and some bladder problems. It can cause dry mouth, constipation, dizziness, abnormal heart rhythms, and dangerous effects in overdose.

Imipramine Overdose

Toxic ingestion of imipramine, a tricyclic antidepressant, which can cause anticholinergic effects, seizures, hypotension, ventricular arrhythmias,

coma, and life-threatening cardiac toxicity.

Imiquimod

Imiquimod is a topical immune-response modifier that activates Toll-like receptor 7 and induces cytokines; it treats selected actinic keratoses, superficial basal-cell carcinomas, and external genital warts, often causing local inflammation.

Immature Ovarian Teratoma

A rare cancer of the ovary made from immature cells that can develop into different body tissues. It occurs most often in teenagers or young adults, and its grade and spread guide treatment.

Immediate Hypersensitivity

A rapid allergic reaction, usually involving IgE antibodies and mast cells. It can cause hives, itching, swelling, wheezing, vomiting, or anaphylaxis within minutes of exposure.

Immersion Foot

A painful cold injury caused by prolonged exposure of the feet to cold, wet conditions without freezing, leading to numbness, swelling, and skin changes.

Alternate Names:
Trench Foot

Immobilization

Restriction of movement of a body part or the whole patient, using rest, splints, casts, braces, traction, or other methods. It may protect an injury but can cause stiffness, pressure injury, muscle loss, venous thromboembolism, and other complications if prolonged.

Immobilize

To restrict movement of a body part, often with a splint or cast, to support healing.

Alternate Names:
Immobilization

Immotile Cilia Syndrome

A genetically heterogeneous autosomal recessive ciliopathy caused by structural defects in ciliary axonemal dynein arms, leading to impaired mucociliary clearance, recurrent sinopulmonary infections, bronchiectasis, male infertility, and situs inversus in the subgroup known as Kartagener syndrome.

Alternate Names:
Primary Ciliary Dyskinesia; PCD

Immune

Having an immune response that recognizes and helps protect against a particular antigen, infection, or toxin; immunity may be innate or acquired.

Immune And Infectious Diseases

Conditions involving abnormal immune defenses or infections caused by bacteria, viruses, fungi, or parasites. Examples include autoimmune disease, allergy, weakened immunity, and infections that are unusually severe or recurrent.

Immune Checkpoint

A control signal that helps prevent immune cells from becoming too active or damaging healthy tissue. Some cancer medicines block these signals to help immune cells attack tumors, but this can cause inflammation in normal organs.

Immune Checkpoint Inhibitor

A cancer medicine that blocks an immune-checkpoint signal, helping immune cells recognize and attack cancer cells. It can also cause inflammation in normal organs, called an immune-related adverse event.

Immune Complex

A cluster formed when an antibody attaches to a foreign or abnormal substance. If these clusters are not cleared, they can collect in tissues and cause inflammation, blood-vessel damage, or kidney disease.

Immune Disorder

A condition caused by an immune system that is overactive, underactive, misdirected, or otherwise abnormal. Major groups include autoimmune disease, immunodeficiency, allergy and hypersensitivity, immune dysregulation, and some inflammatory dis-

orders.

Immune Evasion

The ability of an infection, tumor, or abnormal cell to avoid being recognized or destroyed by the immune system. It may hide identifying markers, block immune signals, or resist immune-cell attack.

Immune Hemolytic Anemia

Anemia caused when antibodies or other immune proteins destroy red blood cells too quickly. It may cause tiredness, jaundice, dark urine, rapid heartbeat, breathlessness, or an enlarged spleen and may follow illness, medicines, or transfusion.

Immune Interference

In vaccinology, an interaction in which one vaccine, antigen, or pre-existing immune response changes the size or type of the immune response to another vaccine antigen. The response may be reduced or increased, and a measured change does not necessarily mean that protection from disease is reduced.

Immune-Mediated Necrotizing Myopathy

An uncommon autoimmune muscle disease that causes worsening weakness, especially in the hips and shoulders, and often markedly raises muscle enzymes. Some cases are linked to statins or specific antibodies; diagnosis may require blood tests, imaging, and muscle testing.

Immune Privileged Sites

Body areas where immune activity is locally limited or carefully controlled, such as parts of the eye, brain, and testes. This protection helps reduce damage to delicate tissues, but it does not mean these areas are completely cut off from immune defenses.

Immune Reconstitution Inflammatory Syndrome

Worsening inflammation that can occur as the immune system begins to recover, often soon after HIV treatment starts. The recovering immune system may react strongly to an infection that was already present, such as tuberculosis or cryptococcosis.

Alternate Names:
IRIS; Immune Restoration Disease

Immune-Related Adverse Event

An inflammatory or autoimmune toxicity caused by immune checkpoint blockade or another immune-activating cancer treatment. It may affect skin, bowel, liver, endocrine organs, lungs, heart, kidneys, or nervous system and often requires treatment-specific immunosuppression.

Immune Response

The body's reaction to an infection, foreign substance, or abnormal cell. It includes rapid defenses such as inflammation and slower, targeted responses involving antibodies and immune cells that remember previous exposures.

Immune Status

The current strength and activity of a person's immune defenses, including protection from previous infection or vaccination and effects of disease, medicines, nutrition, or cancer treatment. It helps estimate infection risk and vaccine response.

Immune System

The body's network of cells, tissues, organs, and proteins that recognizes and responds to infections, abnormal cells, and harmful substances. It includes rapid innate defenses and learned adaptive defenses; overactivity can cause allergy or autoimmunity, while weakness increases infection risk.

Immune Thrombocytopenia

An autoimmune blood disorder in which the body's immune system mistakenly attacks and destroys its own blood-clotting cells (platelets), while also slowing new platelet production in the bone marrow. Having too few platelets prevents normal clotting, increasing the risk of easy or excessive bruising, tiny pinpoint red spots on the skin (petechiae), frequent nosebleeds, bleeding gums, or heavier menstrual bleeding.

Alternate Names:
ITP; Idiopathic Thrombocytopenic Purpura; Immune Thrombocytopenic Purpura

Immune Thrombocytopenia in Pregnancy

An autoimmune disorder in which antibodies destroy platelets, causing a low platelet count and sometimes bruising or bleeding. Pregnancy may complicate diagnosis and delivery planning; treatment and platelet targets depend on bleeding, counts, timing, and planned anesthesia.

Immune Thrombocytopenic Purpura

Older name; see *Immune Thrombocytopenia*.

Immune Tolerance

The ability of the immune system to avoid attacking the body's own tissues while still responding to infections. Failure of tolerance can contribute to autoimmune disease; excessive tolerance can allow some cancers or infections to persist.

Immunity

The body's ability to recognize and defend against infections or other foreign substances. Protection may be present from birth, develop after infection or vaccination, or be provided temporarily by transferred antibodies.

Immunization

The process of acquiring protection against an infectious disease through active or passive immunity. Active immunity develops after exposure to an antigen, including through vaccination or infection; passive immunity follows transfer of antibodies, such as maternal antibodies or immunoglobulin. Vaccination is a means of active immunization.

Immunizations

Alternate plural form; see *Immunization*.

Immunizations For People With Diabetes

Vaccination schedules for people with diabetes vary with age, health, prior vaccination, and local public-health guidance. Diabetes can increase the risk of severe illness from some vaccine-preventable infections.

Immunoassay

A laboratory test that uses the specific binding between an antibody and its target to detect or measure substances such as hormones, medicines, proteins, antigens, or other antibodies in a sample.

Immunoassays

Alternate plural; see *Immunoassay*.

Immunoblast Count

An immunoblast count measures activated lymphocytes, usually in a tissue or blood sample, and may help evaluate immune responses or lymphoid disease.

Immunoblastic Lymphadenopathy

A historical name used for angioimmunoblastic lymphadenopathy, now classified as nodal T-follicular helper cell lymphoma, angioimmunoblastic-type. Older use of the term was not always consistent, so it should not replace the specific diagnosis based on biopsy and current lymphoma classification.

Immunoblotting

Immunoblotting, or Western blotting, separates proteins by electrophoresis and detects a target with specific antibodies; band pattern and intensity are interpreted with controls and clinical context.

Immunochemistry

The study or laboratory measurement of biological molecules using specific antigen-antibody reactions, including immunoassays and immunostaining.

Immunocompetence

The ability of the immune system to recognize harmful or foreign substances and produce an effective, appropriately controlled response. Reduced immunocompetence can increase infection risk and weaken responses to vaccines.

Immunocompetent

Having an immune system capable of mounting an appropriate response to common infectious or foreign antigens.

Immunocompromised

Having weakened or impaired immune defenses because of disease, medication, cancer treatment, transplantation, or another cause, increasing susceptibility to some infections and complications.

Immunocompromised Host

A person whose immune defenses are weakened by an inherited disorder, infection, cancer, organ failure, malnutrition, or immune-suppressing treatment. Such a person may develop unusual, severe, or repeated infections and may have fewer typical symptoms.

Immunocompromised Pneumonia

Pulmonary parenchymal infection occurring in patients with congenital or acquired immunodeficiencies (such as HIV, chemotherapy-induced neutropenia, or organ transplantation). Frequently caused by opportunistic pathogens including *Pneumocystis jirovecii*, fungi, and cytomegalovirus.

Alternate Names:
Immunocompromised Host Pneumonia

Immunoconjugate

A therapeutic or diagnostic molecule in which an antibody or other targeting protein is chemically linked to a drug, toxin, enzyme, or imaging agent.

Immunocytochemistry

A laboratory method using labeled antibodies to identify specific proteins or antigens within cells or tissue sections.

Immunodeficiency

A condition in which part of the immune system is missing, weakened, or does not work properly. It may be inherited or caused by illness, medicines, cancer treatment, poor nutrition, or infection and can lead to repeated or severe infections.

Immunodeficiency And Infections

A weakened immune system increases the risk of infections that are unusually severe, repeated, persistent, or caused by organisms that rarely affect healthy people. Causes include inherited disorders, HIV, cancer treatment, transplantation, and immune-suppressing medicines.

Immunodeficiency Diseases

Alternate name; see *Immunodeficiency*.

Immunodeficiency Disorders

Alternate name; see *Immunodeficiency*.

Immunodeficiency with Ataxia Telangiectasia

Alternate name; see *Ataxia Telangiectasia*.

Immunoelectrophoresis

A laboratory method that separates proteins by electrophoresis and identifies them with specific antibodies, often to study immunoglobulins.

Immunoelectrophoresis – Blood

Alternate name; see *Immunoelectrophoresis*.

Immunofixation Blood Test

A blood test that identifies and types monoclonal immunoglobulins, helping evaluate monoclonal gammopathy, multiple myeloma, and related plasma-cell disorders.

Immunofluorescence

A laboratory method that uses fluorescently labeled antibodies to show specific proteins, germs, or immune deposits in cells, tissues, or body fluids when viewed with a special microscope.

Immunofluorescence Technique

Alternate name; see *Immunofluorescence*.

Immunogenetics

The study of how genes influence immune-system development, function, and disease. It includes inherited susceptibility to autoimmune disease, differences in immune responses, and genetic matching for transplantation.

Immunogenicity

The ability of an antigen, vaccine, or other substance to provoke an immune response, including antibody or cellular responses.

Immunoglobulin

A protein made by immune cells that recognizes a particular foreign substance, germ, or abnormal cell. Antibodies can block harmful targets, mark them for removal, or activate other immune defenses.

Alternate Names:
Antibody

Immunoglobulin A

An antibody found mainly in mucus, saliva, tears, breast milk, and intestinal fluid. It protects surfaces exposed to the outside world and helps prevent germs from attaching and entering tissues.

Immunoglobulin A Deficiency

An immune deficiency in which IgA levels are markedly reduced or absent, while other immunoglobulin classes may be normal. Some people have recurrent respiratory or gastrointestinal infections, allergies, or autoimmune disease, while others have few symptoms.

Immunoglobulin D

A type of antibody found in very small amounts in the blood and on the surface of some B cells. Its exact role is not fully understood, but it may help regulate immune responses in the airways and other tissues.

Immunoglobulin E

A type of antibody involved in allergies and the body's response to some parasites, such as worms. It can attach to certain immune cells. When an allergen activates these cells, they release chemicals that may cause itching, swelling, more mucus, wheezing, or other allergy symptoms.

Alternate Names:
IgE

Immunoglobulin E Test

A blood test measuring total or allergen-specific IgE antibodies to evaluate allergic disorders, atopy, or parasitic infections; see *Immunoglobulin E*.

Immunoglobulin G

The most common antibody in blood and tissue fluid, helping protect against many infections. It can remain after infection or vaccination, cross the placenta during pregnancy, and sometimes cause harmful immune reactions.

Immunoglobulin G4-Related Disease

A long-term immune disorder that can cause inflammation and scar-like growths in organs such as the pancreas, tear or salivary glands, bile ducts, kidneys, and tissues behind the abdomen. Diagnosis usually combines symptoms, imaging, blood tests, and sometimes a tissue sample; a high IgG4 blood level alone does not establish the disease.

Alternate Names:
IgG4-RD; IgG4-Related Systemic Disease

Immunoglobulin G Deficiency

Reduced IgG production or function that can impair antibody-mediated defense and lead to recurrent sinopulmonary or other infections. Evaluation usually considers IgG subclasses, vaccine responses, and associated immune abnormalities.

Immunoglobulin Isotype

The class of an antibody, determined by its constant region. The main isotypes are IgG, IgA, IgM, IgD, and IgE; each has different roles and locations in immune defense.

Immunoglobulin M

A large antibody usually produced early after a new infection or other immune challenge. It helps activate immune defenses and can be measured in blood, but a high result does not by itself prove a recent infection.

Immunoglobulin M Deficiency

An uncommon antibody deficiency characterized

by persistently low IgM with otherwise variable immunoglobulin levels. It may be associated with recurrent infections, allergy, or autoimmune disease.

Immunoglobulin Replacement Therapy

Treatment that supplies pooled antibodies through a vein or under the skin when a person's immune system makes too few effective antibodies. It can reduce recurrent infections in selected inherited or acquired antibody deficiencies; headache, fever, and infusion reactions may occur.

Immunohemolysis

Destruction of red blood cells by an immune reaction involving antibodies, complement, or both. It may occur in autoimmune hemolytic anemia, incompatible transfusion reactions, or other antibody-mediated disorders.

Immunohistochemistry

A laboratory method that uses specially marked antibodies to find particular proteins in a tissue sample. It helps identify tumor type, infection, or immune disease and can guide treatment choices.

Immunologic Adjuvant

A substance added to some vaccines to strengthen or guide the immune response. It may improve protection but can also increase temporary pain, swelling, fever, or other vaccine reactions.

Immunologically Privileged Site

A body area where immune responses are partly limited, helping protect delicate tissues from inflammation while still allowing important defense against infection.

Immunological Memory

Alternate name; see *Immunologic Memory*.

Immunological Synapse

The organized contact point where an immune cell meets a target or another immune cell. Signals gathered at this contact help decide whether the immune cell should become active.

Immunological Tolerance

Alternate name; see *Immune Tolerance*.

Immunologic Factor

A substance, cell, gene, or process that affects immune-system activity or control. Examples include antibodies, immune cells, signaling proteins, inherited traits, medicines, and conditions that alter defense against disease.

Immunologic Memory

The capacity of the adaptive immune system to respond more rapidly and strongly after re-exposure to an antigen because of long-lived memory lymphocytes.

Immunologic Skin Test

An immunologic skin test places a small amount of an antigen or allergen in or on the skin to assess immune reactivity, such as allergy or tuberculosis exposure.

Immunologic Surveillance

The immune system's ongoing detection and removal of abnormal, infected, or damaged cells. This protection helps control infections and may recognize early cancerous changes, although it is not always successful.

Immunologic Technique

A laboratory or clinical method that uses antibodies, antigens, or immune reactions to detect or measure a substance.

Immunologic Test

An immunologic test examines immune cells, antibodies, antigens, or immune-related proteins to help evaluate infection, allergy, autoimmune disease, or immune deficiency.

Immunology

The study of the immune system, its normal functions, and its disorders. Clinical immunology focuses on allergy, immunodeficiency, autoimmunity, and abnormal immune responses to infection or trans-

planted tissue. Basic immunology also investigates immune cells, molecules, and mechanisms.

Immunomodulation

Modification of immune activity to enhance, suppress, or redirect an immune response. Immunomodulatory medicines are used in cancer, autoimmune disease, transplantation, and infection but may increase susceptibility to infection or other adverse effects.

Immunomodulators

Medicines or other treatments that change immune-system activity. Depending on the treatment, they may increase, reduce, or redirect immune responses and are used for conditions such as cancer, autoimmune disease, and some infections. Effects and risks vary by treatment.

Alternate Names:
Immunomodulator; Immune-Modifying Medicines

Immunomodulators In Dermatology

Medicines that adjust local immune activity to treat conditions such as eczema and other inflammatory skin diseases. Topical calcineurin inhibitors are steroid-sparing options and may cause burning or irritation.

Immunomodulatory

Describing a treatment or substance that changes immune activity. It may stimulate, suppress, or otherwise regulate the immune response, depending on the medicine and condition.

Immunophenotyping

A laboratory method that identifies cells by the proteins on or inside them, usually using flow cytometry or stained tissue. It helps classify leukemias and lymphomas and evaluate some immune disorders.

Immunoprotein

A protein involved in immune defense or immune regulation, such as an antibody, complement protein, cytokine, or antigen-presenting molecule. Immunoproteins identify threats, coordinate immune cells, or help remove damaged or infected material.

Immunoradiometric Assay

A laboratory test using radioactive labels on antibodies to measure a specific substance, such as a hormone, protein, or other marker.

Immunoregulation

Control of the strength, duration, and target of immune responses, including activation, suppression, and tolerance. Abnormal immunoregulation contributes to autoimmunity, allergy, immunodeficiency, and chronic inflammation.

Immunosenescence

Age-related changes in immune defenses that can increase susceptibility to some infections, reduce vaccine responses, and alter inflammation. The effects vary with chronic disease, nutrition, medicines, and overall function.

Immunosuppressants

Medicines that reduce immune-system activity. They are used after transplantation and for selected autoimmune or inflammatory disorders, but can increase susceptibility to infection and other adverse effects.

Immunosuppression

Reduced immune-system activity caused by disease, medicines, cancer treatment, or another condition. It can prevent rejection of a transplant or control autoimmune disease but increases susceptibility to infections and some cancers.

Immunosuppression In Transplant

Treatment that reduces immune activity to prevent rejection of a transplanted organ. It can increase infection and cancer risk, affect kidney or liver function, and cause other medicine-related complications.

Immunosuppression Screening

Checks before immune-suppressing treatment to identify infections, cancer risks, organ problems, pregnancy when relevant, and missing vaccinations. Tests may include tuberculosis, hepatitis B or C, HIV, blood counts, and liver and kidney tests.

Immunosuppressive

Describing a medicine, treatment, or condition that reduces immune-system activity. Immunosuppression can prevent transplant rejection or control autoimmune disease, but it may increase the risk of infection, some cancers, and reduced vaccine responses.

Immunotherapy

Cancer treatment that helps the immune system recognize or attack cancer cells, or supplies immune cells or antibodies that do so. Main approaches include checkpoint medicines, engineered immune cells, antibodies, and immune-stimulating treatments. Benefits and side effects depend on the cancer and treatment.

Immunotherapy And Biologic Treatments

Treatments made from or designed to affect living biological systems, including antibodies and other medicines that adjust immune activity. They are used for selected cancers, autoimmune diseases, and inflammatory disorders and may increase infection or organ-inflammation risk.

Immunotherapy For Cancer

Cancer treatment that stimulates, restores, redirects, or supplies immune activity to recognize and attack malignant cells, including immune-checkpoint inhibitors, cellular therapies, and antibodies.

Immunotherapy In Dermatology

Treatment that changes immune activity to manage selected skin cancers or inflammatory skin diseases. The treatment and its risks depend on the diagnosis; immune-based cancer medicines can also inflame normal organs.

Immunotoxicity

Harm to immune-system function caused by chemicals, medicines, infections, or other exposures. It may weaken defenses, trigger excessive sensitivity, cause autoimmunity, or change responses to vaccines and infections.

Immunotoxin

A targeted toxin made by linking a toxic protein or drug to an antibody or binding molecule that directs it toward selected cells.

Immunoturbidimetry

A laboratory method that measures cloudiness produced when antibodies react with a target antigen, allowing estimation of the target's concentration.

Impacted

Firmly wedged or unable to move from its normal position, as with an impacted tooth or stool. The result may cause pain, blockage, inflammation, infection, or damage to nearby tissues.

Impacted Fracture

A fracture in which one broken bone fragment is driven firmly into another, often producing relative stability but sometimes causing shortening or deformity.

Impacted Tooth

A tooth that cannot emerge normally because it is blocked by bone, gum, or another tooth. Wisdom teeth and upper canine teeth are commonly affected and may cause pain, infection, decay, cysts, or damage to neighboring teeth.

Impacted Wisdom Teeth

Wisdom teeth that cannot emerge normally because they are blocked by bone, gum, or another tooth.

Alternate Names:
Impacted Third Molars; Third Molar Impaction

Impaction

Blockage caused by material that is firmly lodged, such as hardened stool, a foreign object, or an impacted tooth. Symptoms depend on the site and may include pain, swelling, vomiting, or inability to pass contents.

Impaired Fasting Glucose

A fasting blood-glucose level above normal but below the range used to diagnose diabetes. It indicates

increased future diabetes risk and may improve with weight management, activity, and treatment of risk factors.

Impaired Glucose Tolerance

A blood-glucose level that is higher than normal two hours after drinking a measured glucose solution but below the range used to diagnose diabetes. It indicates increased future risk of type 2 diabetes and cardiovascular disease.

Impaired Smell

Reduced or absent ability to detect odors, called hyposmia or anosmia, caused by nasal obstruction, viral injury, head trauma, neurodegeneration, medications, or other disease.

Impaired Taste

Impaired taste is reduced, distorted, or absent ability to taste and may result from infection, medicines, oral disease, nerve injury, or changes in smell.

IMP Dehydrogenase

An enzyme that helps cells make guanosine nucleotides, building blocks needed for DNA and RNA. Blocking it can slow the growth of immune cells, which is why some immunosuppressive medicines target this pathway.

Impedance Hearing Testing

A group of tests, including tympanometry, that measure the movement of the eardrum and middle-ear function.

Impedance Plethysmography

A test that measures changes in a limb's electrical resistance as its blood volume changes. It has been used to assess venous blood flow.

Impella Device

A temporary heart pump placed through a blood vessel or during surgery. Depending on the model, it can support the left or right side of the heart by moving blood from a heart chamber into a major artery. It is used in selected cases of severe heart failure or during heart procedures.

Imperforate Anus

A birth difference in which the anus is absent, closed, or not connected normally to the rectum. A newborn may not pass stool and may develop abdominal swelling; other spine, heart, kidney, limb, or digestive differences can occur.

Imperforate Anus Repair

Surgery to create or reposition an anal opening and connect the rectum so stool can pass normally in a baby born with an absent or blocked anus. Some babies need temporary bowel diversion; follow-up assesses healing, constipation, and bowel control.

Imperforate Hymen

A birth difference in which the hymen completely covers the vaginal opening. After puberty, menstrual blood may collect behind it, causing absent periods, monthly pelvic pain, difficulty urinating, or a pelvic swelling.

Imperforate Vagina

A congenital blockage or discontinuity of the vaginal canal, often caused by vaginal atresia or a transverse vaginal septum. After puberty, menstrual blood may collect behind the blockage, causing absent periods, cyclic pelvic pain, or a pelvic mass.

Impetigo

A contagious superficial bacterial skin infection, usually caused by *Staphylococcus aureus* or group A *Streptococcus*. Nonbullous lesions often progress from sores to characteristic honey-colored crusts; bullous impetigo causes fragile fluid-filled blisters. It is common in children but can occur at any age.

Alternate Names:
School Sores; Impetigo Contagiosa

Impingement Syndrome

Pain and restricted movement caused when a tendon or other soft tissue is compressed between bones, commonly in the shoulder during elevation of the arm.

Impingement Syndrome of the Shoulder

Shoulder pain caused when tendons or a fluid-filled cushion beneath the shoulder blade become crowded during arm movement. Pain and limited movement are common.

Alternate Names:
Subacromial Impingement; Rotator Cuff Impingement

Implant

A medical device, tissue, or material placed inside the body to replace, support, monitor, or deliver treatment.

Implantable Cardioverter Defibrillator

Variant spelling; see *Implantable Cardioverter-Defibrillator*.

Implantable Cardioverter-Defibrillator

A small, battery-powered electronic device surgically placed under the skin of the chest to protect people at high risk of sudden cardiac arrest. It continuously monitors the heart's electrical rhythm; if it detects a dangerously fast or chaotic heartbeat in the lower chambers (ventricles), it automatically delivers an electric shock to reset the heart to a normal rhythm.

Alternate Names:
ICD; Automated Implantable Cardioverter-Defibrillator (AICD)

Implantable Cardioverter-Defibrillator Placement

The surgical insertion of a specialized battery-powered device under the skin connected to cardiac leads that continuously monitors heart rhythm and delivers electric shocks or pacing to terminate life-threatening ventricular arrhythmias; see *Implantable Cardioverter-Defibrillator*.

Implantable Defibrillator

A surgically implanted device that detects dangerous ventricular arrhythmias and delivers pacing or an electrical shock to restore an effective rhythm.

Implantable Glucose Sensor

A sensor placed under the skin that measures glucose in interstitial fluid and sends readings to a receiver, reader, or insulin-delivery system. It supports continuous or intermittently scanned glucose monitoring.

Implantable Loop Recorder

A small device placed under the skin of the chest to record heart rhythm for months or years. It helps detect intermittent abnormal rhythms when fainting, palpitations, or a stroke remains unexplained by shorter monitoring.

Implantable Port

A small reservoir placed under the skin and connected to a tube in a large vein. It provides repeated access for medicines, fluids, blood products, or nutrition without a new vein puncture each time; infection, clotting, blockage, or damage can occur.

Implantable Venous Access Port

A totally subcutaneous long-term central venous access device consisting of a silicone or titanium injection reservoir septum connected to a central catheter, accessed percutaneously using a non-coring Huber needle.

Alternate Names:
Port-a-Cath; Subcutaneous Infusion Port; Mediport; Venous Access Port

Implant-Associated Infection

Infection involving an implanted device or the tissue around it. Germs may stick to the device and form a protective layer, so treatment may require antibiotics, drainage, or removal or replacement of the device.

Implantation

The stage of early pregnancy when a fertilized egg attaches to and begins growing into the lining of the uterus, usually about a week after fertilization. It allows the developing pregnancy to receive support from the placenta.

Implantation Procedure

Placement of a device, tissue, medicine-delivery system, or other material inside the body for treatment or support. Examples include joint, dental, heart, and breast implants; risks include bleeding, infection, movement, failure, or rejection of donor tissue.

Implant-Based Breast Reconstruction

Breast reconstruction using a saline- or silicone-filled implant, sometimes after a temporary tissue expander is placed. The approach depends on the person's anatomy, treatment, and preferences.

Alternate Names:
Prosthetic Breast Reconstruction; Implant Breast Reconstruction

Implant Failure

Loss of an implant's ability to work properly or remain safely in place. Causes include infection, breakage, loosening, wear, movement, blockage, material damage, or problems with the surrounding tissue.

Implants

Medical devices, materials, or tissues placed in the body to replace, support, monitor, or deliver treatment. Possible problems include infection, rejection, movement, breakage, or failure.

Implant Sterilization

A validated process that removes or kills all microorganisms, including spores, from an implant or implantable device before use. The method is chosen according to the device's material and design.

Implant-Supported Prosthesis

A fixed or removable dental prosthesis that is supported or retained by one or more dental implants.

Importance Weight

An importance weight is a statistical weight used to adjust observations so a sample better represents a target population or distribution.

Impotence

Older term; see *Erectile Dysfunction*.

Impotence (Erection Problems)

Alternate name for erectile dysfunction, the persistent inability to obtain or maintain an erection adequate for sexual activity; see *Erectile Dysfunction*.

Impression

The concluding section of a medical or imaging report that summarizes the most important findings, their likely meaning, and possible next steps.

Imprinting

A pattern of gene expression determined by whether a gene copy was inherited from the mother or father.

Impulse

An impulse is a brief signal or force; in physiology it commonly refers to an electrical signal travelling along a nerve or through the heart.

Impulse Control Disorder

A class of psychiatric conditions characterized by a persistent failure to resist an impulse, drive, or temptation to perform an act harmful to oneself or others, including kleptomania, pyromania, and intermittent explosive disorder.

Impulse Oscillometry

A breathing test that applies tiny pressure waves while a person breathes normally. It estimates how easily air moves through the lungs and can help assess asthma, chronic lung disease, or small-airway problems, especially when forceful breathing is difficult.

Impulsive Behavior

Impulsive behavior is action with limited forethought or inhibition despite possible harm and may occur with psychiatric, neurologic, substance-related, or developmental conditions.

Impulsivity

A tendency to act quickly without adequate consideration of consequences or difficulty delaying a response; it can occur in ADHD, mania, substance use, and other conditions.

In

In clinical measurements, an abbreviation for inch or inches; the same letters may have other meanings in different contexts.

Inactivated Vaccines

Vaccines made from microorganisms that have been killed or from parts of them. They cannot reproduce or cause the infection they are designed to prevent, but they may need several doses or booster doses to maintain protection.

Inactivator

A substance or process that makes a biological agent inactive. Inactivators may disable viruses, toxins, enzymes, or medicines and are used in immunity, laboratory testing, sterilization, and treatment.

Inamrinone

Inamrinone is an intravenous medicine that increases heart contraction and widens blood vessels; it was used short term in severe heart failure but can cause low blood pressure and abnormal rhythms.

Inanition

Severe physical depletion caused by inadequate food or nutrient intake, often accompanied by weight loss, weakness, dehydration, and metabolic disturbance. Causes may include starvation, malabsorption, chronic disease, or inability to eat.

Inappropriate Antidiuretic Hormone Secretion

Older name for a disorder in which excess vasopressin makes the body retain water and lowers blood sodium; see *Syndrome of Inappropriate Antidiuresis (SIAD)*.

Inappropriate Sinus Tachycardia

A condition in which the heart's normal pacemaker beats too fast at rest or speeds up more than expected with mild activity, without another clear cause such as fever, anemia, or an overactive thyroid. It may cause palpitations, dizziness, tiredness, or shortness of breath.

Alternate Names:
IST

Inborn Error Of Metabolism

An inherited disorder in which an enzyme, transporter, or other protein needed for body chemistry does not work correctly. Harmful substances may accumulate or essential substances may be lacking, causing illness from infancy or later in life.

Inborn Errors Of Immunity

Inherited disorders that impair one or more parts of the immune system. They can cause repeated, unusually severe, or unusual infections, as well as autoimmunity, inflammation, allergy, or increased cancer risk.

Inborn Errors of Metabolism

Alternate name; see *Inborn Error Of Metabolism*.

Inbreed

To reproduce between genetically related individuals; inbreeding can increase the chance that recessive inherited disorders will occur.

Inbreeding

Reproduction between people who share a recent ancestor. It increases the chance that a child inherits two copies of the same recessive disease-causing gene variant.

Incarcerated Femoral Hernia

A femoral hernia whose contents cannot be returned through the femoral canal into the abdomen. The narrow, firm opening increases the risk of bowel obstruction and strangulation, in which blood supply to the trapped tissue is cut off.

Incarcerated Hernia

A hernia whose protruded tissue cannot be returned to the abdominal cavity. It may progress to strangulation and loss of blood supply.

Incentive Spirometry

A breathing device that provides visual feedback while a person inhales slowly and deeply. It may be used with coughing, mobilization, and other measures to encourage lung expansion after illness or surgery; it is a lung-expansion exercise and is not the same as diagnostic spirometry.

Incest

Sexual activity or reproduction between close biological relatives. It can involve abuse or coercion and increases the chance of inherited disorders in children; associated concerns include medical, psychological, and safeguarding needs.

Incidence

The number of new cases of a disease or event in a defined population during a specified period. It describes the chance of developing the condition during that period and differs from prevalence.

Incidental Finding

An unexpected result discovered during an examination or test performed for another reason. It may be harmless or important; follow-up depends on what was found, its appearance, symptoms, and personal risk factors.

Incidentaloma

An unexpected mass or abnormality found during imaging or another test performed for a different reason. It may be harmless or important, so follow-up depends on its size, appearance, location, growth, and the person's risks.

Incised Wound

A cut made by a sharp object such as a knife, piece of glass, or surgical instrument. It usually has straight, clean edges and may damage skin, blood vessels, nerves, tendons, or deeper organs.

Incision

A deliberate cut made by a healthcare professional through the skin or another tissue, usually during surgery or to allow drainage. The wound is closed or left to heal according to its size, location, contamination, and purpose.

Incisional Biopsy

Surgical removal of only part of a lesion for diagnosis, generally used when the lesion is too large or located where complete removal would be inappropriate as an initial procedure.

Incisional Hernia

A hernia through a weakness in a previous surgical incision. It may appear as a bulge that becomes more prominent with standing or straining. Risk factors include wound infection, obesity, smoking, poor nutrition, chronic cough, and repeated surgery.

Incision and Drainage

A procedure that opens an abscess, a pocket of pus, so it can drain. It is often done with local anesthetic. A small drain or packing may be used to keep the opening from closing too soon; some infections also need antibiotics.

Alternate Names:
I&D; Abscess Drainage; Incision and Drainage of Abscess

Incision Care After Surgery

Care practices for a surgical wound, including keeping it clean and protected and watching for infection or separation. Care may involve dressing changes and limits on bathing or activity during healing.

Incisor

One of the specialized anterior teeth in mammalian dentition adapted primarily for cutting, shearing, and gnawing food during mastication. In permanent adult human dentition, there are eight incisors in total (four maxillary and four mandibular, subdivided into two central incisors and two lateral incisors per arch; Universal Numbering System teeth 7, 8, 9, 10, 23, 24, 25, and 26). Anatomically characterized by a single conical root, a chisel-shaped incisal edge, a

lingual fossa, and a prominent cingulum. Primary incisors typically erupt between 6 and 12 months of age, with permanent successors erupting between 6 and 9 years. Highly susceptible to coronal fractures from facial trauma, dental caries, incisal attrition, and periodontal alveolar bone loss.

Incisors

Plural form; see *Incisor*.

Inclusion Body

A visible collection of material inside a cell. It may consist of viral parts, stored fats or sugars, or abnormal proteins; its appearance can help laboratory specialists identify infection, cell injury, or another disease.

Inclusion Body Myositis

A slowly progressive muscle disease, usually beginning after age 50, that causes uneven weakness of the thigh muscles and finger-bending muscles. It can lead to falls and difficulty gripping or swallowing; treatment focuses on safety, exercise, and support.

Inclusion Conjunctivitis

Conjunctivitis caused by *Chlamydia trachomatis*, usually presenting with persistent discharge, follicular inflammation, and sometimes genital infection. In newborns it can be associated with infection elsewhere and complications.

Incompetence

Failure of a structure to close or function adequately; examples include valvular incompetence of the heart and cervical incompetence during pregnancy.

Incompetent Cervix

Painless shortening or opening of the cervix during the middle or late part of pregnancy, without normal labor. It can cause pregnancy loss or premature birth and is assessed with history and ultrasound.

Incomplete Abortion

A pregnancy loss in which some pregnancy tissue remains in the uterus. It may cause vaginal bleeding, cramping, and an open cervix.

Incomplete Heart Block

A cardiac conduction disturbance in which supraventricular impulses are conducted to the ventricles with delay (first-degree AV block) or intermittent failure (second-degree AV block Mobitz I or II), distinguishing it from complete (third-degree) AV block where no impulses conduct.

Alternate Names:
Partial Heart Block

Incomplete Miscarriage

Partial loss of a pregnancy in which some pregnancy tissue remains inside the uterus, potentially causing bleeding, pain, infection, or continued pregnancy symptoms.

Incomplete Ossification

Failure of bone or cartilage to mineralize or develop fully. It may be part of normal development or result from genetic, metabolic, nutritional, or skeletal disorders and is interpreted with age, imaging, and laboratory findings.

Incontinence

Involuntary loss of control over urination, bowel movements, or both. It may result from weakened muscles, nerve disease, infection, constipation, childbirth, prostate problems, medicines, mobility limits, or other conditions.

Incontinence in Men

Involuntary leakage of urine in a man. It may occur with urgency from an overactive bladder, leakage during exertion after prostate surgery, or overflow when the bladder does not empty fully. Causes include prostate treatment, bladder overactivity, urinary blockage, and nerve disorders.

Incontinence/OAB

Urinary incontinence associated with overactive bladder symptoms such as urgency, frequency, or nocturia; see *Overactive Bladder* and *Urinary Incontinence*.

Incontinentia Pigmenti

An X-linked dominant disorder affecting skin, teeth, eyes, and the nervous system, caused by pathogenic variants in IKBKG. Skin lesions evolve through vesicular, verrucous, hyperpigmented, and atrophic stages and may be associated with retinal disease or seizures.

Incoordinatio

Lack of coordination between muscles or body movements; the term is often used in older medical language.

Incoordination

Impaired ability to perform smooth, accurate, coordinated movements, often called ataxia. Causes include cerebellar disease, sensory loss, vestibular disorders, intoxication, medicines, and other neurologic conditions.

Increased Appetite

An abnormally excessive desire for food or marked increase in caloric intake, seen in endocrine disorders (such as diabetes mellitus and hyperthyroidism), hypothalamic injury, psychiatric illness, or medication side effects.

Alternate Names:
Hyperphagia; Polyphagia

Increased Head Circumference

Increased head circumference means head size above the expected range for age and sex and may reflect familial size, hydrocephalus, swelling, or a genetic condition.

Increased Intracranial Pressure

Alternate name; see *Intracranial Hypertension*.

Increased Libido

Increased libido is heightened sexual desire that may be normal or associated with hormones, medicines, mood elevation, neurologic disease, or substance use.

Increased Osteoid

Increased osteoid is excess unmineralized bone matrix, seen when bone formation outpaces mineralization as in osteomalacia or some metabolic disorders.

Increased Vascular Permeability

A change during inflammation that makes small blood vessels leaky. Fluid, proteins, and immune cells then move into nearby tissue, causing swelling, redness, warmth, and sometimes pain.

Increment

An increase or stepwise change in an amount, measurement, dose, or treatment intensity. In treatment, its size and timing affect benefit and risk.

Incretin Effect

The physiological augmentation of insulin secretion observed after oral glucose administration compared to an identical intravenous glucose load, mediated by gastrointestinal incretin peptides such as glucagon-like peptide-1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP).

Alternate Names:
Gut Incretin Response; Oral Glucose Insulinotropic Effect

Incretins

Incretins are gut hormones, mainly GLP-1 and GIP, released after meals that enhance glucose-dependent insulin secretion; GLP-1 also suppresses glucagon, slows gastric emptying, and reduces appetite.

Incubation

Incubation is the time between exposure to an infectious agent and the appearance of symptoms.

Incubation Period

The time between exposure to an infectious agent and the beginning of symptoms. It varies with the organism, dose, route of exposure, and person's immune response.

Incubator

A controlled-environment chamber culturing mi-

croorganisms, cells, or tissues at defined temperature, humidity, and atmospheric composition.

Incus

The incus, commonly known as the anvil, is the middle ossicle of the three bones in the middle ear, articulating with the malleus at the incudomalleolar joint and with the stapes at the incudostapedial joint.

Indapamide

Indapamide is a thiazide-like diuretic used mainly for hypertension; it promotes renal sodium excretion and may cause hyponatraemia, hypokalaemia, dehydration, hyperuricaemia, or photosensitivity.

Indel Mutation

A genetic change in which one or more DNA building blocks are inserted or deleted. If the number is not a multiple of three, it can disrupt the protein reading frame.

Independence

The ability to perform activities and make decisions without assistance, although a person may still use devices, adaptations, or occasional support.

Indeterminate

Indeterminate means not definitively classified or interpreted because available findings are insufficient, conflicting, or nonspecific.

Index of Microcirculatory Resistance

An invasive measure of resistance in the coronary microvessels during maximal vasodilation, calculated from distal coronary pressure and the hyperemic mean transit time of a saline indicator. An increased value can indicate coronary microvascular dysfunction.

Alternate Names:
IMR

India Immunization Schedule

The Government of India's Universal Immunization Programme schedule, which lists vaccines and timing for groups including children and pregnant people. The schedule is updated periodically.

Indiana Type Amyloidosis (Type II)

Hereditary transthyretin amyloid polyneuropathy type II, also called Indiana/Swiss type, caused by a pathogenic transthyretin variant and often involving peripheral nerves.

Indian Tick Typhus

A tick-borne rickettsial infection endemic to India and South Asia, caused by Rickettsia conorii subsp. indica and transmitted by brown dog ticks (Rhipicephalus sanguineus). It typically manifests with acute high fever, severe headache, generalized maculopapular rash involving palms and soles, and occasionally a black necrotic inoculation eschar (tache noire) at the bite site.

Alternate Names:
Indian Spotted Fever; Rickettsia Conorii Indica Infection

Indican

Indican is a compound formed from tryptophan metabolism and excreted in urine; abnormal levels may occur with intestinal bacterial overgrowth or metabolic disease.

Indicate

To show, suggest, or point to a finding or conclusion; an indication is a clinical reason for using a test, treatment, or procedure.

Indication

A clinical condition, symptom, or question that provides the reason for performing a test, procedure, or treatment.

Indigestion

Common term for dyspepsia: discomfort or burning in the upper abdomen that may include early fullness, bloating, belching, or nausea. Persistent symptoms, bleeding, weight loss, vomiting, anemia, or difficulty swallowing may indicate a more serious cause.

Indigo Carmine

Indigo carmine is a blue dye used in selected medical procedures to visualize urinary or other fluid flow and in laboratory staining.

Indirect Antiglobulin Test

A blood test that detects antibodies able to react with red blood cells. It is used before transfusion and during pregnancy to identify antibodies that could harm donated blood or a fetus's red cells.

Indirect Calorimetry

A test that measures oxygen use and carbon-dioxide production to estimate how much energy the body uses at rest. It can help determine nutrition needs when usual calculations are unreliable.

Indirect Coombs Test

An in vitro laboratory diagnostic test used to detect circulating, unattached IgG antibodies against red blood cell surface antigens in the patient's serum, commonly utilized in prenatal maternal Rh-D alloimmunization screening and pre-transfusion compatibility crossmatching.

Alternate Names:
Indirect Antiglobulin Test; IAT

Indirect Inguinal Hernia

An abdominal wall hernia in which abdominal viscera herniate through the deep inguinal ring lateral to the inferior epigastric vessels into the inguinal canal, resulting from congenital persistence and patent failure of closure of the embryonic processus vaginalis.

Alternate Names:
Lateral Inguinal Hernia

Indirect Veneer

A thin covering made outside the mouth and bonded to the front of a tooth to change its shape, color, or appearance. It may be made from porcelain or composite material. Tooth preparation, strength, hygiene, and long-term maintenance affect its suitability.

Indium

A metal whose radioactive isotope indium-111 is used in nuclear medicine. It can label white blood cells to help locate infection or inflammation, or be attached to other molecules used to image certain tumors.

Indium-111

A radioactive form of indium used as a tracer in selected nuclear-medicine tests. It may label white blood cells to help locate inflammation or infection, or be attached to another substance to help show certain tumors. It emits detectable radiation that is recorded by a special camera.

Indium-111 Scan

A nuclear medicine scan that uses the radioactive tracer indium-111 to make selected tissues visible. It may be attached to white blood cells to look for inflammation or infection, or to a substance that helps find some tumors.

Indium-Labelled WBC Scan

A nuclear medicine study in which a patient's white blood cells are labeled with indium-111 and reinjected to localize selected sites of inflammation or infection.

Indocyanine Green

Indocyanine green is a fluorescent dye injected intravenously to assess liver function, blood flow, and retinal or choroidal circulation.

Indocyanine Green Clearance

A dynamic liver function test measuring the elimination rate of intravenously administered indocyanine green dye from circulating plasma by hepatocytes (without enterohepatic recirculation), widely used preoperatively to calculate remnant liver functional reserve prior to major hepatic resection.

Alternate Names:
ICG Clearance

Indole

An aromatic heterocyclic organic compound with

a bicyclic structure consisting of a six-membered benzene ring fused to a five-membered nitrogen-containing pyrrole ring. Naturally biosynthesized by gut microbiota via tryptophan deamination, serving as the core bicyclic scaffold for vital endogenous neuroendocrine molecules—notably the neurotransmitter serotonin (5-hydroxytryptamine), the hormone melatonin, and indole-3-acetic acid—as well as numerous pharmacologic agents (e.g., indomethacin, ondansetron, sumatriptan). Elevated bacterial indole derivatives (such as indoxyl sulfate) act as potent uremic toxins contributing to endothelial dysfunction and vascular calcification in chronic kidney disease.

Indole-3-Carbinol

A compound formed from glucosinolates in cruciferous vegetables and studied for effects on estrogen metabolism and cancer biology.

Indolent

Slow to develop, progress, or cause symptoms; it often describes a relatively slow-growing disease or tumor.

Indolent Systemic Mastocytosis

A usually slow-progressing form of systemic mastocytosis in which abnormal mast cells accumulate in organs such as bone marrow, skin, or digestive tract; see *Systemic Mastocytosis*.

Indoles

Plural form; see *Indole*.

Indometacin

Indometacin is a nonsteroidal anti-inflammatory medicine used for pain and inflammation; it can cause stomach bleeding, kidney problems, and cardiovascular complications.

Indomethacin

Indomethacin is a potent NSAID used for inflammatory pain and selected acute conditions such as gout; gastrointestinal ulceration or bleeding, renal injury, cardiovascular events, and headache are important adverse effects.

Indomethacin Overdose

Toxic exposure to excessive indomethacin, which can cause nausea, vomiting, stomach bleeding, kidney injury, seizures, or other serious effects.

Indoor Allergens

Substances inside buildings that can trigger allergic or asthma symptoms, including dust mites, mold, cockroach particles, and animal dander. Exposure may cause rhinitis, conjunctivitis, wheezing, or eczema. Reduction of exposure and appropriate allergy or asthma treatment depend on the identified trigger.

Induced Abortion

Deliberate ending of a pregnancy using medicines or a procedure. The method depends mainly on pregnancy duration and clinical circumstances; possible complications include heavy bleeding and infection.

Induced Hyperthermia

Induced hyperthermia is deliberate elevation of body or tissue temperature for a therapeutic purpose, with careful monitoring to prevent heat injury.

Induced Labor

Medical initiation of uterine contractions before labor begins naturally to achieve delivery when continuing pregnancy may pose greater risk.

Induced Sputum Analysis

A test in which inhaled salty mist helps a person produce mucus from the airways. The mucus is examined for infection or inflammatory cells to help assess asthma, chronic lung disease, or bronchiectasis.

Inducible Laryngeal Obstruction

Temporary narrowing of the larynx during breathing, often during exercise or exposure to an irritant. It can cause noisy breathing, throat tightness, cough, or shortness of breath and was formerly often called vocal-cord dysfunction.

Inducing Labor

Starting childbirth artificially with medicines, breaking the amniotic sac, or other methods when continuing pregnancy may pose greater risks than delivery.

Induction

Starting a process before it begins on its own or causing it to occur. In medicine, labor induction starts uterine contractions, anesthesia induction brings about unconsciousness, and treatment induction aims to bring a disease into remission or establish immune tolerance. The term names a general process, not one specific procedure.

Induction Of Labor

Starting uterine contractions medically before labor begins on its own. It may be indicated when continuing pregnancy is riskier, using medicines or procedures that soften the cervix and encourage contractions.

Induction Therapy

The first, often intensive, part of treatment given to reduce or remove a disease. In acute leukemia, its main aim is remission, meaning that tests find no clear evidence of leukemia; further treatment is usually needed to reduce the chance of return.

Indurated

Abnormally firm or hardened when palpated, usually because of inflammation, edema, fibrosis, infiltration, or a tumor within the skin or underlying tissue.

Induration

Abnormal hardening of tissue, often detected by palpation and caused by inflammation, infection, edema, fibrosis, or a mass.

Industrial Bronchitis

Industrial bronchitis is chronic airway irritation and inflammation related to workplace dusts, fumes, or chemicals, causing cough, phlegm, and breathing limitation.

Industrial Disease

A disease caused or worsened by workplace exposures or conditions, such as chemicals, dust, noise, radiation, infection, or repetitive strain.

Industrial Health

The branch of occupational health concerned with preventing and managing illness and injury related to industrial work, workplace exposures, and working conditions.

Indwelling Catheter

A catheter left in place for ongoing drainage, infusion, monitoring, or access; urinary indwelling catheters can increase the risk of infection and tissue trauma.

Indwelling Catheter Care

Practices for maintaining a tube that remains in the bladder or another body space to drain fluid. These include keeping the tube unobstructed, reducing infection risk, and monitoring for fever, pain, blockage, or leakage.

Indwelling Pleural Catheter

A flexible tube placed through the chest wall into the space around the lung to drain fluid that keeps returning. It can allow drainage at home and relieve breathlessness, especially when cancer or a lung that cannot fully expand causes the fluid. Possible problems include infection, blockage, pain, or air leakage.

Alternate Names:
IPC; Tunneled Pleural Catheter; PleurX Catheter

Inert Gas Narcosis

Temporary slowing of thinking, judgment, coordination, or awareness caused by breathing compressed gas at depth, usually because nitrogen affects the brain at increased pressure. It may cause euphoria or confusion, becomes more likely at greater depths, and usually improves during ascent.

Alternate Names:
Nitrogen Narcosis; Rapture of the Deep

Inertia

Resistance to a change in motion; in obstetrics, uterine inertia means weak or ineffective contractions that slow labor.

Infant

An infant is a child in the first year of life, a period of rapid growth and changing feeding, immune, neurologic, and developmental needs.

Infant Botulism

A serious illness in which Clostridium botulinum bacteria grow in an infant's intestine and make a toxin. Constipation, poor feeding, weak crying, drooping eyelids, limpness, and breathing weakness can develop.

Infant Cardiopulmonary Resuscitation

Cardiopulmonary resuscitation for a baby younger than 1 year who has no normal breathing or pulse. It combines chest compressions with rescue breaths; the sequence and technique depend on whether one or more rescuers are present and on current resuscitation guidelines.

Alternate Names:
Infant CPR; Pediatric Basic Life Support, Infant; BLS Infant

Infant Feeding

Provision of breast milk, appropriately prepared formula, or both to meet an infant's energy, protein, fluid, and micronutrient requirements. Feeding recommendations depend on age, growth, medical conditions, developmental readiness, and safe preparation practices.

Infant Feeding Patterns and Diet

Age-appropriate nutritional guidance for infants during the first year of life, emphasizing exclusive breastfeeding or iron-fortified infant formula for the first six months, followed by the gradual introduction of complementary solid foods.

Alternate Names:
Infant Nutrition; Infant Feeding Guidelines; Baby Feeding

Infant Formula

Infant formula is manufactured nutrition designed to provide adequate nutrients when breast milk is unavailable, insufficient, or not chosen; preparation and storage practices affect safety.

Infant Formulas

Alternate plural; see *Infant Formula*.

Infant Gynecomastia

Infant gynecomastia is temporary breast enlargement in a newborn or young infant caused by maternal or neonatal hormones and usually resolves spontaneously.

Infant Harlequin Syndrome

Alternate name; see *Neonatal Harlequin Color Change*.

Infant Hearing Loss

Congenital or early-acquired auditory impairment in infants, resulting from genetic mutations (such as connexin 26 mutations), congenital infections (cytomegalovirus, rubella), prematurity, hyperbilirubinemia, or ototoxic drug exposure. Universal newborn hearing screening enables early amplification and speech-language intervention.

Alternate Names:
Infant Hearing Impairment

Infanticide

The killing of an infant. The legal definition and classification vary by jurisdiction; in medicine, the term may appear in forensic and child-protection contexts.

Infantile Bradycardia

An unusually slow heart rate in an infant. It can occur normally during sleep, but may also signal low oxygen, infection, medicines, or a heart or conduction problem; symptoms and the infant's age determine the evaluation.

Infantile Colic

Repeated periods of prolonged crying that are hard

to soothe, without an obvious cause, in an otherwise healthy baby. It often begins in the first weeks of life and usually improves by three to four months. The exact cause is not known.

Infantile Cortical Hyperostosis (Caffey Disease)

A self-limited disorder of infancy characterized by irritability, soft-tissue swelling, and cortical thickening of affected bones. It is usually associated with COL1A1-related disease and resolves over time.

Infantile Fibrosarcoma

A rare cancer of connective or soft tissue that usually appears in a baby or young child as a growing lump. It may involve the limbs or trunk; imaging and biopsy guide treatment, which requires specialist care.

Infantile Gaucher Disease

Gaucher disease presenting in infancy, often with severe neurologic and systemic involvement; see *Gaucher Disease*.

Infantile Hemangioma

A common, noncancerous growth of blood vessels that appears during the first weeks of life. It often grows for a time and then gradually shrinks over several years. Its effects depend on its size and location; some can interfere with vision, breathing, feeding, or skin integrity.

Infantile Hepatic Hemangiomas

Benign growths made of extra blood vessels in an infant's liver. Small lesions may cause no symptoms, while numerous or large lesions can enlarge the liver, strain the heart, lower thyroid hormone, or cause bleeding problems. Ultrasound and specialist follow-up guide monitoring and treatment.

Infantile Myoclonic Encephalopathy

A severe early-life epileptic encephalopathy with recurrent myoclonic seizures and developmental impairment; diagnosis and classification require specialist neurologic evaluation.

Infantile Paralysis

Paralytic poliomyelitis caused by poliovirus infection involving motor neurons, which can produce acute flaccid paralysis and respiratory failure; vaccination prevents most cases.

Infantile Sleep Apnea

Repeated pauses in an infant's breathing during sleep. An event is generally defined as a pause lasting at least 20 seconds, or a shorter pause accompanied by a slowed heart rate, low oxygen, or a color change. Apnea may be central, with no breathing effort; obstructive, with effort but blocked airflow; or mixed. Brief pauses without these changes may be periodic breathing rather than apnea.

Infantile Spasm

Alternate singular form; see *Infantile Spasms*.

Infantile Spasms

A severe seizure disorder of infancy characterized by brief, sudden flexion or extension spasms, often occurring in clusters and associated with developmental impairment.

Infantile Spinal Muscular Atrophy

Spinal muscular atrophy beginning in infancy, causing progressive weakness from loss of motor neurons; see *Spinal Muscular Atrophy*.

Infantile Spinal Muscular Atrophy Type I

The severe infantile form of spinal muscular atrophy, usually beginning in the first months of life with marked weakness and low muscle tone; disease-modifying treatment and respiratory and nutritional support can affect outcomes.

Infant Incubators

Enclosed devices providing controlled warmth, humidity, oxygen, and monitoring for premature, small, or ill newborns who need extra support after birth.

Infant Jaundice

Yellowing of an infant's skin or eyes caused by excess bilirubin. It is often temporary, but jaundice in the

first day, rapid worsening, poor feeding, unusual sleepiness, or pale stools can occur with more serious disease.

Infant Leukemia

Infant leukemia is leukemia diagnosed during infancy, in which abnormal blood-forming cells multiply and interfere with normal blood-cell production.

Infant Mortality

The death of an infant before the first birthday; the infant mortality rate is usually expressed per 1,000 live births.

Infant Nutrition

Nutritional support for infants through breast milk, appropriately prepared formula, and developmentally suitable complementary foods. Requirements change with age, growth, illness, prematurity, and feeding ability; unsafe preparation can cause infection or malnutrition.

Infant Of Diabetic Mother

A newborn born to a mother with diabetes who may be at increased risk of large size, low blood sugar, breathing problems, jaundice, or congenital abnormalities.

Infant Reflex

An involuntary, stereotyped, subcortical motor response elicited by specific sensory stimuli in healthy neonates and infants, serving as an essential clinical indicator of central nervous system integrity and developmental progression. Key primitive reflexes include: the Moro reflex (sudden head extension elicits bilateral arm abduction and extension followed by flexion and cry; disappears by 4–6 months); the rooting and sucking reflexes (tactile perioral stimulation initiates head turning and suckling; integrated by 4 months); the palmar and plantar grasp reflexes (finger and toe flexion around an object; palmar fades by 4–6 months, plantar by 9–12 months); the asymmetric tonic neck reflex ("fencing posture"; disappears by 5–7 months); and the Babinski sign (extensor plantar response, normal up to 12–24 months due to incomplete corticospinal myelination). Persistence, asymmetry, or resurgence in adults (frontal release signs) signifies corticospinal tract lesion, diffuse encephalopathy, or neurodegenerative pathology.

Infant Reflexes

Plural form; see *Infant Reflex*.

Infant Reflux

Backflow of stomach contents into an infant's esophagus, often causing uncomplicated spitting up. It usually improves with age, but poor growth, breathing problems, blood, forceful vomiting, or distress can occur with more serious disease.

Infant Respiratory Distress Syndrome

Alternate name; see *Neonatal Respiratory Distress Syndrome*.

Infant Sleep Position

The position and sleep environment used for an infant. Placing infants on their backs on a firm, flat, nonshared surface without soft or loose bedding reduces the risk of sleep-related death.

Infant Test Procedure Preparation

Preparing a baby for a test may involve checking feeding or fasting instructions, bringing medicines and records, explaining the procedure to caregivers, and planning comfort, warmth, safe positioning, and monitoring afterward.

Infant With Prenatal Substance Exposure

A newborn exposed to alcohol or another substance during pregnancy who may need assessment for withdrawal, toxicity, feeding problems, or developmental effects.

Infarct

An area of dead tissue; see *Infarction*.

Infarction

Tissue death caused by inadequate blood flow and oxygen, usually because a vessel is blocked. Ex-

amples include heart attack, brain infarction, and intestinal infarction.

Infection

Entry and multiplication of bacteria, viruses, fungi, parasites, or other microorganisms in the body. Infection may cause tissue damage and illness, although some infections produce no symptoms; the cause and site determine treatment.

Infection Control

Practices that prevent microorganisms from spreading between people, objects, and healthcare settings. They include hand cleaning, appropriate protective equipment, safe injection and device care, cleaning, sterilization, vaccination, and isolation when needed.

Infection Imaging

A general term for using imaging to locate or assess a suspected infection; it does not name one specific test. Ultrasound or CT can show a collection such as an abscess, while MRI can assess suspected infection in bone, joints, or deep soft tissue. Images are interpreted with examination, laboratory, and microbiology results.

Infection Prevention

Measures that reduce the risk of infection, including hand hygiene, personal protective equipment, environmental cleaning, sterilization, disinfection, vaccination, and appropriate isolation precautions.

Infections in Diabetes

Infection in a person with diabetes, in whom hyperglycemia, vascular disease, neuropathy, or immune dysfunction may increase susceptibility or complicate healing. Assessment includes the source, severity, glycemic status, organ involvement, and need for source control.

Infections In Pregnancy

Infections during pregnancy can affect the pregnant person, placenta, fetus, or newborn. Some, including listeriosis, group B streptococcal infection, urinary infection, and sexually transmitted infections, can cause miscarriage, premature birth, fetal illness, or newborn sepsis. Testing and treatment depend on the organism and stage of pregnancy.

Infectious Arteritis

Inflammation and damage of an artery caused by infection, which can weaken the vessel, reduce blood flow, or produce aneurysm.

Infectious Arthritis

Inflammation of a joint caused by infection, usually bacterial and sometimes viral or fungal. Acute pain, swelling, warmth, fever, and restricted movement may occur, and joint damage can develop quickly.

Infectious Chorea

Chorea caused by an infection or post-infectious immune response, such as Sydenham chorea after group A streptococcal infection; see *Chorea*.

Infectious Colitis

Inflammation of the colon caused by an infection, usually from bacteria, viruses, or parasites. It can cause diarrhea, abdominal cramps, fever, or blood in the stool. The cause and severity vary with the organism and the person's health.

Infectious Conjunctivitis

Inflammation of the conjunctiva caused by a virus, bacterium, or less commonly another infectious organism, often causing redness and discharge.

Infectious Disease

Illness caused by a pathogen such as a bacterium, virus, fungus, or parasite. Infection may spread between people, from animals or the environment, or from organisms normally living in the body.

Infectious Diseases

Alternate plural; see *Infectious Disease*.

Infectious Dose

The amount of a microorganism that must enter the body to cause infection under particular conditions. It varies with the organism, route of exposure, dose

strength, and the person's immune defenses.

Infectious Encephalitis

Brain inflammation caused by an infectious organism, most often a virus. It may cause fever, headache, confusion, seizures, behavior changes, weakness, or reduced consciousness.

Infectious Encephalomyelitis

Infection-related inflammation of the brain and spinal cord that may cause fever, headache, confusion, weakness, seizures, or other neurologic signs.

Infectious Enterocolitis

Infection-related inflammation of the small intestine and colon, commonly causing diarrhea, abdominal pain, fever, or vomiting.

Infectious Esophagitis

Infection and inflammation of the esophagus, most often caused by Candida yeast or herpes viruses in people with weakened immunity. It commonly causes painful or difficult swallowing and pain behind the breastbone.

Infectious Hepatitis

Alternate name; see *Viral Hepatitis*.

Infectious Mediastinitis

Infection and inflammation of the tissues in the middle of the chest, often after esophageal injury, surgery, or spread from a nearby infection.

Infectious Meningitis

Infection and inflammation of the membranes surrounding the brain and spinal cord. Bacterial meningitis may cause headache, fever, neck stiffness, vomiting, confusion, or a new rash.

Infectious Mononucleosis

A viral illness, usually caused by Epstein–Barr virus, that causes marked fatigue, sore throat, fever, and swollen lymph nodes. The spleen may enlarge during the illness.

Alternate Names:
Mono (Infectious Mononucleosis)

Infectious Myringitis

Inflammation and infection of the tympanic membrane, often associated with viral or bacterial respiratory infection. It can cause severe ear pain, fever, hearing reduction, and small fluid-filled blisters on the eardrum.

Infective Cervicitis

Infective cervicitis is inflammation of the cervix caused by organisms such as chlamydia, gonorrhea, trichomonas, or herpes, producing discharge, bleeding, or pelvic discomfort.

Infective Cystitis

Infective cystitis is bacterial or other microbial inflammation of the bladder, causing urinary frequency, urgency, burning, and sometimes blood or fever.

Infective Endocarditis

A serious infection of the inner lining of the heart's chambers and valves (the endocardium). It occurs when bacteria, fungi, or other microbes enter the bloodstream—often through dental procedures, skin infections, or intravenous needles—and settle on damaged, diseased, or artificial heart valves. The multiplying germs form infected clumps that can damage heart valves, disrupt blood flow, or break loose and travel to other organs.

Alternate Names:
Bacterial Endocarditis; Microbial Endocarditis; IE

Infective Endocarditis Duke Criteria

Clinical criteria used to classify suspected infective endocarditis as definite, possible, or rejected by combining major and minor findings. The 2023 Duke-ISCVID revision includes updated microbiological evidence and imaging from echocardiography, cardiac CT, and selected FDG-PET/CT studies, as well as operative findings. Criteria support diagnosis but are interpreted with the full clinical picture.

Alternate Names:
Duke Criteria for Infective Endocarditis; Modified Duke Criteria

Infective Endocarditis Pathology

Infection-associated vegetations composed of fibrin, platelets, inflammatory cells, necrotic debris, and microorganisms on a valve or endocardial surface. Destruction, abscesses, emboli, and healing fibrosis may occur.

Infective Phlebitis

Infective phlebitis is infection and inflammation of a vein, often around an intravenous catheter, causing pain, redness, swelling, and possible bloodstream infection.

Infective Vaginitis

Infective vaginitis is infection or inflammation of the vagina caused by yeast, bacteria, parasites, or viruses and may cause discharge, itching, odor, or pain.

Inferior

Below or nearer the feet compared with another body part. For example, the diaphragm is inferior to the heart, and the inferior vena cava carries blood from the lower part of the body to the heart.

Inferior Alveolar Nerve Block

A local-anesthetic injection near a nerve supplying the lower jaw. It temporarily numbs the lower teeth, jawbone, and lower lip on that side and is commonly used for dental procedures.

Inferior Colliculus

The inferior colliculus is a midbrain auditory relay that integrates sound information and helps orient reflexively to auditory stimuli.

Inferior Hemifield Loss

Loss of vision in the lower half of the area a person can see with one or both eyes. Causes include retinal disease, a stroke, or another problem along the brain's visual pathways; sudden loss can occur with serious disease.

Inferior Mediastinum

The part of the mediastinum below the level of the sternal angle. It is divided into the anterior, middle, and posterior mediastinum.

Inferior Mesenteric Artery

A major artery supplying the lower part of the large intestine, including the descending and sigmoid colon and upper rectum. Blockage or reduced flow can cause abdominal pain and ischemic colitis.

Inferior Myocardial Infarction

A heart attack affecting the lower surface of the heart muscle. It usually results from blocked blood flow in a coronary artery and can cause permanent damage.

Inferior Petrosal Sinus Sampling

A special blood test done through small catheters placed in veins near the pituitary gland. It compares hormone levels from the pituitary area with levels in a regular vein to help find the source of excess ACTH in suspected Cushing disease.

Alternate Names:
IPSS

Inferior Vena Cava

The body's largest vein, carrying blood from the legs, pelvis, abdomen, and liver to the right side of the heart. A clot or pressure on it can cause swelling of both legs and increase the risk of serious complications.

Inferior Vena Cava Filter

A small device placed in the inferior vena cava to catch clots traveling from the legs or pelvis to the lungs. It is used selectively, usually for acute venous thromboembolism when anticoagulation is contraindicated or has failed; complications include migration, vessel perforation, thrombosis, and difficulty removing retrievable filters.

Alternate Names:
IVC Filter; Inferior Vena Cava Filters; Greenfield Filter

Inferior Vena Cava Syndrome

A constellation of clinical symptoms caused by par-

tial or complete occlusion, thrombosis, or external tumor compression of the inferior vena cava, characterized by bilateral lower-extremity pitting edema, extensive superficial abdominal wall collateral vein dilation with cephalad blood flow, and dependent ascites.

Alternate Names:
IVC Obstruction; Caval Syndrome

Inferior Wall Myocardial Infarction

Ischemic myocardial necrosis localized to the inferior (diaphragmatic) aspect of the left ventricle, usually caused by acute thrombotic occlusion of the right coronary artery (RCA) or left circumflex artery, presenting with ST-segment elevation in leads II, III, and aVF, frequently associated with sinus bradycardia or AV block.

Alternate Names:
IWMI

Inferolateral

Located below and toward the side of a reference structure.

Infertility

Failure to achieve pregnancy after 12 months of regular unprotected intercourse, or sooner when age or medical history warrants evaluation. Causes may involve ovulation, sperm, reproductive organs, age, or unexplained factors.

Alternate Names:
Subfertility

Infestation

Presence of parasites such as lice, mites, or worms on or inside the body. The parasite may live on the skin or in an organ and can cause itching, inflammation, tissue injury, or other symptoms.

Infiltrate

A term with different uses in imaging and pathology. In chest imaging, it is an older, nonspecific label for an area of lung opacity; radiology reports now generally describe the opacity and its pattern instead. In pathology, an infiltrate is a collection of cells, such as inflammatory or tumor cells, within tissue.

Infiltrating Cancer

Cancer that has grown beyond its original location into nearby tissue. Such growth may damage normal structures and can allow cancer cells to enter lymph vessels or blood vessels and spread elsewhere.

Alternate Names:
Invasive cancer

Infiltrating Ductal Carcinoma

Alternate name; see *Invasive Carcinoma Of No Special Type*.

Infiltration

Entry or accumulation of cells, fluid, or another substance within tissue. In clinical care, intravenous infiltration means leakage of nonvesicant fluid into surrounding tissue; extravasation of an irritant or vesicant can cause serious injury.

Inflamed Gallbladder

Alternate name; see *Cholecystitis*.

Inflamed Pancreas

Alternate name; see *Pancreatitis*.

Inflamed Pericardium

Alternate name; see *Pericarditis*.

Inflammaging

The gradual, low-level increase in inflammation that can occur with aging. It is influenced by chronic illness, immune-system changes, infections, and tissue damage and may contribute to frailty, artery disease, muscle loss, or brain disorders.

Inflammasomes

Groups of proteins inside immune cells that detect danger signals and activate inflammation. They help release inflammatory messenger proteins and can cause an infected or damaged cell to die. Excessive activation may contribute to autoimmune or inflammatory disease.

Inflammation

The body's protective response to injury, infection, or irritation. It may cause redness, warmth, swelling, pain, and reduced function. Short-term inflammation helps healing, while persistent inflammation can damage tissues and contribute to chronic disease.

Inflammation Imaging

Imaging used to find areas of active inflammation in the body. A scan using a sugar-like tracer may show infection or inflammation, but cancer can look similar; findings are considered alongside symptoms, examination, and other tests.

Inflammatory Back Pain

A pattern of chronic back pain characterized by insidious onset, improvement with exercise, lack of improvement with rest, nocturnal pain, and prolonged morning stiffness. It suggests axial spondyloarthritis but is not diagnostic without supportive clinical, laboratory, and imaging findings.

Inflammatory Bowel Disease

An umbrella term for chronic disorders that involve ongoing inflammation of the digestive tract. It primarily includes extbfCrohn's disease (which can cause patchy, deep-layer inflammation anywhere from the mouth to the anus) and extbfulcerative colitis (which causes continuous superficial inflammation and ulcers in the large intestine and rectum). Symptoms include recurring abdominal cramps, persistent diarrhea (often with blood), fatigue, and unexplained weight loss.

Alternate Names:
IBD

Inflammatory Bowel Disease/Crohn's Disease

Misleading combined label; inflammatory bowel disease includes Crohn disease and ulcerative colitis. See *Inflammatory Bowel Disease* and *Crohn Disease*.

Inflammatory Bowel Disease Diet

An eating plan adapted for Crohn disease or ulcerative colitis to maintain nutrition and reduce symptoms. During flares, temporary changes or liquid nutrition may help; food triggers vary, and restrictive diets can cause nutritional deficiencies.

Inflammatory Bowel Disease: Intestinal Problems

Alternate consumer label; see *Inflammatory Bowel Disease*.

Inflammatory Breast Cancer

A rare, fast-growing breast cancer in which cancer cells block lymph vessels in the skin of the breast, causing rapid redness, swelling, warmth, and thickened or dimpled skin. It often does not form a distinct lump.

Alternate Names:
IBC; Inflammatory Carcinoma of the Breast

Inflammatory Myopathies

A group of acquired muscle diseases in which immune-related inflammation or injury damages skeletal muscle. They commonly cause weakness, often around the hips and shoulders, but the pattern varies by type. Some forms also affect the skin, lungs, or muscles involved in swallowing. Types include dermatomyositis, inclusion body myositis, immune-mediated necrotizing myopathy, and overlap myositis.

Inflammatory Myopathy

A disorder in which immune or other inflammatory processes damage muscle, causing weakness and sometimes pain or involvement of the skin, lungs, swallowing muscles, or other organs.

Inflammatory Response

The body's organized reaction to infection, injury, or irritation. Blood flow changes and immune cells move into the affected area, causing signs such as redness, warmth, swelling, pain, or reduced function.

Infliximab

A biologic medicine that blocks tumor necrosis factor, an inflammatory signal. It treats several inflammatory diseases but can increase the risk of serious infections, tuberculosis reactivation, infusion reac-

tions, and heart-failure worsening.

Influenza

A contagious respiratory illness caused by influenza A or B viruses, characterized by sudden onset of fever, myalgia, headache, malaise, nonproductive cough, sore throat, and nasal congestion. Seasonal epidemics occur annually. Complications: pneumonia (primary viral or secondary bacterial), exacerbation of underlying conditions.

Influenza A Virus

An influenza virus with segmented RNA that infects people and animals and can cause seasonal epidemics or, after major genetic changes, pandemics.

Influenza Test

A test for influenza A or B using a respiratory specimen. Rapid antigen tests provide quick results but may miss infection. Molecular tests are generally more sensitive and may identify or subtype influenza viruses; results vary with symptoms, timing, and laboratory methods.

Influenza Vaccination In Pregnancy

Influenza vaccination during pregnancy protects the pregnant person from severe flu and can provide some protection to the newborn. Inactivated or recombinant vaccines are used; live attenuated nasal-spray vaccine is not used during pregnancy.

Influenza Virus

A segmented, negative-sense RNA virus belonging to the Orthomyxoviridae family. Influenza causes seasonal epidemics and occasional pandemics of respiratory illness. The virus has two surface glycoproteins: hemagglutinin (HA), which mediates attachment, and neuraminidase (NA), which facilitates release.

Influenzavirus A

A group of influenza A viruses that infect people and animals. They are classified into subtypes according to two surface proteins and can cause seasonal outbreaks, severe illness, or pandemics.

Influenzavirus B

Influenza B virus, an enveloped, segmented, negative-sense RNA virus in the family Orthomyxoviridae and genus Betainfluenzavirus. It primarily infects humans and causes seasonal respiratory illness. Unlike influenza A viruses, influenza B viruses are not classified into H and N subtypes; they are grouped into lineages.

Informatics

Informatics applies information science, data, computing, and human factors to organize and improve healthcare, biology, research, or another field.

Informed Consent

A patient's voluntary agreement to a proposed intervention after receiving understandable information about its purpose, benefits, risks, alternatives, and the option of declining, with decision-making capacity or appropriate authorization.

Infrared Rays

Infrared rays are electromagnetic radiation with wavelengths longer than visible red light; excessive exposure can heat tissue and cause burns.

Infrared Spectrometry

A method for identifying or measuring substances by examining how they absorb infrared light. Different chemical bonds absorb different wavelengths, creating a pattern that can help analyze medicines, tissues, samples, or pollutants.

Infrared Therapy

Treatment using infrared radiation, usually to provide heat or light to tissues. It is used in some physiotherapy and skin treatments, but benefits vary and excessive exposure can cause burns or eye injury.

Infrarenal Aorta

The infrarenal aorta is the portion of the abdominal aorta below the renal arteries and above its division into the iliac arteries.

Infraspinatus Muscle

A thick, triangular rotator cuff muscle originating from the infraspinous fossa of the scapula and inserting onto the middle facet of the greater tubercle of the humerus, innervated by the suprascapular nerve; acts primarily as the chief external (lateral) rotator of the glenohumeral joint.

Infratentorial Neoplasm

An abnormal growth in the lower part of the skull, near the cerebellum and brainstem. Its effects depend on size and location and may include headache, vomiting, balance problems, weakness, or changes in coordination.

Infrequent

Infrequent means occurring less often than usual or expected, such as infrequent bowel movements, symptoms, or events.

Infundibular Stenosis

Subvalvular muscular narrowing or hypertrophy of the right ventricular outflow tract below the pulmonary valve, classically forming the dynamic subpulmonary obstruction component in tetralogy of Fallot or isolated subpulmonic stenosis.

Infundibulopelvic Ligament

A peritoneal fold extending from the lateral pelvic wall to the superior pole of the ovary that conveys the ovarian artery, ovarian vein, lymphatic channels, and ovarian nerve plexus, serving as a critical surgical landmark during salpingo-oophorectomy.

Alternate Names:
Suspensory Ligament of the Ovary; IP Ligament

Infundibulum

A funnel-shaped anatomical structure or passage, specifically referring to the hollow neural stalk connecting the hypothalamic median eminence to the posterior pituitary gland (hypophysis), or the funnel-shaped distal expansion of the fallopian tube.

Alternate Names:
Pituitary Stalk; Funnel-Shaped Anatomical Passage

Infuse

To introduce a fluid, medicine, or other substance gradually into the body, commonly through an intravenous line; it can also mean to soak a substance in a liquid.

Infusion

The controlled introduction of a fluid or medicine into the body over time, commonly through a vein but also by other routes such as subcutaneous or intrathecal delivery. The route, rate, and duration depend on the substance and purpose. An infusion differs from a single bolus injection by delivering material gradually.

Infusion Pump

A medical device that delivers a measured amount of fluid or medicine at a controlled rate. Depending on its design, it may deliver material intravenously, subcutaneously, or intrathecally. Common types include volumetric infusion pumps and syringe pumps; alarms may indicate occlusion, air, low battery, or other device conditions.

Alternate Names:
IV Infusion Pump

Ingested Foreign Body

An object accidentally or intentionally swallowed that lodges in the esophagus, stomach, or intestines, such as coins, small toys, button batteries, or sharp objects requiring clinical assessment and possible endoscopic retrieval.

Alternate Names:
Swallowed Foreign Object; Foreign Body Ingestion; Gastrointestinal Foreign Body

Ingestion

The act of taking a substance into the digestive tract by swallowing. Ingestion of a toxic substance can cause poisoning.

Ingredient

An ingredient is a substance included in a medicine, food, cosmetic, or other preparation, whether active or inactive.

Ingrown Hair

A hair that curls back into or grows sideways beneath the skin, causing an itchy or painful bump. It may become inflamed or infected, especially after shaving, waxing, or close trimming.

Ingrown Nail

An ingrown nail occurs when the nail edge grows into surrounding skin, causing pain, redness, swelling, and sometimes infection or granulation tissue.

Ingrown Nail (Onychocryptosis)

Alternate name; see *Ingrown Nail*.

Alternate Names:
Onychocryptosis; Ingrown Toenail

Ingrown Toenail (Onychocryptosis)

An ingrown nail affecting a toe, usually the great toe, in which the nail edge penetrates the lateral nail fold. Persistent pain, pus, spreading redness, or recurrent disease may require clinician treatment or partial nail removal.

Ingrown Toenails

A condition in which the edge of a toenail grows into nearby skin, most often on the big toe. It causes pain, redness, and swelling; infection, diabetes, or severe symptoms may complicate it.

Inguinal

Relating to the groin, the region where the lower abdomen meets the upper thigh and where certain hernias, lymph nodes, and injuries occur.

Inguinal Canal

A short passage through the lower abdominal wall near the groin. It carries the spermatic cord in males and the uterine round ligament in females; weakness here can allow an inguinal hernia.

Inguinal Hernia

A bulge formed when fat or intestine pushes through a weak area in the groin. It may cause discomfort or a lump that appears with standing or straining; severe pain, vomiting, or a trapped lump may indicate reduced blood flow or bowel blockage.

Inguinal Hernia Repair

Surgery that returns tissue to the abdomen and closes or strengthens a weak area in the groin. It may be performed through a larger incision or several small ones, with or without mesh; recurrence, infection, and persistent pain are possible.

Inguinal Orchiectomy

Inguinal orchiectomy is removal of a testicle through an incision in the groin, commonly used when treating suspected testicular cancer.

Inguinal Region

The groin area where the lower abdomen meets the upper thigh. It contains important muscles, blood vessels, nerves, and lymph nodes and is a common site for hernias and some injuries.

Inhalant

A substance breathed into the lungs as a gas, vapor, aerosol, or smoke; inhalants may be medicines, workplace substances, or abused chemicals.

Inhalant Substance Use

Inhalant misuse involves breathing fumes or gases from household or industrial products and can cause sudden cardiac arrest, brain injury, organ damage, dependence, or death.

Inhalation

Drawing air, medicine, particles, or vapors into the lungs. Inhalation is a route for respiratory medicines and anesthetics, while accidental inhalation of food, vomit, smoke, or toxic substances can cause airway obstruction or lung injury.

Inhalational Anesthesia

General anesthesia given by breathing an anesthetic gas or vapor through a mask or breathing tube. The amount reaching the bloodstream controls unconsciousness and is adjusted while breathing, circulation, and other vital signs are monitored.

Inhalation Injury

Damage to the airway or lungs from smoke, hot gases, or toxic chemicals. Swelling, cough, wheezing, low oxygen, and poisoning by carbon monoxide or cyanide may develop or worsen over several hours after a fire.

Inhaled Corticosteroids

Anti-inflammatory medicines breathed into the airways to reduce swelling and prevent asthma symptoms. They are usually used regularly for control; some combination inhalers containing a fast-acting medicine may also be prescribed for symptom relief. Side effects can include hoarseness or oral thrush.

Inhaled Foreign Body

An object or food particle entering the larynx, trachea, or bronchial tree. It may cause choking, coughing, wheezing, stridor, or airway obstruction; removal may require bronchoscopy.

Alternate Names:
Airway Foreign Body; Foreign Body Aspiration; Tracheobronchial Foreign Body

Inhaled Nitric Oxide

A gas given through a breathing system to widen blood vessels in the lungs and sometimes improve oxygen levels. It is used short term in selected critical illnesses and requires continuous delivery and monitoring for blood-salt or oxygen-related effects.

Inhaler

A device that delivers medicine into the airways through the mouth. Pressurised inhalers release a measured spray, while dry-powder inhalers release powder during a strong breath in; technique affects the amount of medicine reaching the lungs.

Inherited Disease

A disease caused wholly or partly by a genetic change inherited from a parent or present in reproductive cells and therefore capable of being passed to offspring. Some disease-causing changes arise de novo in an egg, sperm, or early embryo rather than being inherited from a parent.

Inherited Lipodystrophy

A genetic disorder causing partial or generalized loss or abnormal distribution of body fat, often with severe insulin resistance, diabetes, high triglycerides, and fatty liver; see *Lipodystrophy*.

Inhibin

A glycoprotein hormone produced mainly by the gonads that suppresses pituitary follicle-stimulating hormone secretion and contributes to regulation of reproductive function.

Inhibition

Inhibition is a reduction or suppression of an activity, such as nerve signalling, enzyme action, muscle contraction, or cell growth.

Inhibitory Neurochemical

A chemical messenger that decreases the activity of nerve cells or muscles. Gamma-aminobutyric acid and glycine are important inhibitory neurotransmitters in the nervous system.

Alternate Names:
Inhibitory neurotransmitter

Inhibitory Synapse

A connection between nerve cells that reduces the chance that the receiving cell will generate an electrical signal.

Iniencephaly

A rare, usually lethal neural-tube defect characterized by occipital bone defect, severe retroflexion of the head, and marked shortening or distortion of the cervical and thoracic spine. It is often identified prenatally and may occur with other congenital anomalies.

Initial Insomnia

Initial insomnia is difficulty falling asleep at the beginning of the sleep period, often related to stress, habits, medicines, mood, or another sleep disorder.

Injectable Fillers

Materials placed under or within the skin to re-

store volume, improve contours, or soften wrinkles. Effects vary by product and may include swelling, bruising, infection, lumps, or rare blood-vessel blockage.

Alternate Names:
Dermal fillers

Injection

Introduction of a medication, fluid, or other substance into the body with a needle or other injection device.

Injection Drug Use

Use of medicines or illicit substances by injection. Risks include overdose, blood-borne infection, skin and vascular injury, endocarditis, abscesses, and transmission through shared equipment.

Injury

Damage to the body's tissues or function caused by trauma, force, heat, chemicals, radiation, or another harmful exposure.

Injury Dating

Estimation of the age of an injury using clinical appearance, histopathology, imaging, and the history of symptoms. Exact dating is often uncertain, particularly for bruises and soft-tissue injuries, which limits the precision of conclusions.

Injury Site

The body location where physical harm occurred or where its effects are being examined, documented, treated, and monitored during recovery.

Ink Poisoning

Illness after swallowing or significant exposure to ink; most small pen-ink exposures cause little toxicity, but symptoms depend on the product and amount.

Ink Remover Poisoning

Poisoning caused by chemicals used to remove ink, which may irritate the skin, eyes, lungs, or digestive tract and may cause systemic toxicity.

Innate Immune Evasion

Mechanisms by which pathogens evade the innate immune system. Strategies include capsules that prevent phagocytosis, biofilms that protect against immune cells, and intracellular survival within macrophages. Some bacteria produce enzymes that degrade complement components. Others modify their surface molecules to avoid recognition.

Innate Immunity

The body's rapid defense against germs and tissue damage, present from birth. It includes skin, mucus, inflammation, cells that engulf germs, and protective proteins and usually responds within minutes or hours.

Innate Lymphoid Cells

Immune cells that respond quickly to tissue damage or infection without recognizing one specific antigen. Different groups help control viruses, parasites, bacteria, fungi, allergic inflammation, and tissue repair.

Inner Ear

The deepest part of the ear, containing the cochlea for hearing and balance organs for movement sensing. Disease there can cause hearing loss, ringing, dizziness, or balance problems.

Inner Ear Infection

Inner-ear inflammation can affect hearing and balance, producing vertigo, nausea, tinnitus, or hearing loss. Causes include viral infection, bacterial disease, autoimmune inflammation, or other disorders; sudden hearing loss, severe imbalance, or neurologic signs may occur.

Innervation

The nerve supply to an organ, muscle, or area of the body, including the functional control provided by those nerves.

Innominate

An older anatomical adjective meaning unnamed, used in the names of particular structures. The innominate artery is the brachiocephalic artery, and

the innominate bone is the hip bone, also called the coxal bone.

INOCA

Ischemia with non-obstructive coronary arteries: objective myocardial ischemia or ischemic symptoms in a patient whose coronary arteries do not have an obstructive epicardial stenosis. Mechanisms include coronary microvascular dysfunction and vasospastic angina; treatment varies with the underlying mechanism.

Inoculation

Introduction of microorganisms, cells, or other material into a culture, living body, or normally sterile site. It may be deliberate for laboratory growth, vaccination, or treatment, or accidental and capable of causing infection.

Inoperable

Not safely treatable by surgery, often because a disease is too extensive, located near vital structures, or the person is too medically fragile. Other treatments may still be possible.

Inorganic

Not based mainly on carbon-containing molecular structures. Inorganic substances include water, salts, minerals, and metals, many of which are essential to body function while others can be toxic.

Inorganic Chemical

A chemical compound that is generally not based on carbon chains, such as water, salts, minerals, or metals. In the body, inorganic substances support fluid balance, nerve signals, bone structure, and many chemical reactions.

Inosculation

The joining and establishment of a connection between blood vessels or vascularized tissues, important in wound healing, grafts, flaps, and transplantation.

Inosine

A nucleoside made of hypoxanthine linked to ribose that participates in purine metabolism and cellular energy pathways.

Inosine Monophosphate

A nucleotide containing inosine and one phosphate group; it is an intermediate in purine metabolism and a precursor of other nucleotides.

Inosine Pranobex

A medicine combination marketed in some countries as an immunomodulator or antiviral; evidence and approved uses vary by jurisdiction.

Inositol

A sugar-like compound involved in cell membranes and signaling; some forms are studied or used for selected metabolic, reproductive, or mental-health conditions.

Inositol 1,4,5-Trisphosphate

A second messenger molecule generated when phospholipase C cleaves membrane phosphatidylinositol 4,5-bisphosphate (PIP2). It binds calcium-release channels on the endoplasmic reticulum and mobilizes intracellular calcium stores.

Alternate Names:
IP3; Ins(1,4,5)P3; Inositol Trisphosphate

Inositol Phosphates

Phosphorylated forms of inositol that act in cell signaling, calcium regulation, and other intracellular processes.

Inotropes In Anesthesia

Medicines used during anesthesia or critical illness to increase the force of heart contraction and support blood flow when the heart is failing. They are given by controlled infusion and require monitoring because they can cause abnormal heart rhythms, low or high blood pressure, and increased oxygen demand.

Inotropic

Affecting the force of cardiac muscle contraction; a positive inotropic drug increases contractility, while a negative inotropic effect decreases it.

Inotropic Agent

A pharmacologic agent that modifies myocardial contractility. Positive inotropes (e.g., dobutamine, milrinone, digoxin, dopamine, epinephrine) enhance the force of myocardial contraction to augment cardiac output in decompensated heart failure or cardiogenic shock, while negative inotropes (e.g., beta-blockers, non-dihydropyridine calcium channel blockers) diminish contractile force, reducing myocardial work and oxygen consumption. See also *Inotrope*.

Alternate Names:
Inotropes; Inotropic Drugs

Inpatient

An inpatient is a person admitted to a healthcare facility for monitoring, diagnosis, treatment, surgery, or care requiring an overnight or formal stay.

Inpatient Rehabilitation

Rehabilitation provided while a person stays in a hospital or specialized facility. It combines physical, occupational, speech, nursing, and medical care to restore function after problems such as stroke, brain injury, spinal injury, or major illness.

INR

A standardized blood-test result showing how quickly blood clots. It is used mainly to adjust warfarin and similar medicines; the desired range depends on why the medicine is prescribed, and too high or too low a result can be dangerous.

Insecta

The biological class containing insects. Some insects bite or sting, cause allergic reactions, contaminate food, or spread infections and parasites; medical importance depends on the species and exposure.

Insect Bite

A localized mechanical, chemical, or immunological cutaneous lesion resulting from the puncture or injection of venom or saliva by an arthropod (e.g., mosquitoes, fleas, bedbugs, biting flies, lice). Arthropod saliva contains anticoagulants, vasodilators, and foreign protein antigens that trigger histamine- and IgE- or T-cell-mediated hypersensitivity reactions, presenting clinically as intensely pruritic, erythematous papules, urticarial wheals, or central puncta. Secondary complications include excoriation with bacterial superinfection (impetigo, cellulitis), systemic hypersensitivity (anaphylaxis from hymenoptera stings), and the transmission of vector-borne pathogens (such as malaria, dengue, West Nile virus, Lyme disease, and leishmaniasis). Treatment focuses on antipruritics, topical corticosteroids, antihistamines, and systemic epinephrine for anaphylaxis.

Insect Bites

Plural form; see *Insect Bite*.

Insect Bites And Stings

Bites and stings from insects such as mosquitoes, fleas, bedbugs, bees, wasps, hornets, yellow jackets, and ants can cause local pain, itching, swelling, allergic reactions, infection, or toxin effects; breathing difficulty or widespread symptoms may occur with a severe reaction.

Insecticide

A chemical or biological agent used to kill or control insects. Exposure can cause skin, eye, respiratory, neurologic, or cholinergic toxicity depending on the product; prevention and treatment require identifying the active ingredient.

Insecticide Poisoning

Poisoning whose presentation depends on the active ingredient. Organophosphates and carbamates cause cholinergic excess with secretions, miosis, bronchospasm, fasciculations, and weakness; pyrethroids can cause paresthesias, tremor, or seizures; other products have different toxicities. Identify the product and treat the agent-specific

syndrome.

Insect Sting Allergies

Immune reactions to venom from insects such as bees, wasps, hornets, and fire ants. Reactions may be local or systemic; generalized hives, breathing difficulty, dizziness, vomiting, or throat swelling may indicate anaphylaxis.

Alternate Names:
Hymenoptera Venom Allergy; Insect Venom Allergy

Insect Virus

A virus that infects insects or other arthropods; some are studied for ecology or biological pest control rather than human disease.

Insemination

Introduction of sperm into the female reproductive tract, either through intercourse or an assisted-reproduction procedure such as intrauterine insemination. Indications, success rates, infection screening, and risks depend on the method and patient factors.

Insensible Fluid Loss

Obligatory water loss from the body that occurs continuously and imperceptibly through evaporation from the respiratory tract (exhaled vapor) and diffusion through the skin (transdermal evaporation without sweating), normally accounting for approximately 600 to 800 mL of fluid loss per day in adults.

Insertion

Movement of a muscle attachment toward its fixed attachment, or placement of one structure into another.

Insidious

Developing slowly and quietly, often without obvious early symptoms. An insidious illness may be present for a long time before it is recognized, so the term describes its gradual pattern rather than its cause or severity.

Insinuate

To introduce or insert gradually into a space, or to suggest something indirectly; in anatomy, a structure may insinuate between or around other structures.

In Situ

In its original place. In pathology, carcinoma in situ consists of abnormal or cancer-like cells that remain within the surface layer and have not invaded deeper tissue. It has not spread through blood or lymph vessels, but some lesions can become invasive if untreated.

Alternate Names:
In place

In Situ Carcinoma

Abnormal cells that remain within the tissue layer where they began and have not grown into deeper tissue or nearby blood or lymph vessels. Some can become invasive if untreated.

In Situ Hybridization

A laboratory test that uses marked probes to find a specific DNA or RNA sequence inside cells or tissue. It can detect some gene changes, viruses, or where a gene is active.

Insomnia

Difficulty falling asleep, staying asleep, or waking too early despite adequate opportunity and suitable conditions for sleep. It may be short-term or persistent. Daytime effects can include fatigue, poor concentration, or irritability. Persistent symptoms that cause significant distress or impaired functioning may meet criteria for insomnia disorder.

Alternate Names:
Sleeplessness

Insomnia Disorder

Difficulty falling asleep, staying asleep, or returning to sleep after waking too early, despite adequate opportunity for sleep, at least three nights per week for at least three months. The sleep difficulty causes significant distress or impairment in daytime, social, occupational, educational, or other important

functioning.

Inspection

Systematic visual examination of a person or specimen for abnormalities such as changes in color, swelling, deformity, skin lesions, unusual movement, discharge, breathing effort, or overall appearance.

Inspiratory Capacity

Inspiratory capacity is the maximum volume inhaled after a normal exhalation and equals tidal volume plus inspiratory reserve volume.

Inspiratory Crackles

Brief clicking or popping sounds heard while breathing in. They may occur when small airways or air sacs open and can be caused by fluid, infection, scarring, lung collapse, or heart failure; the sound alone does not identify the cause.

Inspiratory Reserve Volume

The maximum additional volume of gas that can be voluntarily and forcefully inhaled into the lungs at the end of a normal, quiet tidal inspiration, typically measuring approximately 2.5 to 3.0 liters in healthy adults.

Alternate Names:
IRV

Inspiratory Time

The length of time spent breathing in during a natural breath or mechanical-ventilation cycle. Adjusting it can affect airflow, oxygen delivery, comfort, pressure, and the balance between inhaling and exhaling.

Inspiratory-to-Expiratory Ratio

The proportion of time spent breathing in compared with breathing out. The ratio varies with a person's breathing pattern and ventilator settings; a longer time to breathe out may be used in obstructive lung disease to reduce air trapping.

Alternate Names:
I:E Ratio

Inspissation

Thickening of a fluid or secretion as water is lost, leaving dense, concentrated material. In tissue samples, inspissated secretions may appear as dense material within ducts or glands.

Instantaneous Wave-Free Ratio

A measurement made during heart catheterization to judge whether a narrowed heart artery limits blood flow. A pressure wire compares pressure beyond and before the narrowing while the heart is relaxed. A result of 0.89 or less may support treatment when it fits the symptoms and other findings.

Alternate Names:
iFR; Wave-Free Ratio; Resting Coronary Physiology

Instillation

Slow placement of a liquid medicine or solution into a body cavity, organ, wound, or tissue, such as eye drops, bladder treatment, or fluid placed into a surgical space.

Instrument

A tool or device used by healthcare workers for examination, measurement, diagnosis, surgery, treatment, patient care, or laboratory work.

Instrumental Activities Of Daily Living

Everyday tasks needed for independent living outside basic self-care, including preparing food, shopping, managing medicines and money, using transportation, communicating, and maintaining a home. Difficulty with these tasks may signal functional decline.

Instrumental ADL

A complex activity needed for independent community living, such as shopping, cooking, managing medicines or finances, and using transportation.

Instrument Sterilization

A validated process that destroys all forms of microbial life, including bacterial spores, on or within a medical instrument. Common methods include steam under pressure, ethylene oxide, hydrogen-

peroxide plasma, and dry heat, selected according to device material and design.

Insufficient Cervix

Painless shortening and opening of the cervix during pregnancy, usually in the second trimester, without labor contractions. It can cause pregnancy loss or early birth and may require close monitoring or treatment.

Alternate Names:
Cervical Insufficiency; Cervical Incompetence

Insula

The insula is a cerebral cortical region involved in sensation, taste, emotion, interoception, pain, and integration of internal and external information.

Insular Cortex

A pyramid-shaped cortical region situated deep within the lateral sulcus (Sylvian fissure), covered by the frontal, parietal, and temporal opercula, which coordinates interoceptive sensory awareness, visceral autonomic functions, pain perception, gustation, and emotional empathy.

Alternate Names:
Insula; Island of Reil

Insulin

A hormone made by the pancreas that helps cells use glucose and lowers blood sugar. It is used to treat diabetes, but too much can cause dangerously low blood sugar with sweating, confusion, seizures, or unconsciousness.

Insulin Antagonist

A hormone, medicine, or other factor that opposes insulin's effects and can raise blood glucose.

Insulin Aspart

A rapid-acting insulin analog (modified amino acid sequence) with onset 10-20 minutes, peak 1-3 hours, duration 3-5 hours. Used to cover prandial glucose (injected at or just after meals) in type 1 and type 2 diabetes; also used in continuous subcutaneous insulin infusion (pump) and IV in acute settings.

Insulin Autoantibodies

Antibodies directed against insulin. They may be measured when assessing autoimmune diabetes or unexplained changes in blood glucose; antibodies to other beta-cell targets, such as GAD, IA-2, and ZnT8, are separate tests.

Insulin Coma

A state of severe hypoglycemia and unconsciousness caused by excessive insulin; it is a medical emergency and is not a current routine treatment.

Insulin C-Peptide Test

A blood or urine test measuring C-peptide released in equal amounts with endogenous insulin; it helps distinguish native insulin production from injected insulin and evaluate hypoglycemia or diabetes classification.

Insulin-Dependent Diabetes

Older term, usually referring to type 1 diabetes; see *Type 1 Diabetes*.

Insulin Detemir

A long-acting insulin analogue used to provide basal insulin replacement in diabetes mellitus; dosing is individualized and hypoglycemia is the principal serious adverse effect.

Insulin Glargine

A long-acting insulin used to provide background glucose control in diabetes. It is available in several formulations whose duration and dosing schedules differ; it is usually combined with mealtime insulin in type 1 diabetes.

Insulin-Induced Lipohypertrophy

A common complication of subcutaneous insulin therapy characterized by localized accumulation of adipose tissue at injection sites, caused by the lipogenic effect of insulin on subcutaneous fat. It presents as firm, rubbery, non-tender subcutaneous nodules that can cause unpredictable insulin absorption and glycemic variability.

Insulin Injection Technique

The method of injecting insulin into the fatty tissue under the skin. Common sites include the abdomen, thighs, buttocks, and upper arms; repeated injections in one place can cause fatty thickening and variable absorption.

Insulin Isophane

Intermediate-acting human insulin, also called neutral protamine Hagedorn insulin, used for basal glucose control in diabetes mellitus.

Insulin-Like Growth Factor

A hormone, mainly IGF-1, made largely by the liver in response to growth hormone. It supports growth of bone and other tissues and helps regulate metabolism. Abnormally high or low levels can occur with pituitary, liver, nutritional, or chronic illnesses.

Insulin-Like Growth Factor 1

A 70-amino-acid peptide hormone synthesized primarily by hepatocytes under the transcriptional stimulation of growth hormone (GH), which mediates the systemic anabolic, mitogenic, and linear skeletal growth effects of GH; serves as the primary screening biomarker for acromegaly and gigantism.

Alternate Names:
IGF-1; Somatomedin C

Insulin Lipohypertrophy

Thickened, rubbery fatty tissue that develops where insulin is injected repeatedly. Insulin absorbed from these areas may act unpredictably, so rotating injection sites helps prevent the problem and improves glucose control.

Insulin Lispro

A rapid-acting insulin analogue used around meals or for correction of high blood glucose in diabetes mellitus.

Insulinoma

An insulinoma is a usually benign pancreatic beta-cell neuroendocrine tumour that secretes excessive insulin, causing recurrent fasting or exertional hypoglycaemia relieved by glucose.

Insulin Pen Devices

Pre-filled or refillable devices that deliver measured insulin through a small needle under the skin. They are portable; dose, injection technique, storage, and needle disposal vary by device and prescription.

Insulin Preparations

Forms of insulin used to lower blood glucose by helping body cells take up glucose and reducing glucose release by the liver. They differ in onset and duration, and the type and dose vary by treatment plan.

Alternate Names:
Insulins; Insulin Medicines

Insulin Pumps

Insulin pumps deliver rapid-acting insulin continuously and through programmed meal or correction doses, allowing flexible management of diabetes while requiring monitoring and device safety.

Insulin Pump Therapy

Delivery of rapid-acting insulin through a small tube under the skin. The pump gives a continuous background dose and extra doses around meals or to correct high blood glucose. Users need training, monitoring, and a backup plan if the device fails.

Insulin Receptor

A protein on the surface of many cells that binds insulin and sends signals allowing cells to take up and use glucose. It also influences fat, protein, and cell-growth processes.

Insulin Resistance

A state in which muscle, fat, and liver cells respond poorly to insulin. The pancreas may produce extra insulin at first, but blood glucose can eventually rise, increasing the risk of type 2 diabetes and metabolic syndrome.

Alternate Names:
IR (Insulin Resistance)

Insulin Resistance Syndrome

Alternate name; see *Metabolic Syndrome*.

Insulin Resistance Syndromes

Rare inherited disorders in which the body responds poorly to insulin, sometimes because of a change in the insulin receptor. Severe forms can cause very high insulin levels, abnormal growth, diabetes, unusual body features, and serious illness early in life.

Insulin Secretion

Release of insulin from pancreatic beta cells in response primarily to increased plasma glucose, with amplification by incretin hormones and nutrients. Insulin promotes glucose uptake, glycogen synthesis, lipogenesis, and protein synthesis while suppressing hepatic glucose production.

Insulin Signaling

The cellular process initiated when insulin binds its receptor and activates pathways that regulate glucose uptake, glycogen formation, protein synthesis, and fat metabolism.

Insulin Storage and Syringe Safety

Storage and handling of insulin and injection equipment. Unopened insulin is commonly refrigerated, but temperature limits and the time a product can be used after opening vary by insulin, pen, vial, and pump. Freezing or excessive heat can damage insulin; needles and syringes are generally single-use and placed in an approved sharps container.

Alternate Names:
Insulin Administration Safety; Diabetes Sharps Disposal

Insulin Therapy in Diabetes

Treatment with subcutaneous injections or continuous pump infusions of insulin to control blood glucose levels in type 1 diabetes, advanced type 2 diabetes, or gestational diabetes.

Alternate Names:
Insulin Administration; Exogenous Insulin Therapy; Diabetes Insulin Management

Insulin Tolerance Test

A specialist test in which insulin is given through a vein to lower blood sugar under close supervision. It measures how the body releases stress hormones such as cortisol and growth hormone. Because very low blood sugar can be dangerous, the test requires careful monitoring.

Alternate Names:
ITT; Insulin-Induced Hypoglycemia Test

Integrase

Integrase is an enzyme that inserts viral DNA into a host genome, a process targeted by integrase inhibitors used in HIV treatment.

Integrative Medicine

Patient-centered care that combines evidence-based conventional treatment with appropriate complementary approaches, emphasizing whole-person health, prevention, lifestyle, and shared decision-making.

Integrative Rehabilitation

A rehabilitation plan that combines standard physical, occupational, or speech therapy with selected complementary approaches, such as relaxation or mindfulness, when they are safe and supported by evidence.

Integrin

A cell-surface receptor that links cells to the extracellular matrix and helps control adhesion, movement, signaling, and immune-cell activity.

Integrin Binding

The attachment of a molecule or cell to an integrin receptor, which can influence adhesion, migration, signaling, or clot formation.

Integron

A genetic element containing an integrase and an attachment site that can capture and express gene cassettes; integrons commonly contribute to bacterial antimicrobial resistance.

Integrons

Alternate plural; see *Integron*.

Integumentary System

The body system comprising the skin and its appendages: hair, nails, sweat glands, and sebaceous glands. It forms a protective barrier, limits fluid loss, contributes to thermoregulation and sensation, supports immune defence, and participates in vitamin D synthesis.

Intein

An intein is a protein segment that excises itself from a precursor protein while joining the surrounding extein sequences.

Intellectual Developmental Disorder

A neurodevelopmental condition characterized by significant limitations in general intellectual functioning and adaptive behavior during the developmental period; the formal clinical term for intellectual disability. See *Intellectual Disability*.

Intellectual Disability

A developmental condition involving significant difficulty with learning, reasoning, communication, and everyday independent skills. It begins during childhood and varies widely in severity; support needs depend on the person's abilities and environment.

Intelligence

Intelligence is the capacity to learn, reason, solve problems, understand information, and adapt; tests measure selected abilities rather than a person's entire worth or potential.

Intelligence Test

An intelligence test uses standardized tasks to estimate cognitive abilities such as reasoning, memory, language, and problem-solving.

Intense Pulsed Light

A treatment using brief pulses of broad-spectrum light for selected skin conditions and hair reduction. Light is absorbed by pigment or blood vessels, and treatment can cause temporary redness, burns, pigment changes, or eye injury.

Alternate Names:
IPL

Intensity

The degree of effort or physiological demand during physical activity.

Intensity-Modulated Radiation Therapy

A type of radiation treatment that varies the strength of many small radiation beams to match the shape of a tumor. It aims to treat the tumor while reducing radiation to nearby healthy tissue.

Intensive Care

Specialized treatment for people who are seriously ill or at risk of organ failure. It provides continuous monitoring, medicines, procedures, and life support such as a ventilator when needed.

Intensive Care Rehabilitation

Rehabilitation begun during or soon after intensive care to reduce weakness and loss of function. It may include safe positioning, movement, breathing exercises, and help with communication or daily activities.

Intensive Care Unit

A hospital unit for people who are critically ill or at high risk of organ failure. Staff provide continuous monitoring, urgent treatments, and support such as a ventilator, dialysis, or medicines to maintain blood pressure.

Intentional Obstetrical Clavicle Fracture

A deliberate fracture of a baby's collarbone during an emergency delivery when the shoulders are stuck and other measures have failed. It creates more room for birth and usually heals, but is used only as a last-resort obstetric procedure.

Alternate Names:
Cleidotomy; Obstetric Clavicular Fracture

Intention Tremor

A tremor that becomes more pronounced during a purposeful movement toward a target. It commonly suggests cerebellar or cerebellar-pathway dysfunction, although medicines, toxins, and other neurologic disorders can contribute.

Interatrial Septum

The wall between the heart's right and left upper chambers. It includes the fossa ovalis, a normal remnant of fetal circulation, and contains a thinner area that may be crossed during selected catheter procedures.

Intercalated Disc

An intercalated disc is a specialized junction connecting cardiac muscle cells and transmitting electrical and mechanical force through the heart.

Intercalating Agent

An intercalating agent inserts between DNA base pairs and can disrupt replication or transcription; some are laboratory reagents or anticancer drugs.

Intercellular

Located between cells or occurring in the space between cells. Intercellular material and signals help cells attach, communicate, exchange substances, and organize tissues throughout the body.

Intercostal

Intercostal means located between the ribs, especially the muscles, nerves, and blood vessels in those spaces.

Intercostal Muscles

Muscles between the ribs that help expand and compress the chest during breathing and also assist movement of the trunk.

Intercostal Retraction

Inward movement of the skin and soft tissues between the ribs during inspiration, indicating increased work of breathing. It is common in infants and children with respiratory distress and may accompany airway obstruction, bronchiolitis, pneumonia, asthma, or other pulmonary disease.

Intercostal Retractions

Alternate plural; see *Intercostal Retraction*.

Intercostal Space

The space between two neighboring ribs. It contains intercostal muscles, nerves, and blood vessels.

Intercurrent Disease

An illness or complication that develops during the course of another disease or treatment and may affect its management or outcome.

Interdental Brush

A small brush designed to clean between teeth where a regular toothbrush cannot reach. It helps remove plaque and food and may reduce gum inflammation; brush sizes vary to fit different spaces.

Interdigital Neuroma

Alternate name; see *Morton's Neuroma*.

Interference

A factor that alters the accuracy or interpretation of a laboratory test, measurement, or drug effect.

Interferometry

A measurement method that uses interference between waves to determine distance, motion, thickness, optical properties, or other physical quantities.

Interferon

A major family of pleiotropic signaling glycoproteins and cytokines synthesized and secreted by host cells in response to viral pathogens, parasites, and neoplastic transformations. Classified into three distinct families: Type I interferons (primarily IFN-α, produced by plasmacytoid dendritic cells, and IFN-β, synthesized by fibroblasts), which bind the heterodimeric IFNAR1/IFNAR2 receptor complex to activate the JAK-STAT signaling pathway (JAK1/TYK2, STAT1/STAT2, IRF9 forming ISGF3), inducing hundreds of interferon-stimulated

genes (ISGs) including protein kinase R (PKR) and $2', 5'$-oligoadenylate synthetase (OAS) that arrest viral protein synthesis and degrade viral RNA; Type II interferon (IFN-γ), produced predominantly by CD4+ Th1 lymphocytes, CD8+ cytotoxic T cells, and natural killer (NK) cells, acting via IFNGR to activate macrophages, enhance MHC class I and II expression, and govern cell-mediated immunity; and Type III interferons (IFN-λ1–4), acting through IFNLR1/IL10R2 complexes primarily on mucosal epithelial barriers. Recombinant formulations are utilized clinically in chronic hepatitis B and C, relapsing-remitting multiple sclerosis (IFN-β), chronic granulomatous disease (IFN-γ), and specific malignancies (melanoma, Kaposi sarcoma, hairy cell leukemia).

Alternate Names:
IFN

Interferon-Alpha

A type I interferon cytokine with antiviral, antiproliferative, and immune-modulating effects; recombinant forms have been used for selected viral infections and cancers.

Interferon-Beta

A type I interferon cytokine used mainly as an immunomodulatory treatment for relapsing forms of multiple sclerosis.

Interferon Gamma Release Assay

A blood test that measures interferon-gamma released by sensitized T cells after exposure to antigens associated with *Mycobacterium tuberculosis*. It detects tuberculosis infection, including latent infection, and is generally not affected by prior BCG vaccination. Commercial assays use different antigen preparations and methods; results do not distinguish latent infection from active disease by themselves.

Alternate Names:
IGRA

Interferon-Gamma Release Assay

Alternate spelling; see *Interferon Gamma Release Assay*.

Interferon Inducer

A substance that stimulates cells to produce interferons, proteins involved in antiviral and immune responses.

Interferonopathies

Rare inherited or acquired disorders in which interferon-driven immune activity remains abnormally high. They can cause ongoing inflammation, skin or lung disease, blood-vessel injury, or neurologic problems, often beginning in childhood.

Interferons

Plural form; see *Interferon*.

Interferon Signaling

The process by which interferons bind to cell receptors and activate genes that help defend against viruses, regulate immune cells, and sometimes slow cell growth. Different interferons act mainly on different tissues.

Interleukin

A diverse group of immunomodulatory cytokines synthesized primarily by CD4+ helper T lymphocytes, monocytes, macrophages, and endothelial cells that coordinate intercellular communication, leukocyte proliferation, maturation, migration, and systemic inflammatory cascades. Major subtypes include: IL-1 (IL-1α and IL-1β, potent pyrogens inducing fever via hypothalamic prostaglandin E2 synthesis, acute-phase reactants, and neutrophil mobilization); IL-2 (T-cell growth factor driving clonal expansion of effector and regulatory T cells); IL-4 and IL-13 (secreted by Th2 cells, inducing B-cell immunoglobulin class-switching to IgE and activating eosinophils in allergic inflammation); IL-6 (pleiotropic driver of hepatic CRP synthesis, thrombopoietin release, and plasma cell differentiation); IL-10 (potent anti-inflammatory cytokine inhibiting macrophage antigen presentation and pro-inflammatory cytokine secretion); IL-12 and IL-23 (promoting Th1 and Th17 differentiation, respectively); and IL-17 (recruiting neutrophils and driving autoimmune tissue destruction in psoriasis, ankylosing spondylitis, and inflammatory bowel

disease). Therapeutic monoclonal antibodies specifically target interleukin pathways (e.g., anakinra [anti-IL-1R], tocilizumab [anti-IL-6R], dupilumab [anti-IL-4Rα], ustekinumab [anti-IL-12/23p40], secukinumab [anti-IL-17A]).

Alternate Names:
IL; Interleukins

Interleukin 1

A group of proinflammatory cytokines, especially IL-1 alpha and IL-1 beta, that promote fever, leukocyte activation, and inflammatory responses.

Interleukin 13

A cytokine produced by type 2 helper T cells and other immune cells that contributes to allergic inflammation, mucus production, and tissue fibrosis.

Interleukin 2

Interleukin-2 is a T-cell growth factor that promotes proliferation and survival of activated T cells and natural-killer cells; high-dose therapy can cause capillary-leak syndrome and systemic toxicity.

Interleukin-6

A cytokine involved in immune regulation and inflammation that stimulates production of acute-phase proteins by the liver.

Interleukin 7

A cytokine important for development, survival, and homeostasis of T lymphocytes and some B-cell precursors.

Interleukins

Plural form; see *Interleukin*.

Alternate Names:
ILs

INTERMACS Profile

A seven-level system for describing how sick a person is with advanced heart failure. Profile 1 means critical shock with very poor blood flow; profiles 2 and 3 describe worsening or dependence on medicines that strengthen the heart. Profiles 4 through 7 describe repeated hospital stays or increasing limits on activity. The profile helps doctors judge urgency and timing for a heart pump or transplant.

Alternate Names:
INTERMACS Staging; INTERMACS Scale

Intermediate

Intermediate means between two stages, positions, or levels, such as an intermediate metabolite, cell, or developmental phase.

Intermediate Cuneiform

The smallest of three cuneiform bones in the middle of the foot. It lies between the other cuneiform bones and joins the navicular bone and second metatarsal, helping support the foot's arch.

Intermediate-Density Lipoprotein

A temporary particle formed when the body removes some fat from very-low-density lipoprotein. It can be changed into LDL, the type of cholesterol particle that can contribute to fatty buildup in artery walls.

Alternate Names:
IDL

Intermediate Filament

An intermediate filament is a strong cytoskeletal fiber that supports cell shape, mechanical stability, and tissue integrity.

Intermediate Uveitis

Inflammation mainly affecting the gel inside the eye and nearby tissues at the edge of the retina. It may cause blurred vision, floaters, or little pain and can be linked to autoimmune disease, infection, or no identified cause. Eye examination and imaging guide treatment and monitoring for complications.

Intermittent Auscultation

Checking a baby's heart rate at regular intervals during labor with a handheld Doppler or fetoscope rather than recording it continuously. The timing depends on the stage of labor, pregnancy risks, symptoms, and local clinical practice.

Intermittent Claudication

Cramping, aching, or weakness in a leg muscle that reliably starts with walking or exercise and improves with rest. It usually results from narrowed leg arteries and may indicate peripheral artery disease.

Intermittent Explosive Disorder

A mental-health disorder causing repeated, sudden outbursts of verbal or physical aggression that are far greater than the situation warrants. The outbursts are impulsive, not planned, and cause distress or problems in daily life; diagnosis is made from the pattern and history.

Intermittent Fasting

An eating pattern that alternates planned periods of eating with periods of little or no food. Common schedules limit daily eating hours or use selected fasting days. It may help some adults lose weight, but it is not suitable for everyone, especially during pregnancy or with some medical conditions or eating disorders.

Intermittent Fever

A fever that rises and falls with periods when temperature returns to normal or near normal.

Intermittent Mandatory Ventilation

A mechanical ventilation mode in which preset mechanical volume- or pressure-cycled mandatory breaths are delivered at fixed periodic intervals, while permitting spontaneous unassisted or pressure-supported breaths between mandatory cycles.

Alternate Names:
IMV

Intermenstrual Bleeding

Uterine or vaginal bleeding that occurs between normal menstrual periods; see *Metrorrhagia*.

Intern

A physician in the early stage of postgraduate medical training, traditionally the first year after medical school; the exact training structure varies by country.

Internal

Internal means located within the body, an organ, a structure, or a system rather than on its outer surface.

Internal Bleeding

Internal bleeding is blood loss into a body cavity, tissue, or organ rather than through an obvious external wound. Trauma, ulcers, aneurysm, pregnancy complications, medicines, and tumors can cause it; faintness, shock, abdominal swelling, black stool, or vomiting blood may occur.

Internal Capsule

A compact bundle of nerve fibers deep inside the brain that carries movement and sensation signals between the brain's outer layer and lower brain and spinal centers. Damage can cause weakness, numbness, or other neurologic deficits.

Internal Capsule Stroke

A stroke affecting the internal capsule, a compact pathway carrying motor and sensory fibers between the brain and body. A small infarct may cause contralateral weakness, sensory loss, or combined sensorimotor symptoms; the pattern depends on the location and extent of injury. Nearby lesions can produce similar findings, so symptoms alone do not establish the precise site.

Internal Carotid Artery

A branch of the common carotid artery that enters the skull and supplies the brain, eyes, and related structures. It contributes to the cerebral arterial circulation.

Internal Carotid Artery Dissection

A tear in the tunica intima of the extracranial internal carotid artery leading to intramural hematoma formation within the arterial wall, manifesting classically with ipsilateral frontotemporal or retro-orbital headache, neck pain, partial Horner syndrome (ptosis and miosis without anhidrosis), and ischemic stroke in young adults.

Alternate Names:
ICAD

Internal Condom

A thin pouch inserted into the vagina or anus during sex to reduce the chance of pregnancy and transmission of some sexually transmitted infections.

Alternate Names:
Female Condom; Female Condoms

Internal Environment

The fluid and physiologic conditions inside the body that cells require, including temperature, pH, oxygen, electrolytes, and nutrients.

Internal Fixation

Surgical stabilization of a fracture or unstable bone using implanted hardware such as plates, screws, rods, wires, or pins.

Internal Fixator

An internal fixator is a surgically implanted plate, screw, rod, nail, or frame used to stabilize a fracture or correct skeletal alignment.

Internal Hernia

A loop of intestine slips through an opening inside the abdominal cavity, often after abdominal surgery. It can cause intermittent or sudden bowel obstruction with abdominal pain, vomiting, and bloating.

Internal Iliac Artery

A major artery branching from the pelvic arteries. It supplies blood to the pelvic organs, buttocks, pelvic muscles, reproductive organs, bladder, and parts of the rectum.

Internal Iliac Vein

A vein draining the pelvic organs, pelvic wall, and gluteal region that joins the external iliac vein to form the common iliac vein.

Internal Jugular Vein

A large vein in the neck that drains blood from the brain, face, and neck back to the heart. It joins another major vein behind the collarbone and is sometimes used for central intravenous access.

Internal Jugular Vein Cannulation

The percutaneous placement of an indwelling central venous catheter into the internal jugular vein, conventionally performed under real-time ultrasound guidance between the sternal and clavicular heads of the sternocleidomastoid muscle for central venous pressure monitoring, inotropic drug administration, or hemodialysis access.

Alternate Names:
IJ Line Placement

Internal Jugular Vein Thrombosis

A blood clot in the large vein that carries blood from the head and neck toward the heart. It may cause neck pain or swelling and can be linked to infection, a vein catheter, cancer, or a condition that makes blood clot easily.

Jugular Vein Thrombosis

Alternate name; see *Internal Jugular Vein Thrombosis*.

Alternate Names:
IJV Thrombosis; Jugular Vein Phlebothrombosis

Internal Medicine

The medical specialty focused on prevention, diagnosis, and treatment of illness in adults. Internists provide comprehensive care across organ systems, including complex or multiple conditions, in outpatient and hospital settings; some pursue subspecialty training in areas such as cardiology, nephrology, or oncology.

Internal Oblique Muscle

A broad muscle layer in the side of the abdominal wall. It helps compress the abdomen, bend and rotate the trunk, support the spine, and strengthen the groin and abdominal wall.

Internal Podalic Version

A rare obstetric procedure in which a clinician turns a baby inside the uterus by bringing the feet downward, usually to deliver a second twin in an unusual position. It carries serious risks and is performed only in selected emergencies by an experienced specialist.

Internal Resorption

Destruction of tooth tissue from the inside of the tooth outward, caused by activity of specialized cells. It may produce a pink area or no symptoms and can weaken the tooth; dental imaging determines whether root-canal treatment can save it.

International Classification of Diseases

A World Health Organization system for coding diseases, injuries, and other health conditions. Versions such as ICD-10 and ICD-11 support clinical records, statistics, and billing; a code does not replace a clinical diagnosis.

International Normalized Ratio

The INR, a standardized calculation from the prothrombin time used to assess blood clotting and guide treatment with vitamin K antagonists such as warfarin.

International Unit

A unit that measures the biological effect of a substance, such as insulin, a vitamin, or a vaccine. The amount represented by one unit differs between substances, so international units cannot be directly converted to milligrams without knowing the substance.

Interneuron

An interneuron connects neurons within the central nervous system and helps integrate, inhibit, or coordinate neural signals.

Interneurons

Alternate plural; see *Interneuron*.

Internist

A physician specializing in internal medicine who provides comprehensive care for adults. Internists diagnose and manage acute and chronic illnesses affecting any organ system, including complex or multiple conditions. They may practice general primary care or hospital medicine, or complete further training in an internal-medicine subspecialty.

Alternate Names: Internal Medicine Physician; Doctor of Internal Medicine

Internuclear Ophthalmoplegia

A disorder of coordinated side-to-side eye movement caused by damage to a nerve pathway in the brainstem. One eye may not move inward properly, causing double vision or jerky eye movements; stroke and multiple sclerosis are common causes.

Interosseous

Interosseous means located between bones, such as the membrane or muscles between the forearm or lower-leg bones.

Interosseous Nerve Syndrome

Neuropathy affecting an interosseous nerve in the forearm. Anterior interosseous nerve palsy weakens flexion of the thumb interphalangeal joint and index-finger distal interphalangeal joint, impairing tip-to-tip pinch; posterior interosseous nerve palsy weakens finger and thumb extension while usually sparing cutaneous sensation. These are distinct syndromes with different nerve functions.

Interpersonal Psychotherapy

A time-limited talking therapy, used especially for depression, that links mood symptoms with relationships and life changes. It helps address grief, conflict, role changes, loneliness, communication, and social support.

Interphalangeal Dislocation

Displacement of a finger or toe joint between phalanges, usually after hyperextension, twisting, or direct impact. Pain, deformity, swelling, and restricted motion occur; fractures, tendon injury, and neurovascular compromise may accompany it.

Interphalangeal Joint

A joint between the bones of a finger or toe. These joints mainly allow the digit to bend and straighten.

Interphase

Interphase is the portion of the cell cycle between

divisions, including growth, DNA replication, and preparation for mitosis or meiosis.

Interphase Cell

A cell between divisions that grows, performs normal functions, and copies its DNA before possible division.

Interproximal Caries

Dental caries occurring on the contact surfaces between adjacent teeth. It may be difficult to detect clinically and is commonly assessed with bitewing radiographs when imaging is indicated.

Interrupted Aortic Arch

A rare congenital heart defect in which the aorta has a complete gap between its ascending and descending parts. Newborns can rapidly develop poor circulation and heart failure.

Intersexual

Older term; see *Differences Of Sex Development*.

Interstitial

Relating to the spaces between cells or tissues, such as interstitial fluid or interstitial lung disease.

Interstitial Cystitis

A long-lasting condition, also called bladder pain syndrome, that causes pain, pressure, or tenderness felt in the bladder or pelvis together with urinary symptoms. Pain often worsens as the bladder fills and improves after urination; frequent urination and a sudden urge to urinate are common, and sex may be painful. Symptoms may flare and then improve. There is no single known cause. The diagnosis is based on the symptoms and examination while other conditions with similar symptoms, such as a urinary infection, are considered or ruled out.

Alternate Names:
IC; Bladder Pain Syndrome; Painful Bladder Syndrome

Interstitial Fluid

Interstitial fluid is the fluid surrounding tissue cells, formed from blood plasma and returned to circulation through lymphatic vessels.

Interstitial Granulomatous Dermatitis

A rare inflammatory skin disorder that causes red, purple, or brown patches or raised areas, often on both sides of the body. It may be linked to autoimmune disease, medicines, or another illness.

Interstitial Keratitis

Inflammation of the corneal stroma without primary involvement of the corneal surface. It may follow infection, autoimmune disease, or trauma and can cause pain, photophobia, redness, and reduced vision.

Interstitial Lung Disease

A large, diverse group of lung conditions that cause progressive inflammation and scarring of the interstitium—the delicate lace-like tissue surrounding the microscopic air sacs (alveoli) of the lungs. The scarring makes the lungs stiff and hampers the passage of oxygen into the blood. Causes include autoimmune diseases (such as rheumatoid arthritis or scleroderma), long-term exposure to hazardous dusts or molds, certain medications, or unknown factors.

Alternate Names:
ILD; Diffuse Parenchymal Lung Disease (DPLD)

Interstitial Nephritis

Inflammation of the renal interstitium and tubules, which can be acute or chronic. Acute interstitial nephritis is most commonly caused by medications, particularly NSAIDs, antibiotics including penicillins and cephalosporins, and proton pump inhibitors.

Interstitial (Nonidiopathic) Pulmonary Fibrosis

Fibrotic interstitial lung disease with an identifiable or suspected cause, such as connective-tissue disease, occupational exposure, medicines, radiation, or chronic hypersensitivity pneumonitis. Management combines exposure control, treatment of the cause, monitoring, and selected anti-inflammatory

or antifibrotic therapy.

Interstitial Pneumonia

Inflammation affecting the supporting tissue around the lung air sacs. It may be caused by infection, autoimmune disease, medicines, or other lung disorders and can cause dry cough, fever, breathlessness, and low oxygen. Examination and imaging help determine the cause and treatment.

Interstitial Pulmonary Fibrosis

Scarring in the supporting tissue between the lung air sacs, which can reduce oxygen transfer. It may cause progressive breathlessness and dry cough; causes include autoimmune disease, medicines, radiation, or no identified cause.

Interstitium

The supporting tissue between and around the lung air sacs, capillaries, and small airways; inflammation or fibrosis of this tissue can impair lung expansion and gas exchange.

Intertrigo

Intertrigo is inflammation in opposing skin folds caused by moisture, heat, friction, and maceration; Candida or bacterial infection may complicate the tender erythematous rash.

Alternate Names:
Intertriginous Dermatitis

Intertrochanteric Fracture

An extracapsular fracture of the proximal femur occurring along the dense trabecular line extending between the greater and lesser trochanters, carrying a low risk of avascular femoral head necrosis compared to femoral neck fractures, commonly treated with a cephalomedullary nail or sliding hip screw.

Ischiofemoral Impingement

Pinching of soft tissue between the sitting bone of the pelvis and the thighbone. It may irritate a nearby muscle and cause deep buttock or groin pain, often worse when the leg moves backward or turns inward.

Interval

An interval is the time, distance, or range between two points or events, such as a dosing or follow-up interval.

Intervening Sequence

A nucleotide sequence within a gene transcript that lies between coding sequences; in many genes it is an intron removed during RNA processing.

Intervention

An action intended to prevent, diagnose, treat, or change a health condition or outcome, such as a medicine, procedure, counseling, or public-health measure.

Alternate Names:
Medical Intervention; Clinical Intervention

Interventional

Relating to a procedure or active treatment used to diagnose or manage disease, often through minimally invasive access rather than open surgery.

Interventional Cardiology

A subspecialty using catheter-based procedures to diagnose and treat coronary, structural, and selected vascular heart conditions, including angioplasty, stenting, and transcatheter valve procedures.

Interventional Procedure

A targeted procedure used to diagnose or treat disease, often through a needle, tube, or small incision and guided by imaging. Examples include biopsy, drainage, vessel treatment, and tumor ablation; risks depend on the body area and technique.

Interventional Procedures

Alternate plural; see *Interventional Procedure*.

Interventional Radiologist

A physician trained to perform minimally invasive diagnostic and therapeutic procedures using medical imaging for guidance.

Interventional Radiology

A specialty using imaging guidance to perform minimally invasive diagnostic and therapeutic procedures, such as biopsies, drainages, embolization, and vascular treatments.

Interventricular Septum

The wall between the heart's two lower chambers. It is mostly muscle and helps the heart pump effectively; it also contains part of the electrical system that coordinates the heartbeat.

Intervertebral Disc

A strong, flexible cushion between neighboring spinal bones. It absorbs shock and allows limited movement; a bulging or damaged disc can irritate nearby nerves and cause back or neck pain, numbness, or weakness.

Intervertebral Disk

Alternate spelling; see *Intervertebral Disc*.

Intervertebral Foramen

An opening between two neighboring bones of the spine through which a spinal nerve leaves the spinal canal. Narrowing of this opening can press on the nerve and cause pain, numbness, tingling, or weakness in its area of the body.

Alternate Names:
Neural foramen

Intestinal Absorption

Movement of digested nutrients, water, vitamins, and salts through the intestinal lining into the blood or lymph. Damage to the intestine, pancreas, liver, or bile flow can reduce absorption and cause deficiency.

Intestinal Amebiasis

Alternate name; see *Amebiasis*.

Intestinal Angina

A clinical manifestation of chronic mesenteric ischemia characterized by severe, cramping, periumbilical or epigastric abdominal pain developing 30 to 60 minutes after eating ('food fear'), leading to progressive weight loss, caused by severe atherosclerotic stenosis of two or more mesenteric arteries.

Alternate Names:
Chronic Mesenteric Ischemia; Postprandial Abdominal Angina

Intestinal Atresia

A birth defect in which part of the intestine is closed or missing, blocking passage of milk and digestive contents. Newborns may develop swollen abdomen, vomiting, and failure to feed and usually need surgery.

Intestinal Cancer

A cancer that begins in the small or large intestine. It may cause pain, bleeding, anemia, altered bowel habits, blockage, or weight loss, but early disease may cause no symptoms; diagnosis and treatment depend on its site and stage.

Intestinal Carcinoid Tumor

A neuroendocrine tumor arising in the intestine, especially the ileum or jejunum. It may be incidental or cause pain, obstruction, bleeding, or hormone-related carcinoid syndrome after liver or other metastases develop.

Intestinal Crypts

Small glands in the intestinal lining that make mucus and help replace worn-out lining cells.

Intestinal Diseases

Diseases of the small or large intestine include infection, inflammation, poor absorption, blockage, polyps, and cancer. Symptoms may include pain, diarrhea, constipation, bleeding, vomiting, weight loss, or nutritional deficiency.

Intestinal Duplication

A birth difference in which an extra segment or cyst develops beside or within the intestine. It may cause no symptoms or lead to pain, bleeding, infection, blockage, or twisting of the bowel.

Intestinal Failure

Gut function reduced below the level needed to absorb enough nutrients, water, or electrolytes to maintain health or growth, requiring intravenous supplementation. Causes include short bowel, extensive disease of the intestinal lining, intestinal fistula, impaired intestinal movement, and mechanical blockage. The term applies when these problems require intravenous nutrition or fluids, not to malabsorption alone.

Intestinal Fistula

An abnormal passage connecting the intestine with another organ, another bowel segment, or the skin. It may develop after inflammation, infection, surgery, or injury and can cause leakage, infection, dehydration, or poor nutrition.

Intestinal Flukes

Parasitic flatworms that infect the intestine after contaminated food or water is consumed. Infection may cause abdominal pain, diarrhea, malabsorption, or nutritional problems, and diagnosis depends on exposure history and stool or other testing.

Intestinal Ganglioneuromatosis

A rare, usually noncancerous overgrowth of nerve cells and supporting fibers in the intestinal wall. It may cause pain, diarrhea, constipation, or blockage and can occur with certain inherited tumor syndromes.

Intestinal Gas

Gas within the digestive tract that may cause belching, bloating, abdominal discomfort, passing wind, or symptoms from an underlying digestive disorder.

Intestinal Ischemia

Too little blood flow reaching the intestines. It may develop suddenly from a clot or blockage, or gradually from narrowed arteries, and can cause severe pain, bloody stools, or bowel damage.

Alternate Names:
Mesenteric Ischemia; Bowel Ischemia

Intestinal Leiomyoma

A usually benign smooth-muscle tumor arising in the wall of the intestine; symptoms depend on size and location and may include bleeding, obstruction, or abdominal pain.

Intestinal Lipodystrophy

Alternate name; see *Whipple's Disease*.

Intestinal Lipomatosis

A usually noncancerous overgrowth of fatty tissue in the intestinal wall. It often causes no symptoms, but larger areas can lead to bleeding, bowel blockage, or telescoping of one bowel segment into another.

Intestinal Lymphangiectasia

Dilation or obstruction of intestinal lymphatic vessels, causing leakage of lymph into the bowel and loss of protein, lymphocytes, and fat-soluble vitamins. It may produce edema, diarrhea, abdominal symptoms, or poor growth.

Intestinal Lymphoma

A cancer of immune-system cells that begins in the small or large intestine. It may cause abdominal pain, weight loss, diarrhea, bleeding, or blockage; diagnosis requires tissue sampling and specialist evaluation.

Intestinal Malrotation

A birth defect in which the intestines do not move into their usual position before birth. It can allow the bowel to twist and lose its blood supply, causing green vomiting, pain, swelling, or sudden illness in an infant.

Intestinal Malabsorption

Alternate name; see *Malabsorption*.

Intestinal Metaplasia

A change in which the normal lining of the stomach or another area becomes more like the lining of the intestine, usually after long-term irritation or inflammation. Some forms increase the future risk of stomach cancer.

Intestinal Microbiome

The community of microorganisms living in the intestines. These organisms can affect digestion, vitamin production, immune activity, and protection from harmful germs.

Intestinal Motility

The muscle movements that mix and push food, fluid, and stool through the intestines.

Intestinal Motility Disorders

Alternate name; see *Gastrointestinal Motility Disorder*.

Intestinal Mucosa

The inner lining of the intestine, where digestion and nutrient absorption occur. It produces mucus and contains immune defenses that help protect the body from germs and harmful substances in food.

Intestinal Obstruction

A partial or complete blockage that prevents food, fluid, and gas from moving normally through the intestine. Adhesions, hernias, tumors, inflammation, twisting, or poor bowel movement can cause pain, swelling, vomiting, and inability to pass stool or gas.

Intestinal Obstruction And Ileus

Impaired passage of intestinal contents caused by a mechanical blockage or by reduced bowel motility without a physical blockage; symptoms commonly include abdominal pain, distension, vomiting, and inability to pass stool or gas.

Intestinal Obstruction Repair

Surgery or another intervention to relieve an intestinal blockage, remove a diseased segment when necessary, and restore bowel continuity or create a stoma when required.

Intestinal Parasite

A protozoan or worm that lives in the gastrointestinal tract and may cause diarrhea, abdominal pain, anemia, malnutrition, or no symptoms.

Intestinal Perforation

A hole through the bowel wall that allows digestive contents and bacteria into the abdomen. It may result from inflammation, infection, blockage, injury, or surgery and can cause severe pain, abdominal rigidity, infection, and shock.

Intestinal Polyp

A growth that projects from the inner lining of the small or large intestine. Many are harmless, but some can slowly become cancer, so their size, number, type, and location guide follow-up or removal.

Intestinal Polyps

Alternate plural name; see *Intestinal Polyp*.

Intestinal Polyposis

The presence of many polyps in the intestine. It may be inherited or acquired and can cause bleeding, anemia, blockage, or increased cancer risk; evaluation often includes colonoscopy and family-history assessment.

Intestinal Pseudo-Obstruction

Bowel swelling and symptoms of blockage caused by poor intestinal movement despite no physical obstruction. It may be temporary after illness or surgery or result from a long-term nerve or muscle disorder.

Intestinal Resection

Surgery to remove part of the small or large intestine because of disease or injury. The remaining ends may be rejoined, or an opening may be made through the abdominal wall for stool to pass.

Intestinal Transplant

Transplantation of a donor small intestine to treat irreversible intestinal failure when adequate nutrition and fluid balance cannot be maintained by other means. It may be performed alone or with a liver and other abdominal organs and requires lifelong immunosuppression and monitoring for rejection, infection, and graft complications.

Intestinal Tuberculosis

Tuberculosis infection affecting the intestine, most often the area where the small and large intestines meet. It may cause abdominal pain, fever, weight loss, or changes in bowel habits and can resemble Crohn disease. It can also lead to narrowing or blockage of the bowel.

Intestinal Volvulus

Alternate name; see *Volvulus*.

Intestinal Villi

Tiny finger-like projections lining the small intestine that greatly increase its surface area. Their blood and lymph vessels absorb digested nutrients; damage to them can cause diarrhea, weight loss, and nutritional deficiencies.

Intestinal Wall

The layers of tissue that surround the intestinal passage. They move intestinal contents, absorb nutrients and water, and help protect against harmful substances.

Intestine

The part of the digestive tract extending from the stomach to the anus, consisting of the small intestine and large intestine.

Intestine Disorder

Alternate name; see *Intestinal Diseases*.

Intestine Neoplasm

An abnormal growth in the small or large intestine. It may be noncancerous or cancerous and can cause bleeding, anemia, pain, altered bowel movements, blockage, or no symptoms.

Intestine Obstruction

Alternate name; see *Intestinal Obstruction*.

Intimal Dissection

A tear in the inner lining of an artery that allows blood to enter and split the vessel wall, creating a false lumen. Aortic or other arterial dissection can compromise blood flow and is a medical emergency.

Intimal Hyperplasia

Thickening of the inner lining of an artery after injury, surgery, a stent, or a vascular graft. The narrowing can reduce blood flow and cause a treated artery or dialysis access to become blocked again.

Intimate Partner Violence In Pregnancy

Physical, sexual, or psychological abuse by a current or former partner during pregnancy. It can harm the pregnant person and fetus and is associated with complications such as injury, preterm birth, and placental abruption.

Intolerance

An adverse response to a substance that does not involve the immune mechanism of an allergy.

Alternate Names:
Nonallergic Sensitivity; Food Intolerance

Intoxication

A state of physical or mental impairment caused by recent exposure to a substance, such as alcohol, a medicine, or another drug.

Intra-Abdominal Abscess

A pocket of pus inside the abdomen, often near the bowel, pelvis, or diaphragm. It may cause fever, abdominal pain, vomiting, or general illness and can develop after infection, inflammation, injury, or surgery.

Intraabdominal Cancer

Cancer arising in an organ or tissue within the abdomen, such as the bowel, stomach, liver, pancreas, ovaries, or abdominal lining. Symptoms and treatment depend on the organ, cancer type, extent, and overall health.

Intraabdominal Hemorrhage

Bleeding inside the abdominal cavity, often after trauma, surgery, rupture of an organ or blood vessel, pregnancy complications, or internal disease. It may cause pain, swelling, dizziness, or shock.

Intraabdominal Hernia

A loop of intestine or other abdominal tissue slips through an abnormal opening inside the abdominal cavity rather than through the abdominal wall. It can cause pain, vomiting, and bowel obstruction.

Intra-Abdominal Hypertension

A sustained or repeated pathological elevation of intra-abdominal pressure equal to or exceeding 12 mmHg (measured via transvesical bladder pressure catheterization), which when exceeding 20 mmHg with new organ failure defines abdominal compartment syndrome.

Alternate Names:
IAH

Intraabdominal Infection

An infection within the abdominal cavity, such as peritonitis or an abscess, often requiring antibiotics and sometimes drainage or surgery.

Intra-Abdominal Sepsis

Sepsis arising from an infection within the abdominal cavity, commonly due to bowel perforation, peritonitis, an abscess, ischemic bowel, or a leak after surgery. It may cause abdominal pain, fever, ileus, organ dysfunction, shock, or failure of multiple organs.

Intra-Aortic Balloon Pump

A temporary heart-support device with a balloon inside the body's main artery. It inflates and deflates with each heartbeat to improve blood flow and reduce the heart's workload; bleeding, infection, and reduced limb blood flow can occur.

Intra-Arterial

Intra-arterial means within an artery, including a catheter, injection, infusion, or measurement performed directly in an arterial vessel.

Intraarticular

Intraarticular means within a joint, such as an injection, fracture, loose body, or inflammatory process inside the joint space.

Intra-Articular Injection

An injection into a joint space, such as the knee, shoulder, hip, or ankle. It may deliver medicine or remove joint fluid; corticosteroids, local anesthetics, and other substances may be used for selected joint problems.

Alternate Names:
Joint Injection; Intraarticular Injection

Intrabronchial

Intrabronchial means within a bronchus, one of the air passages branching from the trachea into the lungs.

Intracardiac Echocardiography

An invasive imaging modality in which a steerable catheter-tipped ultrasound probe is introduced via the femoral vein into the cardiac chambers (usually the right atrium) to provide real-time, high-resolution visualization of endocardial structures and guide structural heart and electrophysiology interventions.

Alternate Names:
ICE

Intracardiac Electrophysiology Study

An invasive test using electrode catheters inside the heart to record electrical activity and provoke or map arrhythmias, helping guide diagnosis and treatment.

Intracartilaginous

Located within cartilage, such as a lesion, injection, or developing structure. The term identifies position and does not by itself indicate whether the finding is normal, injured, inflamed, or cancerous.

Intracavernosal Injection

An injection of a prescription medicine into the erectile tissue of the penis to treat erectile dysfunction. The medicine relaxes muscle and widens blood vessels, producing an erection that does not require sexual stimulation. Pain, bruising, scar tissue, or a prolonged painful erection can occur.

Alternate Names:

ICI; Penile Injection Therapy; Intracavernous Injection

Intracavitary

Intracavitary means within a body cavity, such as a treatment, device, fluid, or lesion located in the thorax, abdomen, uterus, or another cavity.

Intracavity Radiotherapy

Intracavity radiotherapy places a radiation source inside a body cavity near a tumor, commonly to treat selected cancers of the cervix, uterus, or vagina.

Intracellular

Inside a cell or occurring within a cell. Intracellular fluid contains most of the body's potassium and magnesium, whereas sodium is found mainly outside cells. The cell membrane controls movement of water and dissolved substances between the cell and its surroundings.

Intracellular Fluid

The fluid contained within cells, comprising approximately two thirds of total body water in a typical adult. Its major solutes include potassium, magnesium, phosphate, and intracellular proteins, and its composition is maintained by selective membrane transport.

Intracellular Membrane

A membrane inside a cell that separates compartments and controls movement of substances between them.

Intracellular Pathogens

Germs that live and multiply inside the body's cells. Viruses always do this, and some bacteria do as well; living inside cells can make them harder for immune defenses and some medicines to eliminate.

Intracellular Transport

Movement of proteins and other materials within a cell, often in membrane-bound sacs along the cell's internal framework.

Intracerebral

Intracerebral means within the brain tissue, as in an intracerebral hemorrhage, injection, electrode, or lesion.

Intracerebral Hemorrhage

Bleeding directly into brain tissue, usually from a small ruptured artery. It can cause sudden headache, weakness, vomiting, confusion, seizures, or loss of consciousness.

Intracisternal

Intracisternal means within a cistern, especially a cerebrospinal-fluid space at the base of the brain.

Intracoronal

Located within the crown of a tooth. In cardiology, the related term *intracoronary* means within a coronary artery.

Intracoronary

Intracoronary means within a coronary artery or the coronary circulation, such as a catheter, stent, imaging study, or medicine delivery.

Intracranial

Inside the skull. The term may describe the brain, blood vessels, fluid, bleeding, pressure, infection, or a growth within the skull. Extra fluid, blood, or tissue can raise pressure and damage the brain, causing headache, vomiting, confusion, weakness, seizures, or loss of consciousness.

Intracranial Aneurysm

A weakened, bulging area in a blood vessel inside the skull, usually in an artery supplying the brain. Many cause no symptoms, but a leak or rupture can cause bleeding around the brain and a sudden, severe headache.

Intracranial Hemorrhage

Bleeding inside the skull, either within the brain or around it. It may follow injury, high blood pressure, a ruptured aneurysm, or medicines that prevent clotting and can rapidly cause brain pressure, disability,

or death.

Intracranial Hypertension

Higher than normal pressure inside the skull. Causes include brain swelling, bleeding, a tumor or other growth, or too much fluid around the brain. It can cause headache, vomiting, vision problems, sleepiness, or serious brain injury.

Alternate Names:
Raised Intracranial Pressure; Increased Intracranial Pressure

Intracranial Pressure

The pressure inside the skull produced by the brain, blood, and surrounding fluid. Too much pressure can reduce blood flow to the brain and cause headache, vomiting, confusion, unequal pupils, seizures, unconsciousness, or life-threatening brain injury.

Intracranial Pressure Monitoring

Continuous or intermittent measurement of pressure inside the skull, usually in critically ill patients with severe brain injury, hemorrhage, hydrocephalus, or other risk of intracranial hypertension.

Intracranial Venous Malformations

Abnormal collections or connections of veins within the skull that may bleed or affect nearby brain tissue.

Intractable

Difficult to control, relieve, or cure despite appropriate treatment, as in intractable pain or seizures.

Intracytoplasmic Sperm Injection

A fertility treatment in which a single sperm is injected directly into an egg in a laboratory to help achieve fertilisation.

Alternate Names:
ICSI

Intradermal

Located within the dermis, the layer of skin beneath the epidermis; an intradermal injection places medication or test material into that layer.

Intradermal Nevus

A common, benign melanocytic skin nevus characterized by nests of mature melanocytes located entirely within the dermis without junctional melanocytic proliferation, appearing as a soft, dome-shaped, skin-colored, pedunculated or light brown papule.

Alternate Names:
Intradermal Melanocytic Nevus; Dermal Mole

Intradermal Skin Test

A small amount of a test substance is injected into the top layer of the skin. The area is then checked for a reaction. This method is used for tests such as tuberculin testing and some allergy tests.

Intraductal Carcinoma

A carcinoma involving ductal spaces; the term's meaning depends on the organ and does not always mean the cancer is confined in situ. In the breast, it commonly refers to ductal carcinoma in situ, which has not invaded surrounding tissue. Intraductal carcinoma of the prostate is a distinct, usually aggressive form of prostate cancer that spreads within ducts and glands.

Intraductal Papillary Mucinous Neoplasm

A cyst-forming growth in a pancreatic duct that produces mucus. Some types can progress to pancreatic cancer; evaluation and follow-up depend on imaging features and other risk factors.

Alternate Names:
IPMN; Pancreatic IPMN

Intraductal Papilloma

A benign growth of cells within a breast milk duct. A solitary papilloma near the nipple may cause spontaneous clear or bloody discharge; multiple papillomas or papillomas with atypical cells have different associations with breast cancer risk.

Alternate Names:
Ductal Papilloma; Solitary Intraductal Papilloma; Breast Papilloma

Intraduodenal

Intraduodenal means within the duodenum, the first part of the small intestine beyond the stomach.

Intraepidermal

Intraepidermal means within the epidermis, the outermost layer of skin.

Intraepithelial

Located within the layer of cells that covers a body surface or lines an organ. The word may describe infection, inflammation, or abnormal cell changes that have not yet grown through the supporting layer beneath them.

Intraesophageal

Intraesophageal means within the esophagus, such as a probe, pressure sensor, lesion, or medication delivery.

Intrahepatic

Within the liver. For example, intrahepatic bile-duct blockage or inflammation can cause jaundice and abnormal liver tests, while a tumor may begin in liver cells or in bile ducts inside the liver. The exact meaning depends on the condition being described.

Intrahepatic Cholangiocarcinoma

Cancer arising in bile ducts within the liver, also called intrahepatic bile-duct cancer. It is distinct from perihilar and distal cholangiocarcinoma and from hepatocellular carcinoma, which arises from liver cells.

Alternate Names:
Intrahepatic Bile Duct Cancer; iCCA

Intrahepatic Cholestasis

Reduced bile flow within the liver causing bile substances to build up in blood, often producing itching, jaundice, dark urine, or pale stools.

Intrahepatic Cholestasis Of Pregnancy

A pregnancy-related liver disorder causing intense itching, often on the palms and soles, without a primary rash. Bile acids rise in the blood and can increase fetal risk, so testing and obstetric monitoring are needed.

Intralesional

Delivered directly into a lesion, such as an injection of corticosteroid into a keloid or a medicine into a skin, joint, or tumor lesion. The drug, dose, sterility, and lesion type determine safety.

Intralymphatic

Intralymphatic means within a lymphatic vessel or channel, such as a medicine, tumor spread, infection, or imaging contrast.

Intramedullary

Intramedullary means within the medulla of an organ or the central canal of a bone, especially an implant placed inside a long bone.

Intramedullary Nail

A metal implant inserted into the medullary canal of a long bone to align and stabilize a fracture. It shares load along the bone axis and is commonly used for femoral and tibial shaft fractures.

Intramedullary Spinal Cord Abscesses

Localized collections of pus within the spinal cord, usually caused by infection and associated with severe neurologic deficits, fever, or spinal pain. MRI and urgent antimicrobial and surgical evaluation are typically required.

Intramural Hematoma

Bleeding into the wall of the digestive tract, often in the small intestine. It can follow injury or blood-thinning treatment and may cause abdominal pain, vomiting, or blockage.

Intramural Plaque

An intramural plaque is an atherosclerotic deposit within an artery wall that can narrow the lumen or destabilize and cause thrombosis.

Intramuscular

Within a muscle. An intramuscular injection deliv-

ers a medicine into muscle tissue, commonly in the upper arm, thigh, or hip, where it is absorbed into the bloodstream.

Intramuscular Injection

Delivery of a medicine into a muscle with a needle. The injection site and needle size depend on the medicine and the person's age and body size; pain, bleeding, infection, or nerve injury are possible.

Intramuscular Injection Technique

The method used to place medicine into muscle tissue with a needle and syringe. The site, needle, and injection method vary with the medicine and the person.

Intramuscular Myxoma

A rare, usually noncancerous tumor made of jelly-like tissue within a skeletal muscle. It often appears as a slow-growing painless lump, but imaging or biopsy may be needed to distinguish it from other masses.

Intraocular

Within the eyeball. The term may describe a medicine injection, lens, infection, bleeding, foreign body, pressure, or other finding inside the eye. Increased pressure inside the eye can damage the optic nerve and cause permanent loss of vision.

Intraocular Infection

An infection inside the eye, such as endophthalmitis, that can rapidly threaten vision.

Intraocular Lens

An artificial lens placed inside the eye, usually during cataract surgery, to focus light after the cloudy natural lens is removed. Lens choices can emphasize distance, near vision, or astigmatism correction. Possible complications include glare, clouding behind the lens, infection, or retinal problems.

Intraocular Lens Dislocation

Movement of an artificial lens away from its intended position after eye surgery. It may cause blurred or double vision, glare, or pain and can require repositioning or replacement by an eye specialist.

Intraocular Lens Implant

An artificial lens implanted inside the eye, usually during cataract surgery; see *Intraocular Lens*.

Intraocular Lens Implantation

The surgical insertion of an artificial synthetic lens inside the eye, typically following removal of a cloudy cataractous natural lens; see *Intraocular Lens Implant* and *Cataract Surgery*.

Intraocular Lymphoma

A lymphoma involving the eye, often the jelly-like vitreous or the retina. It may cause blurred vision, floaters, or inflammation and can occur with lymphoma in the brain or other parts of the body.

Intraocular Pressure

The pressure of fluid inside the eye. If it stays too high, it can damage the optic nerve and cause glaucoma, although glaucoma can sometimes occur even when the pressure is within the usual range.

Intraocular Tumor

A growth arising within the eye. It may be noncancerous or cancerous; examples include uveal melanoma in adults and retinoblastoma in children. It can affect vision or eye pressure.

Intraoperative

Occurring during a surgical operation, including monitoring, findings, complications, or treatment decisions made during the procedure.

Intraoperative Blood Transfusion

Blood or blood components given during surgery to replace major blood loss and maintain oxygen delivery. The decision depends on bleeding, symptoms, circulation, hemoglobin, and the person's medical condition.

Intraoperative Neuromonitoring

Electrical tests used during selected operations to

watch the function of the brain, spinal cord, nerves, or muscles. Signals can warn the surgical team about a possible change in nerve function, allowing them to reassess the procedure and protect nearby structures.

Intraoral

Located inside the mouth or performed through the mouth, such as an examination, scan, injection, or surgical procedure.

Intraosseous Access

Placement of a special needle into the inner part of a bone to give fluids, blood, or medicines when a vein cannot be reached quickly. It is temporary and can cause pain, leakage, infection, or bone injury.

Intraosseous Infusion

Giving fluids, blood, or medicine through a needle placed in the marrow space inside a bone. This route provides rapid access to the bloodstream when a vein cannot be reached quickly, especially in emergencies. The procedure can injure bone or nearby tissue or allow fluid to leak.

Alternate Names:
IO Access; Intraosseous Vascular Access

Intrapartum

The period during labor and childbirth, from the onset of regular uterine contractions leading to cervical dilation until delivery of the baby and placenta.

Intrapartum Fever

Fever during labor, which may result from infection, epidural analgesia, dehydration, or other causes and can affect the mother or fetus.

Intrapartum Stillbirth

Intrapartum stillbirth is fetal death occurring during labor after a live fetus was documented before labor, requiring obstetric investigation and support.

Intrapericardial

Located inside the pericardial sac, the thin membrane surrounding the heart. An intrapericardial mass or fluid collection may affect how the heart fills or beats.

Intraperitoneal

Intraperitoneal means within the peritoneal cavity or administered into it, including selected medicines, dialysis fluid, or procedures.

Intraperitonealroute

A route of treatment in which fluid or medicine is placed into the abdominal cavity. It is used for peritoneal dialysis and selected treatments and requires sterile technique to prevent infection.

Intraprostatic

Located within the prostate gland, describing a lesion, injection, infection, biopsy, procedure, or other finding centered inside prostate tissue.

Intrapulmonary

Located within lung tissue or occurring inside the lung's air spaces, blood vessels, or other structures. Intrapulmonary findings may represent normal anatomy, infection, fluid, bleeding, inflammation, or tumors.

Intrapulmonary Shunt

Blood flow through parts of the lungs that are not receiving enough air, so the blood cannot take up normal oxygen. It can occur with pneumonia, lung collapse, or severe lung injury and may cause low oxygen despite supplemental oxygen.

Intrasynovial

Intrasynovial means within the synovial lining or fluid-filled space of a joint or tendon sheath.

Intratendinous

Located within a tendon, describing a tear, calcium deposit, injection, degenerative change, or other abnormality affecting the tendon's substance.

Intratesticular

Located within testicular tissue. An intratesticular mass may be benign or malignant and is usually

evaluated with physical examination and scrotal ultrasound, interpreted in the clinical context.

Intrathecal

Intrathecal means within the fluid-filled space surrounding the brain and spinal cord; medicines may be given there by lumbar puncture.

Intrathecal Chemotherapy

Cancer medicine placed directly into the fluid surrounding the brain and spinal cord, usually through a lumbar puncture or implanted reservoir. It is used for selected leukemias, lymphomas, or cancer spread to this fluid; infection, bleeding, headache, and nervous-system toxicity are possible.

Intrathoracic

Intrathoracic means within the chest cavity, including the lungs, heart, mediastinum, vessels, and thoracic lymph nodes.

Intrathoracic Localized Obstruction

A blockage within the chest affecting an airway, esophagus, or major blood vessel. Tumors, inhaled objects, scarring, or abnormal vessels may cause breathing difficulty, swallowing problems, chest pain, or reduced blood flow and require targeted testing.

Intratracheal

Intratracheal means within the trachea, such as a tube, medicine, foreign body, lesion, or route of administration.

Intratympanic

Intratympanic means delivered through the eardrum into the middle ear, often for selected inner-ear disorders or local treatment.

Intrauterine

Located or occurring within the uterus, including a pregnancy, device, medicine, lesion, or procedure. The term describes location and requires additional information to explain the finding's purpose, cause, or risk.

Intrauterine Adhesions

Bands of scar tissue inside the uterus, often forming after a uterine procedure or infection. They may cause no symptoms or lead to light or absent periods, pelvic pain, difficulty becoming pregnant, or pregnancy loss. Symptomatic adhesions are sometimes called Asherman syndrome.

Alternate Names:
Intrauterine Synechiae

Intrauterine Contraceptive Device

Alternate name; see *Intrauterine Device*.

Intrauterine Device

A small device placed inside the uterus to prevent pregnancy for several years while remaining reversible. Copper devices work without hormones; hormonal devices release a progestogen and often reduce menstrual bleeding. Rare risks include expulsion, perforation during insertion, and infection soon after placement.

Intrauterine Device Insertion

The clinical placement of a small, T-shaped contraceptive device (copper or levonorgestrel-releasing) into the uterine cavity through the cervix; see *Intrauterine Device*.

Intrauterine Devices

Alternate plural; see *Intrauterine Device*.

Intrauterine Fetal Demise

Fetal death occurring inside the uterus after reaching biological or statutory viability; see *Stillbirth*.

Intrauterine Fetal Demise / Stillbirth

Alternate wording; see *Fetal Death* and *Stillbirth*.

Intrauterine Growth Restriction

Older term; see *Fetal Growth Restriction*.

Intrauterine Insemination

A fertility procedure in which prepared sperm is placed directly into the uterus around ovulation. It is used for selected infertility causes and usually

depends on at least one open fallopian tube; risks include cramps, infection, and multiple pregnancy.

Intrauterine Infection

Bacterial or viral infection within the gestational cavity involving the amniotic fluid, placenta, or fetal membranes; see *Chorioamnionitis*.

Intrauterine Pressure Catheter

A thin tube placed inside the uterus during labor to measure contraction strength and timing more directly. It is used in selected situations when external monitoring does not provide enough information and can cause infection or injury.

Intrauterine System

A small T-shaped contraceptive device placed inside the uterus that slowly releases a progestogen hormone to prevent pregnancy.

Alternate Names:
IUS

Intrauterine Transfusion

A specialist procedure that gives compatible red blood cells to a fetus through the umbilical cord or, less often, the fetal abdomen. It treats severe fetal anemia and carries risks such as bleeding, infection, early labor, or fetal loss.

Intravascular

Intravascular means within a blood vessel, including a catheter, clot, injection, or process occurring in the circulation.

Intravascular Catheter Infections

Infections caused by microorganisms entering or growing on a catheter placed inside a blood vessel. They may produce fever, chills, low blood pressure, or bloodstream infection. Diagnosis uses examination and blood cultures, and treatment may require antibiotics and catheter removal.

Intravascular Echocardiography

Alternate name; see *Intravascular Ultrasound*.

Intravascular Filter

A small device placed in a large vein to catch clots traveling from the legs toward the lungs. It is used selectively when blood-thinning treatment cannot be given or has not worked adequately.

Intravascular Hemolysis

Destruction of red blood cells within the bloodstream, releasing hemoglobin into plasma; causes include immune hemolysis, mechanical trauma, infections, toxins, and transfusion reactions.

Intravascular Lymphoma

A rare, fast-growing blood cancer in which abnormal white blood cells collect inside small blood vessels. It may affect the skin, brain, or other organs, causing fever, skin changes, or neurologic problems.

Intravascular Ultrasound

An ultrasound test done from inside a blood vessel. A tiny ultrasound device on a catheter creates pictures of the vessel wall and any narrowing or fatty plaque, helping guide some treatments.

Alternate Names:
IVUS

Intravenous

Into or within a vein; intravenous medicines, fluids, or blood products are delivered directly into the bloodstream.

Intravenous Anesthesia

General anesthesia started or maintained with medicines given through a vein. It acts quickly; dose adjustment and continuous monitoring of breathing, blood pressure, heart rhythm, and recovery are part of its delivery.

Intravenous Catheters

Flexible devices inserted into a vein to deliver fluids, medicines, blood products, nutrition, or contrast, or to obtain blood samples; complications include infection, thrombosis, infiltration, and extravasation.

Intravenous Drip

Delivery of fluid, blood products, nutrients, or medicine directly into a vein through a catheter. The amount and speed are prescribed and monitored for reactions, fluid overload, infection, or vein irritation.

Alternate Names:
Intravenous Infusion

Intravenous Immunoglobulin

A purified preparation of pooled antibodies given through a vein (IVIg) for selected immune deficiencies, autoimmune diseases, inflammatory disorders, and some neurologic conditions.

Intravenous Leiomyomatosis

Extension of benign uterine smooth-muscle tumor into venous channels, sometimes reaching the inferior vena cava or right heart. Imaging is important because extensive disease can cause serious cardiovascular complications.

Intravenous Lipid Emulsion Therapy

Emergency treatment using a fat-containing fluid through a vein for selected severe poisonings, especially local-anesthetic toxicity that does not respond to initial treatment. It requires intensive monitoring; its exact mechanism is not fully understood.

Intravenous Pyelogram

An X-ray examination of the kidneys, ureters, and bladder after iodine-containing contrast is injected into a vein and passed into the urine. CT urography or ultrasound often provides this information today.

Intravenous Pyelography

Alternate name; see *Intravenous Pyelogram*.

Intravenous Sedation

Administration of sedative medicines through a vein to reduce anxiety, discomfort, or awareness during a procedure while maintaining appropriate monitoring and readiness to support breathing.

Intravenous Thrombolysis

Administration of a clot-dissolving medicine through a vein to restore blood flow in selected acute vascular conditions; see *Thrombolysis*.

Intraventricular Hemorrhage

Bleeding into the fluid-filled spaces inside the brain, especially in very premature newborns. The blood can block fluid flow and cause brain injury; ultrasound is used to detect and monitor it.

Intraventricular Hemorrhage Of The Newborn

Intraventricular hemorrhage in a newborn is bleeding into the brain's ventricular system, most often in premature infants, and can cause hydrocephalus or neurologic injury.

Intravesical Therapy

Treatment delivered directly into the bladder through a catheter. It is used for conditions such as some bladder cancers or interstitial cystitis and may cause bladder irritation or, less commonly, effects elsewhere in the body.

Intravitreal Injection

An eye procedure in which medicine is injected into the jelly-like center of the eye to treat retinal or macular disease. Temporary discomfort or floaters may occur; infection, bleeding, retinal detachment, and raised eye pressure are uncommon but serious risks.

Intrinsic

Belonging naturally to a structure or process and arising from within it, rather than being externally imposed.

Intrinsic Factor

A protein secreted by stomach parietal cells that is required for vitamin B12 absorption in the terminal ileum.

Intrinsic Pathway of Coagulation

One of the linked pathways that activates blood-

clotting proteins and helps form a clot. It involves clotting factors that activate factor X; the activated partial thromboplastin time (aPTT) is a laboratory test that assesses this pathway along with other parts of clotting.

Intrinsic Renal AKI

Sudden loss of kidney function caused by damage within the kidney itself. Causes include injury from medicines or toxins, inflammation, infection, poor blood supply, or immune disease.

Intrinsic Sphincter Deficiency

Weakness of the urinary sphincter that causes stress urinary incontinence.

Alternate Names:
ISD

Intrinsic Sympathomimetic Activity

The pharmacological property of certain beta-adrenergic receptor antagonist drugs (such as acebutolol and pindolol) that act as partial agonists, stimulating beta-receptors to a mild degree while simultaneously blocking endogenous catecholamines, resulting in less resting bradycardia.

Alternate Names:
ISA

Introducer Sheath

A short hollow tube placed in a blood vessel to provide access for catheters and other devices during an intravascular procedure.

Introitus

An entrance or opening, especially the entrance to the vagina.

Intron

A non-coding segment of a gene that is transcribed into RNA but spliced out before the messenger RNA is translated into a protein.

Intrusive Thought

An unwanted, distressing thought, image, or impulse that enters awareness repeatedly; it does not necessarily reflect intent or desire.

Intrusive Thoughts

Unwanted, involuntary, and distressing thoughts, images, or urges that suddenly enter consciousness; see *Intrusive Thought*.

Intubate

To place a tube into a body passage, especially an endotracheal tube through the mouth or nose into the trachea to maintain an airway or support ventilation.

Intubation

Placement of a tube into the airway or another body passage to maintain it or deliver treatment.

Intussusception

A serious medical condition in which one segment of the intestine slides or telescopes inside an adjacent segment, much like a folding collapsible telescope. This blocks food and fluid from passing through and pinches off the blood supply to the affected part of the bowel. It is the most common cause of intestinal blockage in infants and young children, classically causing sudden episodes of intense, cramping abdominal pain (where the child pulls their knees to the chest), vomiting, and reddish, jelly-like stools containing mucus and blood.

Alternate Names:
Intestinal Telescoping; Invagination of the Bowel

Inulin

Inulin is a plant fructan used as a dietary fiber and in tests of glomerular filtration because it is freely filtered and minimally handled by the kidney.

In Utero

Within the uterus before birth. The term describes a developing fetus or an event that occurs during pregnancy.

Invasive

Able to enter and spread through tissues; the term may describe an infection, tumor, procedure, or

disease that penetrates nearby structures.

Invasive Candidiasis

A serious Candida infection involving the bloodstream or deep organs, most often in people who are critically ill or have weakened immunity. It may cause persistent fever or signs of organ dysfunction.

Invasive Carcinoma Of No Special Type

The most common type of invasive breast cancer. The cancer cells have grown into surrounding breast tissue, and "no special type" means they lack features that define a more specific subtype.

Alternate Names:
Invasive Ductal Carcinoma; Invasive Ductal Carcinoma, NOS; IDC

Invasive Ductal Carcinoma

Alternate name; see *Invasive Carcinoma Of No Special Type*.

Invasive Lobular Carcinoma

A breast cancer that begins in the milk-producing lobules and invades surrounding breast tissue. Its cells often grow in single-file patterns, which may make the cancer difficult to detect as a distinct lump.

Invasive Mechanical Ventilation

Breathing support delivered through a tube placed in the trachea. A ventilator moves air and oxygen into the lungs and removes carbon dioxide when a person cannot breathe adequately without support.

Invasive Mole

A hydatidiform mole that invades the uterine myometrium or vascular spaces; it is a form of gestational trophoblastic neoplasia and may persist or metastasize.

Invasive Procedure

A medical examination, test, or treatment that enters the body by piercing the skin or inserting an instrument, tube, needle, or camera into internal tissues or organs. Examples range from needle biopsies and endoscopy to open surgery. Possible risks include bleeding, infection, pain, tissue damage, and anesthesia complications.

Alternate Names:
Invasive Medical Procedure; Invasive Intervention

Inverse Agonist

A medicine that binds to a receptor and reduces its natural baseline activity, producing an effect opposite to that of an agonist. Its clinical effect depends on the receptor and the tissues where it is present.

Inverse Psoriasis

A morphological variant of plaque psoriasis that preferentially involves intertriginous and flexural anatomical regions (axillae, inframammary folds, inguinal creases, and intergluteal cleft), appearing as well-demarcated, smooth, glistening erythematous plaques without typical silvery scales due to maceration.

Alternate Names:
Flexural Psoriasis; Intertriginous Psoriasis

Inversion

A chromosome segment that has broken off and rejoined in the reverse direction. It often causes no health problem, but can affect health if the break disrupts a gene or interferes with reproduction.

Invert

To turn upside down, reverse, or turn inward; in anatomy, inversion can describe movement of the sole of the foot toward the midline.

Inverted Nipple

Alternate name; see *Nipple Inversion Or Retraction*.

Inverted Papilloma

A usually benign but locally destructive tumor arising most often in the nasal cavity or sinuses; it can recur and rarely become cancerous.

Invert Sugar

A mixture of glucose and fructose produced by

splitting sucrose, used as a sweetener in foods and medicines. It has nutritional effects similar to other added sugars and contributes to total carbohydrate and energy intake.

Investigational

Being studied in clinical research and not yet established as safe and effective for a particular use. Investigational medicines and devices require appropriate oversight, informed consent, and clear communication of uncertainty.

Inveterate

Long-standing, deeply established, or difficult to change, often describing a habit, condition, or behavior. The word indicates persistence but does not identify the cause, severity, treatment, or expected outcome.

In Vitro

In vitro means performed outside a living organism, such as in a test tube, culture dish, or laboratory system.

In Vitro Fertilisation

British spelling; see *In Vitro Fertilization*.

In Vitro Fertilization

A fertility treatment in which eggs are collected from the ovaries, fertilized with sperm in a laboratory, and an embryo is transferred to the uterus.

In Vivo

Taking place or being studied inside a living person, animal, or other organism. For example, an in vivo test examines how a medicine works in the body rather than only in a laboratory dish.

In-Vivo

Alternate spelling; see *In Vivo*.

Involucrum

An involucrum is a sheath of new bone that forms around dead bone, classically in chronic osteomyelitis.

Involuntary

Occurring without conscious control or deliberate choice, such as a reflex, autonomic function, or involuntary muscle movement.

Involuntary Movement

A non-volitional, spontaneous, purposeless motor activity resulting from functional disruption or neurodegenerative degeneration within the extrapyramidal motor system, basal ganglia (striatum, subthalamic nucleus, globus pallidus, substantia nigra), or cerebellar circuits. Classified into hyperkinetic movement disorders: tremor (rhythmic, oscillatory movement categorized into resting [Parkinson disease], action/postural [essential tremor], or intention [cerebellar]); chorea (rapid, non-stereotyped, dance-like jerky movements, as in Huntington disease and Sydenham chorea); athetosis (slow, writhing, twisting distal limb movements); hemiballismus (violent, large-amplitude flinging limb movements secondary to contralateral subthalamic nucleus stroke); dystonia (sustained muscle contractions resulting in twisting, repetitive posturing, such as torticollis or blepharospasm); myoclonus (sudden, brief, shock-like muscle jerks); and tics (repetitive, semi-voluntary, stereotyped movements or vocalizations preceded by a premonitory urge, hallmark of Tourette syndrome). Diagnostic evaluation incorporates electromyography, neuroimaging (MRI), genetic testing, and screening for metabolic or drug-induced etiologies (e.g., tardive dyskinesia from dopamine receptor antagonists).

Alternate Names:
Hyperkinetic Movement Disorders; Involuntary Motor Activity; Dyskinetic Movements

Involuntary Movements

Plural form; see *Involuntary Movement*.

Alternate Names:
Hyperkinetic Movement Disorders; Involuntary Motor Activity; Dyskinetic Movements

Involuntary Muscle

Muscle that contracts without conscious control, including smooth muscle in internal organs and cardiac muscle in the heart.

Involuntary Psychiatric Treatment

Assessment, hospitalization, or treatment without the patient's consent under applicable law when serious mental disorder creates a substantial risk of harm or severe inability to meet basic needs. The least restrictive alternative, due process, and ongoing reassessment are required.

Involute

To shrink, return toward a former size, or undergo involution; in anatomy, an involute structure may be tightly coiled or rolled inward.

Involution

The normal return of the uterus to its smaller, prepregnancy size after childbirth. This occurs gradually over several weeks as the uterine muscle contracts and the placental attachment heals.

Iodamoeba Butschlii

A usually non-disease-causing intestinal amoeba spread by swallowing cysts in contaminated food or water. Finding it in stool suggests fecal exposure but usually does not require treatment unless another infection is present.

Iodide

A form of the essential mineral iodine that carries a negative electrical charge, commonly found in iodized table salt, seafood, and dairy products. The thyroid gland absorbs iodide from the bloodstream and uses it as an indispensable raw material to produce thyroid hormones, which regulate the body's metabolism, growth, and development.

Iodide-Associated Sialadenitis

Swelling and inflammation of a salivary gland after exposure to a large amount of iodide, sometimes from a medicine or imaging contrast. It can cause painful swelling and dry mouth and usually improves when the cause is addressed.

Iodides

Plural form; see *Iodide*.

Iodinated Contrast Media

Iodine-containing substances injected for CT scans, angiography, X-rays, or fluoroscopy to make vessels and organs easier to see. They can cause allergic-like reactions, leakage into tissue, thyroid changes, or kidney injury in susceptible people.

Iodine

An essential mineral used to make thyroid hormones, which regulate growth, brain development, and metabolism. Too little iodine can cause thyroid enlargement and hormone deficiency, especially harmful during pregnancy and childhood; too much can also disturb thyroid function. Main sources include iodized salt, seafood, dairy, and some supplements.

Iodine-123

A radioactive form of iodine used mainly to create images of the thyroid. It gives off a type of radiation detected by a camera and generally exposes the body to less radiation than iodine-131.

Iodine-131

A radioactive form of iodine used mainly to diagnose or treat selected thyroid disorders. Thyroid cells absorb it, allowing targeted radiation, but exposure can affect other tissues and requires safety precautions.

Iodine Deficiency

Too little iodine in the diet. Because iodine is needed to make thyroid hormones, deficiency can cause thyroid enlargement and low thyroid function. Severe deficiency during pregnancy or childhood can impair growth and brain development.

Iodine Perfusion

The distribution of iodine-containing contrast through tissues or blood vessels, measured during imaging such as computed tomography or angiography. Contrast can rarely cause allergic reactions and may affect kidney or thyroid function.

Iodine Poisoning

Iodine poisoning follows excessive iodine exposure

and can irritate the gastrointestinal tract, disrupt thyroid function, and cause systemic toxicity depending on dose and formulation.

Iododerma

A skin eruption caused by excess iodine, often appearing as acne-like bumps or pus-filled spots on the face, arms, or legs. It usually improves after the iodine source is stopped under medical guidance.

Iodoform

A yellow iodine-containing compound formerly used as an antiseptic and in some wound or dental preparations. It can irritate tissue and cause toxicity if absorbed or swallowed and is now used only in selected contexts.

Iohexol

A water-soluble iodine-containing contrast medicine used during CT scans, angiography, and other imaging studies to make vessels and organs easier to see.

Ion

An atom or molecule that has gained or lost one or more electrons, giving it a positive or negative electrical charge. In the human body, dissolved ions—such as sodium, potassium, calcium, and chloride—are called electrolytes. They conduct tiny electrical currents across cell membranes that allow nerves to fire, muscles to contract, and cells to maintain proper water and chemical balance.

Ion Channel

A protein pore in a cell membrane that allows selected electrically charged particles, such as sodium, potassium, calcium, or chloride, to cross. Ion channels are important for nerve signals, muscle contraction, and secretion.

Ionization

The formation of charged particles by gaining or losing electrons or protons. A medicine's degree of ionization affects its solubility, membrane passage, absorption, distribution, and urinary excretion.

Ionized Calcium Test

A clinical laboratory assay measuring free (unbound), physiologically active calcium ions in serum or whole blood. It provides an accurate assessment of calcium homeostasis independent of serum albumin concentrations, particularly in critical illness, acid-base disorders, and parathyroid pathology.

Alternate Names:
Ionized Calcium; Free Calcium Test; Serum Free Calcium

Ionizing Radiation

Radiation with enough energy to remove electrons from atoms and create ions, including X-rays, gamma rays, and certain particulate emissions. It can cause deterministic tissue effects at sufficient doses and stochastic cancer risk at lower doses.

Ionophore

A molecule that transports ions across a lipid membrane. Ionophores have research, antimicrobial, and veterinary uses; some can disrupt human cellular ion balance and are toxic.

Ions

Plural form; see *Ion*.

Iontophoresis

Use of a mild electrical current to drive an ionized medicine through the skin or alter sweat-gland activity. It is used in selected dermatologic and rehabilitation settings; skin irritation and burns can occur.

Ion Transport

Movement of charged particles across a cell membrane through channels, carriers, or pumps. It maintains membrane potentials, nerve signaling, muscle contraction, fluid balance, and epithelial transport.

Iopamidol

A nonionic iodine-containing contrast medicine used to improve CT, angiography, and other medical images. It can cause warmth, nausea, allergy, kidney problems, or thyroid effects, so risks require assess-

ment beforehand.

Iothalamate Clearance

A specialized test of kidney filtration that measures how quickly injected iothalamate is removed from the blood, sometimes using timed urine samples. It is used when a more direct estimate of kidney function is needed.

Ioxaglic Acid

An older iodinated contrast medium used for radiographic imaging, including selected angiographic and urinary-tract studies. It has largely been superseded by newer agents, but its history is relevant when assessing prior contrast reactions.

IPC

Alternate name; see *Indwelling Pleural Catheter*.

Ipecac

A vomiting medicine formerly used after poisoning. Its use has largely been abandoned because vomiting can cause aspiration and delay more appropriate poisoning treatment.

Ipilimumab

An immunotherapy antibody that blocks CTLA-4, removing a brake on T cells so they can attack cancer. It can cause immune inflammation in the bowel, skin, liver, lungs, hormone glands, or other organs.

IPMN

Abbreviation; see *Intraductal Papillary Mucinous Neoplasm*.

Ipratropium

Ipratropium is an inhaled short-acting muscarinic antagonist that reduces vagally mediated bronchoconstriction and nasal secretion; it is used in COPD and acute asthma with bronchodilators.

Ipratropium Bromide

An inhaled medicine that relaxes narrowed airways and reduces mucus production. It is used mainly for chronic obstructive pulmonary disease and, with other medicines, for severe asthma attacks. Dry mouth and blurred vision can occur.

Iproniazid

Iproniazid is an older monoamine oxidase inhibitor antidepressant that is no longer commonly used because of serious liver toxicity and drug interactions.

Ipsilateral

On or affecting the same side of the body as a stated structure or injury. For example, weakness in the right arm and right leg is ipsilateral to a finding on the right side of the body; the opposite term is contralateral.

IQ Testing

Standardized testing that estimates intellectual functioning by comparing performance on tasks such as reasoning, memory, language, and visual-spatial problem-solving with that of people of the same age. The score is one measure of ability and can be affected by language, education, sensory or motor limits, and the person's developmental stage.

Irbesartan

Irbesartan is an angiotensin-II receptor blocker used for hypertension and diabetic kidney disease; it can cause hyperkalaemia, hypotension, and renal-function changes and is contraindicated in pregnancy.

Iridium

Iridium is a dense metal whose radioactive isotopes, especially iridium-192, are used in industrial testing and some medical brachytherapy.

Iridocyclitis

Inflammation of both the iris and ciliary body, the structures at the front of the eye. It is a form of anterior uveitis and may cause pain, redness, light sensitivity, or blurred vision.

Iridodialysis

A traumatic or surgical separation or avulsion of

the iris root from its anatomical attachment to the ciliary body, producing a characteristic D-shaped eccentric pupil, monocular diplopia, photophobia, and an anterior chamber hyphema.

Iridodonesis

Shaking or trembling of the iris when the eye moves, often because the lens is absent or its supporting fibers are weak. An eye examination can identify the cause and related lens or eye problems.

Iridoschisis

A rare splitting of the iris tissue into layers, usually in older adults. It may be associated with glaucoma or corneal problems and is evaluated in relation to these conditions.

Iridotomy

A laser or surgical procedure that makes a small opening in the iris, allowing aqueous humor to pass between the posterior and anterior chambers and relieving pupillary block. It is used to treat or prevent selected forms of angle-closure glaucoma.

Irinotecan

A chemotherapy medicine that inhibits topoisomerase I and is used for colorectal and several other cancers.

Irinotecan Hydrochloride

A chemotherapy medicine that blocks topoisomerase I and damages cancer-cell DNA, used for selected cancers with diarrhea and low blood counts possible.

Iris

The colored, muscular ring between the cornea and lens that controls the size of the pupil and therefore the amount of light entering the eye. Its muscles constrict the pupil in bright light and enlarge it in dim light.

Iris Atrophy

Thinning or loss of iris tissue resulting from trauma, chronic inflammation, ischaemia, or neurodegenerative disease, leading to a translucent or patched iris appearance. It may be sectoral or diffuse and can be associated with decreased pupillary response, photophobia, or secondary glaucoma.

Iris Cyst

An iris cyst is a fluid-filled lesion on or within the iris, usually benign but sometimes affecting vision, pressure, or the appearance of the eye.

Iris Disease

A disorder of the colored part of the eye, including inflammation, injury, infection, developmental abnormalities, or tumors.

Iris Leiomyoma

A rare benign smooth-muscle tumor of the iris that may appear as a pigmented or nonpigmented mass. It can distort the pupil, impair vision, or resemble melanoma, so ophthalmic examination and imaging are needed.

Iris Melanoma

Iris melanoma is a malignant tumor of pigment cells in the iris and may appear as a growing pigmented lesion, pupil distortion, or glaucoma.

Iris Neoplasm

An iris neoplasm is an abnormal growth arising in the colored part of the eye; it may be benign or malignant and can affect vision or eye pressure.

Iris Prolapse

Protrusion of iris tissue through a corneal or scleral wound, most often after penetrating eye trauma or surgery. It may compromise the globe and is managed with urgent ophthalmic repair.

Iritis

Inflammation of the iris, the colored part of the eye. It is a form of anterior uveitis and may cause eye pain, redness, light sensitivity, or blurred vision.

Alternate Names:
Anterior Uveitis; Iridocyclitis

Iron

A mineral needed to make hemoglobin, the protein that carries oxygen in red blood cells, and to support muscles and cellular energy. Low iron may result from blood loss, poor intake, increased needs, or poor absorption.

Iron Deficiency

A shortage of iron needed to make hemoglobin and support normal cell function. It may result from blood loss, low intake, increased needs, or poor absorption and can cause tiredness, pale skin, shortness of breath, brittle nails, or unusual cravings.

Iron-Deficiency Anaemia

Alternate spelling; see *Iron Deficiency Anemia*.

Iron-Deficiency Anaemia In Adolescents

Iron-deficiency anaemia during adolescence, commonly related to rapid growth, inadequate dietary iron, or menstrual blood loss. Evaluation identifies contributing causes and informs dietary and medical treatment.

Iron Deficiency Anemia

The most common type of anemia, occurring when the body lacks sufficient iron to produce hemoglobin, the protein in red blood cells that carries oxygen to tissues. Without enough iron, red blood cells become abnormally small and pale, and cannot deliver adequate oxygen throughout the body. Common causes include chronic blood loss (such as heavy menstrual periods or slow bleeding in the digestive tract), poor dietary iron intake, or poor iron absorption, leading to fatigue, pale skin, weakness, dizziness, and cold hands and feet.

Alternate Names:
IDA

Iron-Deficiency Anemia

Alternate spelling; see *Iron Deficiency Anemia*.

Iron-Deficiency Anemia in Children

Iron-deficiency anemia in a child caused by too little iron, increased needs during growth, blood loss, or poor absorption. It reduces hemoglobin production and may cause pale skin, tiredness, irritability, poor concentration, or delayed development when severe or long-lasting.

Iron-Deficiency Anemia in Young Children

Iron-deficiency anemia in an infant or toddler caused by too little iron, rapid growth, excessive cow's milk intake, blood loss, or poor absorption. It may cause pale skin, tiredness, irritability, poor appetite, or developmental problems when severe or long-lasting.

Iron Overdose

Poisoning after taking too much iron, especially from supplements. It can cause vomiting, abdominal pain, internal bleeding, severe acid imbalance, shock, liver failure, and death.

Iron Overload

Excess iron stored in the body, which can damage the liver, heart, pancreas, joints, or endocrine organs.

Iron Overload Anemia

Anemia associated with excess iron accumulation, often in disorders such as sideroblastic anemia or repeated transfusion; see *Iron Overload* and *Sideroblastic Anemia*.

Iron Studies

A group of blood tests used to assess iron availability and storage, commonly including serum iron, ferritin, transferrin or total iron-binding capacity, and transferrin saturation. Results help distinguish iron deficiency, inflammation-related changes, and iron overload.

Iron Toxicity

Poisoning from too much iron, often after swallowing iron tablets. Early effects can include vomiting, abdominal pain, and intestinal bleeding; severe poisoning can lead to shock, liver failure, or coma.

Irradiated Foods

Irradiated foods are exposed to controlled ionizing radiation to reduce pathogens, insects, or spoilage; the process does not make food radioactive.

Irradiation

Exposure to or treatment with radiation; irradiation may be used diagnostically or therapeutically, or may cause tissue injury depending on dose and type.

Irradiation Fibrosis

Late-stage irreversible soft-tissue, pulmonary, or visceral scarring, collagen deposition, and microvascular obliterative endarteritis resulting from ionizing therapeutic radiation injury, mediated by sustained transforming growth factor-beta (TGF-beta) activation.

Irregular

Not following the usual pattern, rhythm, shape, timing, or order. In medicine, it may describe an uneven heartbeat, an unpredictable menstrual cycle, an unusual skin edge, or a result that does not match the expected pattern.

Irregular Menstrual Periods

Alternate name; see *Irregular Menstruation*.

Irregular Menstruation

Menstrual bleeding that is unusually early, late, frequent, infrequent, prolonged, heavy, or unpredictable for the person's age and reproductive context. Causes include pregnancy, ovulatory disorders, endocrine disease, medicines, structural lesions, and perimenopause.

Irregular Respiration

An abnormal breathing pattern in rate, depth, rhythm, or pauses. It may occur with sleep disorders, metabolic disturbance, lung disease, drug effects, or neurologic injury and may be accompanied by cyanosis or reduced consciousness.

Irregular Sleep-Wake Syndrome

A sleep disorder in which sleep and wakefulness occur in several poorly timed periods throughout the day and night instead of one regular nighttime sleep. It is more common with brain disease, dementia, aging, or limited exposure to daylight and daily routines.

Irreversible Cell Injury

Damage so severe that a cell cannot recover and eventually dies. It may follow prolonged lack of oxygen, poisoning, infection, heat, or other injury and can lead to loss of function in the affected tissue.

Irrigate

To wash or flush a body part, wound, cavity, or medical device with a fluid to remove debris, contaminants, or secretions.

Irrigation

Flushing a wound, body cavity, or organ with fluid to remove blood, debris, microorganisms, or unwanted material.

Irrigation Solution

A sterile or appropriately prepared liquid used to wash a wound, body cavity, organ, or surgical field. Solutions vary by tissue and procedure; contamination, pressure injury, electrolyte shifts, or chemical irritation can cause harm.

Irritability

An increased tendency to become annoyed, impatient, angry, or easily upset. It may occur with stress, sleep loss, pain, mood disorders, substance use, medicines, infection, or other medical conditions.

Irritable Bowel Syndrome

A disorder of gut–brain interaction that causes repeated abdominal pain and changes in bowel movements, such as diarrhea, constipation, or both. Pain is often related to passing stool and may occur with bloating or a feeling that the bowel has not emptied completely. IBS may be mainly constipation (IBS-C), mainly diarrhea (IBS-D), or a mixture of both (IBS-M). The gut may be unusually sensitive or its muscles may move food too quickly or too

slowly. Unlike inflammatory bowel disease, IBS does not cause visible damage or disease in the digestive tract.

Alternate Names:
IBS

Irritable Bowel Syndrome Diet

An eating plan adapted to reduce symptoms of irritable bowel syndrome while maintaining adequate nutrition. It may include a short trial of reducing fermentable carbohydrates followed by gradual food reintroduction.

Irritable Bowel Syndrome (IBS)

Alternate name; see *Irritable Bowel Syndrome*.

Irritable Mood

A mood marked by increased sensitivity, impatience, anger, or a tendency to become upset easily.

Irritant Contact Dermatitis

Inflammation of the skin caused by direct chemical or physical injury rather than an immune-mediated allergy. It commonly produces redness, burning, scaling, fissures, or pain at the area of exposure.

Irritant Contact Vaginitis

Vaginal or vulvar irritation caused by direct contact with an irritating substance, such as soap, douches, creams, or lubricants. It is not an infection or an allergy and may cause burning, soreness, redness, or swelling.

Irritants

Substances that inflame or damage tissues and cause symptoms without necessarily triggering a true immune allergy. Examples include smoke, chemicals, soaps, fumes, and pollutants affecting skin, eyes, airways, or digestion.

Irritation

A local unpleasant or inflammatory response to mechanical, chemical, thermal, infectious, or allergic stimuli. It may cause redness, itching, burning, pain, cough, or tearing depending on the tissue involved.

Isaacs Syndrome

A rare peripheral nerve hyperexcitability disorder causing continuous muscle-fibre activity, stiffness, cramps, fasciculations, myokymia, and delayed muscle relaxation. It may be autoimmune, paraneoplastic, or associated with inherited or acquired peripheral-nerve disorders.

Isavuconazole

An antifungal medicine used for selected serious infections, including invasive aspergillosis and mucormycosis. It blocks production of a substance fungi need for their cell membranes and can cause liver problems or medicine interactions.

Isazophos

Isazophos is an organophosphate pesticide that can inhibit acetylcholinesterase and cause cholinergic toxicity after exposure.

Ischaemia

Inadequate blood flow and oxygen delivery to a tissue, usually because of narrowed or blocked blood vessels, causing dysfunction or injury.

Ischaemic Heart Disease

Heart disease caused by reduced blood supply to the heart muscle, usually as a result of coronary artery disease; it may cause angina or myocardial infarction.

Ischemia

Reduced blood flow causing too little oxygen for a tissue's needs. It can cause pain, impaired function, permanent injury, or tissue death and may affect the heart, brain, limbs, or bowel.

Ischemia-Reperfusion Injury

Damage that can occur when blood flow returns to tissue that has been deprived of oxygen. The returning blood can trigger inflammation and cell injury, affecting the heart, brain, limbs, or transplanted organs.

Ischemic Bone Necrosis

Alternate name; see *Avascular Necrosis*.

Ischemic Cardiomyopathy

Weakening of the heart muscle caused by long-term reduced blood flow or previous heart attacks from coronary artery disease. Scarring can reduce pumping ability and increase the risk of heart failure and dangerous rhythms.

Ischemic Cascade

The chain of cell changes that occurs when tissue receives too little blood and oxygen. Cells lose energy, their normal balance of salts and water breaks down, and they may swell, become damaged, and die if blood flow is not restored.

Ischemic Chest Pain

Chest pain or discomfort caused by inadequate blood flow and oxygen to the heart muscle; also called angina. It may occur with narrowed coronary arteries, coronary artery spasm, or disease of the small coronary vessels. Symptoms may occur during exertion or at rest, and some people experience breathlessness or other discomfort instead of pain.

Ischemic Cholangiopathy

Damage to the bile ducts caused by inadequate blood flow, usually through the hepatic artery. It can cause bile-duct injury, bile blockage, repeated cholangitis, or narrowing of several bile ducts. It is especially important after liver transplantation or injury to the hepatic artery.

Ischemic Colitis

Inflammation and injury of the colon caused by reduced blood flow. It often causes sudden abdominal pain, bloody diarrhea, or rectal bleeding and commonly affects areas such as the splenic flexure.

Alternate Names:
Colon Ischemia; Ischemic Bowel Disease of the Colon

Ischemic Fasciitis

A noncancerous mass-like reaction in deep soft tissue caused by pressure and reduced blood flow, usually over a bony area in a person who is frail or has limited mobility. It can resemble a sarcoma on examination or imaging.

Ischemic Gangrene

Death of tissue after a prolonged severe loss of blood supply, most often in a toe, foot, finger, or leg. The tissue may become cold, numb, and black, with risk of infection.

Ischemic Heart Disease

Heart disease caused by inadequate blood flow through narrowed or blocked coronary arteries. It may cause chest pressure, breathlessness, heart attack, rhythm problems, heart failure, or sudden death.

Alternate Names:
Coronary artery disease; coronary heart disease

Ischemic Hepatitis

Widespread liver-cell injury caused by too little blood flow or oxygen. It commonly occurs with severe heart failure, very low blood pressure, respiratory failure, or severe infection. Liver enzymes usually rise suddenly and greatly. Despite its name, it is mainly liver-cell injury rather than inflammation.

Ischemic Necrosis of Bone

Bone death caused by inadequate blood supply, also called osteonecrosis or avascular necrosis; see *Avascular Necrosis*.

Ischemic Optic Neuropathy

Damage to the optic nerve caused by reduced blood flow, often producing sudden, usually painless vision loss. It may be arteritic or non-arteritic; older adults may also have headache, jaw pain, or scalp tenderness.

Ischemic Preconditioning

An intrinsic cardioprotective phenomenon in which brief, sub-lethal episodes of myocardial ischemia and reperfusion render the myocardium resistant to subsequent prolonged, potentially lethal ischemic insult, significantly reducing ultimate infarct size.

Ischemic Priapism

Alternate name; see *Priapism*.

Ischemic Stroke

The most common type of stroke, accounting for the vast majority of cases. It occurs when a blood clot or fatty plaque blocks or severely narrows an artery supplying blood to the brain. Deprived of oxygen and vital nutrients, brain cells in the affected area begin to die within minutes. Common signs develop suddenly and include numbness or weakness on one side of the face or body, difficulty speaking or understanding speech, vision loss, confusion, and loss of balance.

Alternate Names:
Cerebral Infarction; Ischemic Cerebrovascular Accident (CVA)

Ischiorectal Abscess

A deep perianal suppurative infection occupying the ischioanal (ischiorectal) fossa between the anal sphincter complex and the obturator internus muscle, typically arising from an infected cryptoglandular anal gland and presenting with severe throbbing perianal pain, induration, and systemic fever requiring surgical incision and drainage.

Alternate Names:
Ischioanal Abscess; Deep Perianal Abscess

Ischium

The lower, back part of each hip bone. Its rounded lower area bears weight when sitting, and nearby parts provide attachment for the hamstring muscles and other pelvic structures.

Ishak Score

A scoring system used on a liver biopsy to describe inflammation and scarring, especially in chronic hepatitis. Higher scores generally indicate more extensive damage; interpretation also depends on other tests and the person's history.

Islet Cell

A cell in a pancreatic islet that helps control blood glucose; beta cells make insulin and alpha cells make glucagon.

Islet Cell Cancer

Alternate name; see *Pancreatic Neuroendocrine Tumors*.

Islets Of Langerhans

Small clusters of hormone-producing cells in the pancreas that release insulin, glucagon, and other hormones regulating blood sugar and metabolism.

Isoaminile

Isoaminile is an older sympathomimetic appetite suppressant that is no longer widely used because of cardiovascular and other adverse effects.

Isoantibodies

Antibodies made against antigens from another individual of the same species, such as antibodies involved in blood-group incompatibility.

Isoantigen

An antigen that differs between individuals of the same species and can trigger an immune response after exposure.

Isocarboxazid

Isocarboxazid is a monoamine oxidase inhibitor used for depression; it has important interactions with other medicines and tyramine-rich foods.

Isochromosomes

Abnormal chromosomes with two identical arms caused by division across the wrong axis of the centromere.

Isocitrate Dehydrogenase

An enzyme involved in how cells produce energy. Changes in the IDH1 or IDH2 genes can alter this enzyme and are found in some brain tumors, blood cancers, and other tumors, helping guide diagnosis and treatment.

Isocyanate

A reactive chemical group found in some industrial products; exposure can irritate the airways and cause occupational asthma or skin reactions.

Isoelectric Point

The acidity level at which a molecule, especially a protein, has no overall electrical charge. This property affects how the molecule dissolves and moves in laboratory tests.

Isoenzyme

One of several forms of an enzyme that catalyze the same chemical reaction but differ in structure, location, or regulation. Measuring selected isoenzymes can help identify the tissue affected by injury.

Isofenphos

A poisonous organophosphate insecticide. Exposure can cause sweating, excess saliva, vomiting, diarrhea, small pupils, muscle twitching, breathing difficulty, seizures, or weakness because it disrupts nerve signals.

Isoflurane

Isoflurane is an inhaled anesthetic used to maintain general anesthesia; it can lower blood pressure and depress breathing.

Isogeneic Graft

A transplant between genetically identical individuals, such as identical twins, so immune rejection risk is relatively low.

Isohemagglutinins

Naturally occurring IgM antibodies present in human serum directed against ABO blood group carbohydrate antigens that are absent on the individual's own red blood cells (anti-A in group B, anti-B in group A, and both in group O), responsible for acute ABO-incompatible hemolytic transfusion reactions.

Isokinetic Exercise

Exercise in which a machine keeps a joint moving at a set speed while the muscles provide resistance. It is used mainly to measure or build strength during rehabilitation.

Isolate

To separate a person, organism, tissue, or substance from others; infection-control isolation separates people who may transmit a pathogen.

Isolated Systolic Hypertension

Elevated systolic blood pressure with normal diastolic pressure, commonly related to arterial stiffness in older adults and associated with increased cardiovascular risk.

Isolation

Separating a person with a contagious infection from others to limit spread, using appropriate rooms, protective equipment, and infection-control procedures.

Isolation Precautions

Measures used with standard precautions to reduce transmission of infection. Additional precautions may be contact, droplet, or airborne, depending on the mode of spread.

Isoleucine

An essential amino acid obtained from food that helps build proteins, support energy production, maintain muscle, and repair body tissues.

Isoleucine 33 Amyloidosis

A rare hereditary transthyretin amyloidosis variant involving an isoleucine substitution at position 33; clinical features depend on whether nerve, heart, or other organs are affected.

Isomerase

An enzyme that rearranges atoms within a molecule to form an isomer. Isomerases participate in metabolism, and inherited defects in related pathways can cause metabolic disease.

Isometric

Describing muscle contraction that produces force without a meaningful change in muscle length or joint movement.

Isometropia

The condition in which both eyes have approximately equal refractive power, so neither eye has

substantially more near-sightedness, far-sightedness, or astigmatism than the other.

Isoniazid

Isoniazid is a first-line antituberculous drug that inhibits mycolic-acid synthesis in Mycobacterium tuberculosis; hepatotoxicity and peripheral neuropathy are important risks, and pyridoxine is often given.

Isoniazid Toxicity

Harm from excessive or unusual sensitivity to isoniazid, especially liver injury, nerve damage, or seizures. Treatment may include vitamin B6, supportive care, activated charcoal, and seizure control.

Isoprenaline

Alternate name; see *Isoproterenol*.

Isoprocarb

Isoprocarb is a carbamate insecticide that can cause cholinergic poisoning if swallowed or absorbed in a significant amount.

Isopropanol Alcohol Poisoning

Poisoning from isopropanol, often found in rubbing alcohol, causing intoxication, vomiting, abdominal pain, low blood pressure, and sometimes coma.

Isopropyl Alcohol

A volatile alcohol used as a disinfectant and solvent. Ingestion can cause rapid intoxication, vomiting, abdominal pain, hypotension, and coma; management is supportive and differs from treatment of methanol or ethylene-glycol poisoning.

Isoproterenol

A beta-adrenergic medicine that increases heart rate and cardiac output. It is used in selected settings, such as certain severe slow heart rhythms; its effects on the heart and blood vessels limit its use.

Isosorbide

Isosorbide is a nitrate medicine that relaxes blood vessels and is used mainly to prevent or relieve angina; headache and low blood pressure are common adverse effects.

Isosorbide Dinitrate

A nitrate medicine that widens blood vessels and reduces the heart's workload. It is used mainly to prevent angina attacks; headache, dizziness, and low blood pressure may occur, and it can interact dangerously with erectile-dysfunction medicines.

Isospora

An older name for a group of intestinal coccidian parasites, now generally classified as Cystoisospora. Infection can cause watery diarrhea, especially in people with weakened immunity.

Isospora Belli

The former name for Cystoisospora belli, a parasite spread by swallowing oocysts in contaminated food or water. It causes watery diarrhea, cramps, nausea, and weight loss and can be severe or prolonged in immunocompromised people.

Isosporiasis

Older name for Cystoisosporiasis, an intestinal infection caused by the parasite Cystoisospora belli.

Iso-Sulfan Blue

A blue dye used to map lymphatic drainage or identify sentinel lymph nodes during selected surgical procedures.

Isotonic

Describing muscle contraction in which muscle length changes to move a joint under a relatively constant external load.

Isotonic Exercise

Exercise in which muscles change length while producing force against a relatively constant load, as in lifting or lowering a weight.

Isotonic Solution

A solution with an effective osmotic concentration close to that of plasma, such as normal saline or

balanced crystalloid. Isotonic fluids may expand extracellular volume; effects depend on the amount and can include fluid overload or electrolyte disturbance.

Isotope

One of two or more atoms of the same element with the same number of protons but different numbers of neutrons.

Isotretinoin

A vitamin-A-related medicine used for severe acne that has not improved with other treatment. It reduces skin-oil production and clogged pores but can cause birth defects, so pregnancy prevention and regular medical monitoring are essential.

Isovaleric Acidemia

A rare inherited disorder in which the body cannot properly break down the amino acid leucine. Harmful substances build up and may cause poor feeding, vomiting, unusual sleepiness, low muscle tone, or a sweaty-feet odor, especially during illness or fasting. Newborn screening can detect it; treatment uses a controlled diet and prevents prolonged fasting.

Alternate Names:
IVA; Isovaleryl-CoA Dehydrogenase Deficiency

Isovolumetric Contraction

The early phase of cardiac ventricular systole lasting from the closure of the atrioventricular (mitral and tricuspid) valves to the opening of the semilunar (aortic and pulmonic) valves, during which ventricular pressure rises steeply at a constant ventricular volume without ejection of blood.

Alternate Names:
Isovolumic Contraction Phase

Isozyme

One of several molecular forms of an enzyme that catalyze the same reaction but differ in structure, tissue distribution, or regulation.

Ispaghula Husk

Ispaghula husk, or psyllium, is a soluble fiber that absorbs water and helps regulate stool consistency; insufficient fluid can cause difficulty swallowing or intestinal blockage.

Isradipine

Isradipine is a calcium-channel blocker used to lower blood pressure; it may cause flushing, headache, ankle swelling, or dizziness.

ISUP Grade Group

A five-level system that grades prostate cancer by how abnormal the cancer looks under a microscope. Group 1 is the lowest risk, usually with a Gleason score of 6 or less. Groups 2 and 3 represent intermediate risk, while groups 4 and 5 represent high or highest risk. The result helps guide monitoring, surgery, radiation, or other treatment.

Alternate Names:
Grade Group; ISUP Prostate Grading System; WHO/ISUP Grade Group

Itch

An unpleasant skin sensation that creates the urge to scratch. It may be localized or widespread and can result from skin disease, allergy, infection, medicines, nerve disorders, or illnesses affecting organs such as the liver or kidneys.

Alternate Names:
Pruritus

Itching

Alternate name; see *Itch*.

Itchy Ear

An itching sensation of the external ear or ear canal, which may result from dermatitis, allergy, infection, dryness, or irritation from objects placed in the ear.

Itchy Skin

Alternate name; see *Itch*.

Iterative Reconstruction

A computer method that repeatedly improves medical images by comparing calculated results with measured scan data. It can reduce image noise

and sometimes allow lower radiation exposure, but usually requires more processing time.

ITP

Abbreviation; see *Immune Thrombocytopenia*.

Itraconazole

Itraconazole is a triazole antifungal that inhibits fungal ergosterol synthesis and treats several superficial and systemic mycoses; absorption, extensive drug interactions, liver injury, and negative inotropic effects require attention.

IUCD

An intrauterine contraceptive device, usually referring to an intrauterine device placed in the uterus to prevent pregnancy.

Ivabradine

Ivabradine slows the heart rate by acting on the sinus node and is used for selected patients with chronic heart failure or stable angina.

IVC Filter

A small device placed in the body's large lower vein to catch clots traveling from the legs to the lungs. It is used selectively when blood thinners cannot be used or have not prevented clots; blockage, movement, or vessel injury can occur.

Ivermectin

An antiparasitic medicine used for selected worm and mite infections, including strongyloidiasis, onchocerciasis, and scabies, when prescribed appropriately.

IVF

Abbreviation for *In Vitro Fertilization*.

IV Fluids

Fluids given through a vein to replace lost water and salts, support circulation, or provide maintenance during illness. The type and amount depend on the person's blood pressure, kidney and heart function, electrolytes, and cause of fluid loss.

IV Treatment At Home

Intravenous treatment given outside a hospital, usually through a catheter with instructions for safe infusion, line care, monitoring, and follow-up.

Ixabepilone

Ixabepilone is a chemotherapy medicine used for some advanced breast cancers; important risks include nerve damage, low blood counts, and allergic reactions.

Ixodes

A genus of hard ticks, including the ticks that transmit Lyme disease and several other infections. A bite may be painless; removing the tick promptly reduces, but does not eliminate, infection risk.

J

Jaccoud Arthropathy

A chronic, usually nonerosive deforming arthropathy, often affecting the hands, in which deformities such as ulnar deviation can be partly corrected by passive movement. It is associated with systemic lupus erythematosus and may follow rheumatic fever; similar deformities can occur in other disorders.

Jaccoud's Arthropathy

Alternate name; see *Jaccoud Arthropathy*.

Jack-In-The-Pulpit Poisoning

Jack-in-the-pulpit poisoning follows ingestion of calcium oxalate crystals from the plant, causing intense burning and swelling of the mouth, throat, and gastrointestinal tract.

Jackknife Position

A face-down position used during some operations in which the table is bent at the hips. The buttocks are raised while the head and legs are lower, improving access to the rectal, anal, or posterior pelvic regions.

Alternate Names:
Kraske Position

Jacksonian Epilepsy

Alternate name; see *Jacksonian March*.

Alternate Names:
Jacksonian March

Jacksonian March

A focal motor seizure in which twitching or jerking starts in one part of the body and spreads to nearby parts, such as from a finger up the arm. The spread reflects seizure activity moving across nearby areas of the brain's motor region. Awareness may remain intact.

Alternate Names:
Focal Motor March

Jacksonian Seizure

Alternate name; see *Jacksonian March*.

Jacobsen Syndrome

A rare chromosome condition caused by loss of part of chromosome 11. It may cause low platelets, unusual facial features, heart defects, bleeding, and developmental delay.

Alternate Names:
11q Terminal Deletion Syndrome; Jacobsen Deletion Disorder

Jadassohn-Lewandowsky Syndrome

A form of pachyonychia congenita, an inherited condition causing very thick, abnormal nails, painful thick skin on the palms and soles, and sometimes white patches in the mouth or rough bumps around hair follicles.

Alternate Names:
Pachyonychia Congenita Type 1; PC-1

Jadassohn's Naevus

A congenital skin hamartoma involving the epidermis, hair follicles, sebaceous glands, and other skin structures. It often appears as a smooth, yellowish, hairless patch or plaque on the scalp or face and may thicken around puberty; secondary tumors can occasionally arise.

Jaffe-Lichtenstein Syndrome

An older term for polyostotic fibrous dysplasia with café-au-lait skin pigmentation but without endocrine hyperfunction. In this bone disorder, abnormal fibrous tissue replaces normal bone at multiple sites, which may weaken, deform, or cause pain in the affected bones. When endocrine hyperfunction is also present, the condition is generally classified within McCune-Albright syndrome.

Alternate Names:
Polyostotic Fibrous Dysplasia; Jaffe-Lichtenstein Disease

JAK2

Janus kinase 2, an essential protein inside cells that helps transmit chemical signals from hormones and growth factors outside the cell to the cell's nucleus. It is especially critical for signaling the bone marrow to produce red blood cells, white blood cells, and platelets. An acquired mutation in the extitJAK2 gene causes the switch to stay permanently turned on, leading to the uncontrolled overproduction of blood cells seen in myeloproliferative disorders such as polycythemia vera.

Jakob-Creutzfeldt Disease

Alternate name; see *Creutzfeldt-Jakob Disease*.

Jakob's Disease

Alternate name; see *Creutzfeldt-Jakob Disease*.

JAK-STAT Pathway

A conserved, rapid intracellular signal transduction cascade that directly couples the binding of extracellular polypeptide cytokines, interferons, interleukins, and colony-stimulating factors to transmembrane receptors with downstream nuclear gene transcription, bypassing second messengers. The pathway comprises three fundamental components: (1) Cell surface receptors lacking intrinsic enzymatic kinase activity (such as cytokine receptor families for erythropoietin, thrombopoietin, growth hormone, prolactin, interferons, and interleukins); (2) Janus Kinases (JAKs: JAK1, JAK2, JAK3, and TYK2), receptor-associated cytoplasmic non-receptor tyrosine kinases; and (3) Signal Transducers and Activators of Transcription (STATs: STAT1, STAT2, STAT3, STAT4, STAT5a, STAT5b, and STAT6), latent cytoplasmic transcription factors containing SH2 (Src homology 2) domains. Upon ligand binding, receptor multimerization brings receptor-bound JAKs into close apposition, triggering transphosphorylation and activation; activated JAKs phosphorylate specific tyrosine residues on the receptor's cytoplasmic tail, creating docking sites for the SH2 domains of STAT proteins. JAKs subsequently phosphorylate STAT monomers on a conserved C-terminal tyrosine residue, driving STAT dissociation from the receptor and spontaneous SH2-mediated homo- or heterodimerization. Activated STAT dimers translocate rapidly into the cell nucleus, where they bind specific DNA promoter sequences to regulate transcriptional programs governing hematopoiesis, cellular proliferation, survival, and immune differentiation. Regulated by negative feedback proteins including Suppressors of Cytokine Signaling (SOCS) and Protein Inhibitors of Activated STAT (PIAS). Dysregulation, constitutive hyperactivation, or somatic activating mutations in JAK-STAT signaling are implicated in myeloproliferative neoplasms (notably the *JAK2* V617F mutation), autoimmune diseases, and immunodeficiencies. Pharmacologic inhibitors (JAK inhibitors, "jakinibs"; such as ruxolitinib, tofacitinib, baricitinib, and upadacitinib) are therapeutic mainstays in rheumatology, dermatology, and hematology.

Jammed Finger

A finger injury caused by sudden force, often involving a sprain, joint dislocation, fracture, or tendon injury. It may cause pain, swelling, deformity, or difficulty moving the finger.

Janeway Lesions

Small, usually painless red or purple spots on the palms or soles associated with infective endocarditis, an infection of the heart lining or valves. They are traditionally linked to tiny infected emboli and differ from the often painful Osler nodes.

Jansen Disease

Alternate name; see *Jansen Metaphyseal Chondrodysplasia*.

Jansen Metaphyseal Chondrodysplasia

A rare autosomal dominant skeletal disorder caused by activating variants in *PTH1R*. It causes short-limb short stature, metaphyseal bone abnormalities, joint swelling, and often hypercalcemia, hypercalciuria, or nephrocalcinosis.

Janus Kinase

One of a family of proteins inside cells that pass signals from hormones and immune chemicals. Janus kinases help control inflammation, blood-cell production, and immune responses.

Janus Kinase Inhibitors

Medicines that block Janus kinase proteins and reduce certain immune signals. They are used for selected inflammatory and blood disorders, but can increase the risk of infections, blood clots, and other serious effects.

Japanese B Encephalitis

Alternate name; see *Japanese Encephalitis*.

Japanese Encephalitis

A viral infection spread by mosquitoes that can inflame the brain. Most infections cause no symptoms, but severe illness can cause fever, confusion, seizures, movement problems, or lasting disability.

Jarcho-Levin Syndrome

A historical term for congenital segmentation defects of the vertebrae and abnormalities of the ribs, usually referring to spondylocostal dysostosis. It has also been applied to spondylothoracic dysostosis, a distinct condition, so the specific diagnosis should be named when known.

Jargon Aphasia

A type of language disorder in which speech is fluent but filled with made-up words, incorrect sounds, or sentences that are hard to understand. Understanding spoken or written language is also impaired.

Alternate Names:
Neologistic Aphasia; Word Salad Speech

Jarisch-Herxheimer Reaction

An acute, self-limiting systemic inflammatory response that classically occurs within 2 to 24 hours following the initiation of effective antimicrobial therapy for spirochetal infections, most commonly primary or secondary syphilis treated with intramuscular penicillin G benzathine, as well as tick-borne relapsing fever (*Borrelia hermsii*), Lyme disease (*Borrelia burgdorferi* treated with doxycycline), and leptospirosis (*Leptospira interrogans*). Pathogenesis is driven by the rapid, massive lysis of abundant spirochetes upon antibiotic exposure, precipitating the abrupt release of spirochetal lipoproteins, endotoxin-like glycolipids, and pathogen-associated molecular patterns (PAMPs) into the systemic circulation. This triggers rapid activation of mononuclear phagocytes via Toll-like receptors (TLR2 and TLR4), inducing an explosive transient surge of pro-inflammatory cytokines, predominantly tumor necrosis factor-alpha (TNF-α), interleukin-6 (IL-6), and interleukin-8 (IL-8). Clinical manifestations include abrupt onset of high-grade fever, shaking chills (rigors), tachycardia, flushing, diaphoresis, headache, myalgias, arthralgias, transient hypotension, and acute exacerbation of pre-existing cutaneous syphilitic lesions. In pregnancy, it can provoke uterine contractions, fetal distress, or premature labor. Differentiated from a drug hypersensitivity reaction by the absence of urticaria, angioedema, or wheezing. Management is supportive with antipyretics (acetaminophen, NSAIDs) and intravenous hydration; antimicrobial therapy should be completed without discontinuation.

Jatene Procedure

An operation for babies born with the major arteries leaving the wrong heart chambers. The aorta and pulmonary artery are switched, and the coronary arteries are reattached.

Alternate Names:
Arterial Switch Operation; ASO

Jaundice

A yellowing of the skin, whites of the eyes (sclerae), and mucous membranes caused by high levels of bilirubin, a yellowish waste pigment produced when the body breaks down old red blood cells. The liver

normally processes bilirubin and excretes it into bile. Jaundice develops when the liver is inflamed or damaged, when bile ducts are blocked (such as by gallstones or a tumor), or when red blood cells break down faster than normal.

Alternate Names:
Icterus; Hyperbilirubinemia

Jaundice And Breastfeeding

Jaundice in a breastfed newborn may reflect low milk intake in the first days after birth, called suboptimal-intake hyperbilirubinemia, or persist despite adequate intake and weight gain, called breastmilk jaundice. Both usually involve unconjugated bilirubin, but have different timing and causes.

Jaundice Causes

Alternate topic; see *Jaundice*.

Jaundice In Adults

Yellowing of the skin or eyes in an adult from increased bilirubin. Causes include red-cell breakdown, liver injury, impaired bile flow, or inherited conditions. Dark urine, pale stool, abdominal pain, fever, confusion, or rapid onset may occur.

Jaundice In Neonates

Alternate name; see *Jaundice In Newborns*.

Jaundice In Newborns

Yellowing of a newborn's skin or eyes caused by increased bilirubin. It is often temporary, but severe hyperbilirubinemia can cause acute bilirubin encephalopathy and permanent brain injury (kernicterus).

Jaundice in Newborns (Hyperbilirubinemia)

Alternate name; see *Jaundice In Newborns*.

Jaw

The upper and lower bony structures of the mouth—the maxilla and mandible—which support the teeth and contribute to chewing, speech, facial shape, and the oral airway.

Jaw Fracture

A break in the lower jawbone or upper jawbone, usually after a blow to the face. Signs may include pain, swelling, loose teeth, numbness, a changed bite, or difficulty opening the mouth. Severe breaks can block the airway, especially when the lower jaw is broken in the front on both sides.

Jaw Jerk Reflex

A brief closing movement of the jaw when the chin is tapped with the mouth slightly open. An unusually strong response may suggest a problem in the brain's motor pathways.

Jaw Neoplasm

An abnormal new growth in the upper or lower jawbone or nearby tissues. It may be noncancerous or cancerous and can cause swelling, pain, loose teeth, numbness, or bone damage. A cyst is a related jaw lesion but is not itself a neoplasm.

Jaw Pain

Pain in the jaw, jaw joint, or chewing muscles caused by temporomandibular disorders, dental disease, infection, injury, or less commonly heart or nerve disease. It may occur with chest discomfort, sweating, breathlessness, exertion, restricted movement, or persistent pain.

Jaw Thrust Maneuver

An airway-opening technique that moves the lower jaw forward without bending the neck. It is used when a neck injury is possible.

Jaw Tumors And Cysts

Abnormal growths or cystic lesions in the jawbones or adjacent tissues. They include odontogenic lesions arising from tooth-forming tissues, bone tumors, giant-cell lesions, and nonodontogenic cysts. Their behavior ranges from benign to malignant, and some cause jaw expansion, pain, tooth displacement, numbness, or bone destruction.

Jaw-Winking Syndrome

A condition present from birth in which a drooping upper eyelid briefly lifts when the jaw moves, such as

during chewing. It results from misdirected nerve signals between muscles that move the jaw and eyelid.

Alternate Names:
Marcus Gunn Jaw-Winking Phenomenon; Trigemino-Oculomotor Synkinesis

Jehovah's Witness

A member of a Christian religious group whose beliefs may lead them to decline transfusions of whole blood and certain blood components. Individual choices about blood products and medical procedures vary.

Jejunal Atresia

A condition present at birth in which part of the jejunum, a section of the small intestine, is closed or missing. It causes bowel blockage in a newborn, with green vomiting, a swollen abdomen, and failure to pass the first stool.

Jejunal Diverticulum

A pouch that forms in the wall of the jejunum, the middle part of the small intestine. It may cause no symptoms, but multiple pouches can be associated with bacterial overgrowth, poor absorption, inflammation, or bleeding.

Jejunal Fistula

An abnormal connection involving the jejunum and another organ, the skin, or a body surface. It may cause intestinal contents to leak, infection, malnutrition, dehydration, or sepsis.

Jejunal Hemorrhage

Bleeding from the jejunum, the middle segment of the small intestine, which may cause maroon or black stool, anemia, abdominal pain, or shock depending on its rate and cause.

Jejunal Neoplasm

An abnormal growth in the jejunum, the middle part of the small intestine. It may be benign or cancerous and can cause pain, bleeding, anemia, vomiting, blockage, or weight loss.

Jejunal Stenosis

Narrowing of the jejunal lumen that can impede intestinal contents and cause cramping, vomiting, distension, malabsorption, or obstruction; causes include Crohn disease, adhesions, tumors, and ischemic injury.

Jejunal Ulcer

An ulcerated break in the lining of the jejunum, caused by inflammation, infection, ischemia, medicines, tumor, or anastomotic disease and potentially producing pain, bleeding, or perforation.

Jejunitis

Inflammation of the lining of the jejunum, the middle section of the small intestine. Causes include infection, Crohn disease, reduced blood flow, and some medicines; symptoms may include abdominal pain, diarrhea, fever, or intestinal bleeding.

Jejunoileal Atresia

A birth defect in which part of the small intestine is completely closed or missing, so milk and digestive fluid cannot pass. Newborns may develop green vomiting, a swollen abdomen, and failure to pass stool. Imaging shows the blockage, and surgery restores intestinal passage.

Jejunojejunostomy

A surgical connection between two parts of the jejunum, the middle section of the small intestine. It may be created during operations such as gastric bypass or to restore the passage of intestinal contents after disease or injury.

Jejunostomy

A surgically created opening into the jejunum, often used for placement of a feeding tube when nutrition cannot safely be given through the stomach.

Jejunostomy Feeding Tube

A tube that delivers liquid nutrition directly into the jejunum, the middle part of the small intestine. It is used when feeding through the mouth or stomach is not possible or suitable.

Jejunum

The middle segment of the small intestine, between the duodenum and ileum. It mixes and propels chyme, secretes fluid and digestive substances, and absorbs much of the nutrients, water, and electrolytes from intestinal contents. Its lining also contributes to gut immune defense. Nutrient absorption continues in other parts of the small intestine.

Jellyfish Sting

A painful skin reaction caused when a jellyfish tentacle releases venom into the skin. It may cause burning, redness, and raised lines; severe exposure can cause vomiting, breathing trouble, fainting, or widespread symptoms.

Alternate Names:
Jellyfish Envenomation

Jellyfish Stings

Alternate name; see *Jellyfish Sting*.

Jendrassik Maneuver

A technique used during a reflex examination in which a person hooks the fingers together and pulls the hands apart, or tenses another muscle group. This can make a tendon reflex, such as the knee reflex, easier to observe.

Alternate Names:
Jendrassik Reinforcement

Jendrassik's Maneuver

Alternate name; see *Jendrassik Maneuver*.

Jerk Nystagmus

Repeated involuntary eye movements with a slow movement in one direction followed by a quick movement back. It may result from problems in the balance organs, cerebellum, or brainstem.

Jerusalem Cherry Poisoning

Jerusalem cherry poisoning follows ingestion of Solanum pseudocapsicum berries, which contain toxic compounds that may cause gastrointestinal symptoms, confusion, weakness, or cardiac effects.

Jervell and Lange-Nielsen Syndrome

A rare, inherited genetic condition characterized by severe hearing loss present from birth combined with an electrical abnormality in the heart known as long QT syndrome. This electrical delay makes the heart vulnerable to dangerously fast, irregular heartbeats, which can cause fainting spells, seizures, or sudden cardiac arrest, often triggered by emotional stress, exercise, or sudden loud noises.

Alternate Names:
JLNS; Cardioauditory Syndrome

Jet Lag

Temporary circadian rhythm disruption after rapid travel across time zones, causing sleep disturbance, fatigue, impaired concentration, and sometimes gastrointestinal symptoms.

Alternate Names:
Desynchronosis; Time Zone Change Syndrome

Jet Lag Prevention

Alternate topic; see *Jet Lag*.

Jeune Syndrome

A rare inherited bone disorder in which the chest is unusually narrow and the limbs are short. It may cause breathing problems, extra fingers or toes, and kidney or liver disease.

Alternate Names:
Asphyxiating Thoracic Dystrophy; ATD

Jimsonweed Poisoning

Jimsonweed poisoning causes anticholinergic toxicity, including dilated pupils, dry mouth, rapid heart rate, urinary retention, agitation, delirium, seizures, or coma.

Job Syndrome

A rare inherited immune disorder, usually caused by a change in the *STAT3* gene, that causes eczema, repeated skin and lung infections, and very high levels of immunoglobulin E (IgE). Dental, bone, and facial differences may also occur.

Jock Itch

A dermatophyte fungal infection of the groin, also called tinea cruris. It usually causes an itchy, scaly rash in the groin folds or upper inner thighs and is favored by warm, moist skin.

Alternate Names:
Tinea Cruris; Ringworm of the Groin

Jod-Basedow Phenomenon

Overactive thyroid function triggered by an excess of iodine, usually in a person with thyroid nodules or other thyroid tissue that works independently of normal control. It may cause weight loss, tremor, sweating, or a fast heartbeat.

Joffroy Sign

A rarely used physical examination sign associated with Graves orbitopathy: the forehead does not wrinkle normally when a person looks upward with the head held still. The sign alone does not establish a diagnosis.

Alternate Names:
Joffroy's Sign; Thyrotoxic Forehead Sign

Johanson-Blizzard Syndrome

A rare autosomal recessive congenital malformation syndrome caused by mutations in the UBR1 gene, characterized by exocrine pancreatic insufficiency, hypoplasia or aplasia of the nasal alae ('beaked nose'), scalp vertex defects, oligodontia, sensorineural hearing loss, and growth retardation.

Alternate Names:
JBS; Pancreatic Insufficiency-Alar Hypoplasia Syndrome

Joint

The place where two or more bones meet. Joints may be fixed, slightly movable, or freely movable, such as the knee, hip, or shoulder.

Joint Aspiration

A needle procedure that removes fluid from a joint for testing or symptom relief, helping assess infection, bleeding, crystals, or inflammation.

Joint Capsule

A tough envelope surrounding a freely movable joint. Its inner synovial membrane produces fluid that helps the joint move, while the capsule helps hold the bones together and provides stability.

Joint Contracture

Permanent or long-lasting limitation of joint movement caused by tightening or scarring of muscles, tendons, ligaments, the joint capsule, skin, or nearby tissues. It may follow immobility, injury, burns, inflammation, or nerve disease.

Joint Crepitus

A grating, crackling, or popping sound or sensation during joint movement. Painless joint noises can occur without disease; grating with pain or swelling may occur with osteoarthritis, cartilage damage, or a tendon moving over bone.

Joint Diseases

Conditions that affect joints, including osteoarthritis, inflammatory arthritis, gout, infection, and injury. They may cause pain, swelling, stiffness, deformity, or reduced movement.

Joint Effusion

Extra fluid inside a joint, often causing swelling, stiffness, or restricted movement. Causes include injury, infection, inflammatory arthritis, bleeding, and crystal disease. Testing the fluid can help identify the cause.

Joint Fluid Culture

Joint fluid culture tests synovial fluid for bacterial, fungal, or other organisms when septic arthritis is suspected; results are interpreted with cell count, crystals, and clinical findings.

Joint Fluid Gram Stain

A quick laboratory test that stains fluid removed from a swollen joint to look for bacteria. It can support the evaluation of a serious joint infection but a negative result does not rule infection out.

Joint Inflammation

Alternate name; see *Arthritis*.

Joint Injection

A procedure in which medicine or another fluid is injected into a joint. It may be used to ease inflammation or pain, or to help diagnose the cause of joint symptoms.

Alternate Names:
Intra-Articular Injection

Joint Mouse

A loose piece of cartilage, bone, or other tissue inside a joint that can cause catching, locking, pain, or swelling.

Joint Pain

Pain felt within or around one or more joints. Causes include arthritis, injury, overuse, infection, or gout; nearby tendon or bursa problems can also cause pain around a joint without damage inside it. Swelling, warmth, redness, stiffness, or reduced movement may occur.

Joint Prosthesis

An artificial joint or implant designed to replace a damaged or diseased biological joint, restoring mobility and relieving chronic pain.

Joint Reconstruction

Surgery to restore the structure and function of a damaged or unstable joint by repairing or replacing injured ligaments, tendons, cartilage, bone, or other supporting tissues. It may be performed arthroscopically or through an open incision after trauma, sports injury, degeneration, or congenital abnormality.

Joint Replacement

Surgery that removes damaged joint surfaces and replaces them with artificial parts to reduce pain and improve movement. It is commonly performed for severe arthritis or joint destruction.

Joint Replacement Rehabilitation

Exercise, education, and daily-activity training after joint replacement, helping restore safe movement, strength, balance, confidence, and independence.

Joint Stiffness

Reduced ease or range of joint movement, often worse after rest. Causes include arthritis, injury, inflammation, prolonged immobility, or muscle and tendon disorders. It may occur with swelling, redness, fever, severe pain, or inability to use the joint.

Joint Swelling

Enlargement of a joint caused by excess synovial fluid, blood, inflammation, infection, trauma, or structural disease. It may be accompanied by pain, warmth, stiffness, or restricted movement and can indicate inflammatory or septic arthritis.

Joint X-Ray

An X-ray picture of a joint used to look for broken bones, abnormal alignment, arthritis-related wear, bone loss, deposits, or other changes. It uses a small amount of radiation and does not show all soft-tissue injuries.

Jones Criteria

A widely used medical guideline created to help doctors diagnose acute rheumatic fever, an inflammatory illness that can develop after an untreated strep throat infection. The criteria combine evidence of a recent strep infection with major clinical signs—including heart valve inflammation (carditis), painful swollen joints (arthritis), involuntary jerky movements (chorea), distinct skin rashes, and small nodules under the skin—along with minor signs like fever and elevated blood inflammation markers.

Alternate Names:
Revised Jones Criteria; AHA Rheumatic Fever Criteria

Jones Fracture

A fracture in zone 2 at the metaphyseal-diaphyseal junction of the fifth metatarsal, with the fracture line extending into the fourth-fifth intermetatarsal joint. It is distinct from a tuberosity avulsion frac-

ture and a more distal shaft stress fracture. The region has a relatively limited blood supply, increasing the risk of delayed union or nonunion. Use of the term varies, so the fracture location is important.

Alternate Names:
Fifth Metatarsal Watershed Fracture; Metaphyseal-Diaphyseal Fifth Metatarsal Fracture

Jones Metatarsal Fracture

Alternate name; see *Jones Fracture*.

Jones Tube

A small tube that creates a drain from the inner corner of the eye to the nose when the usual tear-drainage channels are severely blocked. It is used in a procedure called conjunctivodacryocystorhinostomy.

Jonston's Alopecia

Historical or misspelled index form for alopecia, meaning hair loss; see *Alopecia*.

Joubert Syndrome

A usually autosomal-recessive neurodevelopmental disorder defined by a characteristic cerebellar and brainstem malformation, the molar tooth sign on brain MRI. Features may include infantile hypotonia, abnormal eye movements, disordered breathing, ataxia, and developmental differences. Kidney, liver, retinal, or skeletal involvement may also occur.

Alternate Names:
JSRD; Joubert-Related Disorder

Joule-Thomson Effect

The temperature change that occurs when a real gas expands from high to low pressure without exchanging heat with its surroundings. In cryoablation, expanding pressurized argon cools a probe enough to freeze and destroy targeted tissue.

Alternate Names:
Joule-Kelvin Effect

JRA

Abbreviation for juvenile idiopathic arthritis, a group of inflammatory joint diseases beginning in childhood; see *Juvenile Idiopathic Arthritis*.

J Receptor

A term for pulmonary vagal C-fiber sensory endings located near alveolar capillaries, also called juxtacapillary receptors. Experimental stimulation can produce rapid, shallow breathing and other reflex responses, including during pulmonary congestion. Their contribution to breathlessness in people remains uncertain.

Alternate Names:
Juxtacapillary Receptor

Jugular

Relating to the neck, especially the jugular veins that carry blood from the head and neck back to the heart.

Jugular Bulb

A widened area at the upper end of the internal jugular vein, just below the skull. It lies close to the middle ear and can vary in size and position.

Jugular Foramen

An opening at the base of the skull through which a major neck vein and several nerves pass. Disease in this area can cause difficulty swallowing, hoarseness, shoulder weakness, hearing symptoms, or other neurologic problems.

Jugular Foramen Syndrome

A group of problems caused by damage to nerves passing through an opening at the base of the skull. It can cause difficulty swallowing, hoarseness, and weakness when turning the head or lifting the shoulder.

Alternate Names:
Vernet Syndrome; Posterior Lacerated Foramen Syndrome

Jugular Vein

A major vein that carries blood from the head, face, and neck back to the heart. Each side has an internal jugular vein and an external jugular vein.

Jugular Veins

Alternate name; see *Jugular Vein*.

Jugular Venous Distention

Visible fullness or raised pulsation of the neck veins, usually reflecting increased pressure in the veins returning blood to the heart. It can occur in conditions that raise pressure on the right side of the heart.

Alternate Names:
Jugular Venous Distension; JVD

Jugular Venous Pressure

A physical examination assessment of the pressure inside the right side of the heart, evaluated by observing the height of the pulse in the jugular veins of the neck. Because the jugular vein connects directly to the right upper chamber of the heart without valves, changes in fluid pressure cause the blood column in the neck to rise or fall. An unusually high jugular venous pulse is a classic sign of fluid overload or heart failure.

Alternate Names:
JVP; Jugular Venous Pulse

Jugular Venous Waveform

The pattern of rises and falls seen in the neck vein during a heartbeat. It reflects pressure changes as the right side of the heart contracts and fills.

Alternate Names:
JVP Waveform

Jugulodigastric Node

A lymph node in the upper neck near the angle of the jaw. It receives drainage from the tonsils and nearby parts of the throat and may enlarge during throat infections.

Alternate Names:
Tonsillar Lymph Node; Subdigastric Node

Jumper's Knee

Alternate name for patellar tendinopathy, an overuse disorder of the tendon connecting the kneecap to the shinbone; see *Patellar Tendinopathy*.

Jumping Frenchmen of Maine

A rare historical startle disorder characterized by an exaggerated response to sudden stimuli, sometimes with involuntary jumping or other abrupt movements.

Junctional Bradycardia

A slow heart rhythm that starts near the connection between the heart's upper and lower chambers. The heartbeat is often below 40 beats per minute, and the usual electrical signs from the upper chambers may be absent or reversed.

Junctional Ectopic Tachycardia

An unusually fast heart rhythm that starts near the connection between the upper and lower chambers. It occurs most often in children after heart surgery and can make the heart pump less effectively.

Alternate Names:
JET

Junctional Epidermolysis Bullosa

A severe inherited blistering disorder in which the layers of skin separate easily. It can cause widespread blisters, skin wounds, poor feeding, and other complications from birth.

Alternate Names:
JEB

Junctional Escape Rhythm

A backup heart rhythm that starts near the connection between the upper and lower chambers when the heart's usual pacemaker is too slow or its signals are blocked. It is generally slower than a normal resting heartbeat.

Alternate Names:
AV Junctional Rhythm; Nodal Escape Rhythm

Junctional Nevus

A usually benign, often flat mole formed by pigment cells at the junction between the outer and deeper layers of skin. It may change in size, shape, color, or symptoms.

Junctional Premature Complex

An early extra heartbeat that starts near the connection between the heart's upper and lower chambers. It may occur before the next expected beat and can be followed by a brief pause.

Alternate Names:
PJC; Premature Junctional Contraction

Junctional Rhythm

A heart rhythm that starts near the connection between the upper and lower chambers instead of the heart's usual pacemaker. It may be slow or regular and can occur when the usual pacemaker is suppressed or blocked.

Junctional Tachycardia

A fast heart rhythm that starts near the connection between the upper and lower chambers. It may occur with heart disease, certain medicines, or after heart surgery; the electrical pattern helps distinguish it from other fast rhythms.

Jungian Analysis

Jungian analysis is a psychotherapy approach based on Carl Jung's theories, using exploration of unconscious processes, symbols, dreams, and personality development.

Juvenile Absence Epilepsy

A generalized epilepsy syndrome that typically begins in adolescence and causes brief absence seizures, usually less often than in childhood absence epilepsy. An electroencephalogram shows generalized spike-and-wave activity; generalized tonic-clonic seizures may also occur.

Alternate Names:
JAE; Adolescent Absence Epilepsy

Juvenile Angiofibroma

Alternate name; see *Juvenile Nasopharyngeal Angiofibroma*.

Juvenile Arthritis

Alternate name; see *Juvenile Idiopathic Arthritis*.

Juvenile Astrocytoma

An astrocytoma, a tumor arising from star-shaped support cells called astrocytes, in a child's or adolescent's brain or spinal cord. These tumors include slow-growing low-grade types, such as pilocytic astrocytoma, and faster-growing high-grade types. Symptoms depend on the site and may include headache, seizures, vision changes, weakness, balance problems, or hormone disturbances; modern classification identifies specific subtypes by tissue and molecular features.

Juvenile Dermatomyositis

An autoimmune illness in children that weakens muscles, especially around the hips and shoulders, and causes a purple rash around the eyes or raised patches over the knuckles. It may also affect swallowing, breathing, or other organs.

Juvenile Diabetes

An outdated, imprecise name historically used for type 1 diabetes. Type 1 diabetes can begin at any age, and diabetes diagnosed in childhood may also be type 2 or monogenic diabetes. The specific diabetes type is determined by its underlying cause; see *Type 1 Diabetes*.

Juvenile Granulosa Cell Tumor

A rare ovarian tumor arising from hormone-producing granulosa cells, usually in children or young adults. It may produce estrogen, causing early puberty in children or irregular bleeding in adults. Some tumors are cancerous.

Juvenile Hypermobile Spectrum Disorder

A nonstandard descriptive label for symptomatic joint hypermobility in a child or adolescent. Current pediatric classification distinguishes pediatric generalized joint hypermobility from pediatric generalized hypermobility spectrum disorder according to musculoskeletal complications, skin and tissue features, and associated comorbidities. Adult hEDS criteria are used after biological maturity.

Juvenile Hypermobility Syndrome

An older term for joint hypermobility with symp-

toms in a child or adolescent, such as pain, instability, or repeated sprains. The current pediatric framework uses pediatric generalized joint hypermobility (pGJH) and pediatric generalized hypermobility spectrum disorder (pgHSD); classification considers joint mobility, musculoskeletal complications, skin and tissue features, and related health conditions. The classification may change as a child grows and develops.

Juvenile Idiopathic Arthritis

A group of autoimmune inflammatory conditions that cause persistent joint swelling, pain, warmth, and stiffness in children under the age of 16, lasting for at least six weeks. While the exact cause is unknown, the immune system mistakenly attacks healthy joint tissues. Depending on the subtype, it can affect one joint, multiple joints, or the entire body (systemic arthritis, causing fevers and rashes), and may also cause inflammation inside the eyes.

Alternate Names:
JIA; Juvenile Rheumatoid Arthritis (JRA)

Juvenile Laryngeal Papillomatosis

A condition in which wart-like growths repeatedly form in the voice box, usually because of human papillomavirus types 6 or 11. The growths can cause hoarseness and noisy or difficult breathing.

Alternate Names:
Juvenile-Onset Recurrent Respiratory Papillomatosis; JORRP

Juvenile Myoclonic Epilepsy

A generalized epilepsy syndrome that typically begins in adolescence and causes myoclonic jerks, often after awakening, with possible generalized tonic-clonic or absence seizures.

Juvenile Nasopharyngeal Angiofibroma

A noncancerous but highly blood-rich tumor that usually develops behind the nose in adolescent boys. It can cause repeated nosebleeds, nasal blockage, or facial swelling.

Alternate Names:
JNA; Nasopharyngeal Fibroangioma

Juvenile Osteoporosis

Low bone strength during childhood or adolescence that increases the risk of fractures. It may occur on its own or result from chronic illness, poor nutrition, hormone disorders, limited mobility, or medicines.

Juvenile Polyposis Syndrome

An inherited disorder in which multiple hamartomatous polyps, called juvenile polyps, develop in the gastrointestinal tract, especially the colon and stomach. Polyps may cause bleeding or anemia, and the syndrome increases the risk of colorectal and gastric cancer.

Juvenile Retinoschisis

An inherited retinal disorder, usually X-linked, in which layers of the retina split and impair central or peripheral vision; see *Retinoschisis*.

Juvenile Rheumatoid Arthritis

Older name for juvenile idiopathic arthritis, a group of inflammatory joint diseases beginning before age 16; see *Juvenile Idiopathic Arthritis*.

Juvenile Schizophrenia

Alternate name; see *Childhood Schizophrenia*.

Juvenile Xanthogranuloma

A rare, usually harmless growth of immune cells in the skin of an infant or young child, appearing as a firm red, yellow, or brown bump. It often fades without treatment, but rarely affects the eye or internal organs.

Juxta-Articular

Located next to a joint. The term may describe bone, soft tissue, swelling, a cyst, or a deposit beside a joint rather than within the joint itself.

Juxtaglomerular Apparatus

A microscopic sensory structure located inside each kidney nephron, positioned right where blood vessels enter the filtering unit. It continuously monitors blood pressure in the kidney and the salt concentration in the filtered fluid. When it detects low

blood pressure, reduced blood flow, or low sodium levels, its specialized cells release the enzyme renin, triggering hormonal pathways that constrict blood vessels and help restore normal blood pressure and fluid balance.

Juxtaglomerular Cells

Specialized cells in the kidney that release renin when blood flow or salt delivery to the kidney is low. Renin helps regulate blood pressure and the body's salt and fluid balance.

Alternate Names:
JG Cells; Granular Cells

Juxtaglomerular Cell Tumor

A rare kidney tumor that releases renin, a hormone that helps control blood pressure. It can cause high blood pressure and low blood potassium.

Alternate Names:
Reninoma; Juxtaglomerular Renin-Secreting Tumor

Juxtavesical

Next to the urinary bladder. The term often describes the lower part of a ureter as it approaches the bladder.

J Wave

A notch or slur at the end of the QRS complex, or a positive deflection near the junction of the QRS complex and ST segment on an electrocardiogram. An Osborn wave is a prominent J wave classically associated with hypothermia. Similar terminal QRS changes may occur in early-repolarization patterns and other conditions.

K

Kabuki Syndrome

A rare genetic disorder that may cause distinctive facial features, short stature, developmental or learning difficulties, weak muscle tone, skeletal changes, and heart defects. Hearing loss, seizures, immune problems, and kidney abnormalities may also occur. Most cases result from a change in the *KMT2D* or *KDM6A* gene.

Alternate Names:
Niikawa-Kuroki Syndrome

Kahler Disease

Older name; see *Multiple Myeloma*.

Kahler's Disease

Alternate name; see *Multiple Myeloma*.

Kala-Azar

A serious parasitic infection caused by Leishmania species and transmitted by sandflies. It may cause prolonged fever, weight loss, enlargement of the spleen and liver, and suppression of blood-cell production.

Alternate Names:
Black Sickness; Dumdum Fever

Kallikrein-Kinin System

A group of blood and tissue proteins that produces kinins, including bradykinin. These messengers widen blood vessels, increase leakage from small vessels, and contribute to pain and inflammation.

Alternate Names:
Kininergic System; Bradykinin Cascade; Kinin-Kallikrein System; Kallikrein-Kinin Cascade

Kallmann Syndrome

A congenital form of hypogonadotropic hypogonadism in which deficient gonadotropin-releasing hormone signaling delays or prevents puberty. It is associated with a reduced or absent sense of smell because development of smell-related neurons is also affected.

Kallmann Syndrome and IHH

Alternate topic; see *Hypogonadotropic Hypogonadism* and *Kallmann Syndrome*.

Kanamycin

An antibiotic used for some serious bacterial infections. It can permanently damage hearing and harm the kidneys, especially with prolonged or high-dose use.

Kangaroo Care

A care method for preterm or low-birth-weight newborns. It combines prolonged skin-to-skin contact, begun as soon as possible after birth, with exclusive breast-milk feeding. This practice supports thermal regulation and physiologic stability and may continue after hospital discharge.

Alternate Names:
Kangaroo Mother Care; KMC

Kaolin

A soft clay mineral used in some medicines, laboratory products, and industrial materials. Breathing large amounts of kaolin dust over time can damage the lungs.

Kaposiform Hemangioendothelioma

A rare blood-vessel tumor that usually affects infants and young children. It can grow into nearby tissue and may cause a serious loss of platelets and problems with blood clotting.

Alternate Names:
KHE

Kaposi Sarcoma

A malignant vascular tumor caused by Kaposi sarcoma-associated herpesvirus (HHV-8) that may affect the skin, mucous membranes, lymph nodes, or internal organs. Lesions are often red, purple, or brown patches, plaques, or nodules; clinical forms include classic, endemic, transplant-associated, and HIV-associated disease.

Alternate Names:
Kaposi's Sarcoma

Karnofsky Performance Status

A 0-to-100 scale describing a person's ability to carry out daily activities and care for themselves. It is used to record functional status, especially in cancer care.

Kartagener Syndrome

An inherited condition in which tiny hair-like structures that clear mucus do not work properly. It causes repeated sinus and lung infections and may place the internal organs in a reversed position.

Kartagener Triad

The combination of reversed internal-organ positions, long-term sinus inflammation, and widened damaged airways. It results from an inherited problem with microscopic moving hairs that clear mucus.

Karyolysis

Fading and dissolution of a cell nucleus as its DNA is degraded, seen in dying cells, especially in necrosis.

Karyomegaly

Abnormal enlargement of a cell's nucleus, which contains most of its genetic material. It can occur during cell injury or repair and in some tumors; by itself, it does not establish that a growth is cancerous.

Karyorrhexis

Fragmentation of a cell nucleus into pieces of condensed chromatin during cell death. It occurs in necrosis and apoptosis.

Karyotype

A person's complete set of chromosomes; the term also refers to a laboratory image or report showing chromosomes arranged by number and structure. It can reveal some chromosome-number or large structural changes but does not detect every genetic condition.

Karyotyping

A laboratory test that examines chromosomes in dividing cells to detect some missing, extra, or rearranged chromosomes. It may be used in pregnancy, infertility, repeated miscarriage, developmental conditions, or blood cancers.

Kasabach-Merritt Phenomenon

A severe consumptive coagulopathy associated with kaposiform hemangioendothelioma or tufted angioma, usually in infants and young children. Platelets are trapped within the tumor, causing profound thrombocytopenia and often low fibrinogen and other clotting abnormalities; microangiopathic hemolytic anemia may also occur.

Alternate Names:
KMP; Kasabach-Merritt Syndrome; KMS

Kasai Procedure

An operation for babies with biliary atresia, in which the blocked bile ducts outside the liver are removed and a loop of intestine is connected to the liver so bile can drain. Earlier surgery gives the best chance of restoring bile flow, but many children eventually need a liver transplant.

Alternate Names:
Hepatoportoenterostomy; Kasai Operation; Portoenterostomy

Kashin-Beck Disease

A long-term bone and joint disease seen in some parts of Asia. It can cause pain, stiffness, joint deformity, and poor growth; its cause is not fully understood but may involve low selenium and other environmental factors.

Katayama Fever

An acute systemic reaction to schistosome infection, usually occurring weeks after exposure and causing fever, rash, cough, abdominal symptoms, and eosinophilia.

Alternate Names:
Katayama Syndrome; Acute Bilharziasis

Katz Index

A scale that assesses independence in six basic activities of daily living: bathing, dressing, toileting, transferring, continence, and feeding.

Kava

A plant-derived product traditionally used in the Pacific and marketed for anxiety or relaxation. It can cause drowsiness, interact with medicines, and rarely cause serious liver injury.

Kawasaki Disease

An acute inflammatory illness that causes swelling in the walls of medium-sized blood vessels throughout the body, most commonly affecting children under five years of age. Its most serious concern is inflammation of the coronary arteries that supply blood to the heart muscle, which can lead to coronary artery aneurysms if untreated. Symptoms include a high, persistent fever lasting five or more days, widespread skin rash, bloodshot eyes without discharge, swollen lymph nodes in the neck, cracked red lips, and a bright red 'strawberry' tongue.

Alternate Names:
Mucocutaneous Lymph Node Syndrome; KD

Kawasaki Disease Diagnostic Criteria

Classic Kawasaki disease is identified by fever for at least five days and at least four of five principal findings: bilateral nonpurulent conjunctivitis, oral or lip changes, a polymorphous rash, extremity changes, and cervical lymphadenopathy with at least one node 1.5 cm or larger, usually unilateral. With four or more findings, diagnosis may be made after four days of fever; incomplete forms also occur.

Kayser-Fleischer Rings

A distinctive dark ring of golden-brown or greenish pigment that encircles the outer edge of the cornea (the clear front window of the eye). It is caused by excess copper accumulating in the eye tissues and is a hallmark physical sign of Wilson disease, a rare genetic disorder where the body cannot properly eliminate copper.

KC

Common abbreviation for keratoconus, a progressive thinning and cone-shaped bulging of the cornea; see *Keratoconus*.

K-Complex

A large brain-wave pattern seen during stage 2 sleep. It may occur on its own or after a sound or other sensory stimulus and is recorded during an electroencephalogram (EEG).

Kearns-Sayre Syndrome

A mitochondrial DNA deletion syndrome, usually sporadic rather than inherited. It is classically defined by onset before age 20, progressive external ophthalmoplegia, pigmentary retinopathy, and at least one of cardiac conduction disease, cerebellar ataxia, or elevated cerebrospinal-fluid protein. Short stature, muscle weakness, hearing loss, and endocrine abnormalities may also occur.

Keel Breast

Alternate name; see *Pectus Carinatum*.

Kegel

Alternate name; see *Kegel Exercise*.

Kegel Exercise

Repeated tightening and relaxing of pelvic-floor muscles to improve strength and control, helping reduce urine leakage and support pelvic organs.

Kegel Exercises

Alternate plural form; see *Kegel Exercise*.

Kehr Sign

Pain felt at the tip of the left shoulder when blood or irritation affects the underside of the diaphragm, the main breathing muscle. It can occur with irritation from a spleen injury but is not specific to it.

Keloid

A firm, raised overgrowth of scar tissue that may continue growing beyond the original wound. Unlike a hypertrophic scar, it does not remain confined to the wound margins and usually persists; it may itch or feel tender and can follow surgery, injury, burns, acne, or piercings.

Alternate Names:
Keloid Scar; Cheloid

Keloid and Hypertrophic Scar

A general term for raised scars caused by excess scar tissue. A hypertrophic scar stays within the original wound, while a keloid grows beyond it. Either may itch, hurt, or feel tight.

Keloid Scar

Alternate name; see *Keloid*.

Kennedy Disease

Rare inherited neuromuscular disorder causing progressive muscle wasting in the limbs, face, and throat. See *Spinal And Bulbar Muscular Atrophy*.

Keratan Sulfate

A complex sugar found mainly in the clear front of the eye, cartilage, and brain. In some inherited disorders it cannot be broken down properly and builds up, damaging the eyes, bones, or other tissues.

Keratan Sulphate

Alternate spelling; see *Keratan Sulfate*.

Keratectomy

Removal or reshaping of part of the cornea, the clear front surface of the eye. It may be done to correct vision or remove abnormal tissue, and it can affect eyesight.

Keratic Precipitates

Small groups of inflammatory cells that collect on the inner surface of the cornea, usually during inflammation inside the front of the eye. Their size and appearance can help describe the type of inflammation.

Keratin

A strong structural protein forming much of the skin's outer layer, hair, nails, and other protective tissues. It helps resist water loss, friction, chemicals, and physical injury.

Keratinocyte

The main type of cell in the outer layer of skin. It produces keratin and helps form the skin barrier that limits water loss and protects against injury and infection.

Keratinocytes

Plural form; see *Keratinocyte*.

Keratin Pearl

A round, layered collection of keratin seen under a microscope in some well-differentiated squamous cell skin cancers.

Alternate Names:
Squamous Pearl; Horn Pearl

Keratitis

Inflammation of the cornea, the clear front layer of the eye. Infection, injury, contact-lens wear, or other conditions may cause pain, redness, tearing, light sensitivity, blurred vision, or clouding. Severe keratitis may cause a corneal ulcer.

Keratoacanthoma

A fast-growing, dome-shaped skin tumor with a central plug of keratin, usually on sun-exposed skin. It can resemble squamous cell skin cancer and may be difficult to distinguish from it in a small sample.

Alternate Names:

Crateriform Epithelioma

Keratocele

Severe thinning or ulceration of the cornea that allows its inner layers to bulge outward. It can lead to a hole in the cornea and permanent loss of vision.

Keratoconjunctivitis

Inflammation of the cornea and conjunctiva, the clear tissues at the front of the eye. It can cause redness, pain, discharge, light sensitivity, or blurred vision.

Keratoconjunctivitis Sicca

Long-lasting dryness and inflammation of the eye's front surface, commonly called dry-eye disease. It can cause burning, grittiness, redness, fluctuating vision, or light sensitivity because too few tears are made or tears evaporate too quickly.

Alternate Names:
Dry Eye Disease; Dry Eye Syndrome

Keratoconus

A condition in which the cornea, the clear front of the eye, thins and bulges into a cone shape. It can cause blurred or distorted vision, glare, and light sensitivity, usually in both eyes but often unevenly.

Keratocyte Count

An estimate of the number of living support cells in the middle layer of the cornea. It may be used to assess corneal health or changes after eye surgery.

Keratoderma

Excessive thickening of the skin on the palms or soles. It may be inherited or develop because of skin disease, infection, medicines, or another illness and can cause painful cracks or difficulty walking.

Keratoderma Blennorrhagica

Alternate spelling; see *Keratoderma Blennorrhagicum*.

Keratoderma Blennorrhagicum

Thickened, scaly, or pus-filled skin lesions on the palms and soles associated with reactive arthritis. The lesions may spread to other areas and often appear after an infection affecting the urinary or digestive tract.

Keratoderma Blenorrhagicum

Alternate spelling; see *Keratoderma Blennorrhagicum*.

Keratodermia Blennorrhagicum

Alternate spelling; see *Keratoderma Blennorrhagicum*.

Keratolysis

Breakdown or loss of the outer, keratin-rich layer of skin. It can occur in some skin infections and inflammatory conditions.

Keratolytics

Substances, such as salicylic acid or urea, that soften and loosen excess thickened skin. They are used in some products for corns, calluses, and certain skin conditions.

Keratoma

A localized thickening or growth of the outer skin, such as a callus or corn.

Keratomalacia

Softening and ulceration of the cornea caused most often by severe vitamin A deficiency, potentially leading to blindness.

Keratometer

An eye instrument that measures the curvature of the cornea, the clear front surface of the eye. The measurement helps assess astigmatism and fit rigid contact lenses.

Keratometry

Measurement of the curve of the cornea, the clear front surface of the eye. It helps assess focusing problems and choose contact lenses or an artificial lens for cataract surgery.

Keratoplasty

Surgery to replace or reshape part or all of the cornea, the clear front surface of the eye. It can restore vision after corneal damage, but healing problems, infection, and rejection of donor tissue are possible.

Keratoprosthesis

An artificial cornea implanted to restore sight when a donor-corneal transplant is unlikely to work, such as after severe chemical injury or extensive surface damage. It carries risks of infection, glaucoma, and device problems.

Keratosis

A thickened, rough, or otherwise abnormal area of skin caused by excess keratin. Some forms are harmless, while others result from infection, inflammation, sun damage, or a change that can precede skin cancer.

Keratosis Follicularis

Alternate name for Darier disease; see *Darier's Disease*.

Keratosis Follicularis (Darier Disease)

Alternate name; see *Darier's Disease*.

Keratosis Obturans

A buildup of shed skin cells that blocks the ear canal. It can cause ear pain, hearing loss, discharge, and widening or damage of the canal.

Keratosis Pilaris

A common, harmless skin condition that causes small, rough bumps around hair follicles, usually on the upper arms, thighs, buttocks, or face.

Alternate Names:
KP; Chicken Skin; Follicular Keratosis; Follicular Hyperkeratosis

Keratosis Seborrheic

Alternate word order; see *Seborrheic Keratosis*.

Kerion

An inflamed, boggy, pus-forming mass caused by a fungal infection of hair-bearing skin, usually a severe form of tinea capitis.

Kerley A Lines

Long, fine lines seen on a chest X-ray, usually spreading outward from the central lung areas. They can reflect fluid buildup in the lung tissue.

Alternate Names:
Kerley's A Lines; Upper Zone Interstitial Edema Lines

Kerley B Lines

Short, thin lines seen near the outer edges and bases of the lungs on a chest X-ray. They commonly reflect fluid buildup in the lung tissue, often related to heart failure.

Alternate Names:
Kerley's B Lines; Septal Lines

Kernicterus

Permanent brain damage caused by very high levels of bilirubin, a yellow substance that builds up during severe newborn jaundice. It can cause movement problems, hearing loss, problems looking upward, and damage to tooth enamel.

Alternate Names:
Chronic Bilirubin Encephalopathy; Nuclear Jaundice; Chronic Bilirubin Toxicity

Kernig Sign

Pain or resistance when the knee is straightened while the hip is bent. It may suggest irritation of the coverings of the brain and spinal cord, such as with meningitis, but it is not diagnostic by itself.

Kernig's Sign

Alternate spelling; see *Kernig Sign*.

Kernohan Notch Phenomenon

Weakness on the same side of the body as a brain injury, caused when pressure from brain herniation pushes the brainstem against the opposite side of the skull opening. This misleading sign can make

the injury appear to be on the wrong side.

Alternate Names:
Kernohan-Woltman Notch Phenomenon; Kernohan Sign

Kerosene Poisoning

Harm after swallowing or inhaling kerosene. The greatest danger is entry into the lungs, which can cause chemical pneumonia; coughing, choking, breathing difficulty, drowsiness, or vomiting may occur.

Keshan Disease

A heart-muscle disease linked to severe selenium deficiency, occurring mainly in regions where soil and food contain little selenium. It can weaken the heart and cause heart failure.

Ketamine

A dissociative anesthetic used for anesthesia and procedural sedation. It acts mainly by blocking NMDA-type glutamate receptors and is also used in selected settings for severe pain or depression. It can cause altered perception, increased blood pressure, and drowsiness.

Ketamine Hydrochloride

Alternate name; see *Ketamine*.

Ketamine Toxicity

Harm from taking too much ketamine or using it repeatedly. Acute effects may include confusion, hallucinations, poor coordination, rapid heartbeat, or high blood pressure; long-term heavy use can injure the bladder.

Keto Acid

An organic acid that contains a ketone group. Alpha-keto acids form when amino acids lose an amino group and can be used in energy production or to make other substances.

Ketoacidosis

A metabolic acidosis caused by excess ketone bodies in the blood. It can result from severe insulin deficiency, heavy alcohol use, or prolonged starvation. Symptoms may include vomiting, abdominal pain, deep breathing, confusion, or coma; ketosis alone does not necessarily cause acidosis.

Ketoconazole

An antifungal medicine used mainly on the skin or scalp to treat fungal infections. Oral ketoconazole is rarely used because it can cause severe liver injury and interact with many medicines.

Ketogenesis

The production of ketone bodies from fatty acids, mainly in the liver during fasting, prolonged exercise, or inadequate insulin activity.

Ketogenic Diet

A high-fat, very-low-carbohydrate diet with adequate protein that shifts metabolism toward producing and using ketone bodies. Therapeutic forms are used in selected cases of drug-resistant epilepsy, and their macronutrient ratios vary. Potential adverse effects include gastrointestinal symptoms, kidney stones, and changes in blood lipid levels.

Ketone

A type of chemical compound. In medicine, the term often refers to ketone bodies made when the body uses fat for energy; small amounts can be normal, but high levels may cause ketoacidosis.

Ketone Bodies

Water-soluble molecules produced mainly by the liver from fatty-acid-derived acetyl-CoA during fasting, starvation, prolonged exercise, or insulin deficiency. The principal ketone bodies are acetoacetate, beta-hydroxybutyrate, and acetone.

Ketones

Alternate name; see *Ketone Bodies*.

Ketones Blood Test

A blood test measuring ketone bodies, such as beta-hydroxybutyrate, used to assess ketosis and help diagnose or monitor diabetic ketoacidosis and other

causes of ketone production.

Ketones Urine Test

A urine test detecting ketone bodies produced when the body metabolizes fat; it can support evaluation of diabetic ketoacidosis, starvation, vomiting, or other metabolic states but may lag behind blood ketone levels.

Ketonuria

Ketonuria is the presence of ketone bodies in urine, occurring with fasting, vomiting, low-carbohydrate intake, pregnancy, or uncontrolled diabetes; marked ketonuria with hyperglycaemia may indicate diabetic ketoacidosis.

Ketoprofen

A nonsteroidal anti-inflammatory medicine used to reduce pain, inflammation, and fever. It can irritate the stomach and may cause bleeding or kidney problems.

Ketoprofen Overdose

Harm caused by taking too much ketoprofen, a nonsteroidal anti-inflammatory drug. It may cause nausea, vomiting, stomach bleeding, drowsiness, kidney injury, seizures, or a dangerous buildup of acid in the blood.

Ketorolac

A nonsteroidal anti-inflammatory medicine used for short-term treatment of moderate or severe pain. It can cause stomach bleeding or kidney injury, especially with prolonged use.

Ketorolac Tromethamine

Alternate name; see *Ketorolac*.

Ketosis

A state in which the body makes and uses increased amounts of ketones after breaking down fat for energy. It can occur during fasting or a low-carbohydrate diet, but high ketone levels with illness or high blood sugar may signal diabetic ketoacidosis.

Ketosis-Prone Type 2 Diabetes

A form of diabetes that may present with diabetic ketoacidosis despite features of type 2 diabetes, such as obesity or preserved insulin production. Insulin dependence can change over time according to beta-cell reserve, autoimmunity, and recovery from the initial metabolic stress.

Ketotic Hypoglycemia

Low blood sugar accompanied by ketones, usually after a young child has gone without food or has been ill and unable to eat. Drowsiness, weakness, vomiting, or seizures may occur. Repeated or unusually severe episodes can be caused by cortisol or growth-hormone deficiency, glycogen-storage disease, or another metabolic disorder.

Ketotifen

An allergy medicine that blocks histamine and can reduce allergic symptoms. Eye drops are used for allergic conjunctivitis; tablets are used in some countries for other allergic conditions. It may cause drowsiness.

Kidney

One of two bean-shaped organs that filter waste from the blood into urine. The kidneys also help control body water, salts, blood pressure, and the balance of acids in the blood.

Kidney Abscess

A localized pocket of pus within the kidney, usually caused by a bacterial infection. A perinephric abscess is a related collection outside the kidney.

Alternate Names:
Renal Abscess

Kidney Biopsy

A procedure in which a small sample of kidney tissue is removed, usually with a needle guided by ultrasound, to identify kidney disease. Bleeding is the main risk.

Kidney Calculi

Alternate name; see *Kidney Stone*.

Kidney Cancer

A malignant tumor arising in the kidney. Renal cell carcinoma is the most common type in adults, but other types occur, especially in children.

Kidney Cancer In Children

Cancer arising in a child's kidney. Wilms tumor is the most common type, but other kidney tumors can occur; symptoms may include an abdominal mass, pain, blood in the urine, fever, or high blood pressure.

Kidney Cysts

Fluid-filled sacs in or on the kidneys. Simple cysts are common and usually harmless. Multiple or complex cysts may be linked to inherited kidney disease or reduced kidney function.

Alternate Names:
Renal Cysts

Kidney Disease

Any condition that damages the kidneys or reduces their ability to filter blood, balance fluids and minerals, control blood pressure, or make hormones. Causes include diabetes, high blood pressure, infection, inflammation, inherited disorders, and medicines.

Kidney Disease and Pregnancy

Kidney disease can worsen during pregnancy, and pregnancy can increase the risk of high blood pressure, preeclampsia, preterm birth, or poor fetal growth. Risks are greater with reduced kidney function, high blood pressure, or protein in the urine before pregnancy.

Kidney Disease-Related Anemia

Anemia caused or worsened by kidney disease, mainly because damaged kidneys produce less erythropoietin, the hormone that stimulates red-cell production. Iron deficiency, inflammation, and blood loss may also contribute.

Kidney Diseases

Alternate plural form; see *Kidney Disease*.

Kidney Failure

Severe loss of kidney function. In chronic kidney disease, kidney failure generally means a glomerular filtration rate below 15 mL/min/1.73 m^2 or treatment with dialysis. Acute kidney injury is often classified by cause: prerenal, from reduced kidney blood flow such as blood or fluid loss; intrinsic, from injury within kidney tissue such as glomerulonephritis, sepsis, toxins, prolonged ischemia, or myoglobin casts; or postrenal, from blocked urine outflow such as stones, tumors, an enlarged prostate, strictures, or catheter blockage.

Kidney Function Test

Singular variant; see *Kidney Function Tests*.

Kidney Function Tests

Blood and urine tests used to assess how well the kidneys remove waste and control fluid and salts. Common measures include creatinine, estimated filtration rate, urine protein, and urinalysis.

Kidney Infection

An infection of one or both kidneys, usually caused by bacteria that travel upward from the bladder. It can cause fever, chills, side or back pain, nausea, vomiting, and painful urination and may lead to sepsis.

Kidney Neoplasm

An abnormal growth in the kidney that may be noncancerous or cancerous. It may cause blood in the urine, pain, a lump, weight loss, or no symptoms; imaging and sometimes biopsy identify its type and extent.

Kidney Pain

Pain felt in the side or back below the ribs that may be caused by kidney stones, infection, obstruction, inflammation, or referred pain.

Alternate Names:
Nephralgia

Kidney Position

A side-lying position used during surgery in which

the waist is gently bent and the side of the body is raised to give access to the kidney and nearby tissues.

Kidney Removal

Surgery to remove part or all of a kidney, usually for cancer, severe damage, infection, or a nonfunctioning kidney. The remaining kidney may provide adequate function, but bleeding, infection, injury to nearby organs, or reduced kidney function can occur.

Kidney Replacement Therapy

Treatment used when the kidneys cannot adequately remove waste or maintain fluid, electrolyte, and acid-base balance. It supports or replaces some kidney functions through dialysis (hemodialysis, peritoneal dialysis, or continuous kidney replacement therapy) or kidney transplantation. Dialysis may be temporary or ongoing; transplantation provides a functioning donor kidney.

Alternate Names:
KRT; Renal Replacement Therapy; Renal-Replacement Therapy; RRT

Kidney Stone

A hard pebble-like deposit of minerals and acid salts that forms inside the kidneys when urine becomes too concentrated. As fluid volume decreases, substances like calcium, oxalate, and uric acid crystallize and clump together. While small stones may pass unnoticed in the urine, larger stones can lodge in the urinary tract, causing sudden, excruciating pain in the back or side, pink or red blood in the urine, nausea, and painful urination.

Alternate Names:
Renal Calculus; Nephrolithiasis; Urolithiasis

Kidney Stones

Plural form; see *Kidney Stone*.

Kidney Stone Removal

Therapeutic procedures to extract, fragment, or eliminate renal calculi, including percutaneous nephrolithotomy, ureteroscopy, and shockwave lithotripsy; see *Percutaneous Nephrolithotomy*, *Extracorporeal Shock Wave Lithotripsy*, and *Ureteroscopy*.

Kidney Stones In Children

Mineral deposits that form in a child's kidney or urinary tract. They may cause side or abdominal pain, blood in the urine, nausea, vomiting, urinary symptoms, or infection, but some cause no symptoms.

Alternate Names:
Pediatric Nephrolithiasis; Pediatric Urolithiasis; Pediatric Renal Calculi

Kidney Transplant

Surgical placement of a healthy donor kidney into a person with kidney failure to restore renal function. Lifelong immunosuppressive treatment is generally required to reduce rejection risk.

Kidney Transplantation

Alternate name; see *Kidney Transplant*.

Kidney Transplant Rejection

An immune attack that damages a transplanted kidney. It may occur suddenly or gradually and can cause reduced urine, swelling, high blood pressure, or worsening blood tests; treatment depends on the type and severity.

Kidney Trauma

Alternate name for renal trauma, an injury to the kidney caused by blunt or penetrating force.

Kienbock Disease

Avascular necrosis and progressive structural damage of the lunate, a small bone in the wrist, which may lead to collapse. No single cause is established; altered perfusion, anatomic factors, and mechanical loading may contribute. The condition can cause wrist pain, swelling, stiffness, and reduced grip strength. Imaging stage and any secondary arthritis describe the extent of lunate and wrist damage.

Kieselguhr

Diatomaceous earth containing substantial silica; inhalation of its dust can produce occupational pneumoconiosis and other lung injury.

Kiesselbach Plexus

A network of small arteries on the front part of the nasal septum and a common source of nosebleeds.

Alternate Names:
Little Area; Kiesselbach's Plexus

Kiesselbach Triangle

Alternate name; see *Kiesselbach Plexus*.

Kikuchi Disease

A usually short-term inflammation of the lymph nodes, most often in the neck, with no known cause. It mainly affects young adults and may cause tender swollen nodes, fever, night sweats, and a low white-blood-cell count.

Alternate Names:
Histiocytic Necrotizing Lymphadenitis

Kikuchi-Fujimoto Disease

Alternate name; see *Kikuchi Disease*.

Killer Cold Virus

Informal name sometimes used for adenovirus type 14, a virus linked to outbreaks of severe respiratory illness; see *Adenovirus*.

Killian's Triangle

Alternate name; see *Killian Triangle*.

Killian Triangle

A weak area in the back wall of the throat between two parts of the swallowing muscle. A pouch called a Zenker diverticulum can form through this area.

Alternate Names:
Killian Dehiscence

Killip Classification

A four-level system for describing heart failure during a heart attack. The levels range from no signs of heart failure to lung fluid buildup and, at the most severe level, shock caused by the heart's inability to pump enough blood.

Kilocalorie

A unit of energy equal to 1,000 small calories; the dietary Calorie, written with a capital C, is one kilocalorie.

Kilojoule

The SI unit of energy, equal to 1,000 joules; approximately 4.184 kilojoules equal one kilocalorie.

Kimmelstiel-Wilson Lesion

A round area of thickened tissue in a kidney filter that can occur with long-standing diabetes. It is a sign of diabetic kidney damage and may occur with protein in the urine or reduced kidney function.

Alternate Names:
Nodular Diabetic Glomerulosclerosis; Kimmelstiel-Wilson Nodules

Kimmelstiel-Wilson Nodules

Alternate name; see *Kimmelstiel-Wilson Lesion*.

Kimmelstiel-Wilson Syndrome

Alternate name; see *Kimmelstiel-Wilson Lesion*.

Kimura Disease

A rare long-term immune disorder causing painless lumps under the skin, usually in the head or neck, enlarged nearby lymph nodes, and high levels of eosinophils or IgE. It can sometimes affect the kidneys.

Kinase

An enzyme that attaches a small chemical group called a phosphate to another molecule. This acts like a switch controlling cell growth, energy use, movement, communication, and many other processes.

Kinase Inhibitor

A medicine that blocks one or more kinases, enzymes that control cell signals. Some kinase inhibitors are used to treat cancers or other diseases in which

these signals are overactive.

Kinesia Paradoxa

A brief, unexpected ability to move normally or quickly in a person who usually has severe slowness or difficulty moving, as can occur in advanced Parkinson disease. It may happen during a strong emotional experience or in response to an urgent situation.

Alternate Names:
Paradoxical Kinesia; Paradoxical Movement

Kinesiology

The study of human movement and the forces produced by muscles, joints, and other body structures. It is used in biomechanics, rehabilitation, exercise science, and the assessment of movement and physical function.

Kinesthesia

The sense of how the body's parts are moving and where they are positioned, even when the eyes are closed. Information from muscles, joints, and skin helps the brain control posture, balance, and coordinated movement.

Kinetics

The study of how a process changes over time. In medicine, pharmacokinetics describes how the body absorbs, distributes, changes, and removes a medicine, helping determine its dose and timing.

Kinetochore

A protein structure assembled at the centromere of each chromosome. It attaches the chromosome to spindle fibers during cell division, helping the chromosomes separate into new cells.

Kingella

Kingella is a genus of bacteria that can live in the mouth and can occasionally cause bloodstream, bone, joint, or heart-valve infections.

Kingella Denitrificans

Kingella denitrificans is a rare bacterium found mainly in the upper airway; it can occasionally cause invasive infection.

Kingella Kingae

Kingella kingae is a bacterium that can cause bone or joint infection, especially in young children, and can rarely cause endocarditis.

Kingella Oralis

Kingella oralis is a mouth-associated bacterium that rarely causes invasive infection, including bloodstream infection or endocarditis.

Kingella Potus

Kingella potus is a rare bacterium that has been associated with occasional human infections; clinical importance depends on the specimen and evidence of true infection.

King's College Criteria

Prognostic criteria used in acute liver failure to identify people at high risk of death without transplantation. For acetaminophen-related failure, criteria include arterial pH below 7.30 after resuscitation or all of: international normalized ratio (INR) above 6.5, creatinine above 3.4 mg/dL, and grade III or IV hepatic encephalopathy. For other causes, they include INR above 6.5 or at least three factors: age under 10 or over 40 years, jaundice more than seven days before encephalopathy, bilirubin above 17.4 mg/dL, INR above 3.5, or an unfavorable cause such as drug-induced liver injury.

Kinin

A group of powerful chemical messenger proteins in the blood and body tissues, most notably bradykinin. Kinins play major roles in the body's inflammatory response by causing blood vessels to widen, increasing vessel permeability (leading to swelling and fluid leakage), and stimulating pain receptors at sites of tissue injury or allergic reactions.

Kinin-Kallikrein System

Alternate name; see *Kallikrein-Kinin System*.

Kinins

Plural form; see *Kinin*.

Kinocilium

A specialized hair-like structure on certain sensory cells, especially in the inner ear. It helps the cell detect the direction of movement and contributes to balance and hearing signals.

Kissing Disease

Informal term; see *Infectious Mononucleosis*.

Kite Angle

An angle measured on a front-view X-ray of the foot between the talus and heel bone. It helps assess hindfoot alignment, including in clubfoot.

Alternate Names:
AP Talocalcaneal Angle

Klatskin Tumor

A cancer arising where the right and left bile ducts join near the liver. It can block bile flow and cause jaundice, itching, pale stools, or weight loss.

Klebsiella

A genus of Gram-negative bacteria that can cause pneumonia, urinary-tract infection, bloodstream infection, and other healthcare-associated infections.

Klebsiella Aerogenes

A Gram-negative bacterium that can cause urinary, lung, wound, abdominal, or bloodstream infections, especially in healthcare settings. Some strains resist multiple antibiotics. The former name is *Enterobacter aerogenes*.

Alternate Names:
Enterobacter Aerogenes; Klebsiella Mobilis

Klebsiella Oxytoca

Klebsiella oxytoca is a bacterium that can cause urinary, bloodstream, wound, and hospital-acquired infections and can sometimes cause antibiotic-associated hemorrhagic colitis.

Klebsiella Pneumonia

Pneumonia caused by Klebsiella bacteria. It can cause fever, cough, chest pain, breathlessness, and sometimes thick or blood-stained sputum; severe infection may destroy lung tissue and is more likely in people with serious illness or weakened defenses.

Klebsiella Pneumoniae

Klebsiella pneumoniae is a bacterium that can cause pneumonia, urinary infection, bloodstream infection, and liver abscess; some strains are highly antibiotic-resistant.

Klebsiella Rhinoscleromatis

A gram-negative bacillus causing chronic granulomatous infection of the nasal passages and upper airway, leading to rhinoscleroma with progressive nasal obstruction and tissue destruction.

Klebsiella Singaporensis

Klebsiella singaporensis is a rare environmental bacterium that has occasionally been recovered from human clinical specimens; its significance depends on the specimen and symptoms.

Klebsiella Variicola

Klebsiella variicola is a bacterium closely related to K. pneumoniae that can cause human infections, including bloodstream and urinary infections.

Kleihauer-Betke Test

A blood test that estimates how much fetal blood has entered a pregnant person's bloodstream. It can help assess bleeding between fetal and maternal circulations and guide the dose of Rh immune globulin when needed.

Alternate Names:
Acid Elution Test; Fetomaternal Hemorrhage Assay

Kleine-Levin Syndrome

A rare disorder causing repeated episodes of excessive sleep, often with confusion, reduced activity, and changes in behavior or appetite. Episodes last days to weeks and are separated by periods of more typical function.

Kleptomania

A mental-health disorder involving recurrent inability to resist impulses to steal items that are not needed for personal use or monetary value. The acts are typically preceded by rising tension and followed by relief or gratification, and cause distress or impairment.

Alternate Names:
Compulsive Stealing Pathological Stealing

Klinefelter's Syndrome

Alternate name; see *Klinefelter Syndrome*.

Klinefelter Syndrome

A genetic condition occurring in males born with an extra X chromosome (most commonly an XXY chromosome pattern instead of the typical XY). Because the extra chromosome affects testicular development, the testes produce lower levels of testosterone. Characteristics can include taller-than-average height, reduced muscle mass, less body and facial hair, enlarged breast tissue (gynecomastia), and infertility, though many boys and men have mild symptoms and remain undiagnosed until adulthood.

Alternate Names:
47,XXY Syndrome; XXY Syndrome

Klippel-Feil Syndrome

A condition present from birth in which two or more neck bones are joined together. It may cause a short neck, low hairline, limited neck movement, hearing loss, or spinal and kidney problems.

Klippel-Trenaunay Syndrome

A rare congenital disorder characterized by abnormal blood and lymph vessel development that affects the growth of soft tissue and bone, typically in one leg or arm. Its hallmark features include a distinctive reddish-purple birthmark (port-wine stain) on the skin, abnormally swollen and twisted veins (varicosities), and overgrowth of the affected limb, making it larger or longer than the opposite limb.

Alternate Names:
KTS; Klippel-Trénaunay Syndrome; Angio-Osteohypertrophy Syndrome

Klippel-Trenaunay-Weber Syndrome

Older name sometimes used for Klippel-Trenaunay syndrome. The name can be confused with Parkes-Weber syndrome, a distinct condition that includes abnormal connections between arteries and veins; see *Klippel-Trenaunay Syndrome*.

Klüver-Bucy Syndrome

A rare brain disorder caused by damage to both temporal lobes. It can cause reduced fear, unusual eating or sexual behavior, a tendency to put objects in the mouth, and difficulty recognizing what is seen.

Alternate Names:
Kluver-Bucy Syndrome; Bilateral Amygdala Ablation Syndrome

Klumpke Palsy

An injury to the lower part of the nerve network that supplies the arm and hand, usually involving the C8 and T1 nerve roots. It can cause hand weakness or numbness and sometimes drooping of an eyelid and a smaller pupil on the same side.

Alternate Names:
Klumpke-Dejerine Palsy; Lower Trunk Brachial Plexus Injury

Klumpke Paralysis

Alternate name; see *Klumpke Palsy*.

Klumpke's Paralysis

Alternate name; see *Klumpke Palsy*.

Kluyvera

A genus of gram-negative bacteria in the Enterobacterales group; species can rarely cause opportunistic human infections.

Kluyvera Ascorbata

A gram-negative Kluyvera species found in the environment and occasionally associated with urinary, bloodstream, or other opportunistic infections.

Kluyvera Cryocrescens

A gram-negative environmental bacterium that rarely causes opportunistic human infection.

Kluyvera Georgiana

A rarely encountered Gram-negative Kluyvera species that may appear in clinical samples. It can occasionally cause opportunistic infection, especially in people with serious illness, weakened defenses, or invasive medical devices.

Kluyvera Intermedia

A Gram-negative bacterium occasionally found in human samples and rarely causing opportunistic urinary, wound, bloodstream, or other infections.

Knee

The joint between the thighbone, shinbone, and kneecap. It bends and straightens the leg and is supported by ligaments, cartilage, muscles, and tendons.

Knee Arthroplasty

Alternate name; see *Knee Replacement*.

Knee Arthroscopy

A procedure in which a small camera and instruments are inserted through small cuts to examine or treat problems inside the knee joint.

Knee Bursitis

Inflammation of one of the small fluid-filled sacs around the knee. It can cause local pain, tenderness, or swelling, often worse with movement or pressure.

Kneecap

A flat, rounded bone at the front of the knee, embedded in the tendon of the thigh muscles. It protects the joint and improves the leverage used to straighten the knee; injury or arthritis can cause pain and restricted movement.

Kneecap Dislocation

An injury in which the kneecap slips completely out of the groove at the end of the thighbone, usually toward the outside. It causes sudden pain, swelling, and difficulty moving the knee.

Kneecap Instability

Recurrent or persistent abnormal movement of the patella within or out of the femoral groove, causing pain, giving way, or dislocation; assessment may include examination and imaging.

Kneecap Tracking Disorder

Abnormal alignment or movement of the patella during knee bending and straightening, sometimes causing front-of-knee pain, grinding, or instability.

Knee-Chest Position

A position in which a person rests on the knees and chest with the hips bent. It is used for some spinal or anorectal procedures.

Knee CT Scan

A detailed X-ray scan of the knee made by a computer. It is useful for complex fractures, bone alignment, arthritis, infection, masses, and selected soft-tissue problems, but it exposes the person to more radiation than a plain X-ray.

Knee Dislocation

A complete displacement of the shinbone from its normal position beneath the thighbone. It usually tears several ligaments and can injure a major artery or nerve behind the knee.

Knee Disorders

Problems affecting the knee joint, including injuries to ligaments or menisci, arthritis, bursitis, tendon disorders, infection, and fractures. They may cause pain, swelling, stiffness, instability, locking, or difficulty bearing weight.

Knee Effusion

An abnormal buildup of fluid inside the knee joint. It can cause swelling, stiffness, and limited movement and may result from injury, arthritis, bleeding, or infection.

Knee Hyperextension

Bending the knee backward beyond its normal range. It can strain or tear ligaments and may cause pain, swelling, instability, or difficulty bearing weight.

Knee Injury And Meniscus Tears

A meniscus tear is damage to one of the cartilage pads between the thighbone and shinbone, often from twisting or gradual wear. It may cause knee pain, swelling, catching, or locking.

Knee-Jerk

Alternate name; see *Knee Jerk Reflex*.

Knee Jerk Reflex

The automatic straightening of the lower leg when the tendon below the kneecap is tapped. It tests nerves that connect the thigh muscles with the lower spinal cord.

Alternate Names:
Patellar Reflex; Quadriceps Reflex

Knee Joint

Alternate name; see *Knee*.

Knee Joint Replacement

Alternate name; see *Knee Replacement*.

Knee Meniscus

One of two crescent-shaped pads of cartilage between the thighbone and shinbone. The menisci help spread weight, absorb shock, and stabilize the knee.

Knee Microfracture Surgery

An operation that makes small holes in the bone beneath a damaged area of knee cartilage so marrow cells can form repair tissue. It may improve symptoms in selected small defects, but the new tissue is not identical to normal cartilage and results vary.

Knee MRI Scan

Magnetic resonance imaging of the knee using a magnetic field and radio waves to evaluate cartilage, menisci, ligaments, tendons, bone marrow, muscles, and joint fluid.

Knee Pain

Pain felt in or around the knee, commonly caused by injury, osteoarthritis, bursitis, tendinitis, or inflammatory disease. Swelling, instability, inability to bear weight, or fever may also occur.

Alternate Names:
Gonalgia; Knee Arthralgia

Knee Prosthesis

An artificial joint component used to replace damaged surfaces of the knee, usually including femoral and tibial components and sometimes a patellar component.

Knee Replacement

An operation that replaces part or all of a damaged knee joint with artificial parts, usually to reduce pain and improve movement. It is commonly performed for severe arthritis.

Knee Replacement Surgery

Alternate name; see *Knee Replacement*.

Kniest Dysplasia

A rare inherited disorder of bone and cartilage growth that causes short stature, enlarged joints, unusual facial features, and progressive joint problems. Some people also develop serious eye, hearing, or breathing complications.

Knife-Cut Ulcers From Crohn'S Disease

Deep, linear skin ulcers or fissures associated with Crohn disease, often in the groin, genital, or perianal area. They can occur with or without active intestinal disease and may be an early sign of Crohn disease.

Knock-Knee

Alternate form; see *Knock Knees*.

Knock Knees

Medial angulation of the knees causing the knees to touch while the ankles remain apart, also called

genu valgum. It is common during childhood development but may be pathologic when severe, asymmetric, persistent, or associated with pain or growth disturbance.

Alternate Names:
Genu Valgum

Knotless Anchor

A small surgical anchor securing sutures in bone without requiring tied knots. Orthopedic surgeons use it to repair tendons, ligaments, or other soft tissues, with risks including loosening, infection, or tissue failure.

Knuckle

A projecting finger joint, usually a metacarpophalangeal joint; it may be affected by trauma, inflammation, or arthritis.

Knuckle Pad

A firm, usually painless thickening of skin and tissue over a finger joint. It is commonly related to repeated pressure or a fibrous tissue change and is generally harmless.

Kocher Clamp

A surgical clamp with toothed ends that grip tissue or blood vessels firmly.

Kocher-Debre-Semelaigne Syndrome

Alternate spelling; see *Kocher-Debré-Sémélaigne Syndrome*.

Alternate Names:
Hypothyroid Muscular Pseudohypertrophy; Debré-Sémélaigne Syndrome

Kocher-Debré-Sémélaigne Syndrome

A rare complication of severe, long-term underactive thyroid disease in a child. Muscles may look unusually large but be weak or stiff, with slow reflexes and delayed growth.

Alternate Names:
Infantile Hypothyroid Myopathy

Kocher Incision

A diagonal cut made below the right ribs to reach the gallbladder or bile ducts during surgery.

Kocher Maneuver

A surgical technique that frees the first part of the small intestine and the nearby pancreas from the back wall of the abdomen, allowing access to structures behind them.

Alternate Names:
Duodenal Mobilization; Kocherization

Koch's Bacillus

The bacterium that causes tuberculosis, an infection most often affecting the lungs but capable of involving many organs.

Alternate Names:
Tubercle Bacillus; M. tuberculosis

Koebnerisation

Alternate spelling; see *Koebner Phenomenon*.

Koebner Phenomenon

The appearance of a skin condition, such as psoriasis or vitiligo, at a site of skin injury or repeated rubbing.

Kohler Disease

A childhood condition in which the navicular bone in the middle of the foot temporarily loses some of its blood supply. It may cause pain on the inner side of the foot and a limp.

Alternate Names:
Kohler Bone Disease

KOH Preparation

A test in which a skin, hair, or nail sample is treated with potassium hydroxide and viewed under a microscope to look for fungi. A negative result does not always rule out infection if the sample is small or treatment has already begun.

Koilocyte

A cell with changes often seen after infection with human papillomavirus (HPV). Under a microscope,

it has an enlarged or irregular nucleus and a clear space around the nucleus. The finding supports HPV-related change but is not enough by itself to determine the diagnosis.

Koilonychia

Thin, brittle nails that become concave and curve upward at the edges, giving them a spoon-like shape. It is often linked to iron deficiency but can also result from poor nutrition, repeated injury, inherited conditions, or other illness; widespread changes may reflect an underlying condition.

Koilonychia (Spoon Nails)

Alternate name; see *Koilonychia*.

Kombucha

A fermented tea made with a culture of bacteria and yeast. It may contain sugar, acids, caffeine, and a small amount of alcohol; contaminated or excessive products can cause illness, especially in vulnerable people.

Konno Procedure

Open-heart surgery to widen a severely narrowed path through which blood leaves the left ventricle. The surgeon enlarges the area below and around the aortic valve, often replacing or repairing the valve at the same time. It is used for complex or recurrent obstruction and carries the usual risks of major heart surgery.

Alternate Names:
Konno-Rastan Procedure; Aortoventriculoplasty

Koplik Spots

Tiny, clustered white or bluish-white spots that look like small grains of salt on a bright red background, appearing on the inside lining of the cheeks opposite the molars. They are an early, unmistakable physical sign of measles, typically appearing one to two days before the characteristic red measles body rash breaks out.

Koplik's Spots

Alternate name; see *Koplik Spots*.

Korotkoff Sounds

Sounds heard through a stethoscope over an artery as a blood-pressure cuff is deflated; their appearance and disappearance are used to estimate systolic and diastolic pressure.

Korsakoff's Syndrome

Alternate name; see *Korsakoff Syndrome*.

Korsakoff Syndrome

A long-lasting memory disorder caused by severe thiamine (vitamin B1) deficiency, often associated with alcohol-use disorder. It impairs the ability to form new memories and may cause gaps in past memory that a person unknowingly fills with imagined details.

Kostmann Syndrome

A rare inherited condition in which the bone marrow makes very few neutrophils, a type of white blood cell that fights bacteria. It begins in infancy and causes repeated, sometimes severe infections.

Alternate Names:
Severe Congenital Neutropenia Type 3; Infantile Genetic Agranulocytosis

Koumpounophobia

A strong, persistent fear of buttons that causes significant distress or interferes with daily life. It is a type of specific phobia.

Kounis Syndrome

An acute coronary syndrome triggered by an allergic, hypersensitivity, or anaphylactic reaction. Mast-cell mediators may cause coronary vasospasm, promote plaque erosion or rupture in pre-existing coronary disease, or contribute to stent thrombosis. It can cause myocardial ischemia with or without infarction and may occur alongside skin, respiratory, or circulatory features of hypersensitivity.

KP

Abbreviation; see *Keratosis Pilaris*.

Krabbe Disease

A rare inherited disorder in which missing enzymes damage myelin, the protective covering of nerves. Early disease can cause irritability, stiffness, seizures, loss of skills, and progressive problems with movement, vision, or development.

Krabbe's Disease

Alternate name; see *Krabbe Disease*.

KRAS Gene

A gene that helps control cell growth and division. Certain changes can keep its growth signal switched on, contributing to cancers and affecting which targeted treatments are likely to work.

Kratom

A plant product containing mitragynine and related compounds that can have stimulant or opioid-like effects. It can cause dependence, withdrawal, sedation, seizures, liver injury, and dangerous interactions, especially with other sedatives or opioids.

Kraurosis

Older term for lichen sclerosus, especially when affecting the vulva; see *Lichen Sclerosus*.

Kraurosis Vulvae

Older term for lichen sclerosus affecting the vulva; see *Lichen Sclerosus*.

Krebs Cycle

A series of chemical reactions in mitochondria that oxidizes acetyl-CoA and generates energy-rich molecules used for cellular energy production.

Alternate Names:
Tricarboxylic Acid Cycle; TCA Cycle

Kringles

Small folded parts of certain proteins that help them attach to other molecules. They are found in proteins involved in blood clot breakdown and in some growth signals.

Krukenberg Spindle

A vertical, spindle-shaped band of pigment deposited on the corneal endothelium, the inner surface of the cornea. It is associated with pigment dispersion in the eye and may occur with increased eye pressure.

Alternate Names:
Endothelial Pigment Spindle; Pigment Dispersion Corneal Spindle

Krukenberg's Tumor

Alternate spelling; see *Krukenberg Tumor*.

Krukenberg Tumor

A metastatic ovarian carcinoma characterized by mucin-filled signet-ring cells, most often spread from the stomach and less often from another part of the digestive tract or breast. It commonly affects both ovaries and may cause abdominal swelling, pain, or menstrual changes.

Kt/V

A number used to estimate how much urea a dialysis treatment removes. It combines the dialyzer's cleaning ability and treatment time with the person's body-water volume; clinicians use it with symptoms, fluid balance, laboratory results, and the dialysis schedule.

KTW Syndrome

Abbreviation; see *Klippel-Trenaunay Syndrome*.

Kugelberg-Welander Disease

A milder form of inherited spinal muscular atrophy, also called type 3 spinal muscular atrophy. It usually begins after 18 months of age and causes slowly worsening weakness in muscles close to the body, especially the hips and thighs. Children may have a waddling walk or trouble climbing stairs. Many walk independently, and life expectancy is often near normal with current care.

Alternate Names:
Spinal Muscular Atrophy Type 3 (SMA 3); Juvenile Spinal Muscular Atrophy

Kulchitsky Cells

In the gastrointestinal tract, these are serotonin-secreting enterochromaffin cells, a type of enteroendocrine cell. Their granules react to silver-based stains, so they are also called argentaffin cells. The name has also been used for related but distinct pulmonary neuroendocrine cells.

Alternate Names:
EC Cells; Argentaffin Cells

Kupffer Cells

Immune cells lining the small blood channels in the liver. They remove old blood cells, particles, and some germs from blood coming from the digestive organs.

Kupffer's Cell

Alternate form; see *Kupffer Cells*.

Kuru

A rare, fatal prion disease historically linked to ritual cannibalism. It causes worsening problems with balance and coordination, tremor, and other neurologic changes.

Kussmaul Breathing

A distinct, abnormal pattern of deep, rapid, and labored breathing that occurs when the body's blood becomes dangerously acidic (severe metabolic acidosis). Named after the physician who first described it, this involuntary breathing pattern is the body's automatic attempt to blow off excess carbon dioxide gas through the lungs to reduce blood acidity, commonly seen in severe diabetes crises (diabetic ketoacidosis) or kidney failure.

Kussmaul Respiration

Alternate name; see *Kussmaul Breathing*.

Kussmaul Sign

A rise or failure to fall in the pressure of the large neck veins during breathing in. It suggests that the right side of the heart cannot fill normally and may occur with severe heart failure, constrictive pericarditis, or other conditions affecting right-heart filling.

Kveim-Siltzbach Test

An old skin test once used to support the diagnosis of sarcoidosis. Material from sarcoid tissue was injected under the skin and the area was later biopsied. The test is rarely used now because of safety, availability, and accuracy concerns.

Alternate Names:
Kveim Test; Sarcoidosis Skin Test

Kwashiorkor

A form of severe acute malnutrition marked by swelling in both feet that leaves a dent when pressed; swelling may spread to the legs or other parts of the body. Poor growth, muscle wasting, skin or hair changes, and reduced ability to fight infection may also occur. Its causes are complex and are not explained by protein deficiency alone.

Kyasanur Forest Disease

A viral illness spread by ticks in parts of India. It can cause fever, headache, and muscle pain; severe cases may involve bleeding or inflammation of the brain.

Alternate Names:
KFD; Monkey Fever; Kyasanur Forest Disease Virus Infection

Kynurenine

A substance made when the body breaks down the amino acid tryptophan. It is involved in chemical signaling in the brain and immune system and may change during infection, inflammation, or some diseases.

Kyphoplasty

A minimally invasive procedure that uses a balloon to create space in a collapsed vertebral body and then injects bone cement to stabilize a painful compression fracture.

Kyphoscoliosis

A combination of sideways curvature and excessive forward rounding of the spine. Severe deformity can

reduce chest movement and lung capacity, causing breathlessness or, over time, breathing failure and high blood pressure in the lung arteries.

Kyphosis

Excessive forward rounding of the thoracic spine; a degree of this curve is normal. Causes include poor posture, Scheuermann disease, congenital vertebral changes, degeneration, or compression fractures, often related to osteoporosis. It may cause back pain or stiffness; severe curvature can restrict breathing.

Alternate Names:
Round Back

Kyrle Disease

A rare skin condition that causes large, intensely itchy bumps with hard centers. It is often associated with diabetes or chronic kidney disease.

Kytococcus

A genus of gram-positive cocci found on skin and in the environment that can rarely cause opportunistic infection.

Kytococcus Sedentarius

A skin-associated gram-positive coccus that produces enzymes linked to pitted keratolysis and can rarely cause invasive infection.

L

LAAO

Alternate name; see *Left Atrial Appendage Occlusion*.

Labbe Vein

The inferior anastomotic vein of the cerebral cortex that traverses the surface of the temporal lobe, establishing an anastomotic venous connection between the superficial middle cerebral vein (Sylvian vein) and the transverse dural venous sinus.

Alternate Names:
Inferior Anastomotic Vein; Vein of Labbé

Labetalol

A medicine that lowers blood pressure by slowing the heart and relaxing blood vessels. It is also used for severe high blood pressure during pregnancy and may cause a slow heartbeat, low blood pressure, or breathing problems in people with asthma.

Labhart-Willi Syndrome

Alternate name; see *Prader-Willi Syndrome*.

Labia

The folds of skin surrounding the entrance to the vagina and urethra, consisting mainly of the labia majora and labia minora.

Labial Sounds

Speech sounds made with one or both lips, such as the sounds in “p,” “b,” and “m.” Difficulty making them may occur with problems affecting the lips, mouth, nerves, or speech muscles.

Labia Majora

The paired outer folds of skin of the vulva that help protect the urethral and vaginal openings and contain connective tissue, glands, and fat.

Labia Minora

The paired inner folds of tissue of the vulva, lying within the labia majora and surrounding the vestibule and its openings.

Labiaplasty

Surgical reshaping or reduction of the labia, usually the labia minora, performed for functional symptoms, reconstruction, or selected cosmetic indications. Risks include pain, bleeding, infection, scarring, and altered sensation.

Labile

Easily or rapidly changing, such as blood pressure, blood sugar, mood, or symptoms. Labile measurements may reflect illness, medicines, stress, hormones, or changing treatment and often require repeated observation.

Labile Hypertension

Blood pressure that changes substantially over short periods. Stress, pain, medicines, illness, and measurement conditions can contribute, so repeated properly performed readings help confirm the pattern.

Lability

A tendency to change easily or unpredictably, such as rapidly shifting emotions or blood pressure. Its medical importance depends on the symptom, sever-

ity, and underlying cause.

Labium

A lip-like anatomical structure; in obstetrics and gynecology, usually one of the labia of the vulva.

Labium Majus

One of the paired outer folds of the vulva containing skin, connective tissue, glands, vessels, and nerves and protecting the more internal genital structures.

Labium Minus

One of the paired inner folds of the vulva bordering the vestibule and helping protect the urethral and vaginal openings.

Labor

The process in which regular contractions open the cervix and lead to delivery of the baby and placenta. It includes the stages of cervical opening, birth of the baby, and delivery of the placenta.

Labor and Delivery

The process of uterine contractions, cervical dilation, birth of the baby, delivery of the placenta, and immediate postpartum care.

Labor and Delivery Complications

Problems arising during labor, birth, or the immediate postpartum period, including abnormal fetal position, prolonged labor, excessive bleeding, infection, hypertensive emergencies, or fetal distress.

Laboratory

A facility or department where clinical specimens are examined using microbiologic, hematologic, chemical, molecular, or other diagnostic methods.

Laboratory Medicine

The medical specialty that performs and interprets tests on blood, tissue, and other specimens. Its disciplines include clinical chemistry, hematology, microbiology, immunology, and molecular diagnostics. Results support diagnosis, screening, prognosis, treatment selection, and monitoring.

Laboratory Procedure

A method used to collect, prepare, examine, or measure a patient sample such as blood, urine, tissue, or a swab. Results can help diagnose disease or guide treatment and are considered alongside clinical findings.

Laboratory Test

An examination of a body fluid, tissue, or other specimen to obtain information for diagnosis, monitoring, screening, or treatment.

Labor Complication

A maternal or fetal problem occurring during labor or delivery, such as abnormal labor progress, hemorrhage, infection, fetal distress, or malpresentation, requiring assessment and management based on the cause.

Labor Dystocia

Labor that progresses more slowly than expected or stops progressing during cervical dilation or the pushing stage. It may result from ineffective uterine contractions, the baby's position or size, or factors involving the pelvis. Assessment considers the stage of labor and maternal and fetal condition.

Labor Pain

Pain caused by uterine contractions, cervical dilation, and stretching of pelvic tissues during labor; its intensity and management vary with labor stage and individual factors.

Labor: Signs And Symptoms

Labor is the process of regular uterine contractions that opens the cervix and leads to birth. Possible signs include increasingly regular contractions, rupture of the membranes, a blood-stained mucus discharge, pelvic pressure, and back pain. Heavy bleeding, reduced fetal movement, severe pain, or other complications may occur.

Labour

The process of childbirth, consisting of regular uterine contractions that cause progressive cervical effacement and dilation, leading to delivery of the

baby and placenta.

Labra

The plural of labrum: tough rings of tissue around certain joint sockets, especially the shoulder and hip. They deepen the socket, improve stability, and help distribute pressure during movement.

Labral Tear

A tear in the fibrocartilaginous rim of a joint socket, commonly the shoulder or hip, causing pain, clicking, instability, or reduced range of motion.

Lab Results

Measurements from blood, urine, tissue, or other specimens used with the history and examination to evaluate health, diagnose disease, monitor treatment, or assess risk; an abnormal result is not a diagnosis by itself.

Labrum

A ring of tough, flexible tissue around the socket of a joint. It deepens and stabilizes the shoulder or hip socket.

Labyrinth

The inner-ear system that contains the cochlea for hearing and the balance organs that sense head movement and position. Disease or injury can cause dizziness, unsteadiness, ringing, or hearing loss.

Labyrinth Disorder

A problem affecting inner-ear hearing or balance structures, potentially causing spinning sensations, nausea, unsteadiness, hearing changes, or abnormal eye movements.

Labyrinthine Membrane

The delicate, fluid-containing system inside the inner ear that contains the organs for hearing and balance. Injury or abnormal fluid pressure can cause dizziness, hearing loss, or ringing in the ear.

Labyrinthine Positional Nystagmus

Involuntary rhythmic eye movements triggered by head position or movement because of abnormal vestibular signaling; evaluation distinguishes peripheral inner-ear causes from central neurologic causes.

Labyrinthitis

Inflammation of the inner ear's hearing and balance parts. It can cause sudden spinning dizziness, unsteadiness, nausea, ringing, and sometimes hearing loss.

Laceration

A torn wound caused by blunt or irregular force. It may involve only the skin or extend into fat, muscle, tendons, nerves, or blood vessels; deep, gaping, dirty, or heavily bleeding wounds may need closure or other treatment.

Laceration Suture and Staple Care

Care of a repaired wound closed with sutures or staples, including protection, cleaning, monitoring for infection or wound separation, and removal when indicated. The approach and timing depend on wound location, closure method, and healing.

Alternate Names:
Suture Aftercare; Staple Aftercare; Laceration Closure Aftercare

Lachman Sign

Alternate name; see *Lachman Test*.

Lachman Test

A knee examination in which the lower leg is gently pulled forward while the knee is slightly bent. Too much movement may suggest an injury to the anterior cruciate ligament.

Lachrymal

Relating to tears or the structures that produce and drain them; also spelled lacrimal.

Lacosamide

An antiseizure medicine used mainly for focal seizures. It may cause dizziness, double vision, poor coordination, or changes in the heart's electrical rhythm.

Lacquer Poisoning

Harm from swallowing or breathing lacquer or its solvents. It may irritate the mouth and lungs, cause dizziness or drowsiness, and cause severe lung injury if liquid enters the lungs.

Lacrimal

Relating to tears or the lacrimal glands and drainage passages.

Lacrimal Apparatus

The glands and passages that make, spread, and drain tears. It includes the tear gland, small openings near the inner eyelids, the tear sac, and the duct that drains tears into the nose.

Lacrimal Disease

A disorder of the tear-producing or tear-draining system, including dry eye, dacryocystitis, obstruction, inflammation, or abnormal tearing.

Lacrimal Duct

A drainage channel that carries tears from the lacrimal sac into the nasal cavity. Blockage can cause watering of the eye, recurrent infection, swelling near the inner corner, or discharge.

Lacrimal Gland

One of two glands above the outer part of the eye that make the watery part of tears. The tears spread across the eye and then drain through passages near the inner corner.

Lacrimal Gland Tumor

A benign or malignant growth arising in the tear-producing lacrimal gland, often causing swelling, pain, or displacement of the eye.

Lacrimal Sac

A small sac at the inner corner of the eye that collects tears before they pass through the lacrimal duct into the nose.

Lacrimation

Production and release of tears by the lacrimal glands; excessive tearing may result from irritation, allergy, infection, or blocked tear drainage.

La Crosse Encephalitis

A mosquito-borne viral encephalitis caused by La Crosse virus, usually affecting children and causing fever, headache, seizures, or altered consciousness.

Lactam

A ring-shaped chemical structure found in some medicines. Beta-lactam antibiotics use this structure to weaken bacterial cell walls, but allergies and bacterial resistance can limit their use.

Lactase

An enzyme in the small intestine that breaks lactose, the natural sugar in milk, into absorbable sugars. Low lactase can cause bloating, cramps, gas, diarrhea, or discomfort after dairy foods.

Lactase Deficiency

Reduced activity of the enzyme lactase in the small intestine. It may cause lactose malabsorption and symptoms of lactose intolerance, but not everyone with low lactase has symptoms.

Lactate

A product of cellular metabolism measured in blood. An increased level may occur with strenuous exercise, impaired oxygen delivery, infection, medicines, liver disease, or other conditions; its significance varies with the clinical context.

Lactate Dehydrogenase

An enzyme found in many body tissues. Its blood level may rise when cells are damaged, but the test does not identify the cause by itself.

Lactate Dehydrogenase Test

A blood test measuring lactate dehydrogenase, an enzyme released when cells are injured; increased activity is nonspecific and may occur with hemolysis, liver disease, muscle injury, infection, or malignancy.

Lactation

The production and release of breast milk after childbirth. Early milk, called colostrum, is followed by mature milk; hormones help make and release the milk.

Alternate Names:
Milk Secretion

Lactational Amenorrhea

The temporary absence of menstrual periods during breastfeeding, often because breastfeeding delays the return of ovulation. As a contraceptive method, it is effective only while the person has no periods, is fully or nearly fully breastfeeding, and is less than six months postpartum.

Lactational Mastitis

Alternate name; see *Mastitis*.

Lactation Disorder

A problem with making, releasing, or transferring breast milk after childbirth. Examples include low supply, excess milk, painful engorgement, mastitis, or difficulty with the baby's latch; assessment considers both parent and infant.

Lactation Nutrition

The nutritional needs of a person who is breastfeeding, including enough energy and nutrients to support their health and milk production.

Lacteals

Tiny lymph vessels in the lining of the small intestine that absorb most digested fats and fat-soluble vitamins. They carry these nutrients through the lymph system before they enter the bloodstream.

Lactic Acid

The protonated form of lactate, a product of normal cellular metabolism. At the body's usual pH, nearly all of this compound is present as lactate rather than lactic acid; blood tests measure lactate.

Lactic Acidosis

A metabolic acidosis in which elevated blood lactate contributes to a low blood pH. It can result from poor oxygen delivery to tissues, impaired lactate use or clearance, some medicines, seizures, or severe illness; an elevated lactate alone is not lactic acidosis.

Lactic Acid Test

A test that measures lactate, usually in blood and sometimes in cerebrospinal fluid. It can help assess lactic acidosis or conditions that raise lactate, but the result alone does not identify the cause.

Lactiferous Duct

A duct that carries milk from a mammary-gland lobe toward and through the nipple. Ducts branch within the breast and open separately at the nipple.

Alternate Names:
Galactophore; Mammary Duct

Lactobacillus

A genus of bacteria that produces lactic acid and normally forms part of the healthy vaginal and intestinal microbiota; some species are used as probiotics.

Lactoferrin

Lactoferrin is an iron-binding glycoprotein in milk and mucosal secretions that limits microbial iron access and contributes to innate immune defense.

Lactoflavin

Traditional chemical name for riboflavin, an essential water-soluble B-complex vitamin vital for cellular energy production. See *Vitamin B2*.

Lactose

The principal sugar in milk, composed of glucose and galactose. Lactase in the small intestine digests it.

Lactose Fermentation

The ability of bacteria to break down lactose and produce acid or gas. It is used in the laboratory to help identify different types of bacteria.

Lactose Intolerance

A condition in which the body cannot fully digest lactose, the sugar in milk and dairy products, because it does not make enough lactase. It may cause bloating, gas, abdominal pain, nausea, or diarrhea after consuming lactose.

Lactose Tolerance Test

A medical test used to determine whether the body can properly digest lactose, the natural sugar found in milk and dairy products. After fasting, the patient drinks a liquid containing lactose, and blood samples are drawn over the next two hours to measure blood sugar levels. If the body makes enough of the enzyme lactase, blood sugar will rise normally as lactose is broken down into glucose; if blood sugar levels fail to rise, it indicates lactose malabsorption or intolerance.

Lactose Tolerance Tests

Plural form; see *Lactose Tolerance Test*.

Lactulose

A medicine that softens stool by drawing water into the bowel. It is also used to lower harmful ammonia levels in some people with severe liver disease. Gas and diarrhea can occur.

Lacuna

A small space or cavity in tissue, such as a space containing an osteocyte in bone.

Lacunar Infarct

A small stroke in a deep part of the brain caused by blockage of one of the small arteries supplying that area. It can affect movement, feeling, speech, or coordination, depending on the location.

Alternate Names:
Lacunar Stroke; Subcortical Small Vessel Infarction

Lacunar Stroke

A small ischemic stroke caused by blockage of a tiny artery deep in the brain, often producing weakness, numbness, clumsiness, or speech problems.

Lacunar Syndromes (Small-Vessel Strokes)

Clinical patterns caused by small deep cerebral infarcts in penetrating-artery territories. Recognized patterns include pure motor hemiparesis, pure sensory stroke, sensorimotor stroke, ataxic hemiparesis, and dysarthria–clumsy-hand syndrome.

Ladd Bands

Abnormal bands of tissue present at birth that can cross and squeeze the first part of the small intestine when the bowel is in an abnormal position. They may cause green vomiting and blockage in an infant and are released during the Ladd procedure.

Alternate Names:
Ladd's Peritoneal Bands; Ladd Fibrous Bands

Ladd Procedure

An operation for a child whose intestines developed in an abnormal position and may twist. The surgeon untwists the intestine, releases bands causing blockage, and broadens its attachment to reduce future twisting.

Alternate Names:
Ladd Operation; Ladd's Procedure

Laetrile

A semisynthetic amygdalin-related compound promoted as an alternative cancer treatment; credible evidence has not established anticancer benefit, and cyanide poisoning is a serious risk.

Lafora Disease

A rare inherited epilepsy that usually begins during adolescence and progressively worsens. Seizures, brief muscle jerks, visual symptoms, memory problems, and loss of physical or thinking abilities may occur.

Lagophthalmos

Inability to close the eyelids completely. Exposed cornea can become dry, irritated, scratched, infected, or damaged, especially during sleep, so lubricating treatment and protection may be needed.

LAM

Abbreviation for lymphangioleiomyomatosis, a rare cystic lung disease; see *Lymphangioleiomyomatosis*.

LAMA

Usually, a long-acting muscarinic antagonist: an inhaled medicine that blocks signals that tighten the airways and is used mainly for COPD. In some hospital records, LAMA also means "left against medical advice."

Lambda

A landmark on the back of the skull where two skull seams meet. It is used to describe head shape and the position of nearby structures, especially in newborn examinations and imaging.

Lambert-Eaton Myasthenic Syndrome

An autoimmune disorder in which antibodies reduce calcium entry into nerve endings, weakening the signal to muscles. It causes weakness, often in the hips and shoulders, reduced reflexes, and sometimes dry mouth; strength may briefly improve with repeated movement. It can be associated with small-cell lung cancer.

Lamellar

Made of thin layers or plates. The word may describe the organized layers of mature bone, the skin barrier, or structures in the eye and nervous system. Its exact meaning depends on the body structure being described.

Lamellar Body

A small storage structure inside certain cells that contains layered fats. In lung cells, it stores and releases surfactant, the substance that helps keep the tiny air sacs open.

Lamellar Bone

Mature bone made of organized layers of mineralized tissue. It forms most adult compact and spongy bone and provides strength while being continually remodeled.

Lamellar Ichthyosis

An inherited skin disorder present from birth that causes dry skin covered with large, dark, plate-like scales over much of the body, including the arms and legs. It may reduce sweating and cause overheating, and can affect the hair, nails, eyes, or palms and soles.

Lamin

A structural protein forming part of the nuclear lamina, which supports the inner surface of the cell nucleus.

Lamina

A flat piece of bone that forms part of the back of a vertebra. The two laminae help complete the bony arch around the spinal cord and can be removed during some spine operations.

Lamina Cribrosa

A fenestrated, mesh-like collagenous sheet of the sclera through which unmyelinated axons of retinal ganglion cells exit the eye to form the optic nerve; the primary site of axonal injury and excavation in glaucoma.

Lamina Propria

A thin layer of supporting tissue beneath the inner lining of organs such as the intestine, airways, and bladder. It contains small blood vessels, immune cells, glands, and connective tissue.

Laminectomy

An operation that removes part of a spinal bone to make more room for the spinal cord or nerves. It may be used for spinal narrowing, a tumor, or selected disk problems.

Laminin

A protein in the supporting framework around cells that helps cells attach to underlying tissue. It contributes to tissue structure, development, repair, and the filtering barrier in some organs.

Lamivudine

Lamivudine is a nucleoside reverse-transcriptase inhibitor used with other antiretrovirals for HIV and as an antiviral for chronic hepatitis B; resistance and rare lactic acidosis or hepatic complications require monitoring.

Lamotrigine

Lamotrigine is an antiseizure medicine that inhibits voltage-gated sodium channels and is also used for bipolar-maintenance treatment; rapid dose escalation increases the risk of serious rash including Stevens–Johnson syndrome.

Lancet

A small, sterile, usually single-use device with a sharp point used to puncture the skin and obtain a capillary-blood sample. Lancets are commonly used for fingertip glucose testing and other point-of-care blood tests.

Alternate Names:
Blood Lancet; Fingerstick Lancet

Landolt Ring

A ring-shaped symbol with a gap used to test visual sharpness. The person identifies which direction the gap faces; smaller symbols indicate better visual acuity.

Langerhans' Cell

An immune cell in the skin that captures foreign substances and helps activate T-cell responses.

Langerhans Cell Histiocytosis

A rare clonal disorder in which abnormal Langerhans-like cells accumulate in tissues and form lesions, commonly in bone, skin, or lungs and sometimes in lymph nodes or the pituitary gland. It may affect one or several organs.

Langerhans-Cell Histiocytosis

Alternate spelling; see *Langerhans Cell Histiocytosis*.

Langerhans Cells

Immune cells in the outer skin that capture foreign substances and help start immune responses. They connect skin defenses with nearby lymph tissue and can contribute to allergic or inflammatory reactions.

Langer Lines

Natural lines of skin tension that reflect the predominant orientation of collagen fibers in the dermis and may influence surgical scar direction.

Language Barrier

Difficulty communicating because a patient and healthcare professional do not share a language well enough for safe understanding. A trained interpreter helps explain symptoms, consent, instructions, and risks.

Language Development

The gradual development of understanding, sounds, words, grammar, and communication during childhood. Delays may be related to hearing loss, developmental conditions, neurologic disease, or limited language exposure.

Language Disorder

A developmental or acquired impairment in understanding, producing, or using spoken, written, or signed language that affects communication and daily function.

Language Therapy

Treatment that improves understanding, expression, reading, writing, or other language skills after developmental or acquired impairment.

Lanolin

Lanolin is a waxy substance derived from sheep wool used as an emollient and in topical products; allergy or irritation can occur.

Lanolin Poisoning

Swallowing a small amount of lanolin, a wool-derived moisturizer, usually causes little more than stomach upset. Large amounts or products with

added medicines can cause more serious poisoning.

Lansoprazole

A medicine that strongly reduces stomach acid. It is used for heartburn, ulcers, and some H. pylori infections; long-term use may affect mineral or vitamin levels and infection risk.

Lanthanum

A chemical element whose carbonate salt can bind dietary phosphate and lower phosphate absorption in people with advanced kidney disease.

Lanugo

Fine, soft hair that grows all over the body of a fetus and is typically shed before birth.

Lanugo Hair

Lanugo: the fine, soft, usually unpigmented hair covering a fetus and sometimes present on a premature newborn; it is normally shed before or shortly after birth.

Laparoscope

A slender instrument with a light and camera used to view the abdominal or pelvic cavity through a small incision during minimally invasive surgery.

Laparoscopic Cholecystectomy

Surgical removal of the gallbladder through small abdominal incisions using a laparoscope and instruments, commonly performed for symptomatic gallstones or gallbladder inflammation.

Laparoscopic Colectomy

Laparoscopic colectomy is removal of part or all of the colon through small incisions using a camera and specialized instruments.

Laparoscopic Gallbladder Removal

Surgery to remove the gallbladder through several small abdominal openings using a camera and instruments. It commonly treats symptomatic gallstones or gallbladder inflammation; bleeding, infection, bile leakage, and injury to bile ducts are possible.

Laparoscopic Gastric Banding

A bariatric operation that places an adjustable band around the upper stomach to create a small pouch and restrict food passage; it is less commonly performed than other bariatric procedures.

Laparoscopic Hysterectomy

Removal of the uterus using laparoscopic instruments through small abdominal incisions. The cervix, fallopian tubes, and ovaries may or may not also be removed; the approach and extent depend on the indication, anatomy, and surgical plan.

Laparoscopic Nephrectomy

Removal of part or all of a kidney using a camera and instruments through small incisions. It may be done for cancer, severe kidney disease, or living donation; an adrenal gland is removed only when indicated.

Laparoscopic Surgery

Surgery performed through small cuts using a camera and long instruments. It often causes less pain and faster recovery than open surgery, but still has risks such as bleeding, infection, and injury to nearby organs.

Laparoscopy

Keyhole surgery that uses a small camera and instruments through small cuts in the abdomen or pelvis. It can be used to look for a problem, take a sample, or treat conditions such as appendicitis, gallstones, endometriosis, or an ectopic pregnancy. Recovery is often easier than after open surgery, but risks and recovery time depend on the procedure.

Alternate Names:
Keyhole Surgery; Minimally Invasive Abdominal Surgery; Diagnostic Laparoscopy; Laparoscopic Surgery

Laparotomy

An operation that uses a larger cut in the abdomen to reach the abdominal or pelvic organs.

Lapatinib

Lapatinib is a targeted cancer medicine that blocks HER2 and epidermal-growth-factor receptors and is used for selected advanced breast cancers.

Lapatinib Ditosylate

Lapatinib ditosylate is the salt form of lapatinib, a targeted medicine used for selected HER2-positive breast cancers.

Laplace Law

A principle describing how pressure, radius, and wall thickness affect tension and stress in a hollow structure. For example, as a heart chamber dilates, its wall must develop greater tension to generate the same pressure.

Large Airway Obstruction

A blockage in the windpipe or large breathing tubes. It can cause noisy breathing, shortness of breath, and difficulty clearing mucus and may be caused by narrowing, a tumor, or weakness of the airway wall.

Large Bowel Obstruction

A blockage in the colon, commonly caused by cancer, twisting of the bowel, scar tissue, or diverticular disease. It can cause increasing swelling, cramping, vomiting, and inability to pass stool or gas.

Large Bowel Resection

Surgical removal of a segment of the colon or rectum, followed by reconnection of the bowel or creation of a stoma when necessary to treat cancer, obstruction, ischemia, inflammation, or other disease.

Large Colon

In horses, the large colon is a major part of the large intestine where water and electrolytes are absorbed and digestive contents are moved onward.

Large For Gestational Age

A fetus or newborn larger than expected for the number of weeks of pregnancy, usually above the 90th percentile. Maternal diabetes, family size, and excess pregnancy weight gain can contribute and may increase birth complications.

Large Intestine

The final part of the digestive tract, extending from the small intestine to the rectum. It absorbs water and helps form and move stool.

Laron Syndrome

A rare inherited growth disorder in which the body cannot respond properly to growth hormone. It causes severe short stature, characteristic facial features, and very low levels of the growth signal needed for normal bone development.

Larva Currens From Strongyloides

A rapidly moving, itchy skin rash caused by Strongyloides larvae moving through the skin. It often appears around the buttocks or trunk and may indicate ongoing intestinal infection requiring antiparasitic treatment.

Larva Migrans

A condition caused by migrating larval parasites in human tissues, including cutaneous larva migrans in the skin and visceral larva migrans in internal organs.

Laryngeal

Relating to the larynx, the organ in the throat containing the vocal cords and helping protect the airway.

Laryngeal Botulinum Toxin Injection

Targeted electromyography- or laryngoscopy-guided injection of botulinum neurotoxin into specific intrinsic laryngeal muscles (such as the thyroarytenoid or posterior cricoarytenoid) to reduce involuntary spasms in focal laryngeal dystonias, predominantly adductor or abductor spasmodic dysphonia.

Laryngeal Cancer

Cancer of the larynx, or voice box. Tobacco, alcohol, and some HPV infections increase risk. Persistent hoarseness, painful or difficult swallowing, noisy breathing, or a neck lump may occur.

Laryngeal Candidiasis

A yeast infection of the voice box, usually causing hoarseness, throat pain, or difficulty swallowing. It is more likely with weakened immunity or inhaled steroid use and may require examination of the larynx and antifungal treatment.

Laryngeal Carcinoma

Laryngeal carcinoma is cancer arising in the voice box and may cause hoarseness, swallowing difficulty, pain, or breathing problems.

Laryngeal Cartilage

Laryngeal cartilage forms the structural framework of the voice box, maintains the airway, and supports vocal-fold movement.

Laryngeal Cleft

A laryngeal cleft is a congenital opening between the airway and esophagus that can allow aspiration and cause feeding or breathing problems.

Laryngeal Edema

Swelling of the voice box that can narrow the airway and cause hoarseness, a harsh high-pitched noise when breathing in, or difficulty breathing. Causes include allergy, infection, injury, or a breathing tube.

Laryngeal Fistula

An abnormal passage between the voice box and nearby tissue or the swallowing tract. It can allow food or saliva to enter the airway and cause coughing, repeated chest infections, or breathing problems.

Laryngeal Hemorrhage

Bleeding within or around the larynx, which may result from trauma, instrumentation, vocal strain, vascular lesions, infection, or tumor and can threaten the airway.

Laryngeal Masks

Laryngeal masks are supraglottic airway devices placed above the vocal cords to maintain ventilation during anesthesia or emergencies.

Laryngeal Mucositis

Inflammation and open sores in the lining of the voice box, often after radiation, chemotherapy, infection, or irritation. It can cause hoarseness, throat pain, painful swallowing, or breathing difficulty.

Laryngeal Nerve

A branch of the vagus nerve supplying the larynx; injury can cause hoarseness, swallowing difficulty, or breathing problems.

Laryngeal Nerve Damage

Injury to the recurrent or superior laryngeal nerves causing hoarseness, vocal-cord weakness, swallowing difficulty, or airway compromise. Common causes include thyroid or neck surgery, malignancy, trauma, and compression along the nerve pathway.

Laryngeal Obstruction

Partial or complete blockage of the laryngeal airway caused by edema, foreign body, tumor, trauma, infection, vocal-cord dysfunction, or other structural disease.

Laryngeal Papillomatosis

A condition in which human papillomavirus (HPV) causes noncancerous, wart-like growths in the voice box or airways. The growths may cause hoarseness or make breathing difficult.

Alternate Names:
Recurrent Respiratory Papillomatosis

Laryngeal Prosthesis

A device used to help restore speech after removal of the larynx, commonly through a one-way valve placed between the trachea and esophagus.

Laryngeal Stridor

A harsh, high-pitched noise caused by turbulent airflow through a narrowed upper airway, often most noticeable during inspiration.

Laryngeal Web

A laryngeal web is a thin membrane across part of the airway, usually congenital or acquired after

injury, causing hoarseness or airway narrowing.

Laryngectomee

A person who has undergone laryngectomy, surgical removal of all or part of the larynx; total laryngectomy separates the airway from the mouth and nose.

Laryngectomy

Surgery to remove part or all of the larynx, usually for cancer or severe structural disease. After total removal, breathing occurs permanently through an opening in the neck; partial surgery may preserve some voice and swallowing.

Laryngectomy Tube

A tube placed in the neck opening after larynx surgery to help keep the airway open and allow suctioning or ventilation when needed. Mucus blockage, bleeding, infection, and tissue overgrowth can occur.

Laryngitis

Inflammation of the voice box that causes hoarseness or temporary voice loss. Common causes include viral infection, voice overuse, smoke or other irritation, and reflux.

Laryngocele

An air-filled pouch formed when a small space beside the vocal cords becomes enlarged. It may cause hoarseness, a neck swelling that changes with pressure, coughing, or blockage of the airway.

Laryngomalacia

A birth condition in which soft tissue above an infant's vocal cords partly collapses during breathing in, causing noisy breathing. It often improves with growth, but feeding trouble, pauses in breathing, or poor growth may occur.

Laryngopharyngeal Reflux

Backflow of stomach contents into the throat and voice box. It may cause hoarseness, frequent throat clearing, cough, a lump-like feeling, excess mucus, or throat tightness, often without typical heartburn.

Laryngopharynx

The lower part of the throat behind the voice box, leading to the esophagus. It helps direct swallowed food away from the airway and is a site where some throat cancers can develop.

Laryngoscope

An instrument used to see the throat and vocal cords, especially while placing a breathing tube. Common blades are curved Macintosh and straight Miller types; use can injure teeth, lips, or throat.

Laryngoscopy

An examination of the voice box and nearby throat using a mirror or a thin camera passed through the mouth or nose. It helps investigate hoarseness, swallowing problems, airway narrowing, bleeding, or suspected tumors.

Laryngoscopy And Nasolaryngoscopy

An examination of the voice box and nearby airway using a small rigid or flexible camera passed through the mouth or nose. It helps investigate hoarseness, swallowing difficulty, noisy breathing, bleeding, or a suspected growth.

Laryngospasm

Sudden tightening of the folds inside the voice box that partly or fully blocks breathing. It may be triggered by saliva, blood, reflux, a breathing tube, or anesthesia and can cause choking or difficulty breathing.

Laryngostenosis

Narrowing of the voice box, or larynx, that can restrict breathing. Causes include scarring after intubation, injury, inflammation, tumors, and congenital narrowing; noisy breathing or breathlessness may occur.

Laryngotracheobronchitis

Alternate name; see *Croup*.

Larynx

The voice box in the front of the neck between the

throat and windpipe. It contains the vocal cords, produces sound, helps keep food and liquid out of the lungs, and regulates airflow during breathing.

Larynx Cancer

Laryngeal cancer is a malignant tumor of the voice box and may cause persistent hoarseness, swallowing pain, neck mass, ear pain, cough, or breathing difficulty. Examination and biopsy are used for diagnosis; treatment depends on site and stage.

Alternate Names:
Laryngeal Carcinoma; Cancer of the Voice Box

Larynx Disease

Any disorder affecting the larynx, including inflammation, infection, structural lesions, vocal-cord dysfunction, neurologic disease, or cancer.

Larynx Muscle

A muscle of the voice box that moves the vocal folds and helps protect the airway and produce sound.

Larynx Neoplasm

An abnormal growth in the voice box. It may be noncancerous or cancerous and can cause hoarseness, swallowing difficulty, pain, breathing problems, or a neck lump.

Lasegue Sign

A physical examination test for lumbosacral nerve root irritation (radiculopathy / sciatica, particularly L4, L5, or S1); with the patient supine, passive straight leg raising of the symptomatic leg provokes sharp radicular pain radiating down the posterior leg below the knee between 30 and 70 degrees of hip flexion.

Alternate Names:
Straight Leg Raise Test; SLR Test

Laser

A device that produces a concentrated beam of light. Depending on its wavelength and power, it can measure tissue, cut or seal tissue, remove abnormal growths, or treat selected eye and skin conditions.

Laser Ablation

The use of focused laser energy to heat, destroy, or seal targeted tissue. The technique is used in selected vascular, ophthalmic, dermatologic, and other procedures.

Laser-Assisted In Situ Keratomileusis

Alternate name; see *LASIK*.

Laser Assisted Uvula Palatoplasty

A procedure using laser energy to reshape or remove selected soft-palate and uvula tissue, intended mainly to reduce snoring in carefully selected patients.

Alternate Names:
LAUP

Laser Fiber

A thin optical fiber that carries laser energy into the body during treatment. It can break urinary stones, destroy selected tumors, seal blood vessels, or treat other targeted tissues.

Laser Photocoagulation

A laser treatment that seals or destroys leaking or abnormal blood vessels, especially in the retina, helping limit bleeding, swelling, or damaging new vessel growth.

Laser Eye Surgery

Refractive corneal surgeries that use precise excimer or femtosecond lasers to reshape the cornea and correct myopia, hyperopia, or astigmatism; see *LASIK Eye Surgery* and *Refractive Surgery*.

Laser Surgery

Laser surgery uses a focused beam of light to cut, remove, seal, or reshape tissue in selected procedures.

Laser Surgery For The Skin

Use of concentrated light to remove, vaporize, seal, or reshape selected skin tissue. It may treat scars, abnormal blood vessels, unwanted hair, or some lesions; redness, pigment change, burns, scarring, and infection are possible.

Laser Therapy

Laser therapy uses controlled light energy to treat selected skin, eye, vascular, dental, or other medical conditions.

Laser Therapy For Cancer

Use of an intense, focused beam of light to destroy or shrink selected cancer tissue or control bleeding and blockage. It is useful only for certain tumors and sites; treatment may be combined with surgery, medicines, or radiation.

Laser Trabeculoplasty

Alternate name; see *Trabeculoplasty*.

LASIK

Laser-assisted in situ keratomileusis is a refractive surgery in which a corneal flap is created and an excimer laser reshapes the underlying corneal tissue to correct myopia, hyperopia, or astigmatism.

LASIK Eye Surgery

Alternate name; see *LASIK*.

Lassa Fever

A viral illness that can cause fever, weakness, vomiting, bleeding, and damage to several organs. It is usually spread by contact with urine or droppings of infected rodents in parts of West Africa and sometimes by contact with body fluids.

Lassa Virus

An arenavirus that causes Lassa fever, a potentially severe hemorrhagic illness acquired mainly through contact with infected rodent excreta or body fluids.

Lassitude

A state of marked fatigue, weakness, or lack of energy that may occur with systemic illness, anemia, endocrine disease, infection, medication effects, or psychological conditions.

Last Menstrual Period

The first day of the most recent normal menstrual bleeding. Clinicians use it to estimate how many weeks a pregnancy has lasted and the expected delivery date, but the estimate is less reliable with irregular cycles or uncertain dates.

Latanoprost

Latanoprost is a prostaglandin F2-alpha analogue eye drop that increases uveoscleral outflow and lowers intraocular pressure in glaucoma or ocular hypertension; iris pigmentation and eyelash growth may occur.

Latarjet Procedure

Shoulder-stabilization surgery that moves part of the coracoid bone, with attached tissue, to the front edge of the shoulder socket. It helps prevent repeated dislocation when bone loss or failed previous treatment makes other repairs unsuitable.

Late Decelerations

A repeated, gradual slowing of a baby's heart rate that starts after a uterine contraction begins and recovers after the contraction ends. It can indicate reduced oxygen transfer through the placenta during labor.

Late Effects

Health problems appearing months or years after cancer treatment, including heart, lung, hormone, fertility, nerve, bone, or second-cancer complications.

Late Gadolinium Enhancement

A cardiac MRI finding of increased signal in areas where gadolinium contrast has accumulated in expanded extracellular space, often reflecting myocardial scar or fibrosis and sometimes inflammation or infiltration. Its distribution helps characterize the underlying tissue injury.

Alternate Names:
LGE; Delayed Enhancement

Latent

Present but inactive, hidden, or not currently producing symptoms, as in latent tuberculosis infection or a latent virus.

Latent Autoimmune Diabetes In Adults

Diabetes caused by the immune system gradually damaging insulin-producing cells in an adult. It may first resemble type 2 diabetes, but insulin production usually declines over time and insulin treatment may eventually be needed.

Alternate Names:
Type 1.5 Diabetes; Late-Onset Autoimmune Diabetes of Adulthood

Latent Infection

Persistent infection in which an infectious agent remains in a host in a nonreplicating or intermittently replicating state without active clinical disease. Reactivation can occur when immune control is impaired, as in latent tuberculosis.

Latent Phase Of Labor

The early part of the first stage of labor, beginning with regular contractions and gradual cervical change before active labor. The transition to active labor is assessed clinically, and the duration varies widely between individuals.

Latent Syphilis

Latent syphilis is syphilis infection without current symptoms, identified by testing and classified by duration to guide treatment and follow-up.

Latent Tuberculosis

Infection with *Mycobacterium tuberculosis* without clinical evidence of active tuberculosis disease. People typically have no symptoms and are not infectious, but the infection may later progress to active disease.

Latent Tuberculosis Infection

An immune response to Mycobacterium tuberculosis without clinical or microbiologic evidence of active disease. It is usually asymptomatic and not contagious, but it can reactivate; treatment decisions depend on age, immune status, exposure risk, test results, and drug interactions.

Late-Onset Hypogonadism

A condition in which an older man has symptoms of low testosterone and repeatedly low early-morning blood levels. Symptoms may include reduced sexual desire, erection problems, tiredness, reduced muscle strength, increased body fat, weak bones, or low mood. Other illnesses and medicines can also affect symptoms and testosterone levels.

Alternate Names:
LOH; Age-Related Testosterone Deficiency; Testosterone Deficiency Syndrome

Late Preterm Birth

Births occurring from 34 weeks 0 days through 36 weeks 6 days of gestation. These infants have greater risks than term infants of respiratory, temperature, glucose, jaundice, feeding, and readmission problems.

Alternate Names:
Late Preterm Delivery

Lateral

Toward or located at the side, away from the body's midline. For example, the ears are lateral to the nose; the opposite term is medial.

Lateral Canthotomy And Cantholysis

An emergency operation that opens the outer corner of the eyelids and releases tight supporting tissue around the eye. It lowers dangerous pressure after severe eye injury or bleeding and may protect vision.

Lateral Collateral Ligament Injury

A stretch or tear of the strong ligament on the outer side of the knee, often caused by a blow to the inner knee or a force pushing the lower leg inward. It causes outer-knee pain and may make the knee unstable.

Lateral Cuneiform

One of three small bones in the middle of the foot. It lies between the other cuneiform bones and the cuboid, joins the third toe bone, and helps support the foot's arch.

Lateral Cutaneous Nerve of the Thigh

A sensory nerve arising from the L2 and L3 ventral rami of the lumbar plexus that passes under the lateral end of the inguinal ligament to provide sensation to the anterolateral thigh; entrapment here causes meralgia paresthetica.

Alternate Names:
Lateral Femoral Cutaneous Nerve; LFCN

Lateral Decubitus Position

A position in which a person lies on either side of the body. The side used depends on the examination or procedure.

Lateral Elbow Tendinopathy

Alternate name; see *Lateral Epicondylitis*.

Lateral Epicondylitis

Pain and irritation of the tendons attached to the outer elbow, often from repeated gripping or wrist movement. Despite the name, it is usually a tendon problem rather than inflammation of the bone attachment alone. Also called *tennis elbow*.

Alternate Names:
Lateral Elbow Tendinopathy

Lateral Epicondylosis

Alternate name; see *Lateral Epicondylitis*.

Lateral Geniculate Nucleus

A laminated thalamic sensory relay nucleus that receives visual information directly from retinal ganglion cell axons via the optic tract and projects through the optic radiations (geniculocalcarine tract) to the primary visual cortex (Brodmann area 17).

Alternate Names:
LGN; Lateral Geniculate Body

Lateral Medullary Syndrome

A stroke in the outer part of the lower brainstem. It may cause dizziness, poor coordination, trouble swallowing or speaking, loss of feeling on one side of the face, and loss of pain or temperature sensation on the opposite side of the body.

Alternate Names:
Wallenberg Syndrome; PICA Syndrome

Lateral Meniscus

The lateral meniscus is a crescent-shaped cartilage pad on the outer side of the knee that distributes load and stabilizes movement.

Lateral Pontine Syndrome

A stroke in the outer part of the bridge-like section of the brainstem. It may cause facial weakness, hearing loss, dizziness, poor coordination, and loss of pain or temperature sensation on the opposite side of the body.

Alternate Names:
Marie-Foix Syndrome; AICA Infarction Syndrome

Lateral Rotation

Turning a limb or body part away from the body's midline. Rotating the hip so the knee and foot point outward is one example; limited or painful movement may indicate injury.

Lateral Sclerosis

Damage affecting nerve pathways along the side of the spinal cord that carry movement signals. It may cause increasing stiffness and weakness, as in some motor-neuron diseases; the exact diagnosis requires the associated clinical findings.

Lateral Traction

Lateral traction is a pulling force applied sideways to a body part to improve alignment, reduce a dislocation, or relieve pressure.

Lateral Ventricle

One of two fluid-filled spaces inside the brain that produce and contain cerebrospinal fluid, helping protect and support the brain.

Lateral X-Ray

An X-ray image taken from the side, providing a lateral view of the body part being examined.

Latex Agglutination Test

A laboratory test in which tiny coated particles clump together when they meet a matching substance. The reaction can help detect selected germs, antibodies, or proteins in a patient sample.

Latex Allergy

An immune-mediated hypersensitivity reaction to natural rubber latex. Contact may cause dermatitis, urticaria, rhinitis, asthma, or anaphylaxis, especially in healthcare and occupational settings.

Alternate Names:
Natural Rubber Latex Allergy; NRL Allergy

Lathyrism

A neurologic disorder caused by prolonged or excessive ingestion of certain Lathyrus legumes, especially grass pea, characterized primarily by progressive spastic weakness of the legs.

Latissimus Dorsi

A broad back muscle that extends and internally rotates the arm and assists movements such as climbing.

Latissimus Dorsi Muscle

A broad muscle covering much of the back that pulls the arm down, backward, and toward the body. It is used in climbing, swimming, and rowing and may also be used to reconstruct tissue during surgery.

Latrodectus

Genus of venomous cobweb spiders including the black widow; bites cause muscle cramping and systemic pain. See *Black Widow Spider Bite*.

Lattice Degeneration

A peripheral retinal degeneration characterized by elongated areas of retinal thinning, pigment changes, and abnormal vessels. It can increase the risk of retinal tears or detachment in some people.

Lavage

Washing a body space, organ, or wound with sterile fluid. It may be used to remove blood, infected material, or harmful substances, or to collect a sample; the method and risks depend on the part of the body treated.

Lavage Fluid

Liquid used to wash a body space, wound, or organ during a medical procedure, or collected afterward for laboratory analysis. Its contents can help detect infection, bleeding, cancer cells, inflammation, or abnormal proteins.

Lawton IADL Scale

A tool measuring ability to manage complex daily tasks such as telephone use, shopping, cooking, housekeeping, transportation, medicines, and finances.

Laxative Overdose

Taking too much laxative can cause severe diarrhea, vomiting, dehydration, and abnormal body salts. Some products can disturb heart rhythms or damage the bowel, especially after large exposures or in children.

Laxatives

Medicines or preparations that help relieve constipation by adding bulk, softening stool, drawing water into the bowel, or stimulating bowel movement. The choice depends on the cause and duration of constipation and the person's health.

Laxatives For Constipation

Laxatives relieve constipation through fiber and water retention, stool softening, osmotic effects, or increased bowel contractions. The suitable type depends on the cause, duration, age, medicines, kidney function, and risk of blockage; persistent bleeding, vomiting, or severe pain may indicate another condition.

Alternate Names:
Aperients; Cathartics; Purgatives

Lazy Eye

Reduced vision caused by abnormal visual development during childhood, usually in one eye but sometimes in both. It may result from eye misalign-

ment, unequal focusing, or an obstruction such as a cataract; the medical term is amblyopia.

Alternate Names:
Amblyopia; Functional Amblyopia

Lazy Eye (Amblyopia)

Alternate name; see *Lazy Eye* and *Amblyopia*.

LCH

Abbreviation for Langerhans cell histiocytosis; see *Langerhans Cell Histiocytosis*.

LCIS

Abbreviation; see *Lobular Carcinoma In Situ*.

LDH Isoenzyme Blood Test

A blood test separating lactate dehydrogenase isoenzymes to help suggest the tissue source of an elevated total LDH, although more specific tests are preferred for most conditions.

LDL

Low-density lipoprotein, a blood particle that carries cholesterol to tissues. Too much LDL can contribute to fatty buildup in artery walls and increase the risk of heart attack and stroke; risk-based treatment may lower it.

LDL Cholesterol

Cholesterol carried in low-density lipoprotein particles; high levels contribute to atherosclerosis and cardiovascular risk. See *LDL*.

LDL Test

A blood test measuring low-density lipoprotein cholesterol, a major atherogenic lipoprotein used with the lipid profile to estimate cardiovascular risk and guide lipid-lowering treatment.

L-Dopa

A medicine that the brain converts into dopamine. It is usually combined with carbidopa or benserazide to treat Parkinson disease.

Lead

A toxic heavy metal that can harm the nervous system, blood-forming system, kidneys, cardiovascular system, and reproductive system. Exposure may occur through contaminated paint dust or soil, drinking water, workplaces, hobbies, imported products, or other sources; children and fetuses are especially vulnerable to neurodevelopmental effects.

Lead And Tap Water

Drinking water can become contaminated with lead when it contacts lead-containing service lines, plumbing, fixtures, or solder. Exposure can be reduced through testing, filtration, interim measures, or repair or replacement of the source according to local public-health guidance; boiling water does not remove lead.

Leadless Pacemaker

A small pacemaker placed directly inside a heart chamber without a conventional chest pocket or transvenous lead. It provides pacing for selected slow or unreliable heart rhythms; device selection depends on the person's cardiac anatomy and pacing needs.

Lead Pipe Rigidity

Alternate spelling; see *Lead-Pipe Rigidity*.

Lead-Pipe Rigidity

Smooth, continuous muscle stiffness in which a limb resists movement evenly throughout its range. It can occur in Parkinson disease and other movement disorders.

Alternate Names:
Plastic Rigidity; Extrapyramidal Lead-Pipe Hypertonia

Lead Poisoning

A toxic condition caused by the buildup of lead in the body over time, typically from breathing in lead dust or swallowing lead-based paint chips, contaminated water from old pipes, or contaminated soil. Lead interferes with normal enzyme function, red blood cell production, and nerve signaling. In children, even low levels of exposure can cause per-

manent learning difficulties, behavioral problems, hearing loss, and slowed growth; in adults, high levels cause high blood pressure, abdominal pain, memory loss, kidney damage, and anemia.

Alternate Names:
Plumbism; Saturnism

Lead-Time Bias

The false appearance that screening improves survival because it finds a disease earlier, even though the person dies at the same time as without earlier diagnosis.

Lead Toxicity and Nutrition

Adequate nutrition, especially iron and calcium, can help reduce lead absorption in children with deficiencies. Nutrition does not remove lead exposure or replace blood testing and public-health measures to find and stop the source.

Alternate Names:
Nutritional Lead Protection; Dietary Prevention of Lead Absorption

Learned Helplessness

A psychological state resulting from repeated exposure to inescapable, uncontrollable negative events, leading an individual to believe they lack the agency to alter future outcomes, contributing to passivity and depression.

Learned Insomnia

Ongoing difficulty sleeping maintained by worry, sleep-related habits, and learned associations that make the bed or bedtime trigger alertness instead of sleep.

Learning Difficulties

Persistent problems acquiring or using academic skills such as reading, writing, or mathematics, not explained solely by low intelligence or inadequate education.

Learning Disabilities

Persistent difficulties acquiring or using skills such as reading, writing, mathematics, language, attention, or coordination despite appropriate opportunity and instruction; assessment considers development, education, and other neurologic or sensory factors.

Learning Disorder

A neurodevelopmental disorder causing persistent difficulty acquiring or using academic skills such as reading, writing, or mathematics despite appropriate instruction.

Leber Congenital Amaurosis

A rare inherited disorder of the retina that causes severe vision loss from birth or early infancy. Babies may have wandering eye movements, sensitivity to light, or unusual responses of the pupils; genetic testing can help confirm the cause.

Leber Hereditary Optic Neuropathy

An inherited disorder of the energy-producing parts of cells that damages the optic nerves. It usually causes painless, rapidly worsening loss of central vision in one eye followed by the other, often in young adults. The altered mitochondrial DNA is passed through the mother; genetic testing can confirm the diagnosis.

Alternate Names:
Lhon

Leber's Hereditary Optic Neuropathy

An inherited mitochondrial disorder that causes painless loss of central vision, usually first in one eye and then the other. It mainly affects young men, and genetic counseling and specialist eye care may help.

Lecithin-Sphingomyelin Ratio

A ratio of two substances measured in amniotic fluid that was once used to estimate fetal lung maturity and the risk of newborn respiratory distress. The test is now rarely used; a mature result alone does not establish the safety of early delivery.

Alternate Names:
L/S Ratio; Amniotic Fluid Lecithin-Sphingomyelin Ratio

Leech

A blood-feeding annelid used in selected reconstructive procedures to relieve venous congestion; leech bites can cause bleeding and infection.

Leech Therapy

Carefully controlled use of medicinal leeches to remove congested blood from selected tissue, especially after reconstructive surgery. Their saliva also prevents clotting. Bleeding, infection, anemia, and allergic reactions are possible, so clinical monitoring is essential.

Leflunomide

Leflunomide is a disease-modifying antirheumatic drug that inhibits dihydroorotate dehydrogenase and lymphocyte proliferation; it treats rheumatoid or psoriatic arthritis but can cause hepatotoxicity, cytopenias, hypertension, and fetal harm.

Le Fort Fractures

A classification of traumatic midface fractures based on René Le Fort's fracture patterns. Le Fort I is a horizontal fracture through the upper jaw, Le Fort II is a pyramidal fracture through the midface, and Le Fort III separates the facial bones from the skull base.

Alternate Names:
Le Fort Midface Fractures; Maxillofacial Le Fort System

Left Anterior Descending Artery

A major branch of the left coronary artery that travels in the anterior interventricular groove and supplies the anterior left ventricle, much of the interventricular septum, and the apex. Its occlusion can cause extensive anterior myocardial infarction.

Left Anterior Descending Coronary Artery

A major heart artery supplying the front wall, septum, and much of the left ventricle; blockage can cause a serious heart attack.

Alternate Names:
LAD Artery

Left Anterior Fascicular Block

A cardiac intraventricular conduction defect caused by delay or block in the thin anterior fascicle of the left bundle branch, manifesting on electrocardiogram as marked left axis deviation (between -45 and -90 degrees), small Q waves in leads I and aVL, and small R waves in leads II, III, and aVF.

Alternate Names:
LAFB; Left Anterior Hemiblock

Left Atrial Appendage Occlusion

A procedure that seals a small pouch of the heart where blood clots often form in people with atrial fibrillation. A closure device is placed through a catheter, usually from a vein in the groin. It may reduce stroke risk when long-term blood-thinning medicine is unsuitable, but short-term medication and follow-up are still needed.

Alternate Names:
LAAO; Left Atrial Appendage Closure

Left Atrial Myxoma

A usually benign primary cardiac tumor, commonly arising from the interatrial septum in the left atrium. It may obstruct mitral inflow or cause embolic and constitutional symptoms such as fever, weight loss, or fatigue.

Left Atrium

The upper-left chamber of the heart. It receives oxygen-rich blood from the lungs and passes it through the mitral valve into the left ventricle.

Left Bundle Branch

Part of the heart's electrical wiring that carries signals through the left lower chamber and helps it contract. Damage or blockage can delay the heartbeat signal and appear on an electrocardiogram.

Left Bundle Branch Block

Delay or interruption of electrical signals through the left bundle branch. It changes the ECG pattern and may reflect heart disease, although some people have no symptoms.

Alternate Names:

LBBB

Left Circumflex Coronary Artery

A heart artery curving around the left side and back, supplying parts of the left ventricle and sometimes the lower heart wall.

Alternate Names:
Circumflex Artery

Left Heart Catheterization

A procedure that passes a thin tube into the left side of the heart or nearby arteries to measure pressures, assess valves, or look for blocked coronary arteries.

Left Heart Ventricular Angiography

An imaging study that injects contrast into the left ventricle to assess ventricular contraction, wall motion, ejection fraction, and selected structural abnormalities.

Left Hypochondriac Region

The upper-left area of the abdomen, beneath the lower ribs. It overlies part of the stomach, spleen, pancreas, and colon; pain or swelling there may arise from digestive, splenic, or nearby chest disease.

Left Iliac Region

The lower-left area of the abdomen, overlying part of the large intestine and urinary tract. Pain there may occur with diverticular disease, bowel inflammation, urinary problems, or other pelvic conditions.

Left Lower Quadrant

The lower-left quarter of the abdomen, containing portions of the small and large intestines, the left ureter, and, in females, the left ovary and uterine tube.

Left Main Coronary Artery

The short vessel arising from the left aortic sinus and dividing principally into the left anterior descending and circumflex arteries. Significant left-main disease jeopardizes a large proportion of left-ventricular myocardium.

Left-Sided Superior Vena Cava

A birth-related variation in which a large vein on the left side of the chest drains blood through an unusual route to the heart. It usually causes no symptoms but matters when placing central lines or performing heart surgery.

Left Testicular Torsion

Acute rotation of the left testis on its spermatic cord, obstructing blood flow and causing ischemia. It is a urological emergency presenting with sudden severe left scrotal pain, nausea, vomiting, and a high-riding, horizontally oriented testis with absent cremasteric reflex.

Left Upper Quadrant

The upper-left quarter of the abdomen, containing portions of the stomach, spleen, pancreas, liver, and small and large intestines.

Left Ventricle

The lower-left chamber of the heart. It receives oxygen-rich blood from the left atrium and pumps it through the aortic valve into the aorta and throughout the body.

Left Ventricular Assist Device

A mechanical pump that helps the heart's main pumping chamber move blood around the body. It may support people with severe heart failure while they await a transplant or as long-term treatment. Risks include bleeding, infection, blood clots, and stroke.

Alternate Names:
LVAD; Left Ventricular Assist System

Left-Ventricular Assist Device

Alternate spelling; see *Left Ventricular Assist Device*.

Left Ventricular Hypertrophy

Thickening of the muscle wall of the heart's main pumping chamber. It is often caused by long-term high blood pressure or a narrowed aortic valve and can make the heart stiff, leading to breathlessness,

rhythm problems, or heart failure.

Left Ventricular Non-Compaction

Alternate spelling; see *Left Ventricular Noncompaction*.

Left Ventricular Noncompaction

A finding in which the inner muscle of the heart's main pumping chamber has prominent ridges and spaces. It may occur with heart muscle disease, but the appearance alone does not always mean a person has cardiomyopathy.

Alternate Names:
LVNC; Spongy Myocardium

Leg

The lower limb, often meaning the region between the knee and ankle, although it may also refer broadly to the entire lower extremity.

Leg CT Scan

A series of detailed X-ray pictures of the leg combined by a computer. It can show complex fractures, bone alignment, infection, tumors, blood-vessel problems, and selected soft-tissue injuries.

Leg Fracture

Alternate name; see *Broken Leg*.

Legg-Calve-Perthes Disease

A childhood hip disorder in which the blood supply to the top of the thighbone is temporarily reduced. The bone can weaken and change shape, causing a limp, hip or knee pain, stiffness, and limited movement.

Legg–Calvé–Perthes Disease

A childhood hip disorder in which reduced blood flow temporarily damages the rounded top of the thighbone. It can cause a limp, hip or knee pain, stiffness, and later deformity as the bone heals.

Legionella

Legionella is a group of water-associated bacteria that can cause Legionnaires' disease, a severe pneumonia, or Pontiac fever, a milder illness.

Legionella Longbeachae

Legionella longbeachae is a Legionella species associated particularly with exposure to contaminated potting mix and capable of causing pneumonia.

Legionella Pneumonia

Pneumonia caused by Legionella bacteria, usually after inhaling contaminated water droplets. It can cause high fever, cough, breathlessness, diarrhea, confusion, and low oxygen.

Legionella Pneumophila

A bacterium found in water systems that can cause severe pneumonia after a person inhales contaminated water droplets. It may also cause a milder fever illness; older age, smoking, and weakened immunity increase risk.

Legionellosis

An infection caused by Legionella bacteria, ranging from a mild flu-like illness to Legionnaires' disease with pneumonia.

Legionnaire Disease And Pontiac Fever

Alternate name; see *Legionellosis*.

Legionnaires Disease

A severe, potentially life-threatening type of pneumonia caused by inhaling tiny water droplets contaminated with extitLegionella bacteria. These bacteria thrive in warm, human-made water systems such as commercial building air-conditioning cooling towers, hot tubs, large plumbing systems, and decorative fountains. Symptoms typically begin with high fever, chills, cough, muscle aches, and headache, often accompanied by digestive symptoms like nausea, diarrhea, and confusion.

Legionnaires' Disease

Alternate spelling; see *Legionnaires Disease*.

Leg Lengthening And Shortening

Operations that gradually increase or decrease the

length of a leg bone to correct a major difference between the legs or a deformity. Recovery is prolonged and may involve an external or internal support device and rehabilitation.

Leg MRI Scan

Magnetic resonance imaging of the leg using a magnetic field and radio waves to evaluate muscles, tendons, ligaments, nerves, marrow, joints, and soft-tissue masses.

Leg Or Foot Amputation

Surgical removal of part or all of a leg or foot, usually because of severe injury, infection, poor blood flow, or cancer. Rehabilitation supports mobility afterward.

Leg Pain

Pain in part of a lower limb, commonly the thigh, knee, calf, or foot. Causes include muscle or tendon injury, joint disease, nerve irritation, reduced blood flow, infection, or a blood clot.

Leg Pain With Cramping

Painful tightening or spasms in a leg muscle; causes include exertion, dehydration, medicines, nerve or muscle disorders, and reduced arterial blood flow causing intermittent claudication.

Leg Swelling

Enlargement or puffiness of one or both legs caused by fluid retention, venous disease, injury, infection, inflammation, or a blood clot.

Leg Ulcer

An open sore on the lower leg that heals slowly or not at all. Causes include poor blood flow in the veins or arteries, diabetes-related nerve damage, pressure, and inflammation. Venous ulcers often occur near the ankle and may come with leg swelling or varicose veins; treatment depends on the cause.

Leg Ulceration

Alternate name; see *Leg Ulcer*.

Leigh Disease

A progressive mitochondrial disorder of early life characterized by symmetric lesions of the brainstem and basal ganglia, developmental regression, movement abnormalities, and lactic acidosis.

Leigh's Syndrome

A rare progressive neurologic disorder, usually beginning in infancy or childhood, caused by problems with cellular energy production. It can damage the brainstem and cause developmental regression, movement problems, seizures, or breathing difficulties.

Leigh Syndrome

A rare inherited disorder of cellular energy production, usually beginning in infancy or childhood. It can damage the brainstem and deep brain areas, causing loss of developmental skills, movement problems, seizures, and breathing difficulties.

Alternate Names:
Subacute Necrotizing Encephalomyelopathy; Mitochondrial Leigh Disease

Leiomyoma

A usually noncancerous tumor made of smooth muscle. It most often develops in the uterus, where it is called a fibroid, but it can also occur in the skin, digestive tract, or other organs.

Leiomyomatosis

Leiomyomatosis is development of multiple benign smooth-muscle tumors or proliferations, which may affect the uterus, skin, lungs, or other sites.

Leiomyomatosis Peritonealis Disseminata

A rare benign condition with multiple smooth-muscle nodules scattered over the peritoneum, often associated with pregnancy or hormonal stimulation and sometimes mimicking peritoneal carcinomatosis.

Leiomyosarcoma

A malignant tumor of smooth muscle, most often arising in the uterus, retroperitoneum, or gastroin-

testinal tract.

Leiomyosarcoma Of The Vulva

A rare malignant smooth-muscle tumor of the vulva, usually presenting as a solitary enlarging mass. Histologic atypia, mitotic activity, necrosis, and invasion help determine malignant behavior.

Leishmania

A group of single-celled parasites transmitted mainly by infected sandflies. Different species cause skin, mucosal, or visceral leishmaniasis, ranging from localized ulcers to life-threatening illness.

Leishmania Donovani

A parasite spread by infected sandflies that causes visceral leishmaniasis. It can infect organs such as the spleen, liver, and bone marrow, causing prolonged fever, weight loss, enlarged organs, and reduced blood-cell counts.

Leishmania Infection

A parasitic infection caused by *Leishmania* protozoa and transmitted by infected sandflies; it can cause cutaneous, mucocutaneous, or visceral leishmaniasis.

Leishmania Major

A parasite commonly causing cutaneous leishmaniasis in parts of Africa, Asia, and the Middle East. Sandfly transmission produces one or more skin ulcers that may heal slowly and leave scars.

Leishmania Mexicana

A parasite that causes mainly cutaneous leishmaniasis in the Americas. Infection after a sandfly bite may produce a persistent skin nodule or ulcer and, less commonly, involve mucous membranes.

Leishmaniasis

An infection caused by protozoa of the genus *Leishmania*, usually transmitted by infected sandflies. Cutaneous, mucocutaneous, and visceral forms cause skin lesions, destructive disease of mucous membranes, or systemic illness involving organs such as the liver, spleen, and bone marrow.

Leishmania Tropica

A sandfly-transmitted parasite that commonly causes localized cutaneous leishmaniasis. It produces chronic skin sores that may heal over months and leave permanent scars.

Lemaitre's Sign

Pain or discomfort felt in the urethra or penis during a rectal examination. It has traditionally been associated with inflammation near the prostate or back part of the urinary passage but is not specific for one diagnosis.

Lemierre Syndrome

A rare but serious complication of a throat or mouth infection. The infection can spread to a large vein in the neck, form an infected blood clot, and spread to the lungs or other parts of the body.

Lenalidomide

Lenalidomide is an immunomodulatory anticancer drug used for multiple myeloma and selected myelodysplastic or lymphoma disorders; myelosuppression, thrombosis, infection, and severe teratogenicity are important risks.

Lenegre Disease

An idiopathic, sclerodegenerative process characterized by slowly progressive fibrocalcific degeneration and loss of conduction fibers within the His-Purkinje system, leading to bundle branch blocks, bifascicular block, and spontaneous complete atrioventricular block in middle-aged individuals.

Alternate Names:
Primary Conduction System Sclerosis

Lengthening Of Limb

A surgical or orthopedic process that gradually increases the length of a bone, often using controlled distraction after osteotomy.

Length-Time Bias

The tendency of screening to preferentially detect

slower-growing or less aggressive disease because it remains detectable for a longer preclinical period. It can exaggerate the apparent benefit of screening.

Lennox-Gastaut Syndrome

A severe childhood-onset developmental and epileptic encephalopathy with multiple seizure types, characteristic slow spike-and-wave EEG patterns, cognitive impairment, and often treatment-resistant seizures.

Lenograstim

A recombinant granulocyte colony-stimulating factor that increases neutrophil production and is used to prevent or treat some forms of neutropenia.

Lens

A clear, flexible structure behind the iris and pupil that bends light onto the retina. Muscles change its shape for near or distant focus; clouding causes cataract, while displacement can blur vision or raise eye pressure.

Lens Coloboma

A lens coloboma is a congenital segmental defect or notch in the eye lens caused by incomplete development.

Lens Disease

A disorder of the eye lens, including cataract, dislocation, inflammation-related opacity, or developmental abnormality, that may impair focusing or vision.

Lens Dislocation

Displacement of the crystalline lens from its normal position because of trauma, zonular weakness, surgery, or connective-tissue disease; it can cause blurred vision, glaucoma, or inflammation.

Lensometer

An instrument measuring the prescription, power, and optical alignment of eyeglass lenses. It helps verify new glasses, assess existing lenses, and check whether corrective strength matches the prescribed values.

Alternate Names:
Lensmeter; Focimeter

Lens Prescription

Written instructions specifying the lens power, correction, and other features needed for eyeglasses or contact lenses in each eye.

Lens Subluxation

Partial displacement of the crystalline lens while some zonular attachments remain, potentially causing blurred or fluctuating vision, refractive change, or glaucoma.

Lentiform Nucleus

A group of deep brain structures involved in controlling movement. It includes the putamen and globus pallidus and works with other brain regions to help start and regulate actions.

Lentigines

Alternate plural name; see *Lentigo*.

Lentigo

A lentigo is a sharply defined flat brown skin spot caused by increased melanocytes or pigment and may be benign or, rarely, atypical.

Lentigo Maligna

A melanoma in situ that occurs on chronically sun-damaged skin, most commonly on the face of elderly individuals. It presents as a large, irregularly pigmented, slow-growing macule with variegated shades of brown and black. The radial growth phase may persist for years before invasion occurs.

Lentigo Maligna Melanoma

An invasive melanoma arising in a lentigo maligna on chronically sun-damaged skin, usually of the head or neck; it presents as an enlarging irregular pigmented patch or plaque.

LEOPARD Syndrome

A rare inherited disorder that can cause many dark

skin spots, abnormal heart rhythms, widely spaced eyes, narrowing of the pulmonary valve, genital differences, slow growth, and hearing loss. The combination and severity vary between people.

Leopold Maneuvers

A set of gentle abdominal examinations used to estimate the baby's position and which part is presenting before birth. The findings help guide care but may be limited by body size, fluid level, or the baby's movement and are confirmed with other assessment when needed.

Lepidoptera

The insect order containing butterflies and moths; contact with some caterpillars can cause skin, eye, or systemic reactions.

Lepirudin

Lepirudin is a direct thrombin inhibitor formerly used as an anticoagulant in heparin-induced thrombocytopenia; bleeding and kidney clearance are important considerations.

Lepromatous Leprosy

A form of leprosy with a high number of bacteria and usually widespread skin involvement. It can cause numerous poorly defined patches, nodules, or diffuse thickening, including on the face, and may affect the nose, eyes, and peripheral nerves. Sensation may be preserved early, but untreated nerve damage can lead to numbness, weakness, and disability.

Lepromin Skin Test

A skin test using harmless material from the leprosy bacterium to show how strongly the immune system reacts. It may help classify the type of leprosy but cannot by itself diagnose active infection.

Leprosy

A chronic infection caused by *Mycobacterium leprae* or *M. lepromatosis*, mainly affecting the skin, peripheral nerves, eyes, and upper respiratory mucosa. It can cause pale or reddish skin patches with reduced sensation, thickened nerves, and muscle weakness.

Alternate Names:
Hansen Disease; Hansen's Disease

Leptin

A hormone produced mainly by adipose tissue that signals stored-energy status to the brain and influences appetite and energy balance.

Leptin Receptor

A cell-surface protein that receives signals from leptin, a hormone made mainly by fat tissue. It helps the brain regulate appetite, energy use, growth, and reproductive function in response to stored body energy.

Leptomeningeal

Relating to the pia mater and arachnoid mater, the two thin inner layers covering the brain and spinal cord; cancer or infection can spread in these layers.

Leptomeningeal Metastases

Spread of cancer cells to the pia and arachnoid membranes or cerebrospinal fluid. It may cause headache, nausea, cranial-nerve findings, radicular pain, weakness, sensory change, or bladder dysfunction; MRI and cerebrospinal-fluid testing support diagnosis.

Leptomeningeal Metastasis

Spread of cancer to the thin membranes and fluid surrounding the brain and spinal cord. It can cause headache, vomiting, weakness, confusion, seizures, or changes in vision and is treated according to the cancer type and extent.

Leptomeningeal Sarcoma

Leptomeningeal sarcoma is a rare malignant tumor involving the membranes and fluid spaces around the brain or spinal cord.

Leptomeninges

The arachnoid mater and pia mater, the two delicate inner membranes covering the brain and spinal cord.

Leptomeningitis

Inflammation or infection of the leptomeninges, the arachnoid and pia mater covering the brain and spinal cord.

Leptospira

A genus of spiral-shaped bacteria that includes the causes of leptospirosis, usually acquired through water or soil contaminated with infected animal urine.

Leptospirosis

A zoonotic infection caused by pathogenic spiral-shaped *Leptospira* bacteria. It is usually acquired through contact with infected animal urine or contaminated water, soil, or food; bacteria enter through broken skin or mucous membranes. Illness ranges from asymptomatic infection to fever, headache, muscle pain, and conjunctival redness. Severe disease, classically called Weil disease, can cause jaundice, kidney or liver failure, bleeding, and lung injury.

Alternate Names:
Leptospira Infection; Mud Fever; Seven-Day Fever

Leriche Syndrome

Aortoiliac occlusive disease causing reduced blood flow to the pelvis and lower limbs. The classic presentation includes buttock or thigh claudication, diminished femoral pulses, and erectile dysfunction, although symptoms vary with the extent of collateral circulation.

Leri-Weill Dyschondrosteosis

A rare autosomal dominant pseudoautosomal skeletal dysplasia caused by haploinsufficiency of the short stature homeobox (SHOX) gene on the X and Y chromosomes, characterized by disproportionate mesomelic short stature, shortened forearms and lower legs, and bilateral Madelung wrist deformity.

Alternate Names:
Leri-Weill Syndrome; SHOX Deficiency Mesomelic Dysplasia

Lesch-Nyhan Syndrome

An inherited disorder of purine metabolism caused by severe HPRT enzyme deficiency, leading to high uric acid, neurologic problems, and characteristic self-injurious behavior.

Lesion

Any localized abnormal change in tissue caused by disease, injury, inflammation, infection, or a tumor. A lesion may be visible, felt, or found only on imaging or microscopic examination.

Lesion Identification

The process of locating and describing an abnormal area in the body using examination, imaging, endoscopy, laboratory tests, or tissue sampling.

Lesser Curvature

The shorter, inward curve along the upper and inner edge of the stomach. It is attached to a fold of tissue leading to the liver and contains blood vessels that supply the stomach.

Lesser Omentum

A fold of tissue that connects the liver to the lesser curvature of the stomach and the first part of the small intestine. It contains blood vessels, ducts, nerves, and lymph vessels.

Lesser Peritoneal Cavity

The peritoneal recess behind the stomach and lesser omentum, also called the lesser sac or omental bursa. It communicates with the greater peritoneal cavity through the epiploic foramen.

Alternate Names:
Lesser Sac; Omental Bursa

Lesser Toe Deformities

Deformities in which one or more toes bend abnormally at the middle or end joints. They may cause pain, rubbing, corns, calluses, or difficulty wearing shoes.

Lesser Trochanter

A small bony projection on the inner upper thighbone where the iliopsoas muscle attaches. It helps bend the hip; injury may occur from a sudden mus-

cle pull in adolescents or, in adults, from weakened bone.

Let-Down Reflex

Release of breast milk when oxytocin makes the small muscles around milk-producing glands contract. Suckling, breast stimulation, or seeing or hearing a baby can trigger it, although stress may delay it.

Lethal

Able to cause death. In medicine, the word may describe a disease, injury, dose of a substance, or genetic change that prevents survival.

Lethal-Means Counseling

A preventive intervention that reduces access to firearms, medications, toxic substances, or other methods of self-harm during periods of elevated risk. It is conducted collaboratively and is an important component of suicide prevention.

Lethal Triad

A dangerous combination of low body temperature, excess acid in the blood, and poor blood clotting. It can develop after severe injury or major bleeding, and each problem can worsen the others.

Lethargy

Lethargy is reduced energy, alertness, or responsiveness; it may result from sleep loss, infection, metabolic disease, medicines, depression, or neurologic illness. Sudden marked lethargy can occur with serious illness.

Letrozole

Letrozole is an aromatase inhibitor that lowers oestrogen production and is used mainly for hormone-receptor-positive breast cancer and ovulation induction; hot flushes, arthralgia, bone loss, and fetal harm are important considerations.

Letterer-Siwe Disease

An acute, disseminated, aggressive multisystem form of Langerhans cell histiocytosis occurring in infants and toddlers under 2 years of age, characterized by cutaneous seborrheic and purpuric eruptions, osteolytic bone lesions, hepatosplenomegaly, lymphadenopathy, and pancytopenia.

Alternate Names:
Acute Disseminated LCH; Multisystem Langerhans Histiocytosis

Leucocyte

Another spelling of leukocyte, meaning a white blood cell. Leukocytes help defend against infection and other threats; major groups include neutrophils, lymphocytes, monocytes, eosinophils, and basophils.

Leucocytosis

A higher-than-usual number of white blood cells in the blood. It may occur with infection, inflammation, physical stress, medicines, smoking, or blood and bone-marrow disorders, so the type of cell and the person's symptoms help find the cause.

Leucoderma

Loss or marked reduction of skin pigmentation, often used as a descriptive term for depigmented patches.

Leucomalacia

Softening or loss of tissue after injury, poor blood flow, infection, or inflammation. In newborns, the term often refers to damage of the brain's white matter near the fluid spaces, which may affect movement or development.

Leucopenia

A lower-than-usual number of white blood cells. It may result from medicines, infections, immune disorders, nutritional deficiency, or bone-marrow disease and can increase the risk of infection, especially when neutrophils are low.

Leucoplakia

A persistent white patch on a moist body lining, often inside the mouth, that cannot be wiped away. It may result from irritation and sometimes contains changes that can precede cancer.

Leucopoiesis

The production and maturation of white blood cells, mainly in the bone marrow. It is regulated by growth factors and increases or changes during infection, inflammation, and some blood disorders.

Leucovorin

Leucovorin is a folate medicine used to reduce the toxicity of methotrexate, enhance some chemotherapy regimens, and treat certain folate-related problems.

Leucovorin Calcium

Leucovorin calcium is the calcium salt of leucovorin, used as rescue therapy after methotrexate and in selected colorectal-cancer treatments.

Leukaemia

Alternate spelling; see *Leukemia*.

Leukapheresis

A blood-filtering procedure that removes excess white blood cells and returns the remaining blood. It may rapidly reduce very high counts causing symptoms in leukemia, but it is temporary and does not replace treatment of the underlying disease.

Leukemia

A group of blood cancers that originate in the bone marrow, the soft sponge-like tissue inside bones where blood cells are made. Leukemia causes the bone marrow to produce large numbers of abnormal, immature white blood cells that do not function properly and crowd out healthy red blood cells, platelets, and infection-fighting white blood cells. This leads to symptoms such as fatigue and pale skin (from anemia), frequent infections, easy bruising or bleeding, bone pain, and swollen lymph nodes.

Leukemia Cutis

A condition in which leukemia cells collect in the skin, causing firm red, purple, or brown bumps, nodules, or patches. It often accompanies acute myeloid leukemia and reflects the underlying blood cancer.

Leukemia Genetics

Changes in genes or chromosomes in leukemia cells help identify the leukemia type, estimate its likely course, and choose treatment. The meaning of each change depends on the person's specific leukemia.

Leukemic Infiltration Of The Gingiva

Swelling of the gums caused by leukemia cells collecting in gum tissue. The gums may become red, soft, enlarged, and prone to bleeding, especially in some acute myeloid leukemias.

Leukemoid Reaction

A marked reactive increase in the white-cell count, usually with prominent neutrophilia and immature granulocytes, caused by severe infection, inflammation, malignancy, or tissue injury. It resembles leukemia but is not a clonal hematologic malignancy.

Leukoaraiosis

White-matter changes seen on brain scans, often related to aging and long-term small-vessel disease such as high blood pressure. Extensive changes may be associated with slower thinking, walking problems, or stroke risk.

Leukocoria

A white or pale reflection appearing in the pupil instead of the normal red reflection. It may result from cataract, retinal disease, infection, or a tumor such as retinoblastoma and is especially important in infants and children.

Leukocyte

A medical term for a white blood cell, the cellular defense units of the immune system that protect the body against infectious diseases, foreign substances, and abnormal cells. Formed in the bone marrow, leukocytes include several specialized types: neutrophils and macrophages that engulf bacteria, lymphocytes that produce antibodies and kill infected cells, and eosinophils and basophils that respond to parasites and allergic reactions.

Leukocyte Adhesion Deficiency

A rare inherited immune disorder in which white

blood cells cannot attach to blood-vessel walls and reach infected tissue normally. It can cause delayed umbilical-cord separation, repeated skin infections with little pus, poor wound healing, gum disease, and dangerously severe infection in infants.

Leukocyte Alkaline Phosphatase

A measure of an enzyme in certain white blood cells. It was formerly used to help distinguish a reactive response to infection from chronic myeloid leukemia, but newer genetic and blood tests are usually more informative.

Leukocyte Disorder

A disorder involving the number, function, or development of white blood cells, including leukopenia, leukocytosis, immune deficiency, and malignant leukocyte proliferation.

Leukocyte Esterase Urine Test

A urine dipstick test detecting leukocyte esterase released by white blood cells; a positive result supports pyuria but does not by itself diagnose urinary tract infection.

Leukocytes

Plural form; see *Leukocyte*.

Leukocyte Transfusion

Transfusion of donated white blood cells in rare, carefully selected situations involving life-threatening infection and severe inability to produce neutrophils. Benefits are uncertain and risks include fever, lung injury, immune reactions, and infection transmission.

Leukocytoclastic Vasculitis

A pattern of inflammation in small blood vessels, usually identified by examining a skin biopsy. It commonly causes raised purple or red spots that can be felt, especially on the legs. Medicines, infections, and immune diseases may trigger it; evaluation checks whether inflammation is limited to the skin or also affects internal organs.

Alternate Names:
Cutaneous Small-Vessel Vasculitis

Leukocytosis

A higher-than-usual number of white blood cells. It may occur with infection, inflammation, stress, smoking, medicines, or blood and bone-marrow disorders; the specific cell type and symptoms help identify the cause.

Leukocytosis in Pregnancy

A mild rise in white blood cells can be normal during pregnancy, labor, or stress. Marked or persistent elevation with fever, pain, urinary or respiratory symptoms, or abnormal differential counts may indicate infection, inflammation, medication effect, or another disorder.

Leukocyturia

Alternate name; see *Pyuria*.

Leukoderma

Loss of skin pigment producing sharply defined pale or white patches, usually because melanocytes have been destroyed or have stopped functioning.

Alternate Names:
Achromoderma

Leukodystrophy

A group of inherited disorders that damage myelin, the protective covering around nerves in the brain and spinal cord. They can cause progressive problems with movement, thinking, vision, hearing, or other nervous-system functions.

Leukoencephalopathy

Leukoencephalopathy is disease of the brain's white matter caused by inherited, infectious, toxic, vascular, metabolic, inflammatory, or other processes.

Leukonychia

White spots, lines, or large white areas on one or more nails. Minor nail injury is a common cause; some forms are inherited or linked to infection, medicines, or illness. The pattern and whether it moves as the nail grows can help identify the cause.

Leukonychia Striata

White bands or streaks in the nail plate that may run transversely or longitudinally. They can result from inherited traits, changes in the nail matrix, trauma, skin disease, or some medicines; significance depends on the pattern and cause.

Leukonychia Totalis

Uniform white discoloration involving most or all of one or more nail plates. It is often inherited but can occasionally be associated with illness or medication; persistent changes affecting many nails can occur with other conditions.

Leukopenia

A lower-than-normal number of white blood cells in the blood. It often involves a low neutrophil count, but other types of white blood cells may also be low. Infection risk depends on which cells are low and by how much.

Leukoplakia

A lasting white patch in the mouth that cannot be wiped off and is not explained by another condition. A tissue sample may show normal cells, precancerous changes, or cancer.

Leukopoiesis

The process by which the bone marrow makes and develops white blood cells. Production increases or changes during infection, inflammation, immune disorders, and some blood diseases.

Leukorrhea

Whitish vaginal discharge that may be normal, especially during hormonal changes, or may result from infection or inflammation. Foul odor, itching, pain, bleeding, or a new change may suggest an underlying condition.

Leukostasis

A medical emergency in which very high numbers of abnormal leukocytes impair microvascular blood flow, potentially causing respiratory distress, neurologic symptoms, organ ischemia, or hemorrhage.

Leukotriene

A group of inflammatory chemical messengers produced by white blood cells during allergic reactions and immune responses. When released in the airways, leukotrienes cause the smooth muscles around breathing tubes to tighten and constrict, stimulate excessive mucus production, and trigger airway swelling, playing a central role in asthma attacks, hay fever, and allergic reactions.

Leukotriene Blockers

Medicines that block leukotriene receptors, reducing airway tightening and inflammation. They can help prevent asthma or allergy symptoms but do not treat a sudden asthma attack.

Alternate Names:
Leukotriene Receptor Antagonists

Leukotriene Modifiers

Medicines that reduce the production or effects of leukotrienes, inflammatory chemicals that narrow airways and cause allergy symptoms. They help prevent some asthma or allergy problems but do not usually relieve a sudden asthma attack.

Leukotriene Receptor

A cell-surface protein activated by leukotrienes, inflammatory chemicals that can narrow airways, increase mucus, and promote swelling. Blocking these receptors can help prevent selected asthma and allergy symptoms.

Leukotrienes

Plural form; see *Leukotriene*.

Leuprolide

Leuprolide is a gonadotropin-releasing hormone agonist used to suppress sex-hormone production in conditions such as prostate cancer, endometriosis, and fibroids.

Leuprolide Acetate

Leuprolide acetate is the salt form of leuprolide, used to suppress ovarian or testicular hormone production for selected medical conditions.

Levalbuterol

An inhaled short-acting bronchodilator that stimulates beta-2 receptors and relaxes airway muscle. It relieves wheezing and shortness of breath but may cause tremor, nervousness, headache, or a fast heartbeat.

Levamisole

Levamisole is an antiparasitic and immune-modulating drug used selectively; serious low white-cell counts and vasculitic reactions can occur.

Levator Ani

A group of pelvic-floor muscles that supports the bladder, bowel, and reproductive organs and helps control urination and bowel movements. Weakness or injury may contribute to pelvic organ prolapse or incontinence.

Levator Ani Muscle

A broad, symmetrical muscular sheet forming the major constituent of the pelvic diaphragm, composed of the puborectalis, pubococcygeus, and iliococcygeus muscles, which supports the pelvic viscera and maintains urinary and fecal continence.

Levator Ani Syndrome

A chronic functional anorectal pain disorder characterized by episodic or continuous dull aching, fullness, or pressure sensation in the rectum and perineum that is aggravated by prolonged sitting, associated with tenderness and spasm of the levator ani and puborectalis muscle on digital rectal palpation.

Alternate Names:
Levator Spasm Syndrome

Lev Disease

An age-related degenerative disorder of the cardiac conduction system involving fibrosis and calcification of the fibrous cardiac skeleton and adjacent conduction tissue. It can cause atrioventricular block or bundle-branch block. It is distinguished from Lenègre disease, which classically involves fibrosis predominantly of the His-Purkinje conduction fibres.

Alternate Names:
Idiopathic Conduction System Sclerosis

Levetiracetam

Levetiracetam is a broad-spectrum antiseizure medicine that binds synaptic vesicle protein SV2A; it treats focal and generalized seizures and may cause somnolence, dizziness, or behavioral and mood changes.

Levine Sign

A gesture in which a person places a clenched fist over the chest while describing chest pain. It may occur with heart-related pain but is not specific enough to diagnose angina or a heart attack.

Alternate Names:
Levine's Sign; Clenched Fist Chest Pain Sign

Levobunolol

Levobunolol is a beta-blocker eye drop used to lower pressure inside the eye in glaucoma or ocular hypertension.

Levocardia

Levocardia is a normal left-sided position of the heart; it may occur with normal organ arrangement or with other congenital laterality abnormalities.

Levocarnitine

Levocarnitine is the biologically active form of carnitine used to treat selected carnitine deficiencies and help transport fatty acids into mitochondria.

Levodopa

Levodopa is a dopamine precursor that crosses the blood–brain barrier and is converted to dopamine, usually with carbidopa or benserazide, to treat Parkinson disease; dyskinesias, hallucinations, nausea, and motor fluctuations can develop.

Levofloxacin

Levofloxacin is a fluoroquinolone antibiotic that inhibits bacterial DNA gyrase and topoisomerase IV; tendon injury, peripheral neuropathy, QT prolongation, dysglycaemia, and central-nervous-system effects are important class risks.

Levoleucovorin

Levoleucovorin is the active isomer of leucovorin, used as methotrexate rescue and with selected chemotherapy regimens.

Levoleucovorin Calcium

Levoleucovorin calcium is the calcium salt of levoleucovorin, used to reduce methotrexate toxicity and support selected cancer treatments.

Levomepromazine

A phenothiazine medicine with antipsychotic, sedative, antiemetic, and analgesic properties, used in selected palliative-care and psychiatric settings.

Levonorgestrel

A progestin hormone used in birth-control pills, hormonal intrauterine devices, and emergency contraception to prevent or delay ovulation and alter cervical mucus.

Levorphanol

Levorphanol is a potent opioid analgesic that can relieve severe pain but also cause sedation, dependence, and respiratory depression.

Levothyroxine

A synthetic form of thyroxine (T4) used as thyroid hormone replacement in hypothyroidism and in selected other thyroid conditions; dose is individualized and monitored with laboratory tests.

Levothyroxine Sodium

A manufactured form of thyroid hormone used to replace hormone missing in hypothyroidism. The dose is adjusted using blood tests, and it is usually taken consistently on an empty stomach.

Alternate Names:
Levothyroxine

Levulose

An older name for fructose, a simple sugar found in fruit, honey, and many sweeteners.

Lewy Bodies

Abnormal deposits of the protein alpha-synuclein inside nerve cells. They are seen in Parkinson disease and dementia with Lewy bodies and are associated with movement, thinking, sleep, and visual-perception problems.

Lewy Body

A Lewy body is an abnormal neuronal inclusion containing alpha-synuclein, characteristic of Parkinson disease and Lewy-body dementia.

Lewy Body Dementia

A progressive brain disorder linked to clumps of protein called Lewy bodies in nerve cells. It can cause changes in attention and thinking, seeing things that are not there, movement problems like those in Parkinson disease, and acting out dreams during sleep. In dementia with Lewy bodies, thinking problems begin before or within about a year of movement problems; if they begin later in established Parkinson disease, the term Parkinson disease dementia is used. Some people with Lewy body dementia are very sensitive to certain antipsychotic medicines.

Alternate Names:
DLB; Dementia with Lewy Bodies

Lewy Body Disease

A progressive brain disorder caused by abnormal protein deposits in nerve cells. It may cause changing attention, visual hallucinations, movement problems, stiffness, sleep-related behaviors, and gradual difficulty with thinking and daily activities.

Leydig Cell

A specialized steroidogenic polyhedral endocrine cell situated within the interstitial connective tissue stroma between the seminiferous tubules of the testis (interstitial cell of Leydig). Characterized ultrastructurally by abundant smooth endoplasmic reticulum, lipid droplets, mitochondria with tubulovesicular cristae, and prominent cytoplasmic proteinaceous crystals of Reinke. Under the primary trophic stimulation of pituitary luteinizing hormone (LH)—which binds to G-protein-coupled LH receptors to stim-

ulate cyclic AMP production and StAR (steroidogenic acute regulatory) protein-mediated cholesterol transport into mitochondria—Leydig cells synthesize and secrete the vast majority (> 95%) of systemic testosterone in biological males. Testosterone is essential for in utero virilization of Wolffian duct structures, testicular descent, pubertal maturation of secondary sexual characteristics, maintenance of libido, bone density, muscle mass, and paracrine support of Sertoli cells for spermatogenesis. Leydig cell dysfunction or destruction results in primary hypogonadism with compensatory hypergonadotropism.

Leydig Cells

Plural form; see *Leydig Cell*.

Leydig Cell Testicular Tumor

A usually rare sex-cord stromal tumor arising from testosterone-producing Leydig cells in the testis; it may cause a testicular mass or hormone-related signs.

Leydig Cell Tumor

A testicular sex cord-stromal tumor that secretes testosterone or estrogen, causing precocious puberty or gynecomastia; most are benign and treated by orchidectomy.

LGE

Alternate name; see *Late Gadolinium Enhancement*.

LGMD

Abbreviation for limb-girdle muscular dystrophy; see *Limb-Girdle Muscular Dystrophies*.

LGS

Abbreviation for Lennox-Gastaut syndrome; see *Lennox-Gastaut Syndrome*.

LH

Luteinising hormone, a hormone released by the pituitary gland. In people with ovaries it helps trigger ovulation and supports hormone production; in people with testes it stimulates testosterone production. Blood tests can help assess reproductive or pituitary problems.

Alternate Names:
Luteinizing Hormone

Lhermitte-Duclos Disease

A rare, usually slow-growing abnormal area in the cerebellum, the part of the brain that helps control balance and movement. It may cause headache, dizziness, poor coordination, or seizures and can be associated with PTEN-related conditions, but it is not by itself proof of one diagnosis.

Alternate Names:
Dysplastic Gangliocytoma of the Cerebellum; Cerebellar Hamartoma

Lhermitte Sign

A sudden electric shock-like sensation that travels down the neck and back into the arms or legs when bending the head forward, often seen in multiple sclerosis.

Lhermitte's Sign

Alternate spelling; see *Lhermitte Sign*.

LH Response To GnRH Blood Test

A hormone test that measures luteinizing hormone before and after a medicine that stimulates its release. It helps assess delayed or early puberty and problems involving the brain, pituitary gland, ovaries, or testes.

Libido

A person's sexual desire or interest. It can change with age, relationships, mood, stress, sleep, illness, pregnancy, menopause, hormone levels, and medicines; a change is important mainly when it causes distress or affects a person's wellbeing.

Libido And Sexual Performance

Sexual desire and sexual function can be influenced by hormones, blood flow, nerves, medicines, illness, mood, stress, sleep, and relationships. A persistent or distressing change deserves an assessment for treatable causes.

Libman-Sacks Endocarditis

A sterile, nonbacterial endocardial valvulopathy with verrucous vegetations, most strongly associated with systemic lupus erythematosus and antiphospholipid syndrome. It usually affects the mitral or aortic valve and may cause regurgitation or systemic emboli; infective endocarditis must be excluded when vegetations or fever are present.

Alternate Names:
Marantic Endocarditis; Verrucous Endocarditis; Nonbacterial Verrucous Endocarditis

Lice

Small insects that live on hair or clothing and feed on blood. Head, body, and pubic lice cause itching and may leave eggs attached to hair. They spread mainly through close contact and are not a sign of poor hygiene.

Lice Infestation

Alternate term; see *Lice*.

Lice Infestations

Alternate plural form; see *Lice*.

Licensed Clinical Social Worker

A social worker licensed to provide clinical assessment and psychotherapy or other mental-health services within the scope of local law and training.

Lichen

A descriptive term for a firm, flat-topped, raised skin lesion or for a skin pattern resembling lichen planus. It describes appearance rather than a single disease or cause.

Lichen Amyloidosis

A localized cutaneous amyloidosis causing intensely itchy, rough, hyperkeratotic papules, commonly on the shins or upper back. The deposited amyloid usually derives from damaged keratinocytes and remains confined to the skin.

Lichen Annularis

Alternate name for granuloma annulare, a benign inflammatory ring-shaped skin eruption; see *Granuloma Annulare*.

Lichenification

Thick, leathery skin with more visible skin lines caused by repeated scratching or rubbing. It often develops in long-lasting eczema, allergies, or other itchy skin conditions.

Lichenified

Lichenified skin is thickened and leathery from chronic rubbing or scratching, commonly occurring in longstanding eczema or itch disorders.

Lichen Myxedematosus

A group of rare disorders in which mucin accumulates in the skin, producing firm papules, plaques, or diffuse thickening. The generalized form may be associated with monoclonal gammopathy and internal-organ disease, whereas localized forms may remain confined to the skin.

Lichen Nitidus

A benign inflammatory skin disorder causing numerous tiny, shiny, flat-topped, skin-colored or pink papules, commonly on the trunk, arms, genital area, or hands. It is often asymptomatic and may resolve spontaneously, although itch or extensive disease may need treatment.

Lichenoid Drug Eruption

A lichenoid inflammatory skin reaction caused by a medicine, often resembling lichen planus but with a broader distribution or different clinical and histologic features; improvement may follow withdrawal of the culprit drug.

Lichen Planopilaris

A lymphocytic inflammatory scalp disorder that attacks hair follicles and can cause scarring alopecia, perifollicular scale, redness, and permanent hair loss.

Lichen Planus

A noncontagious inflammatory disorder, generally thought to be immune-mediated, that can affect the

skin, mouth, genitals, nails, or scalp. Skin lesions are often itchy, flat-topped, shiny papules that may appear purple, red-brown, or gray; oral disease can form a lacy white pattern or painful erosions.

Alternate Names:
Lichen Ruber Planus

Lichen Planus Sclerosus Atrophicus

Historical or combined name; see *Lichen Sclerosus*.

Lichen Psoriasis

A descriptive or overlapping term for psoriasis with lichenified, thickened, scaly plaques; similar appearances occur in lichen planus and chronic eczema.

Lichen Ruber Planus

Alternate name; see *Lichen Planus*.

Lichen Sclerosus

A chronic inflammatory skin disorder that most often affects genital or perianal skin, producing pale, thin, fragile plaques that may itch, bruise, or scar. It can also occur elsewhere on the body; longstanding genital disease is associated with an increased risk of squamous-cell carcinoma.

Alternate Names:
White Spot Disease

Lichen Simplex Chronicus

One or more thickened, leathery skin plaques produced by repeated scratching or rubbing in an itch-scratch cycle. It commonly affects the neck, scalp, ankles, lower legs, or genital skin and may develop over an underlying itchy skin or nerve condition.

Lichen Spinulosus

A benign follicular eruption of grouped, rough, spiny papules, often forming round or oval plaques on the trunk, buttocks, or limbs. It commonly begins in childhood or adolescence and may fade spontaneously.

Lichen Striatus

A usually harmless skin condition causing small, flat, pink, brown, or pale bumps in a line along a limb. It often affects children and usually clears without treatment.

Lichen Urticatus

Alternate name for papular urticaria, an itchy hypersensitivity reaction to insect bites; see *Papular Urticaria*.

Licorice Poisoning

Excess glycyrrhizin from licorice inhibits 11-beta-hydroxysteroid dehydrogenase type 2 and produces apparent mineralocorticoid excess. Hypertension, hypokalemia, metabolic alkalosis, edema, weakness, and dysrhythmias may occur; stop the source and correct potassium and blood pressure under medical supervision.

Liddle Syndrome

A rare inherited cause of early high blood pressure in which the kidneys retain too much sodium and lose too much potassium. It may begin in childhood or young adulthood and is treated with medicines that block the overactive kidney channel.

Liddle Syndrome Treatment

Treatment of Liddle syndrome lowers blood pressure and the body's excessive sodium retention, usually with a medicine that blocks the overactive kidney channel. Monitoring includes potassium and kidney function; the inherited condition can occur in relatives.

Lidocaine

Lidocaine is a local anaesthetic that blocks voltage-gated sodium channels and, intravenously, can treat selected ventricular arrhythmias; excessive exposure may cause seizures, hypotension, arrhythmia, or cardiac arrest.

LieberküHn's Crypts

Tubular glands in the intestinal lining between villi that contain stem, absorptive, and secretory cells. They renew the lining, produce intestinal substances, and help maintain the gut's protective barrier.

Life Expectancy

The average number of additional years a person of a specified age is expected to live under current mortality conditions.

Life Support

Medical treatments that temporarily replace or support vital body functions, such as mechanical ventilation, dialysis, circulatory support, or artificial nutrition and hydration, when illness prevents adequate function.

Lifetime Risk

The probability that a person will develop a specified disease or experience an outcome during the remainder of their life or over a defined lifetime period.

Li-Fraumeni Syndrome

An inherited condition that greatly increases the chance of developing several cancers, often at a young age. Cancers may include breast cancer, sarcoma, brain tumors, adrenal cancer, or leukemia; specialized screening is usually advised.

Ligament

A dense, fibrous connective tissue band that connects bone to bone, providing passive joint stability and guiding joint motion. Ligaments are composed predominantly of type I collagen fibers (parallel orientation, crimped pattern) and elastin fibers (10-20% in some ligaments), arranged in bundles.

Ligamentum Flavum

A series of paired, thick elastic ligaments connecting the laminae of adjacent vertebrae from the axis to the sacrum, whose high elastin content imparts a characteristic yellow color and helps preserve the upright posture while preventing excessive spinal flexion.

Ligamentum Teres Hepatis

The obliterated fibrous remnant of the embryonic left umbilical vein that carried oxygenated blood from the placenta to the fetus, running within the free inferior border of the falciform ligament from the umbilicus to the left branch of the portal vein.

Alternate Names:
Round Ligament of the Liver

Ligand

Any molecule that binds specifically to a biological receptor, macromolecule, or active site. In pharmacology and physiology, ligands include hormones, neurotransmitters, drugs, and toxins that bind receptors to initiate (agonist), block (antagonist), or modulate signaling.

Ligase

An enzyme that joins two molecules, often using energy from ATP. Ligases help repair DNA, copy genetic material, and build or maintain other important molecules.

Ligation

The surgical process of tying off a blood vessel or duct using a suture or clip to prevent bleeding or block fluid flow.

Ligature

Any cord, wire, rope, fabric, or flexible object used to constrict the neck, bind limbs, suspend the body, or inflict injury. The resulting pale groove-shaped abrasion may be horizontal with petechiae in homicidal strangulation, or oblique and upward in hanging.

Light

Visible electromagnetic radiation; in medicine it is used for examination, phototherapy, imaging, and selected treatments.

Light Chain-Associated Kidney Disease

Kidney injury caused by abnormal immunoglobulin light chains produced by a plasma-cell or B-cell clone. Light chains may cause cast nephropathy, amyloid, or other deposits, leading to proteinuria, acute kidney injury, or chronic kidney disease.

Light-Chain Deposition Disease

A monoclonal plasma-cell disorder in which non-amyloid immunoglobulin light chains deposit along

kidney and sometimes other organ structures. It commonly causes proteinuria, high blood pressure, declining kidney function, or nephrotic syndrome.

Light Coagulation

Light coagulation uses intense focused light, usually a laser, to heat and seal tissue or blood vessels.

Light Cycle

A light cycle is the recurring pattern of light and darkness that helps regulate circadian rhythms and biological activity.

Lightening

In late pregnancy, descent of the fetus into the pelvis before labor, which may reduce upper-abdominal pressure but increase pelvic pressure and urinary frequency.

Lighter Fluid Poisoning

Harm from swallowing or breathing lighter fluid, a hydrocarbon. The greatest danger is liquid entering the lungs, causing chemical pneumonia, cough, or breathing difficulty.

Lightheadedness

A feeling of near-fainting, floating, or unsteadiness without necessarily perceiving that the surroundings are spinning; causes include dehydration, low blood pressure, anemia, medications, and heart or neurologic conditions.

Light Microscope

An instrument that uses visible light and lenses to magnify cells, tissues, microorganisms, or other small structures. It is widely used in clinical laboratories, pathology, microbiology, and research.

Light Microscopy

Examination of cells, tissues, microorganisms, or other specimens using visible light and a microscope. Different stains and preparation methods reveal structure, infection, inflammation, blood cells, or abnormal growth.

Light-Near Dissociation

A pupil abnormality in which the pupils constrict when focusing on a nearby object but respond poorly or not at all to light. It can occur with certain nerve disorders, infections, diabetes, or midbrain disease.

Lightning Injuries

Injuries caused by direct or indirect lightning exposure, potentially affecting the heart, nervous system, skin, hearing, muscles, and lungs. Cardiac arrest, neurologic deficits, burns, trauma from falls, and temporary skin branching may occur.

Lightning Pains

Brief, stabbing, electric-shock-like pains caused by irritated or damaged nerves. They classically occur in tabes dorsalis but may also accompany shingles, nerve compression, diabetes, or other neurological disorders.

Light Reflex

Automatic narrowing of the pupil when light enters the eye. It tests the retina, optic nerve, brain pathways, and nerve that controls the pupil; an unequal or absent response may indicate disease.

Light Scattering

Deflection of light when it meets particles, cells, molecules, or irregular structures. Measuring the scattered light can help estimate particle size or concentration in laboratory tests and can affect the appearance of tissues on imaging.

Light's Criteria

A set of laboratory comparisons used to decide whether fluid around the lung is caused by inflammation or disease in the chest rather than by pressure or fluid imbalance elsewhere. Protein and enzyme levels in the fluid are compared with blood levels; the result helps guide further testing and treatment.

Light Therapy

Treatment that uses selected wavelengths or intensity of light for conditions such as some skin disorders, seasonal depression, or neonatal jaundice.

Lignocaine

The international nonproprietary name for lidocaine, a local anesthetic and antiarrhythmic drug.

Likelihood Ratio

A measure of how strongly a test result supports or argues against a disease. A value above one supports disease, a value below one argues against it, and larger changes are more informative.

Lilliputian Hallucination

A visual hallucination of unusually small people, animals, or objects; it can occur with neurologic, psychiatric, toxic, infectious, or sensory conditions.

Lily Of The Valley Poisoning

Poisoning from eating lily-of-the-valley plant parts, which contain substances that can disrupt the heartbeat. Nausea, vomiting, dizziness, slow or irregular pulse, confusion, or fainting may occur.

Limb

An arm or leg, including its bones, joints, muscles, tendons, nerves, blood vessels, and skin. Limb problems may affect movement, sensation, strength, circulation, or function.

Limb Bud

A limb bud is an embryonic outgrowth that develops into an arm or leg through coordinated signaling, growth, and tissue differentiation.

Limb Development

Limb development is embryonic formation and growth of the bones, joints, muscles, nerves, vessels, and skin of the arms and legs.

Limb Fracture

A break in a bone of an upper or lower limb, assessed according to location, displacement, open or closed status, joint involvement, and associated neurovascular injury.

Limb Girdle

A limb girdle is the skeletal connection of a limb to the trunk, such as the shoulder or pelvic girdle.

Limb-Girdle Muscular Dystrophies

Limb-girdle muscular dystrophies are inherited muscle diseases causing progressive weakness predominantly around the hips and shoulders, with variable cardiac and respiratory involvement.

Limbic Encephalitis

Inflammation of the limbic system, often presenting subacutely with memory impairment, seizures, psychiatric or behavioral change, and sleep disturbance. It may be autoimmune, paraneoplastic, infectious, or of unknown cause.

Limbic Lobe

A curved region on the inner surface of the brain involved in memory, emotion, motivation, and some responses controlled by the nervous system.

Limbic System

A group of connected brain structures involved in memory, emotion, motivation, learning, and some automatic body responses, such as changes in heart rate during stress.

Limb Injury

Trauma affecting an arm or leg, including injury to bone, joint, muscle, tendon, ligament, nerve, blood vessel, or skin.

Limb-Length Discrepancy

A difference in the lengths of the two legs or, less commonly, the two arms. It may result from growth differences, injury, infection, surgery, or a developmental condition and can affect posture, walking, and joint loading.

Limb Pain

Pain arising from an arm or leg, with causes including trauma, nerve disease, vascular insufficiency, infection, inflammation, and musculoskeletal disorders.

Limb Plethysmography

A noninvasive test measuring changes in limb volume or blood flow, used to evaluate arterial or venous obstruction and sometimes to assess vascular responses.

Limb Prosthesis

A limb prosthesis is an artificial device replacing part or all of an arm or leg to restore mobility, function, appearance, or independence.

Limb Reduction Defects

Birth defects in which part or all of an arm or leg does not form normally. The missing or shortened part may involve a bone, joint, hand, foot, or the whole limb.

Limbs

The arms and legs, including their bones, joints, muscles, nerves, blood vessels, and skin. Limb problems may affect strength, sensation, movement, circulation, balance, daily activities, or independence.

Limb Salvage

Surgical and reconstructive treatment intended to preserve a threatened arm or leg after severe trauma, infection, vascular compromise, tumor, or other tissue loss. It may involve revascularization, debridement, fixation, soft-tissue coverage, nerve or tendon repair, and rehabilitation.

Limbus

The border where the clear cornea meets the white outer coat of the eye. It contains cells that help renew the corneal surface and may be affected by injury, inflammation, or disease.

Alternate Names:
Corneoscleral Limbus

Limbus Corneae

The corneal limbus is the circular border where the transparent cornea meets the white sclera and conjunctiva, containing stem cells important for corneal repair.

Limited Range Of Motion

Limited range of motion is reduced ability to move a joint through its normal extent because of pain, stiffness, weakness, swelling, or structural change.

Linagliptin

Linagliptin is a DPP-4 inhibitor used with diet and exercise to improve blood glucose control in type 2 diabetes.

Lincomycin

Lincomycin is a lincosamide antibiotic used for selected serious bacterial infections; it can cause antibiotic-associated diarrhea and colitis.

Lindane

Lindane is an organochlorine insecticide formerly used for lice or scabies; neurotoxicity and environmental persistence limit its use.

Lindsay's Nails

A distinctive nail abnormality in which the proximal forty to fifty percent of the nail bed is white and opaque while the distal fifty to sixty percent is pink, red, or brownish. It is strongly associated with chronic kidney disease and uraemia.

Alternate Names:
Half-and-Half Nails; Lindsay Nails

Linea

A line or linear anatomical marking, often used in names such as linea alba or linea nigra.

Linea Alba

A dense, fibrous median collagenous band formed by the interlacing decussating aponeuroses of the external oblique, internal oblique, and transversus abdominis muscles, extending vertically from the xiphoid process to the pubic symphysis.

Linea Aspera

Prominent longitudinal posterior femoral shaft ridge from converging muscle attachment lines. Insertion for adductor magnus, vastus medialis/lateralis, and short head of biceps femoris. Thickest femoral cor-

tex, resisting bending forces. Diverges distally into supracondylar lines.

Linea Nigra

A dark brown or black vertical line appearing on the abdomen during pregnancy, extending from the pubic symphysis to the umbilicus or beyond. Caused by hormonal stimulation of melanocytes, resulting in hyperpigmentation. More prominent in darker-skinned women.

Linear

Arranged in a straight or nearly straight line, describing the shape or distribution of a skin lesion or eruption.

Linear Accelerator

A machine accelerating electrons to produce high-energy X-rays or electron beams that precisely deliver radiation treatment to selected tumors.

Linear Energy Transfer

The amount of energy that radiation deposits as it travels through tissue. Radiation with higher transfer deposits energy more densely and may cause more biological damage for the same total dose.

Linear Fracture

A narrow break that runs along the length of a bone without moving the pieces far apart or breaking the bone into many fragments. Treatment depends on the bone, the injury's stability, and whether nearby nerves, blood vessels, or organs are affected.

Linear IgA Bullous Dermatosis

An autoimmune blistering disease caused by linear deposition of IgA at the basement membrane zone. It produces tense blisters, sometimes in annular or "string of pearls" patterns, and may be idiopathic or drug-induced.

Linear Nevus Sebaceous Syndrome

A rare disorder involving a linear sebaceous nevus, a skin lesion caused by abnormal skin glands, together with possible eye, brain, or skeletal abnormalities. Clinical features vary with the organs involved.

Lined Canister

A general equipment term for a canister with an inner liner that separates its contents from the canister body. In medical devices, the liner may collect fluids or waste; the term alone does not identify a particular device or its use.

Lines of Blaschko

Non-random developmental cutaneous pathways representing the routes of epidermal cell migration and clonal proliferation during embryogenesis, which become apparent in X-linked mosaic and cutaneous mosaic disorders (such as incontinentia pigmenti and linear epidermal nevi).

Alternate Names:
Blaschko Lines; Blaschko's Tracks

Lines of Zahn

Microscopic and gross alternating pale and dark laminations seen in arterial and intracardiac thrombi formed in rapid pulsatile blood flow, composed of pale layers of platelets and fibrin mesh alternating with dark layers of trapped red blood cells, distinguishing antemortem thrombi from postmortem clots.

Alternate Names:
Zahn Lines; Laminations of Zahn

Linezolid

Linezolid is an oxazolidinone antibiotic that blocks formation of the bacterial 70S initiation complex and treats resistant Gram-positive infections; adverse effects include thrombocytopenia, neuropathy, lactic acidosis, and serotonin interactions.

Lingua

The anatomical Latin term for the tongue, a muscular organ used for chewing, swallowing, speaking, and tasting. The front two-thirds lies in the mouth and the back third lies in the throat; related terms include sublingual, meaning under the tongue.

Lingua Fissurata

Alternate name for fissured tongue, in which grooves form on the tongue surface; see *Fissured Tongue*.

Lingual

Relating to the tongue or the tongue side of a body structure. Lingual muscles, nerves, blood vessels, and surfaces help with taste, speech, swallowing, and movement of food.

Lingual Artery

A branch of the external carotid artery supplying the tongue, floor of mouth, and sublingual structures. It arises anterior to the hypoglossal nerve and courses deep to the hyoglossus muscle. Lingual artery aneurysm or thrombosis is rare but can cause life-threatening hemorrhage or tongue ischemia.

Lingual Thyroid

A lingual thyroid is thyroid tissue at the base of the tongue caused by failure of normal thyroid descent and may obstruct swallowing or breathing or cause hypothyroidism.

Lingual Tonsil

A prominent unencapsulated aggregation of subepithelial secondary lymphoid tissue located in the lamina propria of the posterior third (base) of the tongue, forming the anteroinferior arc of Waldeyer tonsillar ring. Histologically covered by nonkeratinized stratified squamous epithelium that invaginates to form shallow, non-branching lingual tonsillar crypts, surrounded by rich subepithelial lymphoid follicles with active germinal centers and mucous glands of von Ebner. The lingual tonsil provides mucosal immune surveillance against airborne and ingested antigens entering the oropharynx, producing secretory IgA and activating antigen-specific B- and T-lymphocyte populations. Pathologic enlargement (lingual tonsillar hypertrophy) can arise from chronic laryngopharyngeal reflux, recurrent infection (lingual tonsillitis), or obstructive sleep apnea (OSA), where it may cause oropharyngeal globus sensation, dysphagia, or difficult airway management.

Lingual Tonsils

Plural form; see *Lingual Tonsil*.

Lingua Nigra

Alternate name for black hairy tongue, a usually harmless dark or furry coating caused by elongation and discoloration of tongue papillae; see *Black Hairy Tongue*.

Lingua Villosa Nigra

A benign condition characterized by elongation and dark pigmentation of the filiform papillae of the tongue, often associated with tobacco use, poor oral hygiene, or antimicrobial therapy.

Linguofacial Dyskinesia

Involuntary repetitive movements of the tongue, lips, jaw, or face, often related to medication exposure or neurologic disease; evaluation depends on the pattern and cause.

Liniment

A liquid or semiliquid preparation rubbed onto the skin, usually to provide temporary relief of muscle or joint discomfort. Some contain irritating or warming substances; skin irritation or burns are more likely with broken skin, eye contact, or tight coverings.

Linitis Plastica

A form of stomach cancer that spreads widely through the stomach wall, making it thick and stiff. It may cause early fullness, weight loss, nausea, vomiting, or vague upper-abdominal discomfort.

Linoleic Acid

An essential omega-6 polyunsaturated fatty acid obtained from food. The body uses it to make cell membranes and signaling molecules.

Linolenic Acid

A polyunsaturated fatty acid. Alpha-linolenic acid is an essential omega-3 nutrient from plant foods, while other forms occur in animal tissues and have different roles.

Liothyronine Sodium

A manufactured form of triiodothyronine, an active thyroid hormone, used in selected thyroid disorders. It acts quickly and can cause fast heartbeat, tremor, anxiety, bone loss, or heart strain if excessive.

Lip

The lips are mobile folds of skin and mucosa containing muscle, blood vessels, and sensory nerves; they form the oral seal and assist speech, facial expression, feeding, and swallowing.

Lipase

An enzyme that breaks down fats into smaller molecules. Blood lipase testing is commonly used when pancreatitis is suspected, although an abnormal result is not specific in every case.

Lipase Test

A lipase test measures a pancreatic digestive enzyme in blood and supports evaluation of acute pancreatitis and selected pancreatic or gastrointestinal disorders.

Lip Cancer

Cancer developing in the tissue of the upper or lower lip. It may appear as a persistent sore, lump, crust, bleeding area, numbness, or color change.

Lip Disease

A disorder of the lips, such as infection, inflammation, ulceration, trauma, pigmentation change, benign tumor, or malignancy.

Lipedema

A long-term disorder causing an unusual, usually symmetrical buildup of painful fat in the legs and sometimes arms. The feet and hands are usually spared, while easy bruising, tenderness, and swelling may occur.

Lipemia Retinalis

A creamy pink-white appearance of retinal blood vessels caused by extremely high triglyceride levels. The appearance usually resolves as triglycerides fall; the finding indicates severe hypertriglyceridemia, which can cause acute pancreatitis.

Lipemic Index

A laboratory estimate of how cloudy a blood sample is because of excess fats. Marked cloudiness can interfere with some test results, sometimes leading to sample review or repeat testing.

Lipid

A structurally heterogeneous class of organic biomolecules defined by their high solubility in nonpolar organic solvents (e.g., chloroform, ether) and relative insolubility in aqueous solutions. In human biochemistry and physiology, lipids are categorized into five major classes: (1) Fatty acids (saturated and unsaturated hydrocarbon chains functioning as primary metabolic fuels via mitochondrial β-oxidation); (2) Triglycerides (triacylglycerols, the predominant molecular form of energy storage sequestered in adipose tissue); (3) Phospholipids (amphipathic molecules, such as phosphatidylcholine and sphingomyelin, forming the structural lipid bilayer of all eukaryotic cellular and organellar membranes); (4) Sterols (primarily cholesterol, an essential membrane fluidity regulator and the obligate precursor for steroid hormones, bile acids, and vitamin D); and (5) Eicosanoids (paracrine signaling mediators including prostaglandins, thromboxanes, and leukotrienes). Because of their hydrophobic nature, circulating lipids are packaged into specialized amphipathic macromolecular complexes called lipoproteins (chylomicrons, VLDL, IDL, LDL, HDL) for vascular transport. Abnormalities in lipid metabolism, uptake, or clearance (dyslipidemia) directly drive atherogenesis, ischemic cardiovascular disease, pancreatitis, and nonalcoholic fatty liver disease.

Lipid A

The part of a substance on the outer surface of some bacteria that triggers a strong immune reaction. Large amounts can contribute to widespread inflammation, shock, and abnormal clotting.

Lipid Bilayer

The double layer of fat-like molecules forming the basic structure of cell membranes. It separates the cell from its surroundings and controls movement of substances.

Lipid Disorder

An abnormal level or handling of fats in the blood or tissues, such as high LDL cholesterol, high triglycerides, or unusually low protective HDL cholesterol.

Lipid Emulsion Therapy

Intravenous fat emulsion used as emergency treatment for severe local-anesthetic systemic toxicity and selected other poisonings. Its mechanisms are not fully established, and it is given as part of monitored emergency care.

Lipid Metabolism

The processes by which the body digests, transports, stores, makes, and breaks down fats for energy, cell membranes, and hormone production.

Lipidosis

A disorder involving abnormal accumulation or metabolism of lipids in tissues, often due to inherited enzyme defects.

Lipid Panel

A blood test that usually measures total cholesterol, LDL cholesterol, HDL cholesterol, and triglycerides. These results are used with other risk factors to assess cardiovascular risk and guide or monitor treatment; no single value determines risk by itself.

Alternate Names:
Lipid Profile; Cholesterol Panel; Coronary Risk Panel; Lipid Profile Test

Lipid Profile

Alternate name; see *Lipid Panel*.

Lipid Profile Test

Alternate name; see *Lipid Panel*.

Lipids

Plural form; see *Lipid*.

Lipid Transport

Movement of fats through blood and tissues by lipoproteins, carrier proteins, or other mechanisms for energy use, storage, membrane formation, and hormone production.

Lip Infection

Infection of the lip caused by bacteria, viruses, fungi, or an infected wound. It may cause pain, redness, swelling, blisters, cracks, pus, or fever; rapidly spreading swelling or breathing difficulty may occur in a serious infection.

Lipitor

Brand name for atorvastatin; see *Atorvastatin*.

Lip Moisturizer Poisoning

Swallowing a small amount of ordinary lip moisturizer usually causes mild stomach upset or loose stools. Products containing camphor, salicylates, or other medicines can cause serious poisoning.

Lip Neoplasm

An abnormal growth in the lip that may be benign or malignant; persistent sores or lumps can be associated with cancer.

Lipoatrophy

Loss of the layer of fat beneath the skin, causing dents or hollow areas. It can follow repeated injections, inflammation, autoimmune disease, HIV treatment, or inherited disorders and may alter medicine absorption at injection sites.

Lipoblastoma

A usually benign tumor of immature adipose tissue occurring mainly in infants and young children; it may be localized or diffuse and can recur if incompletely removed.

Lipodermatosclerosis

A chronic fibrosing inflammatory panniculitis of the

subcutaneous adipose tissue of the lower extremity secondary to severe chronic venous insufficiency, producing induration, hyperpigmentation, and the classic "inverted champagne bottle" leg appearance.

Alternate Names:
Sclerosing Panniculitis

Lipodystrophy

Abnormal loss or distribution of body fat. It may be inherited or caused by medicines, metabolic disease, or repeated injections and can lead to insulin resistance, diabetes, high triglycerides, or changes in appearance.

Lipodystrophy Syndromes

Rare disorders in which body fat is absent from some areas, present from birth or lost later, and may collect excessively elsewhere. They can cause severe insulin resistance, diabetes, fatty liver, and very high triglycerides.

Lipofuscin

Lipofuscin is a yellow-brown, non-degradable pigment made of oxidized lipid and protein residues that accumulates in long-lived cells with ageing and in some degenerative diseases.

Lipogranulomatosis

Inflammation in which fat accumulates and triggers organized collections of immune cells called granulomas. It may affect skin, soft tissue, or internal organs and can result from injury, leakage of oily material, or metabolic disease.

Lipohypertrophy

A firm or lumpy buildup of fat under the skin, often at repeated insulin-injection sites. Injecting into these areas can change how insulin is absorbed.

Lipoid Nephrosis

An older name for a kidney disorder, most often in children, in which the kidney filters leak large amounts of protein into the urine. It can cause swelling around the eyes, legs, or abdomen.

Lipoidosis

Abnormal buildup of fats within cells or tissues, usually because a metabolic pathway cannot process or transport them normally. It may be inherited or acquired and can damage organs such as the liver, nerves, or kidneys.

Lipoid Pneumonia

Lung inflammation caused by oil or fat entering the airways or building up in lung tissue. It may follow inhalation or swallowing of oil-based products and can cause cough, breathlessness, fever, or chest changes on imaging.

Lipolysis

Breakdown of stored body fat into fatty acids and glycerol so they can be used for energy. Fasting and stress hormones increase this process, while insulin generally reduces it.

Lipoma

A benign tumor of mature fat cells, usually a slow-growing, soft, movable, painless lump beneath the skin of the trunk, neck, or limbs. Less commonly, lipomas develop deeper within muscle or other tissues.

Lipomastia

Alternate name; see *Pseudogynecomastia*.

Lipomatosis

A condition in which mature fat tissue grows in multiple or broad areas rather than forming one separate lump. It may be symmetrical, involve the trunk or limbs, and be difficult to remove when it extends between nearby structures.

Lipomatous Neoplasm

A growth made partly or mainly of fat cells. It may be noncancerous, like a lipoma, or cancerous, like a liposarcoma; deep, firm, painful, or rapidly enlarging masses are more concerning for malignancy.

Lipophilicity

Lipophilicity is the tendency of a substance to dis-

solve in fats or oils rather than water, influencing drug absorption and distribution.

Lipopolysaccharide

Lipopolysaccharide is the outer-membrane endotoxin of Gram-negative bacteria, consisting of lipid A, core polysaccharide, and O antigen; circulating lipid A can trigger cytokine release, fever, shock, and disseminated inflammation.

Lipoprotein

A particle made of fat and protein that carries cholesterol and other fats through the blood. Different types transport dietary fat, triglycerides, or cholesterol; high LDL levels can contribute to artery disease.

Lipoprotein A

Alternate spelling; see *Lipoprotein(a)*.

Lipoprotein(a)

A cholesterol-carrying particle similar to LDL. Its level is mostly inherited, and a high level raises the risk of heart and blood vessel disease and narrowing of the aortic valve.

Alternate Names:
Lp(a)

Lipoprotein Analysis

Laboratory measurement of blood particles that carry fats, such as LDL, HDL, or lipoprotein(a), to assess cholesterol transport or heart and blood vessel risk.

Lipoprotein Lipase

An enzyme on capillary walls that breaks down triglycerides in chylomicrons and very-low-density lipoproteins so tissues can use or store the fatty acids. Its activity is regulated by nutritional and hormonal signals.

Lipoprotein Metabolism

The body's production, transport, modification, and removal of particles that carry cholesterol and other fats through the bloodstream.

Liposarcoma

A malignant tumor of fat cells, usually arising in the deep soft tissues of the thigh or retroperitoneum; well-differentiated, myxoid, and pleomorphic subtypes are recognized.

Liposarcoma Of The Breast

A rare malignant mesenchymal tumor with adipocytic differentiation arising in breast soft tissue. Diagnosis requires histopathologic and molecular evaluation, and treatment is generally wide excision with sarcoma-focused care.

Liposomal Amphotericin B

A liposomal formulation of amphotericin B used in the treatment of severe systemic fungal infections, with reduced nephrotoxicity compared to conventional amphotericin B. The liposomal formulation encapsulates amphotericin B within lipid vesicles, which alters the drug's biodistribution and reduces renal tubular damage.

Liposome

A liposome is a tiny vesicle made of a lipid bilayer that can carry medicines or other substances into or around the body.

Liposuction

A surgical procedure that uses a cannula and suction to remove localized deposits of subcutaneous fat for body contouring. It is not a treatment for obesity or a substitute for diet and exercise. Risks may include bleeding, infection, contour irregularity, fluid accumulation or shifts, sensory changes, and anesthesia-related complications.

Alternate Names:
Lipoplasty

Lips

The paired movable folds surrounding the opening of the mouth, involved in speech, facial expression, eating, and oral sensation.

Lipschütz Bodies

Older name for sudden, painful ulcers of the vulva

or lower vagina that are not caused by a sexually transmitted infection. Also called *Lipschütz ulcers*.

Lip Swelling

Enlargement of one or both lips caused by local injury, infection, inflammation, dental disease, medication, or angioedema. Sudden swelling with tongue or throat swelling, breathing difficulty, wheezing, faintness, or widespread hives may indicate a severe allergic reaction.

Liquefaction

Conversion of a solid or partly solid material into liquid, such as tissue breakdown during liquefactive necrosis or melting of a substance.

Liquefactive Necrosis

A pattern of tissue death in which enzymes digest dead cells until the area becomes soft or liquid. It commonly occurs in brain injury and some infections and may leave a fluid-filled cavity.

Liquid Bandage for Lacerations

Use of a topical skin adhesive to close selected small, clean, shallow wounds with edges that can be brought together easily. It forms a protective film that wears off as the skin heals; it is not suitable for every wound.

Alternate Names:
Tissue Adhesive Closure; Topical Skin Glue; Cyanoacrylate Liquid Bandage

Liquid Biopsy

A blood or other body-fluid test that looks for tumor-related material, such as circulating tumor DNA or tumor cells. It may help detect cancer changes or guide treatment in selected situations, but it does not replace tissue biopsy in every case.

Liquid Chromatography

A laboratory method that separates dissolved substances as a liquid carries them through a material that interacts differently with each substance. It is used to identify or measure medicines, hormones, metabolites, proteins, and toxins.

Liquid Diet

A diet consisting partly or entirely of liquids; clear-liquid and full-liquid diets differ in allowed foods and may be prescribed temporarily for procedures, illness, or swallowing or digestive problems.

Liquid Incense

A scented liquid product that may contain solvents, oils, or other chemicals. Swallowing or inhaling it can cause irritation, drowsiness, vomiting, seizures, or lung injury; the product container is needed for poison-control assessment.

Liquid Nitrogen

Liquid nitrogen is extremely cold nitrogen used to freeze tissue in cryotherapy; contact can cause frostbite and its gas can displace oxygen.

Liquor

A historical medical term for a body fluid, especially cerebrospinal fluid (*liquor cerebrospinalis*). In pharmacy, it can also mean a liquid medicinal preparation.

LI-RADS

A standardized system for reporting liver-imaging findings in people at increased risk of liver cancer, especially those with cirrhosis. Its categories estimate how likely a finding is to be cancer and help guide follow-up or biopsy.

Liraglutide

Liraglutide is a GLP-1 receptor agonist used to improve glucose control in type 2 diabetes and, at some doses, support weight management.

Lisch Nodule

A small, harmless, brownish or yellow-tan bump that develops on the iris (the colored part of the eye). Named after the eye doctor who first described them, Lisch nodules do not affect vision, but they serve as a classic physical indicator used by doctors to help diagnose neurofibromatosis type 1 (a genetic disorder causing nerve tumors).

Lisch Nodules

Plural form; see *Lisch Nodule*.

Lisfranc Fracture

A severe midfoot injury characterized by fracture, subluxation, or dislocation of the tarsometatarsal joints, classically involving disruption of the strong Lisfranc ligament connecting the medial cuneiform to the base of the second metatarsal bone.

Alternate Names:
Lisfranc Joint Complex Injury; Tarsometatarsal Fracture-Dislocation

Lisfranc Injury

A spectrum of traumatic fracture-dislocations involving the tarsometatarsal articulation of the midfoot, typically disrupting the critical Lisfranc ligament extending between the medial cuneiform and the base of the second metatarsal.

Lisinopril

Lisinopril is an angiotensin-converting-enzyme inhibitor used for hypertension, heart failure, and kidney protection in some diabetes; cough, hyperkalaemia, renal-function changes, angioedema, and fetal toxicity are important risks.

Lissencephaly

A birth condition in which the brain's surface has few or no normal folds because nerve cells did not move to their usual positions during development. It can cause seizures, severe developmental impairment, feeding problems, and movement difficulties.

Listeria

Listeria is a genus of bacteria; L. monocytogenes can cause foodborne illness, bloodstream infection, and meningitis, especially in pregnancy, older adults, and people with weakened immunity.

Alternate Names:
Listeria Species

Listeria Infection

An infection caused by Listeria bacteria, usually acquired from contaminated food. It may cause fever, muscle aches, diarrhea, or vomiting; infection can be severe in pregnancy, newborns, older adults, and people with weakened immune systems.

Listeria Monocytogenes

A gram-positive, facultatively anaerobic rod that causes listeriosis, a foodborne infection. The organism is transmitted through contaminated food, particularly deli meats, soft cheeses, and ready-to-eat foods. It can grow at refrigeration temperatures.

Listeriosis

An infection caused by the bacterium Listeria monocytogenes, usually from contaminated food. It can cause fever, muscle aches, diarrhea, or vomiting. Sometimes the bacteria spread from the gut into the blood or brain, causing serious illness. Infection during pregnancy may lead to pregnancy loss, early birth, or serious illness in the newborn. Older adults and people with weakened immune systems are also at higher risk of severe illness.

Listeriosis In Pregnancy

A foodborne infection that may cause only fever, tiredness, or muscle aches in the pregnant person but can spread to the fetus. It can cause miscarriage, stillbirth, premature birth, or severe infection in the newborn.

Lithiasis

The formation or presence of stones (calculi) in an organ or duct. The term is often named for the site, such as nephrolithiasis in the kidney, ureterolithiasis in the ureter, or cholelithiasis in the gallbladder.

Lithium

Lithium is a mood stabilizer used mainly for bipolar disorder and selected augmentation treatment; its narrow therapeutic range requires monitoring for tremor, thyroid or renal dysfunction, dehydration, drug interactions, and toxicity.

Lithium Carbonate

A mood-stabilizing medicine used mainly to treat bipolar disorder and reduce the risk of manic or depressive episodes; serum levels, kidney function,

thyroid function, and drug interactions require monitoring.

Lithium Nephropathy

Kidney injury related to long-term or toxic lithium exposure, most often causing impaired urine concentration and excessive urination, and sometimes chronic tubulointerstitial scarring or hyperparathyroidism. Monitoring lithium levels, kidney function, and calcium helps reduce risk.

Lithium Toxicity

Poisoning caused by too much lithium in the body, often after dehydration, illness, a dose change, or a medicine interaction. Nausea, diarrhea, worsening tremor, weakness, confusion, poor coordination, seizures, or reduced consciousness may occur.

Lithotomy

A surgical procedure for removing a stone, or the position with the hips and knees flexed and legs supported.

Lithotomy Position

A supine position in which the hips and knees are flexed and the legs are raised and supported to provide access to the pelvis and perineum.

Lithotripsy

Fragmentation of a stone using energy delivered from outside the body or through an endoscope. Shock-wave lithotripsy is used for selected urinary tract stones; laser and other forms may be used during endoscopic stone-removal procedures. Fragments may pass spontaneously or require removal, depending on the stone and procedure.

Alternate Names:
Stone Fragmentation

Lithotripsy Probe

A device that fragments a stone using mechanical, ultrasonic, laser, or shock-wave energy during a stone-removal procedure.

Lithotripter

A device that breaks urinary, bile-duct, or other stones into smaller pieces using shock waves, laser energy, or another treatment method.

Lithotripter Probe

A specialized probe delivering mechanical, electrical, or laser energy to break urinary or bile-duct stones into fragments that can be removed.

Litmus

A dye that changes color with acidity or alkalinity and is used as a simple pH indicator.

Little Area

The highly vascular region of the anterior nasal septum where several arteries meet and where most anterior nosebleeds originate.

Little's Disease

An older name for spastic cerebral palsy, a condition caused by early brain injury or abnormal development that produces stiff muscles and movement difficulties, mainly in the legs. It is not progressive, although needs change over time.

Live Attenuated Vaccines

Vaccines containing weakened forms of viruses or bacteria. They usually produce a strong, long-lasting immune response without causing illness in healthy people, but some are unsuitable for people with severely weakened immune systems or during certain pregnancies.

Alternate Names:
Live Vaccines

Live Birth

A live birth is delivery of an infant showing signs of life such as breathing, heartbeat, or movement, regardless of gestational age.

Livedoid Vasculopathy

A chronic thrombotic occlusion of small dermal vessels, usually affecting the lower legs, ankles, and feet. It causes painful purpuric lesions and ulcers that

may heal with porcelain-white, stellate scars called atrophie blanche; it is not primarily a vasculitis.

Livedo Racemosa

A persistent, irregular, branching net-like pattern of reddish-blue skin caused by disease of small or medium blood vessels. It may occur with autoimmune, clotting, inflammatory, or other systemic disorders.

Livedo Reticularis

A usually regular, netlike pattern of reddish-blue or violaceous discoloration caused by altered blood flow in cutaneous vessels. It often appears on the limbs and may fade with warming. It is a skin finding rather than a diagnosis; persistent or unexplained livedo can accompany vascular, autoimmune, infectious, or clotting disorders.

Liver

The largest internal organ, beneath the right ribs. It processes nutrients, makes bile to help digest fats, stores energy, helps regulate blood chemicals, and breaks down medicines and harmful substances.

Liver Abscess

A pocket of pus in the liver, usually caused by bacteria or the amoeba *Entamoeba histolytica*. It may cause fever, chills, or pain under the right ribs. Bacterial liver abscesses are called pyogenic; amoebic abscesses are caused by a parasite that usually first infects the intestine.

Liver Anatomy and Physiology

Alternate name; see *Liver*.

Liver Biopsy

Percutaneous, transjugular, or laparoscopic sampling of liver tissue for histologic evaluation when noninvasive tests do not answer the clinical question. It may stage fibrosis or characterize inflammation, fatty liver disease, infiltrative disease, or a mass; complications include pain and bleeding.

Liver Cancer

A malignant tumor involving the liver. Primary liver cancers begin in liver cells or bile-duct cells, with hepatocellular carcinoma the most common primary type in adults. Cancer that begins elsewhere and spreads to the liver is metastatic liver cancer and is more common than primary liver cancer. Risk factors for primary liver cancer include cirrhosis, chronic viral hepatitis, alcohol-related liver injury, fatty-liver inflammation, and some toxins.

Alternate Names:
Hepatic Malignancy

Liver Cancer Treatment

Treatment of liver cancer may include surgery, ablation, embolization, radiation, immunotherapy, targeted therapy, chemotherapy, or transplantation according to tumor type, stage, liver function, and overall health.

Liver Circulation

The liver receives oxygen-rich blood from the hepatic artery and nutrient-rich blood from the portal vein. Blood passes through liver tissue and leaves through the hepatic veins to the heart.

Liver Cirrhosis

Alternate name; see *Cirrhosis*.

Liver Damage

Liver damage is injury or loss of liver-cell function caused by infection, alcohol, medicines, toxins, fatty disease, autoimmune disease, or other processes.

Liver Disease

Any acute or chronic pathological condition that damages hepatic parenchyma, disrupts hepatocellular metabolic architecture, or impairs biliary drainage and microvascular perfusion. Etiologies are diverse: viral infections (hepatitis B, C, D); toxic and chemical insults (alcohol-associated liver disease, drug-induced liver injury [DILI, notably acetaminophen toxicity]); metabolic derangements (metabolic dysfunction-associated steatotic liver disease [MASLD / MASH]); autoimmune conditions (autoimmune hepatitis, primary biliary cholangitis

[PBC], primary sclerosing cholangitis [PSC]); genetic inborn errors of metabolism (hemochromatosis, Wilson disease, alpha-1 antitrypsin deficiency); vascular disorders (Budd-Chiari syndrome, portal vein thrombosis); and neoplastic transformations (hepatocellular carcinoma, cholangiocarcinoma). Chronic ongoing injury triggers hepatic stellate cell transdifferentiation into collagen-secreting myofibroblasts, resulting in progressive fibrosis, architectural distortion, and liver cirrhosis complicated by portal hypertension, ascites, hepatic encephalopathy, variceal hemorrhage, hepatorenal syndrome, and acute-on-chronic liver failure.

Liver Disease and Pregnancy

Liver disorders may begin during pregnancy or predate it and can affect maternal health, fetal growth, medication choices, and timing of delivery. Abnormal liver tests, jaundice, severe itching, right-upper-abdominal pain, vomiting, or high blood pressure can indicate a serious pregnancy-related disorder.

Liver Disease Diet

An individualized eating plan for a person with liver disease. It may address adequate energy and protein, sodium or fluid intake, alcohol avoidance, and nutrient deficiencies according to the condition.

Liver Diseases

Plural form; see *Liver Disease*.

Liver Disorder

Any disease affecting the liver, including fatty liver, viral hepatitis, autoimmune disease, scarring, blockage of bile flow, or cancer. Symptoms may be absent or include jaundice, fatigue, pain, swelling, or abnormal blood tests.

Liver Dysfunction

Liver dysfunction is reduced ability of the liver to perform tasks such as processing nutrients, making proteins, clearing toxins, and producing bile.

Liver Elastography

A noninvasive ultrasound- or MRI-based test that estimates liver stiffness. It helps assess scarring (fibrosis) and cirrhosis, but stiffness can also rise from inflammation, congestion, or other conditions; results are considered with other findings.

Liver Enzymes

Blood measurements including ALT, AST, alkaline phosphatase, and GGT that can suggest liver or bile-duct injury. Abnormal results are considered with symptoms, medicines, imaging, and other tests.

Liver Failure

A life-threatening loss of the liver's ability to make proteins, process nutrients, remove harmful substances, and regulate blood clotting. It can cause jaundice, bleeding, confusion, swelling, and multiple-organ failure.

Liver Fibrosis

Excessive scar formation in the liver after ongoing injury or inflammation. It can progress to cirrhosis, reduce liver function, and result from viral hepatitis, alcohol, fatty liver, immune disease, or other causes.

Liver Fluke

A parasitic flatworm that infects the liver or bile ducts, including Clonorchis, Opisthorchis, and Fasciola species.

Liver Function

The liver's ability to process nutrients and medicines, make bile and blood proteins, regulate blood chemicals, and remove harmful substances. Blood tests can assess some aspects of liver function and injury.

Liver Function Test

Singular variant; see *Liver Function Tests*.

Liver Function Tests

Blood tests used to assess liver injury, bile-flow abnormalities, and liver synthetic function. They commonly include aminotransferases, alkaline phosphatase, bilirubin, albumin, and clotting tests; results must be interpreted together with the clinical context.

Liver Health

The ability of the liver to perform its many jobs, including processing nutrients and medicines, making important blood proteins, producing bile, storing energy, and helping remove harmful substances. Alcohol, infections, obesity, medicines, and other diseases can damage the liver.

Liver Infection

Infection of liver tissue, such as a viral hepatitis infection or a bacterial liver abscess. Symptoms may include fever, tiredness, nausea, right-upper-abdominal pain, jaundice, or confusion.

Liver Lobule

A small repeating unit of liver tissue in which blood from branches of the portal vein and hepatic artery flows past liver cells toward a central vein, while bile flows in the opposite direction.

Liver Mass

An unusual area found in the liver, often on an ultrasound, CT scan, or MRI. It may be a harmless cyst or growth, a primary liver cancer, or cancer that spread from elsewhere; further testing may be needed.

Liver Metastases

Liver metastases are cancer deposits that spread to the liver from another primary tumor and may cause no symptoms or produce pain, weight loss, or liver dysfunction.

Liver Neoplasm

A liver neoplasm is an abnormal growth in the liver that may be benign or malignant and may arise from liver cells, bile ducts, or metastasis from another cancer.

Liver Pain

Discomfort in the upper-right abdomen that may arise from the liver, gallbladder, bile ducts, stomach, muscles, or other organs. Persistent pain, jaundice, fever, vomiting, or confusion may indicate an underlying illness.

Liver Regeneration

The liver's ability to restore lost tissue by growing and reorganizing remaining cells after injury or partial surgical removal.

Liver Scan

A nuclear medicine or imaging examination of the liver used to evaluate its size, shape, tissue distribution, focal lesions, blood flow, or selected functional abnormalities.

Liver Shunt

An abnormal or surgically created channel that diverts blood around the liver, such as a portosystemic shunt; it can reduce detoxification and contribute to hepatic encephalopathy.

Liver Spots

Alternate name; see *Age Spots*.

Liver Transplant

Surgical replacement of a diseased liver with a healthy liver or part of a liver from a donor.

Liver Transplantation

Surgery to replace a severely diseased or failing liver with a healthy donor liver or part of one. It may be used for advanced liver disease, sudden liver failure, or selected liver cancers; lifelong medicines help prevent rejection.

Living Donor

Individual who donates an organ (kidney, liver segment, or other tissue) while alive for transplantation into a recipient.

Living Will

A type of advance directive that records a person's preferences for future medical treatment if the person cannot communicate or decide.

Livor Mortis

Post-mortem purplish-red discoloration of dependent body parts resulting from gravitational settling of blood in uncompressed capillaries and small veins

following cessation of circulation.

Alternate Names:
Hypostasis; Postmortem Staining

Lizard Bite

A puncture or tissue injury caused by a lizard; care includes cleaning and assessing for infection, tetanus, venom exposure, and significant tissue damage according to the species and circumstances.

LLETZ

A procedure that uses a thin electrically heated wire loop to remove abnormal tissue from the cervix. The tissue is examined in the laboratory and the procedure can treat precancerous cervical changes.

Alternate Names:
LEEP (loop Electrosurgical Excision Procedure)

Lloyd-Davies Position

A modified lithotomy position in which the patient lies supine with lower-profile leg support (less hip flexion) combined with a Trendelenburg tilt. It is commonly used for pelvic and colorectal surgery, allowing simultaneous abdominal and perineal surgical access.

Loading Dose

The first, sometimes larger, dose of a medicine given to reach a helpful amount in the body quickly. It is followed by regular maintenance doses and is selected according to the medicine and the patient's condition.

Loa Loa

A parasitic worm spread by deer flies in parts of West and Central Africa. Adult worms move under the skin and sometimes across the surface of the eye. Infection can cause temporary, itchy swellings under the skin.

Lobaplatin

Lobaplatin is a platinum-based antineoplastic drug used in some countries and studied for its ability to damage cancer-cell DNA.

Lobar Hemorrhage

Bleeding into one of the large regions, or lobes, of the brain. It can result from long-term high blood pressure, fragile blood vessels, blood-thinning medicines, injury, or other conditions and may cause sudden headache, weakness, confusion, seizures, or loss of consciousness.

Lobar Pneumonia

Pneumonia affecting a large section or an entire lobe of the lung. It can cause fever, cough, chest pain, breathlessness, and low oxygen and may be caused by bacteria, viruses, or other organisms.

Lobe

A lobe is a distinct subdivision of an organ or structure, such as a lung, liver, brain, thyroid, or gland.

Lobectomy

Surgical removal of a lobe of an organ. Most commonly lung lobectomy (removal of one lobe of the lung, performed for lung cancer, bronchiectasis, abscess, or benign tumor) or temporal lobectomy (removal of the anterior temporal lobe for drug-resistant temporal lobe epilepsy).

Lobomycosis

A rare, chronic fungal infection of the skin and subcutaneous tissue caused by *Lacazia loboi*. It produces slowly growing papules, nodules, or plaques, often with a keloid-like appearance, usually on exposed skin in tropical regions of Central and South America.

Alternate Names:
Lacaziosis; Jorge Lobo Disease; Keloidal Blastomycosis

Lobotomy

A historical brain operation that cut or damaged nerve connections in the front part of the brain. It was once used for severe mental illness but caused serious changes in personality and ability and is no longer an accepted treatment.

Lobular Capillary Hemangioma

Alternate name; see *Pyogenic Granuloma*.

Lobular Carcinoma

A breast cancer arising in milk-producing lobular cells that has invaded surrounding breast tissue; this is invasive lobular carcinoma. Lobular carcinoma in situ is a separate noninvasive lesion associated with increased breast-cancer risk.

Lobular Carcinoma In Situ

An abnormal proliferation of cells confined to the breast lobules, without invasion into surrounding tissue. Classic LCIS is not invasive breast cancer and seldom progresses directly, but it increases future breast-cancer risk in either breast.

Lobule

A small anatomical subdivision or structural unit within a larger bodily organ, separated from neighboring units by thin sheets of connective tissue. For example, the liver is composed of thousands of microscopic lobules that filter blood and produce bile, while the breasts and lungs contain lobules specialized for milk production and air exchange, respectively.

Lobules

Plural form; see *Lobule*.

Local

Limited to a particular body site or region rather than involving the whole body. A local treatment or symptom affects the treated or affected area, although nearby or wider effects can sometimes occur.

Local Anesthesia

Temporary loss of sensation, especially pain, in a small, specific body area caused by a local anesthetic applied to the surface or injected nearby. The person usually remains conscious, although sedation may be added; excessive dosing or accidental injection into a blood vessel can cause seizures, heart problems, or other toxicity.

Alternate Names:
Local Anaesthesia

Local Anesthetic Systemic Toxicity

A dangerous reaction when a local numbing medicine enters the bloodstream in excessive amounts. Early signs include tingling around the mouth, ringing in the ears, dizziness, or agitation; seizures and heart problems can follow.

Local Anesthetic Toxicity

Harm from too much local anesthetic in the bloodstream. Early warning signs include ringing in the ears, numbness around the mouth, dizziness, or agitation; seizures, low blood pressure, abnormal rhythms, or cardiac arrest can follow. Treatment may include airway support and intravenous lipid emulsion.

Local Invasion

Growth of a tumor into nearby tissues rather than only at its original site. It is a feature of malignant behavior and differs from distant metastasis.

Localised

Confined to a limited area or a small number of adjacent body sites rather than widespread.

Localization

Determining the body site responsible for a symptom, sign, lesion, or function. Accurate localization helps guide examination, imaging, diagnosis, treatment, surgery, rehabilitation, and assessment of nerve or organ damage.

Localized

Limited to one particular area, organ, or body site without evidence of distant spread. A localized disease may still be serious, but treatment can sometimes focus on the affected area.

Alternate Names:
Localized Disease

Localized Edema

Swelling confined to a particular body region be-

cause of fluid accumulation, commonly caused by venous or lymphatic obstruction, inflammation, trauma, allergy, or local infection.

Localized Epidermolysis Bullosa

An inherited or acquired blistering disorder limited mainly to particular areas of skin or mucosa; friction can cause blisters, erosions, pain, and infection, and the subtype determines management.

Localized Lipodystrophy

Loss of subcutaneous fat in a limited body area, sometimes after injections, trauma, inflammation, pressure, or panniculitis. It may be cosmetic or reflect an underlying local or systemic disorder.

Localized Scleroderma

An autoimmune skin disorder causing localized thickening and hardening of the skin, with or without involvement of deeper tissues; it differs from systemic sclerosis.

Local Therapy

Local therapy treats a disease at or near the affected area rather than throughout the body, for example with a cream, injection, surgery, or focused radiation.

Lochia

The normal vaginal discharge after childbirth. It is usually red and bloody at first, then becomes pink or brown, and finally yellowish or white over the following weeks. Heavy bleeding, large clots, fever, or foul odor can indicate hemorrhage or infection.

Locked-In Syndrome

A condition in which a person remains conscious and able to think but is almost completely paralyzed and cannot speak. Some people can communicate by blinking or moving their eyes.

Alternate Names:
Pseudocoma; De-Efferented State

Lock Jaw

Alternate name; see *Lockjaw*.

Lockjaw

A common name for trismus, difficulty opening the mouth because of jaw-muscle tightening or spasm. It can occur with tetanus, dental infection, jaw injury, or other conditions.

Alternate Names:
Trismus

Locomotion

Movement of an organism or person from one place to another using coordinated muscles, bones, nerves, and balance systems.

Locomotive System

The musculoskeletal and nervous systems working together to produce posture, balance, and movement from place to place.

Locomotor Ataxia

A late manifestation of untreated tertiary syphilis (neurosyphilis) caused by infection with Treponema pallidum, involving progressive degeneration of the dorsal columns (fasciculus gracilis and cuneatus) and dorsal roots of the spinal cord.

Alternate Names:
Syphilitic Myelopathy; Posterior Sclerosis

Locoregional

Affecting a defined local area and nearby tissues or lymph nodes, without necessarily involving the whole body.

Locus

The specific location of a gene or other DNA sequence on a chromosome. It is described using the chromosome number and a coded position on its short or long arm.

Locus Ceruleus

A small brainstem region containing nerve cells that release norepinephrine. It helps regulate alertness, attention, stress responses, sleep, and some automatic body functions.

Alternate Names:
Locus Coeruleus

Locus Coeruleus

The locus coeruleus is a brainstem nucleus whose noradrenaline-producing neurons influence arousal, attention, stress, sleep, and pain.

Locus Minoris Resistentiae

Latin for a site of lesser resistance, meaning a body area considered more vulnerable to injury, infection, or disease because of local weakness or prior damage.

Lod Score

A statistical measure used in genetic linkage analysis to compare how likely it is that two genetic markers are inherited together rather than independently. Higher positive scores provide stronger evidence of linkage in the studied family.

Loeffler Endocarditis

Eosinophil-mediated endomyocardial disease, usually associated with hypereosinophilic syndrome, in which eosinophil infiltration and degranulation cause myocardial or endocardial injury, mural thrombus, and later endocardial fibrosis. It can produce restrictive physiology, valvular regurgitation, emboli, and heart failure; the disease may progress through necrotic, thrombotic, and fibrotic stages.

Alternate Names:
Eosinophilic Endomyocardial Fibrosis; Fibroplastic Parietal Endocarditis

Loeffler Syndrome

A benign, self-limiting pulmonary syndrome characterized by transient migratory pulmonary infiltrates, peripheral blood eosinophilia, dry cough, and low-grade fever, classically triggered by the transpulmonary larval migration of helminth parasites such as Ascaris lumbricoides.

Alternate Names:
Simple Pulmonary Eosinophilia; Loeffler Pneumonia

Loeys-Dietz Syndrome

Loeys-Dietz syndrome is an inherited connective-tissue disorder associated with arterial aneurysm or dissection, distinctive skeletal and craniofacial features, allergic disease, and variable organ involvement. Management often includes lifelong vascular imaging and coordinated specialist care.

Alternate Names:
LDS

Löfgren Syndrome

A sudden form of sarcoidosis causing swollen lymph nodes near the lungs, tender red lumps on the shins, and painful swollen ankles. It often improves over time; involvement of other organs can occur.

Log Roll Test

A physical examination manoeuvre used to assess hip joint pathology. With the patient supine and the lower extremity in full extension, the examiner passively rolls the thigh internally and externally; pain elicited during rotation indicates intra-articular hip pathology, such as femoral neck fracture, labral tear, or synovitis.

Loiasis

Loiasis is infection with the filarial worm Loa loa, transmitted by deerflies and sometimes causing transient eye-worm migration and localized swelling.

Loin

The area of the lower back between the ribs and pelvis, including the side of the body called the flank. Pain there may come from muscles, the spine, kidneys, or nearby organs.

Lomentospora Prolificans

An environmental mold that can cause severe disseminated infection, especially in people with weakened immune systems. It is often resistant to antifungal medicines.

Alternate Names:
Scedosporium Prolificans

Lomotil Overdose

Taking too much diphenoxylate–atropine can cause extreme sleepiness, confusion, dry mouth, fast heartbeat, slowed breathing, coma, or delayed worsening, especially in children.

Lomustine

Lomustine is an oral chemotherapy medicine used for selected brain tumors and other cancers; delayed low blood counts are an important risk.

Lonafarnib

A farnesyltransferase-inhibiting medicine used for selected progeroid syndromes, in which abnormal protein processing contributes to premature aging features. It can cause gastrointestinal symptoms, liver abnormalities, and drug interactions.

Long-Acting Beta-2 Agonists

Inhaled medicines that keep the airways relaxed for many hours and reduce breathing symptoms in asthma or chronic obstructive pulmonary disease. For asthma, they are used with an inhaled corticosteroid, not alone.

Long-Acting Reversible Contraception

Contraceptive methods that prevent pregnancy for months to years without daily action, mainly progestin implants and intrauterine devices. They can be removed when pregnancy is desired or another method is preferred.

Alternate Names:
LARC

Long Arm Of A Chromosome

The longer segment of a chromosome, designated q, extending from the centromere toward the chromosome's end.

Long Bones

Bones that are longer than they are wide, such as the femur, tibia, humerus, and radius. Their shafts provide support and leverage for movement, while their ends form or help form joints; bone marrow inside them produces blood cells.

Long COVID

A condition following probable or confirmed SARS-CoV-2 infection, usually beginning about 3 months after illness and lasting at least 2 months without another explanation. Symptoms may persist from the acute illness or appear after recovery, and can fluctuate or recur. Common features include fatigue, shortness of breath, and cognitive dysfunction, sometimes affecting everyday functioning.

Longitudinal Axis

An imaginary line running along the length of a body or body part, from one end to the other. Rotation around this line is called longitudinal rotation.

Longitudinal Section

A cut or image made along the long axis of an organ, limb, vessel, or other structure.

Longitudinal Studies

Longitudinal studies follow participants or measurements over time to examine change, incidence, exposures, outcomes, and temporal relationships.

Longitudinal Vaginal Septum

A wall of tissue that divides the vagina lengthwise, present from birth. It may cause painful sex, difficulty inserting tampons, blocked menstrual flow, or no symptoms. It can occur with an unusually shaped uterus and may be removed surgically when it causes problems.

Long QT Syndrome

An electrical disorder of the heart that affects how heart muscle cells recharge between beats. On an electrocardiogram (ECG), this delayed electrical recovery is seen as an unusually long interval between the Q and T waves. Because this delay leaves the heart vulnerable to chaotic electrical disruptions, it can trigger sudden, dangerous, irregular heartbeats that cause fainting, seizures, or sudden cardiac arrest, often provoked by exercise, intense emotion, or sudden loud noises.

Alternate Names:
LQTS; Romano-Ward Syndrome

Long-Sightedness

Hyperopia, a refractive error in which distant objects may be clearer than near objects and accommodation is required for focusing.

Long-Term Care

Ongoing help with daily activities, nursing, medical needs, or supervision for a person who cannot live fully independently. Care may be provided at home, in assisted living, or in a nursing facility and changes as needs evolve.

Long-Term Care Facility

A residential or care setting providing ongoing assistance, nursing, rehabilitation, or personal care to people who cannot live independently or need sustained support.

Long-Term Complications Of Diabetes

Chronic complications of diabetes caused mainly by vascular and metabolic injury, including retinopathy, kidney disease, neuropathy, cardiovascular disease, and foot disease.

Long-Term Effect

A health effect that develops or persists after prolonged exposure, treatment, or disease. It may be beneficial, harmful, or uncertain.

Long-Term Memory

Information retained for a long period, from hours or days to a lifetime. It includes explicit memories of facts and events and implicit skills or habits.

Long-Term Potentiation

Long-term potentiation is a lasting increase in the strength of communication between nerve cells after repeated stimulation and is important in learning and memory.

Long-Term Rehabilitation

Ongoing rehabilitation for chronic disease, lasting disability, or persistent injury. Goals include maintaining function, preventing complications, adapting activities, and supporting independence and quality of life.

Loop Diuretic

A powerful class of water-excreting medications—such as furosemide—that act on a specific U-shaped part of the kidney tubules called the loop of Henle. By blocking the kidneys from reabsorbing salt and water, loop diuretics stimulate the kidneys to produce large volumes of urine, helping rapidly clear excess fluid from the body in conditions such as congestive heart failure, severe leg swelling (edema), liver cirrhosis, and kidney disease.

Loop Diuretics

Plural form; see *Loop Diuretic*.

Loop Electrosurgical Excision Procedure

A procedure that uses a thin heated wire loop to remove abnormal tissue from the cervix. It both treats precancerous cervical changes and provides tissue for laboratory examination. Bleeding, infection, narrowing of the cervix, and a small increased risk of later premature birth can occur.

Alternate Names:
LEEP; Large Loop Excision of the Transformation Zone

Loop Of Henle

A U-shaped part of each kidney's tiny filtering tube. It helps the kidney conserve water and control the concentration of urine by allowing water and salts to move differently along its two limbs.

Loose Bodies

Free fragments of cartilage, bone, or other tissue within a joint or body cavity that may cause pain, catching, or locking.

Loose Body

A free-floating intra-articular fragment of bone, calcified hyaline cartilage, or fibrous tissue within a synovial joint space ('joint mouse'), arising from osteochondritis dissecans, osteoarthritis, or trauma, capable of causing abrupt painful mechanical joint locking.

Alternate Names:
Joint Mouse; Intra-Articular Loose Fragment

Loperamide

Loperamide is a medicine that slows intestinal move-

ment and reduces diarrhea. It may be unsafe in bloody or fever-related diarrhea, and excessive doses can cause severe abnormal heart rhythms.

Loperamide Hydrochloride

Loperamide hydrochloride is an antidiarrheal medicine that slows movement through the intestine; excessive doses can cause dangerous heart rhythms.

Lopinavir

Lopinavir is an HIV protease inhibitor used with ritonavir in antiretroviral treatment; drug interactions are common.

Loratadine

An antihistamine used to relieve sneezing, runny nose, itchy or watery eyes, and hives. It usually causes less drowsiness than older antihistamines, but sleepiness, headache, or dry mouth can still occur.

Lorazepam

Lorazepam is a benzodiazepine used short term for severe anxiety, seizures, or sedation; it can cause drowsiness, dependence, and breathing suppression.

Lordosis

The inward curve of the neck or lower back. A curve that is unusually pronounced may be related to posture, pregnancy, muscle imbalance, spinal changes, or another condition and may cause back discomfort.

Losartan

Losartan is an angiotensin-receptor blocker used for high blood pressure, some kidney disease, and heart failure; it can raise potassium levels.

Losartan Potassium

Losartan potassium is the salt form of losartan, an angiotensin-receptor blocker used to lower blood pressure and protect selected patients with kidney or heart disease.

Loss Of Appetite

Reduced desire to eat. It may result from illness, medicines, mood disorders, pain, or other causes.

Loss of Bladder Control

Alternate name; see *Urinary Incontinence*.

Loss Of Consciousness

A temporary loss of awareness and responsiveness. It may result from fainting, seizure, head injury, low blood sugar, intoxication, or other serious conditions; unexplained, prolonged, or injury-associated episodes may indicate significant disease.

Loss-Of-Function Mutation

A genetic change that reduces or abolishes the normal activity or production of a gene product; its clinical effect depends on the gene, variant, and inheritance pattern.

Loss-Of-Function Variant

A genetic variant that reduces or abolishes the normal activity of the encoded gene product. Disease risk depends on the gene, inheritance pattern, residual function, and whether one or both copies are affected.

Loss Of Heterozygosity

Loss of heterozygosity is loss of one of two different versions of a gene in a cell, a change that can contribute to cancer when a tumor-suppressor gene is affected.

Loss of Smell

Partial or complete inability to detect odors, commonly caused by nasal obstruction, infection, inflammation, head injury, neurologic disease, or certain medicines.

Loteprednol Etabonate

Loteprednol etabonate is a corticosteroid eye medicine used for eye inflammation; prolonged use can raise eye pressure and increase infection risk.

Lou Gehrig Disease

Amyotrophic lateral sclerosis, a progressive neurodegenerative disease affecting upper and lower motor neurons and causing weakness, muscle wasting, and eventual respiratory impairment.

Lou Gehrig's Disease

Alternate name; see *Amyotrophic Lateral Sclerosis*.

Louse

Singular form; see *Lice*.

Lovastatin

Lovastatin is a statin medicine that lowers LDL cholesterol and reduces cardiovascular risk; muscle injury and liver effects are uncommon but important risks.

Low Back Pain

Pain or discomfort in the lower back, commonly caused by muscle or ligament strain, disc disease, arthritis, or spinal nerve irritation. Weakness, numbness, new bladder or bowel problems, fever, major trauma, or unexplained weight loss can indicate serious spinal or systemic disease.

Alternate Names:
Lumbago; LBP

Low Back Pain Deciding About MRI

The decision to obtain lumbar MRI depends on red flags, neurologic findings, duration, treatment response, and whether imaging would change management; routine early imaging is not useful for uncomplicated low back pain.

Low Back Pain Exercises

Movements used to improve strength, flexibility, or function in people with low back pain. The choice and intensity depend on the cause of the pain and the person's symptoms.

Low Birth Weight

A birth weight below 2,500 grams (about 5 pounds 8 ounces), whether caused by being born early, slower growth before birth, or both. Lower weights carry greater risks, including temperature instability, feeding difficulty, infection, and breathing problems.

Low Blood Oxygen

An abnormally low oxygen level in arterial blood, usually related to lung disease, impaired breathing, circulation problems, or reduced oxygen availability.

Low Blood Potassium

Low blood potassium, or hypokalemia, can cause weakness, cramps, constipation, abnormal heart rhythms, or paralysis and may result from losses, medicines, or hormonal disease.

Low Blood Pressure

Blood pressure that is lower than expected for a person. Some people have low readings without symptoms; others may have dizziness, fainting, confusion, or signs that organs are not receiving enough blood. A single cutoff does not define low blood pressure for everyone.

Alternate Names:
Hypotension

Low Blood Pressure Causes

Alternate name; see *Hypotension*.

Low Blood Sodium

Low blood sodium, or hyponatremia, reflects excess water relative to sodium and can cause headache, confusion, seizures, or coma when severe or rapidly developing.

Low Blood Sugar

Low blood sugar, or hypoglycemia, occurs when circulating glucose is insufficient for normal brain and body function, causing sweating, tremor, confusion, seizures, or loss of consciousness.

Low Body Temperature

Alternate name; see *Hypothermia*.

Low-Calorie Diet

An eating plan that provides less energy than a person usually uses, often to support weight loss or

a medical goal. Nutritional adequacy depends on protein, vitamins, minerals, fluids, and fiber intake.

Alternate Names:
Calorie-Restricted Diet

Low-Density Lipoprotein

A particle that carries cholesterol through the blood. Too much LDL cholesterol can collect in artery walls, forming fatty deposits that narrow arteries and increase the risk of heart attack and stroke.

Low-Dose Aspirin Therapy

Regular small-dose aspirin used for selected cardiovascular or obstetric indications. It can cause bleeding, and the balance of benefit and risk varies among people, especially in primary prevention.

Low-Dose CT Scan

A CT scan performed with less radiation than a standard scan. It is used for purposes such as lung-cancer screening or follow-up of lung nodules, but abnormal findings may require additional tests.

Lower Airway Obstruction

Narrowing or blockage of the breathing tubes inside the lungs. Asthma, chronic lung disease, infection, swelling, or a foreign object may cause wheezing, cough, breathlessness, or reduced airflow.

Lower Esophageal Ring

A thin ring of tissue near the junction of the esophagus and stomach, often called a Schatzki ring. It can narrow the esophagus and cause intermittent difficulty swallowing solid food or food becoming stuck.

Lower Esophageal Sphincter

A ring of muscle where the esophagus joins the stomach. It opens during swallowing and normally closes afterward to limit backward flow of stomach contents and acid.

Alternate Names:
LES

Lower Extremity

The lower extremity is the hip, thigh, knee, leg, ankle, and foot, including their bones, joints, muscles, nerves, vessels, and skin.

Lower Extremity Amputation Dressing Care

Care of the amputation wound and residual limb, including dressing selection, wound monitoring, swelling management, and limb shaping. The approach depends on the amputation, healing, and rehabilitation plan.

Alternate Names:
Stump Dressing Change; Residual Limb Care; Amputation Wound Management

Lower Extremity Arterial Bypass

An operation that routes blood around a blocked leg artery using a vein or synthetic graft. The bypass may connect arteries at the thigh, knee, or lower leg, depending on the blockage.

Alternate Names:
Leg Arterial Bypass; Peripheral Arterial Bypass

Lower Extremity Peripheral Artery Disease

Narrowing or blockage of arteries supplying the legs, usually from atherosclerosis. It may cause pain while walking, pain at rest, slow-healing sores, or limb-threatening loss of blood flow.

Alternate Names:
Lower Extremity PAD; Leg Arteriosclerosis Obliterans

Lower Extremity Venogram

Contrast imaging of the veins of a leg, used selectively to evaluate suspected deep-vein thrombosis or venous obstruction when noninvasive imaging is inadequate.

Lower Extremity Venous Doppler

An ultrasound test of the leg veins that shows blood flow and whether the veins compress normally. It is commonly used to look for a deep-vein blood clot.

Lower Gastrointestinal Bleeding

Bleeding that originates in the lower digestive tract, including the small intestine, colon, rectum, or anus. It most often appears as bright red or dark maroon blood passed with bowel movements, or as hidden blood leading to anemia; common causes include diverticular bleeding, hemorrhoids, polyps, colon cancer, and colitis. Heavy bleeding, dizziness, or fainting may occur.

Alternate Names:
Lower GI bleeding; LGIB; Lower gastrointestinal hemorrhage.

Lower Leg

The part of the limb between the knee and ankle, containing the tibia, fibula, muscles, nerves, and blood vessels.

Lower Motor Neuron Syndrome

A pattern of weakness caused by damage to nerves that carry movement signals from the spinal cord or brainstem to muscles. It may cause muscle wasting, twitching, low muscle tone, and reduced reflexes.

Lower Segment Cesarean Section

Alternate name; see *Cesarean Section*.

Alternate Names:
LSCS; Lower Segment Cesarian Section

Lower Urinary Tract Symptoms

Problems with storing or passing urine, including urgency, frequency, nighttime urination, weak stream, straining, leakage, or a feeling of incomplete emptying. Causes include infection, prostate enlargement, bladder disorders, nerve disease, medicines, and blockage.

Lowe's Syndrome

A rare inherited disorder, also called oculocerebrorenal syndrome, that mainly affects the eyes, brain, and kidneys. Features may include congenital cataracts, developmental difficulties, low muscle tone, and kidney-related loss of minerals.

Low Eye Tension

Alternate name; see *Ocular Hypotony*.

Low-Fiber Diet

An eating plan that limits foods such as whole grains, nuts, seeds, raw vegetables, and fruit skins. It may temporarily reduce stool volume for selected bowel problems or medical procedures.

Low-Flow Low-Gradient Aortic Stenosis

A severe narrowing of the aortic valve in which less blood moves through the valve and the pressure difference is lower than expected. Echocardiography and other tests help confirm severity.

Alternate Names:
LF-LG Aortic Stenosis

Low-Flow Priapism

Alternate name; see *Priapism*.

Low FODMAP Diet

A temporary eating plan that limits certain poorly absorbed carbohydrates that can cause gas, bloating, pain, or diarrhea in some people with irritable bowel syndrome. Foods are gradually reintroduced with dietitian guidance to identify personal triggers.

Low Grade

Describes a disease or tumor that appears less aggressive or more slowly developing than higher-grade forms. The exact meaning and outlook depend on the specific disease and test used.

Low-Grade Appendiceal Mucinous Neoplasm

A mucin-producing appendiceal neoplasm with low-grade cytologic atypia that may dilate the appendix and rupture, disseminating mucin into the peritoneum as pseudomyxoma peritonei.

Low-Grade Astrocytoma

A usually slow-growing glioma composed of astrocytic cells, often arising in the brain or spinal cord. Symptoms depend on location and may include seizures, headache, weakness, or visual change;

molecular classification and grade guide prognosis and care.

Low-Grade Central Osteosarcoma

A rare low-grade malignant osteogenic tumor arising within the medullary cavity of bone. It may resemble fibrous dysplasia or a benign fibro-osseous lesion; treatment usually involves complete oncologic excision.

Low-Grade Endometrial Stromal Sarcoma

A malignant uterine stromal tumor resembling proliferative-phase endometrial stroma, characterized by infiltrative myometrial or vascular growth and often driven by characteristic gene fusions.

Low HDL Cholesterol (Hypoalphalipoproteinemia)

A low concentration of high-density lipoprotein cholesterol, associated with metabolic disease, obesity, smoking, genetic disorders, or other causes. Cardiovascular risk is assessed from the entire lipid profile and clinical context rather than HDL alone.

Low Hemoglobin Count

A hemoglobin level below the expected range, often indicating anemia from blood loss, reduced production, nutritional deficiency, inflammation, or increased destruction of red blood cells.

Low LDL Cholesterol (Hypobetalipoproteinemia)

An unusually low concentration of low-density lipoprotein cholesterol, often related to inherited apolipoprotein B disorders, other genetic traits, malabsorption, illness, or lipid-lowering treatment. The cause and associated liver or nutritional findings guide evaluation.

Low Molecular Weight Heparin

Alternate spelling; see *Low-Molecular-Weight Heparin*.

Low-Molecular-Weight Heparin

A group of blood-thinning medicines, including enoxaparin and dalteparin, derived from heparin. They prevent or treat blood clots and can cause bleeding or, rarely, a low platelet count.

Alternate Names:
LMWH

Low Nasal Bridge

A low nasal bridge is reduced height of the nasal root and may be a normal familial feature or part of a congenital, genetic, or developmental syndrome.

Low Neutrophil Count

Alternate name; see *Neutropenia*.

Lown-Ganong-Levine Syndrome

A historical term for a short PR interval with a normal-width QRS complex, sometimes seen in people with episodes of rapid heartbeat. It is not considered a distinct syndrome with one established electrical pathway; associated arrhythmias and causes vary.

Alternate Names:
LGL Syndrome; Accelerated AV Conduction Syndrome

Low-Phosphorus Diet

A dietary pattern limiting phosphorus intake for selected patients with chronic kidney disease or persistent hyperphosphatemia. It emphasizes avoidance of phosphate additives while maintaining adequate protein and overall nutritional status.

Low Platelet Count

Alternate name; see *Thrombocytopenia*.

Low Potassium

An abnormally low potassium level in the blood, which can cause weakness, cramps, abnormal heart rhythms, or paralysis and may result from losses, medicines, or hormonal disorders.

Low-Potassium Diet

A dietary pattern limiting potassium intake when clinically indicated, usually for hyperkalemia or advanced kidney disease. The degree of restriction

varies with potassium levels and kidney function; unnecessary restriction can reduce diet quality and cause inadequate intake of fruits and vegetables.

Low Potassium Syndrome

Alternate name for hypokalemia, an abnormally low blood potassium level that can cause weakness, cramps, paralysis, or dangerous heart-rhythm changes; see *Hypokalemia*.

Low-Residue Diet

A short-term diet limiting dietary fiber and foods that leave substantial undigested material in the bowel. It may be used in selected gastrointestinal conditions or around certain procedures but is not a universal treatment for inflammatory bowel disease.

Low-Salt Diet

A low-salt diet limits sodium intake and may help control blood pressure or fluid retention in conditions such as heart failure and kidney disease.

Low-Set Ear

An ear positioned lower on the side of the head than expected relative to facial landmarks; it may be an isolated variation or a feature of a genetic or developmental condition.

Low-Set Ears And Pinna Abnormalities

Differences in the position, size, shape, or folds of the external ear, including ears positioned lower than usual. They may occur alone or with a congenital syndrome and can occur alongside hearing or other physical differences.

Low Sperm Count

A semen condition in which sperm concentration is below the expected reference range. It may reduce the chance of pregnancy, but fertility also depends on sperm movement, shape, ejaculation, and the partner's health.

Low T

Alternate name; see *Low Testosterone*.

Low-Tension Glaucoma

Alternate name; see *Normal-Tension Glaucoma*.

Low Testosterone

A condition in which a person has symptoms of testosterone deficiency and repeatedly low morning testosterone levels. Causes may involve the testes, ovaries, pituitary gland, medicines, obesity, or another illness.

Alternate Names:
Male Hypogonadism; Testosterone Deficiency

Low Vision

Visual impairment that cannot be fully corrected with spectacles, contact lenses, medication, or surgery, impairing daily activities. Managed with low-vision aids (magnifiers, telescopes, adaptive devices), lighting, and occupational therapy.

Low White Blood Cell Count

A reduced number of white blood cells, which can increase susceptibility to infection and may result from medicines, infection, autoimmune disease, nutritional deficiency, or bone marrow disorders.

Low White Cell Count in Cancer

A reduced number of infection-fighting blood cells in a person with cancer or receiving cancer treatment. The risk of serious infection depends on which cells are low and how severely they are reduced.

Lozenges

Solid medicinal preparations that dissolve slowly in the mouth, usually to provide local treatment for the throat or oral cavity.

LRINEC Score

A blood-test score that estimates the chance of a serious soft-tissue infection such as necrotizing fasciitis. It uses inflammation, blood count, sodium, kidney, and blood-sugar results. The score cannot by itself confirm or exclude the infection; severe pain, rapid swelling, or serious illness may occur.

Alternate Names:
Laboratory Risk Indicator for Necrotizing Fasciitis;

LRINEC

LSCS

Surgical delivery of a baby through a transverse incision in the lower part of the uterus. See *Lower Segment Cesarean Section*.

LSD

Lysergic acid diethylamide is a potent hallucinogen that can cause altered perception, visual hallucinations, autonomic effects, and unpredictable changes in mood and behavior.

LSD Substance Use

LSD is a potent hallucinogen that alters perception, mood, and thought and can cause panic, accidents, persistent perceptual symptoms, or psychosis in susceptible people.

LSD Toxicity

Hallucinogen poisoning causing perceptual distortion, anxiety, panic, agitation, hallucinations, mydriasis, tachycardia, hypertension, and impaired judgment. Severe agitation, hyperthermia, seizures, trauma, or persistent psychosis can occur; use a calm environment, supportive care, and benzodiazepines when clinically indicated.

L-theanine

An amino acid found mainly in tea leaves. It may influence relaxation and alertness, but supplements can interact with medicines and are not proven treatments for disease.

Lubiprostone

Lubiprostone activates intestinal chloride channels and is used for selected forms of chronic constipation and irritable bowel syndrome with constipation.

Lubricant

A substance that reduces friction between surfaces; medical lubricants are used on skin, mucosa, instruments, or devices, with formulations varying by tissue compatibility and intended use.

Lucilia

A genus of blowflies; some species can cause wound myiasis, while sterile larvae have occasionally been used in maggot debridement.

Ludwig Angina

A fast-spreading infection under the tongue and jaw, often starting from an infected lower tooth. It can cause swelling that pushes the tongue upward and makes swallowing or breathing difficult.

Ludwig's Angina

Alternate name; see *Ludwig Angina*.

Lugano Classification

A system used to describe how far Hodgkin or non-Hodgkin lymphoma has spread and how it responds to treatment. It combines examination, blood tests, and imaging, often PET with CT. Stages range from disease in one area to widespread disease; the results help guide treatment and follow-up.

Lugol's Iodine

An aqueous solution of iodine and potassium iodide used as an antiseptic, in selected thyroid treatments, and in some laboratory procedures.

Lugol's Solution

Lugol's solution is a mixture of iodine and potassium iodide used in selected laboratory, diagnostic, and medical applications; it can irritate tissue and affect thyroid function.

Lumbago

A non-specific term for low back pain, typically referring to acute or chronic pain in the lumbar region (between the lower ribs and the gluteal folds). Lumbago is a symptom, not a diagnosis.

Lumbar

Relating to the lower back or its five vertebrae (L1–L5), which lie between the thoracic spine and sacrum. The lumbar region also includes the discs, joints, muscles, and nerves around these vertebrae. The lumbar vertebrae support much of the upper

body's weight.

Lumbar Disc Herniation

Protrusion or extrusion of lumbar disc material through the annulus fibrosus, which may irritate or compress a nerve root and cause back or leg pain. Symptoms, examination findings, and imaging determine its significance and treatment.

Lumbar Disk Replacement

Surgical replacement of a worn or herniated intervertebral disc in the lower back with an artificial prosthetic disc to relieve nerve pain while preserving spinal flexibility.

Alternate Names:
Artificial Disc Replacement; Total Disc Arthroplasty; Lumbar Arthroplasty

Lumbar Hernia

A rare abdominal-wall hernia in which tissue, usually fat or bowel, protrudes through a weak area in the lower back or flank. It may be present from birth or develop after surgery or injury and can cause a bulge or discomfort.

Alternate Names:
Flank Hernia; Dorsal Hernia

Lumbar Lordosis

The normal inward curve of the lower spine. An unusually pronounced or reduced curve may be related to posture, pregnancy, muscle imbalance, spinal changes, or another condition.

Alternate Names:
Lumbar Inward Curvature

Lumbar Lordosis Lower Spine

Lumbar lordosis is the normal inward curve of the lower spine; excessive or reduced curvature may be associated with posture, muscle imbalance, hip disease, vertebral deformity, or pain. Examination and imaging are guided by symptoms rather than appearance alone.

Lumbar MRI Scan

Magnetic resonance imaging of the lumbar spine used to evaluate vertebrae, discs, spinal canal, nerve roots, marrow, and soft tissues in conditions such as radiculopathy or spinal stenosis.

Lumbar Pain

Pain arising in the lower back, often from muscles, joints, discs, nerves, or other spinal or nonspinal causes; see *Low Back Pain*.

Lumbar Plexus

The lumbar plexus is a network of nerves from the upper lumbar spinal roots that supplies the lower abdomen, pelvis, and parts of the thigh and leg.

Lumbar Puncture

A procedure in which a needle is inserted between vertebrae in the lower back into the space containing cerebrospinal fluid around the brain and spinal cord. It is used to collect fluid for testing or to measure its pressure. It can also deliver medicines into this space. Fluid testing can help diagnose infections, bleeding, inflammation, and some cancers. Possible complications include headache, temporary back discomfort, bleeding, or infection.

Alternate Names:
LP; Spinal Tap

Lumbar Puncture Opening Pressure

The cerebrospinal fluid pressure measured with a manometer during lumbar puncture, ideally with the patient relaxed in the lateral decubitus position. A typical adult reference range is about 6 to 25 cm H2O; interpretation depends on measurement technique and clinical context.

Lumbar Radiculopathy

Irritation or pressure on a nerve leaving the lower spine, causing pain that travels into the buttock or leg. It may also cause numbness, tingling, or weakness and is often called sciatica.

Lumbar Region

The lumbar region is the lower part of the back between the ribs and pelvis, containing the five lumbar vertebrae.

Lumbar Spinal Stenosis

Alternate name; see *Lumbar Stenosis*.

Lumbar Spine

The lower part of the backbone between the ribs and pelvis, usually made of five vertebrae. It bears much of the body's weight and contains nerves supplying the legs; discs, joints, or nerves there may cause lower-back pain or sciatica.

Alternate Names:
L-Spine; Lower Vertebral Column

Lumbar Spine CT Scan

Computed tomography of the lumbar spine that provides detailed images of vertebral bone and alignment and is particularly useful for detecting fractures or other bony abnormalities.

Lumbar Spondylosis

Alternate name; see *Spondylosis*.

Lumbar Stenosis

A narrowing of the spinal canal or nerve openings in the lower back (lumbar spine), most often caused by age-related wear and tear, arthritis, bone spurs, and thickened ligaments. The narrowed space pinches and compresses the nerves traveling down to the legs, causing aching pain, cramping, numbness, or weakness in the buttocks, thighs, or calves that typically worsens when walking or standing and eases when sitting or bending forward.

Alternate Names:
LSS; Lumbar Spinal Stenosis

Lumbar Vertebrae

The five large bones of the lower spine between the ribs and pelvis. They bear much of the body's weight, allow bending, protect spinal nerves, and can be affected by fractures, arthritis, or disc problems.

Lumbosacral Radiculopathy

Pain, sensory change, or weakness caused by irritation or compression of a nerve root in the lower lumbar or sacral spine. Symptoms often radiate from the back or buttock into the leg in a dermatomal pattern.

Lumbosacral Region

The lumbosacral region is the junction between the lower lumbar spine and the sacrum at the back of the pelvis.

Lumbosacral Spine CT

Computed tomography of the lower spine and sacrum using x-rays and computer reconstruction to evaluate fractures, bone lesions, alignment, and selected causes of nerve compression.

Lumbosacral Spine X-Ray

Plain radiographic imaging of the lumbar spine and sacrum used to evaluate alignment, fractures, degenerative changes, deformity, and some bone lesions.

Lumbricals

Small hand or foot muscles arising from tendons of the flexor digitorum profundus or flexor digitorum longus and assisting flexion-extension coordination.

Lumen

The inner space of a hollow organ, vessel, or tube.

Luminescence

Luminescence is emission of light from a substance through a process other than high-temperature incandescence, such as fluorescence or chemiluminescence.

Luminescence Type

Luminescence type identifies the mechanism by which a material emits light, such as fluorescence, phosphorescence, bioluminescence, or chemiluminescence.

Lumpectomy

Breast-conserving surgery that removes a cancer or other abnormal area with a small margin of nearby tissue. Depending on the diagnosis and recurrence risk, subsequent treatment can include radiation or other cancer therapy.

Lump in Right Iliac Fossa

A lump in the lower-right part of the abdomen. Causes include an enlarged appendix or nearby bowel, a hernia, swollen lymph nodes, or a growth. Examination and tests help find the cause.

Lump In The Abdomen

An abdominal lump may be a hernia, enlarged organ, cyst, stool, inflammation, or tumor; pain, vomiting, fever, growth, or a pulsatile mass can signal a serious underlying cause.

Lumpy Jaw

A chronic granulomatous infection of the jaw, usually cervicofacial actinomycosis, causing swelling and sinus formation.

Lunate

A small crescent-shaped bone in the center of the wrist. It helps the wrist move and can be injured by falls; loss of its blood supply can cause Kienböck disease and bone collapse.

Lunate Bone

A crescent-shaped carpal bone situated in the center of the proximal carpal row between the scaphoid and triquetrum, articulating with the distal radius; vulnerable to avascular necrosis (Kienbock disease) and anterior dislocation into the carpal tunnel.

Lung

One of the two breathing organs in the chest. The lungs take oxygen into the blood and remove carbon dioxide. The right lung has three sections, and the left has two to leave room for the heart.

Lung Abscess

A pocket of infection and pus that forms inside damaged lung tissue, often after inhaling stomach contents or because of bacteria. It may cause fever, cough, foul-smelling sputum, chest pain, and breathlessness.

Lung Anatomy

Alternate name; see *Lungs*.

Lung Cancer

Cancer that begins in the lungs or airways. The main types are small-cell and non-small-cell cancer. Smoking is the leading risk factor, but radon, asbestos, air pollution, inherited risk, and other exposures can also contribute. Early disease may cause no symptoms.

Alternate Names:
Bronchogenic Carcinoma

Lung Capacity

The amount of air the lungs can hold or move, measured with breathing tests such as spirometry and lung-volume testing. Results help assess conditions including asthma, chronic obstructive pulmonary disease, and restrictive lung disease.

Lung Carcinoid Tumors

Neuroendocrine tumors arising in the lung, ranging from typical slow-growing tumors to atypical tumors with greater malignant potential; see *Carcinoid Tumor*.

Lung Collapse

An informal phrase for loss of lung expansion. It may refer to atelectasis, in which part of the lung loses air, or pneumothorax, in which air around the lung compresses it. Use the more specific term when the cause is known.

Lung Compliance

How easily the lungs stretch when a person breathes in. Stiff lungs require more effort, while overly flexible lungs may not spring back well, as can occur in emphysema.

Lung Cyst

A lung cyst is a round air- or fluid-containing space in lung tissue, caused by developmental disease, infection, emphysema, inflammation, or another disorder.

Lung Development

Lung development is embryonic and postnatal formation and maturation of airways, alveoli, blood

vessels, and gas-exchange capacity.

Lung Diffusion Testing

A breathing test that measures how well a gas, usually a small amount of carbon monoxide, passes from the lung air sacs into the blood. It helps assess diseases such as emphysema, lung scarring, or disorders of the lung blood vessels.

Lung Disease

Lung disease includes disorders affecting the breathing tubes, air sacs, lung tissue, covering, blood vessels, or chest wall. These conditions may cause cough, breathlessness, chest discomfort, wheezing, or low oxygen.

Lung Disease/Respiratory Problems

Disorders affecting the airways, lung tissue, pleura, pulmonary blood vessels, or breathing control that may cause cough, shortness of breath, wheezing, chest discomfort, or low oxygen; see *Lung Disease*.

Lung Diseases

Alternate name; see *Lung Disease*.

Lung Fibroma

A usually noncancerous growth made of fibrous tissue in or near the lung. It often causes no symptoms and is found on imaging; appearance, growth, and location determine whether further imaging or biopsy is used.

Lung Fluke

A parasitic flatworm, usually of the Paragonimus group, acquired by eating undercooked freshwater crustaceans. Infection may cause chronic cough, chest pain, blood in sputum, or lung lesions and can rarely affect the brain.

Lung Function Tests

Physiologic tests that measure aspects of breathing, including airflow, lung volumes, and gas transfer, to assess respiratory function.

Lung Herniation

Protrusion of lung tissue through a weak or torn area of the chest wall, usually after chest trauma or surgery. It may appear as a bulge that enlarges with coughing and can cause pain or breathing difficulty.

Lung Injury

Damage to lung tissue or the pulmonary circulation caused by trauma, infection, inhaled substances, inflammation, aspiration, oxygen toxicity, or other disease.

Lung Lavage

A procedure in which doctors wash parts of the airways or lungs with sterile fluid and then remove it. It may clear certain material from the lungs or collect a sample for testing.

Lung Metastases

Lung metastases are cancer deposits that have spread to the lungs from another primary tumor and may cause cough, breathlessness, chest pain, or no symptoms.

Lung Biopsy

The removal of a sample of lung tissue using a needle, bronchoscope, or surgical incision to diagnose pulmonary infiltrates, masses, or interstitial lung disease; see *Biopsy Lung*, *Lung Needle Biopsy*, and *Open Lung Biopsy*.

Lung Needle Biopsy

CT- or ultrasound-guided percutaneous sampling of a lung or pleural lesion to evaluate selected masses, infection, or diffuse disease. Pneumothorax and pulmonary hemorrhage are important complications.

Lung Neoplasm

An abnormal growth in the lung or airways that may be noncancerous or cancerous. It may cause cough, blood in sputum, chest pain, breathlessness, or no symptoms; imaging and sometimes tissue sampling determine its nature.

Lung Nocardiosis

Lung infection caused by Nocardia bacteria, usually in people with weakened immunity. It can cause cough, fever, chest pain, or nodules and may spread to the brain or other organs; see *Nocardiosis*.

Lung Nodule

A rounded, usually well-defined opacity in the lung measuring up to 3 cm on imaging. It may be benign, infectious, inflammatory, or an early manifestation of lung cancer; follow-up often uses interval imaging.

Lung PET Scan

Positron-emission tomography, often combined with computed tomography, using a radiotracer to assess metabolic activity in lung nodules, cancer, infection, or inflammation.

Lung Plethysmography

A breathing test performed in a sealed room to measure how much air the lungs hold, including air that cannot be breathed out, and how much resistance the airways provide.

Lung Problems And Volcanic Smog

Volcanic smog contains gases and fine particles that irritate eyes and airways and can worsen asthma or lung disease; limiting exposure and following public-health advice reduce harm.

Lung Protective Ventilation

A ventilator approach that uses gentle breath sizes and carefully controlled pressures to reduce further lung injury. It is commonly used in acute respiratory distress, with settings adjusted to oxygen levels, blood gases, and the person's condition.

Lung Resection

Surgery to remove a portion or all of a lung, usually to treat cancer or another localized disease. The amount removed may range from a small wedge or segment to a lobe or an entire lung, depending on the disease and the person's lung function.

Lungs

The paired respiratory organs in the chest that exchange oxygen and carbon dioxide between air and blood; they also contribute to acid–base regulation.

Lungs Design And Purpose

Alternate name; see *Lungs*.

Lung Surgery

An operation on the lungs or nearby structures to remove or sample tissue, repair injury, or improve breathing. The procedure depends on the disease and may involve lung resection; bleeding, infection, air leakage, and breathing problems are possible.

Lung Transplant

Surgery to replace one or both severely diseased lungs with donor lungs. It may be considered for advanced lung failure from conditions such as emphysema, lung scarring, cystic fibrosis, or pulmonary hypertension and requires lifelong immune-suppressing medicines.

Lung Transplantation

Alternate name; see *Lung Transplant*.

Lung Volume Reduction Surgery

An operation that removes the most damaged, overinflated parts of the lungs in carefully selected people with severe emphysema. This gives healthier lung tissue and the diaphragm more room to work, which may improve breathing and activity. It has important risks, including air leakage, infection, and respiratory failure.

Alternate Names:
LVRS; Reduction Pneumoplasty; Bilateral Lung Volume Reduction

Lunula

The pale crescent-shaped area at the base of a fingernail or toenail. It is the visible front part of the nail-forming region, although its size and visibility vary normally.

Lupus

A group of autoimmune diseases in which the immune system attacks the body's own tissues. Systemic lupus erythematosus is one form and may affect the skin, joints, kidneys, blood cells, nervous system, and other organs.

Lupus Anticoagulant

An antiphospholipid autoantibody directed against phospholipid-protein complexes that paradoxically prolongs in vitro phospholipid-dependent coagulation tests (such as the dilute Russell viper venom time or aPTT) while promoting a potent in vivo hypercoagulable state with arterial and venous thrombosis.

Alternate Names:
LA; LAC

Lupus Arthritis

Joint pain or inflammation associated with systemic lupus erythematosus. It commonly affects multiple joints and is considered alongside other lupus manifestations and possible overlapping disease.

Lupus Band Test

A skin-biopsy test that looks for immune proteins along the junction between the skin's layers. The pattern may support lupus; its significance varies with symptoms and other test results.

Alternate Names:
LBT; Dermoepidermal Junction Immunofluorescence

Lupus Erythematosus

An umbrella term for autoimmune disorders that can affect the skin alone or multiple organs. Major forms include cutaneous lupus erythematosus, which mainly affects the skin, and systemic lupus erythematosus, which can affect the joints, kidneys, blood, nervous system, lungs, or heart.

Lupus Miliaris Disseminatus Faciei

A chronic granulomatous eruption of numerous red-brown or skin-colored papules, usually around the eyelids and central face. It may heal with small depressed scars; diagnosis often requires biopsy to distinguish it from acne, rosacea, sarcoidosis, and other granulomatous disorders.

Lupus Nephritis

An inflammation of the kidneys that occurs as a serious complication of systemic lupus erythematosus (lupus), an autoimmune disease. In lupus nephritis, the body's immune system produces abnormal antibodies that attack healthy kidney filtering units (glomeruli), causing swelling, inflammation, and potential kidney damage. It often develops quietly without early symptoms, but can lead to foamy or dark urine, swelling in the legs, ankles, and face, and high blood pressure.

Lupus Panniculitis

A chronic inflammatory form of cutaneous lupus affecting subcutaneous fat, producing firm deep nodules that may heal with lipoatrophy, scarring, or overlying discoid changes.

Lupus Pernio

Persistent red-purple or blue-purple swelling and discoloration of the nose, cheeks, lips, ears, or fingers, usually associated with sarcoidosis. It often indicates longer-lasting disease and may cause scarring or cosmetic changes.

Lupus Vulgaris

A long-lasting form of tuberculosis affecting the skin. It usually causes slowly enlarging reddish-brown patches or plaques that may scar and is treated with a combination of tuberculosis medicines.

Luteal Cell

A cell in the ovarian corpus luteum that produces progesterone after ovulation and supports the uterine lining.

Luteal Phase Defect

A term used when the part of the menstrual cycle after ovulation may not provide enough progesterone or enough time for the uterine lining to support pregnancy. The diagnosis is uncertain and cannot be determined from cycle length alone.

Alternate Names:

Luteal Phase Deficiency; LPD

Lutein

A yellow plant pigment found in leafy green vegetables and concentrated in the retina. Along with related pigments, it helps filter blue light and may protect eye tissues from oxidative damage.

Luteinization

Luteinization is the transformation of an ovarian follicle after ovulation into a corpus luteum that produces progesterone.

Luteinized Follicle Cyst

A usually harmless ovarian cyst that develops during pregnancy as hormone-sensitive ovarian tissue enlarges. It may be found by chance or as a pelvic mass and often settles after pregnancy.

Luteinizing Hormone

A hormone released by the pituitary gland. In people with ovaries, a mid-cycle rise triggers ovulation and supports hormone production; in people with testes, it stimulates testosterone production. Blood testing helps assess puberty, fertility, and pituitary or reproductive disorders.

Luteinizing Hormone Blood Test

A blood test measuring luteinizing hormone, which stimulates ovulation and ovarian hormone production in females and testosterone production in males; it helps evaluate puberty, fertility, and pituitary or gonadal disorders.

Luteinizing Hormone Deficiency

Inadequate luteinizing-hormone secretion from hypothalamic or pituitary disease, causing reduced gonadal steroid production, irregular or absent ovulation or menstruation, infertility, or delayed puberty.

Luteinizing Hormone-Releasing Hormone

An older name for gonadotropin-releasing hormone (GnRH), a hypothalamic hormone released in pulses that stimulates the anterior pituitary to secrete luteinizing hormone and follicle-stimulating hormone.

Lutembacher Syndrome

A rare congenital heart defect complex defined by the combination of an atrial septal defect (usually secundum type) and acquired or congenital mitral valve stenosis. The left-to-right atrial shunt partially decompresses the left atrium, reducing pulmonary venous congestion but markedly augmenting right ventricular volume overload and pulmonary arterial blood flow.

Alternate Names:
Lutembacher Disease

Luteolysis

Luteolysis is the breakdown of the corpus luteum, causing progesterone levels to fall when pregnancy has not occurred.

Luteoma

A luteoma is a usually benign ovarian mass of hormone-producing lutein cells, sometimes associated with pregnancy and androgen excess.

Luteoma Of Pregnancy

A benign, pregnancy-associated ovarian proliferation of luteinized stromal cells driven by hormonal stimulation. It may cause maternal or fetal androgen excess and usually regresses after delivery.

Luteotropic Hormone

A hormone that supports the corpus luteum. In humans, the term has historically referred to prolactin; its use can differ among species.

Lutetium-177

A radioactive form of lutetium that releases therapeutic radiation and a small amount of detectable radiation. Attached to a targeting molecule, it can deliver treatment to selected neuroendocrine or prostate cancer cells while limiting exposure to other tissues.

Luxation

Complete dislocation of a joint, where the bone ends lose normal contact. It can stretch or tear nearby ligaments, nerves, and blood vessels, causing severe pain, deformity, swelling, and inability to move.

LVAD

Left-ventricular assist device, an implanted pump helping the heart's main chamber circulate blood. It may support people with severe heart failure while awaiting transplant or as long-term treatment.

Alternate Names:
Left-Ventricular Assist Device

LVNC

Alternate name; see *Left Ventricular Noncompaction*.

LVRS

Alternate name; see *Lung Volume Reduction Surgery*.

Lyase

An enzyme that breaks or joins certain chemical bonds without adding water or using oxidation as the main step. Lyases participate in many processes that make or use energy in cells.

Lyme Arthritis

Joint inflammation caused by Lyme disease, often with swelling in a large joint such as the knee. It can appear weeks or months after infection and is evaluated and treated as part of Lyme disease.

Lyme Disease

A bacterial infection transmitted to humans through the bite of infected blacklegged ticks (deer ticks). The illness often begins with an expanding, circular red rash that frequently resembles a bullseye (extiterythema migrans) at the site of the tick bite, accompanied by flu-like symptoms such as fatigue, fever, headache, and muscle and joint aches. If not diagnosed and addressed early, the bacteria can spread, causing joint swelling (arthritis), facial muscle weakness (Bell palsy), heart palpitations, and nerve pain.

Alternate Names:
Lyme Borreliosis; Borrelia Burgdorferi Infection

Lyme Disease Blood Test

A blood test that looks for immune proteins made after infection with Lyme disease bacteria. Results depend on symptoms, tick exposure, and timing; early testing can be negative and a positive result does not always prove active infection.

Lyme Neuroborreliosis

Neurologic disease caused when Lyme bacteria spread to the nervous system. It can cause meningitis, cranial nerve palsy, or painful inflammation of nerve roots. Bannwarth syndrome is a form of Lyme neuroborreliosis, especially recognized in Europe, and is not a name for every neurologic Lyme infection.

Alternate Names:
Neurological Lyme Disease

Lymph

A clear fluid collected from body tissues and carried through lymph vessels. It transports immune cells and excess fluid to lymph nodes and eventually returns it to the bloodstream.

Lymphadenectomy

Surgical removal of a group of lymph nodes, usually for cancer staging or treatment. The site and extent depend on the disease and may include axillary, inguinal, cervical, or abdominal nodes.

Lymphadenitis

Inflammation or infection of one or more lymph nodes, causing swelling and sometimes tenderness, warmth, or pus. Causes include viruses, bacteria, cat-scratch disease, tuberculosis, and other disorders.

Lymphadenopathy

Enlargement of one or more lymph nodes, either localized to one region or generalized across two or more noncontiguous regions. It is a clinical finding

rather than a diagnosis and may result from infection, inflammation, immune disease, medicines, or cancer.

Lymphangiectasia

Dilatation of lymphatic vessels that can cause clear or blood-tinged vesicles, swelling, or leakage of lymph through the skin or mucosa. It may be primary or follow surgery, radiation, inflammation, infection, or obstruction of lymphatic drainage.

Lymphangiectasis

Abnormal widening of lymph vessels. It may be present from birth or develop later and can cause swelling, leakage of lymph, loss of protein through the intestine, or fluid around the lungs.

Lymphangiogenesis

Formation of new lymph vessels from existing vessels. This can help repair tissue and drain fluid, but it may also contribute to chronic swelling, inflammation, or the spread of cancer.

Lymphangiogram

A lymphangiogram uses contrast imaging to show lymphatic vessels and nodes, helping evaluate obstruction, leakage, malformation, or spread of disease.

Lymphangiography

An imaging test that uses contrast dye to show lymphatic vessels and their flow. It can help find blocked vessels, leaks, or abnormal connections, although newer scans are often preferred.

Lymphangioleimyomatosis

Alternate spelling; see *Lymphangioleiomyomatosis*.

Lymphangioleiomyomatosis

A rare disease, usually affecting women, in which abnormal smooth-muscle-like cells grow in the lungs and lymphatic system and destroy lung tissue, forming many cysts. It can cause breathlessness, collapsed lung, or lymph-fluid buildup; kidney angiomyolipomas may also occur. It may be associated with tuberous sclerosis complex or occur on its own.

Lymphangioma

A noncancerous birth defect in which lymph vessels form abnormally and become enlarged. It usually appears in infancy or childhood as a soft swelling, often in the neck, armpit, or chest.

Lymphangiomatosis

A rare disorder in which abnormal lymph vessels grow in one or more organs. It may cause swelling, fluid buildup, bleeding, bone damage, or breathing problems, depending on the tissues involved.

Lymphangiomyoma

A rare, usually noncancerous growth made of smooth-muscle-like cells around lymph vessels. It is most often associated with lymphangioleiomyomatosis and may contribute to cysts or blockage of lymph flow.

Lymphangiosarcoma

A rare, fast-growing cancer arising from the lining of lymph vessels. It may develop in tissue with long-standing lymph swelling and can appear as a bruise-like, purple, or ulcerated skin lesion.

Lymphangitis

Inflammation and infection of lymphatic vessels, usually spreading from an infected skin wound or cellulitis; tender red streaks, fever, and enlarged regional lymph nodes may occur.

Lymphatic Basin

The group of lymph vessels and lymph nodes that drains a particular body area. Doctors use this drainage pattern to examine nearby nodes and assess possible spread of infection or cancer.

Lymphatic Capillary

The smallest type of lymphatic vessel. It begins in body tissues, collects extra tissue fluid, and carries it into larger lymphatic vessels.

Lymphatic Circulation

The movement of lymph from body tissues through lymphatic vessels and nodes back into the bloodstream.

Lymphatic Disease

Any disorder affecting lymph vessels, lymph nodes, or related organs. It may cause swelling, repeated infection, abnormal fluid collections, or cancer and may result from birth defects, injury, infection, inflammation, or tumor growth.

Lymphatic Drainage

The movement of lymph away from a body area through lymphatic vessels and lymph nodes.

Lymphatic Filariasis

A mosquito-borne infection caused by thread-like worms that live in lymph vessels. Repeated infection can block lymph flow and cause long-term swelling of the legs, arms, breasts, or genitals.

Lymphatic Malformation

A birth defect in which lymphatic vessels form abnormally. It may cause soft, fluid-filled spaces in the skin or deeper tissues.

Lymphatic Mapping

Imaging or tracer-guided identification of lymphatic vessels and lymph nodes that drain a body area. It helps plan surgery, locate a sentinel node, investigate lymphedema, or assess possible cancer spread.

Lymphatic Obstruction

Blocked or damaged lymph vessels or nodes that prevent normal fluid drainage. The affected area may develop persistent swelling called lymphedema.

Lymphatic System

A network of lymph, lymphatic vessels, lymph nodes, and lymphoid organs and tissues, including the spleen, thymus, tonsils, and bone marrow. It returns excess tissue fluid to the bloodstream, transports absorbed dietary fats and fat-soluble nutrients, and supports immune-cell development, surveillance, and responses to infection.

Lymphatic Tissue

Lymphatic tissue contains immune cells and structures that filter lymph, trap antigens, and coordinate immune defense.

Lymphatic Trunk

A large lymphatic vessel formed by the joining of smaller lymphatic vessels. It drains a body region and empties into a lymphatic duct.

Lymphatic Valve

A flap inside a lymphatic vessel that helps keep lymph moving in one direction.

Lymphatic Vessel

A lymphatic vessel transports lymph from tissues through lymph nodes and eventually returns fluid to the bloodstream.

Lymphedema

Chronic swelling caused by a buildup of protein-rich lymph fluid when lymphatic vessels or lymph nodes cannot drain it normally. It most often affects an arm or leg, but may also involve the trunk, breast, face, or genitals. The affected area may feel heavy, tight, or uncomfortable and may develop inflammation, thickened skin, reduced movement, or repeated skin infections. Primary lymphedema results from abnormal lymphatic development or inherited changes; secondary lymphedema follows damage or blockage from causes such as surgery, radiation, cancer, infection, or injury.

Lymphedema Surgery

Procedures intended to reduce persistent lymph-fluid swelling or improve lymphatic drainage. Options include lymphovenous bypass, vascularized lymph-node transfer, liposuction for selected chronic tissue changes, and excision or debulking in advanced disease.

Lymph Leakage

Lymph leakage is escape of lymphatic fluid after in-

jury, surgery, or obstruction and may cause swelling, fluid collections, or chylous drainage.

Lymph Node

A small, encapsulated, bean-shaped secondary lymphoid organ strategically positioned in serial arrays along the lymphatic vascular network to filter interstitial lymph fluid and orchestrate adaptive immune responses against tissue-derived antigens. Histologically enclosed by a dense fibrous capsule and organized into three distinct compartments: (1) The Cortex (containing outer B-cell-rich primary follicles and secondary follicles with active germinal centers where B cells undergo antigen-driven somatic hypermutation, affinity maturation, and class-switch recombination with the assistance of follicular dendritic cells and follicular helper T cells); (2) The Paracortex (the deep cortical zone populated predominantly by naive and memory CD4+ and CD8+ T lymphocytes and interdigitating dendritic cells, containing specialized high endothelial venules [HEVs] expressing addressins that facilitate lymphocyte homing from the bloodstream); and (3) The Medulla (composed of cellular medullary cords containing antibody-secreting plasma cells, macrophages, and B cells, separated by medullary lymphatic sinuses lined by phagocytic reticuloendothelial cells that drain into the single efferent lymphatic vessel at the hilum). Lymph enters via multiple afferent lymphatic vessels piercing the convex capsule, percolates through subcapsular and trabecular sinuses for microvascular antigen sampling, and exits at the concavity (hilum). Pathologic enlargement (lymphadenopathy) reflects immune stimulation (reactive hyperplasia), acute suppurative infection (lymphadenitis), granulomatous disease (sarcoidosis, tuberculosis), or primary/metastatic malignancy (lymphoma, metastatic carcinoma).

Lymph Node Biopsy

Removal of part or all of a lymph node for microscopic and sometimes microbiologic or molecular examination to evaluate malignancy, infection, or inflammatory disease.

Lymph Node Cancer

Cancer involving lymph nodes, either lymphoma arising in lymphatic tissue or cancer spread from another organ; tissue examination and staging establish its type and extent.

Lymph Node Culture

Laboratory culture of lymph-node tissue or aspirate to identify bacteria, fungi, or mycobacteria causing lymphadenitis; culture is interpreted with histology and other tests.

Lymph Node Dissection

Surgery that removes one or more groups of lymph nodes to check for cancer or treat cancer spread. Removed tissue is examined in a laboratory, and the operation can cause swelling or numbness.

Lymph Node / Gland

A small immune organ along a lymph vessel that filters lymph and helps the body recognize infection, inflammation, or abnormal cells. Nodes are found in groups in the neck, armpits, chest, abdomen, and groin.

Lymph Nodes

Plural form; see *Lymph Node*.

Alternate Names:
Lymph Glands

Lymph Node Structure

A lymph node is a small, bean-shaped immune organ with a capsule, spaces that carry lymph, and areas rich in immune cells. It filters lymph and may enlarge during infection, inflammation, or cancer spread.

Lymphoblast

An immature cell that normally develops into a type of infection-fighting white blood cell. Large numbers of abnormal lymphoblasts can build up in the blood or bone marrow in acute lymphoblastic leukemia.

Lymphoblast Count

A lymphoblast count measures immature lymphoid cells in blood or bone marrow and may help evaluate

or monitor acute lymphoblastic leukemia.

Lymphoblastic Lymphoma

An aggressive lymphoma of immature B- or T-cell precursors, closely related to acute lymphoblastic leukemia. It often presents with lymph-node, mediastinal, bone, skin, or marrow disease; immunophenotyping and marrow assessment help classify the extent.

Lymphocele

A lymphocele is a collection of lymphatic fluid caused by disruption or blockage of lymph vessels, often after surgery or transplantation.

Lymphocyte

A type of white blood cell that recognizes infections and abnormal cells and helps coordinate immune defense. The main types are B cells, which make antibodies; T cells, which direct or carry out cellular immune responses; and natural killer cells, which can destroy infected or abnormal cells.

Lymphocyte Activation

The process by which a lymphocyte recognizes a target and begins responding. Activated lymphocytes multiply and help coordinate antibody or cellular immune defense.

Lymphocyte Count

A lymphocyte count measures lymphocytes in the blood and can help assess infection, immune deficiency, inflammation, or blood disorders.

Lymphocyte Proliferation

Rapid multiplication of lymphocytes after immune stimulation. It helps build a response to infection, but abnormal or uncontrolled proliferation can occur in lymphoid cancers.

Lymphocytic

Relating to lymphocytes or containing an increased proportion of these white blood cells. A lymphocytic pattern may occur with viral infection, chronic inflammation, autoimmune disease, or certain cancers.

Lymphocytic Choriomeningitis

A viral infection caused by lymphocytic choriomeningitis virus, usually spread through contact with urine, droppings, or saliva from infected mice. It may cause a flu-like illness or, less often, meningitis; infection during pregnancy can harm the fetus.

Alternate Names:
LCMV Infection

Lymphocytic Colitis

A form of microscopic colitis causing long-lasting, watery diarrhea. The colon may look normal during examination, but a biopsy shows increased immune cells in its lining; medicines, autoimmune disease, or other factors may contribute.

Alternate Names:
IEL-Predominant Colitis

Lymphocytic Interstitial Pneumonia

A rare inflammatory lung disease in which immune cells collect in the tissue around the air sacs. It may cause cough, breathlessness, and abnormal scans and is associated with autoimmune disease or HIV.

Lymphocytic Leukemia

Lymphocytic leukemia is a blood cancer in which abnormal lymphoid cells multiply in the bone marrow, blood, lymph nodes, or other tissues.

Lymphocytic Mastitis

A noncancerous breast lump caused by inflammation and toughening of breast tissue. It is associated with diabetes or autoimmune disease and can look like breast cancer on examination or scans, so testing may be needed.

Lymphocytoma Cutis

Lymphocytoma cutis is a benign skin lymphoid proliferation presenting as red or violaceous plaques or nodules and sometimes associated with infection or immune stimulation.

Lymphocytopenia

An abnormally low number of lymphocytes, a type of white blood cell that helps fight infection. It may be temporary after illness or stress, or result from medicines, immune disorders, infections, poor marrow function, or inherited conditions. Infection risk varies with the severity, duration, and cause.

Lymphocytosis

An abnormally increased number or proportion of lymphocytes in the blood, often associated with viral infection, some bacterial infections, or lymphoproliferative disorders.

Lymphoedema

Alternate spelling; see *Lymphedema*.

Lymphofollicular Hyperplasia

Lymphofollicular hyperplasia is enlargement or increased formation of lymphoid follicles in response to immune stimulation, infection, inflammation, or other triggers.

Lymphogranuloma Venereum

A sexually transmitted infection caused by invasive L1, L2, or L3 serovars of *Chlamydia trachomatis*. It may cause a transient painless genital ulcer followed by tender groin lymph-node swelling or rectal inflammation with pain, bleeding, or discharge.

Alternate Names:
LGV; Fourth Venereal Disease

Lymphoid

Resembling or relating to lymphatic tissue, lymphocytes, or organs involved in lymphocyte development and immune function.

Lymphoid Hyperplasia

Lymphoid hyperplasia is benign increase in lymphoid tissue caused by immune stimulation, infection, inflammation, or sometimes a reactive response near a tumor.

Lymphoid Organs

Organs that contain lymphoid tissue and support the development, storage, or activity of immune cells. They include the bone marrow, thymus, lymph nodes, spleen, and tonsils.

Lymphoid Tissue

Tissue containing lymphocytes and supporting immune responses, found in lymph nodes, spleen, thymus, tonsils, and mucosal sites.

Lymphokine

Older term; see *Cytokine*.

Lymphoma

A cancer of lymphocytes, immune cells that include B cells, T cells, and natural killer cells. Lymphomas are broadly classified as Hodgkin lymphoma or non-Hodgkin lymphoma and can arise in lymph nodes or other lymphatic tissues and organs. They may cause painless enlarged lymph nodes, fever, drenching night sweats, weight loss, or symptoms from an affected organ.

Lymphoma Overview

Alternate name; see *Lymphoma*.

Lymphomatoid Granulomatosis

A rare Epstein-Barr-virus-associated lymphoproliferative disorder that commonly involves the lungs and may also affect the skin, central nervous system, or kidneys. It can produce nodules, cough, breathlessness, or systemic symptoms; diagnosis is based on tissue findings, and treatment varies with disease extent.

Lymphomatoid Papulosis

Lymphomatoid papulosis is a chronic, recurring skin disorder with cancer-like immune cells. The bumps often heal on their own, but some people later develop lymphoma.

Lymphopenia

Alternate name; see *Lymphocytopenia*.

Lymphoplasmacytic Lymphoma

A rare, usually slow-growing lymphoma that devel-

ops in bone marrow and lymphoid tissues. When it makes an abnormal IgM antibody, it is called Waldenström macroglobulinemia.

Lymphopoiesis

The production and development of lymphocytes, a group of white blood cells that help fight infection and abnormal cells. These cells develop mainly in the bone marrow and thymus.

Lymphoproliferative Disorder

A condition in which lymphocytes multiply excessively or abnormally. It may be temporary after infection or immune stimulation, or may represent a cancer such as leukemia or lymphoma.

Lymphoscintigraphy

A scan that follows a small radioactive tracer through lymph vessels. It can map drainage to the first lymph node draining a tumor or show impaired lymph flow in lymphedema and other disorders.

Lymph System

The lymph system includes lymph, lymphatic vessels, lymph nodes, spleen, thymus, and related tissues that return fluid and support immune defense.

Lynch Syndrome

An inherited condition that greatly increases the risk of colorectal, womb, ovarian, stomach, urinary-tract, and several other cancers. Risk management can include regular screening and genetic counseling or testing for relatives.

Lysergic Acid Diethylamide

A potent hallucinogenic drug (psychedelic) classified as a Schedule 1 controlled substance (high abuse potential, no accepted medical use). LSD acts as a partial agonist at serotonin 5-HT2A receptors in the prefrontal cortex, leading to altered sensory perception, mood, and cognition.

Lysine

Lysine is an essential amino acid needed for protein production, growth, and tissue repair; it must be obtained from food.

Lysis

The breakdown, dissolution, or destruction of cells or tissue; examples include hemolysis, the breakdown of red blood cells, and thrombolysis, the dissolution of a blood clot.

Lysogenic Conversion

A change in a bacterium's characteristics after a virus that infects bacteria inserts its genetic material into the bacterial chromosome and provides new genes, such as genes that increase disease-causing ability.

Lysogeny

Lysogeny is a state in which a bacteriophage's genetic material is maintained inside a bacterial cell and replicated with the host genome.

Lysophagy

A form of selective autophagy that removes damaged lysosomes, the cell compartments that digest waste. It helps maintain cell health; failure of lysophagy can allow damaged lysosomes to accumulate and promote inflammation or cell injury.

Lysophosphatidylcholine

A fat-like molecule found in cell membranes and blood. It helps transport fats and can influence inflammation and cell communication; abnormal levels may occur in metabolic or inflammatory diseases.

Lysophospholipids

Lipids related to phospholipids but containing one fewer fatty-acid chain. They are parts of cell membranes and can act as signaling molecules, influencing inflammation, blood vessels, immune responses, and cell movement.

Lysosomal Storage Disorders

A group of inherited diseases in which missing or faulty lysosomal enzymes cause substances to build up inside cells. Accumulation can damage organs,

bones, nerves, or other tissues; treatment depends on the specific disorder.

Lysosome

A small compartment inside a cell containing substances that break down waste, worn-out cell parts, and material brought into the cell. Lysosome disorders can cause harmful material to accumulate in tissues.

Lysozyme

A natural enzyme that helps defend against bacteria by breaking down part of their protective outer wall. It is found in tears, saliva, breast milk, and some immune cells.

Lysozyme Test

A lysozyme test measures the enzyme lysozyme in a sample and may support evaluation of selected blood, inflammatory, or infectious disorders.

Lyssavirus

A group of viruses that includes rabies virus and related viruses. They mainly spread through the bite or saliva of an infected mammal and can cause a severe brain infection; post-exposure vaccination can prevent disease before symptoms begin.

Lytic

Causing or involving lysis, or the breakdown of cells, tissue, or another biological structure; a lytic bone lesion is an area of bone destruction.

Lytic Lesion

A lytic lesion is an area of bone destruction caused by processes such as cancer, infection, or some metabolic bone disorders.

Manual Lymphatic Drainage

A gentle, specialized massage technique intended to move lymph from swollen tissue toward functioning lymphatic pathways. It is used as one component of decongestive therapy for lymphedema, often alongside compression, exercise, and skin care.

Alternate Names: Lymphatic Drainage Massage; Lymphatic Drain Massage; Manual Lymph Drainage

M

MacConkey Agar
A laboratory growth medium used mainly to grow and distinguish certain intestinal bacteria. It helps show whether bacteria can break down lactose, a sugar.

Macerate
To soften and break down tissue after prolonged contact with fluid. The term may describe skin, wounds, or changes in a fetus that has died before delivery.

Maceration
Softening and breakdown of tissue caused by prolonged exposure to moisture or fluid; it may occur in skin, wounds, or a fetus after death.

Macewen Sign
An unusually hollow sound heard when part of the skull is tapped. It may occur with enlarged fluid spaces in the brain or rarely a brain abscess, but it cannot diagnose either condition by itself.

Machupo Virus
An arenavirus that causes Bolivian hemorrhagic fever, a potentially fatal illness characterized by fever, pain, and bleeding; it is endemic in parts of Bolivia.

Macroamylasemia
Macroamylasemia is a benign condition in which amylase binds to immunoglobulin and remains in blood, causing high serum amylase with low urinary clearance.

Macroangiopathy
A disease of the body's larger blood vessels, often caused by fatty buildup or a blood clot. It can reduce blood flow to the heart, brain, legs, or other organs.

Macroautophagy
A cell-cleaning process in which a cell encloses damaged parts or unwanted proteins, breaks them down, and reuses some of their materials. It helps maintain cell health during stress and normal turnover.

Macrocephalus
Alternate name; see *Macrocephaly*.

Macrocephaly
An abnormally large head, usually defined in children by a head circumference more than two standard deviations above the mean or above the 97th percentile for age and sex. It may be familial or result from enlarged brain tissue, excess fluid, or another condition.

Macrocyte
An abnormally large red blood cell, commonly seen in macrocytosis and megaloblastic or other anemias.

Macrocytic
Describing a cell, especially a red blood cell, that is abnormally large; macrocytic anemia features enlarged red blood cells.

Macrocytic Anaemia
Alternate British spelling; see *Macrocytic Anemia*.

Macrocytic Anemia

Anemia in which red blood cells are larger than usual. Common causes include vitamin B12 or folate deficiency, alcohol use, liver disease, underactive thyroid, some bone-marrow disorders, and recovery from blood loss. It may cause tiredness, pale skin, shortness of breath, or tingling.

Alternate Names:
Macrocytosis; Large-Cell Anemia; High-MCV Anemia

Macrocytosis

An abnormal enlargement of mature circulating red blood cells defined by a mean corpuscular volume (MCV) exceeding 100 fL, commonly resulting from vitamin B12 or folate deficiency (megaloblastic anemia), alcoholism, chronic liver disease, reticulocytosis, or myelodysplastic syndrome.

Alternate Names:
Macrocytic Erythrocytes; Elevated MCV

Macrodactyly

Fingers or toes that are unusually large because their bones and soft tissues overgrow. It is usually present from birth, may affect one digit or several, and can interfere with movement or footwear.

Macrodontia

Teeth that are larger than expected. It may affect one tooth or many teeth and can cause crowding, bite problems, or difficulty cleaning; treatment depends on the cause and symptoms.

Macrogenitosomia

Unusual enlargement of the external genitals caused by excessive hormone activity before birth or during childhood. Possible causes include disorders of the adrenal glands, testes, ovaries, or other hormone systems.

Macroglobulin

A large protein in the blood, often made of several protein units joined together. Immunoglobulin M is a major example; abnormal amounts can occur in some immune or blood disorders.

Macroglossia

An unusually large tongue. It may be present from birth or develop later and can affect breathing, eating, speaking, or tooth growth.

Macrognathia

An abnormally large jaw. It may result from excessive bone growth, an inherited condition, or another disorder. It is distinct from prognathism, in which the jaw projects forward.

Macrolide

A class of antibiotics, including azithromycin, clarithromycin, and erythromycin, that treat bacterial infections by stopping bacteria from producing the essential proteins they need to grow and multiply. They are commonly used to treat respiratory tract infections, skin infections, and certain sexually transmitted infections.

Macrolides

Plural form; see *Macrolide*.

Macronutrients

Nutrients needed in large amounts, mainly carbohydrates, proteins, and fats. They provide energy, build and repair tissues, support hormones and cell membranes, and help maintain normal body functions.

Macrophage

A large immune cell that surrounds and removes germs, dead cells, and debris. It also helps coordinate inflammation and tissue repair.

Macrophage Activation

The process by which macrophages, a type of immune cell, respond to infection or tissue injury. They may destroy germs and damaged cells, alert other immune cells, and release substances that promote inflammation or repair.

Macrophage Activation Syndrome

A severe systemic hyperinflammatory syndrome, considered a form of secondary hemophagocytic

lymphohistiocytosis (HLH), that most often complicates rheumatic diseases such as systemic juvenile idiopathic arthritis, adult-onset Still disease, or lupus. Features include persistent fever, markedly elevated ferritin, low blood-cell counts, liver inflammation, and disordered blood clotting; severe cases can progress to multiple-organ dysfunction.

Macrophage Count

The number or percentage of macrophages found in a tissue, body fluid, or laboratory sample. The result may help assess infection, inflammation, tissue repair, or a blood disorder, but its meaning depends on the sample and other findings.

Macropsia

A visual disturbance in which objects appear larger than they really are. It may occur with migraine, seizures, retinal problems, medicines, or brain disorders and can temporarily affect depth and distance judgment.

Macroscopic

Large enough to be seen without a microscope. A macroscopic examination records a specimen's visible size, shape, color, surface, and other gross features before microscopic testing.

Macroscopic Hematuria

Visible blood in the urine, also called gross hematuria; it may arise from the kidneys, ureters, bladder, prostate, or urethra and can be caused by infection, stones, trauma, or malignancy.

Macrosomia

Excessive fetal or newborn size, usually defined by an estimated fetal weight or birth weight above 4,000 to 4,500 g, regardless of gestational age. Thresholds vary. It differs from large for gestational age, which means weight above the 90th percentile for gestational age.

Macrostomia

An abnormally wide mouth or oral opening, usually a congenital facial cleft caused by incomplete fusion of the embryonic facial processes.

Macula

The central part of the retina responsible for sharp, detailed, and color vision. Damage from aging, diabetes, inflammation, or other disease can cause blurred, distorted, or missing central vision.

Macula Densa

A group of specialized cells in the kidney tubule that senses sodium chloride in the filtrate. These cells help regulate renin release and the kidney's filtration rate.

Macula Lutea

The small yellowish area in the center of the retina responsible for sharp vision. Its center, called the fovea, provides the clearest vision.

Macular

Relating to a macule, a flat, circumscribed change in skin color without a change in texture or elevation. Macules may be caused by pigment, inflammation, vascular change, or other processes and are distinguished from raised lesions such as papules.

Macular Amyloidosis

A localized cutaneous amyloidosis characterized by mottled or rippled brown-gray patches, usually on the upper back. It is often associated with chronic friction or rubbing and is distinct from systemic amyloidosis.

Macular Cyst

A cystic defect in the macula, the central retinal area responsible for sharp vision, often associated with vitreous traction and potentially causing distortion or loss of central vision.

Macular Degeneration

A general term for disorders that damage the macula, the central part of the retina responsible for detailed straight-ahead vision. Age-related macular degeneration is a common form and has dry (atrophic) and wet (neovascular) types; inherited and other disorders can also cause macular degeneration.

Macular Drusen

Small yellow deposits beneath the retina in the macula, the area responsible for sharp central vision. A few small deposits may occur with aging, while many large deposits can signal increased risk of macular degeneration.

Macular Edema

Swelling of the macula caused by fluid collecting within the retina, often after blood vessels leak. It can blur or distort central vision and may occur with diabetic retinopathy, retinal vein occlusion, inflammation, or after eye surgery.

Macular Hole

A full-thickness opening in the fovea, the center of the macula, often caused by traction between the vitreous gel and retina. It may cause blurred or distorted central vision or a central blind spot.

Macular Pucker

Alternate name; see *Epiretinal Membrane*.

Macular Skin Lesion

Relating to a macule, a small, flat, circumscribed change in skin color that is neither raised nor depressed.

Macular Sparing

Preservation of central vision despite loss of the surrounding half of the visual field, often after damage to visual pathways. It may occur after a stroke in the occipital lobe, but the mechanism varies.

Macule

A small, flat, discolored area of skin or mucous membrane that does not change the skin's thickness or texture, typically measuring up to 1 centimeter across. Macules can be darker than surrounding skin (such as a freckle or mole), lighter (such as in vitiligo), or reddish from widened tiny blood vessels. Larger flat patches of discoloration are called patches.

Macules

Plural form; see *Macule*.

Maculopapular Lesion

A skin lesion combining flat areas of altered color (macules) with small raised solid lesions (papules); it can occur in infections, drug eruptions, inflammatory diseases, and other conditions.

Madarosis

Loss or absence of eyelashes, eyebrows, or other hair, caused by local disease, inflammation, trauma, or systemic conditions.

Mad Cow Disease

Alternate name; see *Bovine Spongiform Encephalopathy*.

Maddrey Discriminant Function

A score used to estimate the severity of alcohol-associated hepatitis. It uses blood clotting time and bilirubin level; a score of 32 or higher suggests severe disease and helps clinicians assess treatment options.

Alternate Names:
MDF; Maddrey DF Score

Madelung Deformity

A wrist deformity caused by abnormal growth of the volar-ulnar part of the distal radius, producing altered wrist alignment. It may be isolated, inherited, or associated with conditions such as Leri-Weill dyschondrosteosis; pain or limited movement can occur.

Alternate Names:
Madelung Wrist

Madura Foot

A chronic localized infection of the skin and deeper tissues of the foot, caused by fungi or certain bacteria and characterized by swelling, draining sinuses, and granules.

Alternate Names:
Mycetoma Pedis; Maduromycosis

Maduramycosis

Mycetoma, a chronic subcutaneous infection caused by true fungi or filamentous bacteria and characterized by swelling, sinuses, and granules.

Madurella

Madurella is a genus of fungi that can cause mycetoma, a chronic infection of skin and deeper tissue after implantation through the skin.

Madurella Mycetomatis

A fungus that commonly causes eumycetoma, a chronic infection producing nodules, draining sinuses, and grains, usually after traumatic implantation in the foot or limb.

Maffucci Syndrome

A rare condition causing multiple benign cartilage growths and abnormal blood-vessel growths, usually beginning in childhood. It can deform bones, cause fractures, and increase the risk of certain cancers.

MAG3 Renal Scan

A kidney scan that uses a small radioactive tracer to show how well each kidney works and how urine drains. It can help detect blockage or delayed drainage.

Magenblase Syndrome

Stomach discomfort and bloating caused by swallowing too much air, often while eating or drinking. The swallowed air may cause burping, fullness, or visible swelling and can be worsened by chewing gum, fizzy drinks, eating quickly, or anxiety.

Magnesium

A mineral needed for healthy nerves, muscles, bones, heart rhythm, and many body processes. Too little can cause weakness, tremor, muscle cramps, or abnormal heart rhythms.

Magnesium Blood Test

A blood test measuring serum magnesium, an electrolyte involved in neuromuscular function, cardiac rhythm, and metabolism; it helps evaluate deficiency, excess, and related electrolyte disorders.

Magnesium Carbonate

A magnesium salt used in some antacid or laxative preparations and as a magnesium supplement; excessive intake may cause toxicity, especially in renal failure.

Magnesium Chloride

A magnesium salt used in some oral supplements and medical preparations to provide magnesium or, in concentrated solutions, to help correct magnesium deficiency; dosing depends on the elemental magnesium content.

Magnesium Deficiency

An abnormally low body magnesium level, often caused by poor intake, gastrointestinal loss, renal wasting, or medications. It may cause weakness, tremor, muscle cramps, seizures, cardiac arrhythmias, hypokalemia, and hypocalcemia.

Magnesium Hydroxide

An osmotic laxative and antacid that neutralizes gastric acid and draws water into the bowel.

Magnesium In Diet

Dietary magnesium comes from foods such as nuts, seeds, legumes, whole grains, and leafy vegetables and supports nerve, muscle, bone, and heart function.

Magnesium Oxide

An inorganic magnesium compound used in some supplements and antacids; it can also have a laxative effect, and excessive use may cause hypermagnesemia, especially with kidney impairment.

Magnesium Sulfate

A magnesium salt used intravenously or intramuscularly to treat selected magnesium deficiencies and conditions such as eclampsia, and used orally as an osmotic laxative; it is also known as Epsom salt in its hydrated form.

Magnesium Sulfate For Neuroprotection

Magnesium given through a vein before some very early preterm births to lower the baby's risk of brain injury. The timing and dose are guided by obstetric and newborn-care specialists.

Magnesium Sulphate

A magnesium salt used medically for severe magnesium deficiency, prevention or treatment of eclamptic seizures, and selected arrhythmias or asthma indications.

Magnesium Test

A blood test measuring serum magnesium, an essential electrolyte involved in neuromuscular transmission, enzymatic reactions, and cardiac rhythm regulation; see *Magnesium*.

Magnetic Resonance Angiography

MRI techniques used to depict arteries or veins, with or without contrast. It may evaluate stenosis, aneurysm, dissection, thrombosis, and vascular malformation without ionizing radiation.

Magnetic Resonance Cholangiopancreatography

A special MRI scan that shows the bile ducts, gallbladder, and pancreatic duct without inserting a camera into them. It can detect stones, narrowing, inflammation, leaks, and some blockages without using X-rays.

Alternate Names:
MRCP; MR Cholangiopancreatography

Magnetic Resonance Imaging

A scan that uses a strong magnetic field and radio waves to make detailed pictures inside the body without X-rays. It is especially useful for the brain, spinal cord, joints, muscles, and many organs; some scans require injected contrast.

Magnetic Resonance Safety

Procedures used during an MRI scan to prevent injury from the strong magnet, radio waves, heating, loud noise, and metal objects. Screening covers implants, metal fragments, medicines, pregnancy, and other risks before scanning.

Magnetic Resonance Spectroscopy

A special MRI test that measures chemicals in tissue rather than only making a picture of its shape. It may help study brain disorders or provide extra information about a tumor; results are considered alongside ordinary imaging and other tests.

Magnetic Resonance Urography

An MRI scan of the kidneys, ureters, and bladder. It shows the urinary tract without X-rays and may be performed with or without contrast material.

Magnetic Resonance Venography

An MRI test that produces images of veins, with or without injected contrast. It can assess suspected clots or narrowing in veins of the brain, abdomen, pelvis, or limbs and does not use X-rays.

Alternate Names:
MRV; MR Venography

Magnetic Seed

A tiny magnetic marker placed in a breast lesion or lymph node to help a surgeon find it. A special detector locates the marker during surgery, providing an alternative to some wire or radioactive-marker methods.

Magnetic Therapy

Treatment that uses a magnetic field for a health purpose. Ordinary static magnets have not been shown to treat disease, while specialized magnetic stimulation devices have established uses for some neurologic or psychiatric conditions.

Magnetocardiography

A test that records the very weak magnetic fields produced by the heart's electrical activity using sensors outside the body. It may help study heart rhythm or electrical conduction, usually in specialist or research settings.

Magnetoencephalography

A noninvasive technique that records the weak magnetic fields produced by neuronal electrical activity, using sensors outside the head to localize and study brain function and some epileptic discharges.

Magnusiomyces Capitatus

An opportunistic yeast formerly known as *Geotrichum capitatum* or *Saprochaete capitata*; it can cause invasive infections, especially in people with severe immunosuppression or hematologic malignancy.

Mahvash Disease

A rare inherited disorder in which the body's cells do not respond normally to glucagon, a hormone that helps raise blood sugar. It can enlarge the pancreas, increase glucagon levels, and disturb blood-sugar control.

Main-En-Griffe

A claw-like hand position usually caused by damage to the ulnar nerve, which controls several hand muscles. The ring and little fingers may bend at the smaller joints, weaken the grip, and become difficult to straighten.

Maintenance

Ongoing care or treatment intended to preserve health, prevent relapse or deterioration, or sustain a therapeutic result; maintenance therapy is continued after initial control of a condition.

Maintenance Dose

The regular amount of a medicine needed to keep its effect at the desired level. The dose depends on how quickly the body removes the medicine and how much the body absorbs.

Maintenance Of Wakefulness Test

A sleep test that measures how long a person can remain awake in a quiet setting during the day.

Maintenance Therapy

Treatment continued after a disease has improved or been controlled to maintain that benefit, prevent return or worsening, or delay progression. The treatment may be a medicine, procedure, or other care, and its duration depends on the condition, response, risks, and treatment goals.

Maisonneuve Fracture

A spiral fracture of the proximal third of the fibula associated with disruption of the distal tibiofibular syndesmosis, interosseous membrane, and either an avulsion fracture of the medial malleolus or rupture of the deep deltoid ligament of the ankle.

Maize

Corn, a cereal grain used as food and feed; contaminated maize can expose people to fungal toxins such as aflatoxin.

Majeed Syndrome

A rare autoinflammatory disorder caused by LPIN2 variants, characterized by chronic recurrent multifocal osteomyelitis, congenital dyserythropoietic anemia, and inflammatory skin disease.

Majewski Syndrome

A rare inherited skeletal disorder involving abnormal bone growth and distinctive craniofacial or limb findings; the exact features depend on the genetic subtype.

Majocchi Granuloma

A deep follicular infection caused by dermatophyte fungi, producing inflamed papules, pustules, or nodules and sometimes abscesses. It often follows shaving or topical steroid use and requires systemic antifungal treatment rather than topical therapy alone.

Major

Larger, greater, or more significant than another related structure or condition; for example, the teres major muscle is larger than the teres minor muscle.

Major Depression

Alternate name; see *Major Depressive Disorder*.

Major Depression With Psychotic Features

A major depressive episode accompanied by delusions or hallucinations, usually mood-congruent, with significant safety and functional implications.

Major Depressive Disorder

A mood disorder involving one or more major depressive episodes. During an episode, five or more symptoms occur during the same two-week period, including either depressed mood or loss of interest or pleasure (anhedonia). Other symptoms may include changes in sleep, appetite, energy, concentration, movement, guilt, worthlessness, or thoughts of death. The symptoms cause clinically significant distress or impairment.

Alternate Names:
Major Depression

Major Depressive Episode

A period of at least two weeks with depressed mood or loss of interest or pleasure plus additional emotional, cognitive, physical, or behavioral symptoms that cause significant distress or impairment. It may occur in major depressive disorder, bipolar disorder, or other conditions and must be distinguished from symptoms caused by substances or another medical condition.

Major Histocompatibility Complex

A group of genes that encode cell-surface proteins used to display protein fragments to T cells. These proteins help the immune system recognize infected or abnormal cells; in humans, they are called human leukocyte antigens (HLA).

Major Histocompatibility Complex Molecule

A cell-surface protein that displays small pieces of germs or abnormal cells to immune cells. This helps the immune system recognize what belongs to the body and what may need an immune response.

Alternate Names:
MHC Molecule

Major Trauma

A serious injury that may threaten life, limb, or organ function. It can involve multiple body regions or major damage to the brain, spine, chest, abdomen, pelvis, or blood vessels.

Malabsorption

A condition in which the body cannot properly digest or absorb nutrients from food. It may cause chronic diarrhea, greasy stools, weight loss, anemia, or vitamin and mineral deficiencies.

Malabsorption Syndrome

Impaired absorption of nutrients from the small intestine, causing diarrhea, weight loss, anemia, vitamin deficiencies, or other nutritional complications.

Malacia

Abnormal softening or weakening of tissue. It may affect cartilage, bone, or brain tissue after faulty development, injury, infection, reduced blood supply, or another disease; symptoms depend on the tissue involved.

Malacoplakia

Alternate spelling; see *Malakoplakia*.

Maladaptation

An adjustment to a situation or environment that does not work well and harms health or daily functioning. The term may describe physical, psychological, or behavioral responses to illness or stress.

Maladaptive Stress Response

A lasting or overly strong reaction to stress that interferes with health, daily life, or relationships. It may include constant worry, poor sleep, irritability, avoidance, or physical symptoms and can improve with support and appropriate treatment.

Malaise

Malaise is a general feeling of illness, discomfort, or lack of well-being that commonly accompanies infection, inflammation, chronic disease, medication effects, or other systemic conditions.

Malakoplakia

A rare inflammatory disorder, often affecting the bladder, in which defective macrophage function is associated with distinctive mineralized inclusions called Michaelis-Gutmann bodies. It can form a mass that resembles cancer and may also involve the digestive tract or other organs.

Malar

Relating to the cheekbone or cheek area. A malar rash is a red or purple rash across the cheeks and bridge of the nose, often seen in lupus. A malar fracture is a break in the cheekbone and may cause swelling, numbness, or a changed facial shape.

Malaria

A serious and potentially life-threatening infectious disease caused by *Plasmodium* parasites, which are transmitted to humans through the bites of infected female *Anopheles* mosquitoes. Once inside the body, the parasites multiply in the liver before invading and destroying red blood cells. This cyclical destruction causes recurring bouts of high fever, chills, sweating, and severe fatigue, and can lead to dangerous complications such as severe anemia, kidney failure, or brain damage (cerebral malaria).

Malar Rash

A red or violaceous rash across the cheeks and bridge of the nose, often sparing the folds beside the nose. It is classically associated with systemic lupus erythematosus but can occur with other conditions; appearance alone does not establish a diagnosis.

Malassezia

Malassezia is a yeast normally found on skin that can contribute to dandruff, seborrheic dermatitis, pityriasis versicolor, and some folliculitis.

Malassezia Furfur

Malassezia furfur is a yeast that normally lives on skin but can multiply excessively. It is linked with dandruff, oily skin inflammation, and pityriasis versicolor, which causes lighter or darker patches.

Malassezia (Pityrosporum) Folliculitis

An overgrowth of Malassezia yeast in hair follicles causing many small, itchy, fairly uniform papules and pustules, usually on the chest, back, shoulders, or forehead. Heat, sweating, antibiotics, oils, and immune suppression can contribute.

Malassimilation

Failure to properly digest food or absorb its nutrients. It may cause diarrhea, weight loss, bloating, anemia, or vitamin shortages and can result from pancreatic disease, bowel disorders, surgery, infection, or food intolerance.

Malate Dehydrogenase

An enzyme in energy-producing pathways that changes malate into oxaloacetate. It helps cells process nutrients and is involved in transferring chemical energy within mitochondria and other cellular compartments.

Malathion

An organophosphate insecticide that inhibits acetylcholinesterase; topical formulations have also been used to treat head lice, but exposure or ingestion can cause cholinergic toxicity.

Malathion Poisoning

Poisoning caused by the insecticide malathion. It can produce sweating, excess saliva, vomiting, diarrhea, wheezing, slow heartbeat, muscle twitching, weakness, seizures, or breathing failure.

MALDI-TOF Mass Spectrometry

A laboratory method that identifies bacteria or fungi by comparing their protein pattern with a reference database. It can identify an organism quickly, but separate testing is needed to determine antibiotic sensitivity.

Male

Describing a sex associated with reproductive anatomy that produces or is organized around small gametes (sperm); chromosomes, hormones, anatomy, and gender identity do not always fit a simple binary pattern.

Male Breast Cancer

Cancer developing in breast tissue in a man. It is uncommon and may cause a new lump, nipple discharge, skin change, or nipple retraction.

Alternate Names:
Male Mammary Carcinoma; Breast Carcinoma in Men

Male Breast Pathology

Disorders affecting male breast tissue, including gynecomastia, benign epithelial lesions, inflammatory conditions, and carcinoma. Evaluation of a persistent mass or nipple change may include clinical examination, imaging, and biopsy.

Male Chlamydial Infection

A sexually transmitted infection in men caused by *Chlamydia trachomatis* (serovars D–K), most frequently manifesting as non-gonococcal urethritis, epididymo-orchitis, or proctitis, characterized by dysuria, mucoid urethral discharge, and testicular tenderness.

Alternate Names:
Chlamydia in Men; Male Chlamydia

Male Condom

A thin sheath placed over the penis before sexual contact to reduce the risk of pregnancy and transmission of many sexually transmitted infections by acting as a physical barrier.

Male Genitalia

The external and internal reproductive organs of a male, including the penis, scrotum, testes, epididymides, vas deferens, seminal vesicles, prostate, and associated ducts and glands.

Male Genital Sores

Ulcerations, blisters, or skin lesions on the penis, scrotum, or perianal region. Major causes include sexually transmitted infections (such as genital herpes, syphilis, and chancroid), infectious balanitis, inflammatory skin diseases, fixed drug eruptions, trauma, or penile neoplasia.

Alternate Names:
Male Genital Ulcers

Male Groin Pain

Pain in the groin or adjacent lower abdomen, hip, or testicle in a male; causes include muscle strain, hernia, infection, urinary stones, or referred pain.

Male Hypoactive Sexual Desire Disorder

Persistently reduced sexual thoughts or desire in a man that causes personal distress or relationship difficulty. It differs from erection problems, although both can occur together; medicines, illness, mood, and relationship factors may contribute.

Male Hypogonadism

Dysfunction of the testes or hypothalamic-pituitary-gonadal axis that impairs testosterone production, sperm production, or both. In adults, androgen deficiency is generally diagnosed when compatible symptoms or signs accompany consistently low serum testosterone; a low measurement alone is insufficient. Features may include reduced libido, erectile difficulty, infertility, or loss of muscle or bone mass.

Alternate Names:
Adult Male Hypogonadism

Male Infertility

Reduced ability to achieve a pregnancy because of factors affecting sperm production, sperm transport, ejaculation, sexual function, or other reproductive processes.

Alternate Names:
Male Subfertility; Male Factor Infertility

Male Menopause

An informal term sometimes used for age-related changes in testosterone. Unlike menopause, testosterone usually declines gradually, and the term is not a diagnosis; see *Male Hypogonadism*.

Male Pattern Baldness

Androgenetic alopecia, a patterned progressive loss of scalp hair caused by genetic susceptibility and androgen effects on hair follicles.

Male Pelvis

The bony pelvis associated with typical male development. On average, it is narrower and deeper than a pelvis associated with typical female development, though anatomy varies among individuals.

Male Phenotype

The observable reproductive anatomy, secondary sex characteristics, and other traits associated with male sex development, produced by interacting genetic, hormonal, and developmental factors and showing natural variation.

Male Reproductive System

The organs and tissues that produce sperm and male sex hormones and deliver sperm, including the testes, ducts, accessory glands, penis, and scrotum.

Male Self-Catheterization

Intermittent insertion and removal of a catheter through the male urethra to drain the bladder when neurologic, obstructive, or other conditions prevent adequate emptying.

Male Sexual Problems

Sexual symptoms in men, including erectile dysfunction, reduced desire, ejaculation disorders, infertility, or penile curvature; causes may be vascular, hormonal, neurologic, medication-related, psychological, or mixed.

Male Urethritis

Inflammation of the male urethra, commonly caused by sexually transmitted infection but also by irritation or other infection. Dysuria, urethral discharge, itching, or meatal irritation may occur.

Malformation

An abnormal structural development present from birth, caused by disturbed formation of an organ or body part.

Malignancy

Cancerous disease in which abnormal cells grow uncontrollably and may invade nearby tissue or spread to distant organs. Its likely behavior and treatment depend on the cancer type, extent, grade, and important molecular findings.

Malignancy-Associated Hypercoagulability

A cancer-related tendency toward excessive clot formation caused by tumor-associated coagulation activation, inflammation, platelet interaction, treatment, immobility, or vascular injury. See *Cancer-Associated Thrombosis*.

Malignant

Cancerous, with the ability to invade nearby tissues or spread to distant parts of the body. Malignant cells grow abnormally and may damage organs, but behavior varies among cancer types and stages.

Malignant Acanthosis Nigricans

A paraneoplastic syndrome in which velvety, hyperpigmented, verrucous plaques develop rapidly in flexural and mucosal areas as a marker of an underlying internal malignancy, most commonly gastric adenocarcinoma. Unlike benign acanthosis nigricans, the malignant form is extensive, abrupt in onset, and may involve the oral mucosa.

Malignant Ameloblastoma

A rare cancer arising from ameloblastoma-forming tissue, usually in the jaw, with potential to invade locally or spread to distant organs.

Malignant Appendical Tumor

Malignant tumor arising in the appendix; see *Appendiceal Cancer*.

Malignant Ascites

Buildup of fluid in the abdomen caused by cancer involving the abdominal lining or nearby organs. It can cause swelling, discomfort, early fullness, nausea, or breathlessness and may require drainage and cancer-directed treatment.

Malignant Atrophic Papulosis

Alternate name; see *Degos Disease (Malignant At-*

rophic Papulosis).

Malignant Bone Neoplasm

A cancer that begins in bone or nearby supporting tissue. It may cause persistent bone pain, swelling, or a fracture; scans and a biopsy identify the type and extent before treatment.

Malignant Carcinoid Syndrome

Severe carcinoid syndrome caused by hormone-releasing neuroendocrine cancer, potentially producing flushing, diarrhea, bronchospasm, right-sided heart-valve disease, and hemodynamic complications; see *Carcinoid Syndrome*.

Malignant Fibrous Histiocytoma

Alternate name; see *Undifferentiated Pleomorphic Sarcoma*.

Malignant Giant Cell Tumor Of Tendon Sheath

A rare locally aggressive malignant tumor resembling a giant cell tumor of tendon sheath, characterized by destructive growth and potential for metastasis; expert soft-tissue pathology helps establish the diagnosis.

Malignant Glioma

An aggressive primary tumor arising from glial or glial-like cells of the central nervous system; high-grade examples include anaplastic astrocytoma and glioblastoma.

Malignant Hypertension

A severe form of hypertension characterized by advanced hypertensive retinopathy, classically retinal hemorrhages and exudates with or without papilledema, and small-vessel injury. Acute kidney, brain, heart, or other organ damage may also occur.

Malignant Hyperthermia

A rare, life-threatening genetic reaction that occurs in susceptible individuals when exposed to certain general anesthetics and muscle relaxants during surgery. The condition causes an uncontrolled release of calcium inside skeletal muscle cells, leading to sustained muscle rigidity, an abrupt and extreme rise in body temperature, a rapid heart rate, and massive muscle tissue breakdown.

Malignant Large Bowel Tumor

Cancer arising in the colon or rectum; see *Colorectal Cancer*.

Malignant Mastocytosis

An older name for a severe disorder in which abnormal mast cells multiply and collect in organs. It can damage the bone marrow, liver, spleen, or other tissues and may cause flushing, faintness, bleeding, or organ failure.

Malignant Melanoma

Alternate name; see *Melanoma*.

Malignant Mesothelioma

A cancer of the thin lining around the lungs, abdomen, or heart. It is strongly linked to asbestos exposure and may cause chest or abdominal pain, fluid buildup, cough, or breathlessness.

Malignant Myoepithelioma

A rare cancer arising from supportive contractile cells in a gland, most often a salivary gland. It can grow into nearby tissue and spread elsewhere, causing a slowly enlarging or painful mass.

Malignant Neoplasm

A cancerous growth in which abnormal cells multiply without control, invade nearby tissues, and may spread to distant organs through the blood or lymphatic system.

Alternate Names:
Cancer; Malignancy

Malignant Neoplasms of the Small Intestine

Alternate name; see *Small Intestine Cancer*.

Malignant Otitis Externa

An older name for necrotizing otitis externa, an

invasive infection of the external ear canal that can spread to the skull base. It usually affects older adults with diabetes or people with weakened immunity and can cause severe pain or cranial-nerve problems.

Malignant Peripheral Nerve Sheath Tumor

An uncommon soft-tissue cancer arising from or near peripheral nerves. It may cause a growing painful mass, numbness, or weakness and is treated with specialist surgery, radiation, or medicines when appropriate.

Malignant Pleural Effusion

Buildup of fluid around the lung because cancer involves the lung lining or has spread there. It may cause breathlessness, chest discomfort, or cough; drainage relieves symptoms, while cancer treatment may reduce recurrence.

Malignant Pustule

An older name for the skin form of anthrax, caused by Bacillus anthracis and beginning as an itchy papule that develops into a painless black eschar.

Malignant Syphilis

A severe form of secondary syphilis that causes fever and widespread crusted, ulcerated, or tissue-damaging skin lesions. It is more common with weakened immunity and is treated with antibiotic therapy for syphilis.

Malignant Teratoma Of The Mediastinum

A malignant germ-cell tumor containing tissues from more than one embryonic layer and arising in the mediastinum; evaluation uses imaging, tumor markers, and tissue diagnosis.

Malignant Thymoma

An older term for an invasive thymic epithelial tumor; modern usage distinguishes invasive thymoma from thymic carcinoma, which is a separate, more aggressive thymic malignancy.

Malignant Tumor

A cancerous growth capable of invading nearby tissue or spreading to distant sites. Its behavior and treatment depend on its type, grade, stage, and molecular features.

Malignant Vulvar Lesions

Cancerous or potentially invasive lesions of the vulva, most commonly squamous-cell carcinoma but also melanoma, adenocarcinoma, basal-cell carcinoma, or sarcoma. Persistent, ulcerated, pigmented, bleeding, painful, or changing lesions may need examination and biopsy for diagnosis.

Malingering

Deliberately pretending to have, or exaggerating, symptoms to obtain an outside benefit such as money, medicines, shelter, or avoiding an obligation. It is not itself a mental illness; diagnosis depends on reliable evidence.

Mallampati Classification

A grading system used before anesthesia to estimate how difficult it may be to place a breathing tube. The clinician looks inside the open mouth and records which parts of the throat can be seen; it is only one part of the airway assessment.

Malleolus

A bony prominence at the ankle formed by the lower end of the tibia medially or fibula laterally.

Mallet

A surgical hammer used with tools such as osteotomes to cut or shape bone. It delivers controlled force during operations, helping surgeons work on bone while limiting unnecessary injury to nearby tissues.

Mallet Finger

An injury to the extensor tendon at the distal finger joint, causing inability to actively straighten the fingertip. It may result from a forced flexion injury and sometimes includes an avulsion fracture.

Mallet Toe

A flexion deformity of the distal interphalangeal joint, causing the end of a lesser toe to bend downward. It may be flexible or rigid and can cause pain, rubbing, corns, or difficulty wearing shoes; it differs anatomically from hammertoe and claw toe.

Mallet Toe and Hammertoe

Two distinct toe deformities: mallet toe bends at the distal interphalangeal joint near the toenail, while hammertoe bends at the proximal interphalangeal joint in the middle of the toe. Either may cause rubbing, corns, or pain.

Mallet Toes

Alternate plural form; see *Mallet Toe*.

Malleus

The largest of the three small bones in the middle ear, also called the hammer. It is attached to the eardrum and passes sound vibrations to the incus and then the inner ear.

Common name: Hammer

Mallory Bodies

Irregular, ropey, eosinophilic cytoplasmic inclusions within degenerating hepatocytes composed of tangled, ubiquitinated cytokeratin intermediate filaments (cytokeratins 8 and 18), characteristically observed in alcoholic hepatitis, non-alcoholic steatohepatitis (MASH), and Wilson disease.

Alternate Names:
Mallory-Denk Bodies; Mallory Hyaline

Mallory Body

A clump of damaged proteins inside a liver cell, seen most often in alcohol-related liver disease but also in other liver conditions. It is a laboratory finding, not a diagnosis by itself.

Mallory-Weiss Syndrome

Non-transmural, longitudinal mucosal tears localized to the gastroesophageal junction or gastric cardia, typically provoked by severe, forceful retching, vomiting, or coughing, presenting clinically as acute upper gastrointestinal hemorrhage and hematemesis.

Alternate Names:
Mallory-Weiss Tear; Gastroesophageal Laceration

Mallory-Weiss Tear

A superficial tear in the lining of the lower esophagus or upper stomach, usually caused by forceful vomiting or retching. It commonly causes vomiting of blood. Many tears stop bleeding on their own within a few days, but upper endoscopy may be needed for diagnosis and treatment.

Malnutrition

Poor health caused by too little, too much, or an imbalance of nutrients. It can impair growth, immunity, wound healing, muscle function, and organ function and may involve undernutrition, nutrient deficiencies, or excess weight.

Malocclusion

A mismatch in the position of the upper and lower teeth or jaws that affects how the teeth meet. It may cause crowding, an overbite, an underbite, difficulty chewing, speech problems, jaw discomfort, or trouble cleaning the teeth.

Malocclusion and Orthodontics

Misalignment of the teeth or jaws and the dental treatment used to improve bite, spacing, function, or facial balance; see *Malocclusion*.

Malocclusion Of Teeth

Misalignment of the upper and lower teeth or jaws that affects the bite, chewing, speech, appearance, or oral hygiene.

Malondialdehyde

A chemical formed when fats are damaged by oxidation. Laboratory researchers may measure it as an indirect sign of oxidative stress, but the result alone does not diagnose a disease.

Malpighian Bodies

Renal glomeruli within Bowman's capsules, where

blood filtration begins; the term may also refer historically to lymphoid nodules in the spleen.

Malposition

An abnormal position of an organ, body part, implanted device, or fetus; in obstetrics, fetal malposition refers to an abnormal orientation of the presenting part during labor.

Malposition of the Uterus

A uterus tilted or oriented differently from the usual position, such as retroversion or retroflexion. It is often a normal variant, but pain, pressure, infertility, urinary symptoms, or a mass may indicate an underlying condition requiring evaluation.

Malpresentation

A fetal presentation other than the usual vertex presentation, including breech, face, brow, shoulder, or compound presentation. It may complicate labor and influence delivery planning.

Malrotation

Abnormal rotation or fixation of an organ during development, most often referring to abnormal rotation of the intestine and its risk of volvulus.

MALS

Abbreviation; see *Median Arcuate Ligament Syndrome*.

Malta Fever

Brucellosis, a zoonotic infection caused by Brucella species and characterized by intermittent fever, sweats, fatigue, and joint or systemic symptoms.

Maltase

An intestinal enzyme that breaks maltose into two glucose molecules.

MALT Lymphoma

A usually slow-growing B-cell non-Hodgkin lymphoma arising from mucosa-associated lymphoid tissue, often in the stomach. It may occur in other organs and can be associated with chronic infection or autoimmune disease.

Alternate Names:
Extranodal Marginal Zone Lymphoma of Mucosa-Associated Lymphoid Tissue

Maltodextrin

A mixture of short glucose polymers produced by partial hydrolysis of starch, used as a rapidly digestible carbohydrate and as a thickener, filler, or carrier in foods and medicines.

Maltose

A reducing disaccharide composed of two glucose molecules joined by an alpha-1,4 glycosidic bond, produced during starch digestion and hydrolyzed by maltase.

Malt-Worker's Lung

An occupational hypersensitivity pneumonitis caused by inhalation of organic dusts associated with malting or grain processing.

Mammaglobin A

A secretory protein expressed predominantly in mammary tissue and used as an immunohistochemical marker that can help identify breast origin in some metastatic carcinomas.

Mammaplasty

Surgery to change the size or shape of the breast or to rebuild it after breast removal. It may enlarge, reduce, lift, or reconstruct the breast; possible risks include bleeding, infection, altered sensation, scarring, and problems with healing.

Mammary

Relating to the breast or milk-producing gland. Mammary glands develop during puberty and pregnancy and produce milk after childbirth under hormone control. The term may describe normal breast tissue or diseases such as cysts, infection, benign growths, or breast cancer.

Mammary Duct Ectasia

Widening of milk ducts, usually those beneath the

nipple, often with thickened duct walls and material inside the ducts. It may cause nipple discharge, tenderness, nipple inversion, or a lump.

Alternate Names:
Duct Ectasia; Plasma Cell Mastitis; Comedomastitis

Mammary Epithelium

The epithelial lining of the mammary ducts and secretory alveoli; these cells help produce, secrete, and transport milk and can give rise to many breast carcinomas.

Mammary Gland

A specialized, hormone-responsive compound tubuloalveolar exocrine gland located in the subcutaneous tissue of the anterior thoracic wall overlying the pectoralis major and serratus anterior muscles, serving as the anatomical organ for lactation (breast milk synthesis and secretion). Composed of 15 to 20 independent glandular lobes radially arranged around the nipple-areolar complex, each drained by a major lactiferous duct that dilates into a lactiferous sinus beneath the areola before opening onto the nipple surface. Lobes are subdivided into functional terminal duct lobular units (TDLUs), embedded within dense fibrous interlobular connective tissue, suspensory ligaments of Cooper, and abundant adipose tissue. Glandular architecture and secretory function undergo dynamic cyclical changes governed by endocrine signaling: estrogen stimulates lactiferous ductal elongation; progesterone promotes alveolar budding and lobular development; prolactin drives milk protein and lipid biosynthesis; and oxytocin stimulates perialveolar myoepithelial cell contraction to mediate milk ejection (the let-down reflex). The mammary gland is the primary tissue of origin for benign lesions (fibroadenomas, cysts) and malignant neoplasms (ductal carcinoma in situ, invasive ductal carcinoma, and lobular carcinoma).

Mammary Glands

Plural form; see *Mammary Gland*.

Alternate Names:
Breasts; Lactiferous Glands

Mammary Implant

An artificial device placed in the breast for reconstruction or enlargement. Implants may contain saline or silicone gel and may be placed above or below the chest muscle. Possible complications include infection, rupture, hard scar tissue, changes in sensation, and rarely implant-associated lymphoma.

Mammary Paget Disease

Alternate name; see *Paget Disease Of The Breast*.

Mammary Paget's Disease

Alternate name; see *Paget Disease Of The Breast*.

Mammillary Bodies

A pair of small, spherical hypothalamic nuclei situated at the posterior termination of the anterior columns of the fornix on the ventral surface of the diencephalon, forming an essential component of the Papez circuit for memory consolidation; severely damaged in Wernicke encephalopathy.

Alternate Names:
Corpora Mamillaria

Mammillary Body

One of a pair of rounded nuclei on the underside of the hypothalamus that participate in memory circuits connecting the hippocampus with the thalamus; injury can contribute to memory impairment.

Mammogram

A mammogram is a low-dose x-ray examination of breast tissue used for screening and evaluation of masses, asymmetry, calcifications, or other abnormalities.

Mammographic Calcifications

Mineral deposits seen in breast tissue on a mammogram. Large deposits are usually noncancerous, while the shape and arrangement of very small deposits can be linked to early breast cancer or other changes and may lead to further imaging or biopsy.

Alternate Names:
Breast Calcifications

Mammography

X-ray imaging of the breast used to screen for or evaluate breast abnormalities. Screening intervals depend on age, risk, symptoms, and the guideline being followed. Standard views include the craniocaudal and mediolateral-oblique projections.

Mammoplasty

Plastic or reconstructive breast surgery that changes breast size, shape, or contour. It may reduce or enlarge the breasts, lift them, rebuild them after cancer surgery, or correct differences present from birth.

Management of Third-Stage Labor

Care from birth of the baby until delivery of the placenta, including monitoring, uterotonic medication when indicated, controlled cord traction by trained clinicians, and assessment for retained placenta or postpartum hemorrhage.

Mandatory Reporting

A legal or regulatory duty to report specified findings or circumstances—such as suspected child or elder abuse, certain communicable diseases, or some injuries—to designated authorities; requirements vary by jurisdiction.

Mandible

The large movable bone forming the lower face and holding the lower teeth. It supports chewing and speech and contains nerves and blood vessels that supply the teeth, gums, and lip.

Alternate Names:
Jawbone

Mandibular

Relating to the mandible, the lower jawbone. It holds the lower teeth and moves at the jaw joints. A mandibular fracture can cause pain, swelling, numbness, loose teeth, or a changed bite.

Mandibular Advancement Device

An oral appliance that holds the lower jaw or tongue forward during sleep to enlarge or stabilize the upper airway, usually for selected patients with obstructive sleep apnea or snoring.

Mandibular Ameloblastoma

An ameloblastoma arising in the lower jaw, usually a slow-growing locally invasive odontogenic tumor; see *Ameloblastoma*.

Mandibular Condyle

The rounded superior end of each mandibular ramus that articulates with the temporal bone at the temporomandibular joint and permits jaw movement.

Mandibular Fracture

A break in the lower jaw bone typically caused by trauma, presenting with pain, swelling, malocclusion, and difficulty opening the mouth; may require surgical fixation.

Mandibular Prosthesis

An artificial implant or device used to replace, reconstruct, stabilize, or restore part of the mandible after trauma, tumor removal, congenital deformity, or other loss of jaw structure.

Mandibulofacial Dysostosis

A congenital craniofacial disorder, classically Treacher Collins syndrome, involving underdevelopment of the mandible and cheekbones with variable abnormalities of the ears, eyes, and palate.

Manganese

An essential trace element required in small amounts. Excessive exposure, especially by inhalation, can injure the nervous system and cause manganism, a movement disorder resembling parkinsonism.

Mania

A distinct period of abnormally elevated, expansive, or irritable mood and increased energy or activity, with associated symptoms such as reduced need for sleep, rapid speech, racing thoughts, inflated self-esteem, or risky behavior. It causes marked impairment, requires hospitalization, or includes psychotic features; the episode usually lasts at least

one week when hospitalization is not required.

Manic

Relating to mania, a pathological episode of abnormally elevated, expansive, or irritable mood with increased energy or activity and associated changes in thought, speech, sleep, or judgment.

Manic-Depression

Older term; see *Bipolar Disorder*.

Manic Depression in Children and Teens

Older name for bipolar disorder beginning in childhood or adolescence, involving episodes of mania, hypomania, or depression.

Manic-Depressive Disorder

Older name for bipolar disorder, characterized by episodes of mania or hypomania and episodes of depression; see *Bipolar Disorder*.

Manic-Depressive Illness

Alternate name; see *Bipolar Disorder*.

Manic Disorder

Alternate name; see *Bipolar Disorder*.

Manic Episode

A distinct period of abnormally elevated, expansive, or irritable mood and increased energy or activity, lasting at least seven days unless hospitalization is required sooner or psychotic features occur. It includes associated changes such as reduced need for sleep, rapid speech, racing thoughts, inflated self-esteem, or risky behavior and causes marked impairment.

Manic Mood

An abnormally elevated, expansive, or persistently irritable mood accompanied by increased energy or activity, reduced need for sleep, rapid speech, racing thoughts, inflated self-esteem, or risky behavior; it is characteristic of a manic episode.

Manifest

Clearly apparent or expressed; in clinical usage, a disease may manifest through particular signs or symptoms.

Manifestation

A sign, symptom, or other observable expression of a disease or health condition. Manifestations may be noticed by the person, found during examination, or detected through laboratory tests or imaging.

Manipulation

Deliberate physical movement of a body part or joint, often performed therapeutically or diagnostically by a trained clinician.

Manipulation Procedure

Deliberate movement of a body part by a trained clinician to restore motion, alignment, or function. It may be performed with or without anesthesia; soreness, bleeding, nerve injury, fracture, or worsening symptoms are possible depending on the procedure.

Mannan

A polysaccharide composed primarily of mannose units, found in the cell walls or capsules of many fungi and in some plants; fungal mannans can be recognized by the immune system and used in laboratory testing.

Mannheimia

A genus of gram-negative bacteria that mainly infects livestock, especially the respiratory tract of cattle and sheep.

Mannitol

A medicine that pulls water into the urine. It is given by injection in selected emergencies to reduce swelling or pressure around the brain or inside the eye and in some kidney-related situations; it can worsen dehydration or heart failure.

Mannose

A six-carbon monosaccharide related to glucose that

forms part of glycoproteins and glycolipids and is important in protein glycosylation and cell recognition.

Mannose-Binding Lectin Deficiency

Low levels or reduced activity of a blood protein that helps the immune system recognize and attack germs. Many people have no symptoms, but some are more prone to repeated infections, especially if other immune defenses are weak.

Mannosidosis

An inherited lysosomal storage disorder caused by deficient alpha-mannosidase activity, leading to accumulation of mannose-rich oligosaccharides and variable intellectual, skeletal, immune, hearing, and neurologic abnormalities.

Manometer

An instrument that measures pressure in a liquid or gas. In medicine, it may measure pressure in blood vessels, the lungs, the bladder, or another body space.

Manometry

A test that measures pressure and muscle coordination inside an organ or passage, such as the esophagus, stomach, rectum, or urinary tract. It helps identify movement and sphincter disorders.

Mansonella Perstans

A filarial worm that causes mansonellosis, usually acquired through bites of infected midges and often producing mild or no symptoms.

Mansonella Streptocerca

A filarial worm transmitted by biting midges that lives mainly in the skin and can cause itchy skin disease or small nodules.

Mansonelliasis

Infection with filarial nematodes of the genus *Mansonella*, transmitted by biting midges or blackflies; many infections are asymptomatic, but some cause itching, skin lesions, fever, or eosinophilia.

Mantle Cell Lymphoma

A usually fast-growing cancer of B lymphocytes that often enlarges lymph nodes and the spleen and may involve the bone marrow, blood, or digestive tract. A characteristic chromosome change helps confirm the diagnosis and guide treatment.

Mantle Field

A historical radiation-treatment field encompassing lymph-node regions in the neck, mediastinum, and upper chest, formerly used for Hodgkin lymphoma; modern treatment generally uses more limited involved-site fields.

Mantoux Test

A skin test for immune sensitization to tuberculosis. A small amount of purified protein derivative is injected into the forearm, and the raised area is measured 48 to 72 hours later; a positive result does not by itself prove active disease.

Manual

Performed by hand rather than automatically, or a written guide explaining procedures and instructions. In healthcare, manual techniques may assess, move, treat, or support body structures safely.

Manual Removal Of Placenta

A procedure in which a clinician removes a placenta that has not separated or cannot be delivered after birth. The timing and need depend on bleeding, maternal condition, and local clinical protocols.

Manual Therapy or Bodywork

Hands-on treatment involving mobilization, manipulation, massage, or soft-tissue techniques to address pain, stiffness, or movement limitations; risks and suitability depend on the condition and technique.

Manual Vacuum Aspiration

A procedure that uses a handheld syringe and a thin tube to remove tissue from the uterus. It may treat early pregnancy loss or end a pregnancy, depending on local law and clinical circumstances, and is performed by trained clinicians.

Alternate Names:
MVA; Mini-Suction Curettage

Manubrium

The broad, upper quadrangular segment of the sternum articulating superiorly with the clavicles (sternoclavicular joints) and first costal cartilages, and joining inferiorly with the sternal body at the sternal angle of Louis (level of T4-T5 intervertebral disc).

Alternate Names:
Manubrium Sterni

Manus

The hand, including the wrist and fingers, in anatomical terminology.

MAOIs

A class of medicines used mainly for depression and some other conditions. They slow the breakdown of certain brain chemical messengers and can have important interactions with foods and other medicines.

Map-Dot-Fingerprint Type Corneal Dystrophy

A usually bilateral corneal epithelial basement membrane dystrophy producing map-like, dot-like, or fingerprint-like patterns and sometimes recurrent corneal erosions or visual blurring.

Maple Syrup Urine Disease

An inherited disorder in which the body cannot properly break down three amino acids from protein. Harmful substances build up, causing sweet-smelling urine, poor feeding, sleepiness, abnormal movements, seizures, or brain injury without treatment.

Mapping

Charting the location of genes or other identifiable regions on chromosomes; the term may also describe charting functional or anatomical regions in other medical contexts.

Marantic

Relating to a sterile, noninfective process associated with wasting; marantic endocarditis refers to nonbacterial thrombotic endocarditis.

Marantic Endocarditis

Non-infectious heart condition characterized by sterile vegetations forming on heart valves, often linked with advanced malignancy. See *Nonbacterial Thrombotic Endocarditis*.

Marasmus

Severe undernutrition caused by prolonged lack of calories and protein. It leads to marked loss of body fat and muscle, poor growth in children, weakness, and increased vulnerability to infection.

Maraviroc

A CCR5 antagonist (entry inhibitor) used in combination antiretroviral therapy for HIV-1 infection in patients with CCR5-tropic virus. Maraviroc binds to the human CCR5 coreceptor on CD4+ T cells, preventing HIV-1 gp120 binding and viral entry.

Marble Bone Disease

Osteopetrosis, an inherited disorder of defective bone resorption causing abnormally dense but fragile bones and possible marrow failure.

Marburg Virus

A rare and highly lethal virus belonging to the filovirus family, closely related to the Ebola virus, that causes Marburg virus disease. It is a severe viral hemorrhagic fever transmitted to people from fruit bats and spread through contact with the body fluids of infected individuals. It causes sudden high fever, severe headache, muscle aches, widespread internal and external bleeding, and multi-organ failure.

Marburgvirus

Taxonomic genus; see *Marburg Virus*.

Marburg Virus Disease

A severe viral hemorrhagic fever caused by Marburg

virus or Ravn virus. It usually begins abruptly with fever, headache, malaise, and muscle aches; gastrointestinal symptoms may follow, and severe disease can cause bleeding, shock, or organ failure. Infection can pass from fruit bats to people and between people through direct contact with infected blood or other body fluids.

Alternate Names:
Marburg Hemorrhagic Fever; MVD

Marcus Gunn Jaw-Winking Phenomenon

An uncommon congenital synkinetic neuro-ophthalmological anomaly characterized by unilateral upper eyelid retraction or elevation occurring synchronously with movements of the lower jaw (such as chewing, sucking, or lateral jaw excursion). Caused by aberrant congenital innervation of the ipsilateral levator palpebrae superioris muscle (cranial nerve III) by motor branches of the trigeminal nerve (cranial nerve V_3) supplying the pterygoid muscles.

Alternate Names:
Jaw-Winking Syndrome; Marcus Gunn Ptosis

Marcus Gunn Pupil

A relative afferent pupillary defect (RAPD) detected during the swinging-flashlight test, wherein the affected pupil displays paradoxical dilation (or reduced constriction) when the light source is shifted from the unaffected eye to the abnormal eye, indicating unilateral or asymmetric optic nerve or retinal pathology.

Alternate Names:
Relative Afferent Pupillary Defect; RAPD

Marden-Walker Syndrome

A rare inherited disorder characterized by a distinctive facial appearance, low muscle tone, limited joint movement, poor growth, and developmental delay. Care is supportive and involves several specialties.

Marek's Disease

A contagious herpesvirus disease of chickens that can cause nerve paralysis, tumors, weight loss, or death.

Marfanoid Habitus

A body build characterized by features such as tall stature, long limbs, long fingers (arachnodactyly), or joint laxity. It may occur in Marfan syndrome and other connective-tissue or metabolic disorders; body build alone does not establish or exclude Marfan syndrome.

Marfan's Syndrome

Alternate spelling; see *Marfan Syndrome*.

Marfan Syndrome

An autosomal dominant connective-tissue disorder usually caused by a disease-causing variant in the *FBN1* gene, which encodes fibrillin-1. It may affect the aortic root and heart valves, eyes, skeleton, joints, lungs, and dura. Features can include aortic-root enlargement, lens dislocation, tall or long-limbed stature, long fingers, scoliosis, chest-wall differences, and joint laxity; the severity varies among individuals.

Marginal Cord Insertion

Attachment of the umbilical cord at or near the edge of the placental disk rather than toward its center. This differs from velamentous cord insertion, in which the umbilical vessels travel through the fetal membranes before reaching the placenta.

Alternate Names:
Battledore Placenta

Marginal Ulcer

An ulcer occurring at or near a gastrojejunal anastomosis, often after gastric bypass or other gastric surgery, where acid, ischemia, smoking, nonsteroidal anti-inflammatory drugs, or other factors may contribute.

Marginal Zone Lymphoma

A slow-growing non-Hodgkin lymphoma that begins in immune cells in the marginal zone of lymphoid tissue.

Alternate Names:
MZL

Maribavir

Maribavir is an antiviral medicine used to treat certain cytomegalovirus infections that are resistant or refractory to other treatment after transplantation.

Marie-Strümpell Disease

Chronic inflammatory arthritis primarily affecting the spine and sacroiliac joints, potentially causing vertebrae to fuse. See *Ankylosing Spondylitis*.

Marie-Strumpell Disease

Ankylosing spondylitis, a chronic inflammatory disease primarily affecting the sacroiliac joints and spine that can cause back pain, stiffness, and progressive spinal fusion.

Marijuana

Cannabis preparations containing cannabinoids such as THC; medical effects and risks depend on dose, formulation, route, and patient factors.

Alternate Names:
Cannabis; Weed; Pot

Marijuana/Cannabis

Cannabis is a plant containing active chemicals such as THC and cannabidiol. THC can affect memory, coordination, mood, and judgment; cannabis may also interact with medicines and can cause dependence.

Marijuana Intoxication

Temporary changes after using cannabis, including impaired attention, memory, coordination, judgment, or perception. Anxiety, panic, drowsiness, vomiting, or psychosis may occur. Severe symptoms or accidental ingestion by a child can be dangerous.

Marijuana Substance Use

Marijuana or cannabis can impair attention, memory, coordination, and driving and may cause dependence, anxiety, psychosis, or respiratory harm when smoked.

Marine Animal Stings Or Bites

Injuries caused by marine animals through biting, stinging, spines, or venom; effects range from local pain and swelling to allergic, neurologic, or systemic toxicity.

Marine Toxin

A poisonous substance produced or accumulated by marine organisms, such as some fish, shellfish, algae, or bacteria, that can cause neurologic, gastrointestinal, or other poisoning.

Marital Disharmony

Persistent conflict or distress in a marriage or partnership that may contribute to psychological symptoms or require relationship-focused support.

Marital Status

A demographic or social-status variable describing whether a person is unmarried, married or partnered, separated, divorced, widowed, or in another legally or culturally recognized relationship; it may be relevant to social and health assessments.

Marital Therapy

Counseling for couples that addresses communication, conflict, emotional distress, intimacy, and relationship problems. It may help partners improve interaction and make informed decisions about their relationship.

Marjolin Ulcer

A rare, aggressive cutaneous squamous cell carcinoma arising within longstanding chronic nonhealing wounds, burn scars (cicatrices), chronic venous stasis ulcers, or chronic osteomyelitis sinus tracts.

Alternate Names:
Scar Carcinoma; Burn Scar Squamous Cell Carcinoma

Marked

An adjective in clinical reports indicating that a finding is pronounced or substantial. It has no universal numerical threshold; its degree is judged against the scale or reference used for that finding.

Marker

An identifiable biological feature used to track a gene, cell, disease, or process; a genetic marker is a detectable DNA region inherited with a nearby gene, while a blood or tumor marker is a measurable substance associated with a condition.

Maroteaux-Lamy Syndrome

A rare inherited disorder in which certain complex sugars build up in the body. It can cause short stature, stiff joints, enlarged liver or spleen, cloudy corneas, heart-valve disease, breathing problems, and coarse facial features. Intelligence is often normal. Treatment may include enzyme replacement, supportive care, or stem-cell transplantation.

Alternate Names:
Mucopolysaccharidosis Type Vi; MPS VI; Arylsulfatase B Deficiency

Marrow

The soft tissue inside bones, including red marrow that produces blood cells and yellow marrow rich in fat.

Marrow Hyperplasia

Increased activity and numbers of blood-forming cells in the bone marrow. It may occur when the body is replacing blood lost or destroyed, or when tissues are not receiving enough oxygen.

Marshall Syndrome

A rare periodic-fever syndrome, usually associated with PFAPA features, including recurrent fever, aphthous ulcers, pharyngitis, and cervical adenitis, often beginning in childhood.

Marsupialization

A surgical technique that opens a cyst or abscess and sutures its edges to the surrounding skin or mucosa to permit continuing drainage.

Martin-Bell Syndrome

An older name for fragile X syndrome, an inherited neurodevelopmental disorder caused by CGG-repeat expansion in the FMR1 gene.

Martinus Beijerinck

A Dutch microbiologist who helped establish the concept of viruses as infectious agents that reproduce only in living cells and contributed to the development of enrichment culture methods.

MASA Syndrome

An X-linked neurodevelopmental disorder characterized by intellectual disability, absent or limited speech, shuffling gait, spasticity, and adducted or clasped thumbs; it may also include short stature and lumbar lordosis. The name is an older acronym; the condition is also called L1 syndrome.

Masculinization

Development of male-typical physical characteristics, caused by normal puberty, androgen excess, androgen treatment, or certain disorders.

MASH

Abbreviation; see *Metabolic Dysfunction-Associated Steatohepatitis*.

Mask

A covering placed over the face to deliver or filter gases or to protect the wearer or others from droplets or particles. Medical masks include oxygen masks, anesthesia masks, noninvasive-ventilation masks, and surgical masks; the specific type determines its function.

Masked Data

Data altered, obscured, or replaced so that identifying values or sensitive details are hidden while selected analytical properties may be retained; masking is used to protect privacy and can be reversible or irreversible.

Masklike Face

An expressionless face with little spontaneous animation, also called masklike facies; it may occur in Parkinson disease, myotonic dystrophy, and other disorders.

MASLD

Abbreviation; see *Metabolic Dysfunction-Associated Steatotic Liver Disease*.

Masochism

Sexual or nonsexual arousal or gratification associated with receiving pain, humiliation, or degradation; distress or impairment determines clinical significance.

Mason Classification

A system for classifying radial head fractures. Type I is nondisplaced; Type II is a displaced partial-head fracture; and Type III is a comminuted fracture involving the head. The Mason–Johnston modification adds Type IV for a radial head fracture associated with elbow dislocation.

Alternate Names:
Mason–Johnston Classification

Masoprocol

A synthetic derivative of nordihydroguaiaretic acid that inhibits lipoxygenase pathways and has been investigated for topical treatment of actinic keratoses and for antineoplastic activity.

Mass

A lump or localized area of abnormal tissue detected by examination or imaging. It may be benign, malignant, or caused by inflammation or another process; the word alone does not specify its cause or behavior.

Massage

Manual manipulation of soft tissues using techniques such as stroking, kneading, or pressure, used for relaxation or symptom relief; it is not a substitute for diagnosis or treatment of an underlying disease.

Massage Therapy

Massage therapy uses hands-on manipulation of soft tissues to promote relaxation or help manage selected pain and movement problems.

Mass Casualty Incident

An event causing more injured or ill people than nearby medical services can immediately manage. Health teams use triage to prioritize urgent treatment, transport, and limited supplies.

Masseter

A powerful muscle of chewing that elevates the mandible and lies over the lateral surface of the mandibular ramus.

Masseter Muscle

A strong chewing muscle running from the cheekbone to the lower jaw. It raises the jaw to close the mouth and may become painful or enlarged with teeth grinding.

Massive Hemoptysis

Life-threatening coughing of blood that threatens the airway, breathing, or circulation; a fixed volume threshold is not required. Management focuses on airway stabilization and control of the bleeding source.

Massive Ovarian Edema

Marked stromal edema causing enlargement of one or both ovaries, usually due to partial torsion or hormonal stimulation. It can mimic an ovarian neoplasm and may cause pain or virilization.

Massive Pulmonary Embolism

A high-risk, life-threatening pulmonary embolism characterized by extensive clot obstruction causing acute right ventricular strain and hemodynamic collapse (systolic blood pressure < 90 mmHg or obstructive shock). See *Massive Pulmonary Embolus*.

Massive Pulmonary Embolus

A severe blockage of the main blood vessels to the lungs by a blood clot. It can suddenly strain or stop the right side of the heart and cause very low blood pressure, severe breathlessness, fainting, bluish skin, or cardiac arrest. Treatment may include clot-dissolving medicine or removal of the clot.

Alternate Names:

Massive PE; High-Risk Pulmonary Embolism; Fulminant Pulmonary Embolism

Massive Transfusion Protocol

A coordinated protocol for life-threatening hemorrhage that provides rapid, balanced delivery of red cells, plasma, and platelets with monitoring and correction of fibrinogen, calcium, temperature, and acid-base abnormalities.

Mass Screening

Testing a large group of people who do not yet have symptoms to find disease or risk early. Screening programs are evaluated by test performance, follow-up pathways, benefits, and harms.

Mass Spectrometer

A laboratory instrument that identifies chemicals by giving their particles an electrical charge and separating them according to size and charge. It can measure medicines, toxins, proteins, and other substances.

Mass Spectrometry

An analytical method that identifies and measures molecules by their mass-to-charge ratios; coupled with chromatography, it is widely used in clinical chemistry, toxicology, pharmacology, and proteomics.

Mastalgia

Breast pain or tenderness, which may be cyclical with menstruation or noncyclical. Causes include hormonal changes, cysts, infection, trauma, and musculoskeletal pain.

Mast Cell

An immune cell found in tissues that releases substances involved in allergy, inflammation, and defense against some germs. Its products can cause itching, swelling, mucus production, and changes in blood pressure.

Mast Cell Activation Syndrome

A disorder causing recurrent episodes of mast-cell mediator symptoms in at least two organ systems, such as hives, flushing, abdominal symptoms, wheezing, or low blood pressure. Diagnosis also requires an event-related rise in a validated mediator, often tryptase, and a response to treatment that blocks mast-cell mediators or activation.

Mast Cell Sarcoma

A very rare, aggressive cancer of mast cells, immune cells involved in allergic reactions. It forms a destructive growth in tissue or bone. Unlike systemic mastocytosis, it is characterized by a localized sarcomatous tumor and may progress to disseminated mast-cell disease or acute leukemia. Clinical manifestations depend on the involved site and may include pain, swelling, organ dysfunction, or mediator-related symptoms such as flushing and hypotension. Diagnosis requires histopathology, mast-cell immunophenotyping, and systemic staging; management generally involves specialist-directed intensive antineoplastic therapy.

Mast-Cell Sarcoma

Alternate spelling; see *Mast Cell Sarcoma*.

Mastectomy

Surgery to remove breast tissue from one or both breasts, usually to treat or prevent selected breast cancers. Most mastectomies remove nearly all breast tissue; whether the nipple, areola, skin, or nearby lymph nodes are removed depends on the type. A lumpectomy removes a tumor or abnormal area while leaving most of the breast in place.

Masticate

To chew food, using the teeth, tongue, and muscles of mastication to mechanically break it down and mix it with saliva before swallowing.

Mastication

Chewing food with the teeth and moving it with the tongue before swallowing. It breaks food into smaller pieces and mixes it with saliva, making it easier to swallow and begin digesting.

Masticatory Muscle

One of the muscles that moves the mandible during chewing, chiefly the masseter, temporalis, medial pterygoid, and lateral pterygoid muscles.

Mastitis

Inflammation of breast tissue, often occurring during lactation but also possible outside lactation. It may cause localized pain, warmth, swelling, redness, or fever. It may be infectious or noninfectious.

Alternate Names:
Breast Inflammation

Mastocytoma

A localized collection or tumor of mast cells, usually presenting in the skin as a solitary cutaneous mastocytoma; rubbing the lesion can cause itching, redness, or swelling from mediator release.

Mastocytosis

A disorder in which too many mast cells, immune cells involved in allergic reactions, collect in the skin or internal organs. It may cause itchy spots, flushing, abdominal symptoms, wheezing, or low blood pressure.

Mastodynia

Pain or tenderness in one or both breasts, also called mastalgia. It may follow the menstrual cycle or result from injury, infection, medicines, cysts, or other breast conditions; a new persistent lump, skin change, or bloody discharge may indicate another breast problem.

Mastoid

Relating to the mastoid part of the temporal bone behind the ear. This area contains air spaces connected with the middle ear and can become infected, causing pain, swelling, or drainage.

Mastoid Antrum

An air-containing cavity in the mastoid portion of the temporal bone that communicates with the middle-ear attic.

Mastoid Bone

The portion of the temporal bone located behind the ear.

Mastoidectomy

Surgery to remove infected or diseased air cells in the bone behind the ear. It may treat chronic middle-ear infection, cholesteatoma, mastoiditis, or complications that have spread beyond the ear.

Mastoiditis

Infection of the bone behind the ear, usually spreading from a middle-ear infection. It can cause pain, redness, swelling behind the ear, fever, or the ear sticking out, and may spread to nearby areas.

Mastoid Process

The conical bony projection of the temporal bone behind the ear, containing air cells and providing attachment for several neck muscles; infection of its air cells is mastoiditis.

Mastopexy

Breast-lift surgery that removes extra skin and reshapes breast tissue to raise the breasts and nipples. It can improve shape but does not necessarily reduce breast size; scars, altered sensation, asymmetry, and changes in breastfeeding ability are possible risks.

Alternate Names:
Breast Lift

Masturbation

Self-stimulation of the genitals for sexual pleasure. It is a common human behavior; it is generally not harmful unless it causes injury, distress, or interferes with daily life.

Alternate Names:
Autoeroticism; Solitary Sex

Materia Medica

An older term for the body of medicinal substances and information about their properties and uses.

Maternal

Maternal means relating to a mother or the pregnant

person, especially in connection with pregnancy, childbirth, or postpartum health.

Maternal Age

Maternal age is the age of the pregnant person and can influence fertility, pregnancy risks, screening choices, and obstetric care.

Maternal Anemia

A reduction in circulating maternal hemoglobin concentrations below gestational norms (typically < 11 g/dL in the first and third trimesters), most commonly resulting from iron deficiency or plasma volume expansion; see *Anemia*.

Maternal Expulsive Efforts

The pregnant person's efforts to push the baby down and out during the second stage of labor. Pushing may follow the body's urge or be guided by the birth team, depending on the situation and chosen pain relief.

Alternate Names:
Bearing Down; Second Stage Expulsive Efforts

Maternal Hemorrhage

Excessive, potentially life-threatening blood loss during pregnancy, labor, or the postpartum period; see *Antepartum Hemorrhage* and *Postpartum Hemorrhage*.

Maternal-Fetal Medicine

The obstetric subspecialty concerned with pregnancies involving increased risk to the pregnant person or fetus. It includes care related to maternal medical disorders, pregnancy complications, fetal growth or structural conditions, and prenatal diagnosis, often in coordination with other specialties.

Maternal Health

The physical and mental health of a person during pregnancy, childbirth, and the postpartum period. Care includes prevention, antenatal monitoring, safe delivery, and treatment of complications.

Maternal Mortality

Death during pregnancy or within 42 days after pregnancy ends from a cause related to or worsened by pregnancy or its management, excluding accidental or incidental causes. It is measured as a population health indicator; deaths later in the first postpartum year are classified separately as late maternal deaths.

Maternal Mortality Rate

The number of maternal deaths in a specified period relative to the population of women of reproductive age, commonly expressed per 100,000 women per year. It differs from the maternal mortality ratio, which uses live births as its denominator.

Maternal Obesity

Obesity present before or during pregnancy. It can increase the risk of high blood pressure, diabetes, cesarean birth, and health problems for the pregnant person or baby.

Maternal Physiologic Changes In Pregnancy

Normal body changes during pregnancy that support the growing fetus and prepare for birth. They affect blood volume, heart function, breathing, digestion, kidneys, hormones, breasts, skin, and the musculoskeletal system.

Maternal Sepsis

Organ dysfunction caused by a dysregulated maternal response to infection during pregnancy, childbirth, or the postpartum period. It may arise from uterine, urinary, respiratory, wound, or other infection and requires prompt cultures, antimicrobial therapy, source control, and hemodynamic support.

Maternal Serum Alpha-Fetoprotein

A blood test during pregnancy, usually at 15–20 weeks, that measures a protein made by the fetus. An unusually high or low result may be linked to an incorrect pregnancy date, more than one fetus, or certain birth defects or chromosome conditions. It is a screening test, not a diagnosis; abnormal results may lead to additional testing.

Maternal Vaccine

A vaccine given during pregnancy to protect the pregnant person and, through transferred antibodies, provide early protection to the fetus or newborn; recommended products and timing depend on current guidance.

Maternity

The state or service relating to pregnancy, childbirth, and the care of the mother and newborn.

Maternity Services

Healthcare for pregnancy, labor and birth, the postpartum period, and the newborn. Services may include prenatal checks, midwifery or obstetric care, delivery support, breastfeeding help, and emergency care.

Materteral

Relating to a maternal aunt or to the genetic relationship between an aunt and her niece or nephew; synonymous with materterine.

Mathematics Disorder

A learning disorder involving persistent difficulty understanding numbers, calculation, quantity, or mathematical reasoning despite appropriate instruction.

Mating

Sexual pairing or reproduction between organisms that permits exchange or transfer of gametes and may lead to fertilization.

Matrix Band

A thin dental strip placed around a prepared tooth to temporarily replace a missing wall and contain restorative material while a filling or crown buildup is formed.

Matrix Metalloproteinase

An enzyme that cuts proteins in the extracellular matrix surrounding cells. It helps with normal tissue repair and remodeling, but excessive or poorly controlled activity can promote inflammation, tissue destruction, or cancer spread.

Maturation

The process through which cells, tissues, organs, or a person develop and become fully functional. Normal maturation may involve changes in size, structure, ability, hormone activity, and response to the environment.

Maturation Disorders Of Erythropoiesis

Anemia categories caused by ineffective development or maturation of red-cell precursors in the bone marrow. They include disorders of hemoglobin synthesis, such as iron deficiency and thalassemia, and disorders of nuclear maturation, such as vitamin B12 or folate deficiency and myelodysplasia.

Mature Onset Diabetes

Older term; see *Type 2 Diabetes Mellitus*.

Mature Teratoma

A germ-cell tumor composed of well-differentiated tissues from one or more embryonic germ layers; many are benign, but behavior depends on the site, age, and tumor type, and some can undergo malignant transformation.

Maxilla

The paired bones forming the upper jaw and supporting the upper teeth. They also form parts of the cheeks, nose, eye sockets, hard palate, and the air-filled sinuses behind the cheeks.

Maxillary

Relating to the maxilla, the upper jawbone. It supports the upper teeth, forms part of the eye socket and roof of the mouth, and contains the maxillary sinuses. Problems may include tooth infection, sinusitis, or facial fractures.

Maxillary Sinus

The maxillary sinus is a paired, air-filled cavity in the maxilla beneath each orbit. It drains into the nasal cavity and may become inflamed or infected in sinusitis.

Maxillary Sinusitis

Inflammation or infection of the air-filled spaces behind the cheekbones. It may cause cheek or tooth pain, blocked nose, thick nasal discharge, reduced smell, cough, or fever and can follow a cold, allergy, or dental infection.

Maxillofacial

Relating to the jaw, face, mouth, and associated bones and soft tissues. Maxillofacial care may include treatment of injuries, congenital differences, infections, and tumors.

Maxillofacial Prosthesis

An artificial replacement for part of the face, jaw, mouth, nose, eye area, or ear after injury, cancer surgery, or a birth difference. Examples include devices that close a palate opening or replace an eye, nose, or ear.

Maxillofacial Reconstruction

Reconstructive surgery of the jaws, face, mouth, or associated soft tissues after trauma, cancer removal, congenital difference, infection, or severe tissue loss. Reconstruction may use bone or soft-tissue grafts, local or free flaps, implants, and staged procedures.

Maximal Breathing Capacity

The greatest volume of air that can be moved in and out of the lungs in a specified period during maximal effort; it is related to but distinct from standard spirometric measures.

Maximum

The maximum is the greatest value in a set of measurements or the highest level reached by a variable, such as a recorded temperature, blood pressure, or drug concentration.

Maximum Plasma Concentration

The highest measured plasma concentration after a dose. Cmax and the time to reach it are used to describe absorption rate, peak-related toxicity, and comparative pharmacokinetics.

Alternate Names:
Cmax

Maximum Thickness

Maximum thickness is the greatest measured thickness of a structure or specimen. It may be reported in imaging, pathology, or assessment of a lesion, organ, or tissue layer.

Maximum Tolerated Dose

The highest dose of a drug that produces acceptable, manageable toxicity without causing unacceptable adverse effects, determined through dose-escalation studies, most commonly in Phase I clinical trials. The MTD identifies the dose range for subsequent efficacy studies.

Mayer-Rokitansky-Kuster-Hauser Syndrome

A congenital condition in which the uterus, cervix, and upper part of the vagina are absent or underdeveloped. Ovarian function and puberty usually develop normally, but menstruation does not occur because the uterus is absent or very small. Kidney, skeletal, or hearing differences may also occur.

Alternate Names:
MRKH Syndrome; Müllerian Agenesis

Mayer-Rokitansky-Küster-Hauser Syndrome

Alternate spelling; see *Mayer-Rokitansky-Kuster-Hauser Syndrome*.

May-Hegglin Anomaly

An inherited MYH9-related disorder with macrothrombocytopenia, giant platelets, and characteristic leukocyte inclusions; hearing, kidney, or cataract abnormalities may occur.

Mayo Scissors

Strong surgical scissors designed to cut fascia, muscle, sutures, and other tough materials. Their broad blades provide force and control, and they may be straight or curved for different surgical tasks.

Maytansine

Maytansine is a potent antimitotic compound that binds tubulin and inhibits microtubule assembly. Its derivatives are used as cytotoxic payloads in some antibody–drug conjugates.

May-Thurner Syndrome

Compression of the left pelvic vein by the right pelvic artery, which can slow blood flow and increase the risk of a clot or swelling in the left leg.

Maze Procedure

A heart operation for atrial fibrillation. The surgeon creates carefully placed lines of scar tissue in the upper heart chambers to block abnormal electrical signals and help restore a regular rhythm. It may be performed with other heart surgery; recurrence, bleeding, stroke, or the need for a pacemaker are possible.

Alternate Names:
Cox-Maze Procedure; Surgical Ablation for Atrial Fibrillation; Maze Operation

Maze Surgery

A surgical procedure for selected atrial fibrillation in which lines of scar are created in the atria to block abnormal electrical circuits and guide impulses along a controlled pathway.

Mazindol

Mazindol is a sympathomimetic appetite suppressant that affects central catecholamine signaling. It has been used for short-term obesity treatment in some countries and may cause stimulant-related adverse effects.

MB ChB

Abbreviation for Bachelor of Medicine and Bachelor of Surgery, a medical degree awarded in many countries.

MCAD Deficiency

An inherited disorder in which the body cannot break down medium-chain fats for energy, especially during fasting or illness. It can cause hypoketotic hypoglycemia, vomiting, lethargy, seizures, or liver problems and is caused by variants in *ACADM*.

MCA Peak Systolic Velocity

An ultrasound measurement of blood speed in a major artery of the fetus's brain. An unusually high value may suggest fetal anemia and can help guide monitoring or further testing during pregnancy.

McArdle Disease

A rare inherited muscle disorder in which muscles cannot release usable energy from stored sugar during exercise. Activity can cause early muscle pain, cramps, exhaustion, or dangerous muscle breakdown with dark urine. Some people improve after slowing down briefly and restarting gently, called the second-wind phenomenon. Avoiding sudden strenuous exercise helps prevent attacks.

Alternate Names:
GSD V; Myophosphorylase Deficiency; Glycogen Storage Disease Type V

McBurney Point

A surface landmark about one-third of the distance from the right anterior superior iliac spine to the umbilicus, near where the appendix joins the cecum. Tenderness there may occur with appendicitis, but the appendix position and site of greatest tenderness vary.

Alternate Names:
McBurney's Point; Appendiceal Surface Landmark

McBurney Sign

Tenderness at McBurney's point in the right lower abdomen. It can support suspicion of appendicitis but is not diagnostic by itself; appendicitis is inflammation of the appendix and is not necessarily caused by infection.

McBurney's Point

A location in the lower-right abdomen where tenderness may occur when the appendix is inflamed. Pain there can support a diagnosis of appendicitis but cannot confirm it by itself.

Mcc Gene

A gene that helps regulate cell growth and is considered a tumour-suppressor gene. Loss or alteration of its function has been found in some colorectal and other cancers, but the finding alone does not diagnose cancer.

McCune-Albright Syndrome

A mosaic disorder caused by a postzygotic activating variant in *GNAS*. It can affect bone, skin, and hormone-producing organs, causing fibrous dysplasia, café-au-lait skin macules, and hormone excess such as early puberty; the features vary with the tissues involved.

McDonald Cerclage

A common operation that places a strong stitch around the cervix through the vagina. It may help keep the cervix closed when there is a high risk of very early birth; timing and suitability depend on the pregnancy history and examination.

MCH

The average amount of hemoglobin in one red blood cell, reported in a complete blood count. Hemoglobin carries oxygen, and the result helps classify some types of anemia.

MCHC

The average concentration of hemoglobin inside red blood cells, reported in a complete blood count. It helps clinicians assess and classify anemia together with the other blood-count results.

MCL Injury

Abbreviation; see *Medial Collateral Ligament Injury*.

MC Lymphoma

Abbreviation; see *Mantle Cell Lymphoma*.

McMurray Test

A knee examination in which the leg is flexed, rotated, and extended to place stress on the menisci. Pain or a palpable click may suggest a meniscal lesion but is not diagnostic alone.

McRoberts Maneuver

A positioning maneuver for managing shoulder dystocia where the mother's legs are hyperflexed onto her abdomen, with thighs against the abdomen. This flattens the sacrum, increases the anteroposterior diameter of the pelvis, and rotates the symphysis pubis superiorly. Often combined with suprapubic pressure.

MCRPC

Abbreviation; see *Metastatic Castration-Resistant Prostate Cancer*.

MCV

Mean corpuscular volume: the calculated average volume of a red blood cell, derived from hematocrit and red-cell count and reported as part of a complete blood count.

MDMA

3,4-Methylenedioxymethamphetamine, a psychoactive stimulant and hallucinogen commonly known as ecstasy or molly; it can produce serious cardiovascular, neurologic, and temperature-regulation effects.

MDMA Toxicity

Serotonergic and sympathomimetic toxicity from MDMA, with agitation, hyperthermia, diaphoresis, tachycardia, hypertension, jaw clenching, seizures, rhabdomyolysis, and potentially severe hyponatremia from excess water intake. Treatment includes rapid cooling, benzodiazepines, electrolyte assessment, and careful management of complications.

MDS

Abbreviation; see *Myelodysplastic Neoplasms*.

Mead Acid

An omega-9 fatty acid made when the body lacks enough essential omega-6 and omega-3 fatty acids. Increased levels can support laboratory assessment of essential-fatty-acid deficiency, although results

must be interpreted with nutrition and illness history.

Meadow Saffron

Colchicum autumnale, a plant containing colchicine; ingestion can cause severe gastrointestinal illness, multiorgan toxicity, and death.

Mean

The mean is the arithmetic average, calculated by adding all values and dividing by the number of values. It is commonly used to summarize clinical measurements but can be distorted by extreme values.

Mean Arterial Pressure

An estimate of the average pressure pushing blood through the body's organs during each heartbeat. Clinicians use it with other findings to judge whether organs are receiving enough blood.

Mean Cell Volume

The average volume of a red blood cell, calculated from the hematocrit and red-cell count and reported as MCV in a complete blood count.

Mean Corpuscular Hemoglobin Concentration

The average concentration of oxygen-carrying hemoglobin inside red blood cells. It is part of a complete blood count and helps classify the cause of anemia.

Mean Corpuscular Volume

The average size of red blood cells, reported in a complete blood count. Small cells or large cells can point toward different causes of anemia; significance depends on the other blood results.

Mean Diameter

The average diameter of a structure or lesion, usually calculated from one or more measured dimensions. Measurement methods can differ when clinical measurements are compared.

Mean Thickness

Mean thickness is the average thickness calculated from multiple measurements of a tissue, structure, or specimen. It is used in imaging, pathology, and physiologic measurements.

Measles

An acute, highly contagious respiratory infection caused by measles virus. It typically causes fever, cough, runny nose, conjunctivitis, and sometimes Koplik spots, followed by a maculopapular rash that spreads from the face downward. Complications include pneumonia and encephalitis.

Measles Infection

Alternate name; see *Measles*.

Measles Virus

An enveloped, negative-sense single-stranded RNA virus in the genus *Morbillivirus* that causes measles. It spreads through the air and can cause fever, cough, runny nose, conjunctivitis, and rash.

Measurable Residual Disease

Cancer cells that remain after treatment and can be detected with a sensitive, validated test. The amount may be too small to see on scans or by routine examination, but it can help estimate relapse risk and guide further treatment.

Measurement

Measurement is the quantitative determination of a physical, biologic, or clinical characteristic using a defined method and unit. Interpretation depends on accuracy, precision, and the clinical context.

Meatal

Relating to a meatus, a natural opening or passage in the body. It commonly refers to the opening of the urethra, the ear canal, or one of the passages inside the nose. Meatal narrowing can obstruct urine or air flow.

Meatal Stenosis

Narrowing of the urethral meatus, which may cause

a deflected or narrow urinary stream, spraying, dysuria, or difficulty emptying the bladder.

Meatus

A natural anatomical opening, orifice, or canal-like passage leading into or communicating with an interior body cavity or tubular organ. Major clinical examples include: (1) The External acoustic meatus (ear canal, conducting acoustic sound waves from the auricle to the tympanic membrane); (2) The External urethral meatus (the terminal slit-like opening of the urethra on the glans penis in males or in the vulval vestibule in females; meatal stenosis can cause obstructive voiding symptoms); and (3) The Nasal meatuses (superior, middle, and inferior nasal meatuses, cleft-like passages situated beneath the corresponding nasal conchae/turbinates in the lateral nasal wall that receive ostial drainage from the paranasal sinuses and nasolacrimal duct).

Meatuses

Plural form; see *Meatus*.

Mebendazole

A medicine used to treat several intestinal worm infections. It disrupts structures the worms need to absorb nutrients and survive; treatment choices and dosing depend on the parasite, age, pregnancy, and local guidance.

Mebrofenin Scan

A nuclear-medicine scan that follows a tracer through the liver and bile ducts. It can assess gallbladder function, bile blockage, leaks, or selected causes of jaundice and abdominal pain.

Mecamylamine

Mecamylamine is an orally active ganglionic nicotinic-receptor blocker that reduces sympathetic nerve transmission and lowers blood pressure. It has been used for severe hypertension and may cause postural hypotension, dizziness, constipation, and dry mouth.

Mecarzole

Mecarzole is a synonym for carbendazim, a benzimidazole fungicide that interferes with fungal microtubule formation. It is an agricultural chemical rather than a routine human medicine and may be toxic if exposure occurs.

ME/CFS

Abbreviation; see *Myalgic Encephalomyelitis*.

Mechanical Circulatory Support

Machines or pumps that help the heart move blood when it cannot pump enough on its own. They may be used temporarily during severe illness or longer term while awaiting, or instead of, a heart transplant.

Mechanical Insufflation-Exsufflation

A cough-assist device that gives a breath in followed quickly by suction-like pressure out. It helps people with weak breathing muscles clear mucus, especially in neuromuscular disease or spinal-cord injury.

Mechanical Ventilation

Breathing support from a machine that pushes air and oxygen into the lungs and helps remove carbon dioxide. It may be delivered through a mask or a breathing tube when illness or injury prevents adequate breathing.

Mechanical Ventilator

A mechanical ventilator is a machine that supports or replaces spontaneous breathing by delivering controlled or assisted breaths, usually through a mask or an endotracheal tube. Settings are adjusted to oxygenation, ventilation, mechanics, and patient needs.

Mechanism Of Death

The nonspecific physiologic or biochemical failure through which a disease or injury causes death, such as respiratory failure, fatal arrhythmia, exsanguination, or cardiac tamponade. It is distinct from the underlying cause of death and the manner of death; conditions such as sepsis are generally recorded as causes, not mechanisms.

Mechanism Of Toxicity

The way a substance causes injury or illness in the body. It may interfere with an enzyme or receptor, damage cell membranes or DNA, disrupt energy production, or trigger an abnormal immune response. Understanding the mechanism helps guide prevention and treatment.

Mechanoreceptor

A sensory receptor that detects physical forces such as touch, pressure, stretch, vibration, sound, or movement. It converts mechanical stimulation into electrical signals carried by nerves to the brain or spinal cord.

Mechlorethamine

Mechlorethamine is an alkylating antineoplastic agent that cross-links DNA and inhibits cell division. Topical gel is used for cutaneous T-cell lymphoma; systemic use is limited by toxicities such as myelosuppression and tissue injury.

Meckel Diverticulectomy

Surgical removal of a Meckel diverticulum, usually performed when it causes bleeding, inflammation, obstruction, perforation, or is found incidentally in a high-risk setting.

Meckel Diverticulum

A small pouch present from birth on the lower small intestine, caused by a remnant of the embryonic vitelline duct. It often causes no symptoms, but can bleed, become inflamed, or cause bowel obstruction or, rarely, volvulus. A Meckel scan can help detect ectopic gastric tissue in selected children with unexplained gastrointestinal bleeding; treatment depends on symptoms and complications.

Alternate Names:
Meckel's Diverticulum; Omphalomesenteric Diverticulum; Congenital Ileal Diverticulum

Meckel-Gruber Syndrome

A severe inherited birth disorder that causes major abnormalities of the brain, kidneys, and limbs. Typical findings include a sac of brain tissue at the back of the skull, enlarged cystic kidneys, and extra fingers or toes. Poor lung development is common, and the condition is usually fatal before or shortly after birth.

Alternate Names:
Meckel Syndrome; Dysencephalia Splanchnocystica

Meckel's Diverticulum

Alternate name; see *Meckel Diverticulum*.

Meclizine

Meclizine is a first-generation antihistamine with anticholinergic and vestibular-suppressant effects. It is used to prevent or treat motion sickness and vertigo and may cause drowsiness, dry mouth, and blurred vision.

Meclofenamate Overdose

Taking too much meclofenamate, a nonsteroidal anti-inflammatory drug, may cause nausea, vomiting, stomach pain or bleeding, drowsiness, kidney injury, seizures, or metabolic acidosis. Severe poisoning can be life-threatening.

Meconium

The thick, dark first stool of a newborn, composed of intestinal secretions, shed cells, mucus, and swallowed amniotic material.

Meconium Aspiration

Breathing meconium, a newborn's first stool, into the airways before or around birth. It can block airflow and inflame the lungs, causing breathing difficulty and low oxygen.

Meconium Aspiration Syndrome

Breathing problems in a newborn after meconium, the first stool, enters the airways before or during birth. It can block airways and inflame the lungs, causing rapid breathing, low oxygen, and need for respiratory support.

Meconium Ileus

A newborn intestinal obstruction caused by unusually thick, sticky meconium (the first stool) blocking the terminal ileum, the last part of the small intes-

tine. It is strongly associated with cystic fibrosis and may cause abdominal swelling, green (bilious) vomiting, and delayed passage of stool; severe cases can lead to twisting or perforation of the intestine.

Meconium Peritonitis

Inflammation of the tissue lining a fetus's abdomen after a hole in the intestine allows first stool to escape before birth. It can cause abdominal fluid or calcium deposits and may be linked to bowel blockage or cystic fibrosis.

Meconium-Stained Amniotic Fluid

Green or yellow amniotic fluid caused by passage of fetal stool before birth. It may occur with a mature or distressed fetus and increases the risk of breathing problems after delivery; newborns are assessed and supported as needed.

MECP2 Duplication Syndrome

A rare X-linked genetic disorder caused by extra copies or increased dosage of the MECP2 gene. It often causes developmental delay, low muscle tone, seizures, recurrent infections, and breathing or feeding problems, especially in boys.

Medial

Medial means toward or situated nearer the body's midline; it contrasts with lateral and is used to describe anatomical position, movement, or imaging findings.

Medial Collateral Ligament Injury

A stretch or tear of the strong ligament on the inner side of the knee, often caused by a blow to the outer knee or a twisting injury. It causes inner-knee pain and swelling; severe tears may make the knee unstable.

Medial Cuneiform

The largest of three small bones in the inner middle part of the foot. It joins the navicular bone and the first toe bone, helps support the arch, and forms part of the joint that can be injured in a Lisfranc injury.

Medial Epicondylitis

Alternate medical name; see *Golfer's Elbow*.

Medial Gastrocnemius Strain

Overstretching or tearing of the medial head of the gastrocnemius muscle, often during sudden acceleration or push-off. It causes abrupt calf pain, tenderness, swelling, and pain with walking or ankle movement.

Medial Geniculate Nucleus

A specialized thalamic relay nucleus that receives ascending auditory inputs from the inferior colliculus via the brachium of the inferior colliculus and projects auditory radiations to the primary auditory cortex in the superior temporal gyrus (Brodmann areas 41 and 42).

Alternate Names:
MGN; Medial Geniculate Body

Medial Lemniscus

A prominent ascending sensory white matter tract in the brainstem formed by the decussating internal arcuate fibers from the contralateral gracile and cuneate nuclei of the medulla, conveying conscious proprioception, vibration, and discriminative fine touch to the ventral posterolateral (VPL) nucleus of the thalamus.

Medial Medullary Syndrome

A brainstem stroke syndrome (Dejerine syndrome) caused by infarction of the anteromedial medulla oblongata (typically due to occlusion of the anterior spinal artery or vertebral artery), characterized by ipsilateral hypoglossal nerve (CN XII) palsy (tongue deviates toward lesion), contralateral hemiparesis sparing the face, and contralateral loss of vibration and proprioception.

Alternate Names:
Dejerine Anterior Bulbar Syndrome; Inferior Alternating Hemiplegia

Medial Meniscus

The medial meniscus is a crescent-shaped fibrocartilage pad between the medial femoral condyle and medial tibial plateau. It distributes load and con-

tributes to knee stability; tears may cause joint-line pain, swelling, or locking.

Medial Rotation

Turning a limb toward the body's midline. For example, turning the thigh so the knee and foot point inward is medial rotation; the movement is assessed at joints such as the shoulder and hip.

Medial Tibial Stress Syndrome

Alternate name; see *Shin Splints*.

Median

Located in or relating to the middle plane or midpoint of a structure. In medicine, it describes anatomy, measurements, statistical values, nerve positions, or locations between two sides.

Median Arcuate Ligament Syndrome

A symptomatic condition involving compression of the celiac artery and nearby nerves by the median arcuate ligament. It may cause post-meal upper-abdominal pain and weight loss, but similar compression is often found in people without symptoms, so imaging alone does not establish the syndrome.

Alternate Names:
Dunbar Syndrome; MALS

Median Nerve

A major nerve running from the neck through the arm and forearm to the hand. It helps bend the wrist and fingers, moves the thumb, and provides feeling to the thumb, index, middle, and part of the ring finger; compression can cause carpal-tunnel symptoms.

Median Nerve Compression

Compression or injury of the median nerve at any point along its course; symptoms depend on the site. Compression at the wrist causes carpal tunnel syndrome.

Median Neuropathy

Dysfunction of the median nerve caused by compression, trauma, inflammation, or another lesion. Numbness, tingling, pain, or weakness may affect the thumb, index, middle, and radial half of the ring finger or related muscles.

Median Plane

A sagittal plane that passes directly through the midline of the body, dividing it into equal right and left halves.

Median Rhomboid Glossitis

A smooth, red, diamond-shaped area without normal surface papillae on the middle back of the tongue. It is often associated with Candida, though the relationship is not always clear, and may cause no symptoms.

Median Survival

The time by which half of the people in a study have experienced the specified event, such as death. It is a summary measure of survival in a defined population.

Mediastinal Cyst

A mediastinal cyst is a fluid- or tissue-filled cystic lesion in the mediastinum. Common types include bronchogenic, thymic, and pericardial cysts; symptoms depend on size and compression, and imaging guides evaluation.

Mediastinal Disease

A disorder affecting structures in the mediastinum, including the heart, great vessels, thymus, lymph nodes, nerves, and tumors or cysts within the central chest.

Mediastinal Emphysema

Mediastinal emphysema, or pneumomediastinum, is the presence of free air in the mediastinum. It can follow alveolar rupture, trauma, surgery, or esophageal injury and may cause chest pain, neck crepitus, or respiratory compromise.

Mediastinal Hemorrhage

Bleeding into the mediastinum, commonly caused by trauma, vascular rupture, surgery, or invasive

procedures, and potentially causing airway or cardiovascular compression.

Mediastinal Lymphadenopathy

Enlargement of lymph nodes in the mediastinum. It may occur with infection, inflammation, lymphoma, or cancer that has spread from another organ.

Mediastinal Lymph Nodes

Lymph nodes in the central chest that filter lymph from the lungs, heart, esophagus, and nearby tissues.

Mediastinal Lymphoma

Lymphoma involving lymph nodes or other lymphoid tissue in the mediastinum. It may cause cough, chest pressure, breathlessness, superior vena cava obstruction, or constitutional symptoms; CT, PET, biopsy, and immunophenotyping establish the type and extent.

Mediastinal Mass

An abnormal growth or collection of tissue in the mediastinum, the central compartment of the chest. Causes include tumors, enlarged lymph nodes, cysts, and vascular abnormalities.

Mediastinal Neoplasm

A mediastinal neoplasm is an abnormal growth in the central space of the chest between the lungs; it may arise from lymph nodes, thymus, nerves, or other tissues.

Mediastinal Pleura

The mediastinal pleura is the portion of parietal pleura lining the lateral surfaces of the mediastinum. It separates the mediastinal contents from the pleural cavity and reflects around the lung root.

Mediastinal Shift

Mediastinal shift is displacement of the mediastinal structures away from their usual position. It may result from increased pressure on one side, such as a tension pneumothorax, or loss of volume on the other, such as lung collapse.

Mediastinal Tumor

A mediastinal tumor is a mass in the central chest compartment between the lungs and may be benign or malignant.

Mediastinitis

Inflammation of tissues in the mediastinum, the central compartment of the chest. Acute cases are usually infections, often following esophageal perforation, deep neck infection spreading downward, or open-heart surgery, and may progress rapidly. Chronic fibrosing mediastinitis is a distinct form in which scar tissue encases mediastinal structures, sometimes after granulomatous infection.

Mediastinoscopes

Mediastinoscopes are slender endoscopic instruments used during mediastinoscopy to inspect the mediastinum and obtain tissue samples, especially from mediastinal lymph nodes. The procedure is performed through a small incision near the sternum.

Mediastinoscopy

A surgical procedure that accesses the mediastinum through a small incision near the sternum to inspect or biopsy mediastinal lymph nodes or masses. It is one option for staging lung cancer when less-invasive sampling is nondiagnostic or unsuitable.

Mediastinoscopy With Biopsy

A procedure using an instrument inserted through a small incision near the sternum to inspect the mediastinum and obtain lymph-node or mass samples for diagnosis and staging.

Mediastinotomy

A surgical opening into the mediastinum to examine or reach structures in the central chest.

Mediastinum

The central part of the chest between the lungs. It contains the heart, major blood vessels, windpipe, food pipe, thymus, nerves, and lymph nodes.

Mediators Of Inflammation

Molecules that start, strengthen, limit, or coordinate inflammation. They include histamine, prostaglandins, cytokines, and other signals that change blood vessels, attract immune cells, cause symptoms, and support healing.

Medical Abbreviations

Alternate name; see *Common Medical Abbreviations And Terms*.

Medical Cannabis And Cannabidiol

Cannabis and cannabidiol are substances from the cannabis plant used in some medical settings. Their effects and risks vary by product and dose; they may cause sleepiness, impaired judgment, interactions, or dependence, and effectiveness varies by condition.

Medical Condition

A state affecting health or body function, whether temporary, long-lasting, symptomatic, or silent. A medical condition may result from disease, injury, inherited traits, infection, or normal biological changes.

Medical Device

An instrument, implant, machine, software program, or other product used to diagnose, prevent, monitor, or treat disease or injury. Examples include pacemakers, syringes, imaging equipment, and blood-glucose meters.

Medical Entomology

The study of insects and related arthropods that cause disease or transmit disease-causing organisms to humans, including their biology, ecology, physiology, and genetics.

Medical Ethics

Moral principles that guide healthcare decisions, including respect for a person's choices, helping rather than harming, fairness, privacy, and honest communication. Decisions consider the patient's wishes, likely benefits and harms, professional duties, and relevant law.

Medical Examiner

A physician who investigates sudden, unexpected, violent, or suspicious deaths. The examiner may order an autopsy, determine the medical cause of death, and provide information for the official death certificate; exact duties vary by location.

Medical History

A medical history is a structured account of a person's current concerns, past illnesses and operations, medications, allergies, family history, social history, and relevant exposures. It helps guide examination, diagnosis, and treatment.

Medical Illness

The subjective experience of being unwell, which may or may not correspond to an identifiable disease.

Medical Jargon

Specialized words and phrases used by healthcare professionals. Unexplained terms can lead to misunderstanding of a condition, test results, or treatment; plain-language communication improves understanding.

Medical Jurisprudence

The branch of law (and its study) that deals with the rights and duties of physicians and the legal aspects of medical practice, distinct from but overlapping with forensic medicine.

Medical Malpractice

Legal tort occurring when a healthcare provider fails to exercise the standard of reasonable care, skill, or diligence expected of a prudent practitioner of similar standing, resulting in injury, harm, or death to a patient.

Alternate Names:
Clinical Malpractice; Medical Malpractice

Medical Marijuana

Cannabis used under medical supervision to relieve symptoms or support treatment of selected conditions. Products contain cannabinoids such as THC

or cannabidiol; effects, interactions, impairment, and dependence risk vary by product and dose.

Medical Nutrition Therapy

Personalized food and nutrition care provided by a qualified dietitian to manage a health problem. It may support people with diabetes, kidney disease, digestive disorders, cancer, obesity, or malnutrition.

Medical Officer

A physician appointed to provide clinical care or medical oversight for an institution, service, or organization.

Medical Physicist

A specialist who applies physics to medical imaging, radiation treatment, and radiation safety. Medical physicists check equipment, calculate radiation doses, and help ensure that scans and cancer treatments are accurate and as safe as possible.

Medical Physics

The application of physics to medicine, including diagnostic imaging, radiation therapy, radiation safety, and physiological measurement.

Medical Pin

A medical pin is a slender metal fixation device inserted into bone or across a joint to stabilize a fracture or support orthopedic treatment. Pins may be temporary or permanent and require monitoring for infection and displacement.

Medical Practitioner

A licensed physician qualified to diagnose, prevent, and treat illness.

Medical Privacy

Protection of information that can identify a patient and control over its sharing. It includes keeping health records secure, limiting access to appropriate people, and obtaining permission when disclosure is not otherwise allowed.

Medical Procedure

An action performed by a health professional to diagnose, monitor, prevent, or treat a health problem. Procedures range from blood tests and scans to surgery and may be done with or without anesthesia.

Alternate Names:
Clinical Procedure; Healthcare Procedure; Medical Intervention

Medical Records

Written or electronic information about a person's health, including symptoms, examinations, test results, diagnoses, medicines, procedures, and follow-up. Accurate records help healthcare professionals coordinate safe care and track changes over time.

Medical Retina

The ophthalmology subspecialty concerned with diagnosis and nonsurgical treatment of retinal and macular diseases. It includes disorders such as diabetic retinopathy, age-related macular degeneration, retinal vascular disease, and inherited retinal conditions; care may involve imaging, medicines, or office-based procedures.

Medical Symbol

A commonly recognized sign representing medicine, especially the Rod of Asclepius: a staff with one serpent. The winged, two-serpent caduceus is often used incorrectly as a medical symbol.

Medical Tattooing

Medical tattooing (permanent makeup, micropigmentation) covers depigmented skin (vitiligo, vitiligo camouflage), restores areolas after mastectomy, and masks scars. Trichopigmentation simulates hair on bald scalp. Medical tattooing uses specialized pigments and techniques.

Medical Tests

Diagnostic procedures used to screen for, confirm, or monitor disease through analysis of biologic specimens, imaging, physiologic measurements, or genetic material.

Medicinal

Relating to a substance or treatment used for the prevention, diagnosis, relief, or treatment of disease.

Medicine

A substance or treatment used to prevent, diagnose, relieve, or treat disease. Medicines may be prescription, over-the-counter, biological, or traditional, and all can have benefits, risks, and interactions.

Medicines For Back Pain

Medicines for back pain may include selected anti-inflammatory drugs, acetaminophen, muscle relaxants, or other treatments depending on the cause and patient risks.

Medicines For Osteoporosis

Osteoporosis medicines reduce bone loss or increase bone formation and may include bisphosphonates, denosumab, or anabolic treatments chosen according to fracture risk.

Medicines For Sleep

Medicines for sleep may help short-term insomnia but can cause dependence, falls, confusion, or next-day impairment; treatment approaches also vary with the cause of poor sleep.

Medicolegal

Pertaining to the application of medical knowledge to legal questions and the intersection of medicine and the law. Covers forensic pathology, toxicology, psychiatry, and clinical issues: informed consent, malpractice, medical records, disability, personal injury, occupational disease, and public health law.

Meditation

Meditation is a practice of intentionally directing attention, often toward the breath, a sensation, or an object, while observing thoughts without judgment. It may promote relaxation and stress management but does not replace indicated medical treatment.

Mediterranean Anemia

Alternate name; see *Thalassemia*.

Mediterranean Diet

An eating pattern rich in vegetables, fruits, beans, whole grains, nuts, olive oil, and fish, with less red and processed meat and added sugar. It can support cardiovascular health as part of an overall balanced diet.

Mediterranean Fever

An older name for brucellosis, a bacterial infection that can cause prolonged fever, sweats, fatigue, and joint or muscle pain.

Medium

A substance or condition through which something occurs; in microbiology, a culture medium supports the growth of microorganisms.

MEDLARS

Medical Literature Analysis and Retrieval System, an electronic bibliographic system developed by the U.S. National Library of Medicine to index and retrieve biomedical literature; it preceded MEDLINE.

Medroxyprogesterone

Medroxyprogesterone is a progestogen used for contraception, abnormal uterine bleeding, endometriosis, and hormone therapy; depot injections may cause irregular bleeding, weight change, delayed fertility return, and reduced bone density.

Medroxyprogesterone Acetate

Medroxyprogesterone acetate is a synthetic progestin used in hormonal contraception, treatment of endometriosis or abnormal uterine bleeding, and hormone therapy. It suppresses ovulation and produces progestational effects; formulation-specific risks and contraindications apply.

Medulla

The inner or central part of an organ, such as the renal medulla or adrenal medulla.

Medulla Oblongata

The lower part of the brainstem, joined to the spinal cord. It helps control breathing, heart rate, blood

pressure, swallowing, coughing, vomiting, and other automatic functions.

Medullary

Relating to the medulla or inner portion of an organ.

Medullary Carcinoma

A term used for distinct cancers in different organs. Medullary carcinoma of the thyroid arises from calcitonin-producing C cells; medullary-pattern breast carcinoma has a different origin and appearance. The organ must be specified because the diagnoses are not the same.

Medullary Cavity

The hollow space inside the shaft of a long bone. It contains bone marrow and blood vessels.

Medullary Sponge Kidney

A condition present from birth in which tiny urine-collecting tubes inside the kidneys are widened. Urine minerals may form stones or deposits, causing blood in the urine, repeated infections, pain, or no symptoms.

Medullary Thyroid Carcinoma

A cancer of hormone-producing thyroid cells that make calcitonin. It may occur alone or as part of an inherited syndrome; blood tests, imaging, and a biopsy help confirm it.

Medulloblastoma

A fast-growing cancer that usually starts in the cerebellum, the part of the brain that helps with balance and coordination. It occurs most often in children but can also affect adults. It may spread through the fluid around the brain and spinal cord and can cause headaches, vomiting, or unsteady walking.

Medulloepithelioma

A medulloepithelioma is a rare embryonal tumor arising most often from the nonpigmented ciliary epithelium of the eye in children. It may cause visual symptoms, neovascular glaucoma, or a visible mass and is treated according to its extent and pathology.

Mees' Lines

True leukonychia characterized by single or multiple paired, non-blanching transverse white bands across the nail plate that migrate distally as the nail grows. Classically associated with acute arsenic or thallium poisoning, Hodgkin lymphoma, and severe systemic illness.

Alternate Names:
Aldrich-Mees Lines; Mees Lines

Mefenamic Acid

A nonsteroidal anti-inflammatory medicine used for short-term pain, including menstrual pain. It can irritate or bleed from the stomach, affect kidney function, and increase cardiovascular risk, especially with prolonged use or in people with risk factors.

Mefloquine

Mefloquine is an antimalarial drug used for prevention and treatment of susceptible malaria. It has a long half-life and can cause neuropsychiatric, vestibular, and cardiac adverse effects; risks vary with medical history and concurrent medicines.

Megabecquerel

A megabecquerel (MBq) is a unit of radioactivity equal to one million nuclear disintegrations per second. It is used to state the activity of radiopharmaceuticals and other radioactive materials.

Megacalycosis

Congenital, nonobstructive dilatation of the renal calyces, usually with otherwise preserved renal architecture and function. It is often incidental and can resemble obstructive hydronephrosis on imaging.

Megacolon

Abnormal enlargement and dilation of the colon, which may be congenital, acquired, toxic, or inflammatory.

Megakaryocyte

A very large cell in the bone marrow that makes

platelets, the small blood parts that help stop bleeding. It grows long extensions into nearby blood vessels, where pieces break off and enter the bloodstream as platelets.

Megakaryocytopoiesis

Megakaryocytopoiesis is the formation and maturation of megakaryocytes in the bone marrow, followed by platelet production. It is regulated in large part by thrombopoietin and other hematopoietic signals.

Megaloblast

An unusually large, immature cell in bone marrow that normally matures into a red blood cell. It usually reflects faulty DNA production, commonly caused by vitamin B12 or folate deficiency.

Megaloblastic Anaemia

A macrocytic anemia caused by impaired DNA synthesis, most often from vitamin B12 or folate deficiency. Bone marrow produces abnormally large, immature red-cell precursors, and other blood-cell counts may also fall. Vitamin B12 deficiency can cause neurologic injury, sometimes before anemia develops; prolonged injury may be permanent.

Megaloblastic Anemia

A macrocytic anemia caused by impaired DNA synthesis, most often from vitamin B12 or folate deficiency. Bone marrow produces abnormally large, immature red-cell precursors, and other blood-cell counts may also fall. Vitamin B12 deficiency can cause neurologic injury, sometimes before anemia develops; prolonged injury may be permanent.

Megalocephaly

Alternate name; see *Macrocephaly*.

Megamonas Funiformis

Megamonas funiformis is an anaerobic bacterium of the genus Megamonas, commonly associated with the intestinal microbiota. Its detection in a clinical specimen requires interpretation alongside symptoms, specimen quality, and other microbiologic findings.

Megamonas Hypermegale

Megamonas hypermegale is an anaerobic bacterium in the genus Megamonas, primarily associated with the gastrointestinal microbiota. Its presence in a specimen is interpreted in relation to the site, clinical symptoms, and other microbiologic results.

Megasphaera

Megasphaera is a genus of anaerobic bacteria found in the oral cavity and gastrointestinal and genital microbiota. Species identification may be relevant in microbiome studies or when recovered from a clinical specimen.

Megaureter

An abnormally widened ureter, the tube that carries urine from the kidney to the bladder. It may result from a blockage, urine flowing backward, or abnormal ureter development and can cause infection, kidney swelling, or reduced kidney function.

Megestrol

Megestrol is a synthetic progestin used in some settings to treat hormone-responsive cancers and, in certain formulations, anorexia or severe weight loss. It can cause glucocorticoid-like effects, thromboembolic risk, and adrenal suppression.

Megestrol Acetate

Megestrol acetate is the acetate salt of the progestin megestrol. Depending on formulation and indication, it is used for advanced endometrial or breast cancer and for appetite stimulation in selected patients with severe weight loss.

Meglitinides

Short-acting diabetes medicines that encourage the pancreas to release insulin around mealtimes. They lower blood sugar but can cause low blood sugar and weight gain, so doses are usually linked to meals and skipped when a meal is skipped.

Megrim

Older term; see *Migraine*.

Meibomian Gland Dysfunction

A long-term problem with the oil-producing glands in the eyelids. Blocked ducts or abnormal oil can make tears evaporate too quickly, causing dry, irritated eyes.

Alternate Names:
MGD

Meibomian Glands

Sebaceous glands in the eyelids that produce the oily layer of the tear film and help prevent tear evaporation.

Meibomianitis

Meibomianitis is inflammation or blockage of oil-producing eyelid glands, causing irritated eyelid margins, dry eye, crusting, or recurrent styes.

Meige Syndrome

A movement disorder causing repeated involuntary eyelid squeezing and muscle spasms around the mouth, jaw, or tongue. Symptoms may worsen with stress, speaking, chewing, or touch.

Meigs Syndrome

A rare condition involving an ovarian fibroma, fluid in the abdomen, and fluid around the lungs. The fluid usually clears after the tumor is removed.

Meigs' Syndrome

Alternate spelling; see *Meigs Syndrome*.

Meiosis

A specialized cell division that produces haploid eggs or sperm from a diploid precursor cell and creates genetic variation through recombination and chromosome assortment.

Meiotic Recombination

Meiotic recombination is exchange of DNA between homologous chromosomes during meiosis, usually through crossing over. It creates new combinations of alleles and contributes to genetic variation.

Meissner Corpuscle

An encapsulated, rapidly adapting mechanoreceptor located in the dermal papillae of glabrous (hairless) skin (fingertips, palms, soles, lips), sensitive to low-frequency vibrations (30 to 50 Hz), light touch, and dynamic skin flutter.

Alternate Names:
Tactile Corpuscle

Meissner Plexus

A network of unmyelinated autonomic nerve fibers and parasympathetic postganglionic neuronal cell bodies located within the submucosa of the gastrointestinal tract, primarily regulating local glandular secretions, mucosal absorption, and submucosal blood flow.

Alternate Names:
Submucosal Plexus

Meissner's Corpuscles

Small touch sensors in hairless skin, especially the fingertips, palms, and soles. They help the nervous system detect gentle contact, texture, and movement across the skin.

MEK Inhibitor

A targeted medicine that blocks MEK proteins in the MAPK signaling pathway, which can slow growth of some cancers with pathway changes. Side effects vary and may include rash, diarrhea, heart effects, and eye problems.

Melancholia

An older term for severe depression, often describing pervasive sadness, loss of pleasure, psychomotor change, and biological symptoms.

Melancholic Features

A pattern of severe depression marked by almost complete loss of pleasure, very low mood, major changes in movement or sleep, poor appetite or weight loss, excessive guilt, and symptoms that are often worse in the morning.

Melanin

Melanin is a pigment produced by melanocytes that gives skin, hair, and eyes their colour and absorbs ultraviolet radiation; its amount and distribution influence pigmentation disorders and melanoma biology.

Melanoblast

A precursor cell that develops into a melanocyte and produces pigment after migrating into the skin and other tissues.

Melanocyte

A specialized, dendritic, melanin-synthesizing cell originating embryologically from the neural crest that migrates during development into the stratum basale of the epidermis, hair follicles, uveal tract of the eye (iris, ciliary body, choroid), inner ear stria vascularis, and leptomeninges. Within the epidermis, melanocytes reside at a regular density of approximately 1 melanocyte per 10 basal keratinocytes, associating with 30 to 40 surrounding keratinocytes to form the 'epidermal melanin unit.' Melanocytes express tyrosinase, a copper-containing enzyme that catalyzes the rate-limiting oxidation of L-tyrosine to DOPA and dopaquinone within specialized lysosome-related organelles called melanosomes. Melanosomes synthesize photoprotective brown-black eumelanin or reddish-yellow pheomelanin, which are transferred via dendritic processes into neighboring keratinocytes to form a supranuclear melanin cap that shields nuclear DNA from ultraviolet (UV) radiation-induced pyrimidine dimer mutations. Melanocyte proliferation, survival, and melanogenesis are regulated by microphthalmia-associated transcription factor (MITF), α-melanocyte-stimulating hormone (α-MSH) binding to melanocortin 1 receptors (MC1R), and stem cell factor (SCF) binding to KIT. Neoplastic transformation of melanocytes gives rise to melanoma.

Melanocytes

Plural form; see *Melanocyte*.

Melanocytic CNS Tumor

A tumor showing melanocytic differentiation within the CNS or meninges, ranging from benign melanocytoma to malignant melanoma. Evaluation includes imaging, histology, and molecular assessment to determine behavior.

Melanocytic Nevi

Common moles formed by collections of pigment-producing melanocytes. Most are harmless, but changes in size, shape, color, or symptoms can be associated with melanoma.

Melanocytic Nevus

A usually benign, localized proliferation of melanocytes that appears as a macule, papule, or nodule. Changes in size, color, border, or symptoms can indicate atypia or melanoma.

Melanoderma

Increased pigmentation or darkening of the skin caused by increased melanin production or an increased number of melanocytes.

Melanoma

A serious and aggressive type of skin cancer that develops in melanocytes, the cells responsible for producing melanin, the pigment that gives skin its color. While it accounts for a small percentage of skin cancers, it is responsible for the majority of skin cancer deaths because of its tendency to spread rapidly to lymph nodes and other organs. Most melanomas are triggered by ultraviolet (UV) radiation from sunlight or tanning equipment, often appearing as an unusual, irregularly shaped, or changing mole.

Alternate Names:
Malignant Melanoma; Cutaneous Melanoma

Melanoma Of The Eye

A cancer arising from pigment-producing cells in the eye, most often the uveal tract. It may cause blurred vision, flashes, a growing dark spot, or no symptoms at first; diagnosis is made by specialist eye examination and imaging.

Melanoma Skin Cancer

Alternate name; see *Melanoma*.

Melanoma/Skin Cancer

Alternate name; see *Melanoma*.

Melanoma Surveillance

Ongoing examination of the skin and, when appropriate, the eyes or other previously affected sites after melanoma or in people at increased risk. It may include self-checks, clinician examination, dermoscopy, photographs, and evaluation of new or changing lesions.

Melanoma Treatment

Treatment depends on the tumor's depth, spread, molecular findings, overall health, and previous treatment. Localized melanoma is usually removed surgically; selected cases need lymph-node assessment or additional medicine. Disease that has spread may require immune-based or targeted treatment, surgery, radiation, or combinations.

Melanonychia

Brown, gray, or black pigmentation of a nail plate caused by increased melanin or pigment-producing cells. It may affect several nails from medicines or systemic disease; a new or changing single-nail band can indicate nail-unit melanoma.

Melanophore

A melanophore is a pigment-containing cell, especially one in lower vertebrates, whose melanin granules can disperse or aggregate to alter visible coloration. In mammals, melanocytes are the principal melanin-producing cells.

Melanosis

Abnormal accumulation or increased production of melanin in skin, mucosa, an organ, or other tissue.

Melanosis Coli

Dark pigmentation of the colon lining caused by lipofuscin accumulation, classically associated with prolonged stimulant-laxative use. It is usually benign and may fade after the trigger is removed; associated constipation or laxative use may persist.

Melanosome

A melanosome is a specialized organelle in a melanocyte in which melanin is synthesized, stored, and transported. Melanosomes are transferred to keratinocytes and influence skin, hair, and eye pigmentation.

Melasma

An acquired pigmentary disorder causing symmetric light- to dark-brown or gray-brown patches, usually on sun-exposed areas of the face. It is associated with ultraviolet and visible light exposure and hormonal factors, including pregnancy.

Alternate Names:
Facial Melanosis

MELAS Syndrome

A mitochondrial disorder involving encephalopathy, lactic acidosis, and stroke-like episodes, often beginning before adulthood and caused by pathogenic mitochondrial DNA variants.

Melatonin

A hormone produced mainly by the pineal gland that helps coordinate sleep and wake timing. Darkness usually increases its release, while light suppresses it; supplements can cause drowsiness and medicine interactions.

Melatonin Receptor

A cell-surface receptor activated by the hormone melatonin. The main types, MT1 and MT2, help regulate the body's sleep-wake clock and seasonal rhythms and are targets of some sleep medicines.

Melatonin Receptor Agonists

Medicines that act like melatonin at receptors involved in the body's sleep-wake clock. They may help some people fall asleep, but choice of treatment depends on the cause of insomnia, other medicines, and health conditions.

MELD

Model for End-Stage Liver Disease, a laboratory-based score used to estimate severity of advanced liver disease and help prioritize adults for liver transplantation. Traditional versions use bilirubin, creatinine, and INR; current implementations may include additional variables.

MELD-Na Score

A version of the Model for End-Stage Liver Disease that includes serum sodium along with bilirubin, creatinine, and INR to estimate short-term mortality in advanced liver disease. Transplant allocation systems and score formulas vary by country and may change over time.

Alternate Names:
MELD-Sodium Score; Sodium-Adjusted MELD

MELD Score

A medical score estimating the severity and short-term risk of death from advanced liver disease. It uses laboratory results and helps guide urgency for liver transplantation; the calculation may vary as official versions are updated.

Melena

Black, sticky, often foul-smelling stool caused by digested blood, usually from bleeding in the stomach or upper intestine. It can signal serious gastrointestinal bleeding.

Melibiose

A disaccharide composed of galactose and glucose, produced by hydrolysis of raffinose and metabolized by some microorganisms.

Melio

An older shortened form related to melioidosis, the infection caused by Burkholderia pseudomallei.

Melioidosis

An infectious disease caused by Burkholderia pseudomallei, usually acquired from contaminated soil or water through inoculation or inhalation. It may cause pneumonia, skin infection, abscesses, sepsis, or chronic disease and is more severe in people with diabetes or other risk factors.

Melitensis

A species designation, especially Brucella melitensis, a bacterium that causes brucellosis and is associated with goats and sheep.

Melitten

Melitten, more commonly spelled melittin, is the principal peptide toxin in honeybee venom. It disrupts cell membranes and contributes to pain, inflammation, hemolysis, and other effects of envenomation.

Melkersson-Rosenthal Syndrome

A rare neuromucocutaneous disorder characterized by the classic clinical triad of recurrent orofacial edema (especially granulomatous cheilitis of the lips), relapsing peripheral facial nerve (CN VII) palsy, and a fissured tongue (lingua plicata).

Alternate Names:
Cheilitis Granulomatosa Triad; Fissured Tongue and Facial Palsy Syndrome

Melorheostosis

A rare sclerosing bone dysplasia producing irregular, flowing cortical hyperostosis on imaging. It may cause pain, stiffness, limb deformity, restricted movement, contractures, or soft-tissue fibrosis and can affect one or several contiguous bones.

Meloxicam

Meloxicam is a nonsteroidal anti-inflammatory drug that inhibits cyclooxygenase enzymes and reduces prostaglandin synthesis. It is used for pain and inflammation, but can cause gastrointestinal, renal, cardiovascular, and hypersensitivity adverse effects.

Melphalan

A chemotherapy medicine that damages cancer cells by interfering with their DNA. It is used for selected blood cancers and other cancers, but can also suppress bone marrow and increase infection or bleeding risk.

Memantine

An NMDA receptor antagonist (uncompetitive, low-to-moderate affinity) used for moderate to severe Alzheimer disease, often added to an acetylcholinesterase inhibitor. Blocks excessive glutamate-mediated excitotoxicity while preserving normal synaptic transmission. Once or twice daily oral.

Memantine Hydrochloride

Memantine hydrochloride is an NMDA-receptor antagonist used to help manage moderate-to-severe Alzheimer disease. It reduces pathologic glutamate-mediated excitotoxicity; common adverse effects include dizziness, headache, constipation, and confusion.

Membrane

A thin sheet of tissue or material that surrounds a cell, organ, or body cavity. Membranes can protect structures, separate spaces, allow selected substances to pass, and produce or absorb fluids.

Membrane Channel

A membrane channel is a protein-forming pore across a cell membrane that permits selected ions or molecules to pass down an electrochemical or concentration gradient. Many channels are gated by voltage, ligands, or mechanical forces.

Membrane Fusion

Membrane fusion is merging of two lipid bilayers into one continuous membrane. It is required for processes such as synaptic vesicle release, enveloped-virus entry, fertilization, and intracellular vesicle trafficking.

Membrane Lipids

Fat-like molecules that form the main structure of cell membranes. They create a flexible barrier, help cells communicate, and provide attachment sites for proteins; abnormal lipid composition can affect signaling and cell function.

Membrane Microdomain

A membrane microdomain is a small, specialized region of a cell membrane with a distinct composition of lipids and proteins. It can organize receptors, signaling molecules, transporters, and cytoskeletal interactions.

Membrane Part

A membrane part is a structural or molecular component of a biological membrane, such as a lipid, protein, carbohydrate, channel, or receptor. These components determine membrane integrity, transport, signaling, and cell recognition.

Membrane Potential

The electrical potential difference across a cell membrane, approximately -70 mV in most neurons (resting membrane potential). Established by the unequal distribution of ions (primarily K+, Na+, Cl-) across the membrane and selective permeability.

Membrane Protein

A protein attached to or embedded in a cell membrane. It may transport substances, receive signals, act as an enzyme, join cells, anchor the cytoskeleton, or help the immune system identify cells.

Membrane Raft

A membrane raft is a cholesterol- and sphingolipid-enriched membrane microdomain that helps cluster selected proteins and signaling molecules. Raft organization is dynamic and may change during receptor signaling or membrane trafficking.

Membranoproliferative Glomerulonephritis

A pattern of kidney-filter damage that can cause blood and protein in the urine, swelling, and reduced kidney function. Causes include immune disorders, infections, and some blood cancers.

Membranous

Relating to, consisting of, or resembling a membrane. In medicine, the term may describe a thin tissue layer or a disease pattern involving such a layer.

Membranous Labyrinth

A continuous system of communicating, endolymph-

filled epithelial sacs and ducts lodged within the bony labyrinth of the inner ear, comprising the cochlear duct (hearing) and the vestibular apparatus (utricle, saccule, and three semicircular ducts for balance and equilibrium).

Membranous Nephropathy

A kidney disease in which the filtering units are injured by immune proteins deposited along their delicate filter. It often causes large amounts of protein in the urine and swelling and may be linked to autoimmune disease, infection, medicines, or cancer.

Memory

The ability to learn, store, and recall information. Memory depends on several connected areas of the brain and can be affected by sleep problems, stress, medicines, injury, illness, aging, or brain disorders.

Memory Cell

A long-lasting B cell or T cell formed after an infection or vaccination. If the same germ is encountered again, memory cells respond faster and more strongly, helping prevent illness or reduce its severity.

Memory Disorder

Impairment of encoding, storage, retrieval, or recognition of information that exceeds normal variation and may result from neurodegeneration, injury, vascular disease, medication, or other causes.

Memory Impairment

Memory impairment is reduced ability to learn, store, retrieve, or recognize information. It may be transient or persistent and can result from normal aging, medications, sleep problems, neurologic disease, psychiatric illness, or other medical conditions.

Memory Loss

Reduced ability to recall past information, form new memories, or both. Causes include normal aging, medicines, head injury, seizures, stroke, infection, substance use, neurocognitive disorders, and psychological conditions; sudden memory loss can occur with serious illness.

Memory Span

The number of items, such as words or digits, that a person can briefly retain and recall, usually in the original order; it is a measure of short-term or working memory.

Memory T Cells And B Cells

Long-lived immune cells that remember earlier exposures and respond faster when they meet the same target again. They support lasting protection after infection or vaccination, though protection may fade.

Alternate Names:
Memory Lymphocytes

MEN 2

Abbreviation; see *Multiple Endocrine Neoplasia Type 2*.

Menarche

The first menstrual period, usually occurring about 2–3 years after breast development. Its timing varies with genetics, nutrition, health, and pubertal progression. Absence of menstruation by age 15 or more than 3 years after breast development began is termed delayed menarche.

Mendelian Inheritance

Inheritance of traits determined by single genes and transmitted according to dominant, recessive, or sex-linked patterns.

Mendelism

The principles of inheritance based on Gregor Mendel's work, including segregation of alleles and independent assortment of genes; Mendelian traits may follow autosomal or X-linked dominant or recessive patterns.

Mendelson Syndrome

A chemical pneumonitis caused by inhalation of acidic stomach contents, classically during anesthesia or childbirth. It can cause cough, breathing

difficulty, and impaired oxygenation.

Menetrier Disease

A rare disorder of the stomach lining, usually affecting the body and fundus (upper part) of the stomach, in which mucus-producing cells overgrow and form unusually large folds. The lining can leak protein into the stomach, lowering blood albumin and sometimes causing swelling; stomach acid is also reduced. Adult disease is often chronic and is associated with an increased risk of stomach cancer, while childhood cases are often temporary.

Alternate Names:
Hypertrophic Protein-Losing Gastropathy; Giant Hypertrophic Gastritis; Ménétrier Disease; Ménétrier's Disease; Ménétrier's Disease

Meniere Disease

An inner-ear disorder that causes repeated attacks of spinning dizziness, often with hearing loss that comes and goes, ringing, and a feeling of fullness in one ear. Attacks can last from 20 minutes to 12 hours.

Alternate Names:
Ménière's Disease; Meniere's Disease; Ménière Disease; Meniere's Syndrome

Meningeal Carcinomatosis

Spread of cancer cells to the thin coverings and fluid around the brain and spinal cord. It may cause headache, nausea, weakness, seizures, vision changes, or problems with movement and is managed according to the primary cancer and extent of spread.

Meningeal Leukemia

Meningeal leukemia is leukemia involving the membranes or fluid around the brain and spinal cord, potentially causing headache, weakness, or cranial-nerve problems.

Meningeal Lymphoma

Meningeal lymphoma is lymphoma affecting the membranes or fluid spaces around the brain and spinal cord.

Meningeal Neoplasm

A meningeal neoplasm is an abnormal growth arising in or near the membranes surrounding the brain and spinal cord.

Meninges

Three protective layers surrounding the brain and spinal cord. Cerebrospinal fluid circulates in the space between the arachnoid and pia mater, cushioning the nervous system; bleeding or infection involving the meninges can be dangerous.

Meningioma

A growth in the thin layers of tissue that cover the brain and spinal cord. Many grow slowly and are noncancerous, but some grow faster or are cancerous. Symptoms depend on whether the growth presses on the brain, spinal cord, or nearby nerves.

Meningioma Pathology

A usually extra-axial tumor showing meningothelial cells in syncytial sheets, whorls, or other patterns, sometimes with psammoma bodies. Histologic grade reflects mitotic activity, invasion, and other atypical or anaplastic features.

Meningism

A syndrome of neck stiffness, headache, and sometimes photophobia or vomiting that resembles meningeal irritation without necessarily indicating meningitis. Causes include serious conditions such as infection or subarachnoid hemorrhage.

Meningismus

Neck stiffness and other signs of irritation around the brain and spinal cord without proven inflammation of those coverings. It can occur with fever, severe headache, dehydration, bleeding, or other illnesses.

Meningitis

Inflammation of the meninges, the protective membranes that surround and cushion the brain and spinal cord. It is most commonly caused by viral or bacterial infections, though fungi, parasites, and non-infectious conditions can also cause it. Char-

acteristic symptoms include a sudden high fever, severe headache, stiff neck, and sensitivity to light. Bacterial meningitis progresses rapidly and is a medical emergency that can lead to permanent hearing loss, brain damage, or death.

Meningocele

Protrusion of the meninges through a defect in the skull or vertebral column, usually forming a sac containing cerebrospinal fluid. In a spinal meningocele, a form of spina bifida, the meninges bulge through an opening in the vertebrae while the spinal cord remains in the spinal canal. The sac may or may not be covered by skin. Neurologic effects vary with associated spinal or nerve abnormalities and are generally less severe than in myelomeningocele.

Meningocele Repair

Surgery to close an opening in the spine and return the protective coverings of the spinal cord to their proper position. It aims to prevent injury or infection; nerve, bladder, bowel, movement, or fluid problems may remain or develop.

Meningococcal Disease

A serious infection caused by Neisseria meningitidis that can produce meningitis or rapidly spreading bloodstream infection. Fever, severe headache, stiff neck, confusion, vomiting, or a purple rash may occur.

Meningococcal Infection

An infection caused by the bacterium Neisseria meningitidis. It may remain mild or cause life-threatening meningitis or bloodstream infection, with fever, headache, stiff neck, vomiting, confusion, or a purple rash developing quickly.

Meningococcal Meningitis

Acute bacterial meningitis caused by *Neisseria meningitidis*. It typically causes fever, headache, and neck stiffness and may occur with meningococcemia, a bloodstream infection that can cause sepsis and a petechial or purpuric rash.

Meningococcemia

Meningococcemia is bloodstream infection with Neisseria meningitidis, causing fever, rash, shock, clotting failure, and potentially fatal sepsis.

Meningococcus

Neisseria meningitidis, a bacterium that can cause meningitis or rapidly spreading bloodstream infection. It spreads through respiratory secretions and may cause fever, headache, rash, shock, or death.

Meningoencephalitis

Inflammation of both the meninges surrounding the brain and the brain tissue itself, usually caused by infection or autoimmune disease. Fever, headache, neck stiffness, confusion, seizures, or reduced consciousness may occur; severe cases can be life-threatening.

Meningomyelocele

A birth defect in which the protective coverings and spinal-cord tissue bulge through an opening in the spine. It can cause weakness or paralysis of the legs and bladder or bowel problems.

Meniscal Allograft Transplantation

Surgery placing a donated meniscus into a knee after substantial loss of the person's own meniscus. It may reduce pain in carefully selected younger patients, but healing is variable and infection, stiffness, graft failure, or later arthritis can occur.

Meniscal Injuries

Tears or other damage to the knee menisci, which are crescent-shaped pieces of cartilage that help distribute load and stabilize the knee. Symptoms may include joint-line pain, swelling, clicking, or restricted motion. Diagnosis is based on examination and, when needed, imaging.

Alternate Names:
Meniscal Injury

Meniscal Tear

A split in one of the two rubbery cartilage pads that cushion the knee. It may follow a twisting injury

or gradual wear and can cause pain along the joint line, swelling, clicking, catching, locking, or a feeling that the knee gives way.

Meniscectomy

An operation that removes part or all of a damaged meniscus, the rubbery pad that cushions the knee. Surgeons usually remove only the torn portion when possible, because preserving meniscus helps protect the joint from later wear.

Meniscus

A crescent-shaped fibrocartilage structure in the knee, or a curved fluid surface in a container.

Meniscus Tear

Alternate name; see *Torn Meniscus*.

Menkes Disease

A rare inherited disorder, usually caused by changes in the *ATP7A* gene, that disrupts the movement of copper through the body. Copper levels become low in the brain and other tissues, affecting the nervous system and growth. Symptoms usually begin in infancy and may include developmental delay or loss of skills, weak muscle tone, seizures, poor growth, and sparse, brittle, or tightly curled hair.

Menkes Kinky Hair Syndrome

An X-linked disorder of copper transport caused by ATP7A dysfunction. It produces progressive neurodegeneration, seizures, developmental delay, hypopigmented or brittle kinky hair, connective-tissue abnormalities, and failure to thrive.

Menogaril

Menogaril is a semisynthetic anthracycline derivative of nogalamycin. It intercalates into DNA and inhibits topoisomerase II, thereby impairing DNA replication and repair; it was investigated as an antineoplastic agent.

Menometrorrhagia

Excessive uterine bleeding occurring both at expected menstrual times and at irregular intervals; the older term corresponds broadly to heavy and irregular menstrual bleeding, which can have an underlying cause.

Menopausal

Relating to menopause or the years around the permanent end of menstrual periods. Hormone changes may cause hot flashes, sleep problems, mood changes, vaginal dryness, and increased bone-loss risk.

Menopausal Hormone Therapy

Treatment with estrogen, with progestogen when needed to protect the uterus, for troublesome hot flashes, night sweats, or vaginal symptoms during menopause. It may affect clot, stroke, breast-cancer, and other risks, so treatment is individualized.

Menopausal Hot Flashes

Alternate name; see *Hot Flashes*.

Menopause

The permanent end of menstrual periods because of loss of ovarian activity, usually diagnosed after 12 consecutive months without menstruation. Hormonal changes may cause hot flashes, night sweats, vaginal symptoms, sleep problems, or other symptoms.

Menopause and Mood Disorders

Mood symptoms can occur during the menopausal transition because of hormonal fluctuation, sleep disruption, vasomotor symptoms, life stress, or an independent depressive or anxiety disorder. Persistent, severe, or suicidal symptoms can indicate a significant mental-health condition; treatment is individualized.

Menopause And Perimenopause

Perimenopause is the transition before menopause, when menstrual periods and hormone levels become irregular. Menopause is reached after 12 consecutive months without a period when no other cause explains it.

Menopause Status

Menopause status describes whether a person is premenopausal, perimenopausal, or postmenopausal. Natural menopause is clinically defined after 12 consecutive months without menstruation when no other cause explains the amenorrhea.

Menopause Syndrome

A nontechnical term for the group of symptoms that may occur during the menopausal transition, such as hot flashes, night sweats, sleep problems, mood changes, vaginal dryness, and menstrual irregularity. Menopause itself is a normal life stage, not a disease.

Menorrhagia

Older term; see *Heavy Menstrual Bleeding*.

Menorrhagia (Heavy Menstrual Bleeding)

Alternate name; see *Heavy Menstrual Bleeding*.

Menotropin

Menotropin is a urinary-derived preparation containing follicle-stimulating and luteinizing hormone activity, used to stimulate follicular development or spermatogenesis; ovarian hyperstimulation and multiple pregnancy are important risks.

Menses Duration

The number of days of menstrual bleeding in a cycle, counted from the first day of bleeding until bleeding stops. Persistently prolonged, heavy, or irregular bleeding can reflect an underlying condition.

Menstrual

Relating to menstruation or the menstrual cycle, including the monthly shedding of the uterine lining and the bleeding that follows. Cycle length and bleeding vary; very heavy, painful, irregular, or unexpected bleeding can have an underlying cause.

Menstrual Cramps

Cramping pain in the lower abdomen during or around menstruation, medically called dysmenorrhea. Pain may radiate to the back or thighs and may occur with nausea, diarrhea, headache, or fatigue. Severe, worsening, or newly developed pain requires evaluation for causes such as endometriosis or fibroids.

Alternate Names:
Dysmenorrhea; Period Pain; Painful Menstruation

Menstrual Cycle

The recurring hormonal and uterine changes that prepare the body for possible pregnancy. Cycle length and bleeding pattern vary among individuals and across life stages.

Menstrual Disorders

Conditions involving abnormal menstrual timing, regularity, duration, amount of bleeding, or pain. They include absent or infrequent periods, irregular cycles, unusually heavy or prolonged bleeding, painful periods, and bleeding between periods or after sex. Causes include pregnancy, hormonal or ovulatory disorders, fibroids, endometriosis, thyroid disease, medicines, structural abnormalities, and perimenopause; persistent, heavy, or unexpected bleeding can reflect an underlying disorder.

Menstruation

The periodic shedding of the endometrial lining as part of the menstrual cycle when pregnancy does not occur. The timing, duration, and amount of bleeding vary with age, hormonal state, medicines, and health conditions.

Alternate Names:
Menorrhea

Menstruation Disturbance

Alternate name; see *Menstrual Disorders*.

Mental

Relating to thinking, memory, emotion, behavior, or other functions of the mind. It does not by itself mean that a condition is psychiatric.

Mental Age

An estimate of cognitive functioning expressed as the age level at which a standardized test score is typical; it is not the same as chronological age.

Mental Disorder

A clinically significant syndrome or psychological and behavioral pattern characterized by a prominent disturbance in an individual's cognition, emotional regulation, or behavior that reflects a dysfunction in the psychological, biological, or developmental processes underlying mental and behavioral functioning. Diagnostic classification systems (such as the DSM-5-TR and ICD-11) require that the symptoms cause clinically significant subjective distress or impairment in personal, social, occupational, educational, or other important areas of functioning, and are not an expectable or culturally sanctioned response to a common stressor or loss (such as normal bereavement). Major categories include neurodevelopmental disorders, schizophrenia spectrum and other psychotic disorders, bipolar and related disorders, depressive disorders, anxiety disorders, obsessive-compulsive disorders, trauma- and stressor-related disorders, personality disorders, and substance use disorders. Etiology is multifactorial, best conceptualized through the biopsychosocial model integrating genetic vulnerability, neurochemical dysregulation, structural brain circuitry alterations, environmental adverse experiences, and psychological factors.

Mental Disorders

Plural form; see *Mental Disorder*.

Mental Disorders In Children

Mental disorders in children involve persistent, developmentally atypical disturbances in mood, thinking, behavior, or functioning that cause clinically significant distress or impairment. Symptoms must be interpreted in relation to the child's developmental stage and distinguished from normal variation, temporary reactions, and age-appropriate behavior.

Mental Fatigue

Mental fatigue is a subjective feeling of reduced mental energy, concentration, or cognitive endurance after sustained effort or illness. Persistent or severe symptoms may accompany sleep disorders, depression, neurologic disease, medication effects, or other medical conditions.

Mental Health

Mental health encompasses emotional, psychological, and social well-being, affecting how individuals think, feel, behave, and handle stress, relationships, and decision-making.

Mental Health Crisis

A period of severe emotional, behavioral, or psychological distress in which a person's usual ability to cope or maintain safety is overwhelmed. It may involve suicidal thoughts, severe agitation, psychosis, substance intoxication, or inability to care for basic needs; it may or may not meet criteria for a psychiatric emergency.

Mental Illness

A broad, commonly used term for mental disorders and related conditions affecting mood, thinking, behavior, perception, or daily functioning. See *Mental Disorder*.

Mental Illness In Children

Broad, commonly used term; see *Mental Disorders In Children*.

Mental Process

A mental process is a cognitive or affective activity of the mind, such as perception, attention, memory, reasoning, language, emotion, or decision-making.

Mental Recall

Mental recall is retrieval of previously learned or stored information from memory. It may be assessed by asking a person to remember facts, events, words, or experiences after a delay.

Mental Status Examination

A structured part of a clinical interview that assesses a person's appearance, behavior, speech, mood, thinking, perceptions, attention, memory, awareness, judgment, and understanding of their condition.

Mental Status Testing

A structured assessment of appearance, behavior,

alertness, orientation, attention, memory, language, thought, perception, mood, insight, and judgment.

Mentation

The process of thinking, perceiving, reasoning, and other mental activity.

Menthol

A mint-derived or synthetic compound producing a cooling sensation and used in some topical and respiratory preparations.

Menthol Poisoning

Poisoning after swallowing, inhaling, or having substantial skin exposure to menthol. It may cause nausea, abdominal pain, dizziness, drowsiness, agitation, seizures, coma, or breathing problems.

Mepacrine

An older antimalarial and antiprotozoal medicine, also called quinacrine, now used only in selected indications.

Meperidine

An opioid analgesic, also called pethidine, whose use is limited by adverse effects and an active neurotoxic metabolite.

Meperidine Hydrochloride

Meperidine hydrochloride is the hydrochloride salt of the opioid analgesic meperidine. It produces analgesia through opioid-receptor activity and carries risks of sedation, respiratory depression, seizures, dependence, and serotonin toxicity with interacting drugs.

Meperidine Hydrochloride Overdose

Taking too much meperidine hydrochloride, an opioid, can cause extreme sleepiness, pinpoint pupils, slow or stopped breathing, low blood pressure, seizures, or coma. Delayed toxicity and serotonin toxicity are possible, so emergency assessment is required.

Mephenesin

An older centrally acting muscle relaxant with sedative effects. It is rarely used now and can impair alertness, coordination, and breathing when combined with other sedatives.

Mephentermine

A stimulant medicine formerly used in selected situations to raise dangerously low blood pressure. It increases activity of certain adrenaline-like receptors and can cause fast heartbeat, anxiety, or abnormal heart rhythms.

Mephenytoin

Mephenytoin is a hydantoin anticonvulsant formerly used to treat seizures. It is metabolized partly to ethotoin and has limited modern use because of potentially serious adverse effects, including hypersensitivity and blood dyscrasias.

Mepivacaine

A local anesthetic medicine that temporarily blocks pain signals from nerves. It is injected for numbing skin, dental areas, individual nerves, or larger body regions during procedures.

Meprobamate

An older medicine that reduces anxiety and causes sleepiness. It can cause dependence, dangerous breathing and nervous-system depression, and overdose, especially with alcohol or other sedatives, so it is rarely used today.

Meprobamate Overdose

Taking too much meprobamate can cause severe drowsiness, confusion, poor coordination, low blood pressure, slowed breathing, coma, or death. Alcohol and other sedatives increase the danger.

Mepyramine

An antihistamine that blocks H1 receptors and may cause sedation.

Alternate Names:
Pyrilamine

Meralgia Paresthetica

Burning, tingling, or numbness over the outer thigh caused by compression of the lateral femoral cutaneous nerve.

Alternate Names:
Burning Thigh Pain; Bernhardt-Roth Syndrome

Merbromin Poisoning

Poisoning from merbromin, an older mercury-containing antiseptic. Swallowing or repeated exposure may injure the mouth, stomach, kidneys, or nervous system; the amount and route determine risk and require poison-control or medical assessment.

Mercaptopurine

A thiopurine antimetabolite used in selected leukemias and inflammatory disorders, requiring monitoring for marrow and liver toxicity.

Mercurialism

Long-term poisoning caused by mercury exposure. It may damage the nervous system, kidneys, digestive tract, mouth, or mental health, with effects depending on the mercury form, dose, and exposure duration.

Mercuric Chloride Poisoning

Severe poisoning from mercuric chloride, a corrosive inorganic mercury salt. It can burn the mouth and digestive tract and cause vomiting, bloody diarrhea, shock, kidney failure, or neurologic injury; emergency treatment is required.

Mercuric Oxide Poisoning

Poisoning from mercuric oxide, an inorganic mercury compound that can irritate or burn tissues and damage the kidneys and nervous system. Swallowing or inhalation can cause severe poisoning.

Mercury

A metal used in some industrial and laboratory products. Its chemical symbol is Hg; mmHg denotes millimeters of mercury, a unit of pressure. Exposure can harm the nervous system, kidneys, lungs, or digestive tract, so it must be handled and disposed of safely.

Alternate Names:
Hg

Mercury Poisoning

Illness caused by exposure to elemental, inorganic, or organic mercury. Effects depend on the form and dose and may include nerve, kidney, lung, or digestive injury; severe exposure can cause lasting harm.

Meridian

A reference line or plane; in traditional acupuncture it denotes a proposed pathway for qi, while in anatomy it may describe a longitudinal line.

Merkel Cell Carcinoma

A rare, fast-growing neuroendocrine cancer of the skin. It often appears as a firm, painless red, purple, or skin-colored lump, usually on sun-exposed skin. Some cases are associated with Merkel cell polyomavirus; others are linked to ultraviolet damage. Older age and a weakened immune system increase risk.

Alternate Names:
MCC; Neuroendocrine Carcinoma of the Skin

Merkel Cells

Specialized touch-sensing cells in the deepest layer of the skin that help detect light touch and sustained pressure.

Mermaid Syndrome

An extremely rare congenital anomaly in which the legs are fused to varying degrees, also called sirenomelia.

Meropenem

Meropenem is a broad-spectrum carbapenem antibiotic that inhibits bacterial cell-wall synthesis and treats severe susceptible infections, including meningitis; allergy, gastrointestinal effects, seizures, and resistance are possible.

Meropenem-Vaborbactam

An intravenous antibiotic combination used for some serious infections caused by bacteria resistant to many other antibiotics. The choice depends on laboratory susceptibility testing, infection site, kidney function, and local guidance.

MERRF Syndrome

A rare inherited disorder affecting how cells produce energy. It commonly causes muscle jerks, seizures, balance problems, and muscle weakness, and may also affect hearing, vision, or other organs.

MERS-CoV

Middle East respiratory syndrome coronavirus, the virus that causes MERS. Infection can cause fever and respiratory illness ranging from mild disease to severe pneumonia, especially in people with other health conditions.

Merthiolate Poisoning

Poisoning from merthiolate, commonly referring to the mercury-containing antiseptic thimerosal. Small skin exposures usually cause local irritation, but swallowing or repeated exposure may cause corrosive, kidney, or neurologic injury.

Merycism

Rumination, the repeated regurgitation and rechewing of food after eating.

Mesalamine

Mesalamine, or 5-aminosalicylic acid, is an anti-inflammatory drug used to induce and maintain remission in ulcerative colitis and some other inflammatory bowel conditions. It acts mainly topically in the intestinal mucosa and can rarely affect renal function.

Mesangial Cell

Specialized contractile pericyte-like cells located in the central stalk (mesangium) of the renal glomerulus between capillary loops, responsible for phagocytosing macromolecules, synthesizing mesangial matrix, and contracting in response to angiotensin II to regulate glomerular capillary filtration surface area.

Mesangiolysis

Mesangiolysis is dissolution or disruption of the mesangial tissue within a renal glomerulus. It may occur in severe endothelial injury and can be associated with microvascular lesions and glomerular capillary aneurysmal changes.

Mesangium

The mesangium is the supportive tissue between glomerular capillary loops, composed of mesangial cells and extracellular matrix. Mesangial cells provide structural support, regulate capillary flow, and clear certain substances; abnormal expansion occurs in several glomerular diseases.

Mescaline

A naturally occurring psychedelic substance found in certain cacti that alters perception and may cause hallucinations and autonomic effects.

Mesencephalon

The mesencephalon, or midbrain, is the part of the brainstem between the pons and diencephalon. It contains pathways and nuclei involved in eye movements, motor control, arousal, and auditory and visual reflexes.

Mesenchymal Cell

A connective-tissue precursor that can develop into bone, cartilage, fat, muscle, or tendon cells.

Mesenchymal Chondrosarcoma

Mesenchymal chondrosarcoma is a rare aggressive cancer containing cartilage-forming tissue, often arising in bone or soft tissue.

Mesenchymal CNS Tumor

A rare tumor arising from connective or supporting tissue in or around the brain or spinal cord rather than from nerve cells. Its behavior is determined by examination of tissue, imaging, and sometimes genetic testing.

Mesenchyme

Embryonic connective tissue that gives rise to much of the skeleton, connective tissue, blood vessels, and smooth muscle.

Mesenchymoma

A mesenchymoma is a rare tumor containing more than one type of mesenchymal tissue, sometimes including cartilage, bone, fat, or vascular elements. Behavior depends on the site, age, histology, and presence of malignant components.

Mesenteric

Relating to the mesentery, a fold of tissue supporting the intestines. It contains blood vessels, nerves, lymph vessels, and fat that help supply, drain, anchor, and protect the intestines.

Mesenteric Angiography

Contrast imaging of the arteries supplying the intestines, used to evaluate mesenteric ischemia, bleeding, aneurysm, stenosis, occlusion, or vascular anatomy.

Mesenteric Artery

A mesenteric artery supplies blood to portions of the intestine and associated abdominal organs. The superior and inferior mesenteric arteries are the major vessels; obstruction or embolism can cause acute mesenteric ischemia.

Mesenteric Artery Aneurysm

An abnormal bulge in an artery supplying the intestines. It may cause no symptoms, but rupture can cause severe internal bleeding, and clotting or reduced blood flow can injure the bowel.

Mesenteric Artery Ischemia

Inadequate blood flow through the mesenteric arteries, usually caused by embolism, thrombosis, or severe low-flow states. Acute disease presents with severe abdominal pain out of proportion to examination and can progress to bowel infarction.

Mesenteric Artery Occlusion

A blockage in an artery that carries blood to the intestines. It may be caused by a blood clot or severe narrowing. A sudden blockage can quickly cut off blood flow to the bowel and cause a life-threatening emergency called acute mesenteric ischemia.

Mesenteric Cyst

A rare, usually noncancerous, fluid-filled sac in the tissue that supports the intestines. Small cysts may cause no symptoms, while larger ones can cause swelling, pain, infection, twisting, or bowel blockage. Imaging helps locate the cyst, and treatment depends on its size, symptoms, and cause.

Mesenteric Ischemia

Reduced blood flow to the intestines, usually from a blocked or narrowed blood vessel. Sudden blockage may cause severe abdominal pain, often with little tenderness at first, nausea, vomiting, diarrhea, or bloody stool, and is a medical emergency. Long-term narrowing may cause cramping pain after meals, fear of eating, and weight loss. Severe or untreated disease can lead to bowel death, infection, or shock.

Mesenteric Lymphadenitis

Inflammation of lymph nodes in the tissue supporting the intestines, often after a viral or bacterial infection. It can cause right-sided abdominal pain, fever, nausea, and tenderness and may resemble appendicitis.

Alternate Names:
Mesenteric Adenitis

Mesenteric Lymph Nodes

Lymph nodes in the tissue that supports the intestines. They filter lymph from the bowel and help the immune system respond to infection or other abnormal changes.

Mesenteric Veins

Mesenteric veins drain blood from the small and large intestines and carry it mainly through the superior and inferior mesenteric veins to the portal venous system. Thrombosis or impaired flow can

cause intestinal congestion and ischemia.

Mesenteric Venous Thrombosis

A blood clot in a mesenteric vein that impairs intestinal venous drainage and can cause abdominal pain, bowel edema, ischemia, infarction, or gastrointestinal bleeding.

Mesentery

A fold of the abdominal lining that attaches the intestines to the back wall of the abdomen. It carries blood vessels, nerves, and lymph vessels to the bowel and helps hold the intestines in place.

Mesh

A sheet-like implant made from synthetic or biological material that reinforces weakened tissue. It may be used in selected hernia or pelvic-floor operations; possible problems include pain, infection, scarring, movement of the implant, or injury to nearby organs.

Mesial

Located toward the body's midline; in dentistry, located toward the front or midline of a tooth. The term helps describe tooth surfaces, positions, cavities, gum disease, and dental restorations.

Mesial Surface

The mesial surface is the surface of a tooth or other structure oriented toward the midline. In dentistry, mesial surfaces contact adjacent teeth and can be involved in caries, periodontal disease, or restoration margins.

Mesna

A protective medicine given with certain chemotherapy drugs to reduce irritation and bleeding of the bladder. It binds harmful breakdown products in the urine and does not treat the cancer itself.

Mesoderm

The middle germ layer in an embryo, which develops into muscles, bones, cartilage, blood vessels, and the kidneys.

Mesometrium

The portion of the broad ligament of the uterus that extends from the lateral uterus toward the pelvic wall and contains associated vessels, nerves, and connective tissue.

Mesonephric

Mesonephric means relating to the mesonephros, a temporary embryonic kidney, or to structures derived from its ducts and tubules. Mesonephric remnants can give rise to uncommon benign or malignant lesions of the genital tract.

Mesonephric Adenocarcinoma

A rare HPV-independent cervical adenocarcinoma arising from mesonephric remnants, usually presenting as a cervical mass or abnormal bleeding and requiring histopathologic diagnosis.

Mesonephric Tumor

A mesonephric tumor is a rare tumor arising from remnants of embryonic mesonephric ducts, usually in the female reproductive tract.

Mesothelial Neoplasm

A mesothelial neoplasm is a growth arising from the lining of body cavities, such as the pleura, peritoneum, or pericardium.

Mesothelin

Mesothelin is a cell-surface glycoprotein expressed mainly by mesothelial cells and overexpressed in several cancers, including mesothelioma and some ovarian and pancreatic cancers. It is being studied as a biomarker and therapeutic target.

Mesothelioma

A cancer arising from the thin lining of body cavities, most often the pleura around the lungs. It is strongly associated with asbestos exposure and may cause chest pain, breathlessness, or fluid around the lung.

Mesothelium

The mesothelium is a single layer of specialized cells

lining serous body cavities and covering their organs, including the pleura, peritoneum, and pericardium. It produces lubricating fluid and participates in inflammation and repair.

Messenger RNA

A temporary copy of genetic instructions made from DNA. It carries those instructions to cell structures that build proteins and is then broken down; some vaccines use messenger RNA to teach the immune system to recognize a target.

Met

Abbreviation for methionine, an essential sulfur-containing amino acid; it is also represented by the one-letter code M and the codons AUG.

Metabolic

Relating to metabolism, the chemical processes by which cells produce and use energy and materials.

Metabolic Acidosis

An acid-base imbalance in which too much acid accumulates in the body, or too much bicarbonate (a base) is lost, causing the blood to become excessively acidic. It can be caused by increased production of metabolic acids (such as in uncontrolled diabetes or severe oxygen deprivation), kidney failure preventing normal acid excretion, or loss of bicarbonate from severe, prolonged diarrhea.

Metabolic Alkalosis

An acid-base imbalance in which the blood becomes abnormally alkaline due to an excess of bicarbonate or an excessive loss of hydrogen ions (acid). It most commonly occurs after prolonged vomiting or stomach suctioning, which removes large amounts of stomach acid, or from the use of certain diuretic medications that cause the kidneys to lose fluid and electrolytes.

Metabolic Bone Disease

A group of disorders in which abnormal handling of calcium, phosphate, vitamin D, parathyroid hormone, or other factors weakens or changes bone. Examples include osteomalacia, rickets, and some disorders caused by kidney or endocrine disease.

Metabolic Bone Disease of Prematurity

Reduced bone mineral density and defective postnatal skeletal mineralization in very-low-birth-weight or extremely preterm infants. Results from inadequate accretion of calcium, phosphorus, and vitamin D typically transferred during the third trimester, exacerbated by prolonged total parenteral nutrition or diuretic therapy.

Alternate Names:
Osteopenia of Prematurity; Metabolic Bone Disease in Preterm Infants

Metabolic Disease

A disorder that changes how the body processes or uses substances such as sugars, fats, proteins, minerals, or hormones. It may be inherited or acquired and can affect energy, growth, blood chemistry, or organ function.

Metabolic Disorders

Alternate plural form; see *Metabolic Disease*.

Metabolic Dysfunction

Impairment in one or more biochemical processes by which the body produces, stores, or uses energy and materials. The phrase is descriptive rather than a single diagnosis; its meaning depends on the affected pathway and clinical context, such as glucose or lipid metabolism.

Metabolic Dysfunction-Associated Steatohepatitis

A form of metabolic dysfunction-associated steatotic liver disease (MASLD) in which liver fat is accompanied by inflammation and liver-cell injury, with or without fibrosis. It was formerly called nonalcoholic steatohepatitis (NASH).

Alternate Names:
MASH; Nonalcoholic Steatohepatitis (historical name)

Metabolic Dysfunction-Associated

Steatohepatitis (MASH)

Alternate name; see *Metabolic Dysfunction-Associated Steatohepatitis*.

Metabolic Dysfunction-Associated Steatotic Liver Disease

A condition in which fat builds up in the liver in the presence of at least one cardiometabolic risk factor, such as obesity, type 2 diabetes, or abnormal blood fats. It includes simple steatosis and steatohepatitis (MASH) and was formerly called nonalcoholic fatty liver disease (NAFLD).

Alternate Names:
MASLD; Nonalcoholic Fatty Liver Disease (historical name)

Metabolic Equivalent of Task

A physiological measure expressing the energy cost of physical activities, defined as the ratio of metabolic rate during activity to resting metabolic rate, standardized as the consumption of 3.5 mL of oxygen per kilogram of body weight per minute (1 MET).

Alternate Names:
MET

Metabolic Equivalents

Units that compare the energy used during an activity with the energy used while resting. They provide a rough estimate of exercise intensity, but actual energy use varies between people.

Alternate Names:
METs

Metabolic Myopathies

Muscle disorders caused by impaired energy metabolism, often producing exercise intolerance, cramps, weakness, muscle pain, or episodes of rhabdomyolysis.

Metabolic Neuropathies

Nerve damage caused by a metabolic or systemic disorder, such as diabetes, kidney failure, vitamin deficiency, or an inherited metabolic disease. Symptoms commonly include numbness, burning pain, tingling, weakness, or problems with balance.

Metabolic Rate

The speed at which the body uses energy to keep organs working and support activity. It changes with body size, age, muscle amount, hormones, illness, temperature, food intake, and exercise.

Metabolic Response

A metabolic response is a change in energy use, substrate metabolism, or biochemical pathways in response to conditions such as fasting, exercise, infection, trauma, or medication. The response may be adaptive or contribute to illness when excessive or prolonged.

Metabolic Syndrome

A group of risk factors that raises the risk of cardiovascular disease and type 2 diabetes. It is diagnosed when at least three of these are present: increased waist circumference, high blood pressure, high blood glucose, high triglycerides, or low HDL cholesterol. Cutoffs for waist size and some laboratory values vary by guideline and population.

Alternate Names:
Insulin Resistance Syndrome; Syndrome X

Metabolic Tumor Volume

The estimated amount of tumor tissue that shows increased activity on a PET scan. It can help measure disease burden and treatment response, especially in lymphoma, but inflammation and scan technique can affect the result.

Metabolism

The chemical processes cells use to turn food and medicines into energy and building materials, and to break down substances the body no longer needs.

Metabolite

A substance made, changed, or used when the body processes a medicine, nutrient, or naturally occurring molecule. Measuring metabolites in blood or urine can show body function, disease, or drug effects.

Metabolomics

The comprehensive analysis of small molecules (metabolites) in a cell, tissue, biological fluid, or organism under defined conditions. Techniques such as mass spectrometry and nuclear magnetic resonance are used to characterize metabolic state and changes associated with disease, exposures, or treatment.

Metacarpal

One of the five cylindrical tubular long bones of the hand, numbered I through V from the radial (lateral) to ulnar (medial) aspect: first metacarpal (thumb), second (index finger), third (middle finger), fourth (ring finger), and fifth (little finger). Anatomically each metacarpal features a concave proximal base articulating with the distal carpal bones (carpometacarpal joints) and adjacent metacarpals, an elongated longitudinally curved shaft providing attachment for the dorsal and palmar interosseous muscles, and a convex distal rounded head articulating with the proximal phalanges (metacarpophalangeal [MCP] joints). Metacarpal fractures are frequent orthopedic injuries, classically including the 'boxer fracture' (fracture of the neck of the fifth metacarpal from direct axial impact) and intra-articular fractures of the thumb metacarpal base (Bennett and Rolando fractures).

Metacarpal Bone

A metacarpal bone is one of the five long bones of the hand between the wrist bones and the proximal phalanges. Each has a base, shaft, and head; fractures can affect alignment, grip, and joint function.

Metacarpals

Plural form; see *Metacarpal*.

Metacarpophalangeal Joint

A knuckle joint connecting a palm bone to a finger or thumb bone. It allows the digit to bend, straighten, and move from side to side and can be injured by impact or twisting.

Metacarpophalangeal Joint Dislocation

Displacement of a finger or thumb's metacarpophalangeal joint, usually after trauma or forced hyperextension. Pain, deformity, swelling, and restricted movement occur; associated fractures, tendon injury, or neurovascular damage must be assessed.

Metacarpus

The part of the hand between the wrist and fingers, containing the five metacarpal bones.

Metachromatic Leukodystrophy

A rare inherited disorder in which harmful fatty substances build up in nerve cells and damage the protective covering of nerves. It causes worsening movement, thinking, speech, or vision problems, often beginning in childhood.

Metaflammation

Low-grade, persistent inflammation in metabolic tissues associated with excess nutrients and energy. It can involve adipose tissue, liver, muscle, pancreas, and other organs, and is linked to obesity-related insulin resistance and other metabolic dysfunction.

Alternate Names:
Metabolic Inflammation; Metainflammation

Metagenomics

The analysis of genetic material, usually DNA, recovered directly from a mixed biological or environmental sample, typically to characterize the organisms present and the genes they carry without culturing each organism. Gene content can indicate a community's functional potential but does not by itself show which genes are active.

Metagenomics Test

A laboratory test that sequences genetic material in a patient sample to look for microbes without targeting a specific organism. Contamination or harmless microbes can affect results, and a negative result does not rule out infection.

Metagonimus Yokogawai

Metagonimus yokogawai is a small intestinal fluke acquired by eating raw or inadequately cooked freshwater fish. Infection can cause abdominal symptoms and, rarely, ectopic migration of eggs or adult

worms.

Metal Artifact

Distortion or loss of detail on an X-ray, CT, or MRI image caused by metal such as an implant, clip, or bullet. It can hide nearby findings, so special imaging methods or another test may be needed.

Metal Fume Fever

A short-lived influenza-like illness caused by inhalation of fumes from heated metals, especially zinc; symptoms include fever, chills, headache, muscle aches, and cough.

Metalloendopeptidase

A metalloendopeptidase is an endopeptidase whose catalytic activity depends on a bound metal ion, commonly zinc. It cleaves peptide bonds within proteins and includes enzymes involved in extracellular matrix remodeling and signaling.

Metalloporphyrins

Metalloporphyrins are porphyrin molecules containing a centrally coordinated metal ion. Heme, which contains iron, is a biologically important example and forms the functional group of hemoglobin, myoglobin, and many enzymes.

Metalloprotease

A metalloprotease is a proteolytic enzyme that requires a metal ion, commonly zinc, for catalytic activity. Metalloproteases regulate extracellular matrix turnover, cell signaling, inflammation, and tissue remodeling; dysregulation contributes to disease.

Metalloprotein

A protein that contains a metal ion or binds one tightly as part of its structure or function. Iron, zinc, copper, and magnesium in metalloproteins support oxygen transport, enzyme activity, electron transfer, or regulation.

Metallothionein

Metallothionein is a small, cysteine-rich protein that binds metals such as zinc, copper, and cadmium. It helps regulate essential metals and may protect cells from metal toxicity and oxidative stress.

Metanephrine

Metanephrine is a metabolite of epinephrine formed mainly by catechol-O-methyltransferase. Plasma or urinary metanephrine measurements are used in evaluation for catecholamine-secreting tumors such as pheochromocytoma and paraganglioma.

Metaphase

The stage of cell division in which chromosomes align at the cell's equatorial plane.

Metaphase Plate

The metaphase plate is the plane at the center of a dividing cell where chromosomes align during metaphase. It is a geometric arrangement rather than a discrete anatomical structure.

Metaphyseal Corner Fractures

Small corner or bucket-handle breaks near the growth plates of an infant's long bones. They are highly concerning for forceful injury, especially when multiple or at different healing stages, but must be interpreted with the full medical and imaging assessment.

Metaphyseal Widening

Metaphyseal widening is enlargement of the growth-plate or metaphyseal region of a developing long bone. It may be seen in disorders such as rickets, skeletal dysplasia, infection, or healing injury and must be interpreted with imaging and clinical findings.

Metaphysis

The wider part of a growing long bone between its shaft and end. In children it lies next to the growth plate, where new bone forms and the bone lengthens.

Metaplasia

A usually reversible change in which one mature

cell type is replaced by another that better tolerates ongoing irritation or stress. Some persistent forms may increase the risk of further abnormal changes.

Metaplastic Carcinoma

A cancer whose cells have changed to resemble a different type of tissue. The term is used especially for an uncommon, often aggressive breast cancer; diagnosis requires examination of a tissue sample.

Metapneumovirus

A respiratory virus that can cause cough, fever, bronchiolitis, or pneumonia, especially in infants, older adults, and people with chronic disease.

Metastasectomy

Surgery to remove one or more cancer deposits that have spread from the original tumor. It may help selected people when the deposits are limited and removable, but benefit depends on the cancer type, location, and other treatment options.

Metastases To The Breast

Secondary malignant deposits in breast tissue from a nonmammary primary tumor, most often melanoma, lymphoma, or carcinoma from another organ. Imaging and biopsy are needed because the treatment differs from primary breast carcinoma.

Metastasis

The spread of cancer from where it first started to another part of the body, where it forms a new tumor. Cancer cells can travel through the blood or lymph system. A tumor formed this way contains the same type of cancer as the original.

Metastasis-Free Survival

The length of time after treatment before cancer spreads to a distant part of the body or the person dies. Researchers use it to compare treatments and estimate how well they delay spread.

Metastasis Of Colorectal Cancer

Spread of cancer from the colon or rectum to another part of the body, most often the liver, lungs, or abdominal lining. Symptoms and treatment depend on the sites involved, number of tumors, and tumor test results.

Metastatic Adenocarcinoma

A gland-forming cancer that has spread from where it began to distant organs such as the liver, lungs, bones, or brain. Identifying the original site is important because treatment depends on its origin and spread.

Metastatic Brain Tumor

A metastatic brain tumor is cancer that has spread to the brain from a primary tumor elsewhere in the body.

Metastatic Breast Cancer

Breast cancer that has spread beyond the breast and nearby lymph nodes to distant sites, commonly bone, lung, liver, or brain. It may be present at first diagnosis or develop as a distant recurrence after earlier treatment; a tumor in another organ remains breast cancer. This is stage IV disease. Treatment may control the cancer and symptoms; choices depend on biopsy and biomarker results, disease sites, previous treatment, and the person's goals.

Metastatic Calcification

Deposition of calcium salts in previously normal tissues, usually when calcium and phosphate levels in blood are abnormally high. It may affect the kidneys, lungs, stomach, or blood vessels and impair their function.

Metastatic Cancer

Cancer that has spread from its original site to distant organs or tissues through the blood, lymphatic system, or body cavities. Many cancer types classify distant spread as stage IV, but staging rules vary by cancer. Metastatic tumors retain the features of the original cancer; for example, breast cancer that spreads to the lung remains metastatic breast cancer.

Metastatic Cervical Lymphadenopathy

Cancer that has spread from another site to one or more lymph nodes in the neck. A neck lump may be the first sign; the source of the cancer is assessed with examination and tests such as imaging or biopsy.

Metastatic Cancer With Unknown Primary Site

Cancer proven to have spread but for which the original primary tumor cannot be identified after appropriate evaluation. Pathology, immunohistochemistry, imaging, and molecular testing may suggest the origin and guide site-directed or empiric treatment.

Metastatic Bone Disease Of The Hip

Cancer that has spread to bone around the hip, such as the pelvis or upper thighbone. It may cause pain or weaken the bone enough to fracture; see also *Bone Metastases*.

Metastatic Castration-Resistant Prostate Cancer

Prostate cancer that has spread and continues growing despite treatment that lowers male hormones. Care may include hormone-targeting medicines, chemotherapy, radiation, immune treatment, or medicines for bone protection.

Metastatic Colon Cancer

Colon cancer that has spread beyond the bowel, most often to the liver, lungs, or abdominal lining. Symptoms and treatment depend on where it has spread, the tumor's genetic findings, and the person's overall health.

Metastatic Colorectal Cancer

Alternate name; see *Colorectal Cancer*.

Metastatic Inguinal Lymphadenopathy

Enlargement of lymph nodes in the groin because cancer cells have spread to them, often from the leg, genital area, lower abdomen, or anus. Examination and imaging help identify the original cancer and its extent.

Metastatic Lung Cancer

Lung cancer that has spread beyond the lungs to organs such as the brain, bones, liver, or adrenal glands. Treatment depends on the cancer type, molecular findings, areas affected, and overall health.

Metastatic Melanoma

Melanoma that has spread from its original site to nearby lymph nodes, skin or tissue along lymphatic pathways, or distant parts of the body. Distant spread may involve the lungs, liver, brain, bones, or distant lymph nodes.

Metastatic Pleural Tumor

A cancer deposit in the thin lining around the lung that has spread from another tumor, often from the lung, breast, or digestive tract. It may cause chest pain, breathlessness, or fluid around the lung.

Metastatic Spinal Tumor

Alternate name; see *Spinal Metastasis*.

Metastin

Metastin is an older name for kisspeptin, a peptide derived from the KISS1 gene. It stimulates hypothalamic gonadotropin-releasing hormone secretion and helps regulate puberty, reproductive function, and tumor-cell signaling.

Metatarsal

One of the five elongated long bones of the forefoot, designated I through V from the medial (great toe) to lateral (little toe) margin of the foot. Each metatarsal consists of a wedge-shaped proximal base articulating with the tarsal bones (medial, intermediate, and lateral cuneiforms, and cuboid at the tarsometatarsal or Lisfranc joint complex), a narrow longitudinally arched shaft that contributes to the medial and lateral longitudinal arches and transverse arch of the foot, and a rounded distal head that articulates with the proximal phalanges at the metatarsophalangeal (MTP) joints. Common clinical pathologies include stress fractures ('march fractures', typically involving the neck of the second or third metatarsal from repetitive mechanical

loading), avulsion and transverse fractures of the fifth metatarsal base (pseudo-Jones and Jones fractures), and Freiberg disease (avascular necrosis of the second metatarsal head).

Metatarsal Bone

A metatarsal bone is one of the five long bones of the forefoot between the tarsal bones and proximal phalanges. Metatarsal fractures and alignment abnormalities can affect weight bearing and gait.

Metatarsalgia

Pain in the front or ball of the foot, often arising from pressure or irritation around the metatarsal heads.

Metatarsals

Plural form; see *Metatarsal*.

Metatarsal Valgus

Metatarsal valgus is outward deviation of one or more metatarsal bones relative to the foot's normal axis. It may contribute to forefoot deformity and altered load distribution and is assessed clinically and radiographically.

Metatarsophalangeal Joint

A joint between a metatarsal bone of the foot and the first bone of a toe. It helps the toes bend and supports walking.

Metatarsus

The part of the foot between the tarsal bones and toes, containing the five metatarsal bones.

Metatarsus Adductus

A foot deformity in which the forefoot is angled inward relative to the hindfoot, often recognized in infancy and ranging from flexible to rigid.

Metatarsus Varus

Metatarsus varus is inward deviation of the forefoot caused by medial angulation of the metatarsal bones. It is often recognized in infancy and may be flexible or rigid; management depends on severity and persistence.

Metencephalon

The metencephalon is the embryonic brain region that develops into the pons and cerebellum. These structures participate in motor coordination, balance, cranial-nerve functions, and relay of signals between the brain and spinal cord.

Meteorism

Abdominal distension caused by excessive gas in the gastrointestinal tract.

Meter

A metric unit of length equal to 100 centimeters; medical usage may also refer to a measuring device.

Metered-Dose Inhaler

A pressurized inhaler that releases a measured amount of medicine as a spray. Correct timing and breathing are needed for the medicine to reach the lungs; a spacer can make use easier and improve delivery.

Metestrus

The stage of the reproductive cycle after ovulation in many mammals, when the corpus luteum develops and progesterone rises. The exact timing and biological features differ among species.

Metformin

A commonly used medicine for type 2 diabetes that lowers the amount of sugar made by the liver and helps the body use insulin better. Nausea or diarrhea are common; serious illness or severe kidney problems increase rare toxicity risk.

Metformin Hydrochloride

Metformin hydrochloride is the hydrochloride salt of metformin, an oral biguanide used chiefly for type 2 diabetes. It lowers blood glucose without directly stimulating pancreatic insulin release and is available in immediate- and extended-release formulations.

Metformin In Prediabetes

Metformin may reduce progression from prediabetes to type 2 diabetes, especially in people at high risk. Its use depends on age, body size, prior gestational diabetes, kidney function, other conditions, and patient preference; lifestyle intervention remains important.

Methacholine Challenge Test

A breathing test used when asthma is suspected but routine breathing tests are normal. The person inhales increasing amounts of methacholine, which can narrow sensitive airways; breathing is measured after each dose under medical supervision.

Methacholine Chloride

Methacholine chloride is a muscarinic cholinergic agonist used in bronchoprovocation testing. In susceptible people it causes airway narrowing, allowing assessment for bronchial hyperresponsiveness under controlled medical supervision.

Methadone

A long-acting opioid medicine used in selected pain cases and treatment of opioid-use disorder. It reduces withdrawal and cravings but can cause dangerous breathing suppression, sedation, dependence, or heart-rhythm changes.

Methadone Hydrochloride

Methadone hydrochloride is the hydrochloride salt of methadone. It provides long-lasting opioid-receptor activity for selected analgesic and opioid-use-disorder indications, with risks of respiratory depression, dependence, overdose, and cardiac arrhythmia.

Methadone Overdose

Taking too much methadone can cause profound sleepiness, pinpoint pupils, slow or stopped breathing, coma, and death. Effects may be delayed or prolonged, and abnormal heart rhythms can occur.

Methaemoglobinaemia

A condition in which hemoglobin is changed so it cannot carry or release oxygen normally. It may cause blue or gray skin, headache, breathlessness, confusion, or severe oxygen shortage after exposure to certain medicines or chemicals.

Methamidophos

Methamidophos is a highly toxic organophosphorus insecticide that inhibits acetylcholinesterase. Exposure can cause cholinergic poisoning with sweating, salivation, vomiting, bronchospasm, bradycardia, muscle weakness, and potentially respiratory failure.

Methamphetamine

A potent, highly addictive synthetic central nervous system sympathomimetic amine belonging to the substituted amphetamine class. Acts pharmacologically as a substrate for monoamine reuptake transporters—primarily the dopamine transporter (DAT), norepinephrine transporter (NET), and serotonin transporter (SERT)—as well as the vesicular monoamine transporter 2 (VMAT2). By reversing transporter directionality and disrupting vesicular storage, methamphetamine triggers massive, non-exocytotic efflux of dopamine and norepinephrine into the synaptic cleft, stimulating central reward pathways in the nucleus accumbens and activating the peripheral sympathetic nervous system. Acute physiological effects include intense euphoria, increased alertness, anorexia, tachycardia, severe arterial hypertension, hyperthermia, and pupillary dilation. Toxic overdose produces sympathomimetic toxidrome, malignant arrhythmias, hemorrhagic or ischemic stroke, acute myocardial infarction, seizures, and severe rhabdomyolysis. Chronic abuse causes neurotoxicity (depletion of striatal dopamine axons), severe paranoid psychosis, choreoathetoid movements, skin excoriations ('meth bugs' / formication), and rampant dental caries and periodontal decay ('meth mouth'). Management of acute toxicity centers on aggressive sedation with intravenous benzodiazepines, cooling for hyperthermia, and hemodynamic stabilization.

Methamphetamine Overdose

Taking too much methamphetamine can cause agitation, dangerously high temperature, fast heartbeat, high blood pressure, chest pain, seizures, stroke,

abnormal rhythms, or severe confusion. It is a life-threatening poisoning.

Methamphetamines

Plural form; see *Methamphetamine*.

Methamphetamine Toxicity

Severe stimulant toxicity causing agitation, paranoia or psychosis, mydriasis, diaphoresis, tachycardia, hypertension, hyperthermia, seizures, myocardial ischemia, stroke, or rhabdomyolysis. Benzodiazepines, active cooling, ECG monitoring, and treatment of hyperthermia, seizures, ischemia, and complications are central.

Methane

Methane is a colorless, odorless, highly flammable gas produced by anaerobic decomposition and normal intestinal microbial activity. It can displace oxygen in enclosed spaces and cause asphyxiation; it is not itself a direct systemic poison at ordinary exposure levels.

Methane Sulfonate

Methane sulfonate, or mesylate, is the anion or ester derived from methanesulfonic acid. Mesylate salts are commonly used to improve the formulation of medicines; some methanesulfonate esters are potent alkylating agents and toxic impurities.

Methanobrevibacter Smithii

A methane-producing archaeon commonly found in the human intestine. It consumes hydrogen made by other gut microorganisms and may influence intestinal fermentation and gas production.

Methanol

A poisonous alcohol whose breakdown products can cause severe acid buildup, blindness, brain injury, or death. Serious poisoning can develop even before symptoms appear.

Methanol Poisoning

Poisoning by methanol, a type of alcohol found in some industrial products. Its breakdown can cause severe acid buildup, blindness, brain injury, or death, sometimes before symptoms appear.

Methanol Test

A blood test that measures methanol, a poisonous alcohol. It helps confirm toxic exposure, but treatment may begin before results because methanol can cause severe metabolic acidosis and delayed blindness or brain injury.

Methazolamide

Methazolamide is a carbonic anhydrase inhibitor used mainly to lower intraocular pressure in glaucoma. It reduces aqueous humor production and can cause metabolic acidosis, electrolyte abnormalities, kidney stones, or sulfonamide-related reactions.

Methemoglobin

Hemoglobin in which iron has been oxidized so it cannot carry oxygen normally. High levels cause methemoglobinemia, with cyanosis, headache, breathlessness, confusion, or severe tissue oxygen deficiency.

Methemoglobinemia

Methemoglobinemia occurs when hemoglobin iron is oxidized and cannot carry oxygen normally, causing cyanosis, headache, breathlessness, or severe tissue hypoxia.

Methenamine

Methenamine is a urinary antiseptic that decomposes in acidic urine to release formaldehyde, which inhibits bacterial growth. It is used for prevention of recurrent urinary tract infection in selected patients, not for treatment of active upper-tract infection.

Methicillin-Resistant Staphylococcus Aureus

A strain of Staphylococcus aureus that is resistant to several common antibiotics. It can cause skin, wound, lung, blood, bone, or other infections, and treatment is chosen using the infection site and laboratory testing.

Methicillin-Resistant Staphylococcus

Aureus Infection

Alternate name; see *MRSA Infection*.

Methidathion

Methidathion is an organophosphorus insecticide and acaricide that inhibits acetylcholinesterase. Exposure can produce a cholinergic toxidrome with secretions, bronchospasm, bradycardia, gastrointestinal symptoms, weakness, and respiratory failure.

Methimazole

A medicine that reduces production of thyroid hormones and is used mainly for hyperthyroidism and Graves disease. It can rarely cause severe low white-cell counts or liver injury; fever or sore throat during treatment needs prompt medical advice.

Methiocarb

Methiocarb is a carbamate pesticide that inhibits acetylcholinesterase reversibly. Poisoning causes excessive muscarinic and nicotinic cholinergic activity and may require urgent supportive care and antidotal treatment.

Methionine

An essential amino acid containing sulfur that the body uses to build proteins and make other substances. People must obtain it from food, and it can be converted into homocysteine and related compounds.

Methionine Enkephalin

Methionine enkephalin is an endogenous opioid pentapeptide that binds opioid receptors and participates in modulation of pain, stress, reward, and neuroendocrine function. It is one of the products of proenkephalin processing.

Methocarbamol

Methocarbamol is a centrally acting skeletal-muscle relaxant used with rest and physical measures for acute painful musculoskeletal conditions. It can cause drowsiness, dizziness, impaired coordination, and additive central nervous system depression.

Methohexital

Methohexital is an ultra-short-acting barbiturate anesthetic used for induction of general anesthesia and, in selected settings, procedural sedation. It depresses central nervous system activity and may cause respiratory or cardiovascular depression.

Methomyl

Methomyl is a carbamate insecticide that reversibly inhibits acetylcholinesterase. Poisoning produces cholinergic symptoms such as salivation, sweating, vomiting, bronchospasm, bradycardia, weakness, and respiratory compromise.

Methotrexate

An antimetabolite that inhibits folate-dependent enzymes and is used in cancer and selected autoimmune or inflammatory disorders.

Methotrexate In Dermatology

An immunomodulatory antimetabolite used in selected inflammatory and autoimmune skin diseases, including psoriasis, eczema, and some connective-tissue disorders. Treatment requires attention to liver disease, blood counts, infection risk, drug interactions, and strict pregnancy precautions.

Methotrimeprazine

Methotrimeprazine, also called levomepromazine, is a phenothiazine with antipsychotic, sedative, antiemetic, and analgesic properties. It is used in some countries for psychiatric illness and palliative-care symptoms and can cause sedation, hypotension, and anticholinergic effects.

Methoxamine

Methoxamine is a predominantly alpha-adrenergic agonist that increases vascular tone and blood pressure. It has been used as a vasopressor for hypotension but is not a routine first-line agent in many current practice settings.

Methoxsalen

Methoxsalen is a psoralen that intercalates into DNA and, after exposure to UVA, forms cross-links that suppress abnormal lymphocyte or skin-cell ac-

tivity. It is used with UVA phototherapy for selected skin diseases; photosensitivity and skin-cancer risk require precautions.

Methoxyflurane

A vapor medicine formerly used to cause general anesthesia and, in some settings, provide short-term pain relief. High or repeated exposure can damage the kidneys, so use requires careful medical supervision.

Methyclothiazide

Methyclothiazide is a thiazide diuretic that inhibits sodium and chloride reabsorption in the distal convoluted tubule. It is used for hypertension or edema and may cause hypokalemia, hyponatremia, hyperuricemia, and glucose intolerance.

Methyl Alcohol

Another name for methanol, a toxic alcohol that can cause severe acidosis and blindness.

Methylation

The addition of a methyl group to DNA, proteins, or other molecules. DNA methylation can affect gene activity, but its effects depend on the site and cellular context.

Methyl Bromide

Methyl bromide, or bromomethane, is a volatile fumigant and alkylating chemical. Inhalation can cause severe neurologic, respiratory, renal, and cardiovascular toxicity, including delayed seizures and pulmonary edema.

Methylcellulose

A plant-fiber product used as a bulk-forming laxative and as a thickener in medicines and foods. It absorbs water and adds bulk to stool; it can be unsafe when a bowel blockage is present.

Methyl Chloride

Methyl chloride, or chloromethane, is a volatile industrial gas formerly used in refrigerants and other applications. High-level inhalation exposure can depress the central nervous system and cause headache, ataxia, seizures, or cardiac effects.

Methyldopa

A blood-pressure medicine that acts in the brain to reduce nerve signals that tighten blood vessels. It is used in selected cases, including pregnancy, and may cause sleepiness, dizziness, or liver problems.

Methylene Blue

A medicine used mainly for serious methemoglobinemia, a condition in which blood cannot carry oxygen normally. It may be unsafe in some people with an inherited red-cell enzyme deficiency and can interact with certain antidepressants.

Methylene Blue Test

A test or procedure using methylene blue dye to trace fluid flow, identify a structure, or detect a leak or abnormal connection. The purpose depends on the body site; allergy and blood-related complications are uncommon but possible.

Methylene Chloride

Methylene chloride, or dichloromethane, is a volatile industrial solvent. Inhalation can cause central nervous system depression and metabolism to carbon monoxide can produce tissue hypoxia; high exposure may be fatal.

Methylenedioxymethamphetamine

3,4-Methylenedioxymethamphetamine, abbreviated MDMA and commonly called ecstasy or molly, is a psychoactive drug with stimulant and hallucinogenic effects that increases serotonergic signaling and can cause serious toxicity.

Methylergometrine

An ergot alkaloid that increases uterine contraction and may be used to control postpartum hemorrhage when appropriate.

Methyl Isocyanate

Methyl isocyanate is a highly volatile and reactive industrial chemical. Inhalation or eye and skin

exposure can cause severe irritation, pulmonary edema, and delayed respiratory injury; it was the toxic agent in the Bhopal disaster.

Methylmalonic Acid Blood Test

A blood test measuring methylmalonic acid to help detect vitamin B12 deficiency, especially when the B12 result is borderline. Kidney impairment can also raise the result.

Methylmalonic Acidemia

An inherited metabolic disorder in which the body cannot properly process certain fats and proteins, causing methylmalonic acid to build up. Episodes may cause vomiting, dehydration, acidosis, low blood sugar, seizures, or developmental and kidney problems.

Methylmalonic Acid Level

The amount of methylmalonic acid measured in blood or urine. A high level can support vitamin B12 deficiency, especially when the B12 result is unclear, but kidney disease can also raise it.

Methylmalonic Aciduria

A disorder in which methylmalonic acid builds up in blood and urine, usually because of an inherited enzyme or vitamin B12-processing problem. It may cause vomiting, poor feeding, acidosis, developmental problems, kidney disease, or neurologic injury.

Methylmercury Compounds

Methylmercury compounds are organic mercury compounds that can accumulate in aquatic food chains and cross the blood–brain and placental barriers. Exposure primarily injures the nervous system and can impair fetal neurodevelopment.

Methylmercury Poisoning

Poisoning caused by methylmercury, usually through contaminated food. It primarily injures the nervous system and may cause numbness, poor coordination, vision or hearing changes, and impaired fetal brain development.

Methylmethacrylate

Methyl methacrylate is a volatile monomer used to make acrylic plastics and dental or orthopedic bone cement. Vapors may irritate the eyes and airways, and liquid exposure can cause dermatitis or sensitization.

Methylmorphine

Another name for codeine, an opioid medicine used for selected pain or cough indications. It can cause drowsiness, constipation, dependence, and dangerous breathing suppression, especially with alcohol or other sedatives.

Methylnaltrexone

Methylnaltrexone is a peripherally acting mu-opioid-receptor antagonist used to treat opioid-induced constipation when laxatives are insufficient. It generally preserves central analgesia but can cause abdominal pain, diarrhea, and rarely gastrointestinal perforation.

Methylnaltrexone Bromide

Methylnaltrexone bromide is the bromide salt of methylnaltrexone, a peripherally restricted opioid antagonist. It reverses opioid effects in the gastrointestinal tract and is used for opioid-induced constipation under indication-specific precautions.

Methyl Parathion

Methyl parathion is an organophosphorus insecticide that inhibits acetylcholinesterase. Exposure can produce severe cholinergic poisoning with secretions, bronchospasm, bradycardia, weakness, seizures, and respiratory failure.

Methylphenidate

A stimulant medicine used mainly to treat attention-deficit/hyperactivity disorder and narcolepsy, a condition causing excessive sleepiness. It affects brain chemicals involved in attention and alertness; reduced appetite, sleep problems, increased blood pressure, and misuse are possible risks.

Methylprednisolone

A synthetic glucocorticoid used to suppress inflam-

mation and immune activity.

Methyl Salicylate Overdose

Taking too much methyl salicylate, found in some oils and pain-relief products, can cause salicylate poisoning with vomiting, ringing in the ears, rapid breathing, confusion, seizures, acidosis, or coma. Emergency assessment is needed.

Methyltestosterone

A synthetic androgen related to testosterone. It can affect sexual development and other androgen-sensitive tissues but may cause liver injury, adverse cholesterol changes, infertility, or virilization and is used only in selected medical situations.

Metoclopramide

A medicine that helps the stomach empty and relieves nausea and vomiting. It is used for selected digestive problems and treatment-related nausea; prolonged or high-dose use can cause involuntary movements and other nervous-system effects.

Metolazone

A water-removing medicine used for high blood pressure and swelling. It helps the kidneys remove salt and water and is often combined with another diuretic, but can disturb sodium, potassium, kidney function, or hydration.

Metolcarb

Metolcarb is a carbamate insecticide that can inhibit acetylcholinesterase. Exposure may cause cholinergic poisoning with excessive secretions, gastrointestinal symptoms, bronchospasm, bradycardia, weakness, or respiratory compromise.

Metopic Ridge

A metopic ridge is a palpable or visible line along the forehead from fusion of the metopic suture; it may be normal or associated with trigonocephaly.

Metoprolol

Metoprolol is a relatively beta-1-selective blocker used for hypertension, angina, heart failure, rate control, and some post-infarction settings; bradycardia, hypotension, fatigue, and bronchospasm can occur.

Metric System

The metric system is a decimal system of measurement based on units such as the meter, kilogram, and liter. Modern medicine generally uses the International System of Units, with conventional units retained for some measurements.

Metritis

Inflammation or infection of the uterus, often after childbirth, miscarriage, abortion, or a uterine procedure. It may cause fever, lower abdominal pain, unusual discharge, bleeding, or tenderness and usually needs treatment.

Metronidazole

An antibiotic and antiparasitic medicine used for certain infections caused by bacteria that grow without oxygen and by some parasites. It can cause nausea or a metallic taste; nerve problems may occur with prolonged use.

Metronidazole-Associated Encephalopathy

A rare complication of prolonged or high-dose metronidazole therapy, causing cerebellar dysfunction (ataxia, dysarthria, nystagmus) and sometimes confusion or seizures. MRI may show T2-hyperintense lesions in the cerebellar dentate nuclei, corpus callosum splenium, and brainstem. Symptoms typically resolve with drug discontinuation.

Metronomic Chemotherapy

Cancer treatment given in frequent, usually smaller doses over a long period instead of occasional high doses. The goal is to slow cancer growth and sometimes its blood supply; use depends on the cancer and treatment plan.

Metrorrhagia

Uterine bleeding that occurs at unexpected times, including between menstrual periods. Causes include pregnancy, hormonal changes, fibroids, polyps, infec-

tion, medicines, and cancer. New, heavy, prolonged, or postmenopausal bleeding can have an underlying medical cause.

METs

Metabolic equivalents used to estimate activity intensity or energy use. One MET is approximately the energy used while resting; higher values indicate more demanding activity and help describe exercise capacity.

Alternate Names:
Metabolic Equivalents

Metyrapone

A medicine that blocks one step in the production of cortisol, a hormone made by the adrenal glands. It is used for selected hormone tests or treatment under specialist supervision because levels can change quickly.

Metzenbaum Scissors

Fine, lightweight surgical scissors designed to separate and cut delicate soft tissue. Their relatively narrow blades are useful for careful dissection, but they are not intended for cutting hard material or heavy sutures.

Mevalonate Kinase Deficiency

An inherited autoinflammatory disorder caused by changes in the MVK gene. It can cause repeated fever attacks, swollen lymph nodes, abdominal pain, rash, joint pain, or mouth ulcers; the milder form is often called hyperimmunoglobulin D syndrome.

Mevinphos

Mevinphos is a highly toxic organophosphorus insecticide that inhibits acetylcholinesterase. Exposure can rapidly cause cholinergic crisis, including bronchorrhea, bronchospasm, muscle weakness, seizures, and respiratory failure.

Mexacarbate

Mexacarbate is a carbamate insecticide that interferes with acetylcholinesterase. Toxic exposure may produce muscarinic and nicotinic cholinergic symptoms and requires prompt decontamination and medical evaluation.

Mexiletine

Mexiletine is an oral class IB antiarrhythmic and sodium-channel blocker used for selected ventricular arrhythmias and sometimes neuropathic pain. It can cause gastrointestinal and neurologic effects and may worsen or provoke arrhythmias in some patients.

Meyerozyma Guilliermondii

Meyerozyma guilliermondii is a yeast formerly classified as Candida guilliermondii. It is usually an environmental or colonizing organism but can cause opportunistic bloodstream or other infections, particularly in immunocompromised patients.

MF

Abbreviation; see *Mycosis Fungoides*.

MFS

Abbreviation; see *Myxofibrosarcoma*.

MG

Abbreviation; see *Myasthenia Gravis*.

MGUS

See *Monoclonal Gammopathy Of Undetermined Significance*.

MHC Molecule

A protein on the surface of a cell that displays small pieces of proteins to T cells. This helps the immune system recognize infected or abnormal cells and distinguish the body's own cells from foreign material.

Alternate Names:
Major Histocompatibility Complex Molecule

Mianserin

An antidepressant medicine used in some countries to treat depression. It changes signaling by several brain chemicals and can cause sleepiness, increased appetite, weight gain, dizziness, or other medicine-related effects.

MIBG Scan

A nuclear medicine scan that uses a small amount of radioactive MIBG to find certain tumors of nerve-related tissue. It is used especially for pheochromocytoma, paraganglioma, and neuroblastoma; medicines and thyroid protection may be needed before the scan.

MIBG Scintiscan

A nuclear medicine scan using radiolabeled metaiodobenzylguanidine to image tissues derived from the sympathetic nervous system, including selected pheochromocytomas, paragangliomas, and neuroblastomas.

Mica

A group of sheet silicate minerals; inhalation of mica dust can cause occupational lung disease.

Micafungin

An echinocandin antifungal agent used in the treatment and prophylaxis of invasive candidiasis and esophageal candidiasis. Micafungin inhibits beta-(1,3)-D-glucan synthase, disrupting fungal cell wall synthesis and leading to osmotic instability and cell death.

Micelle

A tiny cluster of molecules that helps carry fats and fat-soluble substances through intestinal fluid for absorption.

Michaelis-Menten Kinetics

A mathematical model describing the rate of enzyme-catalyzed reactions by relating reaction velocity (V) to substrate concentration ($[S]$), defined by the maximal velocity (V_{max}) and the Michaelis constant (K_m, the substrate concentration at half-maximal velocity).

Miconazole

An antifungal medicine used in creams, gels, or other preparations for infections of the skin, mouth, or vagina. It stops fungi from making an essential part of their outer covering; irritation and medicine interactions are possible, especially with some oral products.

Microabscess

A very small pocket of pus containing immune cells, damaged tissue, and sometimes germs. It may occur in the skin or an organ because of infection or inflammation and is usually a finding rather than a diagnosis.

Microalbuminuria

Older term for moderately increased albumin in the urine, usually an albumin-to-creatinine ratio of 30–299 mg/g (3–29 mg/mmol). It can indicate kidney or cardiovascular risk; fever, strenuous exercise, urinary infection, or other temporary conditions can raise urine albumin, so an abnormal result is usually confirmed with repeat testing.

Microalbuminuria Test

A urine test that measures albumin, usually as an albumin-to-creatinine ratio, to detect and monitor albuminuria. The older term *microalbuminuria* refers to a ratio of 30–299 mg/g (3–29 mg/mmol); repeat testing may be needed because temporary conditions can raise the result.

Microaneurysm

A very small balloon-like bulge in a blood vessel wall. In the retina, microaneurysms are an early sign of diabetic eye disease and may leak fluid, causing swelling and blurred vision. Their number and associated retinal changes help show how diabetes is affecting the eyes.

Microangiopathic Hemolysis

Destruction of red blood cells as they pass through damaged or narrowed small blood vessels. Blood tests may show fragmented cells, anemia, and other signs of red-cell breakdown; causes include severe high blood pressure, pregnancy complications, infection, and clotting disorders.

Microangiopathic Hemolytic Anemia

An anemia caused by mechanical fragmentation of red blood cells as they pass through damaged or narrowed small blood vessels, producing schistocytes

and often elevated hemolysis markers.

Microangiopathy

Disease or damage affecting the body's smallest blood vessels. Thickened or injured vessel walls can reduce blood flow or allow leakage and may damage organs, especially in diabetes, high blood pressure, or clotting disorders.

Microarray

A laboratory test using a small chip covered with DNA probes. It can measure activity of many genes or find selected missing or extra DNA segments and is used mainly for specialized genetic or research testing.

Microarray Analysis

Microarray analysis measures the abundance or hybridization of many nucleic-acid sequences simultaneously using an array of immobilized probes. It can assess gene expression, copy-number changes, or selected genetic variants.

Microbacterium

A genus of gram-positive bacteria found in soil and water that can rarely cause bloodstream or other opportunistic infections.

Microbe

A microorganism, such as a bacterium, fungus, protozoan, or virus.

Alternate Names:
Microorganism

Microbial Biofilms

Microbial biofilms are organized communities of microorganisms attached to a surface and enclosed in a self-produced extracellular matrix. Biofilms can form on tissues and medical devices and often show increased tolerance to antimicrobials and host defenses.

Microbicide

A microbicide is a chemical or biological agent that kills microorganisms or inactivates them. The term may refer to disinfectants, topical agents, or investigational products intended to reduce sexual transmission of infection.

Microbiology

The study of microorganisms, including bacteria, viruses, fungi, and parasites, and how they interact with people, animals, plants, and the environment. In medicine, it supports the diagnosis, prevention, and treatment of infectious diseases.

Microbiome

The community of microorganisms and their genetic material living in a body site, especially the intestine. These organisms can influence digestion, immunity, and health, although the effects differ by person and condition.

Microcalcification

A very small calcium deposit in tissue. On a mammogram, its shape and arrangement may reflect normal change, injury, infection, or early breast cancer, so suspicious findings may require further imaging or biopsy.

Microcephaly

A head circumference at least 2 standard deviations below the mean for a person's age and sex, measured using an appropriate growth chart. It may result from genetic or developmental conditions, infection, toxic exposures, or injury, and does not by itself predict the degree of neurologic impairment.

Microcirculation

The movement of blood through the body's smallest blood vessels. In these vessels, oxygen and nutrients pass to tissues and waste products pass into the blood; poor microcirculation can slow healing and damage organs.

Microcolon

Microcolon is an abnormally small-caliber colon, often identified on contrast imaging. It may result from reduced fetal intestinal use or obstruction and is associated with conditions such as small-left-colon syndrome, meconium ileus, or distal intestinal

obstruction.

Microcornea

Microcornea is an abnormally small cornea, usually defined in adults by a horizontal diameter below about 10 mm. It may be isolated or associated with microphthalmia, glaucoma, cataract, or genetic syndromes.

Microcurie

A microcurie (μCi) is a unit of radioactivity equal to one-millionth of a curie, or approximately 37 kilobecquerels. It may be used to express the activity of radioactive tracers or sources.

Microcystic Adnexal Carcinoma

A rare, slow-growing but locally aggressive malignant adnexal tumor, usually on the head or neck, with follicular and ductal differentiation; it may extend deeply and requires complete excision.

Microcytic Anemia

Anemia in which red blood cells are smaller than usual. Common causes include iron deficiency, thalassemia, long-term inflammation, lead exposure, and some bone-marrow disorders. Blood counts and iron tests help find the cause; symptoms may include tiredness, weakness, pale skin, or shortness of breath.

Alternate Names:
Microcytic Hypochromic Anemia; Small-Cell Anemia; Low-MCV Anemia

Microdermabrasion

A cosmetic treatment that gently removes the outermost layer of skin with fine crystals or a rough-tipped device. It may improve the look of mild uneven texture, dullness, or some marks, but can cause redness, irritation, infection, or temporary darkening.

Microdialysis

A testing method that uses a very small tube to collect chemicals from the fluid around cells. It can measure local levels of medicines or natural substances, including in the brain or beneath the skin.

Microdiscectomy

A spinal operation that removes part of a herniated disc pressing on a nerve, usually in the lower back. It may reduce pain, numbness, or weakness caused by nerve pressure. Possible complications include infection, bleeding, nerve injury, or a return of the disc problem.

Alternate Names:
Lumbar Microdiscectomy; Microdiskectomy; Minimally Invasive Discectomy

Microdissection

Microdissection is separation or isolation of very small tissue regions or structures under microscopic or highly magnified visualization. It is used in surgery, pathology, and molecular research to obtain selected cells or tissue.

Microdissection Testicular Sperm Extraction

A surgical procedure that uses a microscope to search the testicle for small areas making sperm. It may help some men with very low or absent sperm production obtain sperm for assisted reproduction. The procedure can cause pain, bleeding, infection, or reduced testicular function, and sperm may not be found.

Alternate Names:
Micro-TESE; Microsurgical TESE

Microdontia

Abnormally small teeth, which may affect one or several teeth and can be inherited or developmental.

Microfibril

A very small thread-like structure that supports tissues. In connective tissue, microfibrils help organize elastic fibers and provide strength; in plants, they are made mainly of cellulose.

Microfilament

A microfilament is a thin cytoskeletal filament composed mainly of actin, about 7 nm in diameter.

Microfilaments support cell shape, motility, contraction, cytokinesis, and intracellular transport.

Microfilament Proteins

Proteins that make, organize, move, or regulate actin microfilaments. They help cells maintain shape, migrate, divide, contract, and transport materials; examples include actin, myosin, and actin-binding proteins.

Microfilaria

An early larval stage of a filarial worm, found in the blood or skin of an infected host. A blood-feeding insect may ingest microfilariae; they develop into infective larvae in the insect, which can then transmit infection during a later bite.

Microglandular Adenosis

Microglandular adenosis is an uncommon benign proliferation of small glands in the breast, often associated with hormonal influences such as pregnancy or progestin use. It can mimic invasive carcinoma and is diagnosed histologically.

Microglia

Microglia are resident immune cells of the central nervous system. They survey neural tissue, remove debris, and respond to injury or infection; persistent activation can contribute to neuroinflammation.

Microgliosis

Microgliosis is proliferation or increased activation of microglia in the central nervous system, usually in response to injury, infection, degeneration, or other inflammation. It is a histopathologic finding rather than a specific disease.

Micrognathia

Micrognathia is an unusually small lower jaw that may affect feeding, teeth, facial development, or airway breathing.

Micrognathism

Micrognathism is abnormal smallness of the jaw, usually referring to the mandible. It may be congenital or acquired and can affect feeding, dentition, airway patency, speech, or facial development.

Micrograms

A unit of mass equal to one millionth of a gram, written as mcg. It is commonly used for small medicine doses and nutrient amounts; confusing micrograms with milligrams can cause a serious dosing error.

Micrographia

Abnormally small handwriting, often becoming progressively smaller within a sentence. It commonly occurs in Parkinson disease and other movement disorders because of reduced movement size and control.

Microinjection

Microinjection is delivery of a very small volume of fluid into a cell, tissue, or other microscopic target using a fine needle or micropipette. It is used in assisted reproduction, experimental biology, and some therapeutic procedures.

Micrometastasis

A small group of cancer cells that has spread from the original tumor but is too small to detect on routine scans or examination. It may be found in tissue samples and can affect staging and treatment decisions.

Micrometer

An instrument or unit used to measure very small distances; one micrometer is one-millionth of a meter.

Micromolar

A concentration unit equal to one millionth of a mole per liter, written as $\mu\text{mol}/L$.

Micromole

A micromole (μmol) is an amount of substance equal to one-millionth of a mole, or approximately 6.022×10^{17} entities. It is commonly used for small quantities and concentrations of biochemical sub-

stances.

Micron

A unit measuring one-millionth of a meter, commonly used to describe the size of cells, bacteria, and particles.

Microneme

A microneme is a small secretory organelle in many apicomplexan parasites. It releases proteins that support host-cell attachment, motility, and invasion during the parasite life cycle.

Micronization

Micronization is a process that reduces particles to micrometer-scale dimensions, often to increase surface area and improve dissolution or absorption of a drug. The resulting particle size and formulation still determine clinical performance.

Micronized

Processed into very small particles to improve dispersion or absorption.

Micronutrient

An essential chemical substance required by the human body throughout the lifespan in minute quantities (typically micrograms to milligrams per day) that cannot be synthesized endogenously in adequate amounts and must be obtained from dietary sources. Comprises essential vitamins (fat-soluble: A, D, E, K; and water-soluble: B-complex vitamins and vitamin C) and dietary trace minerals (iron, zinc, iodine, selenium, copper, manganese, fluoride, chromium, and molybdenum). Unlike macronutrients (carbohydrates, proteins, fats), micronutrients do not provide caloric energy, but function critically as obligate coenzymes, prosthetic groups, gene expression regulators, structural components of metalloenzymes, and cellular antioxidants essential for DNA synthesis, erythropoiesis, immune competence, bone mineralization, and neurological function. Specific deficiencies cause classic nutritional deficiency disorders: iron deficiency (anemia), vitamin C deficiency (scurvy), vitamin D deficiency (rickets / osteomalacia), vitamin A deficiency (xerophthalmia / night blindness), thiamine deficiency (beriberi / Wernicke-Korsakoff syndrome), and iodine deficiency (goiter and cretinism).

Micronutrients

Plural form; see *Micronutrient*.

Microorchidism

Abnormally small testes, which may result from impaired development, genetic syndromes, or testicular atrophy after injury or infection.

Microorganism

A microscopic living organism, such as a bacterium, fungus, protozoan, or alga; viruses are acellular infectious agents.

Microorganism Genetics

The study of genetic material, inheritance, variation, and gene activity in microorganisms. It helps explain how microbes grow, cause disease, develop drug resistance, and exchange useful or harmful traits.

Micropenis

An unusually small penis caused by inadequate androgen effect or other developmental conditions, defined clinically by a stretched penile length more than 2.5 standard deviations below the mean for age and population. Evaluation may identify endocrine or genetic causes.

Micro-PET

Small-animal positron emission tomography using a dedicated high-resolution scanner to image radiotracer distribution and biological processes in research animals, especially rodents. It is used in preclinical studies of disease, drug effects, and molecular targets, and is distinct from routine PET imaging in human patients.

Alternate Names:
MicroPET; Small-Animal PET

Microphallus

An abnormally small penis, also called micropenis,

usually defined relative to age and developmental standards; it may reflect hormonal or developmental disorders.

Microphthalmia

A birth defect in which one or both eyes are smaller than usual. It may occur with other eye or genetic conditions and can reduce vision. Treatment depends on the cause and may include glasses, treatment for poor vision, or surgery.

Microphthalmos

A birth condition in which one or both eyeballs are unusually small. Vision may be reduced, and other eye or genetic problems may occur, so affected children need an eye examination and ongoing specialist care.

Microplastics

Very small plastic particles, generally less than five millimeters across, found in the environment and sometimes in food, water, and air. Human health effects are still being studied.

Micropolygyria with Muscular Dystrophy

A rare congenital syndrome combining abnormal folding of the cerebral cortex with muscular dystrophy, causing developmental, seizure, movement, and muscle weakness findings.

Micropsia

A change in vision in which objects appear smaller or farther away than they really are. It can occur with migraine, retinal disease, brain disorders, medicines, or other problems; new or persistent symptoms can be associated with neurologic or eye disease.

MicroRNA

A very small, non-coding RNA that helps control which genes are active, mainly by reducing the production of specific proteins. MicroRNAs are being studied as possible disease markers and treatment targets.

Microsatellite Instability

A tumor pattern in which short repeated DNA sequences gain or lose units because the cell's DNA repair system is faulty. A high level can occur in inherited or sporadic cancers and may help predict benefit from some immune treatments.

Microscope

An instrument that magnifies structures too small to see clearly with unaided eyes. Light, electron, and fluorescence microscopes help examine cells, tissues, blood, microbes, and other samples.

Microscopic

Visible only with a microscope or relating to microscopic examination.

Microscopic Anatomy

The study of cells, tissues, and fine structural details that require magnification for examination; it includes cytology and histology.

Microscopic Colitis

Long-lasting inflammation of the colon that usually causes frequent, watery, non-bloody diarrhea while the colon looks normal during routine colonoscopy. Tiny tissue samples are needed for diagnosis; the main forms are collagenous and lymphocytic colitis.

Microscopic Examination

Examination of cells or tissue with a microscope to look for normal structure, infection, inflammation, or cancer. The sample may be stained and assessed together with its visible appearance, imaging, and other laboratory results.

Microscopic Hematuria

Alternate name; see *Hematuria*.

Microscopic Polyangiitis

An autoimmune disease that inflames and damages small blood vessels. It can affect the kidneys, lungs, skin, nerves, or other organs and may cause blood in the urine, breathing problems, rash, weakness, or

bleeding.

Microscopy

Microscopy is examination of cells, tissues, organisms, or materials with a microscope. Light, fluorescence, electron, and other microscopy methods provide different information about structure and composition.

Microsecond

A unit of time equal to one-millionth of a second.

Microspectrophotometry

Microspectrophotometry measures the absorption or emission spectrum of a microscopic region or individual cell. It can quantify pigments, nucleic acids, proteins, or other chromophores in small biological samples.

Microsphere

A microsphere is a small spherical particle, often made of polymer, glass, or another material, used in drug delivery, imaging, embolization, or laboratory assays. Its size, composition, and surface properties determine its biologic behavior.

Microspherophakia

Microspherophakia is an abnormally small, spherical crystalline lens. It can occur in inherited disorders such as Weill–Marchesani syndrome and may cause lens displacement, pupillary block, angle-closure glaucoma, or reduced vision.

Microsporidia

A group of microscopic spore-forming organisms related to fungi. They can cause prolonged diarrhea, eye disease, muscle disease, or widespread infection, especially in people with weakened immune systems.

Microsporidiosis

An infection caused by microsporidia, microscopic organisms related to fungi that produce resistant spores. It most often affects the intestine and may cause long-lasting diarrhea and weight loss. It can also affect the eyes, muscles, kidneys, brain, or several organs, especially in people with weakened immune systems.

Microsporum

Microsporum is a genus of dermatophyte fungi that can cause ringworm of the skin, scalp, or hair.

Microsporum Audouinii

Microsporum audouinii is a dermatophyte that mainly infects the scalp and can cause tinea capitis, especially in children.

Microsporum Distortum

Microsporum distortum is a rare dermatophyte related to M. canis that can cause skin or scalp infection.

Microsporum Ferrugineum

A fungus that can cause ringworm of the scalp or skin, particularly in children. Laboratory examination can help confirm the infection and distinguish it from other causes of rash or hair loss.

Microsporum Gypseum

Microsporum gypseum is a soil-associated dermatophyte that can cause ringworm of the skin or scalp.

Microstomia

Microstomia is abnormal narrowing or smallness of the mouth opening. It may be congenital or result from scarring, burns, surgery, trauma, or connective-tissue disease and can impair eating, speech, oral hygiene, and dental treatment.

Micro-Surgery

Surgery performed with magnification and fine instruments to repair very small structures such as nerves and vessels.

Microtechnology

Microtechnology is the design and manufacture of devices or structures with micrometer-scale features. Medical applications include microfluidic diagnostics, sensors, drug-delivery systems, and minimally invasive instruments.

Microtia

A birth defect in which the outer ear is smaller than usual or does not form fully. The ear canal may also be narrow or absent, which can reduce hearing.

Microtome

An instrument that cuts extremely thin slices of tissue for examination under a microscope. The slices are mounted on slides, stained, and studied to identify normal structures or disease.

Microtubule

A tiny hollow protein tube inside a cell. Microtubules help maintain cell shape, move materials within the cell, support cell division, and form part of cilia and other moving structures.

Microtubule Bundle

A microtubule bundle is an organized group of parallel or otherwise coordinated microtubules within a cell. Bundles provide structural support and guide transport or movement, including in axons, cilia, and dividing cells.

Microvascular

Relating to the body's smallest blood vessels, including tiny arteries, capillaries, and veins. These vessels deliver oxygen and nutrients, remove waste, and control blood flow through tissues.

Microvascular Disease

Disease affecting the body's smallest blood vessels, which can reduce blood flow and oxygen delivery to organs or tissues. Diabetes, high blood pressure, smoking, inflammation, and aging can damage these vessels.

Microvasculature

The network of the body's smallest blood vessels, including tiny arteries, capillaries, and veins. It delivers oxygen and nutrients, removes waste, controls tissue blood flow, and helps regulate fluid movement between blood and tissues.

Microvilli

Tiny finger-like projections on the surface of cells. In the small intestine, they increase the area available for absorbing nutrients.

Microvillus

A microvillus is a microscopic, actin-supported projection of a cell membrane that increases surface area. Microvilli are abundant on intestinal epithelial cells, where they support nutrient absorption, and on renal tubular cells.

Microvolt

A microvolt (μV) is one-millionth of a volt. It is used to express small bioelectric signals, such as those recorded by electroencephalography, electromyography, electrocardiography, or evoked-potential testing.

Microwave Ablation

A procedure that uses microwave energy to heat and destroy selected tissue, usually under imaging guidance.

Microwave Therapy

Treatment that uses microwave energy to heat or destroy selected tissue. It has specialized uses, such as treating some tumors or controlling bleeding, and the risks depend on the body area and device used.

Micturition

The process of passing urine. The bladder squeezes while the muscles at its outlet relax, under coordinated control from the brain and nerves.

Midaxillary Line

An imaginary vertical line on the side of the body passing through the apex of the axilla (armpit).

Midazolam

Midazolam is a short-acting benzodiazepine used for procedural sedation, anesthesia, and treatment of acute seizures in appropriate settings. It enhances GABA-A receptor activity and can cause profound sedation and respiratory depression, especially with

opioids or other depressants.

Midazolam Hydrochloride

Midazolam hydrochloride is the hydrochloride salt of the short-acting benzodiazepine midazolam. It is used for procedural sedation, anesthesia, and selected seizure emergencies and can cause dose-related sedation, hypotension, and respiratory depression.

Midbrain

The upper part of the brainstem, between the lower brainstem and the main brain. It helps control eye movements, movement, alertness, and automatic responses to sights and sounds.

Midclavicular Line

An imaginary vertical line on the front of the body passing through the midpoint of the clavicle (collarbone).

Middle Ear

An air-filled space between the eardrum and inner ear that contains the malleus, incus, and stapes. These ossicles transmit sound vibrations to the inner ear, and the auditory tube helps equalize middle-ear pressure.

Middle Ear Implant

An implanted hearing device that electrically or mechanically stimulates middle-ear structures to improve sound transmission in selected hearing loss. It differs from a cochlear implant, which directly stimulates the inner-ear auditory nerve pathway.

Middle Ear Infection

Infection or inflammation in the space behind the eardrum. It often follows a cold and may cause ear pain, fever, temporary hearing loss, fluid behind the eardrum, or irritability in children.

Middle East Respiratory Syndrome

A respiratory infection caused by Middle East respiratory syndrome coronavirus (MERS-CoV), usually linked to close contact with infected camels or people. It may cause fever, cough, pneumonia, breathing failure, or kidney and other organ problems.

Alternate Names:
MERS; Camel Flu

Middle Insomnia

Middle insomnia is repeated or prolonged awakening during the middle portion of the sleep period, often with difficulty returning to sleep. It may occur with stress, mood disorders, sleep apnea, pain, substances, medications, or other sleep disorders.

Middle Lobe Syndrome

Chronic or recurrent atelectasis and infection of the right middle lobe due to bronchial obstruction. The long, narrow right middle lobe bronchus is susceptible to compression by lymph nodes, tumors, or mucous plugging. It may be caused by bronchiectasis, malignancy, or granulomatous disease. Treatment depends on the underlying cause.

Middle Mediastinum

The central part of the lower mediastinum that contains the heart, pericardium, roots of the great vessels, and phrenic nerves.

Mid-Dorsal

Situated in the middle region of the back or on the dorsal side of a structure.

Mid-Forearm

The middle part of the forearm, between the elbow and wrist. Measurements or injections described as mid-forearm use this region as a reference point.

Mid-Gut

The embryonic middle portion of the primitive gut, which develops into much of the small intestine and proximal colon.

Midgut Volvulus

A life-threatening twisting of the intestine that can cut off its blood supply, usually because the intestine formed abnormally before birth. Babies may suddenly develop green vomiting, a swollen or painful

abdomen, blood in the stool, or extreme illness. It is an emergency requiring immediate imaging and surgery to untwist and protect the bowel.

Alternate Names:
Midgut Torsion

Mid-Leg

The central part of the lower limb between the knee and ankle. It contains the shin bones, muscles, nerves, blood vessels, and soft tissues that support walking and ankle movement.

Mid-Line

The imaginary or anatomical line dividing a structure or body into right and left portions.

Midomafetamine

Midomafetamine is another name for 3,4-methylenedioxymethamphetamine, a psychoactive amphetamine derivative. It is being studied in controlled psychotherapy-assisted research but can cause hyperthermia, hyponatremia, cardiovascular toxicity, serotonin toxicity, and misuse.

Midostaurin

Midostaurin is a multikinase inhibitor used with chemotherapy for newly diagnosed acute myeloid leukemia with a susceptible FLT3 mutation and for advanced systemic mastocytosis. It can cause nausea, cytopenias, infection, and other treatment-related toxicities.

Midriff

Alternate informal term; see *Abdomen*.

Midsagittal Plane

A vertical plane passing through the midline that divides the body or a structure into equal right and left halves.

Mid-Stream Urine Specimen

A urine sample collected after initial urine is voided, reducing contamination from the urethral opening and used commonly for culture.

Mid-Systolic Click

A sharp heart sound heard during the middle or later part of the heartbeat, often associated with mitral-valve prolapse. It may be followed by a murmur if the valve allows blood to leak backward.

Midtrimester

The middle part of pregnancy, usually covering about weeks 14 through 27. During this period the fetus grows rapidly, routine anatomy screening is often performed, and pregnancy symptoms and risks vary from person to person.

Mid-Upper-Arm Circumference

The circumference of the upper arm measured at the midpoint between the acromion and olecranon processes. It is a practical anthropometric measure of muscle and fat stores, particularly useful when body weight or height cannot be measured reliably.

Midwife

A trained and regulated professional who provides care during pregnancy, labor, birth, and the postnatal period.

Midwifery

The professional practice of supporting and managing normal pregnancy, childbirth, postpartum recovery, and newborn care.

Mifepristone

Mifepristone is a progesterone-receptor antagonist and, at higher doses, a glucocorticoid-receptor antagonist. It is used with misoprostol for medication abortion under applicable protocols and for selected cases of hyperglycemia associated with Cushing syndrome.

Migraine

A recurring neurological disorder that causes attacks of moderate to severe, often throbbing or pulsing head pain. The pain may occur on one or both sides of the head and may be accompanied by nausea, vomiting, or increased sensitivity to light, sound, or smells. Some people have an aura, such as flashing lights, blind spots, tingling, numbness, or temporary

speech problems, which usually develops gradually and resolves completely. Migraine attacks may last from several hours to a few days, and some occur with little or no headache.

Alternate Names:
Migraine Headache; Hemicrania

Migraine And Stroke Symptoms

Migraine aura usually develops gradually and resolves, whereas stroke symptoms often begin suddenly and cause persistent focal deficits such as weakness, speech trouble, facial droop, or vision loss. Sudden or atypical neurologic symptoms can indicate stroke.

Migraine Headaches

Alternate name; see *Migraine*.

Migraine With Aura

A primary headache disorder marked by at least two attacks with fully reversible visual, sensory, speech, or other neurologic symptoms (aura). Aura symptoms often spread gradually; each individual symptom usually lasts 5–60 minutes. Headache commonly accompanies or follows the aura within an hour, but aura can occur without headache.

Migraine Without Aura

A primary headache disorder marked by recurrent attacks lasting 4–72 hours. The headache has at least two features such as one-sided location, pulsating quality, moderate or severe intensity, or worsening with routine activity, and is accompanied by nausea or vomiting, or by both light and sound sensitivity.

Migrainous Neuralgia

Older term; see *Cluster Headache*.

Migrating Motor Complex

Repeating waves of muscle activity that move through the stomach and small intestine between meals. They help clear leftover food, secretions, and some bacteria before the next meal.

Migration

Movement of cells, organisms, substances, or a body structure from one place to another. Normal examples include immune-cell movement and fetal development; abnormal migration can contribute to infection, cancer spread, or blood clots.

Migratory Thrombophlebitis

Recurrent or shifting venous thrombosis associated with an underlying malignancy; an alternate term for the thrombotic manifestation of Trousseau syndrome.

Milan System for Salivary Cytopathology

A six-level system for reporting results from a needle sample of a salivary-gland lump. Results range from an insufficient sample or noncancerous finding to a finding suspicious for or showing cancer. The system helps estimate cancer risk and guide further care.

Mild

Mild describes relatively low intensity, severity, or extent of a symptom, sign, disease, or abnormality. The meaning depends on the condition and the clinical scale used and does not by itself indicate that no treatment or evaluation is needed.

Mild Cognitive Impairment

A noticeable decline in memory or another thinking skill that is greater than expected for age but does not substantially prevent everyday activities. It may remain stable, improve, or progress to dementia depending on the cause.

Mildew Remover Poisoning

Poisoning from a mildew-removal product, often containing bleach, acids, or other corrosive chemicals. It can burn the skin, eyes, mouth, and digestive tract or release dangerous fumes that injure the lungs.

Mile

A mile is a unit of distance equal to 1,609.344 meters. It may be used in descriptions of walking or running distance, although scientific and clinical

measurements generally use SI units.

Milia

Milia are tiny, firm, white or yellow bumps caused by small cysts containing keratin, a protein in the skin. They are common in newborns and may appear on the face in adults; they are harmless and usually go away on their own.

Miliaria

A sweat-retention skin disorder caused by obstruction of eccrine sweat ducts, often in hot or humid conditions. Trapped sweat produces small papules or vesicles that may be itchy or prickly.

Miliaria Crystallina

A harmless heat rash made of tiny clear blisters when sweat becomes trapped just beneath the skin's surface. It can occur in hot, humid conditions or during fever and usually settles when the skin is cooled and kept dry.

Miliaria Profunda

A deeper form of heat rash caused by blocked sweat ducts in the lower layers of the skin. It often follows repeated episodes of miliaria rubra and causes firm, skin-colored bumps. The affected areas may sweat less, making it harder for the body to cool.

Miliaria Rubra

A common form of heat rash that causes itchy, prickly red bumps or small blisters when sweat ducts are blocked in the skin.

Miliary

Describing many tiny spots or lesions that resemble millet seeds. The term is often used for tuberculosis or another disease spread widely through an organ or the bloodstream.

Miliary TB

Tuberculosis that has spread through the bloodstream, producing many tiny areas of infection in the lungs and sometimes the liver, brain, bone marrow, or other organs. It can cause fever, weight loss, night sweats, cough, or organ-specific symptoms.

Miliary Tuberculosis

Tuberculosis that spreads through the bloodstream and forms many tiny areas of infection. It may affect the lungs, liver, brain, bone marrow, or other organs and can cause prolonged fever, weight loss, night sweats, cough, or organ-specific symptoms.

Milieu Therapy

Milieu therapy uses the structured social environment of a treatment setting as part of care, especially in some psychiatric and rehabilitation programs.

Milium

A small, firm, white or yellow bump filled with keratin, usually appearing on the face. It is harmless, does not spread by infection, and may disappear on its own or be removed safely by a clinician.

Milk-Alkali Syndrome

A condition caused by taking too much calcium and absorbable alkali, leading to high blood calcium, excessive blood alkalinity, and kidney problems. Severe cases can cause confusion, vomiting, dehydration, or abnormal heart rhythms.

Milk Allergy

An immune reaction to proteins in cow's milk, often beginning in infancy. It may cause hives, vomiting, wheezing, eczema, diarrhea, or anaphylaxis; it differs from lactose intolerance, which is difficulty digesting milk sugar.

Alternate Names:
Cow's Milk Allergy; Cow's Milk Protein Allergy; CMPA

Milker's Node

A localized nodular skin infection caused by parapoxvirus acquired from infected cattle, also called orf-like milker's nodule.

Milk Intolerance

Difficulty tolerating milk, often because of lactose malabsorption, causing bloating, cramps, gas, or

diarrhea; it is not the same as milk-protein allergy.

Milkman Syndrome

Multiple small weak areas or incomplete breaks in bones, also called Looser zones. They can occur in severe osteomalacia or rickets and may cause bone pain, weakness, or fractures.

Alternate Names:
Looser-Milkman Syndrome; Pseudofracture Syndrome

Milk Of Magnesia

A liquid suspension of magnesium hydroxide used to neutralize stomach acid and relieve constipation. It draws water into the bowel and can cause diarrhea, especially when taken too often or in kidney disease.

Milky Urine

Urine with a cloudy or white appearance caused by chyle, pus, crystals, fat, or other substances; evaluation identifies the cause.

Millard-Gubler Syndrome

A ventral pontine stroke syndrome caused by an ischemic or hemorrhagic lesion in the lower pontine tegmentum, characterized by ipsilateral abducens nerve (CN VI) palsy, ipsilateral peripheral facial nerve (CN VII) palsy, and contralateral hemiparesis of the upper and lower extremities.

Alternate Names:
Ventral Pontine Syndrome; Facial Abducens Hemiplegia Syndrome

Miller Fisher Syndrome

Alternate name; see *Fisher Syndrome*.

Miller's Lung

Hypersensitivity pneumonitis caused by inhaling material associated with the granary weevil (wheat weevil, *Sitophilus granarius*), especially in people working with contaminated grain or flour.

Millicurie

A millicurie (mCi) is one-thousandth of a curie, equal to approximately 37 megabecquerels. It is used to express the activity of radioactive sources and some radiopharmaceutical doses.

Milliequivalent

A unit used to measure the amount and electrical combining power of charged substances, such as sodium, potassium, calcium, or chloride, in medicines and laboratory results.

Milligram

A metric unit of mass equal to one-thousandth of a gram. Its abbreviation is mg, and it is commonly used for medicine doses and small quantities of substances.

Milligram-Percent

An older concentration unit meaning milligrams of a substance in 100 milliliters of fluid. Its number is the same as milligrams per deciliter, written mg/dL, which is preferred in current medical reporting.

Milligray

A unit of absorbed ionizing-radiation dose equal to one-thousandth of a gray, or 0.001 joule per kilogram; its abbreviation is mGy.

Milliliter

A unit of volume equal to one-thousandth of a liter and one cubic centimeter. It is commonly used to measure liquid medicines, blood, urine, laboratory samples, and other small amounts of fluid.

Millimeter

A unit of length equal to one-thousandth of a meter.

Millimolar

A concentration unit equal to one thousandth of a mole per liter, written as mmol/L.

Millimole

A unit measuring the amount of a chemical substance equal to one-thousandth of a mole. Laboratory tests use millimoles to report substances such as glucose, sodium, potassium, and other electrolytes.

Million

A number equal to 1,000,000; laboratory counts may use it as a numerical multiplier.

Milliosmole

A milliosmole (mOsm) is one-thousandth of an osmole, a unit reflecting the number of osmotically active particles in a solution. Osmolality and osmolarity are commonly reported in mOsm/kg or mOsm/L.

Millipede Toxin

Irritating defensive chemicals released by some millipedes. Contact can cause burning, redness, blistering, or dark staining of skin and severe eye irritation; exposure is usually localized to the contact area.

Millisecond

A millisecond (ms) is one-thousandth of a second. It is used to measure brief physiologic events, reaction times, nerve conduction intervals, and timing of electrical or imaging signals.

Milliunit

A milliunit (mU) is one-thousandth of a unit of biologic or enzymatic activity. Because a unit is defined according to the substance or assay, the clinical meaning of a milliunit depends on the specific test or medication.

Millivolt

A unit of electrical voltage equal to one-thousandth of a volt. Small voltages are measured in millivolts in tests of the heart, brain, nerves, muscles, and other electrical activity in the body.

Milrinone

A medicine given by vein for short-term support in severe heart failure or after heart surgery. It helps the heart squeeze more strongly and widens blood vessels, but can lower blood pressure or trigger abnormal heart rhythms.

Milroy Disease

An inherited primary lymphedema caused most often by pathogenic variants affecting VEGFR3 signaling. It typically presents with chronic swelling of the lower limbs from birth or early infancy and may be associated with papillomatosis, hydrocele, or recurrent skin infection.

Milroy's Disease

An inherited form of primary lymphedema, usually present from birth or early life and caused commonly by lymphatic-development abnormalities.

Mimesis

Imitation or mimicry; in medicine, the term can refer to simulation of an organic disease by psychological symptoms or to one organic disease resembling another.

Mimicry

Resemblance of one organism, structure, or clinical pattern to another; in medicine, it may describe a disorder that imitates another disease.

Minamata Disease

A nervous-system disorder caused by poisoning with methylmercury, often after eating contaminated seafood. It can cause numbness, poor coordination, vision or hearing problems, muscle weakness, speech difficulty, and developmental harm in children.

Mind

The collection of mental processes and capacities involved in consciousness, thought, perception, memory, emotion, judgment, and behavior.

Mindful Eating

Paying attention to hunger and fullness, eating slowly, and noticing food's taste and texture. It may improve awareness of eating habits and help some people reduce distracted eating or overeating.

Mineral

An inorganic chemical element or ion required in the human diet to maintain physiological cellular homeostasis, structural integrity, and metabolic pathways. Categorized based on daily dietary require-

ments into: Macrominerals (required in amounts > 100 mg/day, including calcium, phosphorus, magnesium, sodium, potassium, chloride, and sulfur), which function as structural components of bone matrix (hydroxyapatite) and the predominant electrolytes regulating fluid balance, osmotic pressure, and electrical transmembrane action potentials; and Trace minerals / Microminerals (required in amounts < 100 mg/day, including iron, zinc, copper, manganese, iodine, selenium, fluoride, and molybdenum), which act primarily as essential catalytic cofactors for metalloenzymes (e.g., iron in hemoglobin and cytochromes, zinc in carbonic anhydrase and DNA zinc-finger transcription factors, iodine in thyroid hormones). Deficiencies, malabsorption, or excessive toxic accumulation of minerals cause severe metabolic and systemic pathologies.

Mineralocorticoid

A class of adrenal-cortex steroid hormones, chiefly aldosterone, that act mainly on the kidney's distal nephron. They increase sodium reabsorption and potassium and hydrogen-ion excretion; water follows retained sodium, helping regulate extracellular fluid volume, electrolyte balance, and systemic blood pressure.

Alternate Names:
Mineralocorticoids

Mineralocorticoid Receptor

A protein inside cells that responds mainly to aldosterone, a hormone made by the adrenal glands. It helps the kidneys retain salt and water and remove potassium, thereby affecting blood pressure and body-fluid balance.

Mineral Oil

Mineral oil is a purified mixture of liquid hydrocarbons derived from petroleum. It is used in some topical products, cosmetics, and laxatives; aspiration of liquid mineral oil can cause lipoid pneumonia.

Mineral Oil Overdose

Swallowing a large amount of mineral oil is dangerous mainly because it can enter the lungs during vomiting or reflux and cause lipoid pneumonia.

Minerals

Plural form; see *Mineral*.

Mineral Spirits Poisoning

Poisoning from mineral spirits, petroleum-based solvents used in paints and cleaning products. Swallowing or inhalation may cause dizziness, drowsiness, chemical pneumonitis, or breathing failure, especially after liquid enters the lungs.

Miner's Asthma

Asthma caused or worsened by repeated inhalation of dust, fumes, or other substances during mining work. It can cause wheezing, cough, chest tightness, and breathlessness that improve after leaving the exposure.

Miner's Nystagmus

An older term for visual disturbance and nystagmus reported in underground miners, associated with poor lighting and occupational conditions.

Minimal Change Disease

A kidney disease, common in children, in which the kidney tissue looks nearly normal under a standard microscope but leaks large amounts of protein into the urine. It can cause swelling and often responds well to treatment.

Minimal-Change Disease

Alternate spelling; see *Minimal Change Disease*.

Minimally Invasive Aortic Valve Surgery

Aortic valve surgery performed through a smaller incision than a full median sternotomy, such as a mini-thoracotomy or partial sternotomy. Transcatheter aortic valve replacement (TAVR) is a separate procedure.

Alternate Names:
Minimally Invasive Aortic Valve Replacement; MI-AVR

Minimally Invasive Esophagectomy

Removal of part or all of the esophagus using thoracoscopic, laparoscopic, or robotic techniques

through smaller incisions than open surgery. It may reduce surgical trauma or recovery time in selected patients; risks and outcomes depend on the procedure and the person's condition.

Alternate Names:
MIE

Minimally Invasive Gastrointestinal Surgery

Gastrointestinal operations performed through small incisions or natural orifices using laparoscopic, robotic, or endoscopic techniques, often reducing recovery time while retaining procedure-specific risks.

Minimally Invasive Heart Bypass Surgery

Coronary artery bypass graft (CABG) surgery performed through a small thoracotomy incision between the ribs, frequently on a beating heart without cardiopulmonary bypass, avoiding a traditional median sternotomy.

Alternate Names:
MIDCAB; Minimally Invasive Direct Coronary Artery Bypass; Less Invasive CABG

Minimally Invasive Hip Replacement

Hip-replacement surgery performed through a smaller or muscle-sparing approach to reduce tissue disruption. It still replaces damaged joint surfaces and has risks such as infection, blood clots, dislocation, fracture, nerve injury, or implant loosening.

Minimally Invasive Mitral Valve Surgery

Mitral valve repair or replacement performed through smaller incisions, such as a right minithoracotomy, sometimes with video or robotic assistance, rather than a full median sternotomy. It may reduce surgical trauma or recovery time in selected patients; risks and outcomes depend on the procedure and the person's condition.

Alternate Names:
MIMVS; Mini-Thoracotomy Mitral Repair; Port-Access Mitral Surgery

Minimally Invasive Prostate Resection

Endoscopic or robotic transurethral procedures (such as holmium laser enucleation of the prostate [HoLEP], transurethral resection of the prostate [TURP], or robotic simple prostatectomy) performed to remove obstructive adenomatous tissue in benign prostatic hyperplasia.

Alternate Names:
Minimally Invasive BPH Resection

Minimally Invasive Spine Surgery

Spine surgery performed through small incisions using specialized instruments, often reducing muscle disruption and recovery time. It still carries risks such as nerve injury, infection, bleeding, and persistent symptoms.

Minimally Invasive Surgery

Surgery performed through small incisions or natural openings using specialized instruments, usually reducing tissue disruption and recovery time.

Minimal Residual Disease

A small number of cancer cells that remain after treatment and cannot be seen on routine examination or ordinary scans. Highly sensitive blood, bone-marrow, tissue, or molecular tests may detect them and estimate relapse risk.

Mini-Mental State Examination

A brief questionnaire that checks orientation, attention, memory, language, and simple thinking skills. The score can be affected by education, language, hearing, vision, culture, or delirium and cannot diagnose dementia by itself.

Minimization

A psychological or communication process of downplaying the importance or severity of symptoms, events, or problems.

Minimum Alveolar Concentration

A standard measure of how much inhaled anesthetic is needed to prevent movement in half of people during a specified surgical stimulus. It helps compare anesthetic strength and guide dosing during anesthesia.

Minimum Bactericidal Concentration

The lowest concentration of an antimicrobial that kills a defined proportion of the original bacterial inoculum, commonly demonstrated by subculture without growth. MBC is distinct from MIC and is not routinely required for every infection.

Minimum Effect Concentration

The lowest concentration of a drug in the blood or at its site of action that produces a defined measurable effect.

Minimum Inhibitory Concentration

The smallest amount of an antibiotic or other antimicrobial that stops a particular germ from visibly growing in a laboratory test. It helps guide treatment; significance varies with the infection and the patient's condition.

Minimum Lethal Concentration

The lowest concentration of a substance associated with death in a defined test population or experimental setting.

Minimum Lethal Dose

The smallest dose of a substance reported to cause death under specified conditions; it varies by species, route, and individual.

Minipuberty

A normal, temporary rise in reproductive hormone activity during early infancy. Signals from the brain and pituitary gland stimulate the ovaries or testes to produce hormones. The timing and hormone pattern differ by sex; in boys, activity usually peaks in the first few months and declines by about six months.

Minisatellite Repeat

A minisatellite repeat is a tandemly repeated DNA sequence with repeat units commonly ranging from about 10 to 100 base pairs. Variation in repeat number can serve as a genetic marker and, in some loci, influence gene regulation or disease risk.

Mini-Stroke

A common but potentially misleading name for a transient ischemic attack; see *Transient Ischemic Attack*.

Mini-Stroke (TIA)

Alternate name; see *Transient Ischemic Attack*.

MINOCA

A heart attack occurring without a major blockage in the coronary arteries. It is an initial diagnosis; further tests are needed to find causes such as a small clot, artery spasm, artery-wall tear, or inflammation.

Minocycline

An antibiotic used for some bacterial infections and for inflammatory acne. It can cause nausea, dizziness, skin or tooth discoloration, sun sensitivity, and rarely liver or immune problems.

Minor

Smaller, lesser, or less significant than a related structure or condition; for example, the teres minor muscle is smaller than the teres major muscle.

Minority Health

The health status and healthcare experiences of populations affected by social, economic, cultural, or structural disadvantage. Differences in exposure, income, environment, discrimination, and access to care can contribute to health disparities.

Minor Response

A minor response is a limited improvement after treatment that does not meet the predefined criteria for a partial or complete response. The exact threshold depends on the disease, study protocol, and outcome being measured.

Minoxidil

A vasodilator used topically for pattern hair loss and orally in selected cases of resistant hypertension.

Minute Ventilation

The total amount of air breathed in one minute, calculated from breath size multiplied by breathing rate. It may rise with exercise or illness and fall with sedation, muscle weakness, airway disease, or poor breathing effort.

Miosis

Unusually small pupils or normal pupil narrowing in response to light. It may be caused by medicines or toxins, eye disease, or problems affecting nerves in the brain or eye.

Miosis Disorder

Abnormally small pupils or an abnormal pupillary constriction response, caused by medications, neurologic disease, ocular disease, or exposure to certain toxins.

Miotic

A medicine or substance that makes the pupil smaller. Miotics may be used in glaucoma or during some eye procedures and can affect vision in dim light.

Alternate Names:
Miotic Agent; Pupillary Constrictor

Miracidium

The ciliated larval stage of a trematode that hatches from an egg and infects a suitable snail host.

Mirage Syndrome

A rare genetic disorder, usually related to SAMD9 variants, that can cause growth restriction, adrenal insufficiency, recurrent infections, and distinctive developmental findings.

MIRD Schema

A method used to estimate how much radiation reaches organs and tissues after a radioactive medicine is given. It helps specialists plan treatment and assess safety for radiopharmaceutical procedures.

Mirizzi Syndrome

A gallstone stuck near the gallbladder outlet presses on a nearby bile duct and blocks the flow of bile. It can cause jaundice, abdominal pain, fever, or infection and may require an endoscopic or surgical procedure.

Mirror Therapy

A rehabilitation exercise in which a mirror makes movement of the stronger limb appear to come from the affected limb. It may help some people with phantom-limb pain or movement recovery after stroke.

Mirror-Writing

Writing in which letters or words are reversed as if seen in a mirror; it may occur transiently in childhood or with neurologic disease.

Mirtazapine

Mirtazapine is a noradrenergic and specific serotonergic antidepressant used for major depressive disorder. It commonly causes sedation and increased appetite or weight and can rarely cause neutropenia or other serious adverse effects.

Misalignment

Misalignment is abnormal positioning or orientation of two or more structures relative to their intended relationship. It may affect bones, joints, teeth, eyes, implants, or medical devices and can impair function or healing.

Miscarriage

Spontaneous loss of a pregnancy before fetal viability, commonly caused by chromosomal abnormalities but requiring clinical assessment.

Alternate Names:
Spontaneous Abortion; Early Pregnancy Loss

Misdiagnosis

Misdiagnosis is assignment of an incorrect diagnosis or failure to recognize the correct condition. It can lead to inappropriate treatment, delayed care, avoidable harm, or unnecessary testing and may result

from atypical presentation, incomplete information, or system factors.

Mismatch Repair

A system that checks newly copied DNA and corrects small errors. When it fails, genetic changes can accumulate and increase the risk of cancers such as colorectal and womb cancer.

Mismatch Repair Deficiency

Loss of DNA mismatch-repair function that produces microsatellite instability and a high tumor mutational burden. Seen in Lynch syndrome and some sporadic colorectal, endometrial, and other cancers, and associated with responsiveness to immune checkpoint inhibitors.

MISME

Abbreviation; see *Neurofibromatosis Type 2*.

Misophonia

Misophonia is an intense emotional or physiologic reaction to specific repetitive sounds, such as chewing or tapping. It is not simple annoyance; behavioral strategies, sound management, and therapy can reduce impairment, while assessment considers anxiety, obsessive-compulsive symptoms, and sensory sensitivity.

Misoprostol

A synthetic prostaglandin analogue used for selected gynecologic and obstetric indications, including cervical ripening, labor induction, and medical management of some pregnancies. It can cause uterine contractions, bleeding, gastrointestinal effects, or uterine tachysystole; use depends on the clinical setting and gestational age.

Alternate Names:
Prostaglandin E1 Analogue

Missed Dose

A scheduled dose of a medicine that was not taken or administered. The appropriate response varies by drug and timing; doubling a dose can cause harm.

Missed Miscarriage

A nonviable intrauterine pregnancy that has not been expelled and may produce few or no symptoms of miscarriage. Diagnosis requires appropriate ultrasound or other clinical evaluation before management is selected.

Alternate Names:
Missed Abortion; Silent Miscarriage; Early Pregnancy Failure

Missed Period

Absence of an expected menstrual period. Pregnancy is common, but stress, weight change, endocrine disease, medications, perimenopause, and other conditions can also contribute.

Missense Mutation

A missense mutation is a DNA sequence change that substitutes one amino acid for another in a protein. Its effect may be harmful, beneficial, or neutral depending on the affected residue, protein function, and genetic context.

Missense Variant

A single-nucleotide substitution that changes one amino acid in a protein. Its clinical effect ranges from benign to pathogenic and must be assessed using molecular, functional, population, and clinical evidence.

Mistletoe Poisoning

Poisoning after eating mistletoe leaves or berries. It may cause nausea, vomiting, diarrhea, abdominal pain, dizziness, low blood pressure, slow or irregular heartbeat, seizures, or confusion; severe cases can be life-threatening.

Mitchell Disease

Alternate name for erythromelalgia, a disorder causing attacks of burning pain, warmth, and redness in the extremities; see *Erythromelalgia*.

Mite

A tiny, microscopic or near-microscopic invertebrate arthropod belonging to the subclass Acari (alongside

ticks) within the class Arachnida. Characterized by an unsegmented cephalothorax and abdomen (idiosoma) and four pairs of walking legs in the adult stage. Clinically relevant mites include: (1) *Sarcoptes scabiei* var. *hominis*, an obligate human parasite that burrows within the stratum corneum of the epidermis, depositing eggs and feces that trigger severe type IV delayed-hypersensitivity pruritus (scabies); (2) *Demodex* species (*Demodex folliculorum* and *Demodex brevis*), commensal hair follicle and sebaceous gland mites associated with blepharitis, rosacea, and meibomian gland dysfunction; (3) House dust mites (*Dermatophagoides pteronyssinus* and *D. farinae*), whose excreted digestive enzymes (Der p 1 allergen) act as potent inhaled environmental allergens triggering bronchial asthma and allergic rhinitis; and (4) Chigger mites (larval Trombiculidae), which inject proteolytic digestive enzymes into human skin causing intensely pruritic papules and transmitting *Orientia tsutsugamushi* (scrub typhus) in the Asia-Pacific region.

Mites

Plural form; see *Mite*.

Mithramycin

An older antineoplastic antibiotic, also called plicamycin, whose use is limited by substantial toxicity.

Mitobronitol

Mitobronitol is an alkylating antineoplastic compound formerly investigated or used in selected hematologic malignancies. Its cytotoxic effects can damage DNA and cause myelosuppression and other treatment-related toxicities.

Mitochondria

Small structures inside cells that make much of the energy cells need. They also help control calcium, cell survival, and several metabolic processes; mitochondrial disorders can affect organs that need high energy, such as the brain, muscles, heart, and eyes.

Mitochondrial Cristae

Folds of the inner membrane of mitochondria, the energy-producing parts of cells. The folds provide space for the machinery that turns nutrients into usable cellular energy.

Mitochondrial Diabetes

Diabetes caused by a change in mitochondrial DNA, which is usually passed through the mother. It may occur with hearing loss, muscle problems, or other mitochondrial symptoms; insulin production is often reduced and genetic testing may confirm the cause.

Mitochondrial Disease

A group of genetic disorders caused by impaired mitochondrial energy production. Symptoms vary and may affect the brain, muscles, nerves, heart, eyes, or multiple organs; onset and severity can differ widely even within one family.

Mitochondrial DNA

Small circular DNA molecules located primarily in mitochondria that encode some components of oxidative phosphorylation and are inherited predominantly through the maternal line.

Mitochondrial DNA Depletion Syndromes

A group of inherited disorders in which affected tissues have abnormally low amounts of mitochondrial DNA. This reduces mitochondrial energy production; depending on the subtype, the brain, muscles, liver, or several organs may be affected, often beginning in infancy or childhood.

Alternate Names:
Mitochondrial DNA Depletion Syndrome; MDDS

Mitochondrial Fission

Mitochondrial fission is division of one mitochondrion into two or more mitochondria. It helps distribute mitochondria, remove damaged portions through mitophagy, and respond to cell-cycle or metabolic signals; excessive fission may contribute to disease.

Mitochondrial Fusion

Mitochondrial fusion is joining of mitochondria into a connected network. It permits exchange of mitochondrial contents and helps maintain bioenergetic

function and genome integrity; fusion and fission are normally balanced dynamically.

Mitochondrial Inheritance

Inheritance of mitochondrial DNA, which is transmitted predominantly through the egg and therefore usually from the mother. Examples include Leber hereditary optic neuropathy and MELAS. Heteroplasmy means that mutant and normal mitochondrial DNA coexist in a cell.

Mitochondrial Matrix

The mitochondrial matrix is the protein-rich compartment enclosed by the inner mitochondrial membrane. It contains mitochondrial DNA, ribosomes, and enzymes for the citric-acid cycle, fatty-acid oxidation, and other metabolic processes.

Mitochondrial Membrane

The mitochondrial membrane system consists of an outer membrane and a highly folded inner membrane separated by an intermembrane space. It controls transport and houses the respiratory chain and ATP-producing machinery.

Mitochondrial Myopathy

A muscle disorder caused by faulty mitochondria, the cell structures that make energy. It may cause weakness, exercise intolerance, drooping eyelids, hearing loss, seizures, or problems in other organs.

Mitochondrial Ribosome

A mitochondrial ribosome is a ribosome within mitochondria that translates proteins encoded by mitochondrial DNA. Its structure differs from cytosolic ribosomes and defects in mitochondrial translation can cause energy-production disorders.

Mitochondrial Swelling

Enlargement of mitochondria caused by disruption of ion and water balance, often indicating cellular injury, impaired oxidative phosphorylation, or permeability-transition changes.

Mitochondrion

A mitochondrion is a membrane-bound organelle that generates much of a cell's ATP through oxidative phosphorylation. It also participates in apoptosis, calcium handling, metabolism, and production or regulation of reactive oxygen species.

Mitogen

A mitogen is a substance that stimulates a cell, especially a lymphocyte, to enter the cell cycle and proliferate. Mitogens include growth factors, lectins, and other signals that activate proliferative pathways.

Mitolactol

Mitolactol is an alkylating antineoplastic compound formerly used or investigated in cancer treatment. It damages DNA and can cause cytotoxic effects such as myelosuppression and gastrointestinal toxicity.

Mitomycin

A potent antineoplastic antibiotic originally isolated from the soil bacterium *Streptomyces caespitosus*, predominantly represented clinically by Mitomycin C. It functions as a bioreductive alkylating agent: following intracellular enzymatic reduction (catalyzed by NADPH-cytochrome P450 reductase or NQO1), it transforms into an active bifunctional alkylating metabolite that forms covalent cross-links between complementary strands of DNA (specifically at guanine residues within 5′-CpG-3′ sequences). This induces irreversible DNA interstrand cross-linking, inhibiting DNA replication, arresting cells in the late G1 and S phases of the cell cycle, and triggering apoptosis, with preferential cytotoxicity toward hypoxic tumor cells. Utilized clinically as systemic chemotherapy for gastrointestinal adenocarcinomas (gastric, pancreatic, colorectal, anal squamous cell carcinoma in the Nigro protocol) and as local topical or intravesical instillation for non-muscle-invasive bladder cancer and in ophthalmologic glaucoma trabeculectomy to prevent postoperative scar formation. Major dose-limiting toxicities include cumulative myelosuppression (thrombocytopenia and leukopenia), interstitial pneumonitis, and hemolytic uremic syndrome (HUS / thrombotic

microangiopathy).

Mitomycins

Plural form; see *Mitomycin*.

Mitophagy

The process by which a cell identifies and breaks down damaged or unnecessary mitochondria, the cell's energy-producing structures. This helps maintain healthy cells; abnormal mitophagy may contribute to some diseases.

Mitosis

Cell division that produces two genetically similar daughter cells with the same chromosome number as the parent cell.

Mitosporic Fungi

Fungi that reproduce by asexual spores; the term is mainly used for fungi whose sexual stage is unknown or not observed.

Mitotane

Mitotane is an adrenolytic drug used for selected adrenocortical carcinomas and to suppress excess adrenal steroid production. It can cause gastrointestinal and neurologic effects, adrenal insufficiency, and numerous drug interactions.

Mitotic Anaphase

Mitotic anaphase is the stage of mitosis in which sister chromatids separate and move toward opposite poles of the cell. Accurate spindle attachment and chromosome segregation are required for formation of genetically similar daughter cells.

Mitotic Figure

A cell seen under a microscope while it is dividing. The number of dividing cells in a tissue sample can help estimate how quickly a tumor or other tissue is growing.

Mitotic Metaphase

Mitotic metaphase is the stage of mitosis in which duplicated chromosomes align at the cell equator with sister kinetochores attached to opposite spindle poles. A checkpoint helps prevent premature chromosome separation.

Mitotic Prophase

Mitotic prophase is the early stage of mitosis in which chromatin condenses into visible chromosomes, the nucleolus disappears, and the mitotic spindle begins to form. In late prophase or prometaphase, the nuclear envelope breaks down.

Mitotic Recombination
